

GENERAL COLLECTION

OF

VOYAGES AND TRAVELS.

NORTH AMERICA, continued.

THE

GENERAL HISTORY

OF

VIRGINIA, NEW ENGLAND, AND THE SUMMER ISLES:

WITH THE

Names of the Adventurers, Planters, and Governors, from their first beginning, Anno 1584, to this present 1624; with the Proceedings of those several Colonies, and the Accidents that befell them in all their Journies and Discoveries.

ALSO,

THE MAPS AND DESCRIPTIONS OF ALL THOSE COUNTRIES, THEIR COMMODITIES, PEOPLE, GOVERNMENT, CUSTOMS, AND RELIGION, YET KNOWN.

Divided into Six Books.

By Captain John Smith,
Sometime Governor in those Countries, and Admiral of New England.*

TO THE ILLUSTRIOUS AND MOST NOBLE PRINCESS, THE LADY FRANCES, DUCHESS OF RICHMOND AND LENOX.

May it please Your Grace,

THIS History, as for the rarity and variety of the subject, so much more for the judicious eyes it is like to undergo, and most of all for that great name, whereof it dareth implore protection, might and ought to have been clad in better robes than my rude military hand can cut out in paper ornaments. But because, of the most things

* London, 1624, folio.

therein,

therein, I am no compiler by hearfay, but have been a real actor; I take myfelf to have a property in them; and therefore have been bold to challenge them to come under the reach of my own rough pen. That, which hath been indured and paffed through with hardship and danger, is thereby fweetened to the actor, when he becometh the relator. I have deeply hazarded myfelf in doing and fuffering, and why should I stick to hazard my reputation in recording? He that acteth two parts is the more borne withal if he come fhort, or fail in one of them. Where shall we look to find a Julius Cæfar, whose atchievements shine as clear in his own commentaries, as they did in the field? I confefs, my hand, though able to wield a weapon among the barbarous, yet well may tremble in handling a pen among fo many judicious: especially when I am fo bold as to call fo piercing, and fo glorious an eye, as Your Grace, to view thefe poor ragged lines.

Yet my comfort is, that heretofore honorable and virtuous ladies, and comparable but amongft themselves, have offered me rescue and protection in my greatest dangers: even in foreign parts, I have felt relief from that fex. The beauteous Lady Tragabigzanda, when I was a flave to the Turks, did all flee could to fecure me. When I overcame the Bashaw of Nalbrits in Tartaria, the charitable Lady Callamata supplied my necessities. In the utmost of many extremities, that blessed Pokahontas, the great King's daughter of Virginia, oft faved my life. When I escaped the cruelty of pirates and most furious storms, a long time alone in a finall boat at sea, and driven ashore in

France, the good lady Madam Chanoves, bountifully affifted me.

And fo verily these my adventures have tasted the same influence from your gratious hand, which hath given birth to the publication of this narration. If therefore your Grace shall deign to cast your eye on this poor book, view, I pray you, rather your own bounty (without which it had died in the womb) than my imperfections, which have no help but the shrine of your glorious name to be sheltered from censorious condemnation. Vouchfafe fome glimpfe of your honourable afpect, to accept thefe my labours; to protect them under the shadow of your excellent name: which will enable them to be prefented to the King's royal Majefty, the most admired Prince Charles, and the Queen of Bohemia: your fweet recommendations will make it the worthier of their good countenances. And as all my endeavours are their due tribute: fo this page shall record to posterity, that my service shall be to pray to God, that you may still continue the renowned of your fex, the most honored of men, and the highly blessed of God.

Your Grace's faithful and devoted fervant,

JOHN SMITH.

A PREFACE OF FOUR POINTS.

1. THIS plain history humbly sheweth the truth; that our most royal King James hath place and opportunity to inlarge his ancient dominions without wronging any (which is a condition most agreeable to his most just and pious resolutions): and the Prince His Highness may see where to plant new colonies. The gaining provinces addeth to the King's crown; but the reducing heathen people to civility and true religion, bringeth honour to the King of Heaven. If his princely wisdom and powerful

hand

LIBRARY UNIVERSITY OF CALIFORNIA SANTA BARBARA

SMITH'S VIRGINIA.

hand, renowned through the world for admirable government, please but to set these new estates into order, their composure will be singular: the counsel of divers is confused; the general stock is consumed; nothing but the touch of the King's sacred hand can erect a monarchy.

2. Most noble Lords and worthy Gentlemen, it is your Honours that have employed great pains and large expence in laying the foundation of this state, wherein much hath been buried under ground, yet something hath sprung up, and given you a taste of your adventures. Let no difficulties alter your noble intentions. The action is an honour to your country; and the issue may well reimburse you your sums expended. Our practices have hitherto been but essays, and are still to be amended. Let your bounty supply the necessities of weak beginnings, and your excellent judgments rectify the proceedings; the return cannot choose in the end but bring you good commodities, and good contentments, by your advancing shipping and sishing, so useful unto our nation.

3. Ye valiant and generous spirits, personal possessor of these new-found territories, banish from among you cowardice, covetousness, jealousies, and idleness, enemies to the raising your honours and fortunes; virtue, industry, and amity will make you good and great, and your merits live to ensuing ages. You that, in contempt of necessities, hazard your lives and estates, employing your studies and labours in these fair

endeavours, live and profper as I defire my foul fhould profper.

4. For myfelf, let emulation and envy cease; I ever intended my actions should be upright: now my care hath been that my relations should give every man they concern their due. But had I not discovered and lived in the most of those parts, I could not possibly have collected the substantial truth from such a number of variable relations, that would have made a volume at least of a thousand sheets. Though the beginning may seem harsh in regard of the antiquities, brevity, and names, a pleasanter discourse ensues. The style of a soldier is not eloquent, but honest and justifiable; so I desire all my friends and well-wishers to excuse and accept it, and if any be so noble as to respect it, he that brought New England to light, though long since brought in obscurity, he is again to be found a true servant to all good designs.

So I ever rest yours to command,

JOHN SMITH.

with

BOOK I.

How ancient Authors report the New World, now called America, was discovered: and Part thereof first planted by the English, called Virginia, with the Accidents and Proceedings of the same.

FOR the stories of Arthur, Malgo, and Brandon, that fay a thousand years ago they were in the North of America; or the friar of Lynn, that by his black art went to the North Pole in the year 1360, in that I know them not. Let this suffice.

The chronicles of Wales report, that Madock, fon to Owen Quineth, Prince of Wales, feeing his two brethren at debate who should inherit, prepared certain ships,

3

with men and munition, and left his country to feek adventures by fea. Leaving Ireland north, he failed weft till he came to a land unknown. Returning home, and relating what pleafant and fruitful countries he had feen without inhabitants, and for what barren ground his brethren and kindred did murder one another, he provided a number of ships, and got with him fuch men and women as were defirous to live in quietness, that arrived with him in this new land in the year 1170: left many of his people there, and returned for more. But where this place was no history can shew.

The Spaniards fay, Hanno, a Prince of Carthage was the first: and the next, Christopher Columbus, a Genoesian, whom they sent to discover those unknown parts.

1492.

But we find by records, Columbus offered his fervice in the year 1488, to King Henry the Seventh, and by accident undertook it for the Spaniards. In the interim, King Henry gave a commission to John Cabot and his three sons, Sebastian, Lewis, and Sautius. John and Sebastian, well provided, setting fail, ranged a great part of this unknown world, in the year 1497. For though Columbus had sound certain isses, it was 1498 ere he saw the continent, which was a year after Cabot. Now Americus came a long time after, though the whole continent to this day is called America, after his name, yet Sebastian Cabot discovered much more than them all, for he sailed to about forty degrees southward of the line, and to sixty-seven towards the north: for which King Henry the Eighth knighted him, and made him Grand Pilate of England. Being very aged, King Edward the Sixth gave him a pension of 1661. 13s. 4d. yearly. By his directions Sir Hugh Willowby was sent to find out the country of Russia, but the next year he was found frozen to death in his ship, and all his company.

Mr. Martin Frobisher was sent in the year 1576, by our most gracious Queen Elizabeth, to search for the north-west passage, and meta incognita: for which he was

knighted, honoured, and well rewarded.

Sir Humphrey Gilbert, a worthy knight, attempted a plantation in some of those parts, and obtained letters patent to his desire; but with this proviso, he should maintain possession in some of those vast countries within the term of fix years. Yet when he was provided with a navy able to encounter a king's power, even here at home they fell in divisions, and so into confusion, that they gave over the design ere it was begun. Notwithstanding all this loss, his undaunted spirit began again, but his sleet fell with Newsoundland, and he perished in his return, as at large you may read in the third volume of the English Voyages, written by Mr. Hackluit.

Upon all those relations and inducements, Sir Walter Raleigh, a noble gentleman, and then in great esteem, undertook to fend to discover to the southward. And though his occasions and other employments were such he could not go himself, yet he procured Her Majesty's letters patent, and persuaded many worthy knights and gentlemen to adventure with him to find a place sit for a plantation. Their proceedings

followeth.

The most famous, renowned, and ever worthy of all memory, for her courage, learning, judgment, and virtue, Queen Elizabeth, granted her letters patents to Sir Walter Raleigh, for the discovering and planting new lands and countries, not actually possessed by any Christians. This patentee got to be his affistants Sir Richard Grenvell, the valiant; Mr. William Sanderson, a great friend to all such noble and worthy actions; and divers other gentlemen and merchants, who with all speed provided two small barks well furnished with all necessaries, under the command of Captain Philip Amidas

Amidas and Captain Barlow. The 27th of April they fet fail from the Thames, the 10th of May passed the Canarics, and the 10th of June the West Indies; which unneedful southerly course (but then no better was known) occasioned them in that seafon much sickness.

The 2d of July they fell in with the coast of Florida in shoal water, where they felt a most delicate sweet smell, though they saw no land, which ere long they espied, thinking it the continent: an hundred and twenty miles they failed, not finding any harbour. The first that appeared with much difficulty they entered, and anchored, and after thanks to God, they went to view the next land adjoining, to take possession of it for the Queen's most Excellent Majesty; which done, they found their first landing-place very sandy and low, but so full of grapes that the very surge of the sea sometimes overslowed them; of which they found such plenty in all places, both on the sand, the green soil, and hills, as in the plains, as well on every little shrub, as also climbing towards the tops of high cedars, that they did think in the world were not the like abundance.

We passed by the sea-side towards the tops of the next hills, being not high, from whence we might fee the fea on both fides, and found it an ifle of twenty miles in length and fix in breadth, the vallies replenished with goodly tall cedars. Discharging our musquets, such a slock of cranes, the most white, arose by us, with such a cry, as if an army of men had shouted altogether. This isle hath many goodly woods, and deer, conies, and fowl in incredible abundance; and, using the author's own phrase, the woods are not fuch as you find in Bohemia, Muscovy, or Hircinia, barren and fruitless, but the highest and reddest cedars of the world, bettering them of the Azores, Indies, or Libanus; pines, cypress, fassafras, the lentisk that beareth mastic, and many other of excellent finell and quality. Till the third day we faw not any of the people; then in a little boat three of them appeared; one of them went on shore, to whom we rowed, and he attended us without any fign of fear. After he had spoke much, though we understood not a word, of his own accord he came boldly aboard us; we gave him a shirt, a hat, wine, and meat, which he liked well, and after he had well viewed the barks and us, he went away in his own boat, and within a quarter of a mile of us, in half an hour, had loaden his boat with fish, with which he came again to the point of land, and there divided it in two parts, pointing one part to the ship the other. to the pinnace, and fo departed.

The next day came divers boats, and in one of them the King's brother, with forty or fifty men, proper people, and in their behaviour very civil; his name was Granganameo, the King is called Wingina, the country Wingandacoa. Leaving his boats a little from our fhips, he came with his train to the point: where fpreading a mat he fat down. Though we came to him well armed, he made figns to us to fit down without any fhew of fear, ftroking his head and breaft, and also ours to express his love. After he had made a long speech unto us, we presented him with divers toys, which he kindly accepted. He was greatly regarded by his people, for none of them did fit, nor speak a word, but four, on whom we bestowed presents also, but he took all from

them, making figns all things did belong to him.

The King himself in a conflict with a King his next neighbour and mortal enemy, was shot in two places through the body, and the thigh, yet recovered, whereby he lay at his chief town, fix days journey from thence.

A day or two after shewing them what we had, Granganameo taking most liking to a pewter dish, made a hole in it, hung it about his neck for a breast-plate, for which he

gave us twenty deer skins, worth twenty crowns; and for a copper kettle, fifty skins, worth fifty crowns. Much other truck we had, and after two days he came aboard, and did eat and drink with us very merrily. Not long after he brought his wife and children; they were but of mean stature, but well-favoured and very bashful; she had a long coat of leather, and about her privities a piece of the same, about her forehead a band of white coral, and so had her husband, in her ears were bracelets of pearl, hanging down to her middle, of the bigness of great peas; the rest of the women had pendants of copper, and the noblemen five or six in an ear; his apparel as his wives, only the women wear their hair long on both sides, and the men but on one; they are of colour yellow, but their hair is black, yet we saw children that had very fair chesnut-coloured hair.

After that these women had been here with us, there came down from all parts great store of people, with leather, coral, and divers kinds of dyes, but when Granganameo was present, none durst trade but himself, and them that wore red copper on their heads, as he did. Whenever he came, he would signify by so many sires he came with so many boats, that we might know his strength. Their boats are but one great tree, which is but burnt in the form of a trough with gins and fire, till it be as they would have it. For an armour he would have engaged us a bag of pearl, but we refused, as not regarding it, that we might the better learn where it grew. He was very just of his promise, for often we trusted him, and he would come within his day to keep his word. He sent us commonly every day a brace of bucks, conies, hares, and fish, sometimes melons, walnuts, cucumbers, peas, and divers roots. This author sayeth, their corn groweth three times in five months; in May they sow, in July reap; in June they sow, in August reap; in July sow, in August reap. We put some of our peas in the ground, which in ten days were sourceen inches high.

The foil is most plentiful, sweet, wholesome, and fruitful of all other; there are about fourteen several forts of sweet swelling timber trees: the most parts of the underwood, bays, and such like: such oaks as we, but far greater and better. After this acquaintance, myself with seven more went twenty mile into the river Occam, that runneth toward the city Skicoack, and the evening following we came to an isle called Roanoak, from the harbour where we entered seven leagues; at the north end was nine houses, builded with cedar, fortified round with sharp trees, and the entrance like a turnpike. When we came towards it, the wise of Granganameo came running out to meet us (her husband was absent,) commanding her people to draw our boat ashore for beating on the billows, others she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to bring our oars into the house, of she appointed to carry us on their backs aland, others to be appointed to carry us on their backs aland, others to be appointed to carry us on their backs al

After we had thus dried ourselves, she brought us into an inner room, where she set on the board standing along the house somewhat like frumenty, sodden venison, and roasted sish; in like manner melons raw, boiled roots and fruits of divers kinds. There, drink is commonly water boiled with ginger, sometimes with fasfasfras, and wholesome herbs, but whilst the grape lasteth they drink wine. More love she could not express to entertain us; they care but only to defend themselves from the short winter, and seed on what they find natural in summer. In this feasting house was their idol, of whom they told us incredible things. When we were at meat two or three of her men came amongst us with their bows and arrows, which caused us to take our

arms in hand. She perceiving our diftrust, caused their bows and arrows to be broken, and they beaten out of the gate: but the evening approaching we returned to our boat, where at the much grieving, brought our fupper half-boiled, pots and all, but when the faw us, but put our boat a little off from the shore and lie at anchor, perceiving our jealoufy, she fent divers men and thirty women to sit all night on the shore side against us, and fent us five mats to cover us from the rain, doing all she could to perfuade us to her house. Though there was no cause of doubt, we would not adventure: for on our fafety depended the voyage: but a more kind loving people cannot be. Beyond this ifle is the main land and the great river Occam, on which standeth a town called Fomeiock, and fix days higher, their city Skicoak: those people never faw it, but fay their fathers affirm it to be above two hours journey about. Into this river falleth another called Cipo, where is found many muffels wherein are pearls: likewife another river called Nomapona, on the one fide whereof standeth a great town called Chamanock, the lord of the country is not subject to Wingandacoa. Beyond him another King they call Menatonon. These three are in league with each other. Towards the fouth, four days journey, is Sequotan, the fouthernmost part of Wingan-

Adjoining to Secotan beginneth the country Pomouik, belonging to the King called Piamacum, in the country Nusiok, upon the great river Neus. These have mortal wars with Wingina, King of Wingandacoa. Betwixt Piemacum and the lord of Secotan, a peace was concluded, notwithstanding there is a mortal malice in the Secotans, because this Piemacum invited divers men and thirty women to a feast, and when they were altogether merry before their idol, which is but a mere illusion of the devil, they fuddenly flew all the men of Secotan, and kept the women for their use. Beyond Roanoak are many ifles full of fruits and other natural increases, with many towns along the fide of the continent. Those isles lie two hundred miles in length, and between them and the main, a great long fea, in fome places twenty, forty, or fifty miles broad, in others more, fomewhere lefs. And in this fea are one hundred ifles of divers bigneffes, but to get into it, you have but three passages, and they very dangerous. Though this you fee for most part be but the relations of favages, because it is the first, I thought it not amifs to remember them as they are written by them that returned and arrived in England about the midst of September the same year. This discovery was so welcome into England that it pleafed Her Majesty to call this country of Wingandacoa, Virginia, by which name now you are to understand how it was planted, dissolved, reuned, and enlarged.

The performers of this voyage were thefe following:

Philip Amadas, Arthur Barlow, Captains.

William Grenvill, Benjamin Wood, John Wood, James Browewich, Henry Greene,

Simon Ferdinando, of the Nicholas Peryman, [company. John Hewes,

Sir Richard Grenvill's Voyage to Virginia, for Sir Walter Raleigh, 1585.

THE 9th of April he departed from Plymouth, with feven fail: the chief men with him in command, were Mr. Ralph Layne, Mr. Thomas Candish, Mr. John Arundel, Mr. Stukley, Mr. Bremige, Mr. Vincent, Mr. Heryot and Mr. John Clarke. 14th 14th day we fell with the Canaries, and the 7th of May with Dominico in the West Indies; we landed at Portorico, after with much ado at Izabella on the north of Hispaniola, passing by many isles. Upon the 20th, we fell with the main of Florida, and were put in great danger upon Cape Fear. The 26th we anchored at Wocokon, where the Admiral had like to been cast away; presently we fent to Wingina, to Roanoak, and Mr. Arundel went to the main, with Mantco a savage, and that day to Crooton. The 11th the General victualled for eight days, with a selected company went to the main, and discovered the towns of Pomeiok, Aquascogoc, Secotan, and the great lake called Paquipe. At Aquascogoc the Indians stole a silver cup, wherefore we burnt the town and spoiled their corn, so returned to our fleet at Tocokon. Whence we wayed for Hatorask, where we rested, and Granganumeo, King Wingina's brother, with Manteo, came aboard our Admiral, the Admiral went for Weapomeiok, and Mr. John Arundel for England. Our General in his way home took a rich laden ship of 300 tons, with which he arrived at Plymouth the 18th of September, 1585.

These were left under the command of Mr. Ralph Layne to inhabit the country, but they returned within a year.

Philip Amidas, Admiral	Mr. Kendall	Mr. Allen
Mr. Thomas Heryot	Mr. Gardiner	Mr. Michael Pollifon
Mr. Acton	Mr. Predeox	Mr. Thomas Bockner
Mr. Stafford	Mr. Rogers	Mr. James Mason
Mr. Thomas Luddington	Mr. Harvy	Mr. David Salter
Mr. Marvyn	Mr. Snelling	Mr. James Skinner.
Cantain Vaughan	Mr. Antony Ruffe	

With divers others, to the number of 108.

Touching the most remarkable things of the country, and our proceeding from the 17th of August 1585, till the 18th of June 1586, we made Roanoack our habitation. The utmost of our discovery southward was Secotan, as we esteemed 80 leagues from Roanoacke. The passage from thence was thought a broad sound within the main, being without kenning of land, yet full of slats and shoals that our pinnasse could not pass, and we had but one boat with four oars, that would carry but sisteen men with their provisions for seven days: so that because the winter approached we left those discoveries till a stronger supply. To the northward, our farthest was to a town of the Chesapeaks, from Roanoack 130 miles. The passage is very shallow and dangerous by reason of the breadth of the found, and the little succour for a storm, but this territory being 15 miles from the shore, for pleasantness of seat, for temperature of climate, fertility of soil, and commodities of the sea, besides bears good woods, saxefras, walnuts, &c. is not to be excelled, by any other whatsoever.

There be fundry other kings they call Weroances as the Mangoacks, Trypaniks and

Opposians, which came to visit us.

To the north-west our farthest was Chawonock from Roanoack, 130 miles; our passage lieth through a broad sound, but all fresh water, and the channel navigable for a ship, but out of it full of shoals.

The towns by the way by the water, are Paffaquenock the womens' town, Chepanoc, Weapomeiok; from Mufcamunge we enter the river and jurifdiction of Chawonock, there it beginneth to straiten, and at Chawonock it is as Thames at Lambeth: betwixt them as we passed is goodly high land on the left hand, and there is a town called Ohanock,

Ohanock, where is a great corn field, it is fubject to Chawonock, which is the greatest province upon the river, and the town itself can put seven hundred men into the field, besides the forces of the rest. The king is lame, but hath more understanding than all the rest.

The river of Moratoc is more famous than all the rest, and openeth into the sound of Weapomeiok, and where there is but a very fmall current in Chawonock, it hath fo strong a current from the fouth-west, as we doubted how to row against it. Strange things they report of the head of this river, and of Moratoc itself, a principal town on it, and is thirty or forty days journey to the head. This lame king is called Menatonon. When I had him prisoner two days, he told me that three days journey in a canoe up the river Chawonock, then landing and going four days journey north-cast, there is a king whose country lieth on the fea, but his best place of strength is an island in a bay environed with deep water, where he taketh that abundance of pearl, that not only his fkins, and his nobles, but also his beds and houses are garnished therewith. This king was at Chawonock two years ago to trade with black pearl, his worst fort whereof I had a rope, but they were nought; but that king he fayeth hath store of white, and had traffick with white men, for whom he refcued them; he promifed me guides to him, but advised me to go strong, for he was unwilling strangers should come in his country, for his country is populous and valiant men. If a fupply had come in April, I refolved to have fent a small bark to the northward to have found it, whilft I with fmall boats and 200 men, would have gone to the head of the river Chawonock, with fufficient guides by land, infconfing myfelf every two days, where I would leave garrifons for my retreat till I came to this bay.

Very near unto it is the river of Moratoc, directly from the west, the head of it springeth out of a main rock, which standeth so near the sea, that in storms the sea beats over it into this fresh spring, that of itself at the surf is a violent stream. I intended with two wherries and forty persons to have Menatonous soon for guide, to try this presently, till I could meet with some of the Moratocks, or Mangoaks, but hoping of getting more victuals from the savages, we as narrowly escaped starving in

that discovery as ever men did.

For Pemiffapan, who had changed his name of Wingina upon the death of his brother Granganameo, had given both the Chawonests, and Mangoaks word of my purpose: also he told me the Chawonocks had affembled two or three thousand to affault me at Roanock, urging me daily to go against them, and them against us; a great affembly I found at my coming thither, which fudden approach did so difinay them, that we had the better of them; and this confederacy against us was procured by Pemissapan himfelf, our chief friend we trufted; he fent word also to the Moratocks and the Mangoaks, I came to invade them, that they all fled up into the high country, fo that where I affured myself both of succour and provision, I found all abandoned. But being thus far on my journey 160 miles from home, and but victuals for two days, befides the cafualties of cross winds, storms, and the savages treachery, though we intended no hurt to any: I gave my company to understand we were only drawn forth upon these vain hopes by the favages to bring us to confusion: a council we held, to go forward or return, but they all were absolutely resolved but three, that whilst there was but one pint of corn for a man, they would not leave the fearch of that river; for they had two mastiff dogs, which boiled with sassafras leaves (if the worst fell out) upon them, and the pottage they would live two days, which would bring them to the Sound, where they should find fish for two days more to pass it to Roanock, which two days they had VOL. XIII.

rather fast than go back a-foot till they had seen the Mangoaks either as friends or foes.

Though I did foresee the danger and misery, yet the desire I had to see the Mangoaks was, for that there is a province called Chaunis Temoatan, frequented by them and well known to all those countries, where is a mine of copper they call Wassador; they say they take it out of a river that falleth swiftly from high rocks in shallow water, in great bowls, covered with leather, leaving a part open to receive the metal, which by the change of the colour of the water where the spout falleth, they suddenly chop down, and have the bowl full, which they cast into the sire; it presently melteth, and doth yield in five parts at the first melting two parts metal for three of ore. The Mangoaks have such plenty of it, they beautify their houses with great plates thereof: this the savages report; and young Skiko the king of Chawonock's son, my prisoner, that had been prisoner among the Mangoaks, but never at Chaunis Temoatan, for he said

that was twenty days journey over-land from the Mangoaks.

Menatonon also confirmed all this, and promifed me guides to this metal country; by land to the Mangoaks is but one day's journey, but feven by water, which made me fo willing to have met them for fome affay of this metal: but when we came there we found no creature, only we might fee where had been their fires. our two days journey, and our victuals fpent, in the evening we heard fome call as we thought Manteo, who was with me in the boat; this made us glad; he made them a friendly answer, which they answered with a fong, we thought for welcome, but he told us they came to fight. Prefently they did let fly their arrows about the boat, but did no hurt, the other boat fcouring the shore we landed: but they all were fled, and how to find them we knew not. So the next morning we returned to the mouth of the river, that cost us four days rowing up, and here our dogs' pottage stood us in good flead, for we had nothing elfe: the next day we fasted being wind-bound, and could not pass the Sound, but the day following we came to Chippanum, where the people were fled, but their wires afforded us fish: thus being near spent, the next day God brought us to Roanock. I conclude a good mine, or the South-fea will make this country quickly inhabited, and fo for pleafure and profit comparable with any in the world: otherwise there will be nothing worth the fetching. Provided there be found a better harbour then yet there is, which must be northward if there be any. Mr. Vaughan no less hoped of the goodness of the mine, then Mr. Heriot that the river Moratock's head, either riseth by the Bay of Mexico, or very near the South Sea, or fome part that openeth near the fame, which cannot with that facility be done as from the Bay of Pearls, by infconcing four days journey to the Chawonocks, Mangoaks, and Moratocks, &c.

The Conspiracy of Pemissapan; the Discovery of it; and our Return for England with Francis Drake.

ENSENORE, a favage, father to Pemissapan, the best friend we had after the death of Granganimeo, when I was in those discoveries, could not prevail any thing with the King from destroying us, that all this time God had preserved, by his good counsel to the King to be friendly unto us. Pemissapan thinking as the brute was in this last journey we were slain and starved, began to blaspheme our God that would suffer it, and not desend us, so that old Ensenore had no more credit for us; for he began by all the devices he could to invade us. But in the beginning of this brute, when they saw us all return, the report salle, and had Manteo, and three savages more

with us, how little we eftermed all the people we met, and feared neither hunger, killing, or any thing, and had brought their greatest king's fon prisoner with us to Roanock, it a little affuaged all his devifes, and brought Enfenore in respect again, that our God was good, and we their friends, and our foes should perish, for we could do them more hurt being dead, than living, and that being an hundred miles from them, fhot, and struck them fick to death, and that when we die it is but for a time, then we return again. But that which wrought the most fear among them, was the handy-work of Almighty God. For certain days after my return, Menatonon fent meffengers to me with pearl, and Okifco, King of Weopomeoke, to yield himfelf fervant to the Queen of England. Okifco, with twenty-four of his principal men, came to Pemiffapan, to acknowledge this duty and fubjection, and would perform it. All which fo changed the heart of Pemissappan, that upon the advice of Ensenore, when we were ready to famish they came and made us wires, and planted their fields they intended to abandon, (we not having one corn till the next harvest to sustain us.) This being done, our old friend Ensenore died the twentieth of April; then all our encmies wrought with Pemiffapan to put in practice his devifes, which he eafily embraced, though they had planted corn by us, and at Dafamonpeack, two leagues from us: yet they got Okifco our tributary, to get feven or eight hundred, (and the Mandoages, with the Chifapeans, should do the like,) to meet (as their custom is,) to folemnize the funeral of Enfenore: half of whom should lie hid, to cut off the ftragglers feeking crabs and provision; the rest come out of the main upon the signal by fire. Twenty of the principal of Pemissapan's men had charge in the night to beset my house, put fire in the reeds that covered it, which might cause me run out so naked and amazed, they might without danger knock out my brains. The fame order for Mr. Heriots, and the rest; for all should have been fired at an instant. In the mean time they should fell us nothing, and in the night spoil our wires, to make necessity disperse us; for if we were but ten together, a hundred of them would not meddle with us. So our famine increased; I was forced to fend Captain Stafford to Croaten, with twenty, to feed himfelf, and fee if he could efpy any fail pass the coast; Mr. Predeox with ten, to Hatarask, upon the same occasion; and other small. parties to the main to live upon roots and oysters.

Pemiffapan fequestering himself, I should not importune him for victuals, and to draw his troops, found not the Chawonests fo forward as he expected, being a people more faithful and powerful, and defired our friendship, and was offended with him for raifing fuch tales, and all his projects were revealed to me by Skico my prifoner; who, finding himself as well used by me as Pemissapan, told me all. These troubles caused me to fend to Pemissapan, to put sufficion in his head, I was to go presently to Croatan to meet a fleet coming to me, though I knew no fuch matter; and that he would lend me men to fish and hunt. He fent me word he would come himself to Roanock, but delaying time eight days, that all his men were there to be affembled; not liking fo much company, I refolved the next day to go vifit him, but first to give them in the ifle a canvifado, and at an inftant to feize on all their canoes about the ifle; but the town took the alarm before I meant it; for when I fent to take the canoes, he met one going from the shore, overthrew her, and cut off two savages heads; whereupon the cry arose, being by their spies perceived, for they kept as good watch over us, as we of them. Upon this they to their bows, and we to our arms; three or four of them at the first were slain, the rest fled into the woods. The next morning I went to Dassamonpeack, and fent Pemissapan word I was going to Croatan, and took him in my way to complain Ofocon would have stole my prisoner Skico. Hereupon he did abide my coming; and being among eight of the principal, I gave the watch-word to my men, and immediately they had that they purposed for us; himself being shot through with a pistol, felldown as dead, but presently started up and ran away from them all, till an Irish boy shot him over the buttocks, where they took him and cut off his head.

Seven days after Captain Stafforton fent to me, he defcried twenty-three fail. The next day came to me himfelf, (of whom I must fay this, from the first to the last, he neither spared labour or peril, by land or sea, fair weather or soul, to perform any ferious service committed to him.) He brought me a letter from Sir Francis Drake, whose generous mind offered to supply all my defects, of shipping, boats, munition, victuals, cloaths, and men, to surther this action; and upon good consultation and deliberation, he appointed me a ship of seventy tons, with an hundred men, and sour months victuals, two pinnaces, four small boats, with two sufficient masters, with sufficient gangs. All this being made ready for me, suddenly arose such a storm for sour days, that had like to have driven the whole sleet on shore; many of them were forced to the sea, whereof my ship so lately given me was one, with all my provision and company appointed.

Notwithstanding, the storm ceasing, the General appointed me a ship of one hundred and seventy tons, with all provisions as before, to carry me into England the next August, or when I had performed such discoveries as I thought sit. Yet they durst not undertake to bring her into the harbour, but she must ride in the road, leaving the care of the rest to myself, advising me to consider with my company what was sittest,

and with my best speed return him answer.

Hereupon, calling my company together, who were all as privy of the General's offer as myfelf; their whole request was, (in regard of all those former inseries, and no hope of the return of Sir Richard Grenvill,) and with a general consent, they desired me to urge him, we might all go with him for England in his sleet, for whose relief in that storm he'had sustained more peril of wreck, than in all his honourable actions against his enemies. So with praises to God we set fail in June 1536, and arrived in Portsmouth the 27th of July the same year, leaving this remembrance to posterity.

To reason lend me thine attentive ears, Exempt thyself from mind-diffracting cares: Lest that's here thus projected for thy good, By thee rejected be, ere understood.

Written by Mr. RALPH LAYNE, Governor.

The Observations of Mr. Thomas Heriot in this Voyage, for Merchandise and Visituals.

WHAT before is writ is also confirmed by that learned mathematician Mr. Thomas Heriot, with them in the country, whose particular relation of all the beafts, birds, fishes, fowls, fruits, and roots, and how they may be useful; because I have writ it before, for the most part, in the discourse of Captain Amidas, and Captain Layne, except silk-grafs, worm-silk, slax like hemp, allum, wapeith, or terra sigillata, tar, rosin, and turpentine, civet-cats, iron ore, copper that held silver, coprose and pearl: let those briefs suffice, because I would not trouble you with one thing twice.

Dyes.

Dyes.] For dyes, fhumack, the herb wafebur, little roots called chapacor, and the bark of a tree, called by the inhabitants tangomockonominge, which are for divers forts of red.

What more then is related is an herb, in Dutch called melden, described like an orange, growing four feet high; the seed will make good broth, and the stalk, burnt to ashes, makes a kind of salt; other salt they know not, and we used of it for pot-herbs.

Of their tobacco we found plenty, which they efteem their chief physic.

Ground-nuts, tifwaw we call China roots; they grow in clufters, and bring forth a bryer stalk, but the leaf is far unlike, which will climb up to the top of the highest tree; the use known is to cut it in small pieces, then stamp and strain it with water, and boiled makes a jelly good to eat. Cassavia grows in marshes, which the sudians often use for bread and broth. Habascon is like a parsnip, nought of itself, except compounded; and their leeks like those in England.

Sequenummener, a kind of berry like capers, and three kinds of berries like acorns,

called fagatamenor, ofamenor, and pumniuckoner.

Saquenuckot and maquowoc, two kind of beafts, greater than conies, and very good meat; in fome places, fuch plenty of grey conies, like hares, that all the people make them mantles of their fkins. I have the names of 28, feveral forts that are difperfed in the country; of which, 12 kinds we have difcovered, and good to eat; but the favages fometimes kill a lion and eat him.

There is plenty of sturgeon in February, March, April, and May; all herrings in abundance; some such as ours, but the most part of 18, 20, or 24 inches long, and more. Trouts, porpoises, rays, mullets, old wives, plaice, tortoises, both by sea and land; crabs, oysters, muscles, scalops, perriwinkles, crevices, secanank: we have the

pictures of twelve forts more, but their names we know not.

Turkies, stock-doves, partridges, cranes, herns, swans, geefe, parrots, falcons, merlins; I have the names in their language, of eighty-fix several forts. Their woods are such as ours in England for the most part, except rakeock, a great sweet tree, whereof they make their canoes; and ascopo, a kind of tree like laurel and sassans.

Their Natures and Manners.] Their clothing, towns, houses, wars, arts, tools, handicrafts, and educations, are much like them in that part of Virginia we now inhabit: which at large you may read in the description thereof; but the relation of

their religion is strange, as this author reporteth.

Some religion they have, which, although it be far from the truth, yet being as it is, there is hope it may be eafier reformed. They believe there are many gods, which they call mantoac, but of different forts and degrees. Also that there is one chief god, that hath been from all eternity, who, as they fay, when he purposed first to make the world, made first other gods of a principal order, to be as instruments to be used in the creation and government to follow; and after, the sun, moon, and stars, as petty gods; and the instruments of the other order more principal. First, they say, were made waters, out of which, by the gods, were made all diversity of creatures that are visible or invisible.

For mankind, they fay, a woman was made first, which by the working of one of the gods, conceived and brought forth children; and so they had their beginning, but how many years or ages fince, they know not, having no records, but only tradition from father to son.

They think that all the gods are of human shape, and therefore represent them by images,

images, in the forms of men, which they call kewasowok; one alone is called kewasa; them they place in their temples, where they worship, pray, fing, and make many offerings. The common fort think them also gods.

They believe the immortality of the foul, when life departing from the body, according to the good or bad works it hath done, it is carried up to the tabernacles of the gods, to perpetual happiness, or to popogusto, a great pit, which they think to be at

the furthest parts of the world, where the fun fets, and there burn continually.

To confirm this, they told me of two men that had been lately dead, and revived again; the one happened but few years before our coming into the country, of a bad man, which being dead and buried, the next day the earth over him being feen to move, was taken up, who told them his foul was very near entering into popoguffo, had not one of the gods faved him, and gave him leave to return again, to teach his friends what they should do to avoid such torment. The other happened the same year we were there, but fixty miles from us, which they told me for news; that one being dead, buried, and taken up, as the first, shewed, that although his body had lain dead in the grave, yet his soul lived, and had travelled far in a long broad way, on both sides whereof grew more sweet, fair, and delicate trees and fruits, than ever he had seen before; at length, he came to most brave and fair houses, near which he met his father, that was dead long ago, who gave him charge to go back, to shew his friends what good there was to do, to enjoy the pleasures of that place; which when he had done, he should come again.

What fubtlety foever be in the weroances and priests, this opinion worketh so much in the common fort, that they have great respect to their governors; and as great care to avoid torment after death, and to enjoy bliss. Yet they have divers forts of punishments, according to the offence, according to the greatness of the fact. And this is the sum of their religion, which I learned by having special familiarity with their priests, wherein they were not so sure grounded, nor gave such credit, but through conversing with us, they were brought into great doubts of their own, and no small admiration of ours; of which many desired to learn more than we had means, for

want of utterance in their language, to express.

Most things they saw with us, as mathematical instruments, sea-compasses, the virtue of the loadstone, perspective glasses, burning glasses; clocks to go of themselves; books, writing, guns, and such like, so far exceeded their capacities, that they thought they were rather the works of god than men; or at least the gods had taught us how to make them, which loved us so much better than them; and caused many of them to give credit to what we spoke concerning our God. In all places where I came, I did my best to make his immortal glory known. And I told them, although the bible I shewed them contained all, yet of itself it was not of any such virtue as I thought they did conceive. Notwithstanding many would be glad to touch it, to kiss, and embrace it, to hold it to their breass, and heads, and stroke all their body over with it.

The King Wingina where we dwelt, would oft be with us at prayer. Twice he was exceeding fick and like to die. And doubting of any help from his priefts, thinking he was in fuch danger for offending us and our God, fent for fome of us to pray, and be a means to our God, he might live with him after death. And fo did many others in the like cafe. One other strange accident (leaving others) will I mention before I end, which moved the whole country that either knew or heard of us, to

have us in wonderful admiration.

There was no town where they had practifed any villainy against us (we leaving it unpunished,

unpunished, because we fought by all possible means to win them by gentleness) but within a few days after our departure, they began to die; in fome towns twenty, in fome forty, in fome fixty, and in one an hundred and twenty, which was very many in respect of their numbers. And this happened in no place (we could learn) where we had been, but where they had used some practice to betray us. And this disease was fo ftrange, they neither knew what it was, nor how to cure it; nor had they known the like time out of mind; a thing specially observed by us, as also by themselves, in fo much that some of them who were our friends, especially Wingina, had observed fuch effects in four or five towns, that they were perfuaded it was the work of God through our means: and that we by him might kill and flay whom we would, without weapons, and not come near them. And thereupon, when they had any understanding that any of their enemies abused us in our journies, they would intreat us, we would be a means to our God, that they, as the others that had dealt ill with us, might die in like fort: although we shewed them their requests were ungodly, and that our God would not subject himself to any such requests of men, but all things as he pleased came to pass: and that we to shew ourselves his true servants, ought rather to pray for the contrary: yet because the effect fell out so suddenly after, according to their defires, they thought it came to pass by our means, and would come give us thanks in their manner, that though we fatisfied them not in words, yet in deeds we had fulfilled their

This marvellous accident in all the country wrought fo strange opinions of us, that they could not tell whether to think us gods or men. And the rather that all the space of their sickness, there was no man of ours known to die, or much sick. They noted also we had no women, nor cared for any of theirs: some therefore thought we were not born of women, and therefore not mortal, but that we were men of an old generation many years past, and risen again from immortality. Some would prophesy there were more of our generation yet to come, to kill theirs and take their places. Those that were to come after us they imagined to be in the air, yet invisible and without bodies: and that they by our intreaties, for love of us, did make the people die as they did, by shooting invisible bullets into them.

To confirm this, their physicians to excuse their ignorance in curing the disease, would make the simple people believe, that the strings of blood they sucked out of the sick bodies, were the strings wherein the invisible bullets were tied, and cast. Some thought we shot them ourselves from the place where we dwelt, and killed the people that had offended us, as we listed, how far distant soever. And others said it was the special work of God for our sakes, as we had cause in some fort to think no less, whatsoever some do, or may imagine to the contrary; especially some astrologers by the eclipse of the sun we saw that year before our voyage, and by a comet which began to appear but a few days before the sickness began: but to exclude them from being the special causes of so special an accident, there are farther reasons than I think sit to present or allege.

These their opinions I have set down, that you may see there is hope to embrace the truth, and honor, obey, fear and love us, by good dealing and government: though some of our company towards the latter end, before we came away with Sir Francis Drake, shewed themselves too furious in slaying some of the people in some towns, upon causes that on our part might have been borne with more mildness; notwithstanding they justly had deserved it. The best nevertheless in this, as in all actions besides, is to be endeavoured and hoped; and of the worst that may happen, notice

to be taken with confideration; and as much as may be eschewed; the better to allure them hereaster to civility and Christianity. Thus you may see

How
Nature herfelf delights herfelf in fundry Inftruments,
That fundry things be done to deck the earth with Ornaments;
Nor fuffers she her fervants all should run one race,
But wills the walk of every one frame in a divers pace;
That divers ways and divers works, the world might better grace.

Written by THOMAS HERIOT, one of the voyage.

How Sir Richard Grenvill went to relieve them.

IN the year of our Lord 1586, Sir Walter Raleigh and his affociates prepared a ship of a hundred tons, freighted plentifully of all things necessary; but before they set sail from England it was Easter. And arriving at Hatorask, they after some time spent in seeking the colony up in the country, and not finding them, returned with all the provision again to England.

About fourteen or fifteen days after, Sir Richard Grenvill, accompanied with three ships well appointed, arrived there: who not finding the aforesaid ship according to his expectation, nor hearing any news of the colony there seated, and left by him as is said 1585, travelling up and down to seek them, but when he could hear no news of them, and found their habitation abandoned, unwilling to lose the possession of the country, after good deliberation he landed sifty men in the isle of Roanoak, plentifully furnished with all manner of provision for two years, and so returned for England.

Where many began strangely to descant of those cross beginnings, and him; which caused me to remember an old saying of Euripides.

Who broacheth ought that's new, to fools untaught, Himfelf shall judged be unwife, and good for nought.

Three Ships more fent to relieve them by Mr. White.

WE went the old course by the West Indies, and Simon Ferdinando our continual pilot mistaking Virginia for Cape Fear, we failed not much to have been cast away, upon the conceit of our all-knowing Ferdinando, had it not been prevented by the vigilance of Captain Stassord. We came to Hatorask the 22d of July, and with forty of our best men, intending at Roanoack to find the fifty men left by Sir Richard Grenvill. But we found nothing but the bones of a man, and where the plantation had been the houses unhurt, but overgrown with weeds, and the fort desaced, which much perplexed us.

By the history it seems Simon Ferdinando did what he could to bring this voyage to confusion; but yet they all arrived at Hatorask. They repaired the old houses at Roanoack, and Mr. George How, one of the council, straggling abroad, was slain by the savages. Not long after Mr. Stafford, with twenty men, went to Croatan with Manteo, whose friends dwelt there: one of whom we thought to have some news of our fifty men. They at first made shew to fight, but when they heard Manteo, they

threw away their arms, and were friends, and defired there might be a token given to be known by, left we might hurt them by misprision, as the year before one had been

by Mr. Layne, that was ever their friend, and there prefent yet lame.

The next day we had conference with them concerning the people of Secotan, Aquafcogoc, and Pomeiok, willing them of Croatan to fee if they would accept our friendship, and renew our old acquaintance: which they willingly embraced, and promifed to bring their King and governors to Roanoack, to confirm it. We also underflood that Mr. Howe was flain by the men of Wingina, of Dassamonpeak: and by them of Roanoack, that the fifty men left by Sir Richard Grenvill, were fuddenly fet upon by three hundred of Secotan, Aquascogoc, and Dassamonpeak. First they intruded themselves among eleven of them by friendship, one they slew, the rest retiring to their houses, they set them on fire, that our men with what came next to hand were forced to make their passage among them; where one of them was shot in the mouth, and prefently died, and a favage flain by him. On both fides more were hurt; but our men retiring to the water fide, got their boat, and ere they had rowed a quarter of a mile towards Hatorask, they took up four of their fellows, gathering crabs and oysters: at last they landed on a little isle by Hatorask, where they remained awhile, but after departed they knew not whither. So taking our leaves of the Croatans, we came to our fleet at Hatorask.

The governor having long expected the King and governors of Pomeiok, Secotan, Aquafcogoc, and Daffamonpeak, and the feven days expired, and no news of them, being also informed by those of Croatan, that they of Daffamonpeak slew Mr. Howe, and were at the driving our men from Roanoack, he thought no longer to defer the revenge. Wherefore about midnight, with Captain Stafford, and twenty-four men, whereof Manteo was one, for our guide, (that behaved himself towards us as a most

faithful Englishman) he fet forward.

The next day by break of day we landed, and got beyond their houses, where seeing them fit by the fire we affaulted them. The miferable fouls amazed fled into the reeds. where one was fhot through, and we thought to have been fully revenged, but we were deceived, for they were our friends come from Croatan to gather their corn, because they understood our enemies were fled after the death of Mr. Howe, and left all behind them for the birds. But they had like to have paid too dear for it, had we not chanced upon a Weroances wife, with a child at her back, and a favage that knew Captain Stafford, that ran to him, calling him by his name. Being thus disappointed of our purpose, we gathered the fruit we found ripe, left the rest unspoiled, and took Menatonon his wife, with her child, and the rest with us to Roanoack. Though this mistake grieved Manteo, yet he imputed it to their own folly, because they had not kept promise to come to the governor at the day appointed. The 13th of August our favage Manteo was christened, and called Lord of Dassamonpeak, in reward of his faithfulness. And the 18th, Ellinor the governor's daughter, and wife to Ananias Dare, was delivered of a daughter in Roanoack; which being the first Christian there born, was called Virginia.

Our ships being ready to depart, such a storm arose, as the admiral was forced to cut her cables: and it was fix days ere she could recover the shore, that made us doubt she had been lost, because the most of her best men were on shore. At this time contraversies did grow betwixt our governor and the assistants, about choosing one of them twelve to go as factor for them all to England; for all refused save one, whom all men thought most insufficient: the conclusion was by a general consent, they would have the governor go himself, for that they thought none would so truly procure their supplies

as he. Which, though he did what he could to excuse it, yet their importunity would not cease till he undertook it, and had it under all their hands how unwilling he was, but that necessity and reason did doubly constrain him. At their setting fail for England, weighing anchor, twelve of the men in the fly-boat were thrown from the capstern, by the breaking of a bar, and most of them so hurt that some never recovered it. The second time they had the like fortune, being but sifteen, they cut the cable and kept company with their admiral to Flowres and Coruos; the admiral stayed there looking for purchase: but the sly-boats men grew so weak they were driven to Smerwick in the west of Ireland. The governor went for England; and Simon Ferdinando with much ado at last arrived at Portsmouth 1587.

The names of those landed in this plantation were,

John White, Governor, Christopher Couper, Roger Bayley, Thomas Stevens, Ananias Dare, John Samson, George How, Simon Ferdinando, Thomas Smith, Anthony Cage. With divers others to the number of about 115.

The Fifth Voyage to Virginia; undertaken by Mr. John White, 1589.

THE 20th of March three ships went from Plymouth, and passed betwixt Barbary and Mogadoro to Dominico in the West Indies. After we had done some exploits in those parts, the 3d of August we fell with the low fandy isles westward of Wokokon. But by reason of ill weather it was the 11th ere we could anchor there; and on the 12th we came to Croatan, where is a great breach in 35° and a half, in the north-east point of the ifle. The 15th we came to Hatorask in 36° and a terse, at four fathoms, three leagues from shore, where we might perceive a smoke at the place where I left the colony, 1587. The next morning Captain Cook, Captain Spicer, and their companies, with two boats left our fhips, and discharged some ordnance to give them notice of our coming; but when we came there, we found no man nor fign of any that had been there lately, and fo returned to our boats. The next morning we prepared again. for Roanoack. Captain Spicer had then fent his boat ashore for water, so it was ten of the clock ere we put from the ships, which rode two miles from the shore. The admiral's boat being a mile before the other as she passed the bar, a sea broke into the boat and filled her half full of water, but by God's good will, and the careful fleerage of Captain Cook, though our provisions were much wet, we fafe escaped; the wind blew hard at north-east, which caused so great a current and a breach upon the bar; Captain Spicer passed half over, but by the indiscreet steering of Ralph Skinner, their boat was overfet, the men that could catch hold hung about her, the next fea cast her on ground, where fome let go their hold to wade to shore, but the sea beat them down. The boat thus toffed up and down Captain Spicer and Skinner hung there till they were drowned, but four that could fwim a little, kept themselves in deeper water, were faved by the means of Captain Cook, that presently upon the oversetting of their boat, shipped himself to fave what he could. Thus of eleven, seven of the chiefest were drowned. This fo difcomfitted all the failors, we had much to do to get them any more to feek further for the planters, but by their captain's forwardness at last they fitted themselves again for Hatorask in two boats, with nineteen persons. It was late ere we arrived, but feeing a fire through the woods, we founded a trumpet, but no answer could we hear. The next morning we went to it, but could fee nothing but the grafs, and

and fome rotten trees burning. We went up and down the ifle, and at last found three fair Roman letters carved c. R. o. which prefently we knew to fignify the place where I should find them, according to a fecret note between them and me, which was to write the name of the place they would be in upon fome tree, door, or post: and if they had been in any diffress to fignify it by making a cross over it. For at my departure they intended to go fifty miles into the main. But we found no fign of diffress; then we went to a place where they were left in fundry houses, but we found them all taken down, and the place ftrongly inclosed with a high palizado, very fortlike; and in one of the chief posts carved in fair capital letters CROATAN, without any fign of distress, and many bars of iron, two pigs of lead, four fowlers, iron shot, and such like heavy things thrown here and there, overgrown with grafs and weeds. We went by the fhore to feek for their boats but could find none, nor any of the ordnance I left them. At last some of the failors found divers chests had been hidden and digged up again, and much of the goods spoiled, and scattered up and down, which, when I faw, I knew three of them to be my own; but books, pictures, and all things elfe were spoiled. Though it much grieved me, yet it did much comfort me that I did know they were at Croatan; fo we returned to our ships, but had like to have been cast away by a great from that continued all that night.

The next morning we weighed anchor for Croatan, having the anchor a-peak, the cable broke, by the means whereof we lost another: letting fall the third, the ship yet went so fast a drift, we failed not much there to have split. But God bringing us into deeper water, considering we had but one anchor, and our provision near spent, we resolved to go forthwith to St. John's Isle, Hispaniola, or Trinidada, to refresh ourselves and seek for purchase that winter, and the next spring come again to seek our countrymen. But our vice-admiral would not, but went directly for England, and we our course for Trinidada. But within two days after, the wind changing, we were constrained for the Western Isles to refresh ourselves, where we met with many of the Queen's ships, our own confort, and divers others, the 23d of September 1590. And thus we left seeking our colony, that was never any of them found, nor seen to this day, 1622. And this was the conclusion of this plantation, after so much time, labour, and

charge confumed. Whereby we fee,

Not all at once, nor all alike, nor ever hath it been, That God doth offer and confer his bleffings upon men.

Written by Mr. John White.

A brief Relation of the Description of Elizabeth's Isle, and some others towards the North Part of Virginia; and what else they discovered in the Year 1602; by Captain Bartholomew Gosnoll, and Captain Bartholomew Gilbert, and divers other Gentlemen their Associates.

ALL hopes of Virginia thus abandoned, it lay dead and obscured from 1590 till this year 1602, that Captain Gosnoll with thirty-two and himself in a small bark, set sail from Dartmouth upon the 26th of March. Though the wind favoured us not at the first, but forced us as far southward as the Azores, which was not much out of our way; we ran directly west from thence, whereby we made our journey shorter than heretofore by five hundred leagues: the weakness of our ship, the badness of our sailors, and our ignorance of the coast, caused us carry but a low sail, that made our passage longer than we expected.

On Friday the 11th of May, we made land, it was fomewhat low, where appeared certain hummocks or hills in it: the shore white fand, but very rocky, yet overgrown with fair trees. Coming to an anchor, eight Indians in a bask shallop, with mast and sail came boldly aboard us. It seemed by their signs and such things as they had, some Biskiners had sished there, being about the latitude of 43. But the harbour, being naught, and doubting the weather, we went not ashore, but weighed and stood to the southward into the sea. The next morning we found ourselves imbayed with a mighty head-land: within a league of the shore we anchored, and Captain Gosnoll, myself, and three others, went to it in our boat, being a white sand and a bold coast. Though the weather was hot, we marched to the highest hills we could see, where we perceived this head-land part of the main, near invironed with islands. As we were returning to our ship, a good proper lusty young man came to us, with whom we had but small conference, and so we left him. Here in five or six hours we took more cod than we knew what to do with, which made us persuade ourselves there might be found a good softhing in March, April, and May.

At length we came among these fair isles, some a league, two, three, five, or six from the main; by one of them we anchored. We found it four miles in compass, without house or inhabitant. In it is a lake near a mile in circuit, the rest overgrown with trees, which, so well as the bushes, were so overgrown with vines, we could scarce pass them. And by the blossoms we might perceive there would be plenty of strawberries, respises, gooseberries, and divers other fruits: besides, deer and other beasts we saw, and cranes, herns, with divers other forts of sowl, which made us call it Martha's Vineyard.

The rest of the isles are replenished with such like, very rocky, and much tinctured stone-like mineral. Though we met many Indians, yet we could not fee their habitations: they gave us fish, tobacco, and fuch things as they had. But the next ifle we arrived at was but two leagues from the main, and fixteen miles about, environed fo with creeks and coves, it feemed like many ifles linked together by fmall paffages like bridges. it is many places of plain grafs, and fuch other fruits and berries as before were mentioned. In mid May we did fow wheat, barley, oats, and peas, which in fourteen days fprung up nine inches. The foil is fat and lufty, the crust thereof grey, a foot or less in depth. It is full of high timbered oaks, their leaves thrice so broad as ours: cedar straight and tall, beech, holly, walnut, hazel, cherry-trees like ours, but the stalk beareth the bloffom or fruit thereof like a cluster of grapes, forty or fifty in a bunch. There is a tree of orange colour, whose bark in the filing is as smooth as velvet. There is a lake of fresh water three miles in compass, in the midst an isle containing an acre or thereabout, overgrown with wood: here are many tortoifes, and abundance of all forts of fowls, whose young ones we took and eat at our pleafure. Ground nuts as big as eggs, as good as potatoes, and forty on a string, not two inches under ground. All forts of shell-fish, as scalops, mussels, cockles, crabs, lobsters, welks, oysters, exceeding good and very great; but not to cloy you with particulars, what God and nature hath bestowed on those places, I refer you to the author's own writing at large. We called this ifle Elizabeth's Ifle, from whence we went right over to the main, where we stood awhile as ravished at the beauty and delicacy of the sweetness, besides divers clear lakes, whereof we faw no end, and meadows very large and full of green grafs, &c.

Here we espied seven savages, at first they expressed some fear, but by our courteous usage of them, they sollowed us to the neck of land, which we thought had been severed from the main, but we found it otherwise. Here we imagined was a river, but because the day was far spent, we left to discover it till better leisure. But of good harbours, there is no doubt, considering the land is all rocky and broken lands. The

next day we determined to fortify ourselves in the isle in the lake. Three weeks we fpent in building us there a house. But the fecond day after our coming from the main, eleven canoes with near fifty favages, came towards us. Being unwilling they fhould fee our building, we went to, and exchanged with them knives, hatchets, beads, bells, and fuch trifles, for fome beavers, lizards, martins, foxes, wild-cat fkins, and fuch like. We faw them have much red copper, whereof they make chains, collars, and drinking cups, which they fo little esteemed they would give us for small toys, and fignified unto us they had it out of the earth in the main: three days they stayed with us, but every night retired two or three miles from us: after, with many figns of love and friendship, they departed, seven of them staying behind, that did help us to dig and carry fasfafras, and do any thing they could, being of a comely proportion, and the best condition of any favages we had yet encountered. They have no beards but counterfeits, as they did think ours also was, for which they would have changed with some of our men that had great beards. Some of the baser fort would steal, but the better fort we found very civil and just. We saw but three of their women, and they were but of mean stature, attired in skins like the men, but fat and well favoured. The wholesomenefs and temperature of this climate, doth not only argue the people to be answerable to this description, but also of a perfect constitution of body, active, strong, healthful, and very witty, as the fundry toys by them fo cunningly wrought may well testify. For ourselves, we found ourselves rather increase in health and strength than otherwise, for all our toil, bad diet, and lodging, yet not one of us was touched with any fickness. Twelve intended here awhile to have stayed, but upon better consideration, how meanly we were provided, we left this island (with as many true forrowful eyes as were before defirous to fee it) the 18th of June, and arrived at Exmouth the 23d of July.

> But yet man's mind doth fuch itself explay, As God's great will doth frame it every way.

Such thoughts men have, on earth that do but live, As men may crave, but God doth only give.

Written by John Brierton, one of the voyage.

A Voyage of Captain Martin Pring, with two Barks from Bristow, for the North Part of Virginia, 1603.

BY the inducements and perfuasions of Mr. Richard Hackluite, Mr. John Whitson, being mayor, with his brethren the aldermen, and most of the merchants of the city of Bristow, raised a stock of one thousand pounds, to surnish out two barks, the one of sifty tons, with thirty men and boys, the other twenty-fix tons, with thirteen men and boys, having Martin Pring an understanding gentleman, and a sufficient mariner, for captain, and Robert Salterne, his assistant, who had been with Captain Gosnoll there the year before for pilot. Though they were much crossed by contrary winds upon the coast of England, and the death of that ever most memorable miracle of the world, our most dear sovereign Lady and Queen Elizabeth: yet at last they passed by the Western. Isles, and about the 7th of June, sell upon the north part of Virginia, about the degrees of 43, where they found plenty of most forts of fish, and saw a high country sull of great woods of fundry forts. As they ranged the coast at a place they named Whitsun, Bay, they were kindly used by the natives that came to them in troops of tens, twenties, and thirties, and sometimes more. But because in this voyage for most part they followed:

followed the course of Captain Gosnoll, and have made no relation but to the same effect he writ before, we will thus conclude:

Lay hands unto this work with all thy wit, But pray that God would speed and perfect it.

ROBERT SALTERNE.

A Relation of a Discovery towards the Northward of Virginia, by Captain George Waymouth, 1605; employed thither by the Right Honourable Thomas Arundel, Baron of Warder, in the Reign of our most royal King James.

UPON Tuesday the 5th of March we fet fail from Ratcliff, but by contrary winds we were forced into Dartmouth till the last of this month, then with twenty-nine as good feamen, and all necessary provisions as could possibly be gotten, we put to fea, and the 24th of April fell with Flowres and Corvos. We intended, as we were directed, towards the fouthward of 39°; but the winds fo croffed us we fell more northwards, about 41° 20': we founded at one hundred fathom, and by that we had run fix leagues, we had but five, yet faw no land. From the main-top we descried a whitish fandy cliff, west-north-west, some six leagues from us; but ere we had run two leagues further, we found many floals and breaches, fometimes in four fathom, and the next through fifteen or eighteen. Being thus embayed among those shoals, we were conftrained to put back again, which we did with no fmall danger, though both the wind and weather were as fair as we could defire. Thus we parted from the land, which we had not before fo much defired, and at the first fight rejoiced, as now we all joyfully praifed God that he had delivered us from fo imminent danger. Here we found excellent cod, and faw many whales, as we had done two or three days before. Being thus conftrained to put to fea, the want of wood and water caused us take the best advantage of the wind, to fall with the shore wheresoever; but we found our fea-cards most directly false. The 17th of May we made the land again, but it blew fo hard we durst not approach it. The next day it appeared to us a main high land, but we found it an island of fix miles in compass: within a league of it we came to an anchor, and went on fhore for wood and water, of which we found fufficient, the water gushing forth down the rocky cliffs in many places, which are all overgrown with fir, birch, beech, and oak, as the verge is with goofeberries, ftrawberries, wild peas, and rose bushes, and much fowl of divers forts that breed among the rocks. Here, as in all places elfe where we came, we found cod enough.

From hence we might discern the main land and very high mountains; the next day because we rode too open to the sea, we weighed, and came to the isles adjoining to the main, among which we found an excellent road, defended from all winds, for ships of any burthen, in six, seven, eight, nine, or ten farhom, upon a clay ooze. This was upon Whit-Sunday, wherefore we called it Pentecost Harbour. Here I cannot omit, for soolish fear of imputation of slattery, the painful industry of our captain, who, as at sea, he was always most careful and vigilant, so at land he refused no pains; but his labour was ever as much, or rather more, than any man's; which not only encouraged others with better content, but also effected much with great expedition. We digged a garden the 22d of May, where, among our garden feeds, we sowed peas and barley, which in sixteen days grew up eight inches, although this was but the crust of the ground, and much inferior to the mould we after found in the main.

After we had taken order for all our necessary businesses, we marched through two of these isles. The biggest was four or five miles in compass; we found here all forts

of ordinary trees, befides vines, currants, fpruce, yew, angelica, and divers gums, infomuch many of our company wished themselves settled here. Upon the 30th our captain with thirteen went to discover the main: we in the ship espied three canoes that came towards the ship, which, after they had well viewed, one of them came aboard with three men, and by our good ufage of them, not long after the rest. Two days we had their companies; in all respects they are but like them at Elizabeth's Isles, therefore this may fuffice for their description. In this time our captain had discovered a fair river, trending into the main forty miles, and returned back to bring in the ship. The favages also kept their words, and brought us forty beaver, otter, and fable skins, for the value of five shillings in knives, glasses, combs, and fuch toys, and thus we ufed them fo kindly as we could, becaufe we intended to inhabit in their country, they lying aboard with us, and we ashore with them; but it was but as changing man for

man as hostages, and in this manner many times we had their companies.

At last they defired our captain to go with them to the main to trade with their Bashabes, which is their chief lord, which we did, our boat well manned with fourteen, yet would they row faster with three oars in their canoes than we with eight; but when we faw our old acquaintance would not flay aboard us as before for hoftage, but did what they could to draw us into a narrow cirque, we exchanged one Owen Griffin with them for a young fellow of theirs, that he might fee if he could discover any treachery, as he did, for he found there affembled two hundred and eighty-three favages with bows and arrows, but not any thing at all to trade as they pretended. Thefe things confidered, we conceited them to be but as all favages ever had been, kind till they found opportunity to do mischief. Wherefore we determined to take some of them, before they should suspect we had discovered their plot, lest they should absent themselves from us; so the first that ever after came into the ship were three, which we kept, and two we took on shore with much ado, with two canoes, their bows and arrows.

Some time we fpent in founding all the ifles, channels, and inlets thereabouts, and we found four feveral ways a ship might be brought into this bay. In the interim there came two canoes more boldly aboard us, fignifying we should bring our ship to the place where he dwelt to trade. We excufed ourfelves why we could not, but used them kindly, yet got them away with all the speed we could, that they should not be perceived by them in the hole; then we went up the river twenty-fix miles, of which I had rather not write, than by my relation detract from it. It is in breadth a mile, near forty miles, and a channel of fix, feven, eight, nine, or ten fathoms; and on both fides, every half-mile, gallant coves, to contain in many of them one hundred fail, where they may lie on oze, without cable or anchor, only moored with a hawfer, and it floweth eighteen feet, that you may make, dock, or careen ships with much facility. Befides, the land is most rich, trending all along on both fides in an equal plain, neither rocky nor mountainous, but verged with a green border of grafs, doth make tender to the beholder her pleafant fertility, if by cleanfing away the woods she were converted into meadow.

The woods are great and tall, fuch as are spoken of in the islands, and well watered with many fresh springs. Our men that had seen Oronoque, so famous in the world's ears, Reogrande, Loyer, and Slion report, though they be great and goodly rivers, yet are not comparable to it. Leaving our ship we went higher, till we were seven miles higher than the falt water flowed; we marched towards the mountains we had feen, but the weather was fo hot, and our labour fo great, as our captain was contented to return. After we had erected a crofs, we left this fair land and river, in which the higher we went the better we liked it, and returned to our ship. By the way we met a canoe, that much defired one of our men to go up to their Bashabes; but we knew their intents, and fo turned them off; and though we had both time and provision to have discovered much more, and might have found peradventure good trade; yet because our company was but small, we would not hazard so hopeful a business as this was, either for our private or particular ends, being more regardful of a public good, and promulgating God's holy church by planting Christianity, which was the intent of our adventurers fo well as ours. Returning by the ifles in the entry of the Sound, we called them St. George's Isles, and because on Sunday we set out of England, on Sunday also the 16th of June we departed hence. When we had run thirty leagues, we had forty fathoms, then feventy, then one hundred. After two or three watches more we were in twenty-four fathoms, where we took fo much cod as we did not know what to do with: and the 18th of July came to Dartmouth, and all our men as well, God be thanked, as when they went forth.

Thus may you fee,

God hath not all his gifts bestowed on all or any one, Words sweetest, and wits sharpest, courage, strength of bone; All sarities of mind and parts do all concur in none.

Written by JAMES ROSIER, one of the voyage.

BOOK II.

The Sixth Voyage 1606, to another Part of Virginia, where now are planted our English Colonies, (whom God increase and preserve,) discovered and described by Captain John Smith, fometime Governor of the Country.

BY these former relations you may see what inconveniences still crossed those good intents, and how great a matter it was all this time to find but a harbour, although there be fo many. But this Virginia is a country in America, between the degrees of 34 and 45 of the north latitude. The bounds thereof on the east fide are the great ocean; on the fouth lieth Florida; on the north, Nova Francia; as for the west thereof, the limits are unknown. Of all this country we purpose not to speak, but only of that part which was planted by the Englishmen, in the year of our Lord 1606, and this is under the degrees 37, 38, and 39. The temperature of this country doth agree well with English constitutions, being once feasoned to the country; which appeared by this, that though by many occasions our people fell fick, yet did they recover by very finall means, and continued in health, though there were other great causes, not only to have made them fick, but even to end their days, &c.

The fummer is hot as in Spain, the winter cold as in France or England. The heat of fummer is in June, July, and August, but commonly the cool breezes assuage the vehemency of the heat. The chief of winter is half December, January, February, and half March. The cold is extreme tharp; but here the proverb is true, that no

extreme long continueth.

In the year 1607, was an extraordinary frost in most of Europe, and this frost was found as extreme in Virginia. But the next year, for 8 or 10 days of ill weather, other 14 days would be as fummer.

The winds here are variable, but the like thunder and lightning to purify the air, I have feldom either feen or heard in Europe. From the fouth-west came the greatest

gusts, with thunder and heat. The north-west wind is commonly cool, and bringeth fair weather with it. From the north is the greatest cold; and from the east and

fouth-east, as from the Bermudas, fogs and rains.

Sometimes there are great droughts, other times much rain, yet great necessity of neither, by reason we see not but that all the rarity of needful fruits in Europe may be there in great plenty, by the industry of men, as appeareth by those we there

There is but one entrance by fea into this country, and that is at the mouth of a very goodly bay, eighteen or twenty miles broad. The cape on the fouth is called Cape Henry, in honour of our most noble Prince. The land, white hilly fands, like unto the

Downs, and all along the fhores great plenty of pines and firs.

The north cape is called Cape Charles, in honour of the worthy Duke of York. The ifles before it, Smith's Ifles, by the name of the discoverer. Within is a country that may have the prerogative over the most pleasant places known, for large and pleafant navigable rivers; heaven and earth never agreed better to frame a place for man's habitation, were it fully manured and inhabited by industrious people. Here are mountains, hills, plains, vallies, rivers, and brooks all running most pleafantly into a fair bay, compassed, but for the mouth, with fruitful and delightsome land. In the bay and rivers are many ifles both great and fmall, fome woody, fome plain, most of them low and not inhabited. This bay lieth north and south, in which the water sloweth near two hundred miles, and hath a channel for one hundred and forty miles of depth, betwixt fix and fifteen fathoms, holding in breadth for the most part ten or fourteen miles. From the head of the bay to the north-west, the land is mountainous and fo in a manner from thence by a fouth-west line; so that the more fouthward, the farther off from the bay are those mountains; from which fall certain brooks, which after come to fine principal navigable rivers. These run from the north-west into the south-east, and so into the west side of the bay, where the fall of every river is within twenty or fifteen miles one of another.

The mountains are of divers natures, for at the head of the bay the rocks are of a composition like mill-stones; some of marble, &c.; and many pieces like christal, we found, as thrown down by water from these mountains. For in winter they are covered with much fnow, and when it diffolveth the waters fall with fuch violence, that it causeth great inundations in some narrow vallies, which is scarce perceived, being once in the rivers. These waters wash from the rocks such glistering tinctures, that the ground in some places feemeth as gilded, where both the rocks and the earth are fo fplendent to behold, that better judgments than ours might have been perfuaded they contained more than probabilities. The vefture of the earth in most places doth manifeftly prove the nature of the foil to be lufty and very rich. The colour of the earth we found in divers places, refembleth bole armoniac, terra figillata, and lemnia, fuller's-earth, marl, and divers other fuch appearances: but generally for the most part it is a black fandy mould, in fome places a fat flimy clay, in other places a very barren gravel. But the best ground is known by the vesture it beareth, as by the

greatness of trees, or abundance of weeds, &c.

The country is not mountainous, nor yet low, but fuch pleafant plain hills, and fertile vallies, one prettily crofling another, and watered fo conveniently with fresh brooks and fprings, no lefs commodious than delightfome. By the rivers are many plain marshes, containing some twenty, some one hundred, some two hundred acres, fome more, fome less. Other plains there are few, but only where the favages inha-VOL. XIII.

bit, but all overgrown with trees and weeds, being a plain wilderness as God first made it.

On the west fide of the bay we faid were five fair and delightful navigable rivers: The first of those, and the next to the mouth of the bay, hath its course from the westnorth-west; it is called Powhatan, according to the name of a principal country that lieth upon it. The mouth of this river is near three miles in breadth, yet do the shoals force the channel fo near the land, that a facre will overshoot it at point blank. It is navigable one hundred and fifty miles, the shoals and foundings are here needless to be expressed. It falleth from rocks far west in a country inhabited by a nation they call Monacans. But where it cometh into our discovery it is Powhatan. In the farthest place that was diligently observed, are falls, rocks, shoals, &c. which makes it past navigation any higher. Thence in the running downward, the river is enriched with many goodly brooks, which are maintained by an infinite number of fmall rundles and pleafant fprings, that difperfe themselves for best service, as do the veins of a man's body. From the fouth there falls into it, first, the pleasant river of Apamatuck; next, more to the east, are two finall rivers of Quiyougcohanocke; a little farther is a bay, wherein falleth three or four pretty brooks and creeks, that half intrench the inhabitants of Warraskoyac; then the river of Nandsamund; and lastly, the brook of Chesapeack. From the north fide is the river of Chickahamania, the back river of James Town; another by the Cedar Isle, where we lived ten weeks upon oysters, then a convenient harbour for fisher boats at Kencoughtan, that so turneth itself into bays and creeks, it makes that place very pleafant to inhabit, their corn-fields being girded therein in a manner as peninfulas. The most of these rivers are inhabited by several nations, or rather families, of the name of the rivers. They have also over these some governor, as their king, which they call Werowances. In a peninfula on the north fide of this river are the English planted in a place by them called James Town, in honour of the King's most Excellent Majesty.

The first, and next the river's mouth, are the Kecoughtans, who, besides their women and children, have not past twenty fighting men. The Paspaheghes (on whose land is feated James Town, fome forty miles from the bay) have not past forty. The river called Chickahamania near two hundred and fifty; the Weanocks one hundred; the Arrowhatocks thirty; the place called Towhatan, fome forty; on the fouth fide this river, the Appamatucks have fixty fighting men; the Quiyougcohanocks twenty five; the Nandfamunds two hundred; the Chefapeacks one hundred; of this laft place the bay beareth the name. In all these places is a several commander, which they call Werowance, except the Chickahamanians, who are governed by the priefts and their affiftants, or their elders, called Caw-cawwafloughes. In fummer, no place affordeth more plenty of sturgeon, nor in winter more abundance of fowl, especially in the time of frost. I took once fifty-two sturgeons at a draught, at another fixty-eight. From the latter end of May till the end of June are taken few, but young sturgeons of two feet or a yard long. From thence till the midft of September, them of two or three yards long, and few others; and in four or five hours, with one net, were ordinarily taken feven or eight; often more, feldom lefs. In the fmall rivers, all the year, there is good plenty of small fish; so that with hooks, those that would take pains had

fufficient.

Fourteen miles northward from the river Powhatan is the river Pamaunkee, which is navigable fixty or feventy miles, but with catches and fmall barks, thirty or forty miles farther. At the ordinary flowing of the falt water, it divideth itself into two gallant branches. branches. On the fouth fide inhabit the people of Youghtanund, who have about fixty men for wars. On the north branch Mattapament, who have thirty men. Where this river is divided the country is called Pamaunkee, and nourisheth near three hundred able men. About twenty-five miles lower, on the north fide of this river, is Werawocomoco, where their great king inhabited when I was delivered him prisoner; yet there are not past forty able men. Ten or twelve miles lower, on the south side of this river, is Chiskiack, which hath some forty or fifty men. These, as also Apamatuck, Irrohatock, and Powhatan, are their great king's chief alliance, and inhabitants; the rest his conquests.

Before we come to the third river that falleth from the mountains, there is another river, fome thirty miles navigable, that cometh from the inland, called Payankatanke,

the inhabitants are about fifty or fixty ferviceable men.

The third navigable river is called Toppahanock: this is navigable fome hundred and thirty miles; at the top of it inhabit the people called Mannahoacks, amongst the mountains, but they are above the place we described. Upon this river, on the north side, are the people Cuttatawomen, with thirty fighting men. Higher are the Moraughtacunds, with eighty. Beyond them Rapahanock, with one hundred. Far above is another, Cuttatawomen, with twenty. On the south is the pleasant feat of Nantaughtacund, having one hundred and sifty men. This river also, as the two former, is replenished with fish and sowl.

The fourth river is called Patawomeke, fix or feven miles in breadth; it is navigable one hundred and forty miles, and fed as the rest with many sweet rivers and fprings, which fall from the bordering hills: these hills many of them are planted, and yield no less plenty and variety of fruit, than the river exceedeth with abundance of fish; it is inhabited on both sides: first, on the fouth side, at the very entrance is Wighcocomoco, and hath fome hundred and thirty men, beyond them Sekacawone, with thirty; the Onawmanient, with one hundred; and the Patawomekes more than two hundred. Here doth the river divide itself into three or four convenient branches: the greatest of the least is called Quiyough, trending north-west, but the river itself turneth northeast, and is still a navigable stream. On the western side of this bought is Tauxenent, with forty men: on the north of this river is Secowocomoco, with forty: fomewhat further Potapaco, with twenty: in the east part is Pamacaeack, with fixty: after Moyowance, with one hundred: and lastly, Nacotchtanke, with eighty. The river above this place maketh his passage down a low pleasant valley, overshadowed in many places with high rocky mountains, from whence diffil innumerable fweet and pleafant springs.

The fifth river is called Pawtuxunt, of a less proportion than the rest; but the channel is fixteen fathoms deep in some places. Here are infinite skulls of divers kinds of fish more than elsewhere. Upon this river dwell the people called Acquintanacksuak, Pawtuxunt, and Mattapanient. Two hundred men was the greatest strength that could be there perceived; but they inhabit together, and not so dispersed as the rest.

These of all other we found most civil to give entertainment.

Thirty leagues northward is a river, not inhabited, yet navigable, for the red clay refembling bole armoniack, we called it Bolus. At the end of the bay, where it is fix or feven miles in breadth, it divides itself into four branches; the best cometh northwest from among the mountains, but though canoes may go a day's journey or two up it, we could not get two miles up it with our boats for rocks; upon it is seated the Sasquesahanocks, near it north-and-by-west runneth a creek a mile and a half; at the head whereof, the Eble left us on shore, where we found many trees cut with hatchets.

The next tide, keeping the shore, to seek for some savages, (for within thirty leagues sailing we saw not any, being a barren country,) we went up another small river like a creek, six or seven miles: from thence returning, we met seven canoes of the Massowomeks, with whom we had conference by signs, for we understood one another scarce a word: the next day we discovered the small river and people of Tock-

whogh trending eastward.

Having loft our grapnel among the rocks of Safquefahanocks, we were then near two hundred miles from home, and our barge about two tons, and had in it but twelve men to perform this discovery, wherein we lay above twelve weeks upon those great waters in those unknown countries, having nothing but a little meal, oatmeal, and water to feed us, and fcarce half fufficient of that for half that time, but what provision we got among the favages, and fuch roots and fish as we caught by accident, and God's direction; nor had we a mariner, nor any had skill to trim the fails, but two failors and myfelf, the rest being gentlemen, or them were as ignorant in such toil and labour. Yet necessity in a short time, by good words and examples, made them do that that caufed them ever after to fear no colours. What I did with this finall means, I leave to the reader to judge, and the map I made of the country, which is but a finall matter, in regard of the magnitude thereof. But to proceed, fixty of those Sasquesahanocks came to us with fkins, bows, arrows, targets, beads, fwords, and tobacco-pipes, for presents. Such great and well-proportioned men are feldom seen, for they seemed like giants to the English, yea, and to their neighbours, yet seemed of an honest and simple disposition, with much ado restrained from adoring us as gods. Those are the ftrangest people of all those countries, both in language and attire; for their language, it may well befeem their proportions, founding from them as a voice in a vault. Their attire is the skins of bears and wolves; some have cassocks made of bears' heads and skins, that a man's head goes through the skin's neck, and the ears of the bear fastened to his fhoulders, the nofe and teeth hanging down his breaft, another bear's face split behind him, and at the end of the nose hung a paw, the half sleeves coming to the elbows, were the necks of bears, and the arms through the mouth, with paws hanging at their nofes. One had the head of a wolf hanging in a chain for a jewel, his tobacco pipe, three quarters of a yard long, prettily carved, with a bird, a deer, or fome fuch device at the great end, fufficient to beat out one's brains; with bows, arrows, and clubs, fuitable to their greatness. These are scarce known to Powhatan. They can make near fix hundred able men, and are pallifadoed in their towns, to defend them from the Massawomekes, their mortal enemies. Five of their chief Werowances came aboard us, and croffed the bay in their barge. The picture of the greatest of them is fignified in the map; the calf of whose leg was three quarters of a yard about, and all the rest of his limbs so answerable to that proportion, that he seemed the goodliest man we ever beheld. His hair, the one fide was long, the other fhorn close, with a ridge over his crown, like a coxcomb. His arrows were five quarters long, headed with the splinters of a white crystal-like stone, in form of a heart, an inch broad, and an inch and a half or more long: these he wore in a wolf's skin at his back, for his quiver, his bow in the one hand, and his club in the other, as is described.

On the east fide of the bay, is the river Tockwhogh, and upon it a people that can make one hundred men, seated some seven miles within the river: where they have a fort very well pallisadoed and mantled with bark of trees. Next them is Ozinies, with fixty men. More to the south of that east side of the bay, the river Rapahanock, near unto which is the river Kuskarawaock, upon which is seated a people, with two hundred men. After that, is the river Tants Wighcocomoco, and on it a people with

one hundred men. The people of those rivers are of little stature, of another language from the rest, and very rude. But they on the river Acohanock, with forty men, and they of Accomack, eighty men, doth equalize any of the territories of Powhatan, and

fpeak his language, who over all those doth rule as king.

Southward we went to some parts of Chawonock and the Mangoags to search for them left by Mr. White. Amongst those people are thus many several nations of fundry languages, that environ Powhatans territories. The Chawonocks, the Mangoags, the Monacans, the Mannahokes, the Masawomekes, the Powhatans, the Sasquesahanocks, the Atquanachukes, the Tockwoghes, and the Kuscarawaockes. All those not any one understandeth another but by interpreters. Their several habitations are more plainly described by this annexed map, which will present to the eye the way of the mountains, and current of the rivers, with their several turnings, bays, shoals, isles, inlets, and creeks, the breadth of the waters, the distances of places, and such like. In which map observe this, that as far as you see the little crosses on rivers, mountains, or other places have been discovered; the rest was had by information of the savages, and are set down according to their instructions.

Thus have I walked a wayless way, with uncouth pace, Which yet no Christian man did ever trace:
But yet I know this not affects the mind,
Which cars doth hear, as that which eyes do find.

Of fuch Things which are naturally in Virginia, and how they use them.

VIRGINIA doth afford many excellent vegetables, and living creatures, yet grafs there is little or none, but what groweth in low marshes: for all the country is overgrown with trees, whose droppings continually turneth their grass to weeds, by reason of the rankness of the ground, which would soon be amended by good husbandry. The wood that is most common is oak and walnut; many of their oaks are to tall and straight that they will bear two foot and a half square of good timber for twenty yards long. Of this wood there is two or three feveral kinds. The acorns of one kind, whose bark is more white than the other, and somewhat sweetish, which being boiled, at last affords a fweet oil, that they keep in gourds to annoint their heads and joints. The fruit they eat made in bread or otherwife. There is also some elms, some black walnut-tree, and some ash: of ash and elm they make soap ashes. If the trees be very great, the ashes will be good, and melt to hard lumps, but if they be small, it will but powder, and not fo good as the other. Of walnuts there is two or three kinds; there is a kind of wood we called cypress, because both the wood, the fruit, and leaf did most refemble it, and of those trees there are some near three fathom about at the foot, very straight, and fifty, fixty, or eighty feet without a branch. By the dwelling of the favages are fome great mulberry-trees, and in fome parts of the country they are found growing naturally in pretty groves. There was an effay made to make filk, and furely the worms profpered excellent well, till the mafter workman fell fick. During which time they were eaten with rats.

In some parts were found some chesnuts, whose wild fruit equal the best in France, Spain, Germany, or Italy. Plums there are of three sorts. The red and white are like our hedge plums, but the other, which they call putchamins, grow as high as a palmeta: the fruit is like a medlar; it is first green, then yellow, and red when it is ripe; if it be not ripe, it will draw a man's mouth awry, with much torment; but

when it is ripe, it is as delicious as an apricot.

They.

They have cherries, and those are much like a damsen, but for their taste and colour we called them cherries. We faw fome few crabs, but very fmall and bitter. Of vines great abundance, in many parts that climb the tops of the highest trees in some places, but these bear but few grapes. Except by the rivers and favage habitations, where they are not overshadowed from the fun, they are covered with fruit, though never pruned nor manured. Of those hedge-grapes we made near twenty gallons of wine, which was like our French British wine, but certainly they would prove good were they well manured. There is another fort of grape near as great as a cherry, this they call messamins; they be fat, and the juice thick. Neither doth the taste so well please when they are made in wine. They have a fmall fruit growing on little trees, husked like a chesnut, but the fruit most like a very small acorn. This they call chechinquamins, which they esteem a great dainty. They have a berry much like our gooseberry, in greatness, colour, and taste; those they call rawcomens, and do eat them raw or boiled. On these natural fruits they live a great part of the year, which they use in this manner; the walnuts, chefnuts, acorns, and chechinquamins are dried to keep. When they need walnuts they break them between two stones, yet some part of the shells will cleave to the fruit. Then do they dry them again upon a mat over a hurdle. After they put it into a mortar of wood, and beat it very small; that done they mix it with water, that the shells may fink to the bottom. This water will be coloured as milk, which they call pawcohiccora, and keep it for their use. The fruit like medlars, they call putchamins, they cast upon hurdles on a mat, and preserve them as prunes. Of their chefnuts and chechinquamins boiled, they make both broth and bread for their chief men, or at their greatest feasts. Besides those fruit-trees, there is a white poplar, and another tree like unto it, that yieldeth a very clear and an odoriferous gum like turpentine, which fome called balfam. There are also cedars and fasfafras trees. They also yield gums in a small proportion of themselves. We tried conclusions to extract it out of the wood, but nature afforded more than our arts.

In the watery vallies grow a berry which they call ocoughtanamnis very much like unto capers. These they dry in summer. When they eat them they boil them near half a day; for otherwise they differ not much from poison. Mattoum groweth as our bents. The seed is not much unlike to rye, though much smaller. This they use for a

dainty bread buttered with deer fuet.

During fummer there are either strawberries, which ripen in April, or mulberries which ripen in May and June. Raspi ses, hurts, or a fruit that the inhabitants call maracock, which is a pleasant wholesome fruit much like a lemon. Many herbs in the spring are commonly dispersed throughout the woods, good for broths and sallads, as violets, parsley, forrell, &c. Besides many we used whose names we know not.

The chief root they have for food is called tockawhoughe. It grows like a flag in marshes. In one day a favage will gather sufficient for a week. These roots are much of the greatness and taste of potatoes. They used to cover a great many of them with oak leaves and fern, and then cover all with earth in the manner of a coalpit; over it, on each side, they continue a great fire twenty-four hours before they dare eat it. Raw it is no better than poison, and being roasted, except it be tender and the heat abated, or sliced and dried in the sun, mixed with sorrel and meal, or such like, it will prick and torment the throat extremely, and yet in summer they use this ordinarily for bread.

They have another root which they call wighfacan: as the other feedeth the body, fo this cureth their hurts and difeafes. It is a finall root, which they bruife and apply to the wound. Pocones is a finall root that groweth in the mountains, which being dried and beat in powder turns red; and this they use for swellings, aches, anointing

their

their joints, painting their heads and garments. They account it very precious, and of much worth. Mufquafpen is a root of the bigness of a finger, and as red as blood. In drying it will wither almost to nothing. This they use to paint their mats, targets, and fuch like.

There is also pellitory of Spain, fasfafras, and divers other simples, which the apo-

thecaries gathered, and commended to be good and medicinable.

In the low marshes grow plots of onions, containing an acre of ground, or more, in many places; but they are small, not past the bigness of the top of one's thumb.

Of beafts the chief are deer, nothing differing from ours. In the deferts towards the heads of rivers there are many, but amongst the rivers sew. There is a beast they call aroughcun, much like a badger, but ufeth to live on trees, as fquirrels do. Their fquirrels fome are near as great as our smallest fort of wild rabbits, some blackish or

black and white, but the most are grey.

A fmall beaft they have they call affapanie, but we call them flying fquirrels, because spreading their legs, and so stretching the largeness of their skins, that they have been feen to fly thirty or forty yards. An oposium hath a head like a swine and a tail like a rat, and is of the bigness of a cat. Under her belly the hath a bag, wherein she lodgeth, carrieth, and fuckleth her young. A mussafcus is a beast of the form and nature of our water-rats, but many of them finell exceedingly strong of musk. Their

hares no bigger than our conies, and few of them to be found.

Their bears are very little in comparison of those of Muscovy and Tartary. beaver is as big as an ordinary water-dog, but his legs exceeding fhort; his fore-feet like a dog's, his hinder feet like a fwan's. His tail fomewhat like the form of a racket, bare without hair, which to eat the favages efteem a great delicacy. They have many otters, which, as the beavers, they take with fnares, and efteem the skins great ornaments, and of all those beasts they use to feed when they catch them. An utchunquoyes is like a wild cat. Their foxes are like our filver-haired conies, of a fmall proportion, and not finelling like those in England. Their dogs of that country are like their wolves, and cannot bark, but howl, and the wolves not much bigger than our English foxes. Martins, polecats, weafels, and minks, we know they have, because we have feen many of their fkins, though very feldom any of them alive. But one thing is strange, that we could never perceive their vermin destroy our hens, eggs, nor chickens, nor do any hurt, nor their flies nor ferpents any way pernicious, where in the fouth parts of America they are always dangerous, and often deadly.

Of birds the eagle is the greatest devourer. Hawks there be of divers forts, as our falconers called them: fparrow-hawks, lanarets, gofhawks, falcons, and ofpreys, but they all prey most upon fish. Their partridges are little bigger than our quails. Wild turkies are as big as our tame. There are woofels or blackbirds with red shoulders, thrushes, and divers forts of small birds, some red. some blue, scarce so big as a wren; but few in fummer. In winter there are great plenty of fwans, cranes. grey and white, with black wings, herons, geefe, brants, duck, wigeon, dotterell, oxies, parrots, and pigeons. Of all those forts great abundance, and some other strange kinds, to us un-

known by name; but in fummer not any, or a very few to be feen.

Of fish we were best acquainted with sturgeon, grampus, porpus, seals, stingrays, whose tails are very dangerous, brets, mullets, white falmons, trouts, foals, plaice, herrings, coney-fish, rock-fish, eels, lampreys, cat-fish, shads, perch of three forts, crabs, fhrimps, crevices, oysters, cockles, and muscles. But the most strange fish is a small one, so like the picture of St. George and the Dragon as possible can be, except his legs and wings, and the toad-fish, which will swell till it be like to burst, when it cometh into the air.

Concerning the entrails of the earth little can be faid for certainty. There wanted good refiners; for those that took upon them to have skill this way, took up the washings from the mountains, and some moskered shining stones and spangles which the waters brought down, flattering themselves in their own vain conceits to have been supposed what they were not, by the means of that ore, if it proved as their arts and judgments expected. Only this is certain, that many regions lying in the same latitude afford mines very rich, of divers natures. The crust also of these rocks would easily persuade a man to believe there are other mines than iron and steel, if there were but means and men of experience that knew the mine from spar.

Of their planted Fruits in Virginia, and how they use them.

THEY divide the year into five feafons. Their winter fome call popanow, the fpring catapeuk, the fummer cohattayough, the earing of their corn nepinough, the harvest and fall of leaf taquitock. From September until the midst of November are the chief feasts and facrifice. Then have they plenty of fruits, as well planted as natural,

as corn, green and ripe, fish, fowl, and wild beasts exceeding fat.

The greatest labour they take is in planting their corn, for the country naturally is overgrown with wood. To prepare the ground, they bruise the bark of the trees near the root, then do they scorch the roots with fire that they grow no more. The next year with a crooked piece of wood they beat up the weeds by the roots, and in that mould they plant their corn. Their manner is this. They make a hole in the earth with a stick, and into it they put four grains of wheat and two of beans. These holes they make four feet one from another. Their women and children do continually keep it weeding, and when it is grown middle high, they hill it about like a hopyard.

In April they begin to plant, but their chief plantation is in May, and so they continue till the midst of June. What they plant in April they reap in August, for May in September, for June in October. Every stalk of their corn commonly beareth two ears, some three, seldom any four, many but one, and some none. Every ear ordinarily hath between two hundred and sive hundred grains. The stalk being green hath a sweet juice in it, somewhat like a sugar cane, which is the cause that when they gather their corn green, they suck the stalks: for as we gather green peas, so do they their corn being green, which excelleth their old. They plant also peas they call assentances, which are the same they call in Italy sagioli. Their beans are the same the

Turks call garnanses; but these they much esteem for dainties.

Their corn they roast in the ear green, and bruising it in a mortar of wood with a polt, lap it in rolls in the leaves of their corn, and so boil it for a dainty. They also reserve that corn late planted that will not ripe, by roasting it in hot ashes, the heat thereof drying it. In winter they esteem it being boiled with beans for a rare dish, they call pausarowmena. Their old wheat they first steep a night in hot water, in the morning pounding it in a mortar. They use a small basket for their temmes, then pound again the great, and so separating by dashing their hand in the basket, receive the flour in a platter made of wood, scraped to that form with burning and shells. Tempering this flour with water, they make it either in cakes, covering them with ashes till they be baked, and then washing them in fair water, they dry presently with their own heat:

8

or else boil them in water, eating the broth with the bread, which they call ponap. The grouts and pieces of the corns remaining, by fanning in the platter or in the wind, away; the bran they boil three or four hours with water, which is an ordinary food they call ustatahamen. But some more thrifty than cleanly do burn the core of the ear to powder, which they call pungnough, mingling that in their meal, but it never tasted well in bread nor broth. Their fish and flesh they boil either very tenderly, or boil it so long on hurdles over the fire; or else after the Spanish fashion, putting it on a spit, they turn first the one side, then the other, till it be as dry as their jerkin beef in the West Indies, that they may keep it a month or more without putrifying. The broth of fish or slesh they eat as commonly as the meat.

In May also amongst their corn they plant pumpions, and a fruit like unto a musk-melon, but less and worse, which they call macocks. These increase exceedingly, and ripen in the beginning of July, and continue until September. They plant also maracocks, a wild fruit like a lemon, which also increase infinitely. They begin to ripen in September, and continue till the end of October. When all their fruits be gathered, little else they plant, and this is done by their women and children; neither doth this long suffice them, for near three parts of the year they only observe times and seasons,

and live of what the country naturally affordeth from hand to mouth, &c.

· The Commodities in Virginia, or that may be had by Industry.

THE mildness of the air, the fertility of the soil, and situation of the rivers, are so propitious to the nature and use of man, as no place is more convenient for pleasure,

profit, and man's fustenance, under that latitude or climate.

Here will live any beafts, as horses, goats, sheep, asses, hens, &c. as appeared by them that were carried thither. The waters, isles, and shoals, are full of safe harbours for ships of war or merchandize, for boats of all forts, for transportation or fishing, &c. The bay and rivers have much merchantable fish, and places sit for salt coats, building

of ships, making of iron, &c.

Muscovia and Polonia do yearly receive many thousands for pitch, tar, soap-ashes, rofin, flax, cordage, flurgeon, mafts, yards, wainfcot, furs, glafs, and fuch like; alfo Sweedland for iron and copper. France in like manner for wine, canvas, and falt. Spain as much for iron, fleel, figs, raifins, and facks. Italy with filks and velvets confumes our chief commodities. Holland maintains itself by fishing and trading at our own doors. All these temporize with other for necessities, but all as uncertain as peace or wars. Besides the charge, travel, and danger in transporting them by seas, lands, florms, and pirates. Then how much hath Virginia the prerogative of all those flourishing kingdoms, for the benefit of our land, when as within one hundred miles all those are to be had, either ready provided by nature, or else to be prepared, were there but industrious men to labour. Only of copper we may doubt is wanting, but there is good probability that both copper and better minerals are there to be had for their labour. Other countries have it. So then here is a place a nurse for foldiers, a practice for mariners, a trade for merchants, a reward for the good, and that which is most of all, a business (most acceptable to God) to bring such poor insidels to the knowledge of God and his holy gospel.

Of the natural Inhabitants of Virginia.

THE land is not populous, for the men be few; their far greater number is of women and children. Within fixty miles of James Town, there are about fome five thousand vol. XIII.

people, but of able men fit for their wars scarce fifteen hundred. To nourish so many together they have yet no means, because they make so small a benefit of their land, be it never fo fertile. Six or feven hundred have been the most hath been feen together. when they gathered themselves to have surprized me at Pamaunkee, having but fifteen to withfland the worst of their fury. As small as the proportion of ground that hath yet been discovered, is in comparison of that yet unknown: the people differ very much in stature, especially in language, as before is expressed. Some being very great as the Sefquefahanocks, others very little as the Wighcocomocoes, but generally tall and ftraight, of a comely proportion, and of a colour brown when they are of any age, but they are born white. Their hair is generally black, but few have any beards. The men wear half their beards shaven, the other half long, for barbers they use their women, who with two fhells will grate away the hair of any fashion they please. The women are cut in many fashions agreeable to their years, but ever some part remaineth long. They are very firong, of an able body and full of agility, able to endure to lie in the woods under a tree by the fire, in the worst of winter, or in the weeds and grass, in ambufcade in the fummer. They are inconstant in every thing, but what fear conftraineth them to keep. Crafty, timorous, quick of apprehenfion, and very ingenuous. Some are of disposition fearful, some bold, most cautelous, all savage, generally covetous of copper, beads, and fuch like traffi. They are foon moved to anger, and fo malicious that they feldom forget an injury: they feldom fleal one from another, left their conjurors should reveal it, and so they be purfued and punished, that they are thus feared is certain, but that any can reveal their offences by conjuration I am doubtful. Their women are careful not to be suspected of dishonesty without the leave of their husbands. Each houshold knoweth their own lands and gardens, and most live of their own labour. For their apparel, they are fometime covered with the skins of wild beasts, which in winter are dreffed with the hair, but in fummer without. The better fort use large mantles of deer skins, not much differing in fashion from the Irish mantles. Some embroidered with white beads, fome with copper, others painted after their manner, but the common fort have fcarce to cover their nakedness but with grass, the leaves of trees, or fuch like. We have feen fome use mantles made of turkey feathers, so prettily wrought and woven with threads that nothing could be differened but the feathers, that was exceeding warm and very handfome; but the women are always covered about their middles with a fkin, and very fhamefast to be feen bare. They adorn themfelves most with copper beads and paintings. Their women some have their legs, hands, breafts, and face, cunningly embroidered with divers works, as beafts, ferpents, artificially wrought into their flesh with black spots; in each car commonly they have three great holes, whereat they hang chains, bracelets, or copper. Some of their men wear in those holes a fmall green and yellow coloured fnake near half a yard in length, which crawling and lapping herfelf about his neck oftentimes familiarly would kifs his lips; others wear a dead rat tied by the tail, fome on their heads wear the wing of a bird, or fome large feather with a rattle; those rattles are fomewhat like the shape of a rapier, but less, which they take from the tail of a fnake. Many have the whole skin of a hawk or some strange fowl stuffed with the wings abroad, others a broad piece of copper, and fome the hand of their enemy dried. Their heads and fhoulders are painted red with the root pocone bruifed to powder, mixed with oil, this they hold in fummer to preferve them from the heat, and in winter from the cold. Many other forms of paintings they use, but he is the most gallant that is the most monstrous to behold.

Their buildings and habitations are for the most part by the rivers, or not far distant

from some fresh spring; their houses are built like our arbours, of small young springs bowed and tied, and fo close covered with mats, or the barks of trees very handfomely, that notwithstanding either wind, rain, or weather, they are as warm as stoves, but very fmoky, yet at the top of the house there is a hole made for the smoke to go

into right over the fire.

Against the fire they lie on little hurdles of reeds covered with a mat, borne from the ground a foot and more by a hurdle of wood, on these round about the house they lie heads and points one by the other against the fire, some covered with mats, some with skins, and some stark naked lie on the ground, from fix to twenty in a house. Their houses are in the midst of their fields or gardens, which are small plots of ground, fome twenty acres, fome forty, fome one hundred, fome two hundred, fome more, some less. In some places from two to fifty of those houses together, or but a little feparated by groves of trees. Near their habitations is little fmall wood or old trees on the ground by reason of their burning of them for fire, so that a man may gallop a horfe amongst these woods any way, but where the creeks or rivers shall hinder.

Men, women, and children have their feveral names according to the feveral humour of their parents. Their women (they fay) are eafily delivered of child; yet do they love children very dearly. To make them hardy in the cold mornings they them wash in the rivers, and by painting and ointments so tan their skins, that after a year or two no weather will hurt them.

The men bestow their times in fishing, hunting, wars, and such man-like exercises, fcorning to be feen in any woman-like exercife, which is the caufe that the women be very painful, and the men often idle. The women and children do the rest of the work, they make mats, baskets, pots, mortars, pound their corn, make their bread, prepare their victuals, plant their corn, gather their corn, bear all kind of burdens, and fuch like.

Their fire they kindle prefently by chafing a dry pointed flick in a hole of a little fquare piece of wood, that firing itself, will so fire moss, leaves, or any such like dry thing that will quickly burn. In March and April they live much upon their fishing wires, and feed on fish, turkies, and fquirrels. In May and June they plant their fields, and live most of acorns, walnuts, and fish. But to amend their diet, some disperse themselves in small companies, and live upon sish, beasts, crabs, oysters, landtortoifes, ftrawberries, mulberries, and fuch like. In June, July, and August, they feed upon the roots of tocknough berries, fish, and green wheat. It is strange to see how their bodies alter with their diet, even as the deer and wild beafts they feem fat and lean, firong and weak. Powhatan, their great king, and fome others, that are provident, roaft their fifh and flesh upon hurdles as before is expressed, and keep it till scarce times.

For fishing, hunting, and wars, they use much their bow and arrows. They bring their bows to the form of ours, by the scraping of a shell. Their arrows are made tome of straight young sprigs, which they head with bone, some two or three inches long; these they use to shoot at squirrels on trees. Another fort of arrows they use made of reeds; these are pierced with wood, headed with splinters of chrystal, or fome sharp stone, the spurs of a turkey, or the bill of some bird. For his knife he hath the splinter of a reed to cut his feathers in form: with this knife also he will joint a deer, or any beast, shape his shoes, buskins, mantles, &c. To make the notch of his arrow he hath the tooth of a beaver, fet in a slick, wherewith he grateth it by degrees: his arrow-head he quickly maketh with a little bone, which he ever weareth

weareth at his bracert, of any splint of a stone, or glass, in the form of a heart, and these they glue to the end of their arrows. With the sinews of deer, and the tops of deers horns, boiled to a jelly, they make a glue that will not dissolve in cold water.

For their wars also they use targets that are round, and made of the barks of trees, and a sword of wood at their backs, but oftentimes they use for swords the horn of a deer, put through a piece of wood in form of a pickaxe; some a long stone sharpened at both ends, used in the same manner: this they were wont to use also for hatchets, but now by trucking they have plenty of the same form of iron; and those are their chief instruments and arms.

Their fishing is much in boats; these they make of one tree, by burning and fcratching away the coals with stones and shells, till they have made it in form of a trough. Some of them are an ell deep, and forty or fifty feet in length, and fome will bear forty men, but the most ordinary are smaller, and will bear ten, twenty, or thirty, according to their bignefs. Instead of oars, they use paddles and sticks, with which they will row fafter than our barges. Betwixt their hands and thighs, their women use to spin the barks of trees, deer sinews, or a kind of grafs they call pemmenaw, of these they make a thread very even and readily. This thread serveth for many uses, as about their housing, apparel, as also they make nets for fishing, for the quantity as formally braided as ours; they make also with it lines for angles. Their hooks are either a bone grated, as they notch their arrows, in the form of a crooked pin or fish-hook, or of the splinter of a bone tied to the clift of a little flick, and with the end of the line they tie on the bait. They use also long arrows tied in a line, wherewith they shoot at fish in the rivers; but they of Accawmack ufe staves like unto javelins, headed with bone; with these they dart fish swimming in the water. They have also many artificial wires, in which they get abundance

In their hunting and fishing they take extreme pains, yet it being their ordinary exercise from their infancy, they esteem it a pleasure, and are very proud to be expert therein; and by their continual ranging and travel, they know all the advantages and places most frequented with deer, beasts, fish, fowl, roots, and berries. At their huntings they leave their habitations, and reduce themselves into companies, as the Tartars do, and go to the most desert places with their families, where they spend their time in hunting and fowling up towards the mountains, by the heads of their rivers, where there is plenty of game; for betwixt the rivers the grounds are fo narrow, that little cometh here which they devour not: it is a marvel they can fo directly pass these deserts, some three or four days journey, without habitation. Their hunting-houses are like unto arbours covered with mats; these their women bear after them, with corn, acorns, mortars, and all bag and baggage they use. When they come to the place of exercise, every man doth his best to shew his dexterity, for by their excelling in those qualities they get their wives. Forty yards will they shoot level, or very near the mark, and one hundred and twenty is their best at random. At their huntings in the deferts they are commonly two or three hundred together. Having found the deer, they environ them with many fires, and betwixt the fires they place themfelves, and fome take their stands in the midst. The deer being thus frightened by the fires and their voices, they chafe them fo long within that circle, that many times they kill fix, eight, ten, or fifteen at a hunting. They use also to drive them into fome narrow point of land, when they find that advantage, and fo force them into the river, where, with their boats, they have ambufcadoes to kill them. When they have thot a deer by land, they follow him like blood-hounds by the blood and strain, and oftentimes.

oftentimes fo take them. Hares, partridges, turkies, or eggs, fat or lean, young or old, they devour all they can catch in their power. In one of these huntings they found me in the discovery of the head of the river of Chickahamania, where they slew my men, and took me prisoner in a bogmire, where I saw those exercises, and gathered these observations.

One favage hunting alone useth the skin of a deer slit on the one side, and so put on his arm through the neck, so that his hand comes to the head, which is stuffed, and the horns, head, eyes, ears, and every part as artificially counterfeited as they can devise; thus shrouding his body in the skin, by stalking he approacheth the deer, creeping on the ground from one tree to another; if the deer chance to find fault, or stand at gaze, he turneth the head with his hand to his best advantage to seem like a deer, also gazing and licking himself; so watching his best advantage to approach, having shot him, he chaseth him by his blood and strain till he get him.

When they intend any wars, the Werowances usually have the advice of their priefts and conjurors, and their allies, and ancient friends, but chiefly the priefts determine their resolution. Every Werowance, or some lusty fellow, they appoint captain over every nation. They feldom make war for lands or goods, but for women and children, and principally for revenge. They have many enemies, namely, all their westernly countries beyond the mountains, and the heads of the rivers. Upon the head of the Powhatans are the Monacans, whose chief habitation is at Rasauweak, unto whom the Mowhemenchughes, the Massinnacacks, the Monahassanughs, the Monafickapanoughs, and other nations, pay tributes. Upon the head of the river of Toppahanock, is a people called Mannahoacks, to these are contributors the Tauxanias, the Shackaconias, the Ontponeas, the Tegninateos, the Whonkenteaes, the Stegarakes, the Hassinnungaes, and divers others, all confederates with the Monacans, though many different in language, and be very barbarous, living for the most part of wild beasts and fruits. Beyond the mountains, from whence is the head of the river Patawomeke, the favages report, inhabit their most mortal enemies, the Massawomekes, upon a great falt water, which by all likelihood is either some part of Canada, fome great lake, or fome inlet of fome fea that falleth into the South Sea. These Massawomekes are a great nation and very populous; for the heads of all those rivers, especially the Pattawomekes, the Pautuxuntes, the Sasquesahanocks, the Tockwoughes, are continually tormented by them, of whose cruelty they generally complained, and very importunate they were with me and my company to free them from these tormentors: to this purpose they offered food, conduct, affistance, and continual subjection; which I concluded to effect: but the council then present emulating my fuccefs, would not think it fit to spare me forty men to be hazarded in those unknown regions, having passed (as before was spoken of,) but with twelve, and fo was lost that opportunity. Seven boats full of these Massawomekes we encountered at the head of the bay, whose targets, baskets, swords, tobaccopipes, platters, bows and arrows, and every thing shewed they much exceeded them of our parts, and their dexterity in their small boats, made of the barks of trees, sewed with bark, and well luted with gum, argueth that they are feated upon fome great water.

Against all these enemies the Powhatans are constrained sometimes to fight. Their chief attempts are by stratagems, treacheries, or surprisals. Yet the Werowance's women and children they put not to death, but keep them captives. They have a method

method in war, and for our pleasures they shewed it to us, and it was in this manner

performed at Mattapanient.

Having painted and difguifed themselves in the fiercest manner they could devise, they divided themselves into two companies, near a hundred in a company; the one company called Monacas, the other Powhatans; either army had their captain. These, as enemies, took their stand a musket shot one from another, ranked themselves sifteen abreaft, and each rank from another four or five yards, not in file, but in the opening betwixt their files; fo the rear could shoot as conveniently as the front. Having thus pitched the fields, from either part went a messenger with these conditions; that whofoever were vanguished, fuch as escape upon their submission in two days after should live, but their wives and children should be prize for the conquerors. The messengers were no fooner returned, but they approached in their orders; on each flank a ferjeant, and in the rear an officer for lieutenant, all duly keeping their orders, yet leaping and finging after their accustomed tune, which they only use in wars. Upon the first slight of arrows they gave fuch horrible shouts and screaches, as so many infernal hell-hounds could not have made them more terrible. When they had fpent their arrows, they joined together prettily, charging and retiring, every rank feconding other; as they got advantage, they catched their enemies by the hair of the head, and down he came that was taken; his enemy with his wooden fword feemed to beat out his brains, and still they crept to the rear to maintain the skirmish. The Monacans decreasing, the Powhatans charged them in the form of a half moon; they, unwilling to be inclosed, fled all in a troop to their ambuscadoes, on whom they led them very cunningly. The Monacans disperse themselves among the fresh men, whereupon the Powhatans retired with all fpeed to their feconds, which the Monacans feeing, took that advantage to retire again to their own battle, and so each returned to their own quarter. All their actions, voices, and gestures, both in charging and retiring, were so strained to the height of their quality and nature, that the strangeness thereof made it seem very delightful.

For their mufic they use a thick cane, on which they pipe as on a recorder. For their wares they have a great deep platter of wood. They cover the mouth thereof with a skin, at each corner they tie a walnut, which meeting on the back side near the bottom, with a fmall rope they twitch them together till it be fo tough and fliff, that they may beat upon it as upon a drum. But their chief inftruments are rattles made of fmall gourds or pumpeons shells. Of these they have base, tenor, counter-tenor, mean, and treble. These mingled with their voices, sometimes twenty or thirty together, make fuch a terrible noise as would rather affright than delight any man. If any great commander arrive at the habitation of a Werowance, they spread a mat, as the Turks do, a carpet for him to fit upon. Upon another right opposite, they fit themselves. Then do all with a tunable voice of shouting bid him welcome. After this do two or more of their chiefest men make an oration, testifying their love. Which they do with fuch vehemency, and fo great passions, that they sweat till they drop, and are so out of breath they can scarce speak. So that a man would take them to be exceeding angry, or stark mad. Such victuals as they have, they spend freely, and at night, where his lodging is appointed, they fet a woman fresh painted red with

pocones and oil, to be his bed fellow.

Their manner of trading is for copper, beads, and fuch like, for which they give fuch commodities as they have, as skins, fowls, fish, slesh, and their country corn. But their victuals are their chiefest riches.

Every

Every Spring they make themselves fick with drinking the juice of a root they call wighfacan, and water; whereof they pour fo great a quantity, that it purgeth them in a very violent manner; fo that in three or four days after, they fcarce recover their former health. Sometimes they are troubled with dropfies, fwellings, aches, and fuch like difeases; for cure whereof they build a stove in the form of a dove-house with mats, so close that a few coals therein covered with a pot, will make the patient sweat extremely. For fwellings also they use small pieces of touch-wood, in the form of cloves, which pricking on the grief they burn close to the flesh, and from thence draw the corruption with their mouth. With this root wighfacan they ordinarily heal green wounds. But to fearify a fwelling or make incition their best instruments are some splinted stone. Old ulcers, or putrified hurts are feldom feen cured amongst them. They have many professed physicians, who with their charms and rattles, with an infernal rout of words and actions, will feem to fuck their inward grief from their navels, or their grieved places; but of our chirurgeons they were fo conceited, that they believed any plaister would heal any hurt.

> But 'tis not always in physicians' skill To heal the patient that is tick and ill: For sometimes sickness on the patient's part, Proves stronger far than all physicians' art.

Of their Religion.

There is yet in Virginia no place discovered to be so savage in which they have not a religion, deer, and bow and arrows. All things that are able to do them hurt beyond their prevention, they adore with their kind of divine worship; as the fire, water, lightning, thunder, our ordnauce, pieces, horfes, &c. But their chief god they worship is the devil. Him they call Okee, and serve himmore of fear than love. They fay they have conference with him, and fashion themselves as near to his shape as they can imagine. In their temples they have his image evil favouredly carved, and then painted and adorned with chains of copper, and beads, and covered with a skin in such manner as the deformities may well fuit with fuch a god. By him is commonly the fepulchre of their kings. Their bodies are first bowelled, then dried upon hurdles till they be very dry, and fo about the most of their joints and neck they hang bracelets, or chains of copper, pearl, and fuch like, as they use to wear, their inwards they stuff with copper beads, hatchets, and fuch trash. Then lap they them very carefully in white skins, and so roll them in mats for their winding sheets. And in the tomb which is an arch made of mats, they lay them orderly. What remaineth of this kind of wealth their kings have, they fet at their feet in baskets. These temples and bodies are kept by their priefts.

For their ordinary burials they dig a deep hole in the earth with sharp stakes, and the corpse being lapped in skins and mats with their jewels, they lay them upon sticks in the ground, and so cover them with earth. The burial ended, the women, being painted all their faces with black coal and oil, do sit twenty-four hours in the houses mourning and lamenting by turns, with such yelling and howling, as may express their

great passions.

In every territory of a Werowance is a temple and a priest, two or three or more. Their principal temple or place of superstition is at Uttamussack, at Pamaunkee, near unto which is a house, temple, or place of Powhatans.

Upon the top of certain red fandy hills in the woods, there are three great houses filled

filled with images of their kings and devils, and tombs of their predecessors. Those houses are near fixty feet in length, built harbour-wise, after their building. This place they count so holy as that but the priests and kings dare come into them; nor the savages dare not go up the river in boats by it, but they solemnly cast some piece of copper, white beads, or pocones into the river, for fear their Okee should be offended and revenged of them. Thus

Fear was the first their gods begot: Till fear began their gods were not.

In this place commonly are refident feven priefts. The chief differed from the reft in his ornaments, but inferior priefts could hardly be known from the common people, but that they had not fo many holes in their ears to hang their jewels at. The ornaments of the chief prieft were certain attires for his head made thus: they took a dozen or fixteen or more fnake skins and stuffed them with moss, and of weasels and other vermin skins a good many. All these they tie by their tails, so as all their tails meet in the top of their head like a great tassel. Round about this tassel is as it were a crown of feathers, the skins hang round about his head, neck and shoulders, and in a manner cover his face. The faces of all their priests are painted as ugly as they can devise, in their hands they had every one his rattle, some bass, some smaller. Their devotion was most in songs, which the chief priest beginneth and the rest followed him; some times he maketh invocations with broken sentences by starts and strange passions, and at every pause, the rest give a short groan.

Thus feek they in deep foolishness, To climb the height of happiness.

It could not be perceived that they keep any day as more holy than other; but only in some great distress of want, fear of enemies, times of triumph, and gathering together their fruits, the whole country of men, women, and children come together to solemnities. The manner of their devotion is sometimes to make a great fire in the house or fields, and all to sing and dance about it with rattles and shouts together, sour or sive hours. Sometimes they set a man in the midst, and about him they dance and sing, he all the while clapping his hands, as if he would keep time, and after their songs and dancing ended they go to their feasts.

Through god begetting fear, Man's blinded mind did rear A hell-god to the ghosts; A heaven-god to the hoasts; Yea god unto the seas: Fear did create all these.

They have also divers conjurations, one they made when I was their prisoner; of

which hereafter you shall read at large.

They have also certain altar stones they call pawcorances; but these stand from their temples, some by their houses, others in the woods and wildernesses, where they have have had any extraordinary accident or encounter. And as you travel, at those stones they will tell you the cause why they were there erected, which from age to age they instruct their children, as their best records of antiquities. Upon these they offer blood, deer such, and tobacco. This they do when they return from the wars, from

hunting, and upon many other occasions. They have also another superstition that they use in storms, when the waters are rough in the rivers and sea coasts. Their conjurers run to the water sides, or passing in their boats, after many hellish outcries and invocations, they cast tobacco, copper, pocones, or such trash into the water, to pacify that god whom they think to be very angry in those storms. Before their dinners and suppers, the better fort will take the first bit, and cast it in the sire, which

is all the grace they are known to use.

In fome part of the country they have yearly a facrifice of children. Such a one was at Quiyoughcohanock, some ten miles from James Town, and thus performed. Fifteen of the properest young boys, between ten and fifteen years of age, they painted white. Having brought them forth, the people fpent the forenoon in dancing and finging about them with rattles. In the afternoon they put those children to the root of a tree. By them all the men flood in a guard, every one having a bastinado in his hand, made of reeds bound together. This made a lane between them all along, through which there were appointed five young men to fetch these children: fo every one of the five went through the guard to fetch a child each after other by turns, the guard fiercely beating them with their bastinadoes, and they patiently enduring and receiving all, defending the children with their naked bodies from the unmerciful blows that pay them foundly, though the children escape. All this while the women weep and cry out very passionately, providing mats, skins, moss, and dry wood, as things fitting their children's funerals. After the children were thus passed the guard, the guard tore down the trees, branches and boughs with fuch violence that they rent the body, and made wreaths for their heads, or bedecked their hair with the leaves. What elfe was done with the children was not feen; but they were all cast on a heap, in a valley, as dead, where they made a great feast for all the company. The Werowance being demanded the meaning of this facrifice, answered, that the children were not all dead, but that the okee or devil did fuck the blood from their left breaft, who chanced to be his by lot, till they were dead, but the rest were kept in the wilderness by the young men till nine months were expired, during which time they must not converse with any; and of these were made their priests and conjurers. This sacrifice they held to be so necessary, that if they should omit it, their okee, or devil, and all their other quiyoughcofughs, which are their gods, would let them have no deer, turkies, corn, nor fifh, and yet befides, he would make a great flaughter amongst

They think that their Werowances and priefts, which they also esteem quiyough-cosughs, when they are dead, do go beyond the mountains towards the setting of the sun, and ever remain there in form of their okee, with their heads painted red with oil and pocones, finely trimmed with seathers, and shall have beads, hatchets, copper, and tobacco, doing nothing but dance and sing, with all their predecessors. But the common people, they suppose, shall not live after death, but rot in their graves, like dead

dogs.

To divert them from this blind idolatry, we did our best endeavours, chiefly with the Werowance of Quiyoughcohanock, whose devotion, apprehension, and good disposition much exceeded any in those countries, with whom although we could not as yet prevail to forsake his false gods, yet this he did believe, that our God as much exceeded theirs, as our guns did their bows and arrows, and many times did send to me at James Town, intreating me to pray to my God for rain, for their gods would not send them any. And in this lamentable ignorance do these poor souls facrifice themselves to the devil, not knowing their creator; and we had not language VOL. XIII.

fufficient fo plainly to express it, as make them understand it; which God grant they may; for

Religion 'tis that doth diftinguish us From their brute humour, well we may it know; That can with understanding argue thus, Our God is truth; but they cannot do so.

Of the Manner of the Virginians' Government.

Although the country people be very barbarous, yet have they amongst them such government as that their magistrates for good commanding, and their people for due fubjection and obeying, excel many places that would be counted very civil. The form of their commonwealth is a monarchical government, one as emperor, ruleth over many kings or governors. Their chief ruler is called Powhatan, and taketh his name of his principal place of dwelling called Powhatan; but his proper name is Wahunsonacock. Some countries he hath which have been his ancestors, and came unto him by inheritance, as the country called Powhatan, Arrohateck, Appamatuck, Pamaunkee, Youghtanund, and Mattapanient. All the rest of his territories expressed in the map, they report, have been his feveral conquests. In all his ancient inheritances he hath houses built after their manner, like arbours, some thirty, some forty . yards long, and at every house provision for his entertainment, according to the time. At Werowcomoco, on the north fide of the river Pamaunkee, was his refidence, when I was delivered him prisoner, some fourteen miles from James Town, where, for the most part, he was resident; but at last he took so little pleasure in our near neighbourhood, that he retired himself to Orapakes, in the desert betwixt Chickahamanta and Youghtanund. He is of personage a tall well-proportioned man, with a sour look, his head fomewhat grey, his beard fo thin that it feemeth none at all, his age near fixty, of a very able and hardy body to endure any labour; about his person ordinarily attendeth a guard of forty or fifty of the tallest men his country doth afford. Every night, upon the four quarters of his house, are four centinels, each from other a flight shoot, and at every half hour one from the corps du guard doth hollow, shaking his lips with his finger between them; unto whom every fentinel doth answer round from his stand: if any fail, they presently send forth an officer that beateth him extremely.

A mile from Orapakes, in a thicket of wood, he hath a house, in which he keepeth his kind of treasure, as skins, copper, pearl, and beads, which he storeth up against the time of his death and burial. Here also is his store of red paint, for ointment, bows and arrows, targets and clubs. This house is fifty or fixty yards in length, frequented only by priests. At the four corners of this house stand four images as sentinels, one of a dragon, another a bear, the third like a leopard, and the fourth like a giant-like

man, all made evil favouredly, according to their best workmanship.

He hath as many women as he will, whereof, when he lieth on his bed, one fitteth at his head, and another at his feet; but when he fitteth, one fitteth on his right hand, and another on his left; as he is weary of his women, he bestoweth them on those that best deserve them at his hands; when he dineth or suppeth, one of his women before and after meat, bringeth him water in a wooden platter to wash his hands; another waiteth with a bunch of scathers to wipe them, instead of a towel, and the feathers, when he hath wiped, are dried again. His kingdoms descend not to his sons nor children, but first to his brethren, whereof he hath three, namely, Opitchapan,

Opechan-

Opechancanough, and Catataugh, and after their decease, to his fifters: first, to the eldest fister, then to the rest, and after them, to the heirs male or semale of the eldest

fifter, but never to the heirs of the males.

He nor any of his people understand any letters, whereby to write or read, only the laws whereby he ruleth is custom. Yet, when he listeth, his will is a law, and must be obeyed; not only as a king, but as half a god, they esteem him. His inferior kings, whom they call Werowances, are tied to rule by custom, and have power of life and death at their command in that nature. But this word Werowance, which we call and construe for a king, is a common word, whereby they call all commanders; for they have but few words in their language, and but few occasions to use any officers more than one commander, which commonly they call Werowance or Caucoroufe, which is captain. They all know their feveral lands, habitations, and limits, to fifth, fowl, or hunt in; but they hold all of their great Werowance Powhatan, unto whom they pay tribute of skins, beads, copper, pearl, deer, turkies, wild beafts, and corn. What he commandeth, they dare not disobey in the least thing. It is strange to see with what great fear and adoration all these people do obey this Powhatan; for at his feet they present whatsoever he commandeth, and at the least frown of his brow, their greatest spirits will tremble with fear; and no marvel, for he is very terrible and tyrannous in punishing such as offend him: for example, he caused certain malefactors to be bound hand and foot, then having of many fires gathered great store of burning coals, they rake these coals round in the form of a cock-pit, and in the midst they cast the offenders to broil to death. Sometimes he caufeth the heads of them that offend him to be laid upon the altar of facrificing stone, and one with clubs beats out their brains: when he would punish any notorious enemy or malefactor, he causeth them to be tied to a tree, and with muscle-shells or reeds, the executioner cutteth off his joints one after another, ever casting what they cut off into the fire; then doth he proceed with shells and reeds to case the skin from his head and face; then do they rip up his belly, and so burn him with the tree and all. Thus themselves reported they executed George Cassen. Their ordinary correction is to beat them with cudgels. We have feen a man kneeling on his knees, and at Powhatan's command, two men have beat him on the bare skin, till he hath fallen fenfeless in a swoon, and yet never cry nor complained. And he made a woman, for playing the whore, fit upon a great stone, on her bare breech, twentyfour hours, only with corn and water, every three days, till nine days were past, yet he loved her exceedingly; notwithstanding, there are common whores by profession.

In the year 1608, he furprifed the people of Payankatank, his near neighbours and fubjects. The occasion was to us unknown, but the manner was thus: first, he sent divers of his men as to lodge amongst them that night, then the ambuscadoes environed all their houses, and at the hour appointed they all fell to the spoil: twenty-sour men they slew, the long hair of the one side of their heads, with the skin cased off with shells or reeds, they brought away. The surprised also the women and the children, and the werowance: all these they presented to Powhatan. The werowance, women, and children became his prisoners, and do him service. The locks of hair, with their skins, he hanged on a line betwixt two trees; and thus he made oftentation of his triumph at Werowocomoco, where he intended to have done as much to me and my

company.

And this is as much as my memory can call to mind worthy of note; which I have purposely collected, to satisfy my friends of the true worth and quality of Virginia. Yet some bad natures will not stick to slander the country, that will slovenly spit at all things, especially in company, where they can find none to contradict them. Who

though they were fearce ever ten miles from James Town, or at the most, but at the falls; yet holding it a great disgrace that amongst so much action their actions were nothing, exclaim of all things, though they never adventured to know any thing, nor ever did any thing but devour the fruits of other men's labours; being for most part of such tender educations, and small experience in martial accidents, because they found not English cities, nor such fair houses, nor at their own wishes any of their accustomed dainties, with feather-beds and down pillows, taverns and ale-houses in every breathing place, neither such plenty of gold and silver and dissolute liberty, as they expected, had little or no care of any thing but to pamper their bellies, to sly away with our pinnaces, or procure their means to return for England. For the country was to them a misery, a ruin, a death, a hell; and their reports here, and their actions there according.

Some other there were that had yearly flipends to pass to and again for transportation: who to keep the mystery of the business in themselves, though they had neither time nor means to know much of themselves; yet all men's actions or relations they so formally turned to the temporizing times simplicity, as they could make their ignorance feem much more, than all the true actors could by their experience. And those with their great words deluded the world with such strange promises as abused the business much worse than the rest; for the business being built upon the foundation of their fained experience, the planters, the money, and means have still miscarried: yet they ever returning and the planters so far absent, who could contradict their excuses? which, still to maintain their vain glory and estimation, from time to time have used such diligence as made them pass for truths, though nothing more false. And that the adventurers might be thus abused let no man wonder; for the wisest living is soonest

abused by him that hath a fair tongue and a dissembling heart.

There were many in Virginia merely projecting, verbal, and idle contemplators, and those fo devoted to pure idleness, that though they had lived two or three years in Virginia lordly, necessity itself could not compel them to pass the peninsula, or pallisadoes of James Town; and those witty spirits, what would they not affirm in the behalf of our transporters, to get victuals from their ships, or obtain their good words in England, to get their passes? Thus from the clamours and the ignorance of false informers are forung those disasters that forung in Virginia: and our ingenious verbalists were no less plague to us in Virginia, than the locusts to the Egyptians. For the labour of twenty or thirty of the best only preserved in christianity, by their industry, the idle livers of near two hundred of the rest: who living near ten months of such natural means as the country naturally of itself afforded, notwithstanding all this, and the worst fury of the favages, the extremity of fickness, mutinies, faction, ignorance, and want of victual; in all that time I loft but feven or eight men, yet subjected the favages to our defired obedience, and received contribution from thirty-five of their kings, to protect and assist them against any that should assault them, in which order they continued true and faithful, and as fubjects to his Majesty, so long after as I did govern there, until I left the country; fince, how they have revolted, the country loft, and again replanted, and the businesses hath succeeded from time to time, I refer you to the relations of them returned from Virginia, that have been more diligent in fuch observations.

JOHN SMITH writ this with his own hand.

Because many do desire to know the manner of their language, I have inserted these few words:

Ka katorawines yowo? What call you this?
Nemarough, a man.

Crenepo, a woman. Marowanchesso, a boy.

Tehawkans, houses.

Matchcores, skins or garments.

Mocasins, shoes.
Tussan, beds.
Pokatawer, sire.
Attawp, a bow.
Attonce, arrows.
Monacookes, swords.
Aumoubbowgh, a target.
Paweussacks, guns.
Tomabacks, axes.

Tockabacks, pickaxes.
Pamefacks, knives.

Accomprets, thears. Paropecones, pipes.

Mattafin, copper.

Uffawassin, iron, brass, filver, or any white

Musses, woods.

Attasskuss, leaves, weeds, or grass.

Chepsin, land.

Shacquohocan, a stone. Wepenter, a cuckold. Suckahanna, water. Noughmaff, fish.

Copotone, sturgeon. Weghshaughes, flesh.

Sawwehone, blood. Netoppew, friends.

Marrapough, enemies.

Maskapow, the worst of enemies.

Mawchick chammay, the best of friends.

Cafacunnakack, peya quagh acquintan
uttafantafough? In how many days will
there come hither any more English

fhips?

Their numbers:

Necut, 1; Ningh, 2; Nus, 3; Yowgh, 4; Paranske, 5; Comotinch, 6; Toppawos, 7; Nuswash, 8; Kekatawgh, 9; Kaskeke, 10. They count no more but by tens, as followeth:

Case, how many.

Ninghsapooeksku, 20;

Nussapooeksku, 30 ; Yowghapooeksku, 40 ;

Parankestassapooeksku, 50;

Comatinchitassapooeksku, 60;

Nuffswafhtaffapooeksku, 70;

Kekataughtassapooeksku, 90;

Necuttoughtysmough, 100;

Necuttweunquaough, 1000. Rawcosowghs, days.

Keskowyhes, funs.

Toppquough, nights.

Nepawweshowghs, moons.

Pawpaxfoughes, years.

Pummahumps, stars.

Ofies, heavens.

Okees, gods.

Quiyoughcofoughs, petty gods, and their affinities.

Righcomoughes, deaths.

Kekughes, lives.

Mowchick woyawgh tawgh nocragh kaquere mecher? I am very hungry; what shall I eat?

Tawnor nebiegh Powhatan? Where dwells Powhatan?

Mache, nehiegh yourowgh, Orapaks, Now he dwells a great way hence, at Orapaks.

Vittapitchewayne anpechitchs nehawper Werowacomoco, You lie, he staid ever at Werowacomoco.

Kator nehiegh mattagh necr uttapitchewayne, Truly he is there, I do not lie.

Spaughtynere keragh werowance mawmarinough kekate wawgh peyaquaugh, Run you then to the King Mawmarynough, and bid him come hither.

Utteke, e peya weyack wighwhip, Get you

gone, and come again quickly.

Kekaten Pokahontas patiaquagh niugh tanks manotyens neer mowchick rawrenock audowgh, Bid Pokahontas bring hither two little baskets, and I will give her white beads, to make her a chain.

BOOK III.

CHAP. I.— The Proceedings and Accidents of the English Colony in Virginia, extracted from the Authors following, by William Simons, Doctor of Divinity.

IT might be well thought a country fo fair as Virginia is, and a people fo tractable, would long ere this have been quietly possessed, to the satisfaction of the adventurers, and the eternizing of the memory of those that effected it. But because all the world do see a defailment, this following treatise shall give satisfaction to all indifferent readers, how the business hath been carried; where, no doubt, they will easily understand and answer to their question, how it came to pass, there was no better speed and

fuccess in those proceedings.

Captain Bartholomew Gofnoll, one of the first movers of this plantation, having many years solicited many of his friends, but sound small assistance, at last prevailed with some gentlemen, as Captain John Smith, Mr. Edward Maria Wingsield, Mr. Robert Hunt, and divers others, who depended a year upon his projects, but nothing could be effected, till, by their great charge and industry, it came to be apprehended by certain of the nobility, gentry, and merchants, so that His Majesty, by his letters patents, gave commission for establishing councils, to direct here; and to govern, and to execute there. To effect this, was spent another year, and by that, three ships were provided, one of one hundred tons, another of forty, and a pinnace of twenty. The transportation of the company was committed to Captain Christopher Newport, a mariner well practised for the western parts of America. But their orders for government were put in a box, not to be opened, nor the governors known until they arrived in Virginia.

On the 19th of December, 1606, we fet fail from Blackwall, but by unprosperous winds were kept fix weeks in the fight of England; all which time Mr. Hunt, our preacher, was so weak and fick, that sew expected his recovery. Yet although he were but twenty miles from his habitation (the time we were in the Downs), and notwithstanding the stormy weather, nor the scandalous imputations (of some few, little better than atheists, of the greatest rank amongst us) suggested against him, all this could never force from him so much as a seeming desire to leave the business, but preferred the service of God, in so good a voyage, before any affection to contest with his godless foes, whose disastrous designs (could they have prevailed) had even then overthrown the business, so many discontents did then arise, had he not, with the water of patience and his godly exhortations (but chiefly by his true devoted examples) quenched those

flames of envy and diffention.

We watered at the Canaries; we traded with the favages at Dominica; three weeks we fpent in refreshing ourselves amongst these West India isles; in Guardalupa we found a bath so hot, as in it we boiled pork as well as over the fire. And at a little isle called Monica, we took from the bushes with our hands, near two hogsheads sull of birds in three or four hours. In Mevis, Mona, and the Virgin isles, we spent some time, where, with a loathsome beast like a crocodile, called a guayn, tortoises, pelicans, parrots, and sishes, we daily feasted. Gone from thence in search of Virginia, the company was not a little discomforted, seeing the mariners had three days passed their reckoning, and found no land, so that Captain Ratlisse (captain of the pinnace) rather defired to bear up the helm to return for England, than make further search. But God, the guide of all good actions, forcing them by an extreme storm to hull all

night,

cruelty.

night, did drive them by his providence to their defired port, beyond all their expectations, for never any of them had feen that coast. The first land they made they called Cape Henry; where thirty of them recreating themselves on shore, were assaulted by five favages, who hurt two of the English very dangerously. That night was the box opened, and the orders read, in which Bartholomew Gofnell, John Smith, Edward Wingfield, Christopher Newport, John Ratlisse, John Martin, and George Kendall, were named to be the counfel, and to choose a president amongst them for a year, who with the council should govern. Matters of moment were to be examined by a jury, but determined by the major part of the council, in which the prefident had two voices. Until the 13th of May they fought a place to plant in, then the council was fworn, Mr. Wingfield was chosen prefident, and an oration made, why Captain Smith was not admitted of the council as the rest.

Now falleth every man to work, the council contrive the fort, the rest cut down trees to make place to pitch their tents; fome provide clapboard to relade the ships, some make gardens, fome nets, &c. The favages often vifited us kindly. The prefident's overweening jealoufy would admit no exercife at arms, or fortification, but the boughs of trees cast together in the form of a half moon by the extraordinary pains and diligence of Captain Kendall. Newport, Smith, and twenty others, were fent to discover the head of the river: by divers small habitations they passed, in fix days they arrived at a town called Powhatan, confifting of fome twelve houses, pleasantly feated on a hill; before it three fertile isles, about it many of their corn fields, the place is very pleafant, and strong by nature; of this place the prince is called Powhatan, and his people Powhatans; to this place the river is navigable: but higher within a mile, by reason of the rocks and isles, there is not passage for a small boat; this they call the falls: the people in all parts kindly treated them, till being returned within twenty miles of James Town, they gave just cause of jealousy, but had God not blessed the discoverers otherwife than those at the fort, there had then been an end of that plantation; for at the fort, where they arrived the next day, they found seventeen men hurt, and a boy flain by the favages, and had it not chanced a cross bar shot from the ships struck down a bough from a tree amongst them, that caused them to retire, our men had all been flain, being fecurely all at work, and their arms in dry fats.

Hereupon the prefident was contented the fort should be pallifadoed, the ordnance mounted, his men armed and exercised, for many were the assaults, and ambuscades of the favages, and our men by their diforderly straggling were often hurt, when the favages by the nimbleness of their heels well escaped. What toil we had, with so small a power to guard our workmen adays, watch all night, refift our enemies, and effect our bufinefs, to relade the ships, cut down trees, and prepare the ground to plant our corn, &c. I refer to the reader's confideration. Six weeks being spent in this manner, Captain Newport (who was hired only for our transportation) was to return with the Now Captain Smith, who all this time from their departure from the Canaries was reftrained as a prisoner upon the scandalous suggestions of some of the chiefs (envying his repute) who fained he intended to usurp the government, murder the council, and make himself king, that his confederates were dispersed in all the threeships, and that divers of his confederates that revealed it, would affirm it; for this he was committed as a prisoner: thirteen weeks he remained thus suspected; and by that time the ships should return, they pretended out of their commiserations, to refer him to the council in England to receive a check, rather than by particularifing his defigns make him fo odious to the world, as to touch his life, or utterly overthrow his reputation. But he fo much fcorned their charity, and publicly defied the uttermost of their

cruelty, he wifely prevented their policy, though he could not suppress their envy, yet so well he demeaned himself in this business, as all the company did see his innocence, and his adversaries malice, and those substrated to accuse him, accused his accusers of subornation; many untruths were alleged against him; but being so apparently disproved, begat a general hatred in the hearts of the company against such unjust commanders, that the president was adjudged to give him 2001. So that all he had was seized upon, in part of satisfaction, which Smith presently returned to the store for the general use of the colony. Many were the mischiefs that daily sprung from their ignorant (yet ambitious) spirits, but the good doctrine and exhortation of our preacher Mr. Hunt reconciled them, and caused Captain Smith to be admitted of the council; the next day all received the communion, the day following the savages voluntarily desired peace, and Captain Newport returned for England with news; leaving in Virginia one hundred, the 15th of June 1607. By this observe;

Good men did ne'er their countries ruin bring. But when evil men shall injuries begin; Not caring to corrupt and violate The judgment-seat for their own lucre's sake: Then look that country cannot long have peace, Though for the present it have rest and ease.

The names of them that were the first planters, were these following:

Mr. Edward Maria Wingfield Captain Bartholomew Gofnoll Captain John Smith Captain John Ratliffe Captain John Martin Captain George Kendall	Council.	Nathaniel Powell Edward Brown Robert Behethland John Penington Jeremy Alicock George Walker	
Mr. Robert Hunt, Preacher Mr. George Percie Anthony Gosnoll George Flower Captain Gabriell Archer Robert Fenton Robert Ford William Bruster Edward Harrington Dru Pickhouse Thomas Jacob John Brookes Ellis Kingston Thomas Sands Benjamin Beast John Robinson Thomas Mouton Eustace Clovill Stephen Halthrop Kellam Throgmorton Edward Morish	Gent. CHAP. II.—What happened till the first Supply.

BEING thus left to our fortunes, it fortuned that within ten days scarce ten amongst us could either go, or well ftand, fuch extreme weaknefs and ficknefs oppressed us. And thereat none need marvel, if they confider the cause and reason, which was this; whilft the ships stayed, our allowance was somewhat bettered, by a daily proportion of bifcuit, which the failors would pilfer to fell, give, or exchange with us, for money, fasfafras, furs, or love. But when they departed, there remained neither tavern, beerhouse, nor place of relief, but the common kettle. Had we been as free from all fins as gluttony and drunkenness, we might have been canonized for saints; but our prefident would never have been admitted, for ingroffing to his private, oatmeal, fack, oil, aquavitæ, beef, eggs, or what not, but the kettle; that indeed he allowed equally to be distributed, and that was half a pint of wheat, and as much barley boiled with water for a man a day, and this having fried fome twenty-fix weeks in the ship's hold, contained as many worms as grains; fo that we might truly call it rather fo much bran than corn; our drink was water, our lodgings castles in the air: with this lodging and diet, our extreme toil in bearing and planting pallifadoes, so strained and bruised us, and our continual labour in the extremities of the heat had fo weakened us, as were cause sufficient to have made us as miserable in our native country, or any other place in the world. From May to September, those that escaped, lived upon sturgeon, and fea-crabs; fifty in this time we buried: the rest feeing the president's projects to elcape these miseries in our pinnace by slight (who all this time had neither felt want nor fickness) so moved our dead spirits, as we deposed him; and established Ratcliffe in his place (Gofnoll being dead), Kendall deposed, Smith newly recovered, Martin and Ratcliffe was by his care preserved and relieved, and the most of the soldiers recovered, with the skilful diligence of Mr. Thomas Wotton our chirurgeon-general. But now was all our provision spent, the sturgeon gone, all helps abandoned, each hour expecting the fury of the favages; when God, the patron of all good endeavours, in that desperate extremity so changed the hearts of the savages, that they brought such plenty of their fruits and provision as no man wanted.

And now where some affirmed it was ill done of the council to fend forth men so badly provided, this incontradictable reason will shew them plainly they are too ill advised to nourish suchill conceits; first, the fault of our going was our own: what could be thought fitting or necessary we had; but what we should find, or want, or where we should be, we were all ignorant, and supposing to make our passage in two months, with victuals to live, and the advantage of the spring to work; we were at sea sive months, where we both spent our victuals and lost the opportunity of the time and season to plant, by the unskilful presumption of our ignorant transporters, that understood not at all what they undertook.

Such actions have ever fince the world's beginning been fubject to fuch accidents; and every thing of worth is found full of difficulties; but nothing fo difficult as to establish a commonwealth fo far remote from men and means, and where men's minds are fo untoward as neither do well themselves, nor fusfer others. But to proceed.

The new prefident and Martin, being little beloved, of weak judgment in dangers, and less industry in peace, committed the managing of all things abroad to Captain Smith, who, by his own example, good words, and fair promifes, fet some to mow, others to bind thatch, fome to build houses, others to thatch them, himself always bearing the greatest task for his own share; so that in short time, he provided most of them lodgings, neglecting any for himfelf. This done, feeing the favages fuperfluity begin to decrease (with some of his workmen) shipped himself in the shallop to search the country for trade. The want of the language, knowledge to manage his boat without fails, the want of a fufficient power, (knowing the multitude of the favages) apparel for his men, and other necessaries, were infinite impediments, yet no discouragement. Being but fix or feven in company, he went down the river to Kecoughtan, where at first they scorned him, as a samished man, and would in derision offer him a handful of corn, a piece of bread, for their fwords and mufkets, and fuch like proportions also for their apparel. But feeing by trade and courtefy there was nothing to be had, he made bold to try fuch conclusions as necessity inforced, though contrary to his commission, let fly his muskets, ran his boat on shore, whereat they all sled into the woods. So marching towards their houses, they might see great heaps of corn, much ado he had to reftrain his hungry foldiers from prefent taking of it, expecting (as it happened) that the favages would affault them, as not long after they did with a most hideous noise: fixty or seventy of them, some black, some red, some white, some party-coloured, came in a fquare order, finging and dancing out of the woods, with their okee (which was an idol made of fkins, ftuffed with mofs, all painted and hung with chains and copper) borne before them; and in this manner being well armed with clubs, targets, bows and arrows, they charged the English, that so kindly received them with their muskets loaden with pistol shot, that down fell their god, and divers lay sprawling on the ground, the rest sled again to the woods, and ere long sent one of their quiyoughkasoucks to offer peace, and redeem their okee. Smith told them, if only fix of them would come unarmed and load his boat, he would not only be their friend, but restore them their okee, and give them beads, copper, and hatchets besides, which, on both fides, was to their contents performed; and then they brought him venifon, turkies, wild fowl, bread, and what they had, finging and dancing in fign of friendship till they departed. In his return he discovered the town and country of Warraskoyack.

Thus God, unboundless by his power, Made them thus kind, would us devour.

Smith perceiving (notwithstanding their late misery) not any regarded but from hand to mouth (the company being well recovered), caused the pinnace to be provided with things fitting to get provision for the year following; but in the interim he made three or four journies, and discovered the people of Chickahamania: yet what he carefully provided the rest carelessly spent. Wingsield and Kendall living in disgrace, feeing all things at random in the absence of Smith, the company's dislike of their prefident's weaknefs, and their fmall love to Martin's never-mending ficknefs, strengthened themselves with the failors, and other confederates, to regain their former credit and authority, or at least, such means aboard the pinnace, (being sitted to fail as Smith had appointed, for trade) to alter her course and to go for England. unexpectedly returning had the plot discovered to him, much trouble he had to prevent it, till with ftore of fakre and musket shot he forced them to stay or fink in the river, which action cost the life of Captain Kendall. These brawls are so disgustful, as fome will fay they were better forgotten; yet all men of good judgment will conclude, it were better their baseness should be manifest to the world than the business bear the fcorn and shame of their excused disorders. The president and Captain Archer not long after intended also to have abandoned the country, which project also was curbed and suppressed by Smith. The Spaniard never more greedily defired gold than he victuals, nor his foldiers more to abandon the country, than he to keep it. But finding plenty of corn in the river of Chickahamania, where hundreds of favages in divers places stood with baskets expecting his coming. And now the winter approaching, the rivers became fo covered with fwans, geefe, ducks, and cranes, that we daily feasted with good bread, Virginia peas, pumpions, and putchamins, fish, fowl, and divers forts of wild beafts as fat as we could eat them, fo that none of our tuftaffaty humourists defired to go for England. But our comedies never endured long without a tragedy; fome idle exceptions being muttered against Captain Smith, for not discovering the head of Chickahamania river, and taxed by the council to be too flow in fo worthy ah attempt. The next voyage he proceeded fo far, that with much labour by cutting of trees afunder he made his passage, but when his barge could pass no further, he left her in a broad bay out of danger of shot, commanding none should go ashore till his return; himfelf with two English and two favages went up higher in a canoe, but he was not long abfent; but his men went ashore, whose want of government gave both occasion and opportunity to the favages to surprise one George Cassen, whom they flew, and much failed not to have cut off the boat and all the rest. Smith little dreaming of that accident, being got to the marshes at the river's head, twenty miles in the defert, had his two men flain (as is supposed) fleeping by the canoe, whilst himself, by fowling, sought them victuals; who finding he was beset with two hundred favages, two of them he flew, still defending himself with the aid of a favage his guide, whom he bound to his arm with his garters, and used him as a buckler, yet he was fhot in his thigh a little, and had many arrows that stuck in his cleaths, but no great hurt, till at last they took him prisoner. When this news came to James Town, much was their forrow for his lofs, few expecting what enfued. Six or feven weeks those barbarians kept him prisoner, many strange triumphs and conjurations they made of him, yet he fo demeaned himfelf amongst them, as he not only diverted them from furprifing the fort, but procured his own liberty, and got himfelf and his company fuch estimation amongst them, that those savages admired him more than their own quiyouckafoucks. The manner how they used and delivered him, is as followeth.

The favages having drawn from George Caffen whither Captain Smith was gone, profecuting that opportunity they followed him with three hundred bow-men, conducted

by the King of Pamaunkee, who, in divisions, fearching the turnings of the river, found Robinson and Emry by the fire-fide, those they shot full of arrows and slew. Then finding the captain, as is faid, that used the favage that was his guide as his shield (three of them being flain and divers others fo galled), all the reft would not come near him. Thinking thus to have returned to his boat, regarding them as he marched more than his way, flipped up to the middle in an oozy creek, and his favage with him; yet durst they not come to him, till being near dead with cold he threw away his arms; then according to their composition, they drew him forth and led him to the fire, where his men were flain: diligently they chafed his benumbed limbs. He demanding for their captain, they shewed him Opechankanough, King of Pamaunkee, to whom he gave a round ivory double compass dial. Much they marvelled at the playing of the fly and needle, which they could fee fo plainly, and yet not touch it, because of the glass that covered them. But when he demonstrated by that globe-like jewel, the roundness of the earth and skies, the sphere of the sun, moon, and stars, and how the fun did chafe the night round about the world continually, the greatness of the land and fea, the diversity of nations, variety of complexions, and how we were to them antipodes, and many other fuch like matters, they all stood as amazed with admiration. Notwithstanding, within an hour after they tied him to a tree, and as many as could ftand about him prepared to shoot him, but the King holding up the compass in his hand, they all laid down their bows and arrows, and in a triumphant manner led him

to Orapaks, where he was after their manner kindly feafted and well used.

Their order in conducting him was thus: drawing themselves all in file, the King in the midst had all their pieces and swords borne before him. Captain Smith was led after him by three great favages, holding him fast by each arm; and on each side six went in file with their arrows nocked. But arriving at the town (which was but only thirty or forty hunting-houses made of mats, which they remove as they please, as we our tents) all the women and children ftaring to behold him; the foldiers first, all in file, performed the form of a biffone fo well as could be, and on each flank officers, as ferjeants, to fee them keep their order. A good time they continued this exercife, and then cast themselves in a ring, dancing in such several postures, and singing and yelling out fuch hellish notes and screeches; being strangely painted, every one his quiver of arrows, and at his back a club; on his arm a fox or an otter's skin, or some fuch matter for his vambrace; their heads and shoulders painted red, with oil and pocones mingled together, which fearlet-like colour made an exceeding handsome shew; his bow in his hand, and the skin of a bird, with her wings abroad dried, tied on his head, a piece of copper, a white shell, a long feather, with a small rattle growing at the tails of their fnakes, tied to it, or fome fuch like toy. All this while Smith and the King flood in the midft, guarded, as before is faid, and after three dances they all departed. Smith they conducted to a long house, where thirty or forty tall fellows did guard him, and ere long more bread and venison was brought him than would have ferved twenty men; I think his ftomach at that time was not very good; what he left they put in baskets and tied over his head. About midnight they set the meat again before him; all this time not one of them would cat a bit with him, till the next morning they brought him as much more, and then did they cat all the old, and referved the new as they had done the other, which made him think they would fat him to eat him: yet in this desperate estate to defend him from the cold, one Maocaffater brought him his gown, in requital of fome beads and toys Smith had given him at his first arrival in Virginia.

Two days after a man would have flain him (but that the guard prevented it) for

the death of his fon, to whom they conducted him, to recover the poor man then breathing his laft. Smith told them, that at James Town he had a water would do it, if they would let him fetch it; but they would not permit that, but made all the preparations they could to affault James Town, craving his advice, and for recompence he should have life, liberty, land, and women. In part of a table-book he writ his mind to them at the fort, what was intended, how they should follow that direction to affright the messengers, and without fail send him such things as he writ for, and an inventory with them. The difficulty and danger, he told the savages, of the mines, great guns, and other engines, exceedingly affrighted them; yet according to his request, they went to James Town, in as bitter weather as could be of frost and snow, and within three days returned with an answer.

But when they came to James Town, feeing men fally out, as he had told them they would, they fled; yet in the night they came again to the fame place where he had told them they fhould receive an answer, and such things as he had promised them, which they found accordingly, and with which they returned with no small expedition, to the wonder of them all that heard it, that he could either divine, or the paper could speak; then they led him to the Youthtanunds, the Mattapanients, the Payankatanks, the Nantaughtacunds, and Onawmanients, upon the rivers of Raphanock and Patawomek, over all those rivers, and back again by divers other several nations, to the King's habitation at Pamaunkee, where they entertained him with most strange and fearful conjurations,

As if near led to hell, Amongst the devils to dwell.

Not long after, early in a morning, a great fire was made in a long house, and a mat fpread on the one fide as on the other; on the one they caused him to fit, and all the guard went out of the house, and prefently came skipping in a great grim fellow, all painted over with coal mingled with oil, and many fnakes and weafels skins stuffed with mofs, and all their tails tied together, fo as they met on the crown of his head in a taffel, and round about the taffel was as a coronet of feathers, the skins hanging round about his head, back, and shoulders, and in a manner covered his face, with a hellish voice, and a rattle in his hand. With most strange gestures and passions he began his invocation, and environed the fire with a circle of meal; which done, three more fuch like devils came rushing in with the like antic tricks, painted half black, half red; but all their eyes were painted white, and some red strokes like mustachoes along their cheeks: round about him those fiends danced a pretty while, and then came in three more as ugly as the rest, with red eyes, and white strokes over their black faces: at last they all sat down right against him, three of them on the one hand of the chief prieft, and three on the other. Then all with their rattles began a fong, which ended, the chief prieft laid down five wheat corns; then ftraining his arms and hands with fuch violence that he fweat, and his veins fwelled, he began a short oration; at the conclusion they all gave a short groan, and then laid down three grains more. After that they began their fong again, and then another oration, ever laying down fo many corns as before, till they had twice encircled the fire; that done, they took a bunch of little flicks prepared for that purpose, continuing still their devotion, and at the end of every fong and oration they laid down a stick betwixt the divisions of corn. Till night neither he nor they did either eat or drink, and then they feafted merrily, with the best provisions they could make. Three days they used this ceremony, the meaning whereof they told him was to know if he intended them well

well or no. The circle of meal fignified their country, the circles of corn the bounds of the fea, and the sticks his country. They imagined the world to be flat and round, like a trencher, and they in the midst. After this they brought him a bag of gunpowder, which they carefully preserved till the next spring, to plant as they did their corn, because they would be acquainted with the nature of that seed. Opicahapam, the King's brother, invited him to his house, where, with as many platters of bread, sowl, and wild beasts, as did environ him, he bid him welcome; but not any of them would eat a bit with him, but put up all the remainder in baskets. At his return to Opechancanoughs, all the King's women, and their children, slocked about him for their parts, as a due by custom, to be merry with such fragments.

But his waking mind in hideous dreams did oft fee wondrous shapes Of bodies strange, and huge in growth, and of stupendous makes.

At last they brought him to Meronomoco, where was Powhatan their emperor. Here more than two hundred of those grim courtiers stood wondering at him, as he had been a monster, till Powhatan and his train had put themselves in their greatest braveries. Before a fire, upon a feat like a bedstead, he fat covered with a great robe, made of rarowcun fkins, and all the tails hanging by. On either hand did fit a young wench of fixteen or eighteen years, and along on each fide the house two rows of men, and behind them as many women, with all their heads and shoulders painted red; many of their heads bedecked with the white down of birds, but every one with fomething, and a great chain of white beads about their necks. At his entrance before the King all the people gave a great fhout. The Queen of Appamatuck was appointed to bring him water to wash his hands, and another brought him a bunch of feathers, instead of a towel to dry them. Having feasted them after the best barbarous manner they could, a long confultation was held; but the conclusion was, two great stones were brought before Powhatan; then as many as could laid hands on him, dragged him to them, and thereon laid his head, and being ready with their clubs to beat out his brains, Pocahontas, the King's dearest daughter, when no intreaty could prevail, got his head in her arms, and laid her own upon his to fave him from death: whereat the Emperor was contented he should live to make him hatchets, and her bells, beads, and copper, for they thought him as well of all occupations as themselves; for the King himself will make his own robes, shoes, bows, arrows, pots; plant, hunt, or do any thing as well as the reft.

They fay, he bore a pleasant shew; But sure his heart was fad; For who can pleasant be, and rest, That lives in sear and dread: And having life suspected, doth It still suspected lead?

Two days after Powhatan having difguised himself in the most fearful manner he could, caused Captain Smith to be brought forth to a great house in the woods, and there, upon a mat by the fire, to be left alone: not long after, from behind a mat that divided the house, was made the most doleful noise he ever heard; then Powhatan, more like a devil than a man, with some two hundred more as black as himself, came unto him, and told him now they were friends, and presently he should go to James Town, to fend him two great guns and a grindstone, for which he would give him the country of the Capehowosick, and for ever esteem him as his son Nantaquoud. So to James Town, with twelve guides, Powhatan sent him. That night

they

they quartered in the woods, he still expecting (as he had done all this long time of his imprisonment) every hour to be put to one death or other, for all their feasting. But almighty God (by his divine Providence) had mollified the hearts of those stern barbarians with compassion. The next morning betimes they came to the fort, where Smith having used the favages with what kindness he could, he shewed Rawhunt, Powhatan's trufty fervant, two demi-culverines and a millstone to carry Powhatan. found them fomewhat too heavy; but when they did fee him discharge them, being loaded with stones, among the boughs of a great tree loaded with ificles, the ice and branches came fo tumbling down, that the poor favages ran away half dead with fear. But at last we regained some conference with them, and gave them such toys, and fent to Powhatan, his women, and children fuch prefents, as gave them in general full content. Now in James Town they were all in combustion, the strongest preparing once more to run away with the pinnace, which, with the hazard of his life, with fakre, falcon, and musket-shot, Smith forced now the third time to stay or fink. Some no better than they should be, had plotted with the president the next day to have put him to death by the Levitical law, for the lives of Robinson and Emry, pretending the fault was his that had led them to their ends; but he quickly took fuch order with fuch lawyers, that he laid them by the heels, till he fent fome of them prifoners for England. Now ever once in four or five days, Pocahontas, with her attendants, brought him fo much provision that faved fo many of their lives, that else for all this had flarved with hunger.

> Thus from numb death our good God fent relief, The fwect affuager of all other grief.

His relation of the plenty he had feen, especially at Werawocomoco, and of the state and bounty of Powhatan (which till that time was unknown) so revived their dead spirits (especially the love of Pocahontas) as all men's fear was abandoned. Thus you may see what difficulties still crossed any good endeavour, and the good success of the business being thus brought to the very period of destruction, yet you see by what strange means God hath still delivered it. As for the insufficiency of them admitted in commission, that error could not be prevented by the electors, there being no other choice, and all strangers to each other's education, qualities, or disposition: and if any deem it a shame to our nation to have any mention made of those enormities, let them peruse the histories of the Spaniards' discoveries and plantations, where they may see how many mutinies, disorders, and dissentions have accompanied them, and crossed their attempts; which being known to be particular men's offences, doth take away the general scorn and contempt which malice, presumption, covetousness, or ignorance might produce, to the scandal and reproach of those whose actions and valiant resolutions deserve a more worthy respect.

Now whether it had been better for Captain Smith to have concluded with any of those several projects, to have abandoned the country, with some ten or twelve of them, who were called the better fort, and have left Mr. Hunt, our preacher, Mr. Anthony Gosnoll, a most honest, worthy, and industrious gentleman, Mr. Thomas Wotton, and some twenty-seven others of his countrymen, to the sury of the savages, famine, and all manner of mischiefs and inconveniencies (for they were but forty in all to keep possession of this large country), or starve himself with them for company, for want of lodging; or but adventuring abroad to make them provision, or by his opposition to preserve the action, and save all their lives, I leave to the censure of all

honest men to consider. But

We men imagine in our jollity, That 'tis all one, or good or bad to be; But then anon we alter this again, If happily we feel the fenfe of pain; For then we're turn'd into a mourning vein.

Written by Thomas Studley, the first Cape merchant in Virginia, ROBERT FENTON EDWARD HARRINGTON, and I. S.

CHAP. III.—The Arrival of the first Supply, with their Proceedings, and the Ship's Return.

ALL this time our care was not fo much to abandon the country, but the treafurer and council in England were as diligent and careful to supply us; two good ships they fent us, with near a hundred men, well furnished with all things could be imagined necessary, both for them and us; the one commanded by Captain Newport, the other by Captain Francis Nelson, an honest man, and an expert mariner; but fuch was the leewardness of his ship, (that though he was within the fight of Cape Henry) by stormy contrary winds was he forced so far to sea that the West Indies was the next land for the repair of his masts, and relief of wood and water; but Newport got in, and arrived at James Town, not long after the redemption of Captain Smith, to whom the favages, as is faid, every other day repaired with fuch provisions that sufficiently did serve them from hand to mouth; part always they brought him as presents from their Kings or Pocahontas; the rest he, as their market clerk, fet the price himfelf how they should fell: fo he had enchanted these poor souls, being their prisoner; and now Newport, whom he called his father, arriving, near as directly as he foretold, they efteemed him as an oracle, and had them at that fubmission he might command them what he listed. That God that created all things, they knew, he adored for his God; they would also in their discourses term the God of Captain Smith.

> Thus the Almighty was the bringer on, The guide, path, term, all which was God alone.

But the prefident and council fo much envied his estimation among the favages, (though we all in general equally participated with him of the good thereof,) that they wrought it into the favages' understandings, (by their great bounty in giving four times more for their commodities than Smith appointed,) that their greatness and authority as much exceeded his, as their bounty and liberality. Now the arrival of this first supply so overjoyed us, that we could not devise too much to please the mariners. We gave them liberty to truck or trade at their pleasures; but in a short time it followed, that could not be had for a pound of copper which before was fold us for an ounce: thus ambition and sufferance cut the throat of our trade, but confirmed their opinion of the greatness of Captain Newport, (wherewith Smith had poffeffed Powhatan,) especially by the great presents Newport often sent him, before he could prepare the pinnace to go and vifit him; fo that this great favage defired also to see him. A great coil there was to set him forward. When he went, he was accompanied with Captain Smith, and Mr. Scrivener, a very wife understanding gentleman, newly arrived, and admitted of the council, with thirty or forty chosen men for their guard. Arriving at Werowocomoco, Newport's conceit of this great favage bred many doubts and fuspicions of treacheries, which Smith to make appear was needless, with twenty men well appointed, undertook to encounter the worst that could happen: knowing

All is but one and felf-fame hand, that thus Both one while fcourgeth, and that helpeth us.

Thefe, with nine others (whofe names I have forgotten), coming ashore, landed amongst a many of creeks, over which they were to pass such poor bridges, only made of a few cratches thrult in the ofe, and three or four poles laid on them, and at the end of them the like, tied together only with barks of trees, that it made them much fuspect those bridges were but traps, which caused Smith to make givers favages go over first, keeping some of the chief as hostage till half his men were passed to make a guard for himself and the rest. But finding all things well, by two or three hundred favages they were kindly conducted to their town, where Powhatan strained himself to the utmost of his greatness to entertain them, with great shouts of joy, orations of protestations, and with the most plenty of victuals he could provide to feast them; fitting upon his bed of mats, his pillow of leather embroidered, (after their rude manner, with pearl and white beads,) his attire a fair robe of skins, as large as an Irish mantle, at his head and feet a handsome young woman, on each side of his house fat twenty of his concubines, their heads and shoulders painted red, with a great chain of white beads about each of their necks. Before those fat his chiefest men in like order in his arbour-like house, and more than forty platters of fine bread stood as a guard in two files on each fide the door; four or five hundred people made a guard behind them for our passage; and proclamation was made, none upon pain of death to prefume to do us any wrong or discourtely. With many pretty discourses to renew their old acquaintance, this great king and our captain fpent the time, till the ebb left our barge aground. Then renewing their feafts with feats, dancing and finging, and fuch like mirth, we quartered that night with Powhatan. The next day Newport came ashore, and received as much content as those people could give him. A boy named Thomas Savage was then given unto Powhatan, whom Newport called his fon, for whom Powhatan gave him Namontack his trufty fervant, and one of a shrewd, subtle capacity. Three or four days more we fpent in feasting, dancing, and trading, wherein Powhatan carried himself fo proudly, yet discreetly, (in his favage manner,) as made us all admire his natural gifts, confidering his education. As fcorning to trade as his subjects did, he bespake Newport in this manner.

Captain Newport, it is not agreeable to my greatness, in this pedling manner to trade for trifles, and I esteem you also a great Werowance; therefore lay me down all your commodities together, what I like I will take, and in recompence give you what I think fitting their value. Captain Smith being our interpreter, regarding Newport as his father, knowing best the disposition of Powhatan, told us his intent was but only to cheat us; yet Captain Newport thinking to out-brave this savage in oftentation of greatness, and so to bewitch him with his bounty, as to have what he listed; it so happened that Powhatan having his desire, valued his corn at such a rate, that I think

it better cheap in Spain, for we had not four bushels for that we expected to have twenty hogsheads. This bred some unkindness between our two captains; Newport feeking to please the unfatiable defire of the savage, Smith to cause the savage to please him; but smothering his distaste to avoid the savages' suspicion, glanced in the eyes of Powhatan many trifles, who fixed his humour upon a few blue beads. long time he importunately defired them, but Smith feemed fo much the more to affect them, as being composed of a most rare substance of the colour of the skies, and not to be worn but by the greatest kings in the world. This made him half mad to be the owner of fuch strange jewels, so that ere we departed, for a pound or two of blue beads, he brought over my king for two or three hundred bushels of corn, yet parted good friends. The like entertainment we found of Opechankanough, King of Pamaunkee, whom also he in like manner fitted (at the like rates) with blue beads, which grew, by this means, of that estimation, that none durst wear any of them but their great kings, their wives and children. And fo we returned all well to James Town, where this new fupply being lodged with the rest, accidently fired their quarters and fo the town, which being but thatched with reeds, the fire was fo fierce as it burnt their pallifados (though eight or ten yards diftant), with their arms, bedding, apparel, and much private provision; good Mr. Hunt, our preacher, loft all his library and all he had but the cloaths on his back, yet none never heard him repine at his loss. This happened in the winter in that extreme frost, 1607. Now though we had victuals fufficient, I mean only of oatmeal, meal, and corn, yet the flip flaying fourteen weeks when she might as well have been gone in fourteen days, spent a great part of that, and near all the rest that was sent to be landed. When they departed what their discretion could spare us, to make a little poor meal or two, we called feasts, to relish our mouths, of each formewhat they left us, yet I must confess, those that had either money, fpare cloaths, credit to give bills of payment, gold rings, furs, or any fuch commodities, were ever welcome to this removing tavern, fuch was our patience to obey fuch vile commanders, and buy our own provisions at fifteen times the value, fuffering them feaft (we bearing the charge) yet must not repine, but fast, lest we should incur the censure of factious and seditious persons: and then leakage, ship-rats, and other casualties occasioned them lofs, but the vessels and remnants (for totals) we were glad to receive with all our hearts to make up the account, highly commending their Providence for preferving that, left they fhould discourage any more to come to us. Now for all this plenty our ordinary was but meal and water, so that this great charge little relieved our wants, whereby with the extremity of the bitter cold frost and those defects, more than half of us died; I cannot deny but both Smith and Scrivener did their best to amend what was amis, but with the president went the major part, that their horns were too fhort. But the worst was our gilded refiners with their golden promifes made all men their flaves in hope of recompences; there was no talk, no hope, no work, but dig gold, wash gold, refine gold, load gold, such a bruit of gold, that one mad fellow defired to be buried in the fands left they should by their art make gold of his bones: little need there was and less reason the ship should stay, their wages run on, our victuals confume fourteen weeks, that the mariners might fay, they did help to build fuch a golden church that we can fay the rain washed near to nothing in fourteen days. Were it that Captain Smith would not applaud all those golden inventions, because they admitted him not to the fight of their trials nor golden confultations, I know not; but I have heard him often question with Captain Martin and tell him, except he could flew him a more fubstantial trial, he was not enamoured with their dirty skill, breathing out these and many other passions, never any thing did

more torment him, than to fee all necessary business neglected, to fraught such a drunken ship with so much gilded dirt. Till then we never accounted Captain Newport a refiner, who being ready to set sail for England, and we not having any use of parliaments, plays, petitions, admirals, recorders, interpreters, chronologers, courts of plea, nor justices of peace, sent Mr. Wingsield and Captain Archer home with him, that had engrossed all those titles, to seek some better place of employment.

Oh curfed gold, those hunger-starved movers, 'To what misfortunes leadest thou all those lovers; For all the China wealth, nor Indies, can Suffice the mind of avaricious man.

CHAP. IV. — The Arrival of the Phanix; her Return; and other Accidents.

THE authority now confisting in Captain Martin, and the still fickly prefident, the fale of the stores' commodities maintained his estate, as an inheritable revenue. The fpring approaching, and the ship departing, Mr. Scrivener and Captain Smith divided betwixt them the rebuilding James Town; the repairing our pallifadoes; the cutting down trees; preparing our fields; planting our corn, and to rebuild our church, and recover our store-house. All men thus busy at their several labours, Mr. Nelson arrived with his loft Phoenix; loft (I fay) for that we all deemed him loft. Landing fafely all his men, (fo well he had managed his ill hap,) caufing the Indian ifles to feed his company, that his victuals, to that we had gotten, as is faid before, was near after our allowance fufficient for half a year. He had not any thing but he freely imparted it, which honest dealing (being a mariner) caused us to admire him: we would not have wished more than he did for us. Now to reload this ship with some good tidings, the prefident (not holding it stood with the dignity of his place to leave the fort) gave orders to Captain Smith to discover and search the commodities of the Monacans country beyond the falls. Sixty able men was allotted them, the which, within fix days, Smith had fo well trained to their arms and orders, that they little feared with whom they should encounter: yet so unseasonable was the time, and so opposite was Captain Martin to any thing, but only to freight his ship also with this phantastical gold, as Captain Smith rather defired to reload her with cedar, (which was a prefent dispatch) than either with dirt, or the hopes and reports of an uncertain discovery, which he would perform when they had less charge and more leifure. But,

The God of Heaven, he eafily can Immortalife a mortal man,
With glory and with shame:
The same God e'en as eafily may,
Afflict a mortal man, I say,
With sorrow and with shame.

Whilst the conclusion was a resolving, this happened.

Powhatan (to express his love to Newport) when he departed, presented him with twenty turkies, conditionally to return him twenty swords, which immediately was sent him; now after his departure he presented Captain Smith with the like luggage, but not finding his humour obeyed in not fending such weapons as he defired, he caused his people with twenty devices to obtain them. At last by ambuscades at our very ports they would take them perforce, surprise us at work, or any way; which was so long permitted, they became so insolent there was no rule; the command from England was

fo strait not to offend them, as our authority-bearers (keeping their houses) would rather be any thing than peace-breakers. This charitable humour prevailed, till well it chanced they meddled with Captain Smith, who without farther deliberation gave them fuch an encounter, as fome he fo hunted up and down the ifle, fome he fo terrified with whipping, beating, and impriforment, as for revenge they furprized two of our foraging diforderly foldiers, and having affembled their forces, boldly threatened at our ports to force Smith to re-deliver feven favages, which for their villanies he detained prisoners, or we were all but dead men. But to try their fury, he sallied out amongst them, and in less than an hour, he so hampered their insolence, they brought them his two men, defiring peace without any further composition for their prisoners. Those he examined, and caused them all to believe, by several vollies of shot, one of their companions was shot to death because they would not confess the intents and plotters of those villainies. And thus they all agreed in one point, they were directed only by Powhatan to obtain him our weapons, to cut our own throats, with the manner where, how, and when, which we plainly found most true and apparent: yet he sent his messengers, and his dearest daughter Pocahontas with presents to excuse him of the injuries done by some rash untoward captains his subjects, desiring their liberties for this time, with the aflurance of his love for ever. After Smith had given the prifoners what correction he thought fit, used them well a day or two after, and then delivered them Pocahontas, for whole fake only he fained to have faved their lives, and gave them liberty. The patient council, that nothing would move to war with the favages, would gladly have wrangled with Captain Smith for his cruelty, yet none was flain to any man's knowledge, but it brought them in fuch fear and obedience as his very name would fufficiently affright them; where before we had fometime peace and war twice in a day, and very feldom a week, but we had fome treacherous villainy or other.

The freight of this ship being concluded to be cedar, by the diligence of the master, and Captain Smith, she was quickly releaded: Mr. Scrivener was neither idle nor flow to follow all things at the fort; the ship being ready to set fail, Captain Martin being always very fickly, and unserviceable, and desirous to enjoy the credit of his supposed art of finding the golden mine, was most willingly admitted to return for England;

CHAP. V .- The Accidents that happened in the Discovery of the Bay of Chesapeak.

THE prodigality of the prefident's flate went fo deep into our fmall flore, that Smith and Scrivener tied him and his parafites to the rules of proportion: but now Smith being to depart, the prefident's authority fo overfwayed the difcretion of Mr. Scrivener, that our flore, our time, our flrength and labours were idly confumed to fulfil his fantafies. The fecond of June 1608, Smith left the fort to perform his difcovery with this company:

Thefe being in an open barge near three tons burthen, leaving the Phoenix at Cape Henry, they croffed the bay to the eaftern shore, and fell with the isles called Smith's Isles, after our captain's name. The first people we saw were two grim and stout savages upon Cape Charles, with long poles like lavelings, headed with bone; they boldly demanded what we were, and what we would; but after many circumstances they feemed very kind, and directed us to Accomack, the habitation of their werowance, where we were kindly intreated. This king was the comelieft, proper, civil favage we encountered. His country is a pleafant fertile clay foil, fome small creeks; good harbours for small barks, but not for ships. He told us of a strange accident lately happened to him, and it was, two children being dead, fome extreme patitions, or dreaming visions, phantasses, or affection, moved their parents again to revisit their dead carcases, whose benumbed bodies reflected to the eyes of the beholders such delightful countenances, as though they had regained their vital spirits. This, as a miracle, drew many to behold them, all which being a great part of his people, not long after died, and but few escaped. They spake the language of Powhatan, wherein they made such descriptions of the bay ifles, and rivers, that often did us exceeding pleafure. Paffing along the coast, searching every inlet and bay, fit for harbours and habitations. Seeing many isles in the midst of the bay, we bore up for them; but ere we could obtain them, such an extreme guft of wind, rain, thunder, and lightening happened, that with great danger, we escaped the unmerciful raging of that ocean-like water. The highest land on the main, yet it was but low, we called Keale's Hill, and those uninhabited isles, Russels Isles. The next day, fearching them for fresh water, we could find none, the defect whereof forced us to follow the next eaftern channel, which brought us to the river of Wighcocomoco. The people, at first, with great fury seemed to assault us, yet at laft, with fongs and dances and much mirth, became very tractable; but fearching their habitations for water, we could fill but three barricoes, and that fuch puddle, that never till then we ever knew the want of good water: we digged and fearched in many places, but before two days were expired, we would have refused two barricoes of gold for one of that puddle water of Wighcocomoco. Being past these isles, which are many in number, but all nought for habitation, falling with a high land upon the main, we found a great pond of fresh water, but so exceeding hot, we supposed it some bath; that place we called Point Ployer, in honour of that most honourable house of Moufay, in Britain, that in an extreme extremity once relieved our captain. From Wighcomoco to this place, all the coast is low broken isles of Morap, growing a mile or two in breadth, and ten or twelve in length, good to cut for hay in fummer, and to catch fish and fowl in winter; but the land beyond them is all covered over with wood, as is the rest of the country.

Being thus refreshed in crossing over from the main to other isles, we discovered the wind and waters so much increased with thunder, lightning, and rain, that our mast and fail blew overboard, and such mighty waves overracked us in that small barge, that with great labour we kept her from sinking, by freeing out the water. Two days we were forced to inhabit these uninhabited isles, which for the extremity of gusts, thunder, rain, storms, and ill weather, we called Limbo. Repairing our sail with our shirts, we set sail for the main, and fell with a pretty convenient river on the east called Cuskarawack; the people ran, as amazed, in troops from place to place, and divers got into the tops of trees; they were not sparing of their arrows, nor the greatest passion they could express of their anger. Long they shot, we still riding at anchor, without their reach, making all the signs of friendship we could. The next day, they came unarmed, with every one a basket, dancing in a ring, to draw us on shore; but

feeing there was nothing in them but villainy, we discharged a volley of muskets, charged with piftol fhot, whereat they all lay tumbling on the ground, creeping fome one way, fome another, into a great cluster of reeds hard by, where their companies lay in ambufcado. Towards the evening, we weighed, and approaching the fhore, difcharged five or fix fhot among the reeds; we landed where there lay a many of baskets, and much blood, but faw not a favage. A fmoke appearing on the other fide the river, we rowed thither, where we found two or three little houses, in each a fire; there we left fome pieces of copper, beads, bells, and looking-glaffes, and then went into the bay, but when it was dark, we came back again. Early in the morning, four favages came to us in their canoe, whom we used with such courtefy, not knowing what we were, nor had done, having been in the bay a fishing, bade us stay, and ere long they would return, which they did, and fome twenty more with them; with whom, after a little conference, two or three thousand men, women, and children came clustering about us, every one prefenting us with fomething, which a little bead would fo well requite, that we became fuch friends, they would contend who should fetch us water, flay with us for hoftage, conduct our men any whither, and give us the best content. Here doth inhabit the people of Sarapinagh, Nause, Arseek, and Nantaquak, the best merchants of all other favages. They much extolled a great nation called Maffawo. mekes, in fearch of whom we returned by Limbo; this river but only at the entrance is very narrow, and the people of fmall stature as them of Wightcocomoco; the land but low, yet it may prove very commodious, because it is but a ridge of land betwixt the bay and the main ocean. Finding this eastern shore shallow broken isles, and for most part without fresh water, we passed by the straits of Limbo for the western shore; fo broad is the bay here, we could fcarce perceive the great high cliffs on the other fide; by them we anchored that night, and called them Rickard's Clifts; thirty leagues we failed more northwards, not finding any inhabitants, leaving all the eastern shore low iflands, but overgrown with wood, as all the coast beyond them so far as we could fee; the western shore, by which we failed, we found all along well watered, but very mountainous and barren; the vallies very fertile, but extremely thick of fmall wood, as well as trees, and much frequented with wolves, bears, deer, and other wild beafts, We paffed many shallow creeks, but the first we found navigable for a ship we called Bolus, for that the clay in many places under the cliffs, by the high-water mark, did grow up in red and white knots, as gum out of trees, and in fome places fo participated together as though they were all of one nature, excepting the colour; the rest of the earth on both fides being hard fandy gravel, which made us think it Bole-Armoniack and Terra-figillata. When we first set fail, some of our gallants doubted nothing but that our captain would make too much hafte home; but having lain in this fmall barge not above twelve or fourteen days, often tired at the oars, our bread spoiled with wet, fo much that it was rotten, (yet fo good were their stomachs, that they could digeft it,) they did with continual complaints fo importune him now to return, as caused him befpeak them in this manner:

"Gentlemen, if you would remember the memorable history of Sir Ralph Layne, how his company importuned him to proceed in the discovery of Moratico, alledging they had yet a dog, that being boiled with fassafras leaves, would richly feed them in their return; then what a shame would it be for you (that have been so suspicious of my tenderness) to force my return, with so much provision as we have, and scarce able to say where we have been, nor yet heard of that we were sent to seek? You cannot say but I have shared with you in the worst which is past; and for what is to come, of lodging, diet, or whatsoever, I am contented you allot the worst part to myself. As

for your fears that I will lofe myfelf in these unknown waters, or be swallowed up in some stormy gust; abandon these childish fears, for worse than is past is not likely to happen; and there is as much danger to return as to proceed. Regain therefore your old spirits, for return I will not (if God please) till I have seen the Massawomeks, found Patawomek, or the head of this water, you conceit to be endless." Two or three days we expected wind and weather, whose adverse extremities added such discouragement, that three or four fell sick, whose pitiful complaints caused us to return, leaving the bay some nine miles broad, at nine and ten sathon water.

The 16th of June we fell with the river Patowomek: fear being gone, and our men recovered, we were all content to take fome pains, to know the name of that feven mile broad river: for thirty miles fail we could fee no inhabitants: then we were conducted by two favages up a little bayed creek, towards Onawmanient, where all the woods were laid with ambufcados to the number of three or four thousand favages, fo ilrangely painted, grimmed and difguised, shouting, yelling and crying as so many spirits from hell could not have shewed more terrible. Many bravadoes they made, but to appeale their fury, our captain prepared with as seeming willingness as they to encounter them. But the grazing of our bullets upon the water (many being shot on purpose they might see them) with the echo of the woods so amazed them, as down went their bows and arrows; and exchanging hostage James Watkins was sent six miles up the woods to their King's habitation. We were kindly used of those savages, of whom we understood, they were commanded to betray us, by the direction of Powhatan, and he so directed from the discontents at James Town, because our captain did cause them stay in their country against their wills.

The like encounters we found at Patowomek Gecocawonee and divers others places: but at Moyaones, Nacotchtant and Toags the people did their best to content us. Having gone fo high as we could with the boat, we met divers favages in canoes, well loaden with the flesh of bears, deer and other beasts, whereof we had part: here we found mighty rocks, growing in fome places above the ground as high as thrubby trees, and divers other folid quarries of divers tinctures: and divers places where the waters had fallen from the high mountains they had left a tinctured spagled skurf, that made many bare places feem as gilded. Digging the ground above in the highest clifts of rocks, we faw it was a clay fand to mingled with yellow spangles as if it had been half pindust. In our return, inquiring still for this Matchqueon, the king of Patawomeke gave us guides to conduct us up a little river called Quiyough, up which we rowed as high as we could. Leaving the boat, with fix fhot, and divers favages, he marched feven or eight miles before they came to the mine: leading his hoftages in a finall chain they were to have for their pains, being proud fo richly to be adorned. The mine is a great rocky mountain like Antimony; wherein they digged a great hole with fliells and hatchets: and hard by it, runneth a fair brook of christal-like water, where they wash away the drofs and keep the remainder, which they put in little bags and fell it all over the country to paint their bodies, faces, or idols; which makes them look like blackmoors dusted over with filver. With so much as we could carry we returned to our boat, kindly requiting this kind King and all his kind people. The cause of this difcovery was to fearch this mine, of which Newport did affure us that those small bags (we had given him) in England he had tried to hold half filver; but all we got proved of no value: also to fearch what furs, the best whereof is at Cuscarawaoke, where is made fo much rawranoke or white beads that occasion as much differition among the favages, as gold and filver amongit Christians; and what other minerals, rivers, rocks, nations, woods, fishings, fruits, victuals, and what other commodities the land afforded:

and

and whether the bay was endless or how far it extended: of mines we were all ignorant, but a few beavers, otters, bears, martins and minks we found, and in divers places that abundance of fish, lying so thick with their heads above the water, as for want of nets (our barge driving amongst them) we attempted to catch them with a frying-pan: but we found it a bad instrument to catch fish with: neither better fish, more plenty, nor more variety for small fish, had any of us ever feen in any place so swimming in the water, but they are not to be caught with frying-pans: some small cod also we did see swim close by the shore by Smith's Isles, and some as high as Riccards Clifts. And some we have found dead upon the shore.

To express all our quarrels, treacheries and encounters amongst those favages I should be too tedious: but in brief, at all times we so encountred them, and curbed their infolencies, that they concluded with prefents to purchase peace, yet we lost not a man: at our first meeting, our captain ever observed this order to demand their bows and arrows, fwords, mantles and furs, with fome child or two for hoftage, whereby we could quickly perceive, when they intended any villainly. Having finished this discovery (though our victuals was near fpent) he intended to fee his imprisoned acquaintances upon the river of Rapahanok, by many called Toppahanock, but our boat by reason of the ebb, chancing to ground upon many shoals lying in the entrances, we fpied many fishes lurking in the reeds: our captain sporting himself by nailing them to the ground with his fword, fet us all a fishing in that manner: thus we took more in one hour than we could eat in a day. But it chanced our captain taking a fish from his fword (not knowing her condition) being much of the fashion of a thornback, but a long tail like a riding rod, whereon the middest is a most poisoned sting, of two or three inches long, bearded like a faw on each fide, which she struck into the wrest of his arm near an inch and a half; no blood nor wound was feen, but a little blue fpot, but the torment was infantly fo extreme, that in four hours had fo fwollen his hand, arm and fhoulder, we all with much forrow concluded his funeral, and prepared his grave in an island by, as himself directed: yet it pleased God, by a precious oil Doctor Russel at the first applied to it when he founded it with probe, ere night, his tormenting pains was fo well affuaged that he eat of the fish to his supper, which gave no less joy and content to us than ease himself, for which we called the island Stingray Isle, after the name of the fish.

Having neither furgeon, nor furgery, but that prefervative oil, we prefently fet fail for James Town, passing the mouths of the rivers of Payankatank, and Pamaunkee: the next day we fafely arrived at Kecougtan. The fimple favages feeing our captain hurt, and an other bloody by breaking his shin, our numbers of bows, arrows, swords, mantles, and furs, would needs imagine we had been at war; the truth of these accidents would not fatisfy them, but impatiently importuned us to know with whom. their aptness to believe we failed not (as a great secret) to tell them any thing that might affright them, what spoil we had got and made of the Massawomeks. This rumour went faster up the river then our barge, that arrived at Waraskoyack the 20th of July; where trimming her with painted streamers, and such devices as we could, we made them at James Town jealous of a Spanish frigate, where we all, God be thanked, fafely arrived the 21st of July. There we found the last supply were all sick, the rest fome lame, fome bruifed; all unable to do any thing but complain of the pride and unreasonable needless cruelty of the filly president, that had riotously consumed the ftore: and to fulfil his follies about building him an unneceffary building for his pleasure in the woods, had brought them all to that misery; that had we not arrived, they had as strangely tormented him with revenge: but the good news of our dif-VOL. XIII.

covery, and the good hope we had by the favage's relation, that our bay had ftretched into the South Sea, or somewhat near it, appealed their fury; but conditionally that Ratliffe should be deposed, and that Captain Smith would take upon him the government, as by course it did belong. Their request being effected, he substituted Mr. Scrivener, his dear friend, in the presidency, equally distributing those private provisions the other had ingrossed, appointing more honest officers to affist Mr. Scrivener (who then lay exceeding sick of a callenture); and in regard of the weakness of the company, and heat of the year, they being unable to work, he left them to live at ease, to recover their health, but embarked himself to finish his discovery.

Written by Walter Ruffell, Anas Todkill, and Thomas Momford.

CHAP. VI. — The Government furrendered to Mr. Scrivener. — What happened the Second Voyage in discovering the Bay.

THE 24th of July, Captain Smith fet forward to finish the discovery with twelvemen: their names were

Nathaniel Powell
Thomas Momford
Richard Fetherston
Michael Sicklemore
James Bourne
Anthony Bagnall, chirurg.

James Profit
Anas Todkill
Edward Pising
Richard Keale
James Watkins
William Ward

The wind being contrary, caufed our ftay two or three days at Kecoughtan: the King feasted us with much mirth; his people were persuaded we went purposely to be revenged of the Maslawomeks. In the evening we fired a few rockets, which slying in the air fo terrified the poor favages, they supposed nothing impossible we attempted, and defired to affift us. The first night we anchored at Stingray Isle. The next day croffed Patawomeks River, and haftened to the river Bolus. We went not much further before we might fee the bay to divide in two heads, and arriving there we found it divided in four, all which we fearched fo far as we could fail them. Two of them we found inhabited, but in croffing the bay we encountered feven or eight canoes full of Maffawomeks; we feeing them prepare to affault us, left our oars and made way with our fail to encounter them, yet were we but five with our captain that could fland; for within two days after we left Kecoughtan, the rest (being all of the last supply) were fick almost to death, until they were seasoned to the country. Having shut them under our tarpauling, we put their hats upon flicks by the barge fide, and betwixt two hats a man with two pieces, to make us feem many; and fo we think the Indians fupposed those hats to be men, for they fled with all possible speed to the shore, and there stayed, staring at the failing of our barge till we anchored right against them. Long it was ere we could draw them to come unto us: at last they fent two of their company unarmed in a canoe, the rest all followed to second them if need required. These two being but each presented with a bell, brought aboard all their fellows, prefenting our captain with venifon, bears' flesh, fish, bows, arrows, clubs, targets, and bears' skins. We understood them nothing at all but by figns, whereby they fignified unto us they had been at wars with the Tockwoghes, the which they confirmed by shewing us their green wounds; but the night parting us, we imagined they appointed the next morning to meet, but after that we never faw them.

Entering the river of Tockwogh, the favages all armed in a fleet of boats, after their barbarous manner, round invironed us, so it chanced one of them could speak the language of Powhatan, who perfuaded the rest to a friendly parley. But when they saw us furnished with the Massawomeks weapons, and we faining the invention of Kecoughtan, to have taken them perforce; they conducted us to their pallisadoed town, mantled with the barks of trees, with scaffolds like mounts, breasted about with breasts very formally. Their men, women, and children with dances, songs, fruits, furs, and what they had kindly welcomed us, spreading mats for us to fit on, stretch-

ing their best abilities to express their loves.

Many hatchets, knives, pieces of iron and brafs, we faw amongst them, which they reported to have from the Sasquesahanocks; a mighty people and mortal enemies with the Massawomeks. The Sasquesahanocks inhabit upon the chief spring of these four branches of the bay's head, two days journey higher than our barge could pass for rocks, yet we prevailed with the interpreter to take with him another interpreter, to persuade the Sasquesahanocks to come visit us, for their language are different. Three or four days we expected their return, then fixty of those giant-like people came down, with presents of venison, tobacco-pipes three foot in length, baskets, targets, bows and arrows. Five of their chief Werowances came boldly aboard us to cross the bay for Tockwhogh, leaving their men and canoes, the wind being so high they durst not

pass.

Our order was daily to have prayer, with a pfalm, at which folemnity the poor favages much wondered; our prayers being done, awhile they were bufied with a confultation till they had contrived their business, then they began in a most passionate manner to hold up their hands to the fun with a most fearful fong, then embracing our captains they begun to adore him in like manner; though we rebuked them, yet they proceeded till their fong was finished, which done, with a most strange furious action, and a hellish voice, began an oration of their loves; that ended, with a great painted bear's fkin they covered him, then one ready with a great chain of white beads, weighing at least fix or seven pounds, hung it about his neck, the others had eighteen mantles, made of divers forts of skins sewed together, all these with many other toys they laid at his feet, stroking their ceremonious hands about his neck for his creation to be their governor and protector, promifing their aids, victuals, or what they had to be his if he would ftay with them to defend and revenge them of the Maffawomeks. But we left them at Tockwhogh, forrowing for our departure, yet we promifed the next year again to vifit them. Many descriptions and discourses they made us of Atquanachuck, Massawomek, and other people, fignifying they inhabit upon a great water beyond the mountains, which we understood to be some great lake, or the river of Canada, and from the French to have their hatchets and commodities by trade. These know no more of the territories of Powhatan then his name, and he as little of them, but the Atquanachuks are on the ocean fea.

The highest mountain we saw northward we called Peregrine's Mount, and a rocky river, where the Massawomeks went up, Willowbyes River, in honour of the town our captain was born in, and that honourable house the Lord Willoughby, his most honoured good friend. The Sasquesahanocks River we called Smith's Falls; the next point to Tockwhogh, Pising's Point; the next it Point Bourne. Powell's Isles and Smal's Point is by the river Bolus, and the little bay at the head Prosit's Poole; Watkin's, Read's, and Momford's Points are on each side Limbo; Ward, Cantrell, and Sicklemore, betwixt Patawomek and Pamaunkee, after the names of the discoverers. In all those places and the furthest we came up the rivers, we cut in trees

fo many croffes as we would, and in many places made holes in trees, wherein we writ notes, and in fome places croffes of brafs, to fignify to any, Englishmen had been there.

Thus having fought all the inlets and rivers worth noting, we returned to discover the river of Pawtuxunt; these people we found very tractable, and more civil than any: we promised them, as also the Patawomeks, to revenge them of the Massawomeks, but

our purpofes were croffed.

In the discovery of this river some call Rapahanock, we were kindly entertained by the people of Moraughtacund; here we encountered our old friend Mosco, a lusty favage of Wighcocomoco, upon the river Patawomek: we supposed him some Frenchman's fon, because he had a thick black bush beard, and the savages seldom have any at all, of which he was not a little proud to fee fo many of his countrymen. Wood and water he would fetch us, guide us any whither, nay, cause divers of his countrymen help us tow against wind or tide from place to place till we came to Patawomek; there he refted till we returned from the head of the river, and occasioned our conduct to the mine we supposed antimony; and in the place he failed not to do us all the good he could, perfuading us in any cafe not to go to the Rapahanocks, for they would kill us for being friends with the Moraughtacunds, that but lately had stolen three of the King's women. This we did think was but that his friends might only have our trade, so we croffed the river to the Rapahanocks. There some twelve or fixteen standing on the shore, directed us a little creek, where was good landing, and commodities for us in three or four canoes we faw lie there; but according to our custom, we demanded to exchange a man in fign of love, which after they had a little confulted, four or five came up to the middle to fetch our man, and leave us one of them, shewing we need not fear them, for they had neither clubs, bows, nor arrows. Notwithstanding, Anas Todkill, being fent on shore to see if he could discover any ambufcadoes, or what they had defired to go over the plain to fetch fome wood, but they were unwilling, except we would come into the creek, where the boat might come close ashore. Todkill by degrees having got some two stones-throws up the plain, perceived two or three hundred men (as he thought) behind the trees, fo that offering to return to the boat, the favages effayed to carry him away per force, that he called to us we were betrayed, and by that he had spoke the word, our hostage was overboard. but Watkins his keeper, flew him in the water. Immediately we let fly amongst them, fo that they fled, and Todkill escaped, yet they shot so fast that he fell flat on the ground ere he could recover the boat. Here the Maffawomek targets stood us in good flead, for upon Mosco's words, we had set them about the forepart of our boat like a forecastle, from whence we securely beat the savages from off the plain without any hurt, yet they shot more than a thousand arrows, and then sled into the woods. Arming ourfelves with these light targets (which are made of little small sticks woven betwixt ftrings of their hemp and filk grafs, as is our cloth, but fo firmly that no arrow can possibly pierce them): we rescued Todkill, who was all bloody by some of them who were shot by us that held him, but as God pleased, he had no hurt; and following them up to the woods we found fome flain, and in divers places much blood. It feems all their arrows were fpent, for we heard no more of them; their canoes we took, the arrows we found we broke, fave them we kept for Mosco, to whom we gave the canoes for his kindness, that entertained us in the best triumphing manner, and warlike order in arms of conquest he could procure of the Moraughtacunds.

The rest of the day we spent in accommodating our boat, instead of thoules we made sticks like bed-staves, to which we fastened so many of our Massawomek targets,

that environed her as waste cloaths. The next morning we went up the river, and our friend Mosco followed us along the shore, and at last desired to go with us in our boat. But as we passed by Pisacack, Matchopeak, and Mecuppom, three towns situated upon high white clay clifts, the other side all a low plain marsh, and the river there but narrow, thirty or forty of the Rapahanocks had so accommodated themselves with branches, as we took them for little bushes growing among the sedge, still seeing their arrows strike the targets, and dropped in the river, whereat Mosco sell slat in the boat on his face, crying the Rapahanocks, which presently we espied to be the bushes, which at our first volley fell down in the sedge, when we were near half a

mile from them, they shewed themselves dancing and singing very merrily.

The Kings of Pissassack, Nandtaughtacund, and Cuttatawomen, used us kindly, and all their people neglected not any thing to Mosco to bring us to them. Betwixt Secobeck and Massawteck is a small isle or two, which causeth the river to be broader than ordinary; there it pleased God to take one of our company, called Mr. Fetherstone, that all the time he had been in this country had behaved himself honestly, valiantly, and industriously, where, in a little bay we called Fetherstone's Bay, we buried him with a volley of shot: the rest, notwithstanding their ill diet and bad lodging, crowded in so small a barge, in so many dangers never resting, but always tossed to and again, had all well recovered their healths. The next day we failed so high as our boat would float, there setting up crosses, and engraving our names in the trees. Our centinel saw an arrow fall by him, though we had ranged up and down more than an hour in digging in the earth, looking of stones, herbs, and springs, not seeing where a

favage could well hide himfelf.

Upon the alarum by that we had recovered our arms, there was about an hundred nimble Indians skipping from tree to tree, letting fly their arrows so fast as they could: the trees here ferved us for barricadoes as well as they. But Mosco did us more fervice than we expected, for having fhot away his quiver of arrows, he ran to the boat for more. The arrows of Mosco at the first made them pause upon the matter, thinking by his bruit and skipping there were many favages. About half an hour this continued, then they all vanished as suddenly as they approached. Mosco followed them fo far as he could fee us till they were out of fight. As we returned there lay a favage as dead, fhot in the knee, but taking him up we found he had life, which Mosco feeing, never was dog more furious against a bear than Mosco was to have beat out his brains, fo we had him to our boat, where our chirurgeon who went with us to cure our captain's hurt of the stingray, so dressed this favage that within an hour after he looked fomewhat cheerfully, and did eat and fpeak. In the meantime we contented Mofco in helping him to gather up their arrows, which were an arm full, whereof he gloried not a little. Then we defired Mofco to know what he was and what countries were beyond the mountains: the poor favage mildly answered, he and all with him were of Hasinninga, where there are three kings more like unto them, namely, the King of Stegora, the King of Tauxuntania, and the King of Shakahonea, that were come to Mohaskahod, which is only a hunting town, and the bounds betwixt the kingdom of the Mannahocks and the Nandtaughtacunds, but hard by where we were. We demanded why they came in that manner to betray us that came to them in peace and to feek their loves; he answered, they heard we were a people come from under the world to take their world from them. We asked him how many worlds he did know; he replied, he knew no more but that which was under the fky that covered him, which were the Powhatans, with the Monacnas, and the Massawomeks, that were higher up in the mountains. Then we asked him what was beyond the mountains, he answered.

answered, the fun: but of any thing else he knew nothing, because the woods were not burnt. These and many such questions we demanded concerning the Massawomeks, the Monacans, their own country, and where were the Kings of Stegora, Tauxintania, and the rest. The Monacans, he said, were their neighbours and friends, and did dwell as they in the hilly countries by fmall rivers, living upon roots and fruits, but chiefly by hunting. The Maffawomeks did dwell upon a great water and had many boats, and so many men that they made war with all the world, for their kings; they were gone every one a feveral way with their men on hunting, but those with him came thither a fifthing till they faw us, notwithstanding they would be altogether at night at Mahafkahod. For his relation we gave him many toys, with perfuafions to go with us, and he as earnestly defired us to stay the coming of those kings, that for his good usage should be friends with us, for he was brother to Hasinninga. But Mosco advised us prefently to be gone, for they were all naught, yet we told him we would not till it was night. All things we made ready to entertain what came, and Mosco was as diligent in trimming his arrows. The night being come we all embarked, for the river was fo narrow, had it been light, the land on the one fide was fo high, they might have done us exceeding much mischief. All this while the King of Hasinninga was feeking the rest, and had consultation a good time what to do, but by their spies, seeing we were gone, it was not long before we heard their arrows dropping on every fide the boat; we caused our favages to call unto them, but fuch a yelling and hallooing they made that they heard nothing, but now and then a piece, aiming so near as we could where we heard the most voices. More than twelve miles they followed us in this manner; then the day appearing, we found ourselves in a broad bay, out of danger of their shot, where we came to an anchor, and fell to breakfast. Not so much as speaking to them till the fun was rifen; being well refreshed, we untied our targets that covered us as a deck, and all shewed ourselves with those shields on our arms, and swords in our hands, and also our prisoner, Amoroleck; a long discourse there was betwixt his countrymen and him, how good we were, how well we used him, how we had a Patawomek with us, loved us as his life, that would have flain him had we not preferved him, and that he should have his liberty, would they be but friends, and to do us any hurt it was impossible. Upon this they all hung their bows and quivers upon the trees, and one came fwimming aboard us with a bow tied on his head, and another with a quiver of arrows, which they delivered our captain as a prefent. The captain having used them so kindly as he could, told them the other three kings should do the like, and then the great King of our world should be their friend, whose men we were. It was no fooner demanded but performed; fo upon a low moorish point of land we went to the shore, where those four kings came and received Amoroleck. Nothing they had but bows, arrows, tobacco-bags, and pipes: what we defired none refused to give us, wondering at every thing we had, and heard we had done; our piftols they took for pipes, which they much defired, but we did content them with other commodities; and to we left four or five hundred of our merry Mannahocks, finging, dancing, and making merry, and fet fail for Moraughtacund.

In our return we vifited all our friends, that rejoiced much at our victory against the Mannahocks, who many times had wars also with them, but now they were friends, and defired we would be friends with the Rapahanocks, as we were with the Mannahocks. Our captain told them, they had twice affaulted him that came only in love to do them good, and therefore he would now burn all their houses, destroy their corn, and for ever hold them his enemies, till they made him satisfaction; they desired to know what that should be; he told them they should present him the king's bow and

arrows, and not offer to come armed where he was; that they should be friends with the Moraughtacunds his friends, and give him their King's fon in pledge to perform it, and then all King James's men should be their friends. Upon this they presently sent to the Rapahanocks to meet him at the place where they first fought, where would be the Kings of Nantautacund and Piffaffac: which according to their promife were there fo foon as we, where Rapahanock prefented his bow and arrows, and confirmed all we defired, except his fon, having no more but him he could not live without him, but inflead of his fon he would give him the three women Moraughtacund had ftolen. This was accepted; and fo in three or four canoes, fo many as could, went with us to Moraughtacund, where Mofco made them fuch relations, and gave to his friends fo many bows and arrows, that they no lefs loved him than admired us. three women were brought our captain, to each he gave a chain of beads; and then caufing Moraughtacund, Mosco, and Rapahanock to stand before him, bid Rapahanock take her loved best, and Moraughtacund chose next, and to Mosco he gave the third. Upon this away went their canoes over the water, to fetch their venison, and all the provision they could, and they that wanted boats swam over the river: the dark commanded us then to reft. The next day there was of men, women, and children, as we conjectured, fix or feven hundred, dancing and finging, and not a bow nor arrow feen amongst them. Mosco changed his name Uttasantasough, which we interpret, ftranger, for fo they call us: all promifing ever to be our friends, and to plant corn purposely for us; and we to provide hatchets, beads, and copper for them; we departed, giving them a volley of shot, and they us as loud shouts and cries as their ftrength could utter. That night we anchored in the river of Payankatank, and discovered it fo high as it was navigable; but the people were most a hunting, save a few old men, women, and children, that were tending their corn, of which they promifed us part when we would fetch it, as had done all the nations wherever we had yet been.

In a fair calm, rowing towards point Comfort, we anchored in Gosnoll's Bay, but fuch a fudden gust surprised us in the night with thunder and rain, that we never thought more to have seen James Town. Yet running before the wind, we sometimes saw the land by the slashes of fire from heaven, by which light only we kept from the splitting shore, until it pleased God in that black darkness to preserve us by that light to find Point Comfort: there refreshing ourselves, because we had only but heard of the Chesapeak and Nansamunds, we thought it as sit to know all our neighbours near

home, as fo many nations abroad.

So fetting fail for the fouthern shore, we failed up a narrow river up the country of Chesapeak; it hath a good channel, but many shoals about the entrance. By that we had sailed fix or seven miles, we saw two or three little garden-plots with their houses, the shores overgrown with the greatest pine and fir trees we ever saw in the country. But not seeing nor hearing any people, and the river very narrow, we returned to the great river to see if we could find any of them. Coassing the shore towards Nansamund, which is most oyster banks; at the mouth of that river we espied six or seven savages making their wires, who presently sled: ashore we went, and where they wrought we threw divers toys, and so departed. Far we were not gone ere they came again, and began to sing and dance and recall us; and thus we began our first acquaintance. At last one of them desired us to go to his house up that river; into our boat voluntarily he came, the rest ran after us by the shore with all shew of love that could be. Seven or eight miles we sailed up this narrow river: at last on the western shore we saw large corn-fields, in the midst a little isse, and in it was abundance of corn; the people, he told us, were all a hunting; but in the

isle was his house, to which he invited us with much kindness; to him, his wife, and children we gave fuch things as they feemed much contented them. The others being come, defired us also to go but a little higher to see their houses: here our host left us, the rest rowed by us in a canoc, till we were so far past the isle the river became very narrow. Here we defired some of them to come aboard us, whereat pauling a little, they told us they would but fetch their bows and arrows, and go all with us; but being ashore and thus armed, they perfuaded us to go forward, but we could neither perfuade them into their canoe, nor into our boat. This gave us cause to provide for the worst. Far we went not ere seven or eight canoes full of men armed appeared following us, staying to see the conclusion. Presently from each side of the river came arrows fo fast as two or three hundred could shoot them, whereat we returned to get the open. They in the canoes let fly also as fast, but amongst them we bestowed fo many shot, the most of them leaped overboard and swam ashore, but two or three escaped by rowing, being against their plains: our muskets they found shot further than their bows, for we made not twenty shot ere they all retired behind the next trees. Being thus got out of their trap, we feized on all their canoes, and moored them in the midft of the open. More than an hundred arrows stuck in our targets, and about the boat, yet none hurt, only Anthony Bagnall was shot in his hat, and another in his fleeve. But feeing their multitudes, and fuspecting, as it was, that both the Nanfamunds, and the Chefapeaks were together, we thought it best to ride by their canoes a while, to bethink if it were better to burn all in the ifle, or draw them to composition, till we were provided to take all they had, which was fufficient to feed all our colony; but to burn the isle at night it was concluded. In the interim we began to cut in pieces their canoes, and they prefently to lay down their bows, making figns of peace; peace, we told them, we would accept, would they bring us their King's bows and arrows, with a chain of pearl; and when we came again, give us four hundred baskets full of corn, otherwife we would break all their boats, and burn their houses and corn, and all they had. To perform all this they alleged only the want of a canoe, fo we put one adrift, and bid them fwim to fetch her; and till they performed their promife, we would but only break their canoes. They cried to us to do no more; all should be as we would: which prefently they performed, away went their bows and arrows, and tag and rag came with their baskets: so much as we could carry we took, and so departing good friends, we returned to James Town, where we fafely arrived the 7th of September, 1608. There we found Mr. Scrivener, and divers others, well recovered; many dead; fome fick; the late prefident prisoner for mutiny; by the honest diligence of Mr. Scrivener, the harvest gathered, but the provision in the store much Spoiled with rain. Thus was that fummer (when little wanted) confumed and spent, and nothing done (fuch was the government of Captain Ratliff) but only this difcovery; wherein to express all the dangers, accidents, and encounters this small number passed in that fmall barge, by the fcale of proportion, about three thousand miles, with fuch watery diet in those great waters and barbarous countries (till then to any Christian utterly unknown) I rather refer their merit to the cenfure of the courteous and experienced reader, than I would be tedious or partial, being a party.

But to this place to come who will adventure, With judgment's guide and reason how to enter; Finds in this world's broad sea, with wind and tide, There's safer sail than any where beside. But cause to wanton novices it is A province full of fearfulness I wiss:

Into the great vast deep to venture out, Those shallow rivers let them coast about, And by a small boat learn there first, and mark How they may come to make a greater bark.

Written by Anthony Bagnall, Nathaniel Powell, and Anas Todkill.

CHAP. VII.—The Presidency surrendered to Captain Smith: the Arrival and Return of the second Supply, and what happened.

THE 10th of September, by the election of the council and request of the company, Captain Smith received the letters patent, which till then by no means he would accept, though he was often importuned thereunto. Now the building of Ratcliffe's palace flaid as a thing needless; the church was repaired; the storehouse recovered; buildings prepared for the fupplies we expected; the fort reduced to a fine fquare form; the order of the watch renewed; the squadrons (each setting of the watch) trained; the whole company every Saturday exercifed in the plain by the west bulwark, prepared for that purpole, we called Smithfield, where fometimes more than a hundred favages would stand in an amazement to behold how a file would batter a tree, where he would make them a mark to shoot at; the boats trimmed for trade, which being fent out with Lieutenant Percy, in their journey encountered the fecond fupply, that brought them back to difcover the country of Monacan. How or why Captain Newport obtained fuch a private commission, as not to return without a lump of gold, a certainty of the South Sea, or one of the loft company fent out by Sir Walter Raleigh, I know not; nor why he brought fuch a fine pieced barge, nor to bear us to that South Sea, till we had borne her over the mountains, which how far they extend is yet unknown. As for the coronation of Powhatan, and his prefents of bason and ewer, bed, bedstead, clothes, and such costly novelties, they had been much better well spared than so ill spent, for we had his favour much better only for a plain piece of copper, till this flately kind of foliciting made him fo much overvalue himself, that he respected us as much as nothing at all. As for the hiring of the Poles and Dutchmen to make pitch, tar, glass, mills, and foap-ashes when the country is replenished with people, and necessaries, would have done well; but to fend them and feventy more without victuals to work, was not fo well advifed nor confidered of, as it should have been. Yet this could not have hurt us had they been two hundred, though then we were one hundred and thirty that wanted for ourselves; for we had the favages in that decorum (their harvest being newly gathered) that we feared not to get victuals for five hundred. Now was there no way to make us miferable but to neglect that time to make provision whilft it was to be had, the which was done by the direction from England to perform this strange discovery; but a more strange coronation to lose that time, spend that victuals we had, tire and starve our men, having no means to carry victuals, munition, the hurt or fick, but on their own backs. How or by whom they were invented I know not; but Captain Newport we only accounted the author, who, to effect these projects, had so gilded men's hopes with great promifes, that both company and council concluded his refolution for the most part. God doth know they little knew what they did, nor understood their own estates, to conclude his conclusions, against all the inconveniencies the foregoing prefident alledged. Of this fupply there was added to the council one Captain Richard Waldo and Captain Richard Wynne, two ancient foldiers and valiant gentlemen, but yet ignorant of the bufiness (being but newly arrived). Ratcliffe was also permitted VOL. XIII.

to have his voice, and Mr. Scrivener, defirous to fee ftrange countries; fo that although Smith was prefident, yet the major part of the council had the authority, and ruled it as they lifted. As for clearing Smith's objections, how pitch and tar, wainfcot, clapboard, glass, and soap-ashes, could be provided to relade the ship, or provision got to live withal, when none was in the country, and that we had, spent, before the ship departed to effect these projects. The answer was, Captain Newport undertook to freight the pinnace of twenty tons with corn in going and returning in his discovery, and to refreight her again from Werowocomoco of Powhatan; also promising a great proportion of victuals from the ship; inferring that Smith's propositions were only devices to hinder his journey, to effect it himfelf, and that the cruelty he had used to the favages might well be the occasion to hinder these designs, and seek revenge on him; for which taxation all works were left, and one hundred and twenty chosen men were appointed for Newport's guard in this discovery. But Captain Smith, to make clear all those feeming fuspicions that the favages were not so desperate as was pretended by Captain Newport, and how willing (fince by their authority they would have it fo) he was to affift them what he could, because the coronation would confume much time, he undertook himself their message to Powhatan, to entreat him to come to James Town to receive his prefents; and where Newport durft not go with less than one hundred and twenty, he only took with him Captain Waldo, Mr. Andrew Buckler, Edward Brinton, and Samuel Collier. With these four he went over-land to Werowocomoco, fome twelve miles; there he passed the river of Pamaunkee in a favage canoe. Powhatan being thirty miles off, was prefently fent for: in the mean time. Pocahontas and her women entertained Captain Smith in this manner:

In a fair plain field they made a fire, before which he fitting upon a mat, fuddenly amongst the woods was heard such a hideous noise and shrieking, that the English betook themselves to their arms, and seized on two or three old men by them, suppofing Powhatan with all his power was come to furprize them. But prefently Pocahontas came, willing him to kill her if any hurt were intended; and the beholders, which were men, women, and children, fatisfied the Captain there was no fuch matter. Then prefently they were prefented with this antic: thirty young women came naked out of the woods, only covered behind and before with a few green leaves, their bodies all painted, fome of one colour fome of another, but all differing: their leader had a fair pair of buck's horns on her head, and an otter's skin at her girdle, and another at her arm, a quiver of arrows at her back, a bow and arrows in her hand; the next had in her hand a fword, another a club, another a pot-stick, all horned alike; the rest every one with their several devices. These siends, with most hellish shouts and cries, rushing from among the trees, cast themselves in a ring about the fire, singing and dancing with most excellent ill variety, oft falling into their infernal passions, and folemnly again to fing and dance. Having fpent near an hour in this mafquerade, as

they entered in like manner they departed.

Having re-accommodated themselves, they solemnly invited him to their lodgings, where he was no sooner within the house, but all these nymphs more tormented him than ever with crowding, pressing, and hanging about him, most tediously crying, "Love you not me? Love you not me?" This salutation ended, the feast was set, consisting of all the savage dainties they could devise; some attending, others singing and dancing about them; which mirth being ended, with sirebrands instead of torches they conducted him to his lodging.

Thus did they flew their feats of arms, and others art in dancing, Some other used their oaten pipe, and others voices chaunting. The next day came Powhatan. Smith delivered his message of the presents sent him, and redelivered him Namontack he had sent for England, desiring him to come to his father Newport, to accept those presents, and conclude their revenge against the Mo-

nacans. Whereunto this fubtle favage thus replied:

"If your King have fent me prefents, I also am a king, and this is my land: eight days I will stay to receive them. Your father is to come to me, not I to him, nor yet to your fort, neither will I bite at such a bait. As for the Monacans I can revenge my own injuries; and as for Atquanachuk, where you say your brother was slain, it is a contrary way from those parts you suppose it: but for any falt-water beyond the mountains, the relations you have had from my people are false." Whereupon he began to draw plots upon the ground (according to his discourse) of all those regions. Many other discourses they had (yet both content to give each other content in complimental courtesses); and so Captain Smith returned with this answer.

Upon this the prefents were fent by water, which is near a hundred miles, and the captain's went by land with fifty good shot. All being met at Werowocomoco, the next day was appointed for his coronation; then the prefents were brought him, his bason and ewer, bed and furniture set up, his scarlet cloak and apparel with much ado put on him, being perfuaded by Namontack they would not hurt him; but a foul trouble there was to make him kneel to receive his crown, he neither knowing the majefty nor meaning of a crown, nor bending of the knee, endured fo many perfuafions, examples, and inftructions, as tired them all; at last, by leaning hard on his shoulders, he a little stooped, and three having the crown in their hands put it on his head, when by the warning of a piftol the boats were prepared with fuch a volley of fhot, that the King flarted up in a horrible fear, till he faw all was well. Then remembering himfelf, to congratulate their kindness, he gave his old shoes and his mantle to Captain Newport: but perceiving his purpose was to discover the Monacans, he laboured to divert his refolution, refufing to lend him either men or guides more than Namontack; and fo, after fome fmall complimental kindness on both fides, in requital of his prefents, he prefented Newport with a heap of wheat ears, that might contain fome feven or eight bushels, and as much more we bought in the town, wherewith we returned to the fort.

The flip having diffourdened herself of feventy persons, with the first gentlewoman and woman-fervant that arrived in our colony, Captain Newport, with one hundred and twenty chofen men, led by Captain Waldo, Lieutenant Percy, Captain Winne, Mr. West, and Mr. Scrivener, fet forward for the discovery of Monacan, leaving the president at the fort with about eighty or ninety (fuch as they were) to relade the ship. Arriving at the Falls, we marched by land some forty miles in two days and a half, and so returned down the fame path we went. Two towns we discovered of the Monacans, called Maffinacak and Mowhemenchouch; the people neither used us well nor ili; yet for our fecurity we took one of their petty kings, and led him bound to conduct us the way; and in our return, fearched many places we supposed mines, about which we fpent fome time in refining, having one William Callicut, a refiner, fitted for that purpose. From that crust of earth we digged he persuaded us to believe he extracted fome small quantity of filver; and (not unlikely) better stuff might be had for the digging. With this poor trial, being contented to leave this fair, fertile, well-watered country; and coming to the falls, the favages feigned there were divers ships come into the bay to kill them at James Town. Trade they would not, and find their corn we could not, for they had hid it in the woods; and being thus deluded, we arrived at James Town, half fick, all complaining, and tired with toil, famine, and difcontent, to have only but difcovered our gilded hopes, and fuch fruitless certainties as Captain Smith foretold us.

But those that hunger seek to slake, Which thus abounding wealth would rake; Not all the gems of Ister shore, Nor all the gold of Lydia's store, Can fill their greedy appetite, It is a thing so infinite.

No fooner were we landed, but the prefident dispersed so many as were able, some for glass, others for tar, pitch, and soap-ashes, leaving them with the fort to the councils' oversight, but thirty of us he conducted down the river some sive miles from James Town, to learn to make clapboard, cut down trees, and lie in woods. Amongst the rest he had chosen Gabriel Beadle, and John Russell, the only two gallants of this last supply, and both proper gentlemen. Strange were these pleasures to their conditions; yet lodging, eating, and drinking, working or playing, they but doing as the president did himself. All these things were carried so pleasantly as within a week they became masters: making it their delight to hear the trees thunder as they fell; but the axes so oft blistered their tender singers, that many times every third blow had a loud oath to drown the echo; for remedy of which sin, the president devised how to have every man's oath numbered, and at night for every oath to have a can of water poured down his sleeve, with which every offender was so washed, (himself and all) that a man should scarce hear an oath in a week.

For he who fcorns, and makes but jells of curfings, and his oath, He doth contemn, not man but God, nor God, nor man, but both.

By this, let no man think that the prefident and these gentlemen spent their times as common wood-haggers at felling of trees, or such other like labours, or that they were pressed to as hirelings, or common slaves; for what they did, after they were but once a little inured, it seemed and some conceited it only as a pleasure and recreation, yet thirty or forty of such voluntary gentlemen would do more in a day then one hundred of the rest that must be prest to it by compulsion, but twenty good workmen had been better than them all.

Mr. Scrivener, Captain Waldo, and Captain Winne at the fort, every one in like manner carefully regarded their charge. The prefident returning from amongst the woods, feeing the time confumed and no provision gotten, (and the ship lay idle at a great charge and did nothing,) prefently embarked himself in the discovery barge, giving order to council to fend Licutenant Percie after him with the next barge that arrived at the fort; two barges he had himfelf and eighteen men, but arriving at Chickahamania, that dogged nation was too well acquainted with our wants, refufing to trade with as much fcorn and infolency as they could express. The prefident perceiving it was Powhatan's policy to flarve us, told them he came not fo much for their corn, as to revenge his impriforment, and the death of his men murdered by them, and fo landing his men, and ready to charge them, they immediately fled: and prefently after fent their ambaffadors with corn, fish, fowl, and what they had to make their peace, (their corn being that year but bad) they complained extremely of their own wants, yet freighted our boats with an hundred bushels of corn, and in like manner Lieutenant Percie that not long after arrived, and having done the best they could to content us, we parted good friends, and returned to James Town.

Though

Though this much contented the company, (that feared nothing more than starving) yet some so envied his good success, that they rather desired to hazard a starving then his pains should prove so much more essectual than theirs. Some projects there were invented by Newport and Ratlisse, not only to have deposed him, but to have kept him out of the fort; for that being president, he would leave his place and the fort without their consent, but their horns were so much too short to essect it, as they themselves

more narrowly escaped a greater mischief. All this time our old tavern made as much of all them that had either money or ware as could be defired: by this time they were become fo perfect on all fides (I mean the foldiers, failors, and favages) as there was ten times more care to maintain their damnable and private trade than to provide for the colony things that were necessary. Neither was it a fmall policy in Newport and the mariners to report in England we had fuch plenty, and bring us fo many men without victuals, when they had fo many private factors in the fort, that within fix or feven weeks, of two or three hundred axes, chiffels, hoes, and pick-axes, fearce twenty could be found: and for pike-heads, fhot, powder, or any thing they could fteal from their fellows, was vendible; they knew as well (and as fecretly) how to convey them to trade with the favages for fur, baskets, Mussaneeks, young beast, or such like commodities, as exchange them with the failors for butter, cheefe, beef, pork, aqua vitæ, beer, bifcuit, oatmeal, and oil: and then feign all was fent them from their friends. And though Virginia afforded no furs for the store, yet one master in one voyage hath got so many by this indirect means, as he confessed to have sold in England for 30l.

Those are the faint-seeming worthies of Virginia, that have notwithstanding all this meat, drink, and wages; but now they begin to grow weary, their trade being both perceived and prevented; none hath been in Virginia that hath observed any thing, which knows not this to be true, and yet the loss, the scorn, the misery, and shame, was the poor officers, gentlemen, and careless governors, who were all thus bought and sold; the adventurers cozened, and the action overthrown by their false excuses, informations, and directions. By this let all men judge, how this business could prosper, being thus abused by such pilfering occasions. And had not Captain Newport cried peccavi, the president would have discharged the ship, and caused him to have

staid one year in Virginia, to learn to speak of his own experience.

Mr. Scrivener was fent with the barges and pinnace to Werowocomoco, where he found the favages more ready to fight than trade; but his vigilancy was fuch as prevented their projects, and by the means of Namontack got three or four hogsheads of corn, and as much pocones, which is a red root, which then was esteemed an excellent dye.

Captain Newport being dispatched, with the trials of pitch, tar, glass, frankincense, foap-ashes, with that clapboard and wainscot that could be provided, met with Mr. Scrivener at Point Comfort, and so returned for England. We remaining were about

two hundred.

The Copy of a Letter fent to the Treasurer and Council of Virginia from Captain Smith then President in Virginia.

" Right Honorable, &c.

"I received your letter, wherein you write, that our minds are fo fet upon faction and idle conceits in dividing the country without your confents, and that we feed you but with ifs and ands, hopes, and fome few proofs; as if we would keep the mystery of the

business to ourselves: and that we must expressly follow your instructions fent by Captain Newport: the charge of whose voyage amounts to near two thousand pounds, the which, if we cannot defray by the ship's return, we are like to remain as banished men. To these particulars I humbly intreat your pardon, if I offend you with my rude answer.

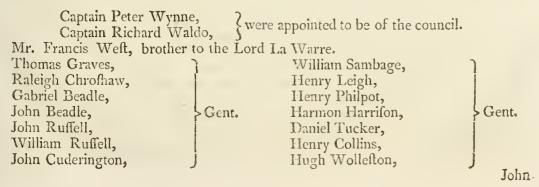

"For our factions, unless you would have me run away and leave the country, I cannot prevent them: because I do make many stay that would else sly any weather. For the idle letter sent to my Lord of Salisbury, by the president and his confederates, for dividing the country, &c. what it was I know not, for you saw no hand of mine to it; nor ever dreamed I of any such matter. That we feed you with hopes, &c.; though I be no scholar, I am past a school-boy; and I desire but to know what either you, and these here do know, but that I have learned to tell you by the continual hazard of my life. I have not concealed from you any thing I know; but I fear some cause you to believe much more than is true.

"Expressly to follow your directions by Captain Newport, though they be performed, I was directly against it; but according to our commission, I was content to be over-ruled by the major part of the council, I fear to the hazard of us all, which now is generally confessed when it is too late. Only Captain Winne and Captain Waldo I have sworn of the council, and crowned Powhatan, according to your instructions.

"For the charge of this voyage of two or three thousand pounds, we have not received the value of an hundred pounds. And for the quartered boat to be borne by the foldiers over the falls, Newport had one hundred and twenty of the best men he could chuse. If he had burnt her to ashes, one might have carried her in a bag, but as she is, five hundred cannot, to a navigable place above the falls. And for him at that time to find in the South Sea, a mine of gold; or any of them fent by Sir Walter Raleigh: at our confultation I told them was as likely as the rest. But during this great discovery of thirty miles, (which might as well have been done by one man, and much more, for the value of a pound of copper at a feafonable time,) they had the pinnace and all the boats with them, but one that remained with me to ferve the fort. In their absence I followed the new begun works of pitch and tar, glass, soap-ashes, and clapboard, whereof fome small quantities we have fent you. But if you rightly consider what an infinite toil it is in Ruffia and Sweden, where the woods are proper for nothing elfe, and though there be the help both of man and beast in those ancient commonwealths, which many an hundred years have used it, yet thousands of those poor people can fearce get necessaries to live, but from hand to mouth. And though your factors there can buy as much in a week as will freight you a ship, or as much as you please, you must not expect from us any fuch matter, which are but a many of ignorant miserable fouls, that are fcarce able to get wherewith to live, and defend ourselves against the inconstant favages: finding but here and there a tree fit for the purpose, and want all things elfe that the Russians have. For the coronation of Powhatan, by whose advice you fent him fuch prefents, I know not; but this give me leave to tell you, I fear they will be the confusion of us all ere we hear from you again. At your ship's arrival, the favages harvest was newly gathered, and we going to buy it, our own not being half fufficient for fo great a number. As for the two ships loading of corn, Newport promifed to provide us from Powhatan, he brought us but fourteen bushels; and from the Monacans nothing, but the most of the men sick and near famished. From your flip we had not provision in victuals worth twenty pounds, and we are more than two hundred to live upon this; the one half fick, the other little better. For the failors (I confefs) they daily make good cheer, but our diet is a little meal and water, and not fufficient

fufficient of that. Though there be fish in the fea, fowls in the air, and beafts in the woods, their bounds are fo large, they fo wild, and we fo weak and ignorant, we cannot much trouble them. Captain Newport we much suspect to be the author of those inventions. Now that you should know I have made you as great a discovery as he, for less charge than he spendeth you every meal, I have fent you this map of the bay and rivers, with an annexed relation of the countries and nations that inhabit them, as you may fee at large. Also two barrels of stones, and such as I take to be good iron ore at the least; so divided, as by their notes you may see in what places I found them. The foldiers fay, many of your officers maintain their families out of that you fend us; and that Newport hath an hundred pounds a year for carrying news. For every mafter you have yet fent can find the way as well as he, fo that an hundred pounds might be fpared, which is more than we have all, that help to pay him wages. Captain, Ratliff is now called Sicklemore, a poor counterfeited imposture. I have fent you him home, left the company should cut his throat. What he is, now every one can tell you: if he and Archer return again, they are fufficient to keep us always in factions. When you fend again I entreat you rather fend but thirty carpenters, husbandmen, gardeners, fishermen, blacksmiths, masons, and diggers up of trees, roots, well provided, than a thousand of such as we have: for except we be able both to lodge them, and feed them, the most will confume with want of necessaries before they can be made good for any thing. Thus if you please to consider this account, and of the unnecessary wages to Captain Newport, or his ship's fo long lingering and staying here (for notwithstanding his boasting to leave us victuals for twelve months, though we had eighty-nine by this discovery lame and sick, and but a pint of corn a day for a man, we were constrained to give him three hogsheads of that to victual him homeward) or yet to fend into Germany or Poland for glass men and the rest, till we be able to sustain ourselves, and relieve them when they come. It were better to give five hundred pound a ton for those gross commodities in Denmark, than fend for them hither, till more necessary things be provided. For in over-toiling our weak and unfkilful bodies, to fatisfy this defire of present profit, we can scarce ever recover ourselves from one supply to another: and I humbly entreat you hereafter, let us know what we should receive, and not stand to the sailors courtesy to leave us what they please, else you may charge us with what you will, but we not you with any thing. These are the causes that have kept us in Virginia, from laying fuch a foundation, that ere this might have given much better content and fatisfaction; but as yet you must not look for any profitable returns: fo I humbly reft.

The names of those in this supply were these; with their proceedings and accidents:

John Hoult, Thomas Norton, George Yarington, George Burton, Thomas Abbay, William Dowman,	Gent.	Thomas Lavander, Henry Bell, Mr. Powell, David Ellis, Thomas Gibson,	} Tradefmen
Thomas Maxes, Michael Lowick, Mr. Hunt, Thomas Forrest, John Dauxe,		Thomas Dawfe, Thomas Mallard, William Taylor, Thomas Fox, Nicholas Hancock,	
Thomas Phelps, John Prat, John Clarke, Jeffrey Shortridge, Dionis Oconor, Hugh Wynne,	Tradefmen.	Walker, Williams, Floud, Morley, Rofe, Scot, Hardwyn,	Labourers.
David ap Hugh, Thomas Bradley, John Burras,		Millman, Hilliard,	}-Boys.

Mrs. Forrest, and Anne Burras her maid; eight Dutchmen and Poles, with some others, to the number of seventy persons, &c.

These poor conclusions so affrighted us all with famine, that the president provided for Nanfamund, and took with him Captain Wynne, and Mr. Scrivener, then returning from Captain Newport. These people also long denied him not only the four hundred baskets of corn they promised, but any trade at all; (excusing themselves they had spent most they had, and were commanded by Powhatan to keep that they had, and not to let us come into their river) till we were constrained to begin with them perforce. Upon the discharging of our muskets they all sled and shot not an arrow; the first house we came to we set on fire, which when they perceived, they desired we would make no more spoil, and they would give us half they had: how they collected it I know not, but before night they loaded our three boats; and fo we returned to our quarter some four miles down the river, which was only the open woods under the lay of a hill, where all the ground was covered with fnow, and hard frozen; the show we digged away and made a great fire in the place; when the ground was well dried, we turned away the fire; and covering the place with a mat, there we lay very warm. To keep us from the wind we made a shade of another mat; as the wind turned we turned our shade, and when the ground grew cold we removed the fire. And thus many a cold winter night have we lain in this miferable manner, yet those that most commonly went upon all those occasions, were always in health, lusty, and fat. For sparing them this year, the next year they promised to plant purposely for us; and fo we returned to James Town. About this time there was a marriage betwixt John Laydon and Anne Burras; which was the first marriage we had in Virginia.

Long he staid not, but sitting himself and Captain Waldo with two barges. From Chawopoweanock, and all parts thereabouts, all the people were sled, as being jealous of our intents, till we discovered the river and people of Apamatuck; where we found not much, that they had we equally divided, but gave them copper, and such things as con-

tented

tented them in confideration. Mr. Scrivener and Lieutenant Percie went also abroad,

but could find nothing.

The prefident feeing the procraftinating of time, was no course to live, resolved, with Captain Waldo, (whom he knew to be fure in time of need) to furprife Powhatan, and all his provision, but the unwillingness of Captain Winne and Mr. Scrivener, for fome private respect, plotted in England to ruin Captain Smith, did their best to hinder the project; but the prefident, whom no perfusions could perfuse to starve, being invited by Powhatan to come unto him; and if he would fend him but men to build him a house, give him a grindstone, fifty swords, some pieces, a cock and a hen, with much copper and beads, he would load his ship with corn. The president, not ignorant of his devifes and fubtilty, yet unwilling to neglect any opportunity, prefently fent three Dutchmen and two English, having so small allowance, few were able to do any thing to purpose; knowing there needed no better a castle to effect this project, took order with Captain Waldo to fecond him, if need required; Scrivener he left his substitute, and fet forth with the pinnace, two barges, and forty-fix men, which only were fuch as voluntarily offered themselves for his journey, the which, by reason of Mr. Scrivener's ill fuccefs, was cenfured very desperate, they all knowing Smith would not return empty, if it were to be had; howfoever, it caused many of those that he had appointed, to find excuses to stay behind.

CHAP. VIII. - Captain Smith's fourney to Pamaunkee.

THE 29th of December he fet forward for Werowocomoco; his companions were these:

In the Discovery barge himself. In the pinnace. Robert Behethland Lieut. Percy, brother to the Earlof Northumberland. Nathaniel Graves Mr. Francis West, brother to the Lord La Warre. John Ruffell William Phittiplace, Captain of the pinnace. Gent. Raleigh Chrashow Michael Phittiplace Jeffery Abbott, serjeant Michael Sicklemore Gent. Richard Worley William Tankard George Yarington Anas Todkill William Love James Browne William Bentley **Edward Brinton** Soldiers. Jeffery Shortridge George Burton Soldiers. Edward Pifing Thomas Coe William Ward John Dods Henry Powell Jonas Profit, master. Robert Ford, clerk of the council.

Thomas Gibson, David Ellis, Nathaniel Peacock, sailors; John Prat, George Acrig, James Read, Nicholas Hancock, James Watkins, Thomas Lambert, sour Dutchmen, and Richard Salvage, were sent by land before, to build the house for Powhatan against our arrival.

This company being victualled but for three or four days, lodged the first night at Warraskoyaek, where the president took sufficient provision. This kind King did his best to divert him from seeing Powhatan; but perceiving he could not prevail, he advised in *Vol. XIII.

this manner: "Captain Smith, you shall find Powhatan to use you kindly, but trust him not, and be sure he have no opportunity to seize on your arms, for he hath sent for you only to cut your throats." The captain thanking him for his good counsel, yet the better to try his love, desired guides to Chawwonock, for he would send a present to that King, to bind him his friend. To perform this journey was sent Mr. Sicklemore, a very valiant, honest, and painful soldier; with him two guides, and directions how to seek for the lost company of Sir Walter Raleigh, and silk grass. Then we departed thence, the president assuring the King perpetual love; and left with him Samuel Collier, his page, to learn the language.

So this King's deeds by facred oath adjur'd, More wary proves, and circumfpect by odds; Fearing at least his double forfeiture, To offend his friends, and fin against his gods.

The next night being lodged at Kecoughtan; fix or feven days the extreme wind. rain, frost, and snow, caused us to keep Christmas among the savages, where we were never more merry, nor fed on more plenty of good oyfters, fish, flesh, wild-fowl, and good bread; nor ever had better fires in England, than in the dry fmoaky houses of Kecoughtan; but departing thence, when we found no houses, we were not curious in any weather to lie three or four nights together under the trees by a fire, as formerly is faid. An hundred and forty-eight fowls the prefident, Anthony Bagnall, and Serjeant Pifing did kill at three shots. At Kiskiack, the frost and contrary winds forced us three or four days also (to suppress the insolence of those proud savages) to quarter in their houses, yet guard our barge, and cause them to give us what we wanted; though we were but twelve and himfelf, yet we never wanted shelter where we found any houses. The 12th of January we arrived at Werowocomoco, where the river was frozen nearly half a mile from the shore; but to neglect no time, the president with his barge so far had approached by breaking the ice, as the ebb left him amongst those oozy shoals, yet rather than to lie there frozen to death, by his own example he taught them to march near middle deep, a flight shot through this muddy frozen ooze. When the barge floated, he appointed two or three to return her on board the pinnace. Where for want of water in melting the ice, they made fresh water, for the river there was salt. But in this march Mr. Ruffell, (whom none could perfuade to ftay behind) being fomewhat ill, and exceeding heavy, to overtoiled himfelf, as the rest had much ado (ere he got ashore) to regain life into his dead benumbed spirits. Quartering in the next houses we found, we fent to Powhatan for provision, who sent us plenty of bread, turkies, and venison; the next day, having feasted us after his ordinary manner, he began to ask us when we would be gone, feigning, he sent not for us, neither had he any corn, and his people much lefs; yet, for forty fwords he would procure us forty bafkets. The prefident shewing him the men there present that brought him the message and conditions, asked Powhatan how it chanced he became so forgetful; thereat the king concluded the matter with a merry hughter, asking for our commodities, but none he liked without guns and fwords, valuing a basket of corn more precious than a basket of copper, faying, he could rate his corn, but not the copper.

Captain Smith seeing the intent of this subtle savage, began to deal with him after this manner: Powhatan, though I had many courses to have made my provision, yet believing your promises to supply my wants, I neglected all to satisfy your defire; and to testify my love, I fent you my men for your building, neglecting my own. What your people had you have engrossed, forbidding them our trade; and now you think,

by confuming the time, we shall confume for want, not having to fulfil your strange demands. As for swords and guns, I told you long ago I had none to spare; and you must know those I have can keep me from want; yet steal or wrong you I will not, nor dissolve that friendship we have mutually promised, except you constrain me by our

bad ufage.

The King having attentively listened to this discourse, promised that both he and his country would spare him what he could, the which within two days they should receive. "Yet Captain Smith, (saith the King,) some doubt I have of your coming hither, that makes me not so kindly seek to relieve you as I would: for many do inform me, your coming hither is not for trade, but to invade my people, and possess my country, who dare not come to bring you corn, seeing you thus armed with your men. To free us of this fear, leave aboard your weapons, for here they are needless, we being all friends, and for ever Powhatans."

With many fuch discourses they spent the day, quartering that night in the King's houses. The next day he renewed his building, which he little intended should proceed. For the Dutchmen sinding his plenty, and knowing our want, and perceiving his preparations to surprise us, little thinking we could escape both him and famine, (to obtain his favour) revealed to him so much as they knew of our estates and projects, and how to prevent them. One of them being of so great a spirit, judgement, and resolution, and a hireling that was certain of his wages for his labour, and ever well used, both he and his counstrymen, that the president knew not whom better to trust; and not knowing any fitter for that employment, had fent him as a spy to discover Powhatan's intent, then little doubting his honesty, nor could ever be certain of his villany till near half a year after.

Whilst we expected the coming in of the country, we wrangled out of the King ten quarters of corn for a copper kettle, the which the president perceiving him much to affect, valued it at a much greater rate; but in regard of his scarcity he would accept it, provided we should have as much more the next year, or else the country of Monacan. Wherewith each seemed well contented, and Powhatan began to exposulate

the difference of peace and war after this manner.

"Captain Smith, you may understand that I having feen the death of all my people thrice, and not any one living of those three generations but myself; I know the difference of peace and war better than any in my country. But now I am old and ere long must die, my brethren, namely Opitchapam, Opechancanough, and Kekataugh, my two fifters, and their two daughters, are distinctly each others fuccessors. I wish their experience no less than mine, and your love to them no less than mine to you. But this bruit from Nandfamund, that you are come to destroy my country, so much affrighteth all my people as they dare not vifit you. What will it avail you to take that by force you may quickly have by love, or to destroy them that provide you food? What can you get by war, when we can hide our provisions and fly to the woods? whereby you must famish by wronging us, your friends. And why are you thus jealous of our loves, feeing us thus unarmed, and both do, and are willing still to feed you, with that you cannot get but by our labours? Think you I am so simple not to know it is better to eat good meat, lie well, and fleep quietly with my women and children, laugh and be merry with you, have copper, hatchets, or what I want, being your friend, than be forced to fly from all, to lie cold in the woods, feed upon acorns, roots, and fuch trash, and be so hunted by you that I can neither rest, eat, nor sleep; but my tired men must watch, and if a twig but break, every one crieth, There cometh Captain Smith! then must Isly I knownot whither: and thus with miserable fear end my miserable life, leaving

my pleasures to such youths as you, which, through your rash unadvisedness, may quickly as miserably end, for want of that you never know where to find. Let this therefore assure you of our loves, and every year our friendly trade shall furnish you with corn; and now also, if you would come in friendly manner to see us, and not thus with your guns and swords as to invade your foes."

To this subtle discourse the president thus replied:

"Seeing you will not rightly conceive of our words, we strive to make you know our thoughts by our deeds; the vow I made you of my love, both myself and my men have kept. As for your promise I find it every day violated by some of your subjects: yet we sinding your love and kindness, our custom is so far from being ungrateful, that for your sake only, we have curbed our thirsting desire of revenge; else had they known as well the cruelties we use to our enemies, as our true love and courtesy to our friends. And I think your judgement sufficient to conceive, as well by the adventures we have undertaken, as by the advantage we have (by our arms) of yours, that had we intended you any hurt, long ere this we could have effected it. Your people coming to James Town are entertained with their bows and arrows without any exceptions; we esteeming it with you as it is with us, to wear our arms as our apparel. As for the danger of our enemies, in such wars consist our chiefest pleasure: for your riches we have no use: as for the hiding your provisions, or by your slying to the woods, we shall not so unadvisedly starve as you conclude; your friendly care in that behalf is needless, for we have a rule to find beyond your knowledge."

Many other discourses they had, till at last they began to trade. But the King seeing his will would not be admitted as a law, our guard dispersed, nor our men disarmed,

he fighing breathed his mind once more in this manner.

"Captain Smith, I never use any Werowance so kindly as yourself, yet from you I receive the least kindness of any. Captain Newport gave me swords, copper, clothes, a bed, towels, or what I desired; ever taking what I offered him, and would send away his guns when I intreated him: none doth deny to lie at my feet, or resuse to do what I desire, but only you; of whom I can have nothing but what you regard not, and yet you will have whatsoever you demand. Captain Newport you call father, and so you call me; but I see for all us both you will do what you list, and we must both seek to content you. But if you intend so friendly as you say, send hence your arms, that I may believe you; for you see the love I bear you, doth cause me thus nakedly to forget myself."

Smith feeing this favage but trifle the time to cut his throat, procured the favages to break the ice that his boat might come to fetch his corn and him: and gave order for more men to come on shore, to surprise the King, with whom also he but trifled the time till his men were landed: and to keep him from suspicion, entertained the time

with this reply:

"Powhatan you must know, as I have but one God, I honour but one King; and I live not here as your subject, but as your friend to pleasure you with what I can. By the gifts you bestow on me, you gain more than by trade: yet would you visit me as I do you, you should know it is not our custom to fell our courtesy as a vendible commodity. Bring all your country with you for your guard, I will not dislike it as being over jealous. But to content you, to-morrow I will leave my arms, and trust to your promise. I call you father indeed, and as a father you shall see I will love you: but the small care you have of such a child caused my men to persuade me to look to myself."

By this time Powhatan having knowledge his men were ready whilft the ice was a breaking, with his luggage, women, and children, fled. Yet to avoid suspicion, left two

or three of the women talking with the captain, whilst he secretly ran away, and his men that secretly beset the house. Which being presently discovered to Captain Smith, with his pistol, sword, and target he made such a passage among these naked devils, that at his first shoot, they next him tumbled one over another, and the rest quickly sled some one way, some another: so that without any hurt, only accompanied with John Russell, he obtained the corps du guard. When they perceived him so well escaped, and with his eighteen men (for he had no more with him on shore), to the uttermost of their skill they sought excuses to dissemble the matter: and Powhatan to excuse his slight and the sudden coming of this multitude, sent our Captain a great bracelet and a chain of pearl, by an ancient orator that bespoke us to this purpose, perceiving even then from our pinnace, a barge and men departing and coming unto us.

"Captain Smith, our Werowance is fled, fearing your guns, and knowing when the ice was broken there would come more men, fent these numbers but to guard his corn from stealing, that might happen without your knowledge: now though some be hurt by your misprission, yet Powhatan is your friend and so will for ever continue. Now since the ice is open, he would have you send away your corn, and if you would have his company, send away also your guns, which so affrighteth his people, that they dare

not come to you as he promifed they should."

Then having provided baskets for our men to carry our corn to the boats, they kindly offered their fervice to guard our arms that none should steal them. A great many they were of goodly well proportioned fellows, as grim as devils; yet the very fight of cocking our matches and being to let fly, a few words caused them to leave their bows and arrows to our guard, and bear down our corn on their backs; we needed not importune them to make difpatch. But our barges being left on the oose by the ebb, caused us stay till the next high water, so that we returned again to our old quarter. Powhatan and his Dutchmen bursting with desire to have the head of Captain Smith, for if they could but kill him they thought all was theirs, neglected not any opportunity to effect his purpose. The Indians with all the merry sports they could devife, fpent the time till night, then they all returned to Powhatan, who all this time was making ready his forces to furprife the house and him at supper, notwithstanding the eternal all-seeing God did prevent him, and by a strange means; for Pocahontas, his dearest jewel and daughter, in that dark night came through the irksome woods, and told our captain great cheer should be fent us by-and-by, but Powhatan and all the power he could make, would after come kill us all, if they that brought it could not kill us with our own weapons when we were at supper. fore if we would live she wished us presently to be gone. Such things as she delighted in he would have given her, but with the tears running down her cheeks, she said she durst not be seen to have any, for if Powhatan should know it she were but dead, and fo she ran away by herfelf as she came. Within lefs then an hour came eight or ten lufty fellows with great platters of venifon and other victuals, very importunate to have us put out our matches (whose fmoke made them fick) and fit down to our But the captain made them tafte every dish, which done, he ent some of them back to Powhatan, to bid him make hafte, for he was prepared or his coming. As for them he knew they came to betray him at his supper, but te would prevent them and all their other intended villanies, fo that they might be gone. Not long after came more messengers to see what news, not long after them others. Thus we fpent the night as vigilantly as they till it was high water, yet eemed to the favages as friendly as they to us, and that we were fo defirous to giv. Powhatan content, as he requested, we did leave him Edward Brynton to kill him fowl, and the Dutchmen to

finish his house; thinking at our return from Pamaunkee the frost would be gone, and then we might find a better opportunity if necessity did occasion it, little dreaming yet of the Dutchmen's treachery, whose humour well suited this verse:

Is any free, that may not live as freely as he list? Let us live fo, then we're as free and brutish as the best.

CHAP. IX. - How we escaped surprising at Pamaunkee.

WE had no fooner fet fail but Powhatan returned, and fent Adam and Francis (two flout Dutchmen) to James Town, who feigning to Captain Winne that all things were well, and that Captain Smith had use of their arms, wherefore they requested new (the which were given them) they told him their coming was for fome extraordinary tools and shift of apparel, by which colourable excuse they obtained fix or feven more to their confederacy, fuch expert thieves, that prefently furnished them with a great many fwords, pike-heads, pieces, shot, powder, and fuch like, favages they had at hand to carry it away, and the next day they returned unfufpected, leaving their confederates to follow, and in the interim to convey them fuch things as they could, for which fervice they should live with Powhatan, as his chief affected, free from those miseries that would happen to the colony. Samuel, their other consort, Powhatan kept for their pledge, whose diligence had provided them three hundred of their kind of hatchets, the rest fifty swords, eight pieces, and eight pikes. Brynton and Richard Salvage feeing the Dutchmen fo diligent to accommodate the favages with weapons, attempted to have gotten to James Town, but they were apprehended, and expected ever when to be put to death.

Within two or three days we arrived at Pamaunkee, the king as many days entertained us with feafting and much mirth. And the day appointed to begin our trade, the prefident, Lieutenant Percie, Mr. West, Mr. Russell, Mr. Behethland, Mr. Crashaw, Mr. Powell, Mr. Ford, and some others to the number of fifteen, went up to Opechancanough's house a quarter of a mile from the river, where we found nothing but a lame fellow and a boy, and all the houses round about of all things abandoned. Not long we stayed ere the king arrived, and after him came divers of his people loaden with bows and arrows, but such pinching commodities, and those esteemed at such a

value, as our captain began with the king after this manner:

"Opechancanough, the great love you profess with your tongue seems mere deceit by your actions. Last year you kindly freighted our ship, but now you have invited me to starve with hunger, you know my want, and I your plenty, of which by some means I must have part, remember it is fit for kings to keep their promise. Here are my commodities, whereof take your choice, the rest I will proportion fit bargains for

your people.'

The ring feemed kindly to accept his offer, and the better to colour his project, fold us what they had to our own content, promising the next day more company, better provided. The barges and pinnace being committed to the charge of Mr. Phetiplace the president, with his old sifteen, marched up to the King's house, where we found four or sive men newly arrived, each with a great basket. Not long after came the King, who with a strained cheerfulness held us with discourse what pains he had taken to keep his promise; till Mr. Russell brought us in news that we were all betrayed, for a least seven hundred savages well armed had environed the house and beset the fields. The King conjecturing what Russel related, we could

well perceive how the extremity of his fear bewrayed his intent, whereat fome of our company feeming difmayed with the thought of fuch a multitude, the captain

encouraged us to this effect:

"Worthy countrymen, were the milchiefs of my feeming friends no more than the danger of these enemies, I little cared were they as many more, if you dare do but as I. But this is my torment, that if I escape them our malicious council with their open mouthed minions, will make me fuch a peace-breaker (in their opinions in England) as will break my neck. I could wish those here, that make these feem-faints and me an oppressor. But this is the worst of all, wherein I pray you aid me with your opinions. Should we begin with them and furprife the King, we cannot keep him and defend well ourfelves. If we flould each kill our man and fo proceed with all in the house, the rest will all sly, then shall we get no more than the bodies that are slain, and fo starve for victuals. As for their fury it is the least danger, for well you know, being alone affaulted with two or three hundred of them, I made them by the help of God, compound to fave my life. And we are fixteen, and they but feven hundred at the most; and affure yourselves, God will so affist us that if you dare stand but to discharge your pieces, the very smoke will be sufficient to afflight them. Yet howfoever, let us fight like men and not die like sheep, for by that means you know God hath often delivered me, and fo I trust will now. But first I will deal with them to bring it to pass we may fight for something, and draw them to it by conditions. If you like this motion promise me you will be valiant."

The time not permitting any argument, all vowed to execute whatfoever he attempted

or die: whereupon the captain in plain terms told the King this:

"I fee Opechancanough your plot to murder me, but I fear it not. As yet your men and mine have done no harm but by our direction. Take therefore your arms, you fee mine, my body shall be as naked as yours, the isle in your river is a fit place if you be contented, and the conqueror of us two shall be lord and master over all our men. If you have not enough take time to fetch more and bring what number you will, so every one bring a basket of corn, against all which I will stake the value in copper, you see I have but sifteen, and our game shall be, the conqueror take all."

The King being guarded with forty or fifty of his chief men, feemed kindly to appeale Smith's fulpicion of unkindness, by a great present at the door, they entreated him to receive; this was to draw him out of the door, where the bait was guarded with at least two hundred men, and thirty lying under a great tree (that lay thwart as a barricado) each his arrow knocktready to fhoot. The prefident commanded one to go fee what kind of deceit this was, and to receive the prefent, but he refused to do it, yet the gentlemen and all the rest were importunate to go, but he would not permit them, being vexed at that coward: and commanded Lieutenant Percie, Mr. West, and the rest to make good the house, Mr. Powell and Mr. Behethland he commanded to guard the door, and in fuch a rage fnatched the King by his long lock in the midft of his men, with his piftol ready bent against his breast. Thus he led the trembling King near dead with fear amongst all his people, who delivering the captain his vambrace, bow, and arrows, all his men were easily entreated to east down their arms, little dreaming any durst in that manner have used their King, who then to escape himself bestowed his presents in good sadness, and causing a great many of them come before him unarmed, holding the King by the hair (as is faid) he fpake to them. to this effect:

"I fee (you Pamaunkees) the great defire you have to kill me, and my long fuffering your injuries hath emboldened you to this prefumption. The cause I have for-

borne

borne your infolences is the promise I made you (before the God I serve) to be your friend till you give me just cause to be your enemy. If I keep this vow my God will keep me, you cannot hurt me, if I break it, he will destroy me. But if you shoot but one arrow to shed one drop of blood of any of my men, or steal the least of these beads or copper, I spurn here before you with my foot; you shall see I will not cease revenge (if once I begin) so long as I can hear where to find one of your nation that will not deny the name of Pamaunkee. I am not now at Rassaweak half drowned with mire, where you took me prisoner, yet then for keeping your promise and your good usage and saving my life, I so affect you, that your denials of your treachery do half persuade me to mistake myself. But if I be the mark you aim at, here I stand, shoot he that dare. You promised to freight my ship ere I departed, and so you shall, or I mean to load her with your dead carcasses, yet, if as friends you will come and trade, I once more promise not to trouble you, except you give me the first occasion; and your King shall be free and be my friend, for I am not come to hurt him or any of you."

Upon this away went their bows and arrows, and men, women, and children, brought in their commodities, two or three hours they so thronged about the president and so overwearied him as he retired himself to rest, leaving Mr. Behethland and Mr. Powell to receive their presents; but some savages perceiving him fast asleep, and the guard somewhat carelessly dispersed, forty or sitty of their choice men, each with a club or an English sword in his hand, began to enter the house, with two or three hundred others that pressed to second them. The noise and haste they made in did so shake the house they awoke him from his sleep, and being half amazed with this sudden sight, betook him strait to his sword and target, Mr. Chrashaw and some others charged in like manner, whereat they quickly thronged faster back than before forward. The house thus cleansed, the King and some of his ancients we kept yet with him, who with a long oration excused this intrusion. The rest of the day was spent with much kindness, the company again renewing their presents with their best provi-

fions, and whatfoever he gave them they feemed therewith well contented.

Now in the mean while fince our departure, this happened at our fort. Mr. Scrivener having received letters from England, to make himfelf either Cæfar or nothing, he began to decline in his affection to Captain Smith, that ever regarded him as himfelf, and was willing to cross the surprising of Powhatan. Some certain days after the prefident's departure, he would needs go visit the Isle of Hogs, and took with him Captain Waldo (though the president had appointed him to be ready to second his occasions) with Mr. Anthony Gosnoll and eight others; but so violent was the wind (that extreme frozen time) that the boat sunk, but where or how none doth know. The skiff was much over-loaden, and would scarce have lived in that extreme tempest had she been empty; but by no persuasion he could be diverted, though both Waldo and an hundred others doubted as it happened. The savages were the first that sound their bodies, which so much the more encouraged them to effect their projects. To advertise the president of this heavy news, none could be found would undertake it, but the journey was often resused of all in the fort, until Mr. Richard Wyssin undertook alone the performance thereof.

In this journey he was encountered with many dangers and difficulties in all parts as he passed. As for that night he lodged with Powhatan, perceiving such preparation for war, not finding the president there, he did assure himself some mischief was intended. Pocahontas hid him for a time, and sent them who pursued him the clean contrary way to seek him; but by her means, and extraordinary bribes, and much trouble in three days travel, at length he sound us in the midst of these turmoils.

This

This unhappy news the prefident fwore him to conceal from the company, and fo diffembling his forrow with the best countenance he could, when the night approached, went fafely on board with all his foldiers; leaving Opechancanough at liberty, accord-

ing to his promife, the better to have Powhatan in his return.

Now fo extremely Powhatan had threatened the death of his men, if they did not by fome means kill Captain Smith, that the next day they appointed all the country should come to trade unarmed; yet unwilling to be treacherous, but that they were constrained, hating fighting with him almost as ill as hanging, such fear they had of bad success. The next morning the fun had not long appeared, but the fields appeared covered with people and baskets, to tempt us on shore; but nothing was to be had without his prefence, nor they would not indure the fight of a gun. When the prefident faw them begin to depart, being unwilling to loofe fuch a booty, he fo well contrived the pinnace, and his barges with ambufcades, as only with Lieutenant Percy, Mr. Weft, and Mr. Ruffell, with their arms, went on fhore; others he appointed unarmed to receive what was brought. The favages flocked before him in heaps, and the bank ferving as a trench for a retreat, he drew them fair open to his ambuscades. For he not being to be perfuaded to go vifit their king, the king knowing the most of them unarmed, came to vifit him with two or three hundred men, in the form of two half moons; and with fome twenty men, and many women laden with painted bafkets. But when they approached fomewhat near us, their women and children fled. For when they had environed and befet the fields in this manner, they thought their purpose sure, yet so trembled with fear as they were fearce able to nock their arrows; Smith standing with his three men ready bent, beholding them till they were within danger of our ambufcades, who upon the word discovered themselves, and he retired to the barge, which the favages no fooner perceived than away they fled, esteeming their heels for their best advantage.

That night we fent Mr. Chrashaw and Mr. Ford to James Town, to Captain Winne. In the way between Werowocomoco and the fort, they met four or five of the Dutchmen's confederates going to Powhatan; the which to excuse those gentlemen's suspicion

of their running to the favages, returned to the fort, and there continued.

The favages hearing our barge go down the river in the night, were fo terribly afraid, that we fent for more men (we having fo much threatened their ruin, and the raifing of their houses, boats, and wires), that the next day the King sent our captain a chain of pearl, to alter his purpose and stay his men; promising, though they wanted themselves, to freight our ship and bring it aboard to avoid suspicion. So that five or six days after, from all parts of the country within ten or twelve miles, in the extreme frost and snow,

they brought us provision on their naked backs.

Yet notwithstanding this kindness and trade, had their art and poison been sufficient, the president, Mr. West, and some others, had been poisoned; it made them sick, but expelled itself. Wecuttanow, a stout young fellow, knowing he was suspected for bringing this present of poison, with forty or sifty of his chief companions (seeing the president but with a few men at Potauncak,) so proudly braved it, as though he expected to encounter a revenge. Which the president perceiving in the midst of his company, did not only beat, but spurned like a dog, as scorning to do him any worse mischief. Whereupon all of them sled into the woods, thinking they had done a great matter to have so well escaped; and the townsmen remaining, presently freighted our barge to be rid of our companies; framing many excuses to excuse Wecuttanow, (being son to their chief King, but Powhatan) and told us if we would shew them him

that brought the poifon, they would deliver him to us to punish as we pleased. Men may think it strange there should be such a stir for a little corn; but had it been gold, with more ease we might have got it; and had it wanted, the whole colony had starved. We may be thought very patient to endure all those injuries, yet only with fearing them we got what they had. Whereas if we had taken revenge, then, by their loss, we should have lost ourselves. We fearched also the countries of Youghtanund and Mattapanient, where the people imparted that little they had with such complaints and tears from the eyes of women and children, as he had been too cruel to have been a Christian, that would not have been fatisfied and moved with compassion. But had this happened in October, November, and December, when that unhappy discovery of Monacan was made, we might have freighted a ship of forty tuns, and twice as much might have been had from the rivers of Rapahanock, Patawomek, and Pawtuxunt.

The main occasion of our thus temporizing with them was to part friends as we did, to give the less cause of suspicion to Powhatan to fly, by whom we now returned with a purpose to have surprised him and his provision. For effecting whereof (when we came against the town) the president sent Mr. Wyssin and Mr. Coe ashore to discover and make way for his intended project. But they found that those damned Dutchmen had caufed Powhatan to abandon his new house and Werowocomoco, and to carry away all his corn and provision; and the people they found so ill affected, that they were in great doubt how to escape with their lives. So the prefident finding his intent frustrated, and that there was nothing now to be had, and therefore an unfit time to revenge their abuses, sent Mr. Michael Phittiplace by land to James Town, where we failed with all the speed we could; we having in this journey (for twentyfive pounds of copper, and fifty pounds of iron and beads) enough to keep forty-fix men fix weeks, and every man for his reward a month's provifion extraordinary (no trade being allowed but for the flore); we got near two hundred pounds weight of deer fuet, and delivered to the Cape merchant four hundred and feventy-nine bushels of corn.

Those temporizing proceedings to some may seem too charitable, to such a daily daring, treacherous people: to others not pleasing, that we washed not the ground with their blood, nor shewed such strange inventions in mangling, murdering, ransacking, and destroying (as did the Spaniards) the simple bodies of such ignorant souls; nor delightful, because not stuffed with relations of heaps and mines of gold and silver, nor such rare commodities as the Portuguese and Spaniards sound in the East and West Indies; the want whereof hath begot us (that were the first undertakers) no less scorn and contempt, than the noble conquests and valiant adventures beautisted with it, praise and honour. Too much I consess the world cannot attribute to their ever memorable merit: and to clear us from the blind world's ignorant censure, these sew words may suffice any reasonable understanding.

It was the Spaniards good hap to happen in those parts where were infinite numbers of people, who had manured the ground with that providence, it afforded victuals at all times. And time had brought them to that perfection, they had the use of gold and filver, and the most of such commodities as those countries afforded: so that, what the Spaniard got was chiefly the spoil and pillage of those country people, and not the labours of their own hands. But had those fruitful countries been as savage, as barbarous, as ill peopled, as little planted, laboured, and manured, as Virginia, their proper labours it is likely would have produced as small profit as ours. But had Virginia been peopled, planted, manured, and adorned with such store of precious jewels,

and

and rich commodities as was the Indies, then had we not gotten and done as much as by their examples might be expected from us; the world might then have traduced us and

our merits, and have made shame and infamy our recompence and reward.

But we chanced in a land even as God made it, where we found only an idle, improvident, scattered people, ignorant of the knowledge of gold or filver, or any commodities, and carcless of any thing but from hand to mouth, except baubles of no worth; nothing to encourage us but what accidentally we found nature afforded; which, ere we could bring to recompense our pains, defray our charges, and fatisfy our adventurers, we were to discover the country, subdue the people, bring them to be tractable, civil, and industrious, and teach them trades, that the fruits of their labours might make us some recompence, or plant such colonies of our own, that must first make provision how to live of themselves, ere they can bring to perfection the commodities of the country, which doubtlefs will be as commodious for England as the West Indies for Spain, if it be rightly managed, notwithstanding all our homebred opinions that will argue the contrary, as formerly some have done against the Spaniards and Portuguefe. But to conclude, against all rumour of opinion, I only fay this, for those that the three first years began this plantation, notwithstanding all their factions, mutinies, and miseries, so gently corrected and well prevented; peruse the Spanish decades, the relations of Mr. Hackluit, and tell me how many ever, with fuch fmall means as a barge of twenty-two tons, fometimes with feven, eight, or nine, or but at most twelve or fixteen men, did ever discover so many fair and navigable rivers, fubject to fo many feveral kings, people, and nations, to obedience and contribution, with fo little bloodshed.

And if in the fearch of those countries we had happened where wealth had been, we had as surely had it as obedience and contribution; but if we have overskipped it, we will not envy them that shall find it: yet can we not but lament it was our fortunes to end, when we had but only learned how to begin, and found the right course how

to proceed.

By Richard Wyffin, William Phittiplace, Jeffrey Abbot, and Anas Todkill.

CHAP. X. - How the Savages became subject to the English.

WHEN the ships departed, all the provision of the store (but that the president had gotten) was so rotten with the last summer's rain, and eaten with the rats and worms, as the hogs would scarcely eat it; yet it was the soldiers' diet till our return, so that we found nothing done, but our victuals spent, and the most part of our tools, and a good part of our arms conveyed to the savages. But now casting up the store, and sinding sufficient till the next harvest, the fear of starving was abandoned, and the company divided into tens, sisteens, or as the business required; six hours each day was spent in work, the rest in passime and merry exercises; but the untowardness of the greatest number caused the president to advise as solloweth:

"Countrymen, the long experience of our late miferies, I hope, is fufficient to perfuade every one to a prefent correction of himfelf, and think not that either my pains, nor the adventurers' purfes, will ever maintain you in idlenefs and floth. I fpeak not this to you all, for divers of you I know deferve both honour and reward, better than is yet here to be had; but the greater part must be more industrious or starve, however you have been heretofore tolerated by the authority of the council, from that I have often commanded you. You see now that power resteth wholly in myself: you must obey this now for a law, that he that will not work shall not eat (except by sickness he be disabled); for the labours of thirty or forty honest and industrious men shall not be consumed to maintain a hundred and sifty idle loiterers: and though you presume the authority here is but a shadow, and that I dare not touch the lives of any, but my own must answer it, the letters patent shall each week be read to you, whose contents will tell you the contrary. I would wish you, therefore, without contempt, seek to observe these orders set down, for there are now no more counsellors to protect you, nor curb my endeavours. Therefore, he that offendeth let him assuredly expect his due punishment."

He made also a table, as a public memorial of every man's deferts, to encourage the good, and with shame to spur on the rest to amendment. By this many became very industrious, yet more by punishment performed their business, for all were so tasked, that there was no excuse could prevail to deceive him; yet the Dutchmen's consorts so closely conveyed them powder, shot, swords, and tools, that though we

could find the defect, we could not find by whom till it was too late.

All this time the Dutchmen remaining with Powhatan (who kindly entertained them to instruct the favages the use of our arms), and their consorts not following them as they expected, to know the cause they sent Francis, their companion, a stout young fellow, difguifed like a favage, to the glass-house, a place in the woods, near a mile from James Town, where was their rendezvous for all their unfuspected villainy. Forty men they procured to lie in ambuscade for Captain Smith, who no sooner heard of this Dutchman, but he fent to apprehend him (but he was gone); yet to cross his return to Powhatan, the Captain presently dispatched twenty shot after him, himself returning from the glass-house alone. By the way he encountered the King of Paspahegh, a most strong, stout favage, whose persuasions not being able to persuade him to his ambush, feeing him only armed but with a falchion, attempted to have shot him; but the prefident prevented his fhot by grappling with him, and the favages as well prevented him for drawing his falchion, and perforce bore him into the river to have drowned them. Long they ftruggled in the water, till the prefident got fuch hold on his throat, he had near strangled the King; but having drawn his falchion to cut off his head, feeing how pitifully he begged his life, he led him prisoner to James Town, and put him in chains.

The Dutchman ere long was also brought in, whose villainy, though all this time it was fuspected, yet he feigned such a formal excuse, that for want of language Captain Winne understood him not rightly, and for their dealings with Powhatan, that to fave their lives they were constrained to accommodate his arms, of whom he extremely complained to have detained them perforce, and that he made this escape with the hazard of his life, and meant not to have returned, but was only walking in the woods to gather walnuts. Yet for all this fair tale there was fo finall appearance of truth, and the plain confession of Paspahegh of his treachery, he went by the heels, Smith purposing to regain the Dutchmen by the faving his life. The poor favage did his best by his daily messengers to Powhatan, but all returned that the Dutchmen would not return, neither did Powhatan stay them, and to bring them fifty miles on his men's backs they were not able. Daily this King's wives, children, and people came to vifit him with prefents, which he liberally beftowed to make his peace. Much truft they had in the prefident's promife; but the King finding his guard negligent, though fettered yet escaped. Captain Winne thinking to pursue him, found such troops of favages to hinder his paffage, as they exchanged many vollies of fhot for flights of

arrows. Captain Smith hearing of this in returning to the fort, took two favages prisoners, called Kemps and Tuffore, the two most exact villains in all the country. With these he sent Captain Winne and fifty choice men, and Lieutenant Percie, to have regained the King, and revenged this injury, and fo had done, if they had followed his directions, or been advifed with those two villains, that would have betrayed both King and kindred for a piece of copper; but he trifling away the night, the favages the next morning, by the rifing of the fun, braved him to come ashore to fight: a good time both fides let fly at other, but we heard of no hurt, only they took two

canoes, burnt the King's house, and so returned to James Town.

The prefident, fearing those bravadoes would but encourage the favages, began again himself to try his conclusions, whereby fix or feven were slain, as many made prisoners. He burnt their houses, took their boats, with all their fishing wires, and planted some of them at James Town for his own use, and now resolved not to cease till he had revenged himfelf of all who had injured him. But in his journey passing by Paspahegh, towards Chickahamania, the favages did their best to draw him to their ambuscades; but feeing him regardlefsly pass their country, all shewed themselves in their bravest manner. To try their valour he could not but let fly; and ere he could land, they no fooner knew him, but they threw down their arms and defired peace. Their orator was a lufty young fellow, called Okaning, whose worthy discourse deserveth to

be remembered. And thus it was:

"Captain Smith, my mafter is here prefent in the company, thinking it Captain Winne, and not you, (of him he intended to have been revenged) having never offended him. If he hath offended you in escaping your imprisonment, the fishes swim, the fouls fly, and the very beafts strive to escape the snare and live. Then blame not him being a man. He would entreat you remember, you being a prisoner, what pains he took to fave your life. If fince he hath injured you, he was compelled to it: but howfoever, you have revenged it with our too great lofs. We perceive and well know you intend to destroy us, that are here to intreat and defire your friendship, and to enjoy our houses, and plant our fields, of whose fruit you shall participate: otherwise you will have the worfe by our abfence; for we can plant any where, though with more labour; and we know you cannot live if you want our harvest, and that relief we bring you. If you promife us peace, we will believe; if you proceed in revenge, we will abandon the country."

Upon these terms the president promised them peace, till they did us injury, upon condition they should bring in provision. Thus all departed good friends, and so con-

tinued till Smith left the country.

Arriving at James Town, complaint was made to the prefident that the Chickahamanians, who all this while continued trade, and feemed our friends, by colour thereof were the only thieves: and amongst other things a pistol being stolen, and the thie fled, there was apprehended two proper young fellows, that were brothers, known be his confederates. Now to regain this piftol, the one was imprifoned, the ged: was fent to return the piftol again within twelve hours, or his brother to be his, and yet the prefident, pitying the poor naked favage in the dungeon, fent him victor but the fome charcoal for a fire. Ere midnight his brother returned with the pift, but the poor favage in the dungeon was fo fmothered with the fmoke he had bewailed his piteoufly burnt, that we found him dead. The other most lamentally duiet him told death, and broke forth into fuch bitter agonies, that the prefident quiet him told him, that if hereafter they would not fteal, he would make him live again: but he little thought he could be again. little thought he could be recovered; yet we doing our best wir aqua vitæ and vinegar, it pleafed God to restore him again to life, but so drunk and affrighted, that he feemed lunatic, the which as much tormented and grieved the other, as before to fee him dead; of which malady, upon promife of their good behaviour, the prefident promifed to recover him, and fo caufed him to be laid by a fire to fleep, who in the morning, having well flept, had recovered his perfect fenfes, and then being dreffed of his burning, each a piece of copper given them, they went away fo well contented, that this was spread among all the savages for a miracle, that Captain Smith could make a man alive that was dead.

Another ingenious favage of Powhatans, having gotten a great bag of powder, and the back of an armour, at Werowocomoco, amongst many of his companions, to shew his extraordinary skill, he dried it on the back, as he had seen the foldiers at James Town; but he dried it so long, they peeping over it to see his skill, it took fire, and blew him to death, and one or two more, and the rest so scorched, that they had little

pleafure to meddle any more with powder.

These and many other such pretty accidents so amazed and affrighted both Powhatan and all his people, that from all parts, with prefents, they defired peace, returning many stolen things which we never demanded, nor thought of; and after that, those that were taken stealing, both Powhatan and his people have fent them back to James Town, to receive their punishment; and all the country became absolutely as free for us as for themselves.

CHAP. XI. — What was done in three Months, having Vizuals; the Store devoured by Rats; how we lived three Months on fuch natural Fruits as the Country afforded.

NOW we fo quietly followed our business, that in three months we made three or four lasts of tar, pitch, and soap-ashes, produced a trial of glass, made a well in the fort of excellent fweet water, which till then was wanting; built fome twenty houses, recovered our church, provided nets and wires for fishing; and to stop the disorders of our diforderly thieves, and the favages, built a blockhouse in the neck of our isle, kept by a garrifon to entertain the favages' trade, and none to pass or repass, savage nor christian, without the prefident's order; thirty or forty acres of ground we digged and planted; of three fows in eighteen months increased fixty and odd pigs, and near five hundred chickens brought up themselves, without having any meat given them; but the hogs were transported to Hog Isle, where also we built a blockhouse, with a garrison, to give us notice of any fhipping, and for their exercise they made a clapboard and wainfcot, and cut down trees; we built also a fort for a retreat, near a convenient river, upon a high commanding hill, very hard to be affaulted, and eafy to be defended; but ere it was finished, this defect caused a stay.

In fearching our casked corn, we found it half rotten, and the rest so consumed with amany thousands of rats, that increased so fast; but their original was from the ships, fore knew not how to keep that little we had. This did drive us all to our wit's end, and Te was nothing in the country but what nature afforded; until this time, Kemps and plane were fettered prisoners, and did double task and taught us how to order liked our ur fields, whom now for want of victuals we fet at liberty, but so well they fixteen days panies, they did not desire to go from us, and to express their loves, for days of 5 in autinuance the country people brought us (when least) one hundred a day of fquirrels, urkies, deer, and other wild beafts: but this want of corn occasioned the end of all our orks, it being work fufficient to provide victuals. Sixty or eighty, with Enfign Laxon, "ere fent down the river to live upon oysters, and twenty, with

Lieutenant Percy, to try for fishing at Point Comfort; but in fix weeks they would not agree once to cast out the net, he being fick and burnt fore with gunpowder. Mr. West with as many went up to the falls, but nothing could be found but a few acorns; of that in flore every man had his equal proportion. Till this present, by the hazard and endeavours of some thirty or forty, this whole colony had ever been fed; we had more flurgeon than could be devoured by dog and man, of which the industrious, by drying and pounding, mingled with caviare, forell, and other wholesome herbs, would make bread and good meat; others would gather as much tockwhogh roots in a day as would make them bread a week; fo that of those wild fruits, and what we caught, we lived very well in regard of fuch a diet; but fuch was the strange condition of some hundred and fifty, that had they not been forced, nolens, volens, perforce to gather and prepare their victuals, they would all have flarved, or have eaten one another. Of those wild fruits the favages often brought us, and for that the prefident would not fulfil the unreasonable defire of those distracted gluttonous loiterers, to fell not only our kettles, hoes, tools, and iron, nay, fwords, pieces, and the very ordnance and houses, might they have prevailed to have been but idle; for those favage fruits, they would have imparted all to the favages, especially for one basket of corn they heard of to be at Powhatan, fifty miles from our fort. Though he bought near half of it to fatisfy their humours, yet to have had the other half they would have fold their fouls, though not fufficient to have kept them a week. Thousands were their exclamations, fuggestions, and devices, to force him to those base inventions, to have made it an occasion to abandon the country. Want perforce constrained him to endure their exclaiming follies, till he found out the author, one Dyer, a most crafty fellow, and his ancient maligner, whom he worthily punished, and with the rest he argued the case in this manner:

"Fellow foldiers, I did little think any fo falfe to report, or fo many to be fo simple to be perfuaded, that I either intend to starve you, or that Powhatan at this present hath corn for himself, much less for you; or that I would not have it, if I knew where it was to be had: neither did I think any fo malicious as I now fee a great many; yet it shall not fo passionate me, but I will do my best for my most maligner. But dream no longer of this vain hope from Powhatan; not that I will longer for bear to force you from your idleness, and punish you if you rail; but if I find any more runners for Newfoundland with the pinnace, let him affuredly look to arrive at the gallows. You cannot deny but that by the hazard of my life many a time I have faved yours, when (might your own wills have prevailed,) you would have starved; and will do still whether I will or no; but I protest by that God that made me, fince necessity hath not power to force you to gather for yourselves those fruits the earth doth yield, you shall not only gather for yourselves, but those that are sick. As yet I never had more from the store than the worst of you, and all my English extraordinary provision that I have, you shall see me divide it amongst the fick; and this savage trash you so scornfully repine at, being put in your mouths, your stomachs can digest; if you would have better, you should have brought it, and therefore I will take a course you shall provide what is to be had. The fick shall not starve, but equally share of all our labours; and he that gathereth not every day as much as I do, the next day shall be set beyond the river, and be banished from the fort as a drone, till he amend his conditions or starve." But some

would fay with Seneca,

I know those things thou say'ft are true, good nurse, But fury forceth me to follow worse; My mind is hurried headlong up and down, Desiring better counsel, yet finds none.

This order many murmured was very cruel; but it caused the most part to so well beflirthemselves, that of two hundred, (except they were drowned) there died not past seven; as for Captain Winne and Mr. Leigh, they were dead ere this want happened, and the rest died not for want of such as preserved the rest; many were billetted amongst the savages, whereby we knew all their passages, fields, and habitations, how to gather and use their fruits as well as themselves; for they knew we had such a commanding

power at James Town, they durst not wrong us of a pin.

So well those poor favages used us that were thus billetted, that divers of the foldiers ran away to fearch Kemps and Taffore our old prisoners. Glad were these savages to have such an opportunity to testify their love unto us; for instead of entertaining them, and fuch things as they had stolen, with all their great offers and promises they made them how to revenge their injuries upon Captain Smith. Kemps first made himfelf fport, in shewing his countrymen (by them) how he was used, feeding them with this law, who would not work must not eat, till they were near starved indeed, continually threatening to beat them to death: neither could they get from him, till he and his conforts brought them perforce to our captain, that so well contented him and punished them, as many others that intended also to follow them, were rather contented to labour at home, than adventure to live idly amongst the favages (of whom there was more hope to make better Christians and good subjects, than the one-half of those that counterfeited themselves both). For so afraid were all those kings and the better fort of the people to displease us, that some of the baser fort that we have extremely hurt and punished for their villanies, would hire us we should not tell it to their kings or countrymen, who would also re-punish them, and yet return them to James Town to content the prefident for a testimony of their loves.

Mr. Sicklemore well returned from Chawwonoke; but found little hope, and less certainty of them were lest by Sir Walter Raleigh. The river he saw was not great, the people sew, the country most overgrown with pines, where there did grow here and there stragglingly perminaw, we call silk-grass. But by the river the ground was

good, and exceeding fertile.

Mr. Nathaniel Powell and Anas Todkill were also by the Quiyoughquohanocks conducted to the Mangoags to search them there; but nothing could they learn but they were all dead. This honest proper good promise-keeping King, of all the rest did ever best affect us, and though to his false gods he was very zealous, yet he would confess our God as much exceeded his as our guns did his bow and arrows, often sending our president many presents, to pray to his God for rain or his corn would perish, for his gods were angry. Three days journey they conducted them through the woods, into a high country towards the south-west, where they saw here and there a little corn field, by some little spring or small brook, but no river they could see: the people in all respects like the rest, except their language: they live most upon roots, fruits and wild beasts; and trade with them towards the sea and the fatter countries for dried fish and corn, for skins.

All this time to recover the Dutchmen and one Bentley, another fugitive, we employed one William Volday, a Swifs by birth, with pardons and promifes to regain them. Little we then fufpected this double villain of any villainy, who plainly taught us, in the most trust was the greatest treason; for this wicked hypocrite, by the scenning hate he bore to the lewd conditions of his cursed countrymen, (having this opportunity by his employment to regain them,) conveyed them every thing they desired to effect their projects, to destroy the colony. With much devotion they expected the Spaniards, to whom they intended good service, or any other, that would but carry them from us.

But

But to begin with the first opportunity: they seeing necessity thus enforced us to disperse ourselves, importuned Powhatan to lend them but his forces, and they would not only destroy our hogs, fire our town, and betray our pinnace, but bring to his fervice and subjection the most of our company. With this plot they had acquainted many discontents, and many were agreed to their devilish practice. But one Thomas Doufe, and Thomas Mallard (whofe Christian hearts relented at such an unchristian act) voluntarily revealed it to Captain Smith, who caused them to conceal it, persuading Doufe and Mallard to proceed in their confederacy: only to bring the irreclaimable Dutchmen and the inconstant favages in such a manner amongst such ambuscadoes as he had prepared, that not many of them should return from our peninsula. But this brute coming to the ears of the impatient multitude, they so importuned the president to cut off those Dutchmen, as amongst many that offered to cut their throats before the face of Powhatan, the first was Lieutenant Percy, and Mr. John Cuderington, two gentlemen of as bold resolute spirits as could possibly be found. But the president had occasion of other employment for them, and gave way to Mr. Wysfin and serjeant Jeffry Abbot, to go and flab them or shoot them. But the Dutchmen made such excufes, accusing Volday, whom they supposed had revealed their project, as Abbot would not, yet Wyffin would, perceiving it but deceit. The King understanding of this their employment, fent prefently his meffengers to Captain Smith to fignify it was not his fault to detain them, nor hinder his men from executing his command: nor did he nor would be maintain them, or any to occasion his displeasure.

But whilft this bufinefs was in hand, arrived one Captain Argall, and Mr. Thomas Sedan, fent by Mr. Cornelius to truck with the colony, and fish for sturgeon, with a ship well furnished with wine, and much other good provision. Though it was not sent us, our necessities was such as enforced us to take it. He brought us news of a great fupply, and preparation for the Lord La Warre, with letters that much taxed our prefident for his hard dealing with the favages, and not returning the ships freighted. Notwithstanding, we kept this ship till the fleet arrived. True it is Argall lost his voyage, but we revictualled him, and fent him for England, with a true relation of the causes of our defailments, and how impossible it was to return that wealth they expected, or observe their instructions to endure the favages' insolence, or do any thing to any purpose, except they would fend us men and means that could produce that they so much defired: otherwife all they did was loft, and could not but come to confusion. The villainy of Volday we still diffembled. Adam, upon his pardon, came home; but Samuel still stayed with Powhatan, to hear further of their estates by this supply. Now all their plots Smith fo well understood, they were his best advantages to secure us from any treachery could be done by them or the favages: which with facility he could revenge when he would, because all those countries more feared him than Powhatan. and he had fuch parties with all his bordering neighbours; and many of the rest for love or fear would have done any thing he would have them, upon any commotion, though these fugitives had done all they could to perfuade Powhatan King James would

kill Smith, for using him and his people so unkindly.

By this you may see for all those crosses, treacheries, and dissentions, how he wrestled and overcame (without bloodshed) all that happened; also what good was done; how few died; what food the country naturally afforded; what small cause there is men should starve, or be murdered by the savages, that have discretion to manage them with courage and industry. The two first years, though by his adventures, he had oft brought the savages to a tractable trade, yet you see how the envious authority ever crossed him, and frustrated his best endeavours. But it wrought in him that expe-

rience and estimation amongst the savages, as otherwise it had been impossible he had ever effected that he did. Notwithstanding the many miserable, yet generous and worthy adventures, he had oft and long endured in the wide world, yet in this case he was again to learn his lecture by experience. Which with thus much ado having obtained, it was his ill chance to end, when he had but only learned how to begin. And though he left those unknown difficulties (made easy and familiar) to his unlawful fucceffors, (who, only by living in James Town, prefumed to know more than all the world could direct them:) now though they had all his foldiers, with a triple power, and twice triple better means; by what they have done in his absence, the world may fee what they would have done in his prefence, had he not prevented their indifcretions: it doth justly prove, what cause he had to send them for England, and that he was neither factious, mutinous, nor dishonest. But they have made it more plain since his return for England; having his absolute authority freely in their power, with all the advantages and opportunity that his labours had effected. As I am forry their actions have made it fo manifest, so I am unwilling to say what reason doth compel me, but only to make apparent the truth, least I should seem partial, reasonless, and malicious.

CHAP. XII. - The Arrival of the third Supply.

TO redrefs those jars and ill proceedings, the treasurer, council, and company of Virginia, not finding that return and profit they expected; and them engaged there not having means to fubfift of themselves, made means to His Majesty to call in their commission and take a new in their own names, as in their own publication, 1610, you may read at large. Having thus annihilated the old by virtue of a commission made to the Right Honourable Sir Thomas West, Lord de la Warre, to be General of Virginia, Sir Thomas Gates, his lieutenant, Sir George Somers, admiral, Sir Thomas Dale, high marshal, Sir Ferdinando Wainman, general of the horse, and so all other offices to many other worthy gentlemen for their lives, (though not any of them had ever been in Virginia, except Captain Newport, who was also by patent made viceadmiral); those noble gentlemen drew in such great sums of money, that they sent Sir Thomas Gates, Sir George Somers, and Captain Newport, with nine ships and five hundred people, who had each of them a commission, who first arrived to call in the old, without the knowledge or confent of them that had endured all those former dangers to beat the path, not any regard had at all of them. All things being ready, because those three captains could not agree for place, it was concluded they should go all in one ship, so all their three commissions were in that ship with them called the Sea-Venture. They fet fail from England in May 1609. A fmall catch perished at fea in a hericano, the admiral with an hundred and fifty men, with the two knights, and their new commissions, their bills of loading, with all manner of directions, and the most part of their provision arrived not. With the other seven ships, as captains, arrived Ratliffe, whose right names (as is faid) was Sicklemore, Martin, and Archer, with Captain Wood, Captain Webbe, Captain Moone, Captain King, Captain Davis, and divers gentlemen of good means and great parentage. But the first as they had been troublefome at fea began again to mar all ashore, for though (as is said) they were formerly fent for England, yet now returning again, graced by the titles of captains of the passengers, seeing the admiral wanting, and great probability of her lofs, ftrengthened theinfelves with those new companies, so exclaiming against Captain Smith, that they mortally hated him cre ever they faw him. Who, understanding by his fcouts, the arrival of fuch a fleet, little dreaming of any fuch fupply, fupposed them Spaniards. But he quickly so determined and ordered our affairs, as we little feared their arrival, nor the success of our encounter; nor were the savages any way negligent for the most part to aid and affist us with their best power. Had it so been we had been happy, for we would not have trusted them but as our foes, where receiving them as our countrymen and friends, they did what they could to murder our president, to surprise the store, the fort, and our lodgings, to usurp the government, and make us all their fervants and slaves till they could consume us and our remembrance; and rather indeed to supplant us then supply us, as Mr. William Box, an honest gentleman in this voyage, thus relateth.

In the tail of a hurricane we were feparated from the admiral, which although it was but the remainder of that ftorm, there is feldom any fuch in England, or those northern parts of Europe. Some lost their masts, some their fails blown from their yards; the seas so over-raking our ships, much of our provision was spoiled, our sleet separated, and our men sick, and many died, and in this miserable state we arrived at

Virginia.

But in this ftorm,

When rattling thunder ran along the clouds, Did not the failors poor, and masters proud, A terror feel as struck with fear of God: Did not their trembling joints then dread his rod, Least for foul deeds and black mouth'd blasphemies, The rueful time be come that vengeance cries?

To a thousand mischiefs those lewd captains led this lewd company, wherein were many unruly gallants, packed thither by their friends to escape ill destinies, and those would dispose and determine of the government, sometimes to one, the next day to another, to-day the old commission must rule, to-morrow the new, the next day neither, in fine they would rule all or ruin all: yet in charity we must endure them thus to destroy us, or by correcting their follies, have brought the world's censure upon us to be guilty of their bloods. Happy had we been had they never arrived, and we for ever abandoned, and as we were left to our fortunes, for on earth for the number

was never more confusion or misery, than their factions occasioned.

The prefident feeing the defire those braves had to rule, feeing how his authority was so unexpectedly changed, would willingly have left all, and have returned for England. But seeing there was small hope this new commission would arrive, longer he would not suffer those factious spirits to proceed. It would be too tedious, too strange, and almost incredible, should I particularly relate the infinite dangers, plots, and practices, he daily escaped amongst this factious crew, the chief whereof he quickly laid by the heels, till his leisure better served to do them justice, and to take away all occasions of surther mischief; Mr. Percie had his request granted to return for England, being very sick; and Mr. West with an hundred and twenty of the best he could choose, he sent to the Falles; Martin with near as many to Nandsamund, with their due proportions of all provisions according to their numbers.

Now the prefident's year being near expired he made Captain Martin prefident to follow the order for the election of a prefident every year, but he knowing his own infufficiency and the companies' untowardness and little regard of him, within three hours after refigned it again to Captain Smith, and at Nandfamund thus proceeded. The people being contributers used him kindly, yet such was his jealous fear, in the midst of their mirth he did surprise this poor naked king with his monuments, houses,

and the ifle he inhabited, and there fortified himfelf, but so apparently distracted with fear, as emboldened the savages to assault him, kill his men, release their king, gather and carry away a thousand bushels of corn, he not once offering to intercept them; but fent to the president, then at the Falls, for thirty good shot, which from James Town immediately was sent him. But he so well employed them they did just nothing, but returned complaining of his tenderness, yet he came away with them to James Town, leaving his company to their fortunes.

Here I cannot omit the courage of George Forrest, that had seventeen arrows sticking in him and one shot through him, yet lived six or seven days, as if he had small

hurt, then for want of chirurgery died.

Mr. West having seated his men by the Falls, presently returned to revisit James Town, the president followed him to see that company seated, met him by the way, wondering at his so quick return, and found his company planted so inconsiderately in a place not only subject to the river's inundation, but round environed with many intolerable inconveniences.

For remedy whereof he presently sent to Powhatan to sell him the place called Powhatan, promising to defend him against the Monacans. And these should be his conditions, (with his people) to resign him the fort and houses, and all that country for a proportion of copper; that all stealing offenders should be sent him, there to receive their punishment; that every house as a custom should pay him a bushel of corn for an inch square of copper, and a proportion of pocones, as a yearly tribute to King James for their protection, as a duty; what else they could spare to barter at

their best discretion.

But both this excellent place and those good conditions did those furies refuse, contemning both him, his kind care and authority. So much they depended on the Lord-General's new commission, as they regarded none: the worst they could do to shew their fpite they did; fuppofing all the Monacan's country, gold; and none should come there but whom they pleafed. I do more than wonder to think how only with five men, he either durft or would adventure as he did, (knowing how greedy they were of his blood) to land amongst them, and commit to imprisonment all the chieftains of those mutinies, till by their multitudes, being an hundred and twenty, they forced him to retire; yet in that interim he surprised one of their boats, wherewith he returned to their ship; where indeed was their provision, which also he took; and well it chanced he found the mariners fo tractable and conftant, or there had been small possibility he had ever escaped. There were divers other of better reason and experience, that from their first landing, hearing the general good report of his old foldiers, and seeing with their eyes his actions fo well managed with diferetion, as Captain Wood, Captain Webbe, Captain Moone, Captain Fitz-James, Mr. William Powell, Mr. Patridge, Mr. White, and divers others, when they perceive the malice of Ratliffe and Archer, and their faction, left their companies, and ever refted his faithful friends. But the worft was that the poor favages, that daily brought in their contribution to the prefident, that diforderly company fo tormented those poor fouls, by stealing their corn, robbing their gardens, beating them, breaking their houses, and keeping some prisoners that they daily complained to Captain Smith, he had brought them for protectors, worfe enemies then the Monacans themselves: which, though till then, for his love they had endured, they defired pardon if hereafter they defended themselves; fince he would not correct them, as they had long expected he would. So much they importuned him to punish their misdemeanors, as they offered (if he would lead them) to fight for him against them. But having fpent nine days in feeking to reclaim them; shewing them how much

much they did abuse themselves with these great gilded hopes of the South Sea mines, commodities, or victories, they so madly conceived; then seeing nothing would prevail, he set fail for James Town.

Thus oft we fee from small green wounds, and from a little grief, A greater fore and sickness grows, than will admit relief. For thus themselves they did beguile, and with the rest play'd thief.

Now no fooner was the ship under fail, but the favages assaulted those hundred and twenty in their fort, sinding some straggling abroad in the woods: they slew many, and so affrighted the rest, as their prisoners escaped, and they safely retired, with the swords and cloaks of those they had slain. But ere we had sailed half a league, our ship grounding, gave us once more liberty to summon them to a parley; where we found them all so strangely amazed with this poor silly assault of twelve savages, that they submitted themselves upon any terms to the president's mercy; who presently put by the heels six or seven of the chief offenders: the rest he seated gallantly at Powhatan, in that savage fort, ready built, and prettily fortisted with poles and barks of trees, sufficient to have defended them from all the savages in Virginia, dry houses for lodgings, and near two hundred acres of ground ready to be planted, and no place we knew so strong, so pleasant, and delightful in Virginia, for which we called it Non-such. The savages also he presently appealed, re-delivering to either party their former losses. Thus all were friends.

New officers appointed to command, and the prefident again ready to depart, at that inftant arrived Captain West, whose gentle nature (by the persuasions and compassion of those mutinous prisoners, alledging they had only done this for his honour) was so much abused, that to regain their old hopes, new turboils did arise. For they ashore being possessed of all their victuals, munition, and every thing, grew to that height in their former factions, as the president left them to their fortunes; they returned again to the open air at Wests Fort, abandoning Non-such, and he to James Town with his

best expedition, but this happened him in that journey.

Sleeping in his boat, (for the fhip was returned two days before) accidentally, one fired his powder-bag, which tore the flesh from his body and thighs, nine or ten inches fquare in a most pitiful manner, but to quench the tormenting fire, frying him in his cloaths, he leaped overboard into the deep river, where ere they could recover him he was near drowned. In this flate without either furgeon or furgery, he was to go near a hundred miles. Arriving at James Town, caufing all things to be prepared for peace or war to obtain provision, whilst those things were providing, Ratlisse, Archer, and the rest of their confederates, being to come to their trials; their guilty consciences, fearing a just reward for their deferts, seeing the president unable to stand, and near bereft of his fenses by reason of his torment, they had plotted to have murdered him in his b" But his heart did fail him that fhould have given fire to that merciless piftol. § not finding that course to be the best, they joined together to usurp the government hereby to escape their punishment. The president had notice of their projects, e which to withstand, though his old soldiers importuned him but permit them to take neir heads that would refift his command, yet he would not fuffer them, but fent for the masters of the ships, and took order with them for his return for England. ceing there was neither surgeon nor surgery in the fort to cure his hurt, and the steps to depart the next day, his commission to be suppressed he knew not why, himset and soldiers to be rewarded he knew not how, and a new commission granted thy knew not to whom, (the which disabled that authority he had, as made them presume so oft to those mutinies.

mutinies as they did:) befides fo grievous were his wounds, and fo cruel his torments (few expecting he could live) nor was he able to follow his business to regain what they had loft, suppress those factions, and range the countries for provision as he intended; and well he knew in those affairs his own actions and presence was as requisite as his directions, which now could not be, he went presently abroad, resolving there to appoint them governors, and to take order for the mutineers, but he could find none, he thought fit for it, would accept it. In the mean time, seeing him gone, they persuaded Mr. Percy to stay, who was then to go for England, and be their president. Within less than an hour was this mutation begun and concluded. For when the company understood Smith would leave them, and saw the rest in arms called presidents and councillors, divers began to fawn on those new commanders, that now bent all their wits to get him resign them his commission: who after much ado and many bitter repulses; that their confusion (which he told them was at their elbows) should not be attributed to him, for leaving the colony without a commission, he was not unwilling they should steal it, but never would he give it to such as they. And thus,

Strange violent forces drew us on unwilling, Reason persuading 'gainst our loves rebelling; We saw and knew the better, ah curse accust, That notwithstanding we embrace the worst

But had that unhappy blast not happened, he would quickly have qualified the heat of those humors and factions, had the ships but once left them and us to our fortunes, and have made that provision from among the savages, as we neither feared Spaniard, savage, nor famine; nor would have left Virginia, nor our lawful authority, but at as dear a price as we had bought it, and paid for it. What shall I say but thus, we left him, that in all his proceedings, made justice his first guide, and experience his second, even hating baseness, sloth, pride, and indignity, more than any dangers; that never allowed more for himself than his soldiers with him; that upon no danger would fend them where he would not lead them himself; that would never see us want, what he either had, or could by any means get us; that would rather want than borrow, or starve than not pay; that loved action more than words, and hated falshood and covetousness worse than death; whose adventures were our lives, and whose loss our deaths.

Leaving us thus with three ships, seven boats, commodities ready to trade, the harvest newly gathered, ten weeks provision in the store, four hundred ninety and odd persons, twenty-four pieces of ordnance, three hundred muskets, snaphances, and sirelocks, shot, powder, and match sufficient, curats, pikes, swords, and morrios, more than men; the savages, their language, and habitations well known to an hundred full-trained and expert soldiers, nets for sissing, tools of all forts to work, apparel to suffice the sum of the same sand a horse, sive or six hundred swine, as many hens and chick as, some goats, some sheep, what was brought or bred there remained. But they nothing, to persect some colourable complaints against Captain Smith; for effecting whereof, the weeks longer they stayed the ships, till they could produce them. That time and chars might much better have been spent, but it suited well with the rest of their discretions.

Befides James 1 wn, that was strongly pallisadoed, containing some fifty or fixty houses, he left five of fix other several forts and plantations; though they were not so sumptuous as our successrs expected, they were better than they provided any for us.

All

All this time we had but one carpenter in the country, and three others that could do little, but defired to be learners, two blackfmiths, two failors, and those we write labourers were for most part footmen, and such as they that were adventurers brought to attend them, or such as they could persuade to go with them, that never did know what a day's work was, except the Dutchmen and Poles, and some dozen other; for all the rest were poor gentlemen, tradesmen, serving-men, libertines, and such like, ten times more sit to spoil a commonwealth, than either begin one, or but help to maintain one: for when neither the fear of God, nor the law, nor shame, nor displeasure of their friends, could rule them here, there is small hope ever to bring one in twenty of them ever to be good there. Notwithstanding, I confess divers amongst them had better minds, and grew much more industrious than was expected; yet ten good workmen would have done more substantial work in a day, than ten of them in a week; therefore men may rather wonder how we could do so much, than use us so badly, because we did no more, but leave those examples to make others beware, and the fruits of all, we know not for whom.

But to fee the justice of God upon these Dutchmen; Valdo before spoke of, made a shift to get for England, where persuading the merchants what rich mines he had found, and great service he would do them, was very well rewarded, and returned with the Lord La Warre; but being found a mere impostor, he died most miserably. Adam and Francis, his two conforts, were sled again to Powhatan, to whom they promised, at the arrival of my Lord, what wonders they would do, would he suffer them but to go to him; but the King seeing they would be gone, replied, You, that would have betrayed Captain Smith to me, will certainly betray me to this great Lord for your

peace: fo caufed his men to beat out their brains.

To conclude, the greatest honour that ever belonged to the greatest monarchs, was the enlarging their dominions, and erecting commonwealths. Yet, howfoever any of them have attributed to themselves the conquerors of the world, there is more of the world never heard of them, than ever any of them all had in subjection; for the Medes. Persians, and Assyrians never conquered all Asia, nor the Grecians but part of Europe and Asia: the Romans, indeed, had a great part of both, as well as Africa; but as for all the northern parts of Europe and Asia, the interior southern and western parts of Africa, all America and Terra Incognita, they were all ignorant: nor is our knowledge yet but fuperficial: that their beginnings, ending, and limitations, were proportioned by the Almighty is most evident; but to consider of what small means many of them have begun is wonderful; for some write that even Rome herself, during the reign of Romulus, exceeded not the number of a thousand houses, and Carthage grew so great a potentate, that at first was but encircled in the thongs of a bulls skin, as to fight with Rome for the empire of the world. Yea, Venice, at this time the admiration of the earth, was at first but a marsh, inhabited by poor fishermen; and likewise Ninevie, Thebes, Babylon, Delus, Troy, Athens, Mycena, and Sparta, grew from fmall beginnings to be most famous states, though now they retain little more than a naked name. Now this our young commonwealth, in Virginia, as you have read, once confifted but of thirty-eight persons, and in two years increased but to two hundred; yet by this small means, fo highly was approved the plantation in Virginia, as how many lords, with worthy knights, and brave gentlemen, pretended to fee it, and fome did, and now after the expense of fifteen years more, and fuch maffy fums of men and money, they grow difanimated. If we truly confider our proceedings with the Spaniards, and the rest, we have no reason to despair, for with so small charge, they never had either greater discoveries, with fuch certain trials of more feveral commodities, than in this short time

hath been returned from Virginia, and by much less means. New England was brought out of obscurity, and afforded freight for near two hundred sail of ships where there is now erected a brave plantation. For the happiness of Summer Isles, they are no less than either, and yet those have had a far less and a more difficult beginning than either Rome, Carthage, or Venice.

Written by RICHARD POTS, clerk of the council, WILLIAM TANKARD, and G. P.

BOOK IV.

TO make plain the true proceedings of the history for 1609, we must follow the examinations of Dr. Simons, and two learned orations published by the Company; with the relation of the Right Honourable the Lord De la Ware.

What happened in the first Government after the Alteration in the Time of Captain George Piercie, their Governor.

THE day before Captain Smith returned for England with the ships, Captain Davis arrived in a fmall pinnace, with fome fixteen proper men more; to these were added a company from James Town, under the command of Captain John Sickelmore, alias Ratcliffe, to inhabit Point Comfort. Captain Martin and Captain West, having lost their boats and near half their men among the favages, were returned to James Town; for the favages no fooner understood Smith was gone, but they all revolted, and did fpoil and murder all they encountered. Now we were all conftrained to live only on that Smith had only for his own company, for the rest had confumed their proportions, and now they had twenty prefidents, with all their appurtenances: Mr. Piercie, our new prefident, was fo fick he could neither go nor fland. But ere all was confumed, Captain-West and Captain Sickelmore, each with a small ship, and thirty or forty men well appointed, fought abroad to trade. Sickelmore, upon the confidence of Powhatan, with about thirty others as carelefs as himfelf, were all flain, only Jeffrey Shortridge efcaped, and Pokahontas, the King's daughter, faved a boy called Henry Spilman, that lived many years after, by her means, amongft the Patawomekes. Powhatan, still as he found means, cut off their boats, denied them trade, fo that Captain West fet fail for England. Now we all found the loss of Captain Smith, yea, his greatest maligners could now curse his loss. As for corn, provision, and contribution from the favages, we had nothing but mortal wounds, with clubs and arrows; as for our hogs, hens, goats, sheep, horse, or what lived, our commanders, officers, and favages daily confumed them; fome fmall proportions fometimes we tafted, till all was devoured; then fwords, arms, pieces, or any thing, we traded with the favages, whose cruel fingers were so oft imbrued in our bloods, that what by their cruelty, our governor's indifcretion, and the lofs of our ships, of five hundred within fix months after Captain Smith's departure, there remained not past fixty men, women, and children, most miserable and poor creatures; and those were preserved for the most part by roots, herbs, acorns, walnuts, berries, now and then a little fifh: they that had ftarch in thefe extremities made no fmall use of it; yea, even the very skins of our horses; nay, fo great was our famine, that a favage we flew and buried, the poorer fort took him up again and eat him, and fo did divers one another, boiled and flewed with roots and herbs: and one amongst the rest did kill his wife, powdered her, and had eaten

part of her before it was known, for which he was executed, as he well deferved; now whether she was better roasted, boiled, or carbonadoed, I know not, but of such a dish as powdered wife I never heard of. This was that time, which still to this day we called the starving time; it were too vile to fay, and scarce to be believed what we endured: but the occasion was our own, for want of providence, industry, and government, and not the barrenness and defect of the country, as is generally supposed; for till then in three years, for the numbers were landed us, we had never from England provision sufficient for fix months, though it feemed by the bills of lading fufficient was fent us, fuch a glutton is the fea, and fuch good fellows the mariners, we as little tasted of the great proportion sent us, as they of our want and miseries; yet notwithstanding they ever over-swayed and ruled the business, though we endured all that is faid, and chiefly lived on what this good country naturally afforded; yet had we been even in paradife itfelf with thefe governors, it would not have been much better with us; yet there was amongst us, who had they had the government as Captain Smith appointed, but that they could not maintain it, would furely have kept us from those extremities of miseries. This in ten days more would have supplanted us all with death.

But God, that would not this country should be unplanted, sent Sir Thomas Gates and Sir George Sommers, with one hundred and fifty people, most happily preserved by the Bermudas to preserve us: strange it is to say, how miraculously they were preserved in a leaking ship, as at large you may read in the ensuing history of those islands.

The Government resigned to Sir Thomas Gates, 1610.

WHEN these two noble knights did see our miseries, being but strangers in that country, and could understand no more of the cause, but by conjecture of our clamours and complaints, of accusing and excusing one another: they embarked us with themselves, with the best means they could, and abandoning James Town, set fail for England, whereby you may see the event of the government of the former commanders lest to themselves; although they had lived there many years, as formerly hath been spoken (who hindered now their proceedings, Captain Smith being gone).

At noon they fell to the Isle of Hogs, and the next morning to Mulberry Point, at what time they descried the long-boat of the Lord La Ware, for God would not have it so abandoned. For this honourable Lord, then governor of the country, met them with three ships, exceedingly well furnished with all necessaries sitting, who again returned them to the abandoned James Town.

Out of the observations of WILLIAM SIMMONS, Doctor of Divinity,

The Government devolved to the Lord La Ware.

HIS LORDSHIP arrived the ninth of June, 1610, accompanied with Sir Ferdinando Waynman, Captain Houlcroft, Captain Lawfon, and divers other gentlemen of fort; the 10th he came up with his fleet, went on shore, heard a fermon, read his commission, and entered into confultation for the good of the colony, in which secret council we will a little leave them, that we may duly observe the revealed counsel of God. He that shall but turn up his eye, and behold the spangled canopy of heaven, or shall but cast down his eye, and consider the embroidered carpet of the earth, and withal shall mark how yol. XIII.

the heavens hear the earth, and the earth the corn and oil, and they relieve the necessities of man, that man will acknowledge God's infinite providence: but he that shall further observe, how God inclineth all casual events to work the necessary help of his faints, must needs adore the Lord's infinite goodness. Never had any people more just cause to cast themselves at the very footstool of God, and to reverence his mercy, than this diffressed colony; for if God had not sent Sir Thomas Gates from the Bermudas, within four days they had almost been famished; if God had not directed the heart of that noble knight to fave the fort from firing at their flipping, for many were very importunate to have burnt it, they had been destitute of a present harbour and fuccour; if they had abandoned the fort any longer time, and had not fo foon returned, questionless the Indians would have destroyed the Fort, which had been the means of our fafeties amongst them, and a terror. If they had fet fail sooner, and had launched into the vaft ocean, who would have promifed they should have encountered the fleet of the Lord La Ware, especially when they made for Newfoundland, as they intended, a course contrary to our navy approaching. If the Lord La Ware had not brought with him a year's provision, what comfort would those poor fouls have received to have been relanded to a fecond destruction? This was the arm of the Lord of Hofts, who would have his people pass the Red Sea and wilderness, and then to possess the land of Canaan. It was divinely spoken of heathen Socrates, " If God for man be careful, why should man be over-distrustful? for he hath so tempered the contrary qualities of the elements,

That neither cold things want heat, nor moist things dry, Nor sad things spirits, to quicken them thereby, Yet make they musical content of contrariety, Which conquer'd, knits them in such links together, They do produce even all this whatsoever.

The lord-governor, after mature deliberation, delivered fome few words to the company, laying just blame upon them for their haughty vanities and fluggish idleness, earneftly entreating them to amend those desperate follies, less he should be compelled to draw the fword of justice, and to cut off fuch delinquents, which he had rather draw, to the fliedding of his vital blood, to protect them from injuries; heartening them with relation of that store he had brought with him, constituting officers of all conditions, to rule over them, allotting every man his particular place, to watch vigilantly, and work painfully: this oration and direction being received with a general applaufe, you might fhortly behold the idle and refty difeases of a divided multitude, by the unity and authority of this government to be substantially cured. Those that knew not the way to goodness before, but cherished singularity and faction, can now chalk out the path of all respective duty and service: every man endcavoureth to outstrip other in diligence: the French preparing to plant the vines, the English labouring in the woods and grounds; every man knoweth his charge, and dischargeth the fame with alacrity. Neither let any man be discouraged, by the relation of their daily labour (as though the fap of their bodies should be spent for other men's profit) the fettled times of working, to effect all themselves, or as the adventurer's need desire, required no more pains than from fix of the clock in the morning, until ten, and from two in the afternoon till four, at both which times they are provided of fpiritual and corporal relief. First, they enter into the church, and make their prayers unto God, next they return to their houses and receive their proportion of food. Nor should it be conceived that this bufinefs excludeth gentlemen, whose breeding never knew what a day's labour meant, for though they cannot dig, use the spade, nor practise the axe, yet may the staid spirits of any condition, sind how to employ the force of knowledge, the exercise of council, the operation and power of their best breeding and qualities. The houses which are built, are as warm and defensive against wind: d weather, as if they were tiled and slated, being covered above with strong boards, and some matted round with Indian mats. Our forces are now such as are able to tame the fury and treachery of the savages: our forts assure the inhabitants, and frustrate all assailants. And to leave no discouragement in the heart of any, who personally shall enter into this great action, I will communicate a double comfort; first, Sir George Sommers, that worthy admiral, hath undertaken a dangerous adventure for the good of the colony.

Upon the 15th of June, accompanied with Captain Samuel Argall, he returned in two pinnaces unto the Bermudas, promifing (if by any means God will open a way to that ifland of rocks) that he would foon return with fix months provision of flesh. With much cross weather at last he there fasely arrived, but Captain Argall was forced back again to James Town, whom the Lord De la Ware not long after sent to the river of Patawomeke, to trade for corn; where finding an English boy, one Henry Spilman, a young gentleman well descended, by those people preserved from the sury of Powhatan, by his acquaintance had such good usage of those kind savages, that they

freighted his ship with corn, wherewith he returned to James Town.

The other comfort is, that the Lord la Ware hath built two new forts, the one called Fort Henry, the other Fort Charles, in honour of our most noble Prince, and his hopeful brother, upon a pleasant plain, and near a little rivulet they call Southampton river; they stand in a wholesome air, having plenty of springs of sweet water, they command a great circuit of ground, containing wood, pasture and marsh, with apt places for vines, corn and gardens; in which forts it is resolved, that all those that come out of England, shall be at their first landing quartered, that the wearisomeness of the sea may be refreshed in this pleasing part of the country, and Sir Thomas Gates he sent for England. But to correct some injuries of the Paspahegs, he sent Captain Piercie, Mr. Stacy, and sifty or threescore shot, where the savages slying, they burnt their houses, took the Queen and her children prisoners, whom not long after they slew.

The fertility of the foil, the temperature of the climate, the form of government, the condition of our people, their daily invocating of the name of God being thus expressed, why should the success, by the rules of mortal judgment, be disparaged? why should not the rich harvest of our hopes be seasonably expected? I dare say, that the resolution of Cæsar in France, the designs of Alexander, the discoveries of Hernando Cortes in the West, and of Emanuel King of Portugal in the East, were not

encouraged upon fo firm grounds of state and possibility.

But his lordship being at the Falls, the savages assaulted his troops, and slew three or four of his men. Not long after, his honour growing very sick, he returned for England the 28th of March; in the ship were about five and sifty men, but ere we arrived at Fyall, forty of us were near sick to death, of the scurvy, calenture, and other diseases: the governor, being an Englishman, kindly used us, but small relief we could get, but oranges, of which we had plenty, whereby within eight days we recovered, and all were well and strong by that they came into England.

Written by WILLIAM Box:

The counsel of Virginia finding the smallness of that return which they hoped should have defrayed the charge of a new supply, entered into a deep consultation, whether it were fit to enter into a new contribution, or in time to send for them home, and give

over the action, and therefore they adjured Sir Thomas Gates to deal plainly with, them, who with a folemn and a facred oath replied, "That all things before reported were true, and that all men know that we fland at the devotion of politic princes and flates, who for their proper utility devife all courfes to grind our merchants, and by all pretences to conficate their goods, and to draw from us all manner of gain by their inquifitive intentions, when in Virginia, a few years labour, by planting and husbandry, will furnish all our defects with honour and fecurity."

Out of a declaration published by the council, 1610.

The Government left again to Captain George Piercie, and the return of the Lord La Ware, with his relation to the Council.

MY LORDS, now by accident returned from my charge at Virginia, contrary either to my own defire, or other men's expectations, who spare not to censure me, in point of duty, and to discourse and question the reason, though they apprehend not the true cause of my return, I am forced out of a willingness to satisfy every man, to deliver unto your lordships and the rest of this assembly, in what state I have lived ever since my arrival to the colony, what hath been the just cause of my sudden departure, and on what terms I have left the fame, the rather because I perceive, that fince my coming into England, fuch a coldness and irresolution is bred in many of the adventurers, that fome of them feek to withdraw their payments, by which the action must be supported, making this my return colour of their needless backwardness and unjust protraction: which that you may the better understand, I was welcomed to James Town by a violent ague; being cured of it, within three weeks after I began to be diftempered with other grievous fickness which successively and severally affailed me, for befides a relapfe into the former difease, which with much more violence held me more than a month, and brought me to greater weakness; the flux surprized me, and kept me many days, then the cramp affaulted my weak body with strong pains, and after, the gout; all those drew me to that weakness, being unable to stir, brought upon me the fourty, which though in others it be a fickness of flothfulness, yet was it in me an effect of weakness, which never left me, till I was ready to leave the world.

In these extremities I resolved to consult with my friends, who sinding nature spent in me, and my body almost consumed, my pains likewise daily increasing, gave me advice to preser a hopeful recovery, before an assured ruin, which must necessarily have ensued, had I lived but twenty days longer in Virginia, wanting at that instant both food and physic, sit to remedy such extraordinary diseases (wherefore I shipped myself with Doctor Bohun and Captain Argall, for Mevis, in the West Indies, but being crossed with southerly winds, I was forced to shape my course for the Western siles, where I sound help for my health, and my sickness assuged, by the means of fresh diet, especially oranges and lemons, an undoubted remedy for that disease: then I intended to have returned back again to Virginia, but I was advised not to hazard myself, before I had perfectly recovered my strength: so I came for England, in which accident, I doubt not but men of judgment will imagine, there would more prejudice

have happened by my death there, than I hope can do by my return.

For the colony I left it to the charge of Captain George Piercie, a gentleman of honour and resolution, until the coming of Sir Thomas Dale, whose commission was likewise to be determined upon the arrival of Sir Thomas Gates, according to the order your Lordships appointed: the number I left were about two hundred, the most in health, and provided of at least ten months victuals, and the country people tract-

able and friendly. What other defects they had, I found by Sir Thomas Gates at the Cowes; his fleet was fufficiently furnished with supplies, but when it shall please God that Sir Thomas Dale and Sir Thomas Gates shall arrive in Virginia with the extraordinary supply of one hundred kine, and two hundred swine, besides store of other provision, for the maintenance of the colony, there will appear that success in the action, as shall give no man cause of distrust, that hath already adventured, but encourage every good mind to further so good a work, as will redound both to the glory of God, to the credit of our nation, and the comfort of all those that have been instruments in the furthering of it."

Out of the Lord La Ware's discourse, published by authority, 1611.

The Government furrendered to Sir Thomas Dale, who arrived in Virginia the 10th of May 1611. Out of Mr. Hamor's Book.

BEFORE the Lord La Ware arrived in England, the council and company had difpatched away Sir Thomas Dale with three ships, men and cattle, and all other provisions necessary for a year; all which arrived well the 10th of May 1611, where he found them growing again to their former state of penury, being so improvident as not to put corn in the ground for their bread, but trusted to the store, then surnished but with three months provision; his first care therefore was to employ all hands about setting of corn, at the two forts at Kecoughtan, Henry and Charles, whereby the season then not fully past, though about the end of May, we had an indifferent crop of good corn.

This business taken order for, and the care and trust of it committed to his underofficers, to James Town he hastened, where most of the company were at their daily
and usual works, bowling in the streets; these he employed about necessary works, as
felling of timber, repairing their houses ready to fall on their heads, and providing
pales, posts and rails, to impale his proposed new town, which by reason of his ignorance,
being but newly arrived, he had not resolved where to seat; therefore to better his
knowledge, with one hundred men he spent some time in viewing the river of Nausamund, in despite of the Indians then our enemies; then our own river to the Falls,
where upon a high land, environed with the main river, some twelve miles from the

Falls, by Arfahattock, he refolved to plant his new town.

It was no fmall trouble to reduce his people fo timely to good order, being of fo ill a condition, as may well witness his fecurity and strict imprinted book of articles, then needful with all extremity to be executed; now much mitigated: fo as if his laws had not been fo strictly executed, I see not how the utter subversion of the colony should have been prevented, witness Webbe's and Price's defign the first year, fince that of Abbot's, and others, more dangerous than the former. Here I entreat your patience for an apology, though not a pardon. This Jeffrey Abbots, however this author cenfures him, and the governor executes him, I know he had long ferved both in Ireland and Netherlands; here he was a ferjeant of my company, and I never faw in Virginia a more fufficient foldier, less turbulent, a better wit, more hardy or industrious, nor any more forward to cut off them that fought to abandon the country, or wrong the colony; how ungratefully those deferts might be rewarded, envied, or neglected, or his far inferiors preferred to over-top him, I know not, but fuch occasions might move a faint, much more a man, to an unadvifed passionate impatience; but however, it feems he hath been punished for his offences, that was never rewarded for his deferts. And even this fummer Cole and Kitchins plot with three more, bending their

course

course to Ocanahowan, five days journey from us, where they report are Spaniards inhabiting. These were cut off by the savages, hired by us to hunt them home to receive their deferts: fo as Sir Thomas Dale hath not been fo tyrannous nor fevere by the half, as there was occasion and just cause for it, and though the manner was not ufual, we were rather to have regard to those, whom we would have terrified and made fearful to commit the like offences, than to the offenders juftly condemned, for amongst them so hardened in evil, the fear of a cruel, painful, and unusual death more restrains them, than death itself. Thus much I have proceeded of his endeavours, until the coming of Sir Thomas Gates, in preparing himfelf to proceed as he intended.

Now in England again to fecond this noble knight, the council and company with all possible expedition prepared for Sir Thomas Gates fix tall ships, with three hundred men, and one hundred kine and other cattle, with ammunition and all other manner of provision that could be thought needful; and about the 1st or 2nd of August 1611, arrived fafely at James Town.

The Government returned again to Sir Thomas Gates, 1611.

THESE worthy knights being met, after their welcome falutations, Sir Thomas Dale acquainted him what he had done, and what he intended, which defign Sir Thomas Gates well approving, furnished him with three hundred and fifty men, such as himself made choice of. In the beginning of September 1611, he fet fail, and arrived where he intended to build his new town: within ten or twelve days he had environed it with a pale, and in honour of our noble Prince Henry, called it Henrico. The next work he did, was building at each corner of the town, a high commanding watch-house, a church, and store-houses; which finished, he began to think upon convenient houses for himself and men, which, with all possible speed he could, he effected, to the great content of his company, and all the colony.

This town is fituated upon a neck of a plain rifing land, three parts environed with the main river, the neck of land well impaled, makes it like an ifle; it hath three ftreets of well framed houses, a handsome church, and the foundation of a better laid, to be built of brick, besides store-houses, watch-houses, and such like: upon the verge of the river there are five houses, wherein live the honester fort of people, (as farmers in England) and they keep continual centinel for the town's fecurity. About two miles from the town, into the main, is another pale, near two miles in length, from river to river, guarded with feveral commanders, with a good quantity of corn-ground impaled fufficiently fecured to maintain more than I fuppose will come this three years.

On the other fide of the river, for the fecurity of the town, is intended to be impaled for the fecurity of our hogs, about two miles and a half, by the name of Hope in Faith, and Coxendale, fecured by five of our manner of forts, which are but palifadoes, called Charity Fort, Mount Malado, a guest house for fick people, a high feat and wholesome air, Elizabeth Fort, and Fort Patience: and here hath Mr. Whitaker chosen his parsonage, impaled a fair framed parfonage, and one hundred acres called Rocke-hall, but

these are not half finished.

About Christmas following in this same year 1611, in regard of the injury done us by them of Apamatuck, Sir Thomas Dale, without the lofs of any, except fome few favages, took it and their corn, being but five miles by land from Henrico, and confidering how commodious it might be for us, refolved to poffess and plant it, and at the inftant called it the New Bermudas, whereunto he hath laid out and annexed to

the

the belonging freedom and corporation for ever, many miles of champaign and wood-land ground in feveral hundreds, as the upper and nother hundreds, Rochdale hundred, West Sherly hundred, and Dig's hundred. In the nether hundred he first began to plant, for there is the most corn ground, and with a pale of two miles, cut over from river to river, whereby we have secured eight English miles in compass; upon which circuit, within half a mile of each other, are many fair houses already built, besides particular men's houses near to the number of sifty. Rochdale, by a cross pale well nigh four miles long, is also planted with houses along the pale, in which hundred our hogs and cattle have twenty miles circuit to graze in securely. The building of the city is referred till our harvest be in, which he intends to make a retreat against any foreign enemy.

About fifty miles from these is James Town, upon a fertile peninsula, which although formerly scandaled for an unhealthful air, we find it as healthful as any other part of the country; it hath two rows of houses of framed timber, and some of them two stories, and a garret higher, three large store-houses joined together in length, and he hath newly strongly impaled the town. This ise, and much ground about it, is much inhabited: to Kecoughtan we accounted it forty miles, where they live well with half that allowance the rest have from the store, because of the extraordinary quantity of sish, sowl, and deer, as you may read at large in the discoveries of Captain Smith. And thus I have truly related unto you the present estate of that

fmall part of Virginia we frequent and poffefs.

Since there was a ship freighted with provision and forty men; and another since then with the like number and provision, to stay twelve months in the country with Captain Argall, which was fent not long after. After he had recreated and refreshed his company, he was fent to the river Patawoineke to trade for corn, the favages about us having fmall quarter, but friends and foes as they found advantage and opportunity: but to conclude our peace, thus it happened. Captain Argall having entered into a great acquaintance with Iapazaws, an old friend of Captain Smith's, and fo to all our nation, ever fince he discovered the country: hard by him there was Pocahontas, whom Captain Smith's relations entitled the nonpareil of Virginia, and though she had been many times a preserver of him and the whole colony, yet till this accident fhe was never feen at James Town fince his departure, being at Patawomeke, as it feems, thinking herfelf unknown, was eafily by her friend Iapazaws, perfuaded to go abroad with him and his wife to fee the ship, for Captain Argall had promised him a copper kettle to bring her but to him, promifing no way to hurt her, but keep her till they could conclude a peace with her father; the favage for this copper kettle would have done any thing it feemed by the relation, for though she had feen and been in many fhips, yet he caused his wife to fain how defirous she was to see one, and that he offered to beat her for her importunity till the wept. But at last he told her if Pocahontas would go with her, he was content: and thus they betrayed the poor innocent Pocahontas aboard, where they were all kindly feafted in the cabin. Iapazaws treading often on the captain's foot, to remember he had done his part, the captain when he faw his time, perfuaded Pocahontas to the gun-room, feigning to have fome conference with Iapazaws, which was only that she should not perceive he was any way guilty of her captivity: fo fending for her again, he told her before her friends fhe must go with him, and compound peace betwixt her country and us, before fhe ever should see Powhatan, whereat the old Jew and his wife began to howl and cry as fast as Pocahontas, that upon the captain's fair persuasions, by degrees pacifying herfelf, and Iapazaws and his wife with the kettle and other toys, went merrily on shore, and she to James Town. A messenger forthwith was sent to her father, that his daughter Pocahontas he loved so dearly, he must ransom with our men, swords,

pieces, tools, &c. he treacherously had stolen.

This unwelcome news much troubled Powhatan, because he loved both his daughter and our commodities well, yet it was three months after ere he returned us any answer: then by the persuasion of the council, he returned seven of our men, with each of them an unserviceable musket, and sent us word that when we would deliver his daughter, he would make us satisfaction for all injuries done us, and give us sive hundred bushels of corn, and for ever be friends with us. That he fent we received in part of payment, and returned him this answer, that his daughter should be well used, but we could not believe the rest of our arms were either lost or stolen from him,

and therefore till he fent them we would keep his daughter.

This answer it seemed much displeased him, for we heard no more from him a long time after, when with Captain Argall's ship, and some other vessels belonging to the colony, Sir Thomas Dale, with a hundred and fifty men well appointed, went up into his own river, to his chief habitation with his daughter; with many scornful bravadoes they affronted us, proudly demanding why we came thither; our reply was, we had brought his daughter, and to receive the ransom for her that was promifed or to have it perforce. They nothing dismayed thereat, told us we were welcome if we came to sight, for they were provided for us, but advised us, if we loved our lives to retire, else they would use us as they had done Captain Ratliffe: we told them we would presently have a better answer, but we were no sooner within shot of the shore than

they let fly their arrows among us in the ship.

Being thus juftly provoked, we prefently manned our boats, went on shore, burned all their houses, and spoiled all they had we could find, and so the next day proceeded higher up the river, where they demanded why we burnt their houses, and we why they fhot at us; they replied, it was fome straggling savage, with many other excuses, they intended no hurt, but were our friends; we told them we came not to hurt them, but vifit them as friends alfo. Upon this we concluded a peace, and forthwith they dispatched messengers to Powhatan, whose answer, they told us, we must expect fourand-twenty hours ere the meffengers could return: then they told us our men were run away for fear we would hang them, yet Powhatan's men were run after them; as for our fwords and pieces, they should be brought us the next day, which was only but to delay time, for the next day they came not. Then we went higher to a house of Powhatan's, called Matchot, where we faw about four hundred men well appointed; here they dared us to come on shore, which we did; no shew of fear they made at all, nor offered to refift our landing, but walking boldly up and down amongst us, demanded to confer with our captain, of his coming in that manner, and to have truce till they could but once more fend to their king to know his pleafure, which if it were not agreeable to their expectation, then they would fight with us, and defend their own as they could, which was but only to defer the time to carry away their provision; yet we promifed them truce till the next day at noon, and then if they would fight with us, they should know when we would begin by our drums and trumpets.

Upon this promife, two of Powhatan's fons came unto us to fee their fifter, at whose fight, feeing her well, though they heard to the contrary, they much rejoiced, promising they would persuade her father to redeem her, and for ever be friends with us. And upon this, the two brethren went on board with us, and we sent Mr. John Rolfe and Mr. Sparkes to Powhatan, to acquaint him with the business; kindly they were entertained, but not admitted the presence of Powhatan, but they spoke with Opechau-

canough,

canough, his brother and fuccessor; he promised to do the best he could to Powhatan, all might be well. So it being April, and time to prepare our ground, and set our corn, we returned to James Town, promising the forbearance of their performing their promise till the next harvest.

Long before this, Mr. John Rolfe, an honest gentleman, and of good behaviour, had been in love with Pocahontas, and she with him, which thing at that instant I made known to Sir Thomas Dale, by a letter from him, wherein he intreated his advice, and she acquainted her brother with it, which resolution Sir Thomas Dale well approved; the bruit of this marriage came soon to the knowledge of Powhatan, a thing acceptable to him, as appeared by his sudden consent; for within ten days, he sent Opachisco, an old uncle of hers, and two of his sons, to see the manner of the marriage, and to do in that behalf what they were requested, for the confirmation thereof, as his deputy; which was accordingly done about the first of April; and ever since we have had friendly trade and commerce, as well with Powhatan himself as all his subjects.

Besides this, by the means of Powhatan, we became in league with our next neighbours, the Chicahamanias, a lusty and a daring people, free of themselves. These people, so soon as they heard of our peace with Powhatan, sent two messengers with presents to Sir Thomas Dale, and offered them his service, excusing all former injuries, hereafter they would ever be King James's subjects, and relinquish the name of Chickahamania, to be called Tassautessus, as they call us, and Sir Thomas Dale their governor, as the King's deputy; only they desired to be governed by their own laws, which is eight of their elders as his substitutes. This offer he kindly accepted, and appointed the day he would come to visit them.

When the appointed day came, Sir Thomas Dale and Captain Argall, with fifty men, well appointed, went to Chickahamania, where we found the people expecting our coming; they used us kindly, and the next morning fat in council, to conclude their

peace upon these conditions:

First, they should for ever be called Englishmen, and be true subjects to King James

and his deputies.

Secondly, neither to kill nor detain any of our men, nor cattle, but bring them home. Thirdly, to be always ready to furnish us with three hundred men, against the Spaniards, or any.

Fourthly, they shall not enter our towns, but fend word they are new Englishmen. Fifthly, that every fighting man, at the beginning of harvest, shall bring to our store two bushels of corn, for tribute, for which they shall receive so many hatchets.

Lastly, the eight chief men should see all this performed, or receive the punishment themselves; for their diligence they should have a red coat, a copper chain, and King

James's picture, and be accounted his noblemen.

All this they concluded with a general affent, and a great shout to confirm it; then one of the old men began an oration, bending his speech first to the old men, then to the young, and then to the women and children, to make them understand how strictly they were to observe these conditions, and we would defend them from the fury of Powhatan, or any enemy whatsoever, and furnish them with copper, beads, and hatchets; but all this was rather for fear Powhatan and we, being so linked together, would bring them again to his subjection; the which to prevent, they did rather choose to be protected by us, than tormented by him, whom they held a tyrant. And thus we returned again to James Town.

When our people were fed out of the common store, and laboured jointly together, glad was he could slip from his labour, or slumber over his task he cared not how, nay,

the most honest amongst them would hardly take so much true pains in a week, as now for themselves they will do in a day; neither cared they for the increase, prefuming that howfoever the harvest prospered, the general store must maintain them, so that we reaped not fo much corn from the labours of thirty, as now three or four do provide for themselves. To prevent which, Sir Thomas Dale hath allotted every man three acres of clear ground, in the nature of farms, except the Bermudas, who are exempted, but for one month's fervice in the year, which must neither be in feed-time nor harvest; for which doing, no other duty they pay yearly to the store, but two barrels and a half of corn (from all those farmers, whereof the first was William Spence, an honest, valiant, and an industrious man, and hath continued from 1607 to this prefent,) from those is expected such a contribution to the store, as we shall neither want for ourselves, nor to entertain our supplies; for the rest, they are to work eleven months for the flore, and hath one month only allowed them to get provision to keep them for twelve, except two bushels of corn they have out of the store; if those can live fo, why should any fear starving; and it were much better to deny them passage, that would not ere they come, be content to engage themselves to those conditions: for only from the flothful and idle drones, and none elfe, hath fprung the manifold imputations Virginia innocently hath undergone; and therefore I would deter fuch from coming here, that cannot well brook labour, except they will undergo much punishment and penury, if they escape the scurvy; but for the industrious, there is a reward sufficient; and if any think there is nothing but bread, I refer you to his relations that discovered the country first.

The Government left to Sir Thomas Dale, upon Sir Thomas Gates's Return for England.

SIR Thomas Dale understanding there was a plantation of Erenchmen in the north part of Virginia, about the degrees of 45, sent Captain Argall to Port Royal and Santa Crux, where finding the Frenchmen abroad, dispersed in the woods, surprised their ship and pinnace, which was but newly come from France; wherein was much good apparel, and other provision, which he brought to James Town, but the men escaped, and

lived among the favages of those countries.

It pleased Sir Thomas Dale, before my return to England, because I would be able to speak somewhat of my own knowledge, to give me leave to visit Powhatan and his court; being provided, I had Thomas Savage with me for my interpreter; with him, and two savages for guides, I went from the Bermuda in the morning, and came to Matchet the next night, where the King lay upon the river of Pamaunke; his entertainment was strange to me; the boy he knew well, and told him, "My child, I gave you leave, being my boy, to go see your friends, and these four years I have not seen you, nor heard of my own man Namoutack, I sent to England, though many ships since have been returned thence." Having done with him, he began with me, and demanded for the chain of pearl he sent his brother Sir Thomas Dale, at his first arrival, which was a token betwixt them, whenever he should send a messenger from himself to him, he should wear that chain about his neck, since the peace was concluded, otherwise he was to bind him, and fend him home.

It is true, Sir Thomas Dale had fent him fuch word, and gave his page order to give it me, but he forgot it, and till this prefent I never heard of it; yet I replied I did know there was fuch an order, but that was when upon a fudden he should have occasion to find an Englishman without an Indian guide; but if his own people should conduct his messenger, as two of his did me, who knew my message, it was sufficient; with which

which answer he was contented, and so conducted us to his house, where was a guard of two hundred bow-men, that always attend his person. The first thing he did, he offered me a pipe of tobacco, then asked me how his brother Sir Thomas Dale did, and his daughter, and unknown son, and how they lived, loved, and liked. I told him his brother was well, and his daughter so contented, she would not live again with him; whereat he laughed, and demanded the cause of my coming. I told him my message was private, and I was to deliver it only to himself and Papaschicher, one of my guides that was acquainted with it; instantly he commanded all out of the house, but only his two Queens, that always sit by him; and bade me speak on.

I told him, by my interpreter, Sir Thomas Dale hath fent you two pieces of copper, five strings of white and blue beads, five wooden combs, ten sish-hooks, a pair of knives, and that when you would fend for it, he would give you a grind stone. All this pleased him: but then I told him his brother Dale, hearing of the same of his youngest daughter, desiring in any case he would send her by me unto him, in testimony of his love, as well for that he intended to marry her, as the desire her sister had to see her, because being now one people, and he desirous for ever to dwell in his country, he conceived there could not be a truer assurance of peace and friendship, than in such a

natural band of an united union.

I needed not entreat his answer by his oft interrupting me in my speech; and prefently with much gravity he thus replied:

"I gladly accept your falute of love and peace, which while I live, I shall exactly keep; his pledges thereof I receive with no lefs thanks, although they are not fo ample as formerly he had received: but for my daughter, I have fold her within this few days to a great Werowance, for two bushels of rawrenoke, three days journey from me." I replied, I knew his greatness in restoring the rawrenoke; might call her again to gratify his brother, and the rather, because she was but twelve years old; assuring him, befides the band of peace, he should have for her three times the worth of the rawrenoke in beads, copper, hatchets, &c. His answer was, he loved his daughter as his life; and though he had many children, he delighted in none fo much as fhe, whom if he should not often behold, he could not possibly live, which she living with us he could not do. Having resolved upon no terms to put himself into our hands, or come amongft us, therefore defired me to urge him no further, but return his brother this answer: that, "I defire no firmer assurance of his friendship than the promise he hath made: from me he hath a pledge, one of my daughters, which fo long as she lives shall be fufficient, when she dies, he shall have another: I hold it not a brotherly part to defire to bereave me of my two children at once. Farther, tell him, though he had no pledge at all, he need not distrust any injury from me or my people; there have been too many of his men and mine flain, and by my occasion there shall never be more, (I, which have power to perform it, have faid it) although I should have just cause, for I am now old, and would gladly end my days in peace: if you offer me injury, my country is large enough to go from you: thus much I hope will fatisfy my brother. Now because you are weary, and I sleepy, we will thus end." So commanding us victuals and lodging, we rested that night; and the next morning he came to visit us, and kindly conducted us to the best cheer he had. WILLIAM PARKER.

While I here remained, by chance came an Englishman, whom there had been furprifed three years ago at Fort Henry, grown so like, both in complexion and habit like a favage, I knew him not, but by his tongue: he defired me to procure his liberty, which I intended, and so far urged Powhatan, that he grew discontented, and told me, you have one of my daughters, and I am content; but you cannot see one of your men with me, but you must have him away, or break friendship; if you must needs have him, you shall go home without guides, and if any evil befall you, thank yourselves: I told him I would, but if I returned not well, he must expect a revenge; and his brother might have just cause to suspect him. So in passion he left me till supper, and then gave me such as he had with a cheerful countenance: about midnight he awaked us, and promised in the morning my return with Parker: but I must remember his brother to fend him ten great pieces of copper, a shaving-knife, a frow, a grind stone, a net, sishhooks, and such toys; which lest I should forget, he caused me write in a table-book he had; however he got it, it was a fair one; I desired he would give it me; he told me no, it did him much good in shewing to strangers; yet in the morning when we departed, having surnished us well with provision, he gave each of us a buck's skin as well dressed as could be, and sent two more to his son and daughter: and so we returned to James Town.

Written by Mr. RALPH HAMOR and JOHN ROLPH.

I have read the substance of this relation in a letter written by Sir Thomas Dale, another by Mr. Whitaker, and a third by Mr. John Rolfe, how careful they were to inftruct her in christianity, and how capable and desirous she was thereof; after she had been fome time thus tutored, she never had defire to go to her father, nor could well endure the fociety of her own nation; the true affection she constantly bore her husband was much; and the strange apparitions and violent passions he endured for her love, as he deeply protefted, was wonderful; and the openly renounced her country's idolatry, confessed the faith of Christ, and was baptized, but either the coldness of the adventurers, or the bad ufage of that was collected, or both, caufed this worthy knight to write thus: "Oh why should so many princes and noblemen engage themselves, and thereby intermeddling herein, have caufed a number of fouls transport themselves, and be transported hither? Why should they, I say, relinquish this so glorious an action: for if their ends be to build God a church, they ought to persevere; if otherwise, yet their honour engageth them to be constant; howsoever they stand affected, here is enough to content them. These are the things have animated me to stay a little season from them, I am bound in conscience to return unto; leaving all contenting pleasures and mundall delights, to refide here with much turmoil, which I will rather do than fee God's glory diminished, my King and country dishonoured, and these poor souls I have in charge revived, which would quickly happen if I should leave them; so few I have with me fit to command or manage the business: Mr. Whitaker, their preacher, complaineth, and much museth, that so few of our English ministers, that were so hot against the furplice and subscription come hither, where neither is spoken of. Do they not wilfully hide their talents, or keep themselves at home, for fear of losing a few pleasures; be there not any among them of Moses's mind, and of the apostles, that forfook all to follow Christ? but I refer them to the Judge of all hearts, and to the King that shall reward every one according to his talent.

From Virginia, June 13, 1614.

The business being brought to this perfection, Captain Argall returned for England in the latter end of June 1614, arriving in England, and bringing these good tidings to the council and company by the assistances of Sir Thomas Gates, that also had returned from Virginia but the March before; it was presently concluded, that to supply this good success with all expedition, the standing lottery should be drawn with all diligent conveniency, and that posterity may remember upon occasion to use the like according to the declaration, I think it not amis to remember thus much.

The

1000

The Contents of the Declaration of the Lottery published by the Council.

IT is apparent to the world, by how many former proclamations, we manifested our intents to have drawn out the great standing lottery long before this, which not falling out as we desired, and others expected, whose monies are adventured therein, we thought good, therefore, for the avoiding all unjust and finister constructions, to refolve the doubts of all indifferent minded, in three special points for their better satisfaction.

But ere I go any further, let us remember there was a running lottery used a long time in St. Paul's Church-yard, where this stood, that brought into the treasury good

funs of money daily, though the lot was but fmall.

Now for the points: the first is, for as much as the adventurers came in so slackly for the year past, without prejudice to the generality, in losing the blanks and prizes, we were forced to petition to the Honourable Lords, who out of their noble care to further this plantation, have recommended their letters to the countries, cities, and good towns in England, which we hope by sending in their voluntary adventurers will sufficiently supply us.

The fecond, for fatisfaction to all honest well affected minds, is, that though this expectation answer not our hopes, yet we have not failed in our Christian care the good of that colony, to whom we have lately fent two fundry supplies, and were they but now supplied with more hands, we should soon resolve the division of the country by

lot, and so lessen the general charge.

The third is, our constant resolution, that seeing our credits are so far engaged to the Honourable Lords and the whole state, for the drawing this great lottery, which we intend shall be without delay the 26th of June next, desiring all such as have undertaken with books to solicit their friends, that they will not withhold their monies till the last month be expired, lest we be unwillingly forced to proportion a less value and number of our blanks and prizes, which hereafter solloweth.

The prizes, welcomes, and rewards shall be paid in ready money, plate, or other goods reasonably rated; if any dislike of the plate or goods, he shall have money, abating only the tenth part, except in small prizes of ten crowns or under.

The money for the adventurers is to be paid to Sir Thomas Smith, knight, and treasurer for Virginia, or fuch officers as he shall appoint in city or country, under the

common feal of the company for the receipt thereof.

All prizes, welcomes, and rewards, drawn wherever they dwell, shall of the treasurer have present pay; and whosoever under one name or poety payeth three pounds in ready money, shall receive fix shillings and eight-pence, or a filver spoon of that value at his choice.

About this time it chanced a Spanish ship beat to and again before Point Comfort, and at last sent ashore their boat as desirous of a pilot. Captain James Davis, the governor, immediately gave them one, but he was no sooner in the boat, but away they went with him, leaving three of their companions behind them, this sudden accident occasioned some distrust, and a strict examination of those three thus left, yet with as good usage as our estate could assord them. They only confessed having lost their admiral; accident had forced them into those parts, and two of them were captains, and in chief authority in the sleet; thus they lived till one of them was found to be an Englishman, and had been the Spaniards' pilot for England in 1588, and having here induced some mal-contents to believe his projects, to run away with a small bark, which was apprehended, some executed, and he expecting but the hangman's courtesy, directly

directly confessed that two or three Spanish ships was at sea; purposely to discover the estate of the colony, but their commission was not to be opened till they arrived in the bay, so that of any thing more he was utterly ignorant. One of the Spaniards at last died, the other was sent for England, but this reprieved, till Sir Thomas Dale hanged him at sea in his voyage homeward; the English pilot they carried for Spain, whom after a long time imprisonment, with much suit was returned for England.

Whilst those things were effecting, Sir Thomas Dale having settled to his thinking all things in good order, made choice of one Mr. George Yearly to be deputy-governor in his absence, and so returned for England, accompanied with Pocahontas, the King's daughter, and Mr. Rolfe her husband, and arrived at Plymouth the 12th

of June 1616.

The Government left to Captain Yearly.

NOW a little to commentary upon all these proceedings, let me leave but this as a caveat by the way; if the alteration of government hath subverted great empires, how dangerous is it then in the infancy of a commonwealth? The multiplicity of governors is a great damage to any state, but uncertain daily changes are burdensome, because their entertainments are chargeable, and many will make hay whilst the sun doth

shine, however it shall fare with the generality.

This dear bought land with fo much blood and cost, hath only made some few rich, and all the rest losers. But it was intended at the first, the first undertakers should be first preferred and rewarded, and the first adventurers satisfied, and they of all the rest are the most neglected; and those that never adventured a groat, never faw the country, nor ever did any fervice for it, employed in their places, adorned with their deferts, and enriched with their ruins; and when they are fed fat, then in cometh others for lean as they were, who through their omnipotency doth as much. Thus what one officer doth another undoth, only aiming at their own ends; thinking all the world derides his dignity, cannot fill his coffers being in authority with any thing. Every man hath his mind free, but he can never be a true member to that estate, that to enrich himself beggars all the country. Which bad course there are many yet in this noble plantation, whose true honour and worth as much scorns it, as the other love it : for the nobility and gentry there is scarce any of them expects any thing but the profperity of the action: and there are fome merchants and others, I am confidently perfuaded, do take more care and pains, nay, and at their continual great charge, than they could be hired to for the love of money, fo honestly regarding the general good of this great work, they would hold it worfe than facrilege, to wrong it but a shilling, or extort upon the common foldiers a penny. But to the purpose, and to follow the history.

Mr. George Yearly, now invested deputy-governor by Sir Thomas Dale, applied himself for the most part in planting tobacco, as the most present commodity they could devise for a present gain, so that every man betook himself to the best place he could for the purpose: now though Sir Thomas Dale had caused such an abundance of corn to be planted, that every man had sufficient, yet the supplies sent us, came so unfurnished as quickly eased us of our supersluity. To relieve their necessities, he sent to the Chickahamanias for the tribute-corn Sir Thomas Dale and Captain Argall had conditioned for with them: but such a bad answer they returned him, that he drew together one hundred of his best shot, with whom he went to Chickahamania; the people in some places used him indifferently, but in most places

with

with much fcorn and contempt, telling him he was but Sir Thomas Dale's man, and they had payed his mafter according to condition, but to give any to him they had no fuch order, neither would they obey him as they had done his mafter; after he had told them his authority, and that he had the fame power to enforce them that Dale had, they dared him to come on thore to fight, prefuming more of his not daring, than their own valour. Yearly feeing their infolencies, made no great difficulty to go on flore at Ozinies, and they as little to encounter him: but marching from thence towards Mamanahunt, they put themselves in the same order they see us, lead by their Captain Kiffanacomen, governor of Ozinies, and fo marched clofe along by us, each as threatening other who should first begin. But that night we quartered against Mamanahunt, and they passed the river. The next day we followed them; there are few places in Virginia had then more plain ground together, nor more plenty of corn, which although it was but newly gathered, yet they had hid it in the woods where we could not find it: a good time we fpent thus in arguing the cause, the savages without fear standing in troops amongst us, seeming as if their countenances had been fufficient to daunt us: what other practices they had I know not, but to prevent the worft, our captain caused us all to make ready, and upon the word, to let fly among them, where he appointed: others also he commanded to seize on them they could for prifoners; all which being done according to our direction, the captain gave the word, and we prefently discharged, where twelve lay, some dead, the rest for life fprawling on the ground, twelve more we took priloners, two whereof were brothers, two of their eight elders, the one took by Scrjeant Boothe, the other by Robert, a Polonian; near one hundred bushels of corn we had for their ransoms, which was promifed the foldiers for a reward, but it was not performed: now Opechancanough had agreed with our captain for the fubjecting of those people, that neither he nor Powhatan could ever bring to their obedience, and that he should make no peace with them without his advice: in our return by Ozinies with our prisoners, we met Opechancanough, who with much ado feigned with what pains he had procured their peace, the which to requite, they called him the King of Ozinies, and brought him from all parts many prefents of beads, copper, and fuch trash as they had; here as at many other times we were beholden to Captain Henry Spilman our interpreter, a gentleman who had lived long time in this country, and fometimes a prifoner among the favages, and done much good fervice, though but badly rewarded. From hence we marched towards James Town; we had three boats loaded with corn and other luggage, the one of them, being more willing to be at James Town with the news than the other, was overfet, and eleven men caft away with the boat, corn and all their provifion; notwithstanding, this put all the rest of the savages in that fear, especially in regard of the great league we had with Opechancanough, that we followed our labours quietly, and in fuch fecurity, that divers favages of other nations daily frequented us with what provisions they could get, and would guide our men on hunting, and often hunt for us themselves. Captain Yearly had a favage or two so well trained up to their pieces, they were as expert as any of the English, and one he kept purposely to kill him fowl. There were divers others had favages in like manner for their men. Thus we lived together as if we had been one people, all the time Captain Yearly flayed with us; but fuch grudges and discontents daily increased among ourselves, that upon the arrival of Captain Argall, fent by the council and company to be our governor, Captain Yearly returned for England in the year 1617.

From the writings of Captain NATHANIEL POWELL, WILLIAM

CANTRILL, Serjeant BOOTHE, EDWARD GURGANEY.

During this time the Lady Rebecca, alias Pocahontas, daughter to Powhatan, by the diligent care of Mr. John Rolfe, her husband and his friends, was taught to speak such English as might well be understood, well instructed in christianity, and was become very formal and civil after our English manner; she had also by him a child, which she loved most dearly, and the treasurer and company took order both for the maintenance of her and it, besides there were divers persons of great rank and quality had been very kind to her; and before she arrived at London, Captain Smith, to deserve her former courtesses, made her qualities known to the Queen's most Excellent Majesty and her court, and wrote a little book to this essect to the Queen: an abstract whereof followeth:

To the most high and virtuous Princess Queen Anne of Great Britain.

Most admired Queen,

THE love I bear my God, my King, and country, hath so often emboldened me in the worst of extreme dangers, that now honesty doth constrain me presume thus far beyond myself to present Your Majesty this short discourse: if ingratitude be a deadly poison to all honest virtues, I must be guilty of that crime, if I should omit any means

to be thankful. So it is,

That fome ten years ago, being in Virginia, and taken prisoner by the power of Powhatan, their chief king, I received from this great savage exceeding great courtesy, especially from his son Nantaquaus, the most manliest, comeliest, boldest spirit I ever saw in a savage, and his sister Pocahontas, the king's most dear and well-beloved daughter, being but a child of twelve or thirteen years of age, whose compassionate pitiful heart, of my desperate state, gave me much cause to respect her; I being the first christian this proud King and his grim attendants ever saw, and thus enthralled in their barbarous power, I cannot say I felt the least occasion of want that was in the power of those my mortal foes to prevent, notwithstanding all their threats. After some six weeks fatting amongst those savage courtiers, at the minute of my execution, she hazarded the beating out of her own brains to save mine, and not only that, but so prevailed with her father, that I was safely conducted to James Town, where I found about eight-and-thirty miserable poor and sick creatures, to keep possession of all those large territories of Virginia, such was the weakness of this poor commonwealth, as had the savages not fed us, we directly had starved.

And this relief, most gracious Queen, was commonly brought us by this Lady Pocahontas, notwithstanding all these passages when inconstant Fortune turned our peace to war, this tender virgin would still not spare to dare to visit us, and by her our jars have been oft appeased, and our wants still supplied; were it the policy of her father thus to employ her, or the ordinance of God thus to make her his instrument, or her extraordinary affection to our nation, I know not; but of this I am sure, when her father, with the utmost of his policy and power, sought to surprize me, having but eighteen with me, the dark night could not affright her from coming through the irksome woods, and with watered eyes, gave me intelligence, with her best advice, to escape his sury; which had he known, he had surely slain her. James Town, with her wild train, she as freely frequented as her father's habitation; and during the time of two or three years, she next, under God, was still the instrument to preferve this colony from death, samine, and utter consusion, which if in those times had once been dissolved, Virginia might have lain as it was at our first arrival to this day. Since then this business having

been turned and varied by many accidents from that I left it at, it is most certain, after a long and troublesome war, after my departure, betwixt her father and our colony, all which time she was not heard of, about two years after she herself was taken prisoner, being so detained near two years longer; the colony by that means was relieved, peace concluded, and at last, rejecting her barbarous condition, was married to an English gentleman, with whom at this present she is in England; the first Christian ever of that nation, the first Virginian ever spake English, or had a child in marriage by an Englishman, a matter surely, if my meaning be truly considered and well understood,

worthy a Princess's understanding.

Thus, most gracious Lady, I have related to Your Majesty, what at your best leisure our approved histories will account you at large, and done in the time of Your Majesty's life, and however this might be prefented you from a more worthy pen, it cannot from a more honest heart; as yet I never begged any thing of the state, or any, and it is my want of ability and her exceeding defert, your birth, means and authority, her birth, virtue, want, and fimplicity, doth make me thus bold, humbly to befeech Your Majesty to take this knowledge of her, though it be from one fo unworthy to be the reporter as myself, her husband's estate not being able to make her fit to attend Your Majesty: the most and least I can do, is to tell you this, because none so oft hath tried it as myfelf, and the rather being of fo great a spirit, however her stature: if she should not be well received, feeing this kingdom may rightly have a kingdom by her means; her present love to us and christianity, might turn to such scorn and sury, as to divert all this good to the worst of evil, where finding so great a Queen should do her some honour more than she can imagine, for being so kind to your fervants and subjects, would fo ravish her with content, as endear her dearest blood to effect that Your Majefty and all the King's honest subjects most earnestly desire; and so I humbly kiss your gracious hands.

Being about this time preparing to fet fail for New England, I could not flay to do her that fervice I defired, and she well deserved; but hearing she was at Branford, with divers of my friends, I went to see her: after a modest falutation, without any word, she turned about, obscured her face, as not seeming well contented; and in that humour, her husband, with divers others, we all left her two or three hours, repenting myself to have writ she could speak English. But not long after, she began to talk, and remembered me well what courtesies she had done; faying, "You did promise Powhatan what was yours should be his, and he the like to you; you called him father, being in his land a stranger, and by the same reason, so must I do you:" which, though I would have excused, I durst not allow of that title, because she was a King's daughter. With a well-set countenance, she said, "Were you not assaid to come into my father's country, and caused fear in him and all his people (but me); and fear you here I should call you father? I tell you then I will, and you shall call me child, and so I will be for ever and ever your countryman. They did tell us always you were dead, and I knew no other till I came to Plymouth; yet Powhatan did command Vetamatomakkin to

feek you, and know the truth, because your countrymen will lie much."

This favage, one of Powhatan's council, being amongst them held an understanding fellow, the King purposely sent him, as they say, to number the people here, and inform him well what we were, and our state. Arriving at Plymouth, according to his directions, he got a long stick, whereon by notches he did think to have kept the number of all the men he could see, but he was quickly weary of that task; coming to London, where by chance I met him, having renewed our acquaintance, where many were defirous to hear and see his behaviour, he told me, Powhatan did bid him to find me out,

to flew him our God, the King, Queen, and Prince, I fo much had told them of: concerning God, I told him the best I could; the King, I heard, he had seen, and the rest he should see when he would; he denied ever to have seen the King, till by circumstances he was satisfied he had; then he replied very fadly, "You gave Powhatan a white dog, which Powhatan sed as himself; but your King gave me nothing, and I am

better than your white dog."

The small time I staid in London, divers courtiers and others, my acquaintances, hath gone with me to see her, that generally concluded, they did think God had a great hand in her conversion, and they have seen many English ladies worse favoured, proportioned, and behavioured; and as since I have heard it pleased both the King and Queen's Majesty honourably to esteem her, accompanied with that honourable lady the Lady De la Warre, and that honourable Lord her husband, and divers other persons of good qualities, both publicly at the masks and otherwise, to her great satisfaction and content, which doubtless she would have deserved, had she lived to arrive in Virginia.

The Government devolved to Captain Samuel Argall, 1617.

THE treasurer, council, and company having well furnished, Captain Samuel Argall, the lady Pocahontas alias Rebecca, with her husband and others, in the good fhip called the George, it pleafed God, at Gravefend, to take this young lady to his mercy, where the made not more forrow for her unexpected death, than joy to the beholders, to hear and fee her make fo religious and godly an end. Her little child, Thomas Rolfe, therefore was left at Plymouth, with Sir Lewis Stukly, that defired the keeping of it. Captain Hamar, his vice-admiral, was gone before, but he found him at Plymouth. In March they fet fail, 1617, and in May he arrived at James Town, where he was kindly entertained by Captain Yearley and his company in a martial order, whose right hand file was led by an Indian. In James Town he found but five or fix houses, the church down, the pallifadoes broken, the bridge in pieces, the well of fresh water spoiled; the store-house they used for the church, the market-place, and ftreets, and all other spare places planted with tobacco, the favages as frequent in their houses as themselves, whereby they were become expert in our arms, and had a great many in their custody and possession, the colony dispersed all about, planting tobacco. Captain Argall not liking those proceedings, altered them agreeable to his own mind, taking the best order he could for repairing those defects, which did exceedingly trouble us; we were constrained every year to build and repair our old cottages, which were always a decaying in all places of the country; yea, the very courts of guard built by Sir Thomas Dale, was ready to fall, and the pallifadoes not fufficient to keep out hogs. Their number of people were about four hundred, but not past two hundred fit for husbandry and tillage: we found there in all one hundred and twenty-eight cattle, and fourfcore and eight goats, befides innumerable numbers of fwine; and good plenty of corn in some places: yet the next year the captain sent out a frigate and a pinnace, that brought us near fix hundred bushels more, which did greatly relieve the whole colony: for from the tenants we feldom had above four hundred bushels of rent corn to the store, and there was not remaining of the companies' company, past fourand-fifty men, women and children.

This year having planted our fields, came a great drought, and fuch a cruel fform of hail, which did fuch fpoil both to the corn and tobacco, that we reaped but fmall profit, the magazine that came in the George, being five months in her passage, proved

very badly conditioned, but ere fhe arrived, we had gathered and made up our tobacco,

the best at three shillings the pound, the rest at eighteen pence.

To fupply us, the council and company, with all possible care and diligence, furnished a good ship, of some two hundred and sifty tons, with two hundred people and the Lord la Ware. They fet fail in April, and took their course by the western isles, where the governor of the ifle of Saint Michael received the Lord la Ware, and honourably feasted him, with all the content he could give him. Going from thence, they were long troubled with contrary winds, in which time many of them fell very fick, thirty died, one of which number was that most honourable lord governor the Lord La Ware, whose most noble and generous disposition is well known, to his great cost, had been most forward in this business, for his country's good: yet this tender state of Virginia was not grown to that maturity to maintain fuch state and pleasure as was fit for such a personage, with so brave and great attendance: for some small number of adventurous gentlemen to make difcoveries, and lie in garrifon, ready upon any occasion to keep in fear the inconstant savages, nothing were more requisite, but to have more to wait and play than work, or more commanders and officers than industrious labourers, was not fo necessary: for in Virginia, a plain foldier, that can use a pick-axe and fpade, is better than five knights, although they were knights that could break a lance; for men of great place, not inured to those encounters, when they find things not fuitable, grow many times fo discontented, they forget themselves, and oft become so carelefs, that a difcontented melancholy brings to them much forrow, and to others much mifery. At last they stood in for the coast of New England, where they met a fmall Frenchman, rich of beavers and other furs. Though we had here but fmall knowledge of the coast nor country, yet they took such an abundance of fish and fowl, and fo well refreshed themselves there with wood and water, as by the help of God thereby, having been at fea fixteen weeks, got to Virginia, who without this relief had been in great danger to perish. The Frenchmen made them such a feast, with such an abundance of variety of fish, fowl, and fruits, as they all admired, and little expected that wild wilderness could afford such wonderful abundance of plenty. In this fhip came about two hundred men, but very little provision, and the ship called the Treafurer came in again not long after with forty passengers; the Lord la Ware ship, lying in Virginia three months, we victualled her with three fcore bushels of corn, and eight hogheads of flesh, besides other victuals she spent whilst they tarried there: this ship brought us advice that great multitudes were a preparing in England to be fent, and relied much upon that victuals they should find here: whereupon our captain called a council, and writ to the council here in England the state of the colony, and what a great mifery would enfue, if they fent not provision as well as people; and whatthey did fuffer for want of skilful husbandmen, and means to fet their ploughs on work, having as good ground as any man can defire, and about forty bulls and oxen, but they wanted men to bring them to labour, and irons for the ploughs, and harnefs for the cattle. Some thirty or forty acres we had fown with one plough, but it stood follong on the ground before it was reaped, it was most shaken, and the rest spoiled wish the cattle and rats in the barn, but no better corn could be for the quantity.

Richard Killingbeck being with the captain at Kekoughtan, defired leave to return to his wife at Charles Hundred, he went to James Town by water, there he got four more to go with him by land, but it proved that he intended to go trade with the Indians of Chickahamania, where making shew of the great quantity of truck they had, which the favages perceiving, pardy for their truck, partly for revenge of some friends they

pretended

pretended should have been slain by Captain Yearley, one of them, with an English piece, fhot Killingbeck dead; the other favages affaulted the reft and flew them, stripped them, and took what they had; but fearing this murther would come to light. and might cause them to suffer for it, would now proceed to the perfection of villainy; for prefently they robbed their Machacomocko house of the town, stole all the Indian treafure thereout, and fled into the woods, as other Indians related. On Sunday following, one Parfax, that dwelt a mile from the town, going to church, left his wife and three fmall children fafe at home, as he thought, and a young youth: flie fupposing prayer to be done, left the children, and went to meet her husband; presently after came three or four of those fugitive savages, entered the house, and slew a boy and three children, and also another youth that stole out of the church in prayer time, meeting them, was likewife murdered. Of this difafter the captain fent to Opechankanough for fatisfaction; but he excused the matter, as altogether ignorant of it; at the fame time the favages that were robbed were complaining to Opechankanough, and much feared the English would be revenged on them, so that Opechankanough sent to Captain Argall, to affure him the peace should never be broken by him, desiring that he would not revenge the injury of those fugitives upon the innocent people of that town, which town he should have, and sent him a basket of earth, as possession given of it, and promifed, fo foon as possibly they could catch these robbers, to fend him their heads for fatisfaction, but he never performed it.

SAMUEL ARGALL, JOHN ROLFE.

A Relation from Mr. John Rolfe, June 15, 1618.

CONCERNING the state of our new common-wealth, it is somewhat bettered, for we have fufficient to content ourselves, though not in such abundance as is vainly reported in England. Powhatan died this last April, yet the Indians continue in peace. Itopatin, his fecond brother, fucceeds him, and both he and Opechankanough have confirmed our former league. On the 11th of May, about ten of the clock in the night, happened a most fearful tempest, but it continued not past half an hour, which poured down hailstones eight or nine inches about, that none durst go out of their doors, and though it tore the bark and leaves of the trees, yet we find not they hurt either man or beaft; it fell only about James Town, for but a mile to the east, and twenty to the west there was no hail at all. Thus in peace every man followed his building and planting without any accidents worthy of note. Some private differences happened betwixt Captain Bruster and Captain Argall, and Captain Argall and the company here in England; but of them I am not fully informed, neither are they here for any use, and therefore unfit to be remembered. In December one Captain Stallings, an old planter in those parts, being employed by them of the west country, for a fishing voyage, in New-England, fell foul of a Frenchman, whom he took, leaving his own thip to return for England, himself with a finall company remained in the French bark, some small time after upon the coast, and thence returned to winter in Virginia.

The Government furrrender to Sir George Yearley.

FOR to begin with the year of our Lord 1619, there arrived a little pinnace privately from England about Easter, for Captain Argall, who taking order for his affairs, within four or five days returned in her, and left for his deputy, Captain Nathauiel Powell.

On the 18th of April, which was but ten or twelve days after, arrived Sir George Yearley, by whom we understood Sir Edwin Sands was chosen treasurer, and Mr. John Farrar his deputy, and what great supplies was a preparing to be sent us, which did ravish us so much with joy and content, we thought ourselves now fully satisfied for our long toil and labours, and as happy men as any in the world. Notwithstanding, such an accident happened Captain Stallings, the next day his ship was cast away, and he not long after slain in a private quarrel. Sir George Yearley, to begin his government, added to be of his council, Captain Francis West, Captain Nathaniel Powell, Mr. John Pory, Mr. John Rolfe, and Mr. William Wickam, and Mr. Samuel Macocke, and propounded to have a general assembly with all expedition. Upon the 12th of this month, came in a pinnace of Captain Bargrave's, and on the 17th, Captain Lownes, and one Mr. Evans, who intended to plant themselves at Waraskoyack, but now Opechan-

kanough will not come at us, that causes us to suspect his former promises.

In May came in the Margaret of Bristol, with four and thirty men, all well and in health, and also many devout gifts, and we were much troubled in examining some fcandalous letters fent into England, to difgrace this country with barrenness, to difcourage the adventurers, and fo bring it and us to ruin and confusion; notwithstanding we find by them of best experience, an industrious man not other ways employed, may well tend four acres of corn, and one thousand plants of tobacco, and where they say an acre will yield but three or four barrels, we have ordinarily four or five, but of new ground, fix, feven, and eight, and a barrel of peafe and beans, which we efteem as good as two of corn, which is after thirty or forty bushels an acre; fo that one man may provide corn for five, and apparel for two, by the profit of his tobacco: they fay also English wheat will yield but fixteen bushels an acre, and we have reaped thirty; besides to manure the land, no place bath more white and blue marble than here, had we but carpenters to build and make carts and ploughs, and skilful men that know how to use them, and train up our cattle to draw them, which though we endeavour to effect, yet our want of experience brings but little to perfection but planting tobacco, and yet of that many are fo covetous to have much, they make little good; besides there are fo many fofisticating tobacco-mongers in England, were it never fo bad, they would fell it for Verinas, and the trash that remaineth should be Virginia, such devilish bad minds we know fome of our own countrymen do bear, not only to the bufiness, but also to our mother England herself; could they or durst they as freely defame

The 25th of June came in the Trial with corn and cattle all in fafety, which took from us clearly all fear of famine; then our governor and council caused burgesses to be chosen in all places, and met at a general assembly, where all matters were debated thought expedient for the good of the colony, and Captain Ward was sent to Monahigan in New England, to sish in May, and returned the latter end of May, but to small purpose, for they wanted salt: the George also was sent to Newsoundland with the Cape merchant; there she bought sish, that defrayed her charges, and made a good voyage in seven weeks. About the last of August came in a Dutch man of war that sold us twenty negroes, and Iapazous, King of Patawomeck, came to James Town, to desire two ships to come trade in his river, for a more plentiful year of corn had not been in a long time, yet very contagious, and by the treachery of one Poule in a manner turned heathen, we were very jealous the savages would surprise us. The governors have bounded four corporations; which is the companies, the university, the governors and glebe land: Ensign William Spencer, and Thomas Barret a serjeant, with

fome

fome others of the ancient planters being fet free, we are the first farmers that wint forth, and have chosen places to their content, so that now knowing their own land, they strive who should exceed in building and planting. The fourth of November the Bonanoua came in with all her people luftly and well; not long after one Mr. Dirmer fent out by some of Plymouth, for New England, arrived in a bark of five tons, and returned the next fpring; notwithstanding the ill rumours of the unwholesomeness of James Town, the new comers that were planted at Old Pafpaheghe, little more than a mile from it, had their healths better than any in the country. In December Captain Ward returned from Patawomeck; the people there dealt falfly with him, fo that he took 800 bushels of corn from them perforce. Captain Woddiffe of Bristol, came in not long after, with all his people lufty and in health, and we had two particular governors fent us, under the titles of deputies to the company, the one to have charge of the College Lands, the other of the Company's: now you are to understand, that because there have been many complaints against the governors, captains, and officers in Virginia, for buying and felling men and boys, or to be fet over from one to another for a yearly rent, was held in England a thing most intolerable, or that the tenants or lawful fervants should be put from their places, or abridged their covenants, was so odious, that the very report thereof brought a great fcandal to the general action. The council in England did fend many good and worthy instructions for the amending those abuses, and appointed a hundred men should, at the companies' charge be allotted and provided to ferve and attend the governor during the time of his government, which number he was to make good at his departure, and leave to his fuccessor in like manner, fifty to the deputy-governor of the College Land, and fifty to the deputy of the Company's Land, fifty to the treasurer, to the secretary five and twenty, and more to the marshal and Cape merchant; which they are also to leave to their successors, and likewife to every particular officer fuch a competency, as he might live well in his office, without oppressing any under their charge, which good law I pray God it be well observed; and then we may truly fay in Virginia, we are the most happy people in the world.

By me, John Rolfe.

There went this year by the Company's records eleven ships and twelve hundred and fixteen persons to be thus disposed on: tenants for the governor's land sour score, besides sifty sent the former spring; for the Company's land a hundred and thirty; for the college a hundred; for the glebe land sifty; young women to make wives ninety; servants for public service sifty; and sifty more whose labours were to bring up thirty

of the infidels' children; the rest were sent to private plantations.

Two perfons unknown have given fair plate and ornaments for two communion tables, the one at the college, the other at the church of Mrs. Mary Robinson, who towards the foundation gave two hundred pounds; and another unknown person sent to the treasurer five hundred and sifty pounds, for the bringing up of the savage children in Christianity. Mr. Nicholas Farrar, deceased, hath by his will given three hundred pounds to the college, to be paid when there shall be ten young savages placed in it; in the mean time sour-and-twenty pounds yearly to be distributed unto three discreet and godly young men in the colony, to bring up three wild young insidels in some good course of life; also there were granted eleven patents, upon-condition to transport people and cattle to increase the plantation.

A desperate Sea-sight betwixt two Spanish Men of War and a small English Ship, at the Isle of Dominica, going to Virginia, by Captain Anthony Chester.

HAVING taken our journey towards Virginia in the beginning of February, a ship called the Margaret and John, of one hundred and fixty tons, eight iron pieces and a falcon, with eighty passengers besides failors, after many tempests and foul weather, about the 14th of March we were in 13 and a half of northerly latitude, where we descried a ship at hull: it being but a fair gale of wind, we edged towards her to see what she was, but she presently set fail, and ran us quickly out of fight. This made us keep our courfe for Metfalina, and the next day passing Dominica, we came to an anchor at Guadaloupe, to take in freih water. Six Frenchmen there, cast away sixteen months ago, came aboard us; they told us, that a Spanish man of war, but seven days before, was feeking his confort; and this was fhe we descried at hull. At Mevis we intended to refresh ourselves, having been eleven weeks pestered in this unwholesome fhip; but there we found two tall ships with the Hollanders' colours, but necessity forcing us on shore, we anchored fair by them, and in friendly manner sent to hail them; but feeing they were Spaniards, retiring to our ship, they fent such a volley of fhot after us, that shot the boat, split the oars, and some through the cloaths, yet not a man hurt; and then followed with their great ordnance, that many times overraked our ship, which being so cumbered with the passengers' provisions, our ordnance was not well fitted, nor any thing as it should have been; but perceiving what they were, we fitted ourselves the best we could to prevent a mischief, seeing them warp themselves to windward, we thought it not good to be boarded on both sides at an anchor; we intended to fet fail, but that the vice-admiral battered fo hard our starboard fide, that we fell to our bufiness, and answered their unkindness with such fair shot from a demi-culverine, that shot her between wind and water, whereby she was glad to leave us and her admiral together. Coming fair by our quarter, he took in his Holland flag, and put forth his Spanish colours, and so hailed us.

We quietly and quickly answered him, both what we were and whither bound. relating the effect of our commission, and the cause of our coming thither for water, and not to annoy any of the King of Spain's subjects, nor any. She commanded us amain for the King of Spain; we replied, with enlarging the particulars, what friends both the Kings, our mafters, were; and as we would do no wrong, we would take none. They commanded us aboard to flew our commission, which we refused, but if they would fend their boat to us willingly, they should fee it. But for answer they made two great shot at us, with a volley of small shot, which caused us to leave the decks; then, with many ill words, they laid us aboard, which caused us to raife our main-fail, and give the word to our finall shot, which lay close and ready, that paid them in such fort, they quickly retired. The fight continued half an hour, as if we had been environed with fire and fmoke, until they discovered the waste of our ship naked, where they bravely boarded us loofe for loofe, hasting with pikes and fwords to enter, but it pleased God so to direct our captain, and encourage our men with valour, that our pikes being formerly placed under our half-deck, and certain shot lying close for that purpose under the port-holes, encountered them so rudely, that their fury was not only rebated, but their hastiness intercepted, and their whole company beaten back:

many of our men were hurt, but I am fure they had two for one.

In the end they were violently repulfed, until they were reinforced to charge again by their commands, who standing upon their honours, thought it a great indignity to be fo affronted, which caused a second charge, and that answered with a second beating back: whereat the captain grew enraged, and constrained them to come on again as fresh, which they did so essectionally, that questionless it had wrought an alteration, if the God that tosseth monarchies, and teareth mountains, had not taught us to toss our pikes with prosperous events, and poured out a volley of small shot amongst them, whereby that valiant commander was slain, and many of his soldiers dropped down likewise on the top of the hatches. This we saw with our eyes, and rejoiced with it at our hearts, so that we might perceive good success coming on; our captain presently took advantage of their discomfiture, though with much commisseration of that resolute captain, and not only plied them again with our ordnance, but had more shot under the pikes, which was bestowed to good purpose, and amazed our enemies with the suddenness.

Amongst the rest, one Lucas, our carpenter's mate, must not be forgotten, who perceiving a way how to annoy them, as they were thus puzzled and in a confusion, drew out a minion under the half-deck, and there bent it upon them in fuch a manner, that when it was fired, the cases of stones and pieces of iron fell upon them so thick, as cleared the deck, and flew many; and in short time we saw few assalants, but such as crept from place to place covertly from the fury of our fhot, which now was thicker than theirs: for although as far as we may commend our enemies, they had done fomething worthy of commendations; yet, either wanting men, or being overtaken with the unlooked for valour of our men, they now began to shrink, and give us leave to be wanton with our advantage. Yet we could only use but four pieces of ordnance. but they ferved the turn as well as all the rest: for she was shot so oft between wind and water, we faw they were willing to leave us, but by reason she was fast in the latch of our cable, which in hafte of weighing our anchor hung aloof, she could not clear herfelf as the wrought to do, till one cut the cable with an axe, and was flain by freeing us. Having been aboard us two hours and a half, feeing herfelf clear, all the shot we had played on both fides, which lasted till we were out of shot, then we discovered the vice-admiral coming to her affiftance, who began a-far off to ply us with their ordnance, and put us in mind we had another work in hand. Whereupon we separated the dead and hurt bodies, and manned the ship with the rest, and were so well encouraged we waifed them amain. The admiral flood aloof off, and the other would not come within falcon shot, where she lay battering us till she received another payment from a demiculvering, which made her bear with the shore for smooth water to mend her leaks. The next morning they both came up again with us, as if they had determined to devour us at once, but it feemed it was but a bravado, though they forfook not our quarter for a time within musket shot: yet all the night only they kept us company, but made not a shot, during which time we had leifure to provide us better than before; but God be thanked they made only but a fliew of another affault, ere fuddenly the vice-admiral fell aftern, and the other lay shaking in the wind, and so they both left us. The fight continued fix hours, and was the more unwelcome, because we were so ill provided, and had no intent to fight, nor give occasion to disturb them. As for the loss of men, if religion had not taught us what by the providence of God is brought to pals, yet daily experience might inform us, of the dangers of wars, and perils at fea, by florms, tempests, shipwrecks, encounters with pirates, meeting with enemies, crofs winds, long voyages, unknown fhores, barbarous nations, and an hundred inconveniencies of which human policies are not capable, nor men's conjectures apprehenfive. We loft Doctor Bohun, a worthy valiant gentleman, (a long time brought up amongst the most learned surgeons, and physicians in Netherlands, and this his VOL. XIII. fecond

fecond journey to Virginia); and feven flain outright, two died fhortly of their wounds, fixteen was fhot, whose limbs God be thanked was recovered without maim, and now fettled in Virginia: how many they lost we know not, but we saw a great many lie on the decks, and their skuppers run with blood, they were about three hundred tons a piece, each sixteen or twenty brass pieces. Captain Chester, who in this fight had behaved himself like a most vigilant, resolute, and a courageous soldier, as also our honest and valiant master, did still so comfort and encourage us by all the means they could, at last to all our great contents we arrived in Virginia, and from thence returned safely to England.

The Names of the Adventurers for Virginia, alphabetically fet down, according to a printed Book, fet out by the Treasurer and Council in this present Year, 1620.

Z Edward, Lord Zouch, John Zouch, Efquire.

That most generous and most honourable Lord, the Earl of Southampton, being pleafed to take upon him the title of treafurer, and Mr. John Farrar his deputy, with fuch instructions as were necessary, and admonitions to all officers to take heed of extortion, ingroffing commodities, forestalling of markets, especially to have a vigilant care, the familiarity of the favages living amongst them made them not way to betray or furprife them, for the building of guest-houses to relieve the weak in, and that they did wonder in all this time they had made no difcoveries, nor knew no more than the very place whereon they did inhabit, nor yet could ever fee any return for all this continual charge and trouble, therefore they fent to be added to the council feven gentlemen, namely Mr. Thorp, Captain Nuce, Mr. Tracy, Captain Middleton, Captain Blount, Mr. John Pountas, and Mr. Harwood, with men, ammunition, and all things thought fitting: but they write from Virginia, many of the ships were so pestered with difeafed people, and thronged together in their passage, there was much sickness and a great mortality, wherefore they defired rather a few able fufficient men well provided, than great multitudes: and because there were few accidents of note, but private advertifements by letters, we will conclude this year, and proceed to the next.

Collected out of the Council's Letters for Virginia.

The inftructions and advertisements for this year were both from England and Virginia, much like the last: only whereas before they had ever a suspicion of Opechankanough, and all the rest of the savages, they had an eye over him more than any; but now they all write fo confidently of their assured peace with the favages, there is now no more fear nor danger either of their power or treachery, fo that every man planteth himself where he pleaseth, and followeth his business securely. But the time of Sir George Yearley being near expired, the council here made choice of a worthy young gentleman Sir Francis Wyat, to fucceed him, whom they forthwith furnished and provided, as they had done his predeceffors, with all the necessary inftructions all these times had acquainted them for the conversion of the savages, the suppressing of planting tobacco, and planting of corn, not depending continually to be supplied by the savages, but in case of necessity to trade with them, whom long ere this, it hath been promised and expected should have been fed and relieved by the English, not the English by them; and carefully to redrefs all the complaints of the needlefs mortality of their people, and by all diligence feek to fend fomething home to fatisfy the adventurers, that all this time had only lived upon hopes, grew fo weary and discouraged, that it must now be fubstance that must maintain their proceedings, and not letters, excuses, and promises;

feeing they could get fo much and fuch great estates for themselves, as to spend after the rate of one hundred pounds, two, three, four, five, fix, seven, eight, nine, ten, nay some two or three thousand pounds yearly, that were not worth so many pence when they went to Virginia, can scarce contain themselves either in diet or apparel, gaming, and all manner of such superfluity, within a less compass than our curious, costly, and consuming gallants here in England, which cannot possibly be there supported, but either by oppressing the commonalty there, or deceiving the generality here, or both.

Extracted out of the Council's Letters for Virginia.

From Virginia, by the relations of the chieftains there, and many I have conferred with, that came from thence hither, I have much admired to hear of the incredible pleafure, profit, and plenty this plantation doth abound in, and yet could never hear of any return but tobacco: but it hath oft amazed me to understand how strangely the favages hath been taught the use of our arms, and employed in hunting and fowling with our fowling-pieces, and our men rooting in the ground about tobacco, like fwine; befides, that the favages that do little but continually exercise their bow and arrows. should dwell and lie so familiarly amongst our men that practised little but the spade. being fo far afunder, and in fuch small parties dispersed, and neither fort, exercise of arms used, ordnances mounted, courts of guard, nor any preparation nor provision to prevent a foreign enemy, much more the favages howfoever; for the favages' uncertain conformity I do not wonder, but for their constancy and conversion, I am and ever have been of the opinion of Mr. Jonas Stockam, a minister in Virginia, who even at this time, when all things were fo prosperous, and the savages at the point of conversion, against all their governors' and councils' opinions, writ to the council and company in England to this effect:

" May 28.

We that have left our native country to fojourn in a strange land, some idle spectators, who either cowardly dare not, or covetously will not adventure either their purses or persons in so commendable a work; others supporting Atlas of this almost unsupportable burdens as yourselves, without whose affistance this Virginia sirmament (in which some) and I hope in short time will shine many more glorious stars, though there be many Italianated and Spaniolized Englishmen envies our prosperity, and by all their ignominious scandals they can devise seek to dishearten what they can, those that are willing to surther this glorious enterprize, to such I wish according to the decree of Darius, that whosoever is an enemy to our peace, and seeketh either by getting monipolical patents, or by forging unjust tales to hinder our welfare, that his house were pulled down, and a pair of gallows made of the wood, and he hanged on them in the place.

"As for those lazy fervants, who had rather stand all day idle than work, though but an hour in this vineyard, and spend their substance riotously, than cast the superfluity of their wealth into your treasury, I leave them as they are to the Eternal Judge of the world. But you right worthy, that hath adventured so freely, I will not examine, if it were for the glory of God, or your desire of gain, which it may be you expect should flow unto you with a full tide, for the conversion of the savages: I wonder you use not the means, I confess you say well to have them converted by fair means, but they scorn to acknowledge it; as for the gifts bestowed on them they devour them, and so they would the givers if they could; and though many have endeavoured by all the means they could by kindness to convert them, they find nothing from them but deri-

fion and ridiculous answers. We have fent boys amongst them to learn their language, but they return worse than they went; but I am no statesman, nor love I to meddle with any thing but my books: but I can find no probability by this course to draw them to goodness; and I am persuaded if Mars and Minerva go hand in hand, they will effect more good in an hour than those verbal Mercurians in their lives; and till their priests and ancients have their throats cut, there is no hope to bring them to conversion."

The Government of Sir Francis Wyat.

About October arrived Sir Francis Wyatt, with Mr. George Sands, appointed treasurer, Mr. Davison secretary, Doctor Pot the physician, and Mr. Cloyburne the surgeon; but much provision was very badly conditioned, nay, the hogs would not eat that corn they brought, which was a great cause of their sickness and mortality, and whatsoever is said against the Virginia corn, they find it doth better nourish than any provision is sent thither; the sailors still they complain are much to blame for embezzling the provisions sent to private men, killing of swine, and disorderly trucking; for which some order would be taken.

In them nine ships that went with Sir Francis Wyat, not one passenger died; at his arrival he fent Mr. Thorpe to Opechankanough, whom he found much fatisfied with his coming, to confirm their leagues as he had done his predeceffors, and fo contented his people should co-inhabit amongst them, and he found more motions of religion in him than could be imagined: every man betaking himfelf to his quarter, it was ordered, that for every head they should plant but one thousand plants of tobacco, and upon each plant nine leaves, which will be about one hundred weight, the corn being appointed but at two shillings and sixpence the bushel, required such labour, it caused most men to neglect it, and depend upon trade; where were it rated at ten shillings the bushel, every man would endeavour to have plenty to fell to the new comers, or any that wanted, and feldom any is transported from England, but it standeth in as much, befides the hazard and other necessaries, the ships might transport of that burden. The 22d of November arrived Mr. Gookin out of Ireland, with fifty men of his own, and thirty passengers, exceedingly well furnished with all forts of provision and cattle, and planted himself at Nupors-newes: the cotton trees in a year grew fo thick as one's arm, and fo high as a man: here any thing that is planted doth prosper so well as in no place better. For the mortality of the people accuse not the place, for of the old planters and the families scarce one of twenty miscarries, only the want of necessaries are the occasions of those diseases. And so we will conclude this year with the shipping and numbers sent.

Out of the Council's Letters from Virginia.

This year was fent one-and-twenty fail of ships that employed more than four hundred failors, and thirteen hundred men, women and children of divers faculties, with fourfcore cattle. The Tiger fell in the Turk's hands, yet fafely escaped, and by the return of their letters from thence, the company is assured there can be no fitter places of mines, wood, and water for iron than there; and the Frenchmen assured is more proper for vines, olives, sike, rice, and salt, &c., of which the next year they promise a good quantity.

Gifts.

The gentlemen and mariners that came in the Royal James from the East Indies, gave towards the building of a free-school seventy pounds eight shillings and sixpence; and an unknown person to further it, sent thirty pounds; and another in like manner five-and-twenty pounds; another, refufing to be made known, gave forty shillings yearly for a fermon before the Virginia Company; also another, that would not be known, fent for the college, at Henrico, many excellent good religious books, worth ten pounds, and a most curious map of all that coast of America. Mr. Thomas Bargave their preacher there, deceased, gave a library valued at one hundred marks; and the inhabitants hath made a contribution of one thousand and five hundred pounds, to build a house for the entertaining of strangers. This year also there was much suing for patents for plantations, who promifed to transport such great multitudes of people; there was much disputing concerning those divisions, as though the whole land had been too little for them; fix-and-twenty obtained their defires, but as yet not past fix hath fent thither a man; notwithstanding many of them would have more, and are not well contented, whom I would entreat, and all other wranglers, to peruse this saying of honest Claudius.

See'st not the world of Nature's work, the fairest well, I wot, How it, itself together ties, as in a true-love's knot, Nor feest how th' elements are combin'd, maintain one constant ple', How midst of heaven contents the Sun, and shore contains the sea; And how the air both compasseth, and carrieth still earth's frame, Yet neither pressing burdens it, nor parting leaves the same.

The Observations of Mr. John Pory, Secretary of Virginia, in his Travels.

HAVING but ten men, meanly provided, to plant the fecretary's land on the eastern shore near Acomack, Captain Wilcock's plantation, the better to secure and assist each other; Sir George Yearley intending to visit Smith's Isles, fell so sick that he could not, so that he sent me with Estinien Moll, a Frenchman, to find a convenient place to make salt in. Not long after, Namenacus, the King of Pawtuxunt, came to us to seek for Thomas Savage, our interpreter: thus infinuating himself, he led us into a thicket, where all sitting down, he shewed us his naked breast; asking if we saw any deformity upon it; we told him, No. "No more," said he, "is the inside, but as sincere and pure, therefore come freely to my country, and welcome;" which we promifed we would within six weeks after. Having taken a muster of the company's tenants, I went to Smith's Isles, where was our falt-house; not far off we found a more convenient place, and so returned to James Town.

Being furnished the second time, we arrived at Aquochanock, and conferred with Kiptopeke their King. Passing Russel's Isle and Onaucoke, we arrived at Pawtuxunt: the description of those places you may read in Captain Smith's discoveries, therefore needless to be writ again. But here arriving at Attoughcomoco, the habitation of Namenacus, and Wamanato, his brother, long we staid not ere they came on board us with a brass kettle, as bright without as within, full of boiled oysters. Strict order was given none should offend us, so that the next day I went with the two Kings a hunting, to discover what I could in their confines. Wamanato brought me first to his house, where he shewed me his wife and children, and many corn-fields; and being two miles within the woods a hunting, as the younger conducted me forth, so the elder brought me home,

hunting,

and used me as kindly as he could, after their manner. The next day he presented me twelve beaver skins and a canoe, which I requited with such things to his content, that he promifed to keep them whilft he lived, and bury them with him being dead. He much wondered at our bible, but much more to hear it was the law of our God, and the first chapter of Genesis expounded of Adam and Eve, and simple marriage; to which he replied, he was like Adam in one thing, for he never had but one wife at once; but he, as all the reft, feemed more willing of other difcourfes they better understood. The next day the two Kings, with their people, came on board us, but brought us nothing according to promife, fo that Enfign Savage challenged Namenacus the breach of three promifes, viz. not giving him a boy, nor corn, though they had plenty, nor Montapassa fugitive, called Robert Marcum, that had lived five years amongst those northerly nations, which he cunningly answered by excuses. Womanato, it feems, was guilty of this fallhood, because he staid alone when the rest were gone. I asked him if he defired to be great and rich; he answered, they were things all men aspired unto; which I told him he should be, if he would follow my counsel; so he gave me two tokens, which being returned by a messenger, should suffice

to make him confident the meffenger could not abuse us.

Some things being stolen from us, he took such order that they were presently reftored, then we interchanged prefents: in all things he much admired our discretions, and gave us a guide that he called brother, to conduct us up the river: by the way we met with divers that still told us of Marcum; and though it was in October, we found the country very hot, and their corn gathered before ours at James Town. The next day we went to Paccamaganant, and they directed us to Assacomoco, where their King Caffatowap, had an old quarrel with Enfign Savage, but now feeming reconciled, went with us, with another Werowance towards Mattapanient, where they perfuaded us ashore upon the point of a thicket; but supposing it some treachery, we returned to our boat: far we had not gone from the shore, but a multitude of favages fallied out of the wood, with all the ill words and figns of hostility they could. When we saw plainly their bad intent, we fet the two Werowances at liberty, that all this while had lain in the cabin, as not taking any notice of their villany, because we would convert them by courtefy. Leaving them as we found them, very civil and fubtile, we returned the fame way we came, to the laughing Kings on the eastern shore, who told us plainly, Namanicus would also have allured him into his country, under colour of trade, to cut his throat. He told us also Opechancanough had employed Onianimo to kill Savage, because he brought the trade from him to the eastern shore, and some disgrace he had done his fon, and fome thirteen of his people before one hundred of those Easterlings in rescuing Thomas Graves, whom they would have flain, where he and three more did challenge the thirteen Pamaunkes to fight, but they durft not, fo that all those Easterlings so derided them, that they came there no more.

This Thomas Savage, it is fixteen years fince he went to Virginia, being a boy, he was left with Powhatan, for Namontacke to learn the language, and as this author affirmeth, with much honefty and good fuccefs, hath ferved the public, without any public recompence, yet had an arrow fhot through his body in their fervice. This laughing King at Accomack, tells us the land is not two days journey over in the broadest place; but in some places a man may go in half a day, betwixt the bay and the main ocean, where inhabit many people, so that by the narrowness of the land there is not many deer, but most abundance of fish and sowl. Kiptope his brother, rules as his lieutenant, who seeing his younger brother more affected by the people than himself, freely resigned him the moiety of his country, applying himself only to husbandry and

hunting, yet nothing neglected in his degree, nor is he careless of any thing concrns. the state, but as a vigilant and faithful counfellor, as he is an affectionate brother, bearing the greater burden in government, though the lesser honour, where clean contrary, they on the western shore, the younger bears the charge, and the elder the dignity. Those are the best husbands of any favages we know; for they provide corn to serve them all the year, yet spare; and the other not for half the year, yet want. They are the most civil and tractable people we have met with, and by little sticks will keep as just an account of their promifes as by a tally. In their marriages they observe a large diftance, as well in affinity as confanguinity; nor do they use that devilish custom in making black boys. There may be on this shore about two thousand people; they on the west would invade them, but that they want boats to cross the bay, and so would divers other nations, where they not protected by us. A few of the western renagadoes had confpired against the laughing King; but fearing their treason was discovered, fled to Smith's Isles, where they made a massacre of deer and hogs; and thence to Rickahake, betwixt Cissapeack and Nansamund, where they now are feated under the command of Itoyatin, and fo I returned to James Town, where I found the government rendered to Sir Francis Wyat. In February also he travelled to the fouth river Chawonock, fome fixty miles over land, which he found to be a very fruitful and pleafant country, yielding two harvests in a year, and found much of the filk-grass formerly fpoken of, was kindly used by the people, and so returned.

Captain Each fent to build a Fort to fecure the Country.

IT was no finall content to all the adventurers to hear of the fafe arrival of all those ships and companies, which was thought sufficient to have made a plantation of themfelves; and again to fecond them was fent Captain Each, in the Abigail, a ship of three or four hundred tons, who hath undertaken to make a block-house amongst the oysterbanks that shall secure the river. The furnishing him with instruments cost three hundred pounds; but the whole charge, and the ship's return, will be near two thoufand pounds. In her went Captain Barwicke, with five-and-twenty men, for the building fhips and boats, and not other way to be employed; and also a felected number to build the East India school; but as yet from Virginia little returns but private men's tobacco, and fair promifes of plenty of iron, filk, wine, and many other good and rich commodities, besides the speedy conversion of the savages, that at first were much discouraged from living amongst them, when they were debarred the use of their pieces; therefore it was disputed as a matter of state, whether such as would live amongst them should use them or not, as a bait to allure them, or at least such as should be called to the knowledge of Chrift. But because it was a great trouble for all causes to be brought to James Town for a trial, courts were appointed in convenient places to relieve them; but as they can make no laws in Virginia till they be ratified here, fo they think it but reason none should be enacted here without their consents, because they only feel them, and must live under them. Still they complain for want of corn but what must be had by trade, and how unwilling any officer when he leaveth his place is to make good his number of men to his fucceffor; but many of them during their times to help themselves undoes the company: for the servants you allow them, or fuch as they hire, they plant on their private lands, not upon that belongeth to their office, which crop always exceeds yours, befides those which are your tenants to halves, are forced to row them up and down, whereby both you and they lofe more than half. Nor are those officers the ablest or best deserving, but make their experience upon the company's company's cost, and your land lies unmanured to any purpose, and will yield as little profit to your next new officers.

The Maffacre upon the 22d of March.

THE prologue to this tragedy is supposed was occasioned by Nemattanow, otherwife called Jack of the Feather, because he commonly was most strangely adorned with them; and for his courage and policy was accounted amongst the favages their chief captain, and immortal from any hurt could be done him by the English. This captain coming to one Morgan's house, knowing he had many commodities that he defired, perfuaded Morgan to go with him to Pamaunke to truck; but the favage murdered him by the way, and after two or three days returned again to Morgan's house, where he found two youths, his fervants, who asked for their master. Jack replied directly, he was dead. The boys suspecting as it was, by seeing him wear his cap, would have had him to Mr. Thorp; but Jack fo moved their patience, they shot him; so he fell to the ground; put him in a boat to have him before the governor, then feven or eight miles from them; but by the way Jack finding the pangs of death upon him, defired of the boys two things; the one was, that they would not make it known he was flain with a bullet, the other, to bury him amongst the English. At the loss of this favage, Opechankanough much grieved and repined, with great threats of revenge; but the English returned him such terrible answers, that he cunningly dissembled his intent with the greatest figns he could of love and peace, yet within fourteen days after he acted what followeth.

Sir Francis Wyat, at his arrival, was advertifed; he found the country fettled in fuch a firm peace, as most men there thought sure and inviolable, not only in regard of their promises, but of necessity. The poor weak savages being every way bettered by us, and safely sheltered and defended, whereby we might freely follow our business; and such was the conceit of this conceited peace, as that there was seldom or never a sword, and seldomer a piece, except for a deer or fowl, by which assurances the most plantations were placed stragglingly and scatteringly, as a choice vein of rich ground invited them, and further from neighbours the better. Their houses generally open to the savages, who were always friendly, fed at their tables, and lodged in their bed-chambers, which made their way plain to effect the intents, and the conversion of the savages,

as they supposed.

Having occasion to send to Opechankanough about the middle of March, he used the messenger well, and told him he held the peace so firm, the sky should fall or he dissolved it; yet such was the treachery of those people, when they had contrived our destruction, even but two days before the massacre, they guided our men with much kindness through the woods; and one Brown, that lived among them, to learn the language, they sent home to his master; yea, they borrowed our boats to transport themselves over the river, to consult on the devilish murder that ensued, and of our utter extirpation, which God of his infinite mercy (by the means of one of themselves converted to Christianity) prevented, and as well on the Friday morning that fatal day, being the 22d of March, as also in the evening before, as at other times they came unarmed into our houses, with deer, turkies, fish, fruits, and other provisions to sell us; yea, in some places fat down at breakfast with our people, whom immediately with their own tools they slew most barbarously, not sparing either age or sex, man, woman, or child; so sudden in their execution, that sew or none discerned the weapon or blow that brought them to destruction: in which manner also they slew many of

our people at feveral works in the fields, well knowing in what places and quarters each of our men were, in regard of their familiarity with us, for the effecting that great mafter-piece of work, their conversion; and by this means fell that fatal morning, under the bloody and barbarous hands of that perfidious and inhuman people, three hundred and forty-seven men, women, and children, most by their own weapons; and not being content with their lives, they fell again upon the dead bodies, making as well as they could a fresh murder, defacing, dragging, and mangling their dead carcases into many pieces, and carrying some parts away in derision, with base and brutish triumph.

Neither yet did these beasts spare those amongst the rest well known unto them, from whom they had daily received many benefits, but spitefully also massacred them without any remorse or pity, being in this more fell than lions and dragons, as histories record, which have preserved their benefactors; such is the force of good deeds, though done to cruel beasts, to take humanity upon them; but these miscreants put on

a more unnatural brutishness than beasts, as by those instances may appear.

That worthy religious gentleman, Mr. George Thorp, deputy to the college lands, fometime one of his Majesty's pensioners, and in command one of the principal of Virginia, did so truly affect their conversion, that whosoever under him did them the least displeasure, were punished severely. He thought nothing too dear for them; he never denied them any thing, insomuch that when they complained that our mastissed did fear them, he, to content them in all things, caused some of them to be killed in their presence, to the great displeasure of the owners, and would have had all the rest gelt, to make them the milder, might he have had his will. The King dwelling but in a cottage, he built him a fair house after the English sashion, in which he took such pleasure, especially in the lock and key, which he so admired, as locking and unlocking his door a hundred times a day, he thought no device in the world comparable to it.

Thus infinuating himself into this King's favour for his religious purpose, he conferred oft with him about religion, as many others in this former difcourse had done: and this Pagan confessed to him as he did to them, our God was better than theirs, and feemed to be much pleafed with that difcourfe, and of his company, and to requite all those courtesies; yet this viperous brood did, as the sequel shewed, not only murder him, but with fuch fpight and fcorn abused his dead corps, as is unfitting to be heard with civil ears. One thing I cannot omit, that when this good gentleman upon his fatal hour, was warned by his man, who perceiving fome treachery intended by those hell-hounds, to look to himself, and withal ran away for fear he should be apprehended, and so faved his own life; yet his mafter out of his good meaning, was so void of fuspicion and full of confidence, they had flain him, or he could or would believe they would hurt him. Captain Nathaniel Powell, one of the first planters, a valiant foldier, and not any in the country better known amongst them; yet such was the error of an over-conceited power and prosperity, and their simplicity, they not only slew him and his family, but butcher-like haggled their bodies, and cut off his head, to express their uttermost height of cruelty. Another of the old company of Captain Smith, called Nathaniel Caufie, being cruelly wounded, and the favages about him, with an axe did cleave one of their heads, whereby the rest sled and he escaped: for they hurt not any that did either fight or fland upon their guard. In one place where there was but two men that had warning of it, they defended the house against fixty or more that affaulted it. Mr. Baldwin, at Warrafkoyack, his wife being fo wounded, fhe lay for dead, yet by his oft discharging of his piece, saved her, his house, himself, and divers

divers others. At the fime time they came to one Mr. Harrison's house, near half a mile from Baldwin's, where was Mr. Thomas Hamer with fix men, and eighteen or nineteen women and children. Here the favages, with many presents and fair persuasions, feigned they came for Captain Ralfe Hamer to go to their King, then hunting in the woods; presently they sent to him, but he not coming as they expected, set fire to a tobacco-house, and then came to tell them in the dwelling-house of it to quench it; all the men ran towards it, but Mr. Hamer not suspecting any thing, whom the savages pursued, shot them full of arrows, then beat out their brains. Hamer having sinished a letter he was writing, followed after to see what was the matter, but quickly they shot an arrow in his back, which caused him to return and barricade up the doors, whereupon the savages set sire on the house. Harrison's boy sinding his master's piece loaded, discharged it at random, at which bare report the savages all fled, Baldwin still discharging his piece, and Mr. Hamer with two-and-twenty persons thereby got to his house, leaving their own burning. In like manner they had fired Lieutenant Basse's house, with all the rest thereabout, slain the people, and so left that plantation.

Captain Hamer all this while not knowing any thing, coming to his brother that had fent for him to go hunt with the King, meeting the favages chafing some, yet escaped, retired to his new house then building, from whence he came; there only with spades, axes, and brick-bats, he defended himself and his company till the savages departed. Not long after the master from the ship had fent six musketeers, with which he recovered their merchants store-house, where he armed ten more, and so with thirty more unarmed workmen, found his brother and the rest at Baldwin's: now seeing all they had was burnt and consumed, they repaired to James Town with their best expedition; yet not far from Martin's hundred, where seventy-three were slain, was a little house

and a small family, that heard not of any of this till two days after.

All those and many others whom they have as maliciously murdered, fought the good of those poor brutes, that thus despising God's mercies, must needs now as miscreants be corrected by justice: to which leaving them, I will knit together the thread of this discourse. At the time of the massacre, there were three or four ships in James river, and one in the next, and daily more to come in, as there did within fourteen days after, one of which they endeavoured to have furprifed : yet were the hearts of the English ever stupid, and averted from believing any thing might weaken their hopes, to win them by kind ufage to Christianity. But divers write from thence, that Almighty God hath his great work in this tragedy, and will thereout draw honour and glory to his name, and a more flourishing estate and safety to themselves, and with more speed to convert the favage children to himself, since he so miraculously hath preferved the English, there being yet, God be praifed, eleven parts of twelve remaining, whose careless neglect of their own safeties feem to have been the greatest cause of their destruction: yet you see, God, by a converted savage that disclosed the plot, saved the rest, and the pinnace then in Pamaunkes river, whereof (fay they) though our fins made us unworthy of fo glorious a conversion, yet his infinite wisdom can nevertheless bring it to pass, and in good time, by such means as we think most unlikely: for in the delivery of them that furvive, no man's particular carefulness saved one person, but the mere goodness of God himself, freely and miraculously preserving whom he pleafed.

The letters of Mr. George Sands, a worthy gentleman, and many others befides them returned, brought us this unwelcome news, that hath been heard at large in public court, that the Indians and they lived as one nation, yet, by a general combinazion, in one day plotted to subvert the whole colony, and at one instant, though our

feveral plantations were one hundred and forty miles up on river on both fides.

But for the better understanding of all things, you must remember these wild naked natives live not in great numbers together, but dispersed, commonly in thirty, forty, sifty, or fixty in a company. Some places have two hundred, sew places more, but many less; yet they had all warning given them one from another in all their habitations, though far asunder, to meet at the day and hour appointed for our destruction, at all our several plantations, some directed to one place, some to another, all to be done at the time appointed, which they did accordingly: some entering their houses under colour of trading, so took their advantage; others drawing us abroad under fair pretences, and the rest suddenly falling upon those that were at their labours.

Six of the council fuffered under this treason, and the slaughter had been universal, if God had not put it into the heart of an Indian, who lying in the house of one Pace, was urged by another Indian his brother, that lay with him the night before, to kill Pace, as he should do Perry which was his friend, being so commanded from their King; telling him also how the next day the execution should be sinished: Perry's Indian presently arose and reveals it to Pace, that used him as his son; and thus those that escaped were saved by this one converted insidel. And though three hundred and forty seven were slain, yet thousands of ours were by the means of this alone thus

preferved, for which God's name be praifed for ever and ever.

Pace upon this, fecuring his house, before day rowed to James Town, and told the governor of it, whereby they were prevented, and at such other plantations as possibly intelligence could be given; and where they saw us upon our guard, at the sight of a piece they ran away; but the rest were most slain, their houses burnt, such arms and ammunition as they found they took away, and some cattle also they destroyed. Since we find Opechankanough the last year had practised with a King on the eastern shore, to furnish him with a kind of poison, which only grows in his country, to poison us. But of this bloody act never grief and shame possessed any people more than themselves, to be thus butchered by so naked and cowardly a people, who dare not stand the presenting of a stass in manner of a piece, nor an uncharged piece in the hands of a woman. (But I must tell those authors, though some might be thus cowardly, there

were many of them had better spirits.)

Thus have you heard the particulars of this maffacre, which in those respects some fay will be good for the plantation, because now we have just cause to destroy them by all means possible; but I think it had been much better it had never happened, for they have given us an hundred times as just occasions long ago to subject them, (and I wonder I can hear of none but Mr. Stockam and Mr. Whitaker of my opinion.) Moreover, where before we were troubled in clearing the ground of great timber, which was to them of fmall use; now we may take their own plain fields and habitations, which are the pleafantest places in the country. Besides, the deer, turkies, and other beafts and fowls will exceedingly increase if we beat the savages out of the country, for at all times of the year they never spare male nor female, old nor young, eggs nor birds, fat nor lean, in season or out of season, with them all is one. The like they did in our fwine and goats, for they have used to kill eight in ten more than we, or elfe the wood would most plentifully abound with victuals; besides, it is more easy to civilize them by conquest than fair means; for the one may be made at once, but their civilizing will require a long time and much industry. The manner how to suppress them is so often related and approved, I omit it here; and you have twenty examples of the Spaniards how they got the West Indies, and forced the treacherous and rebellious insidels to do all manner of drudgery work and flavery for them, themselves living like soldiers upon the fruits of their labours. This will make us more circumspect, and be an example to posterity: (but I say, this might as well have been put in practice

fixteen years ago as now.)

Thus upon this anvil shall we now beat ourselves an armour of proof hereafter to defend us against such incursions, and ever hereafter make us more circumspect: but to help to repair this loss, besides his Majesty's bounty in arms, he gave the company out of the Tower, and divers other honourable persons have renewed their adventures, we must not omit the honourable city of London, to whose endless praise we may speak it, are now setting forward one hundred persons, and divers others at their own costs are repairing; and all good men do think never the worse of the business for all these disasters.

What growing state was there ever in the world which had not the like? Rome grew by oppression, and rose upon the back of her enemies: and the Spaniards have had many of those counterbuffs more than we. Columbus upon his return from the West Indies into Spain, having left, his people with the Indians, in peace and promise of good usage amongst them, at his return back found not one of them living, but all treacherously flain by the savages. After this again, when the Spanish colonies were increased to great numbers, the Indians from whom the Spaniards for trucking stuff used to have all their corn, generally conspired together to plant no more at all, intending thereby to famish them, themselves living in the meantime upon cassava, a root to make bread, only then known to themselves. This plot of theirs by the Spaniards' overfight, that foolishly depended upon strangers for their bread, took such effect, and brought them to fuch mifery by the rage of famine, that they spared no unclean nor loathfome beaft, no not the poisonous and hideous serpents, but eat them up also, devouring one death to fave them from another; and by this means their whole colony well near furfeited, fickened and died miferably; and when they had again recovered this lofs, by their incontinency an infinite number of them died on the Indian difease, we call the French pox, which at first being a strange and an unknown malady, was deadly upon whomfoever it lighted: then had they a little flea called nigua, which got between the skin and the flesh before they were aware, and there bred and multiplied, making fwellings and putrefactions, to the decay and lofs of many of their bodily members.

Again, divers times they were near undone by their ambition, faction, and malice of the commanders. Columbus, to whom they were also much beholden, was fent with his brother in chains into Spain, and some other great commanders killed and murdered one another. Pizzaro was killed by Almagro's son, and him Vasco beheaded, which Vasco was taken by Blasco, and Blasco was likewise taken by Pizzaro's brother: and thus by their covetous and spightful quarrels, they were ever shaking the main pillars of their commonwealth. These and many more mischiefs and calamities happened them, more than ever did to us, and at one time being even at the last gasp, had two ships not arrived with supplies as they did, they were so disheartened, they were leaving the country: yet we see for all those miscries they have attained to their ends at last, as is manifest to all the world, both with honour, power, and wealth: and whereas before sew could be hired to go to inhabit there, now with great suit they must obtain it; but where there was no honesty, nor equity, nor fanctity, nor verity, nor piety, nor good civility in such a country, certainly there can be no stability.

Therefore

Therefore let us not be difcouraged, but rather animated by those conclusions, feeing we are fo well assured of the goodness and commodities may be had in Virginia; nor is it to be much doubted there is any want of mines of most forts, no not of the richeft, as is well known to fome yet living that can make it manifest when time shall ferve: and yet to think that gold and filver mines are in a country otherwise most rich and fruitful, or the greatest wealth in a plantation, is but a popular error, as is that opinion likewife, that the gold and filver is now the greatest wealth of the West Indies at this prefent. True it is indeed, that in the first conquest the Spaniards got great and mighty flore of treasure from the natives, which they in long space had heaped together, and in those times the Indians shewed them entire and rich mines, which now by the relations of them that have been there, are exceedingly wasted, fo that now the charge of getting those metals is grown excessive, besides the consuming the lives of many by their peftilent finoke and vapours in digging and refining them, fo that all things confidered, the clear gains of those metals, the King's part defrayed, to the adventurers is but finall, and nothing near fo much as vulgarly is imagined; and were it not for other rich commodities there that enrich them, those of the contractionhouse were never able to subfift by the mines only, for the greatest part of their commodities are partly natural and partly transported from other parts of the world, and planted in the West Indies, as in their mighty wealth of sugar canes, being first tranfported from the Canaries; and in ginger and other things brought out of the East Indies, in their cochineal, indigos, cotton, and their infinite store of hides, quickfilver, allum, woad, Brazil woods, dyes, paints, tobacco, gums, balms, oils, medicinals, and perfumes, farfaparilla, and many other physical drugs; these are the means whereby they raife that mighty charge of drawing out their gold and filver to the great and clear revenue of their King. Now feeing the most of those commodities, or as ufeful, may be had in Virginia by the fame means, as I have formerly faid; let us with all fpeed take the priority of time, where also may be had the priority of place, in choosing the best feats of the country, which now by vanquishing the savages, is like to offer a more fair and ample choice of fruitful habitations than hitherto our gentlenefs and fair comportments could attain unto.

31 At Mr. Thomas Perfe's house by Mulbery Isle, himself and

30 At Enfign Spence's house

This lamentable and fo unexpected a difaster caused them all believe the opinion of Mr. Stockam, and drove them all to their wits end: it was twenty or thirty days ere they could refolve what to do, but at last it was concluded, all the petty plantations should be abandoned, and drawn only to make good five or fix places, where all their labours now for the most part must redound to the Lords of those lands where they were refident. Now for want of boats, it was impossible upon such a sudden to bring also their cattle and many other things, which with much time, charge, and labour they had then in possession with them; all which for the most part at their departure was burnt, ruined, and destroyed by the favages. Only Mr. Gookins at Nuports-newes would not obey the commander's command in that, though he had fearce five and thirty of all forts with him, yet he thought himself sufficient against what could happen, and to did to his great credit and the content of his adventurers. Mr. Samuel Jorden gathered together but a few of the ftragglers about him at Beggars-bush, where he fortified and lived in defpight of the enemy. Nay, Mrs. Proctor, a proper modelt civil gentlewoman did the like, till perforce the English officers forced her and all them. with. her togo with them, or they would fire her housethemselves, as the lavages did when they were gone, in whose despight they had kept it, and what they had a month or three weeks after the maffacre; which was to their hearts a grief beyond comparison, to lose all they had in that manner, only to fecure others pleafures. Now here in England it was thought all those remainders might presently have been reduced into fifties or hundreds in places most convenient with what they had, having such strong houses as they reported they had, which with fmall labour might have been made invincible calles again all the favages in the land, and then prefently raifed a company, as a running army, to torment the barbarous, and fecure the reft, and fo have had all that

country betwixt the rivers of Powhatan and Pamaunke to range and fuftain them; especially all the territories of Kecoughtan, Chifkact and Paspahege, from Ozenies to that branch of Pamaunke, coming from Youghtanund, which strait of land is not past 4 or 5 miles, to have made a peninfula much bigger than the Summer Isles, environed with the broadest parts of those two main rivers, which for plenty of such things as Virginia affords is not to be exceeded, and were it well manured, more than fufficient for ten thousand men. This, were it well understood, cannot but be thought better than to bring five or fix hundred to lodge and live on that, which before would not well receive and maintain a hundred, planting little or nothing, but fpend that they have upon hopes out of England, one evil begetting another, till the difease is past cure: therefore it is impossible but such courses must produce most fearful miseries and extreme extremities; if it prove otherwife, I should be exceeding glad. I confess I am somewhat too bold to cenfure other men's actions being not prefent, but they have done as much of me; yea, many here in England that were never there, and also many there that know little more than their plantations, but as they are informed; and this doth touch the glory of God, the honour of my country, and the public good fo much, for which there hath been fo many fair pretences, that I hope none will be angry for speaking my opinion, feeing the old Proverb doth allow lofers leave to fpeak; and Du Bartas faith,

E'en as the wind the angry ocean moves, Wave hunteth wave, and billow billow shoves; So do all nations jostle each the other, And so one people do pursue another; And scarce a second bath the first unhous'd, Before a third him thence again have rous'd.

Amongst the multitude of these several relations, it appears Captain Nuse seeing many of the difficulties to ensue, caused as much corn to be planted as he could at Elizabeth's City, and though some destroyed that they had set, searing it would serve the savages for ambuscadoes, trusting to relief by trade, or from England, which hathever been one cause of our miseries, for from England we have not had much, and for trading, every one hath not ships, shalops, interpreters, men, and provisions to perform it, and those that have, use them only for their own private gain, not the public good, so that our beginning this year doth cause many to distrust the event of the next. Here we will seave Captain Nuse for a while, lamenting the death of Captain Norton, a valiant, industrious gentleman, adorned with many good qualities, besides physic and surgery, which for the public good, he freely imparted to all gratis, but most bountifully to the poor; and let us speak a little of Captain Croshaw amongst the midst of those broils in the river of Patawomeke.

Being in a small bark called the Elizabeth, under the command of Captain Spilman, at Cekacawone, a savage stole aboard them, and told them of the massacre, and that Opechankanough had plotted with his King and country to betray them also, which they refused, but them of Wighcocomoco at the mouth of the river had undertaken it; upon this Spilman went thither; but the savages seeing his men so vigilant and well armed, they suspected themselves discovered, and to colour their guilt, the better to delude him, so contented his desire in trade, his pinnace was near freighted; but seeing no more to be had, Croshaw went to Patawomek, where he intended to stay and trade for himself, by reason of the long acquaintance he had with this King that so earnestly entreated him now to be his friend, his countenancer, his captain, and director against the Pazaticans, the Nacotchtanks, and Moyaons, his mortal enemies. Of this oppor-

tunity

tunity Croshaw was glad, as well to satisfy his own defire in some other purpose he had, as to keep the King as an opposite to Opechancanough, and adhere him unto us, or at least make him an instrument against our enemies; so only Elis Hill stayed with him, and the pinnace returned to Elizabeth City; here shall they rest also a little, till we see

how this news was entertained in England.

It was no fmall grief to the council and company, to understand of such a supposed impossible loss, as that so many should fall by the hands of men so contemptible; and yet having such warnings, especially by the death of Nemattanow, whom the savages did think was shot-free, as he had persuaded them, having so long escaped so many dangers without any hurt. But now to leap out of this labyrinth of melancholy, all this did not so discourage the noble adventurers, nor divers others still to undertake new several plantations, but that divers ships were dispatched away, for their supplies and affishance thought sufficient. Yet Captain Smith did intreat and move them to put in practice his old offer, seeing now it was time to use both it and him, how slenderly heretofore both had been regarded, and because it is not impertinent to the business, it is not much amiss to remember what it was.

The Project and Offer of Captain John Smith, to the Right Honourable and Right Worship-ful Company Virginia.

IF you pleafe I may be transported with a hundred foldiers and thirty failors by the next Michaelmas, with victuals, ammunition, and such necessary provision, by God's affistance, we would endeavour to enforce the savages to leave their country, or bring them in that fear and subjection that every man should follow their business securely, whereas now half their times and labours are spent in watching and warding, only to defend, but altogether unable to suppress the savages, because every man now being for himself will be unwilling to be drawn from their particular labours, to be made as pack-horses for all the rest, without any certainty of some better reward and preferment than I can understand any there can or will yet give them.

These I would employ only in ranging the countries, and tormenting the savages, and that they should be as a running army till this were effected, and then settle themselves in some such convenient place, that should ever remain a garrison of that strength, ready upon any occasion against the savages or any other for the defence of the country, and to see all the English well armed, and instruct them their use. But I would have a bark of one hundred tons, and means to build six or seven shallops to

transport them where there should be occasion.

Towards the charge, because it is for the general good, and what by the massacre and other accidents, Virginia is disparaged, and many men and their purses much discouraged, however a great many do hasten to go, thinking to be next heirs to all the former losses, I fear they will not find all things as they do imagine; therefore leaving those gilded conceits, and dive into the true estate of the colony, I think if His Majesty were truly informed of their necessity and the benefit of this project, he would be pleased to give the custom of Virginia, and the planters also according to their abilities would add thereto such a contribution, as would be fit to maintain this garrison till they be able to subsist, or cause some such other collections to be made as may put it with all expedition in practice, otherwise it is much to be doubted, there will neither come custom nor any thing from thence to England within these sew years.

Now if this should be thought an employment more fit for ancient soldiers there bred, than such new comers as may go with me, you may please to leave that to my discretion, to accept or resuse such as that will hazard their fortunes in the trials of these events, and discharge such of my company that had rather labour the ground than subdue their enemies: what relief I should have from your colony I would fatisfy and spare them (when I could) the like courtesy. Notwithstanding these doubts, I hope to feed them as well as defend them, and yet discover you more land unknown than they all yet know, if you will grant me such privileges as of

necessity must be used.

For against any enemy we must be ready to execute the best can be devised by your state there, but not that they shall either take away my men, or any thing else to employ as they please by virtue of their authority, and in that I have done somewhat for New England as well as Virginia, so I would desire liberty and authority to make the best use I can of my best experience, within the limits of those two patents, and to bring them both in one map, and the countries betwixt them, giving always that respect to the governors and government, as an Englishman doth in Scotland, or a Scotchman in England, or as the regiments in the Low Countries do to the governors of the towns and cities where they are billeted or in garrison, where though they live with them and are as their servants to defend them, yet not to be disposed on at their pleasure, but as the prince and state doth command them, and for my own pains in particular I ask not any thing but what I can produce from the proper labour of the savages.

Their Answer.

I CANNOT fay it was generally for the company, for being published in their court, the most that heard it liked exceeding well of the motion, and some would have been very large adventurers in it, especially Sir John Brooks and Mr. David Wyssin, but there were such divisions amongst them, I could obtain no answer but this, the charge would be too great; their stock was decayed, and they did think the planters should do that of themselves if I could find means to essect it; they did think I might have leave of the company, provided they might have half the pillage; but I think there are not many will much strive for that employment, for except it be a little corn at some time of the year is to be had, I would not give twenty pounds for all the pillage is to be got amongst the savages in twenty years, but because they supposed I spoke only for my own ends, it were good those understand providents for the company's good they so much talk of, were sent thither to make trial of their profound wisdom and long experience.

About this time also was propounded a proposition concerning a falary of five-and-twenty thousand pounds to be raised out of tobacco, as a yearly pension to be paid to certain officers for the erecting a new office, concerning the sole importation of tobacco, besides His Majesty's custom, freight, and all other charges. To nominate the undertakers, favourers and opposers, with their arguments pro and con, would be too tedious and needless, being so publicly known, the which to establish, spent a good part of that year and the beginning of the next. This made many think wonders of Virginia, to pay such pensions extraordinary to a few here that were never there, and also in what state and pomp some chieftains and divers of their associates

live

live in Virginia, and yet no money to maintain a garrifon, pay poor men their wages, nor yet five-and-twenty pence to all the adventurers here, and very little to the most

part of the planters there, bred such differences in opinion, it was diffolved.

Now let us return to Captain Croshaw at Patawomek, where he had not been long ere Opechancanough sent two baskets of beads to this King, to kill him and his man, affuring him of the massacre he had made, and that before the end of two moons there should not be an Englishman in all their countries: this fearful message the King told this captain, who replied, he had seen both the cowardice and treachery of Opechancanough sufficiently tried by Captain Smith, therefore his threats he seared not, nor for his favour cared, but would nakedly sight with him, or any of his, with their own swords; if he were slain, he would leave a letter for his countrymen to know the fault was his own, not the King's; two days the King deliberated upon an answer; at last told him the English were his friends, and the savage Emperor Opitchapam, now called Toyatan, was his brother, therefore there should be no blood fined betwick them; so he returned the presents, willing the Pamaunkes to come no more in his country, lest the English, though against his will, should do them any mischief.

Not long after, a boat going abroad to feek out some relief amongst the plantations, by Nuports-newes, met such ill weather, though the men were saved, they lost their boat, which the storm and waves cast upon the shore of Nandsamund, where Edward Waters, one of the three that first stayed in Summer Isles, and found the great piece of ambergrease; dwelling in Virginia at this massacre, he and his wife these Nandsamunds kept prisoners, till it chanced they found this boat, at which purchase they so rejoiced, according to their custom of triumph, with songs, dances, and invocations, they were so busied, that Waters and his wife found opportunity to get secretly into their canoc, and so crossed the river to Kecoughtan, which is nine or ten miles, whereat the English no less wondered and rejoiced, than the savages were mad with discontent. Thus you may see how many desperate dangers some men escape, when others die that have all

things at their pleafure.

All men thinking Captain Croshaw dead, Captain Hamer arriving with a ship and a pinnace at Patawomek, was kindly entertained both by him and the King; that Don Hamer told the King he came for corn: the King replied, he had none, but the Nacotchtanks and their confederates had, which were enemies both to him and them; if they would fetch it, he would give them forty or fifty choice bow-men, to conduct and affift them. Those favages, with some of the English, they fent, who so well played their parts, they flew eighteen of the Nacotchtanks, some write but four, and some say they had a long skirmish with them, where the Patawomeks were so eager of revenge, they drove them not only out of their town, but all out of fight through the woods, thus taking what they liked, and spoiling the rest; they retired to Patawomek, where they left Captain Croshaw, with four men more, the rest set sail for James Town. Captain Croshaw now, with five men and himself, found night and day so many alarms, he retired into fuch a convenient place that, with the help of the favages, he had quickly fortified himfelf against all those wild enemies. Captain Nuse, his pinnace meeting Hamar by the way, understanding all this, came to see Captain Croshaw; after their best interchanges of courtefies, Croshaw writ to Nuse, the estate of the place where he was, but understanding by them the poor estate of the colony, offered if they would fend him but a bold shallop, with men, arms, and provision for trade, the next harvest he would provide them corn fufficient; but as yet, it being but the latter end of June, there was little or none in all the country.

This being made known to the governor and the rest, they sent Captain Madyson, with

with a ship and pinnace, and some fix-and-thirty men; those Croshaw a good time taught the use of their arms, but receiving a letter from Boyse, his wife, a prisoner, with nine-teen more, at Pamaunke, to use means to the governor for their liberty; so he dealt with his King, he got first two of his great men to go with him to James Town, and eight days after to send four of his council to Pamaunke, there to stay till he sent one of his two to them, to persuade Opachankanough to send two of his with two of the Patawomekes, to treat about those prisoners, and the rest should remain their hostage at Pamaunke; but the commanders at James Town, it seems, liked not of it, and so fent the Patawomekes

back again to their own country, and Captain Croshaw to his own habitation. All this time we have forgot Captain Nuse, where we left him but newly acquainted with the maffacre, calling all his next adjoining difperfed neighbours together, he regarded not the pestering his own house, nor any thing to relieve them, and with all speed entrenched himself, mounted three pieces of ordnance, so that within fourteen days, he was strong enough to defend himself from all the savages; yet when victuals grew fcant, fome that would forage without order, which he punished, near occasioned a mutiny: notwithstanding, he behaved himself so fatherly and kindly to them all, they built two houses for them he daily expected from England, a fair well of fresh water, mantled with brick, because the river and creeks are there brackish or falt; in all which things he played the fawyer, carpenter, dauber, labourer, or any thing; wherein, though his courage and heart were fleeled, he found his body was not made of iron, for he had many ficknesses, and at last a dropfy, no less grief to himself than forrow to his wife, and all under his government. These crosses and losses were no small increafers of this malady, nor the thus abandoning our plantations, the lofs of our harveft, and also tobacco, which was as our money; the vineyard our vineyetors had brought to a good forwardness, bruised and destroyed with deer, and all things ere they came to perfection, with weeds, diforderly perfons, or wild beafts; fo that as we are, I cannot perceive but the next year will be worfe, being still tormented with pride and flattery, idleness and covetousness, as though they had vowed here to keep their court, with all the pestilential vices in the world for their attendants, enchanted with a conceited stateliness, even in the very bottom of miserable senselessiness.

Shortly after, Sir George Yearley and Captain William Powell took each of them a company of well-difposed gentlemen and others, to seek their enemies: Yearley ranging the shore of Weanock, could see nothing but their old houses which he burnt, and so went home: Powell searching another part, found them all sled but three he met by chance, whose heads he cut off, burnt their houses, and so returned; for the savages are so light and swift, though we see them, (being so loaded with armour,) they have

much advantage of us, though they be cowards.

I confess this is true, and it may cause some to suppose they are grown invincible; but will any go to catch a hare with a taber and a pipe? for who knows not, though there be monsters both of men and beafts, fish and fowl, yet the greatest, the strongest, the wildest, cruellest, siercest, and cunningest, by reason, art, and vigilancy, courage and industry, hath been slain, subjected, or made tame, and those are still but savages as they were, only grown more bold by our own simplicity, and still will be worse and worse, till they be tormented with a continual pursuit, and not with lying inclosed within palisadoes, or affrighting them out of your sights, thinking they have done well, can but desend themselves; and to do this to any purpose, will require both charge, patience, and experience. But to their proceedings.

About the latter end of June, Sir George Yearley, accompanied with the council, and a number of the greatest gallants in the land, stayed three or four days with Cap-

tain

tain Nufe, he making his moan to a chief man amongst them for want of provision for his company: the great commander replied, he should turn them to his green corn, which would make them plump and fat; thefe fields being fo near the fort, were better regarded and preferved than the reft; but the great man's command, as we call them, was quickly obeyed, for though it was fearce half grown either to the greatness or goodness, they devoured it green though it did them small good. Sir George with his company went to Accomack to his new plantation, where he flaid near fix weeks; fome corn he brought home, but as he adventured for himself, he accordingly enjoyed the benefit; fome petty magazines came this fummer, but either the restraint by proclamation, or want of boats, or both, caufed few but the chieftains to be little better by them. So long as Captain Nufe had any thing we had part; but now all being fpent, and the people forced to live upon oysters and crabs, they became so faint no work could be done; and where the law was, no work, no meat, now the case is altered to no meat, no work; fome fmall quantity of milk and rice the captain had of his own. and that he would distribute gratis as he saw occasion; I say gratis, for I know no place elfe, but it was fold for ready payment: those ears of corn that had escaped till August, though not ripe by reason of the late planting, the very dogs did repair to the corn fields to feek them as the men till they were hanged; and this I protest before God is true that I have related, not to flatter Nufe, nor condemn any; but all the time I have lived in Virginia, I have not feen nor heard that any commander hath taken fuch continual pains for the public, or done so little good for himself, and his virtuous wife was no less charitable and compassionate according to her power. For my own part, although I found neither mulberries planted, houses built, men nor victuals provided, as the honourable adventurers did promife me in England; yet at my own charge, having made these preparations, and the filk-worms ready to be covered, all was lost, but my poor life and children, by the massacre, the which as God in his mercy did preferve, I continually pray we may fpend to his glory. The 9th of September we had an alarm, and two men at their labours flain; the captain, though extremely fick, fallied forth, but the favages lay hid in the corn-fields all night, where they deftroyed all they could, and killed two men more; much mischief they did to Mr. Edward Hill's cattle, yet he alone defended his house, though his men were fick and could do nothing, and this was our first affault fince the massacre.

About this time Captain Madyson passed by us, having taken prisoners the King of Patawomek, his fon, and two more, and thus it happened: Madyfon not liking fo well to live amongst the savages as Croshaw did, built him a strong house within the fort, fo that they were not fo fociable as before, nor did they much like Poole the interpreter; many alarms they had, but faw no enemies: Madyfon, before his building, went to Moyaones, where he got provision for a month, and was promifed much more, so he returned to Patawomek and built this house, and was well used by the savages. Now by the four great men the King fent to Pamaunke for the redemption of the prifoners, Madyfon fent them a letter, but they could neither deliver it nor fee them: fo long they staid that the King grew doubtful of their bad usage, that he swore by the skies, if they returned not well, he would have wars with Opechankanough fo long as he had any thing: at this time two of Madyfon's men ran from him; to find them, he fent Mr. John Upton and three more with an Indian guide to Nazatica, where they heard they were. At this place was a King beat out of his country by the Necosts, enemies to the Patawomeks; this expelled King, though he professed much love to the Patawomeks, yet he loved not the King because he would not help him to revenge his injuries; but to our interpreter, Poole, he protested great love, promising if any treason were, he would reveal it: our guide conducted this Bandyto with them up to Parawomek, and there kept him; our fugitives, we found the Patawomeks had taken and brought home, and the four great men returned from Pamaunke; not long after, this expelled King defired private conference with Poole, urging him to fwear by his God never to reveal what he would tell him; Poole promifed he would not: "Then," quoth this King, "those great men that went to Pamaunke, went not as you suppose they pretended, but to contract with Opechankanough how to kill you all here, and these are their plots.

"First, they will procure half of you to go a fishing to their furthest town, and there set upon them, and cut off the rest; if that fail, they will seign a place where are many strangers would trade their furs, where they will persuade half of you to go trade, and there murder you and kill them at home; and if this fail also, then they will make alarms two nights together, to tire you out with watching, and then set upon you; yet, of all this, (said he,) there is none acquainted but the King and the great

conjurer."

This being made known to the captain, we all flood more punctually upon our guard, at which the favages wondering, defired to know the cause; we told them we expected fome affault from the Pamaunkes, whereat they feemed contented, and the next day the King went on hunting with two of our men, and the other fishing and abroad as before, till our fhallop returned from James Town, with the two favages, fent home with Captain Crofhaw; by those the governor fent to Madyson, that this King should fend him twelve of his great men; word of this was fent to the King at another town where he was, who not coming prefently with the messenger, Madyson conceited he regarded not the meflage, and intended, as he supposed, the same treason. The next morning the King coming home, being fent for, he came to the captain, and brought him a dish of their daintiest fruit; then the captain feigned his return to James Town; the King told him he might if he would, but defired not to leave him deflitute of aid, having fo many enemies about him; the captain told him he would leave a guard, but entreated his answer concerning the twelve great men for the governor; the King replied, his enemies lay fo about him he could not spare them; then the captain defired his fon and one other; my fon, faid the King, is gone abroad about business, but the other you defire you shall have, and that other fits by him; but that man refused to go, whereupon Madyson went forth and locked the door, leaving the King, his son, and four favages, and five Englishmen in the strong-house, and setting upon the town with the rest of his men, slew thirty or forty men, women, and children: the King demanding the cause, Poole told him the treason, crying out to entreat the captain cease from such cruelty; but having slain and made sly all in the town, he returned, taxing the poor King of treafon, who denied to the death not to know of any fuch matter; but faid, this is fome plot of them that told it, only to kill me for being your friend. Then Madyfon willed him, to command none of his men flould floot at him as he went aboard, which he prefently did, and it was performed: fo Madyfon departed, leading the King, his fon, and two more to his ship, promising when all his men were shipped, he should return at liberty; notwithstanding he brought them to James Town, where they lay fome days, and after were fent home by Captain Hamer, that took corn for their ranfom, and after fet fail for Newfoundland.

But, alas the cause of this was only this. They understood, nor knew what was amiss.

Ever fince the beginning of these plantations, it hath been supposed the King of Spain would invade them, or our English Papilts endeavour to dissolve them. But neither all the councils of Spain nor Papilts in the world could have devised a better course to bring them all to ruin, than thus to abuse their friends: nor could there ever have been a better plot to have overthrown Opechankanough than Captain Crossaws, had it been fully managed with expedition. But it seems God is angry to see Virginia made a stage where nothing but murder and indiscretion contends for

victory.

Among the rest of the plantations all this summer little was done, but securing themfelves, and planting tobacco, which passes there as current silver, and by the oft turning and winding it, fome grow rich, but many poor, notwithstanding ten or twelve ships or more liath arrived there fince the maffacre although it was Christmas ere any returned, and that return greatly revived all men's longing expectation here in England; for they brought news, that not with standing their extreme fickness, many were recovered, and finding the favages did not much trouble them, except it were fometimes fome diforderly stragglers they cut off. To lull them the better in fecurity, they fought no revenge till their corn was ripe; then they drew together three hundred of the best foldiers they could, and would leave their private business, and adventure themselves amongst the favages, to surprize their corn, under the conduct of Sir George Yearley, being embarked in convenient shipping, and all things necessary for the enterprise; they first went to Nandsamund, where the people set sire on their own houses, and fpoiled what they could, and then fled with what they could carry; fo that the English did make no flaughter amongst them for revenge. Their corn-fields being newly gathered, they furprifed all they found, burnt all the houses remained unburnt, and so departed. Quartering about Kecoughtan, after the watch was fet, Samuel Collyer, one of the most ancient planters, and very well acquainted with their language and habitation, humours and conditions, and governor of a town, when the watch was fet going the round, unfortunately by a centinel that discharged his piece, was slain.

Thence they failed to Pamaunke, the chief feat of Opechankanough, the contriver of the maffacre: the favages feemed exceeding fearful, promifing to bring them Sara, and the rest of the English yet living, with all the arms, and what they had to restore, much desiring peace, and to give them any satisfaction they could. Many such devices they seigned to procrassinate the time ten or twelve days, till they had got away their corn from all the other places up the river, but that where the English kept their quarter; at last, when they saw all those promises were but delusions, they seized on all the corn there was, set fire on their own houses; and in following the savages that sled before them, some few of those naked devils had that spirit, they lay in ambuscado, and as our men marched, discharged some shot out of English pieces, and hurt some of them, slying at their pleasures where they listed, burning their empty houses before them, as they went to make themselves sport; so they escaped; and Sir George returned with corn, where for our pains we had three bushels a-piece; but we were enjoined before we had it, to pay ten shillings the bushel for freight and other charges. Thus, by this means, the savages are like, as they report, to endure no small misery this winter; and that some

of our men are returned to their former plantations.

What other passages or impediments happened in their proceedings, that they were not fully revenged of the savages before they returned, I know not, nor could ever hear more, but that they supposed they slew two, and how it was impossible for any men to do more than they did; yet worthy Ferdinando Courtus had scarce three hundred Spaniards to conquer the great city of Mexico, where thousands of savages dwelled in

ftrong

ftrong houses; but because they were a civilized people, had wealth, and those mere barbarians, as wild as beasts have nothing; I intreat your patience, to tell you my opinion, which if it be God's pleasure I shall not live to put in practice, yet it may be hereaster

useful for some, but howsoever, I hope not hurtful to any, and this it is.

Had these three hundred men been at my disposing, I would have sent first one hundred to Captain Rawley Croshaw to Patawomek, with some small ordnance for the fort, the which but with daily exercising them, would have struck that love and admiration into the Patawomeks, and terror and amazement into his enemies, which are not far off, and most seated upon the other side the river, they would willingly have been friends, or have given any composition they could, before they would be tormented with such a visible fear.

Now though they be generally perfidious, yet necessity constrains those to a kind of constancy because of their enemies, and neither myself that first found them, Captain Argall, Croshaw, nor Hamar, never found themselves in sifteen years trial; nor is it likely now they would have so hostaged their men, suffer the building of a fort, and their women and children amongst them, had they intended any villany; but suppose they had, who would have defired a better advantage than fuch an advertisement, to have prepared the fort for fuch an affault, and furely it must be a poor fort they could hurt, much more take, if there were but five men in it, durst discharge a piece: therefore a man not well knowing their condition, may be as well too jealous as too carelefs; fuch another lope fconce would I have had at Onawmanient, and one hundred men more to have made fuch another at Atquacke, upon the river of Toppahanock, which is not past thirteen miles distant from Onawmanient: each of which twelve men would keep, as well as twelve thousand, and spare all the rest, to be employed as there should be occasion: and all this with these numbers might easily have been done, if not by courtefy, yet by compulsion, especially at that time of September. when all their fruits were ripe, their beafts fat, and infinite numbers of wild-fowl began to repair to every creek, that men, if they would do any thing, could not want victuals. This done, there remained yet one hundred who should have done the like at Ozinieke, upon the river of Chickahamania, not past fix miles from the chief habitations of Opechankanough. These small forts had been cause sufficient to cause all the inhabitants of each of those rivers to look to themselves; then having so many ships, barks, and boats in Virginia, as there was at that prefent, with what facility might you have landed two hundred and twenty men, if you had but only five or fix boats, in one night; forty to range the branch of Mattapanyent, forty more that of Youghtanund, and forty more to keep their rendezvous at Pamaunke itself. All which places lie fo near they might hear from each other within four or five hours, and not any of those small parties, if there were any valour, discretion, or industry in them, but as sufficient as four thousand, to force them all to contribution, or take or spoil all they had: for having thus fo many convenient rendezvous to relieve each other, though all the whole countries had been our enemies, where could they rest, but in the depth of winter we might burn all the houses upon all those rivers in two or three days? Then without fires they could not live, which they could not fo hide, but we should find, and quickly so tire them with watching and warding, they would be fo weary of their lives, as either fly all their countries, or give all the had, to be released of such an hourly misery. Now if but a finall number of the favages would affift us, as there is no question but divers of them would; and to suppose they could not be drawn to such faction, were to believe they are more virtuous than many Christians, and the best governed people in the world. All the Pamaunkes might have been dispatched as well in a month as in a year, and then

then to have dwelt with any other enemies at our pleafure, and yet made all this toil

and danger but a recreation.

If you think this strange or impossible, twelve men with myself I found sufficient, to go where I would a-days, and surprise a house with the people, if not a whole town in a night, or encounter all the power they could make, as a whole army, as formerly at large hath been related: and it seems, by these small parties last amongst them, by Captain Croshaw, Hamar, and Madyson, they are not grown to that excellency in policy and courage, but they might be encountered, and their wives and children apprehended. I know I shall be taxed for writing so much of myself, but I care not much, because the judicial know there are few such soldiers as are my examples, have writ their own actions, nor know I who will or can tell my intents better than myself.

Some again find as much fault with the Company for meddling with fo many plantations together, because they that have many irons in the fire some must burn; but I think no, if they have men enough know how to work them; but howsoever, it were better some burn than have none at all. The King of Spain regards but how many powerful kingdoms he keeps under his obedience, and for the savage countries he hath subjected, they are more than enough for a good cosmographer to nominate. And is three molebills so much to us, and so many empires so little for him? For my own part, I cannot choose but grieve, that the actions of an Englishman should be inferior to any, and that the command of England should not be as great as any monarchy that ever was since the world began; I mean, not as a tyrant to torment all Christendom, but to suppress her disturbers, and conquer her enemies.

For the great Romans got into their hand, The whole world's compass, both by sea and land, Or any seas, or heaven or earth extended, And yet that nation could not be contented.

Much about this time arrived a fmall bark of Barnstaple, which had been at the Summer Isles, and in her Captain Nathaniel Butler, who having been governor there three years, and his commission expired, he took the opportunity of this ship to see Virginia. At James Town he was kindly entertained by Sir Francis Wyat, the governor. After he had rested there sourteen days, he fell up with his ship to the river of Chickahamania, where meeting with Captain William Powell, joining together such forces as they had to the number of eighty, they set upon the Chickahamanians, that fearfully sled, suffering the English to spoil all they had, not daring to resist them. Thus he returned to James Town, where he staid a month, at Kecoughtan as much

more, and fo returned for England.

But riding at Kecoughtan, Mr. John Argent, fon of Dr. Argent, a young gentleman that went with Captain Butler from England to this place, Michael Fuller, William Gany, Cornelius May, and one other, going ashore with some goods late in a fair evening, such a sudden gust did arise, that drove them athwart the river, in that place at least three or four miles in breadth, where the shore was so shallow at a low water, and the boat beating upon the sands, they lest her, wading near half a mile, and oft up to the chin: so well it happened, Mr. Argent had put his bandalier of powder in his hat, which, next God, was all their preservations; for it being February, and the ground so cold, their bodies became so benumbed, they were not able to strike sire with a steel and a stone he had in his pocket; the stone they lost twice, and thus those poor souls groping in the dark, it was Mr. Argent's chance to find it, and with a few withered leaves, reeds, and brush, make a small sire: being upon the Chesapeak's

flore, their mortal enemies, great was their fear to be discovered. The joyful morning appearing, they found their boat and goods driven ashore, not far from them, but to fplit, the was unferviceable; but fo much was the frolt, their clothes did freeze upon their backs, for they durft not make any great fire to dry them, left thereby the bloody favages might defery them, fo that one of them died the next day, and the next night digging a grave in the fands with their hands, buried him. In this bodily fear they lived and fasted two days and nights, then two of them went into the land to feek fresh water; the others, to the boat, to get fome meal and oil. Argent and his comrade found a canoe, in which they refolved to adventure to their ship, but she was adrift in the river before they returned: thus frustrated of all hopes, Captain Butler, the third night, ranging the thore in his boat to feek them, difcharged his muskets; but they fuppofing it fome favages had got fome English pieces, they grew more perplexed than ever, so he returned, and lost his labour. The fourth day they unloaded their boat, and stopping her leaks with their handkerchiefs and other rags, two rowing, and two baling out the water; but far they went not ere the water grew upon them so fast, and they fo tired, they thought themselves happy to be on shore again, though they perceived the Indians were not far off by their fires. Thus, at the very period of defpair, Fuller undertook to fit aftride upon a little piece of an old canoe; fo well it pleafed God, the wind and tide ferved, by paddling with his hands and feet in the water, beyond all expectation, God fo guided him three or four hours upon this board, he arrived at their ship, where they no less amazed than he tired, they took him in. Prefently, as he had concluded with his companions, he caufed them to discharge a piece of ordnance if he escaped, which gave no less comfort to Mr. Argent and the rest, than terror to those plantations that heard it (being late), at such an unexpected alarum: but after, with warm cloaths and a little ftrong water, they had a little recovered him, fuch was his courage and care of his diffressed friends, he returned that night again, with Mr. Felgate to conduct him to them; and fo giving thanks to God for fo hopeless a deliverance, it pleased his divine power both they and their provision came fafely aboard; but Fuller, they doubt, will never recover his benumbed legs and thighs.

Now, before Butler's arrival in England, many hard fpeeches were rumoured against him for fo leaving his charge, before he received order from the Company: divers again of his foldiers as highly commended him for his good government, art, judgment, and industry. But to make the misery of Virginia appear, that it might be reformed in time, how all those cities, towns, corporations, forts, vineyards, nurseries of mulberries, glafs-houses, iron-forges, guest-houses, filk-worms, colleges, the Company's great estate, and that plenty some do speak of here, are rather things in words and paper, than in effect, with divers reasons of the causes of those defects; if it were falfe, his blame nor shame could not be too much: but if there be such defects in the government, and diffress in the colony, it is thought by many it hath been too long concealed, and requireth rather reformation than diffrutation: but, however, it were not amifs to provide for the worft, for the best will help itself. Notwithstanding, it was apprehended fo hardly, and examined with that passion, that the bruit thereof was fpread abroad with that expedition it did more hurt than the maffacre; and the fault of all now, by the vulgar rumour, must be attributed to the unwholesomeness of the air, and barrenness of the country, as though all England were nought, because the fens and marshes are unhealthy; or barren, because some will lie under windows and starve in Cheapside, rot in gaols, die in the street, highways, or any where, and use a thouland devices to maintain themselves in those miseries, rather than take any pains

to live as they may by honest labour; and a great part of such like are the planters of

Virginia, and partly the occasion of these defailments.

In the latter end of this last year, or the beginning of this, Captain Henry Spilman, a gentleman that hath lived in those countries thirteen or fourteen years, one of the best interpreters in the land, being furnished with a bark and fix-and-twenty men, he was fent to truck in the river of Patawomek, where he had lived a long time amongst the favages; whether he prefumed too much upon his acquaintance amongst them, or they fought to be revenged of any for the flaughter made amongst them by the English so lately, or he fought to betray them, or they him, are all feveral relations, but it feems but imaginary: for then returned report they left him ashore about Patawomek; but the name of the place they knew not, with one-and-twenty men, being but five in the bark, the favages, ere they suspected any thing, boarded them with their canoes, and entered fo fast, the English were amazed, till a failor gave fire to a piece of ordnance, only at random; at the report whereof the favages leaped overboard, fo diffracted with fear, they left their canoes and fwam ashore; and presently they heard a great bruit amongst the favages ashore, and faw a man's head thrown down the bank; whereupon they weighed anchor, and returned home; but how he was furprized or flain is uncertain.

> Thus things proceed and vary not a jot, Whether we know them, or we know them not.

A Particular of fuch Necessaries as either private Families or fingle Persons shall have Cause to provide to go to Virginia, whereby greater Numbers may in part conceive the better how to provide for themselves.

Now if the number be great, nets, hooks, and lines, but cheefe, bacon, kine, and goats, must be added. And this is the usual proportion the Virginia Company do bestow upon their tenants they fend.

A brief Relation, written by Captain Smith to His Majesty's Commissioners, for the Reformation of Virginia, concerning some Aspersions against it.

Honourable Gentlemen,

FOR fo many fair and navigable rivers fo near adjoining, and piercing through for fair a natural land, free from any inundations, or large fenny unwholesome marshes, I have not feen, read, nor heard of: and for the building of cities, towns, and wharfage, if they will use the means, where there is no more ebb nor flood, nature in few places affords any so convenient, for falt marshes or quagmires. In this tract of James Town river, I know very few; some small marshes and swamps there are, but more profitable than hurtful; and I think there is more low marsh ground betwixt Erith and Chelsea, than Kecoughton and the Falls, which is about one hundred and eighty miles by the course of the river.

Being

Being enjoined by our commission not to unplant nor wrong the savages, because the channel was so near the shore, where now is James Town, then a thick grove of trees, we cut them down, where the savages pretending as much kindness as could be, they hurt and slew one-and-twenty of us in two hours. At this time our diet was for most part water and bran, and three ounces of little better stuff in bread for sive men a meal; and thus we lived near three months: our lodgings under boughs of trees, the savages being our enemies, whom we neither knew nor understood, occasions, I think, sufficient to make men sick and die.

Necessity thus did enforce me, with eight or nine, to try conclusions amongst the favages, that we got provision, which recovered the rest, being most sick. Six weeks I was led captive by those barbarians, though some of my men were slain, and the rest sled; yet it pleased God to make their great King's daughter the means to return me safe to James Town, and relieve our wants; and then our commonwealth was in all

eight-and-thirty, the remainder of one hundred and five.

Being supplied with one hundred and twenty, with twelve men in a boat of three tons, I spent fourteen weeks in those large waters; the contents of the way of my boat, protracted by the scale of proportion, was about three thousand miles, besides the river we dwell upon, where no Christian known ever was, and our diet for the most part what

we could find, yet but one died.

The favages being acquainted, that by command from England we durst not hurts them, were much imboldened; that famine and their infolencies did force me to break our commission and instructions, cause Powhatan sly his country, and take the King of Pamaunke prisoner; and also to keep the King of Paspahegh in shackles, and put his men to double tasks in chains, till nine-and-thirty of their Kings paid us contribution, and the offending savages sent to James Town to punish at our own discretion: in the two last years I staid there, I had not a man slain.

All those conclusions being not able to prevent the bad events of pride and idleness, having received another supply of seventy, we were about two hundred in all, but not twenty workmen: in following the strict directions from England to do that was impossible at that time; so it happened, that neither we nor they had any thing to eat, but what the country assorded naturally; yet of eighty who lived upon oysters in June and July, with a pint of corn a week for a man, lying under trees, and one hundred and twenty for the most part living upon sturgeon, which was dried till we pounded it.

to powder for meal, yet in ten weeks but feven died.

It is true, we had of tools, arms, and ammunition fufficient, some aquavitæ, vinegar, meal, pease, and oatmeal, but in two years and a half not sufficient for fix months, though by the bills of lading the proportions sent us would well have contented us, notwithstanding we sent home ample proofs of pitch, tar, sope-ashes, wainscoat, clapboard, filk-grass, iron ore, some sturgeon, and glass, sassafras, cedar, cypress, and black walnut, crowned Powhatan, sought the Monacans country, according to the instructions sent us, but they caused us neglect more necessary works: they had better given for pitch and soap-ashes one hundred pound a ton in Denmarks: we also maintained five or fix several plantations.

James Town being burnt, we rebuilt it and three forts more; befides the church and store-house, we had about forty or fifty several houses to keep us warm and dry, environed with a palifado of sourteen or fifteen feet, and each as much as three or sour men could carry. We digged a fair well of fresh water in the fort, where we had three bulwarks, sour-and-twenty pieces of ordnance, of culvering, demiculvering, sacar and salcon, and most well mounted upon convenient platforms, planted one hundred acres.

of corn. We had but fix ships to transport and supply us, and but two hundred seventy seven men, boys, and women, by whose labours Virginia being brought to this kind of perfection, the most difficulties past, and the foundation thus laid by this small means: yet because we had done no more, they called in our commission, took a new in their own names, and appointed us near as many offices and officers as I had foldiers, that neither knew us, nor we them, without our consents or knowledge; since there have gone more than one hundred ships of other proportions, and eight or ten thousand people. Now if you please to compare what bath been spent, sent, discovered and done these fisteen years, by that we did in the three first years, and every governor that hath been there since, give you but such an account as this, you may easily find what hath been the cause of those disasters in Virginia.

Then came in Captain Argall and Mr. Sedan, in a ship of Mr. Cornelius, to sish for sturgeon, who had such good provision, we contracted with them for it, whereby we

were better furnished than ever.

Not long after came in feven ships, with about three hundred people; but rather to supplant us than supply us; their admiral with their authority being cast away in the Bermudas, very angry they were we had made no better provision for them. Seven or eight weeks we withstood the inundations of these disorderly humours, till I was near blown

to death with gunpowder, which occasioned me to return for England.

In the year 1609, about Michaelmas, I left the country, as is formerly related, with three ships, seven boats, commodities to trade, harvest newly gathered, eight weeks provision of corn and meal, about five hundred persons, three hundred muskets, shot, powder, and match, with arms for more men than we had. The savages their language and habitation, well known to two hundred expert soldiers; nets for sishing, tools of all forts, apparel to supply their wants: six mares and a horse, sive or six hundred swine, many more poultry, what was brought or bred, but victuals there remained.

Having spent some five years, and more than five hundred pounds in procuring the letters patents and setting forward, and near as much more about New England, &c. Thus these nineteen years I have here and there not spared any thing according to my ability, nor the best advice I could, to persuade how those strange miracles of misery might have been prevented, which lamentable experience plainly taught me of necessity must ensue; but sew would believe me till now too dearly they have paid for it. Wherefore hitherto I have rather lest all than undertake impossibilities, or any more such costly tasks at such chargeable rates: for in neither of those two countries have I one foot of land, nor the very house I builded, nor the ground I digged with my own hands, nor ever any content or satisfaction at all; and though I see ordinarily those two countries shared before me by them that neither have them nor know them, but by my descriptions; yet that doth not so much trouble me, as to hear and see those contentions and divisions which will hazard if not ruin the prosperity of Virginia, if present remedy be not found, as they have hindered many hundreds who would have been there ere now, and makes them yet that are willing to stand in a demurrer.

For the books and maps I have made, I will thank him that will shew me so much for so little recompence, and bear with their errors till I have done better. For the materials in them I cannot deny, but am ready to affirm them both there and here, upon such grounds as I have propounded, which is to have but sifteen hundred men to subdue again the savages, fortisty the country, discover that yet unknown, and both defend and seed their colony, which I most humbly refer to His Majesty's most judicial judgment, and the most honourable Lords of his privy council, you his trusty and well

beloved

beloved commissioners, and the honourable company of planters and well willers to Virginia, New England and Sommer-Islands.

Out of these Observations it pleased His Majesty's Commissioners for the Reformation of Virginia, to desire my Answer to these seven Question's.

Quest. 1. WHAT conceive you is the cause the plantation hath prospered no better

fince you left it in so good a forwardness?

Answ. Idleness and carelessness brought all I did in three years in fix months to nothing; and of five hundred I lest, scarce threescore remained; and had Sir Thomas Gates not got from the Bermudas, I think they had been all dead before they could be supplied.

Quest. 2. What conceive you should be the cause, though the country be good,

there comes nothing but tobacco?

Answ. The often altering of governors, it seems, causes every man make use of his time; and because corn was stinted at two shillings and fix-pence the bushel, and tobacco at three shillings the pound, and they value a man's labour a year worth fifty or threescore pounds, but in corn not worth ten pounds, presuming tobacco will furnish them with all things; now make a man's labour in corn worth threescore pounds, and in tobacco but ten pounds a man, then shall they have corn sufficient to entertain all comers, and keep their people in health to do any thing; but till then there will be little or nothing to any purpose.

Quest. 3. What conceive you to have been the cause of the massacre; and had the savages had the use of any pieces in your time, or when, or by whom they were

taught?

Answ. The cause of the massacre was the want of martial discipline, and because they would have all the English had by destroying those they found so carelesty secure, that they were not provided to defend themselves against any enemy, being so dispersed as they were. In my time, though Captain Nuport furnished them with swords by truck, and many fugitives did the like, and some pieces they got accidently, yet I got the most of them again, and it was death to him that should shew a savage the use of a piece. Since, I understand, they became so good shot, they were employed for sowlers and huntsmen by the English.

Quest. 4. What charge think you would have fettled the government both for

defence and planting when you left it?

Answ. Twenty thousand pounds would have hired good labourers and mechanical men, and have furnished them with cattle and all necessaries, and one hundred of them would have done more than a thousand of those that went, though the Lord La Ware, Sir Ferdinando Waynman, Sir Thomas Gates, and Sir Thomas Dale were persuaded to the contrary; but when they had tried, they confessed their error.

Quest. 5. What conceive you would be the remedy and the charge?

Answ. The remedy is to fend soldiers and all sorts of labourers and necessaries for them, that they may be there by next Michaelmas; the which to do well will stand you in five thousand pounds: but if His Majesty would please to lend two of his ships to transport them, less would serve, besides the benefit of his grace to the action would encourage all men.

Quest. 6. What think you are the defects of the government both here and there? Answ. The multiplicity of opinions here, and officers there, makes such delays by questions and formality, that as much time is spent in compliment as in action;

seirdes,

befides, fome are fo defirous to employ their ships, having fix pounds for every passenger, and three pounds for every ton of goods, at which rate a thousand ships may now better be procured than one at the first, when the common stock desrayed all freights, wages, provisions and magazines, whereby the ships are so pestered, as occafions much fickness, diseases and mortality; for though all the passengers die they are fure of their freight; and then all must be satisfied with orations, disputations, excuses and hopes. As for the letters of advice from hence, and their answers thence, they are fo well written, men would believe there were no great doubt of the performance, and that all things were well, to which error here they have been ever much subject; and there not to believe, or not to relieve the true and poor estate of that colony, whose fruits were commonly spent before they were ripe, and this loss is nothing to them here, whose great estates are not sensible of the loss of their adventures, and so they think, or will not take notice; but it is fo with all men, but howfoever they think or dispose of all things at their pleasure, I am sure not myself only, but a thousand others have not only spent the most of their estates, but the most part have lost their lives and all, only but to make way for the trial of more new conclusions, and he that now will adventure but twelve pounds ten shillings shall have better respect and as much favour than he that fixteen years ago adventured as much, except he have money as the other hath, but though he have adventured five hundred pounds, and fpent there never fo much time, if he have no more and not able to begin a family of himself, all is lost by order of court.

But in the beginning it was not fo, all went then out of one purfe, till those new devices have confumed both money and purfe, for at first there were but fix patentees, now more than a thousand, then but thirteen counsellors, now not less than an hundred; I fpeak not of all, for there are fome both honourable and honest, but of those officers, which did they manage their own estates no better than the affairs of Virginia, they would quickly fall to decay fo well as it; but this is most evident, few officers in England it hath caufed to turn bankrupts, nor for all their complaints would leave their places, neither yet any of their officers there, not few of the rest but they would be at home, but fewer adventurers here will adventure any more till they fee the business better established, although there be some so wilfully improvident they care for nothing but to get thither, and then if their friends be dead, or want themselves, they die or live but poorly for want of necessaries, and to think the old planters can relieve them were too much fimplicity, for who here in England is so charitable to feed two or three strangers, have they never so much, much less in Virginia where they want for themselves. Now the general complaint faith, that pride, covetousness, extortion and oppression in a few that engrosses all, than fell all again to the commonalty at what rate they pleafe, yea, even men, women and children, for who will

give most occasions no small mischief amongst the planters.

As for the company, or those that do transport them, provided of necessaries, God forbid but they should receive their charges again with advantage, or that masters there should not have the same privilege over their servants as here, but to sell him or her for forty, sifty, or threescore pounds, whom the company hath sent over for eight or ten pounds at the most, without regard how they shall be maintained with apparel, meat, drink, and lodging, is odious, and their fruits suitable; therefore such merchants it were better they were made such merchandize themselves than suffered any longer to use that trade, and those are defects sufficient to bring a well settled commonwealth to misery, much more Virginia.

Quest. 7. How think you it may be rectified?

Answ. If His Majesty would please to entitle it to his crown, and yearly that both the governors here and there may give their accounts to you, or feme that are not engaged in the bufiness, that the common stock be not spent in maintaining one hundred men for the governor, one hundred for two deputies, fifty for the treasurer, five-andtwenty for the fecretary, and more for the marthal and other officers who were never there nor adventured any thing, but only preferred by favour to be lords over them that broke the ice and beat the path, and must teach them what to do; if any thing happen well it is their glory; if ill, the fault of the old directors, that in all dangers must endure the worst, yet not five hundred of them have so much as one of the others; also that there be some present course taken to maintain a garrison to suppress the favages, till they be able to fubfift, and that His Majesty would pleafe to remit his custom, or it is to be feared they will lose custom and all, for this cannot be done by promifes, hopes, counfels, and countenances, but with fufficient workmen and means to maintain them, nor fuch delinquents as here cannot be ruled by all the laws in England, yet when the foundation is laid, as I have faid, and a commonwealth established, then such there may better be constrained to labour than here: but to rectify a commonwealth with debauched people is impossible, and no wife man would throw himself into such a society, that intends honestly, and knows what he undertakes, for there is no country to pillage as the Romans found: all you expect from thence must be by labour.

For the government I think there is as much ado about it as the kingdoms of Scotland and Ireland, men here conceiting Virginia as they are, erecting as many stately offices as officers with their attendants, as there are labourers in the country, where a constable were as good as twenty of their captains, and three hundred good soldiers and labourers better than all the rest that go only to get the fruits of other men's labours by the title of an office. Thus they spend Michaelmas rent in Midsummer moon, and would gather their harvest before they have planted their corn.

As for the maintenance of the officers, the first that went never demanded any, but adventured good fums; and it feems strange to me, the fruits of all their labours, befides the expense of an hundred and fifty thousand pounds, and such multitudes of people, those collateral officers could not maintain themselves so well as the old did, and having now fuch liberty to do to the favages what they will, the others had not. I more then wonder they have not five hundred favages to work for them towards their general maintenance, and as many more to return fome content and fatisfaction to the adventurers, that for all their care, charge and diligence, can hear nor fee nothing but miserable complaints; therefore under your correction to rectify all, is with all expedition to pass the authority to them who will relieve them, lest all be consumed ere the differences be determined. And except His Majesty undertake it, or by act of parliament fome finall tax may be granted throughout his dominions, as a penny upon every poll, called a head-penny; two pence upon every chimney, or fome fuch collection might be raifed; and that would be fufficient to give a good stock, and many fervants to fufficient men of any faculty, and transport them freely for paying only homage to the Crown of England, and fuch duties to the public good as their estates increased, reason should require. Were this put in practice, how many people of what quality you pleafe, for all those disasters would yet gladly go to spend their lives there, and by this means more good might be done in one year, than all those petty particular undertakings will effect in twenty.

For the patent the King may, if he please, rather take it from them that have it, than from us who had it first, pretending to His Majesty what great matters they would vol. XIII.

do, and how little we did, and for any thing I can conceive, had we remained still as at first, it is not likely we could have done much worse; but those oft altering of governments are not without much charge, hazard, and loss. If I be too plain, I humbly crave your pardon; but you requested me, therefore I do but my duty. For the nobility, who know not how freely both in their purses and assistance many of them have been to advance it, committing the managing of the business to inferior persons, amongst whom questionless also many have done their utmost best, sincerely and truly according to their conceit, opinion, and understanding; yet gross errors have been committed: but no man lives without his faults; for my own part, I have so much ado to amend my own, I have no leisure to look into any man's in particular, but those in general I conceive to be true. And so I humbly rest,

Your's to command, I. S.

Thus those discords, not being to be compounded among themselves, nor yet by the extraordinary diligence, care and pains of the noble and right worthy commiffioners, Sir William Jones, Sir Nicholas Fortescue, Sir Francis Goston, Sir Richard Sutton, Sir Henry Bourgchier, and Sir William Pitt; a corante was granted against Mr. Deputy Farrar, and twenty or thirty others of that party, to plead their causes before the right honourable the lords of His Majesty's privy council: now notwithflanding all the relations, examinations, and intercepting of all letters whatfoever come from thence, yet it feems they were fo far unfatisfied, and defired to know the truth, as well for the prefervation of the colony, as to give content and do all men right, they fent two commissioners strictly to examine the true state of the colony. Upon whose return, after mature deliberation, it pleafed His Royal Majesty to suppress the course of the court at Deputy Farrars, and that for the prefent ordering the affairs of Virginia, until he should make a more full settlement thereof, the Lord Viscount Mandevile, lord prefident of His Majefty's privy council, and also other privy councillors, with many understanding knights and gentlemen, should every Thursday in the afternoon meet at Sir Thomas Snith's, in Philpot-lane, where all men whom it should concern may repair, to receive fuch directions and warrant for their better fecurity, as more at large you may fee in the proclamation to that effect, under the great feal of England, dated the 15th of July 1624. But as for the relations last returned, what numbers they are, how many cities, corporations, towns, and houses, cattle and horses they have, what fortifications or discoveries they have made, or revenge upon the favages; who are their friends or foes, or what commodities they have more than tobacco, and their prefent effate, or what is prefently to be put in execution, in that the commissioners are not yet fully satisfied in the one, nor resolved in the other, at this present time when this went to the press, I must entreat you pardon me till I be better affured.

Thus far I have travelled in this wilderness of Virginia, not being ignorant for all my pains this discourse will be wrested, tossed and turned as many ways as there is leaves; that I have writ too much of some, too little of others, and many such like objections. To such I must answer, in the Company's name I was requested to do it: if any have concealed their approved experience from my knowledge, they must excuse me; as for every satherless, or stolen relation, or whole volumes of sophisticated rehearfals, I leave them to the charge of them that desire them. I thank God I never undertook any thing yet any could tax me of carelessness or dishonesty; and what is he to whom I am indebted or troublesome? Ah! were these my accusers but to change cases and places with me but two years, or till they had dene but so much as I, it may

De

be they would judge more charitably of my imperfections. But here I must leave all to the trial of time, both myself, Virginia's preparations, proceedings, and good events, praying to that great God, the protector of all goodness, to fend them as good success as the goodness of the action and country deserveth, and my heart desireth.

BOOK V.

The general History of the Bermudas, now called the Summer Isles, from their beginning, in the Year of our Lord 1593, to this present 1624, with their Proceedings, Accidents, and present Estate.

BEFORE we prefent you the matters of fact, it is fit to offer to your view the stage whereon they were acted, for as geography without history feemeth a carcafe without motion, fo history without geography, wandereth as a vagrant without a certain habita-Those islands lie in the huge main ocean, and two hundred leagues from any continent, fituated in 32 degrees and 25 minutes of northerly latitude, and distant from England west-fouth-west, about three thousand three hundred miles, some twenty miles in length, and not past two miles and a half in breadth, environed with rocks, which to the northward, westward, and south-east, extend further than they have been yet well discovered: by reason of those rocks the country is naturally very strong, for there is but two places, and fcarce two, unlefs to them who know them well, where shipping may fafely come in, and those now are exceeding well fortified, but within is room to entertain a royal fleet: the rocks in most places appear at low water, neither are they much covered at high, for it ebbs and flows not past five feet; the shore for most part is a rock, fo hardened with the fun, wind, and fea, that it is not apt to be worn away with the waves, whose violence is also broke by the rocks before they can come to the fhore; it is very uneven, diffributed into hills and dales; the mould is of divers colours, neither clay nor fand, but a mean between; the red which refembleth clay is the worst, the whitest resembling sand, and the blackest is good, but the brown betwixt them both, which they call white, because there is mingled with it a white meal, is the best: under the mould two or three feet deep, and sometimes less, is a kind of white hard fubstance, which they call the rock: the trees usually fasten their roots in it; neither is it indeed rock or stone, or so hard, though for most part harder than chalk; nor fo white, but pumish-like and spungy, easily receiving and containing much water. In some places, clay is found under it; it seems to be engendered with rain water, draining through the earth, and drawing with it of his fubstance unto a certain depth, where it congeals; the hardest kind of it lies under the red ground like quarries, as it were thick flates one upon another, through which the river hath its paffage; fo that in fuch places there is fcarce found any fresh water, for all or the most part of the fresh water cometh out of the sea draining through the sand, or that sub-stance called the rock, leaving the salt behind, it becomes fresh: sometimes we dug wells of fresh water, which we find in most places, and but three or four paces from the sea fide; some further, the most part of them would ebb and flow as the sea did, and be level or little higher than the superfices of the sea, and in some places very ftrange, dark, and cumberfome caves.

The air is most commonly clear, very temperate, moist, with a moderate heat, very healthful, and apt for the generation and nourishing of all things, so as many things transported from hence yield a far greater increase, and if it be any living thing, it be-

comes fatter and better; by this means, the country is fo replenished with hens and turkies, within the space of three or four years, that many of them being neglected, forfake the houses, and become wild, and so live in great abundance; the like increase there is in hogs, tame conies, and other cattle, according to their kinds. There feems to be a continual fpring, which is the cause some things come not to that maturity and perfection as were requifite; and though the trees shed their leaves, yet they are always full of green; the corn is the fame they have in Virginia and the West-Indies: of this and many other things without plowing or much labour, they have two harvests every year, for they set about March, which they gather in July; and again in August, which they reap in December; and little slips of fig-trees and vines do usually bear fruit within the year, and fometimes in lefs; but we find not the grapes as yet come to any perfection; the like fertility it hath in oranges and lemons, pomegranates, and other things. Concerning the ferenity and beauty of the fky, it may as truly be faid of those islands as ever it was faid of the Rhodes, that there is no one day throughout the twelve months, but that in some hour thereof, the sun looks singularly and clear upon them, for the temperature it is beyond all others most admirable; no cold there is beyond an English April, nor heat much greater than an ordinary July in France, fo that frost and snow is never seen here, nor stinking and infectious mists very feldom, by reason of the main ocean, there is some wind stirring that cools the air; the winter they have observes the time with ours, but the longest days and nights are shorter than ours almost by two hours.

We found it at first all overgrown with weeds and plants of several kinds, as many tall and goodly cedars, infinite store of palmetoes, numbers of mulberries, wild olivetrees store, with divers others, unknown both by name and nature, so that as they become lost to many useful employments, which time and industry, no doubt, will one day discover, and even already certain of the most notorious of them have gotten them appellations from their apparent effects, as the prickle-pear which grows like a shrub by the ground, with broad thick leaves, all over armed with long and sharp dangerous thorns, the fruit being in form not much unlike a small green pear, and on the outside of the fame colour, but within blood red, and exceeding full of juice, with grains not much unlike the pomegranate, and colouring after its nature. The poisoned weed is much in shape like our English juy, but being but touched, causeth redness, itching, and lastly, blisters, the which, howsoever, after a while pass away of themselves, without further harm; yet because for the time they are somewhat painful, it hath got itfelf an ill name, although questionless of no ill nature. Here is also frequently growing a certain tall plant, whose stalk being all over covered with a red rind, is thereupon termed the red weed, the root whereof being foaked in any liquor, or but a fmall quantity of the juice drunk alone, procures a very forcible vomit, and yet is generally used by the people, and found very effectual against the pains and distempers of

the stomach.

A kind of woodbine there is likewife by the fea very commonly to be found, which runs upon trees, twining itfelf like a vine; the fruit fomewhat refembles a bean, but fomewhat flatter, the which, any way eaten, worketh excellently in the nature of a purge, and though very vehemently, yet without all peril. Contrary to this, another finall tree there is, which caufeth coftiveness: there is also a certain plant like a bramble-bush, which bears a long yellow fruit, having the shell very hard, and within it a grey berry, that beaten and taken inwardly purgeth gently. There is another fruit, much like our barberries, which being beaten or bruised between the teeth, sets all the mouth on an extreme heat, very terrible for the time; to avoid which, they are swallowed

down.

down whole, and found of the same or better operation than the red pepper, and thence borroweth the name. In the bottom of the sea, there is growing upon the rocks a large kind of plant, in the form of a vine-leaf, but far more spread with veins, in colour of a pale red, very strangely interlaced and woven one in another, which we call the feather, but the virtue thereof is altogether unknown, but only regarded for the rarity. Now besides these natural productions, providences, and pains, since the plantation, have offered divers other seeds and plants, which the soil bath greedily embraced and cherished, so that at this present 1623, there are great abundance of white, red, and yellow coloured potatoes, tobacco, sugar-canes, indigos, parsnips, exceeding large radishes, the American bread, the cassado-root, the Indian pumpeon, the water-melon, musk-melon, and the most delicate pine-apples, plantains, and papaws; also the English artichoke, pease, &c.; briefly, whatsoever else may be expected for the satisfaction either of

curiofity, necessity, or delight.

Neither hath the air for her part been wanting with due supplies of many forts of fowls, as the grey and white hearn, the grey and green plover, fome wild ducks and mallard, coots, and red-fhanks, fea-widgeons, grey bitterns, cormorants, numbers of finall birds, like fparrows and robins, which have lately been destroyed by the wild cats, wood-peckers, very many crows, which fince this plantation are killed, the rest fled, or feldom feen, except in the most uninhabited places, from whence they are observed to take their flight about fun-set, directing their course towards the north-west, which makes many conjecture there are fome more islands not far off that way. Sometimes are also feen falcons and jar-falcons, ofprays, a bird like a hobby, but because they come seldom, they are held but as passengers; but above all these, most deferving observation and respect, are those two forts of birds, the one for the tone of his voice, the other for the effect, called the cahow and egg-bird, which on the first of May, a day conftantly observed, fall a laying infinite store of eggs, near as big as hens', upon certain fmall fandy bays, especially in Couper's Isle; and although men sit down amongst them when hundreds of them have been gathered of a morning, yet there is hath staid amongst them till they have gathered as many more: they continue this course till Midsummer, and so tame and fearless, you must thrust them off from their eggs with your hand; then they grow fo faint with laying, they fuffer them to breed, and take infinite numbers of their young to eat, which are very excellent meat.

The cahow is a bird of the night, for all the day she lies hid in holes in the rocks, where they and their young are also taken with as much ease as may be, but in the night if you but whoop and hollow, they will light upon you, that with your hands you may chuse the fat and leave the lean; those they have only in winter; their eggs are as big as hens', but they are speckled, the other white. Mr. Norwood hath taken twenty dozen of them in three or four hours, and since there hath been such havock made of them, they were near all destroyed, till there was a strict inhibition for their preservation. The tropick bird is white, as large as a pullet, with one only long feather in her tail, and is seldom seen far distant from other of the tropicks: another small bird there is, because she cries pemblyco, they call her so; she is seldom seen in the day but when she sings, as too oft she doth very clamorously, too true a prophet she proves of huge winds and boisterous weather: there were a kind of small owls in great abundance, but they are now all slain or sled: some tame ducks, geese and pigeons

there are; but the two latter profper not.

Concerning vermin and noisome creatures there are not many, but only rats and cats, there increased since the plantation; but how they agree together you shall hear hereafter. The musketos and slies are also too busy, with a certain India bug, called by

the Spaniards, a cacarootch, the which creeping into chefts they eat and defile with their ill-fcented dung: also the little ants in summer time are so troublesome they are sorced to dry their figs upon high frames, and anoint their fcet with tar, wherein they stick, else they would spoil them all ere they could be dried: worms in the earth also there are, but too many, so that to keep them from destroying their corn and tobacco, they are forced to worm them every morning, which is a great labour, else all would be destroyed. Lizards there were many and very large, but now none; and it is said they were destroyed by the cat. Certain spiders also of very large size are sound hanging upon trees, but instead of being any way dangerous as in other places, they are here of a most pleasing aspect, all over drest as it were with silver, gold, and pearl, and their webs in the summer woven from tree to tree, are generally a perfect raw silk, and that as well in regard of substance as colour, and so strong withal, that divers birds bigger than black-birds, being like snipes, are often taken and snared in them as a net: then what would the filk-worm do were she there to feed upon the continual green

mulberry?

But above all the rest of the elements, the sea is found most abundantly liberal: hence have they as much excellent fish, and as much variety as need be defired. The most of which being unknown to our northern parts, got there new names, either for their fhapes or conditions; as the large rock-fish from his like hue, and haunting amongst the rocks; the fat hog-fish from his swine-like shape and snout, for this is not the old known hog-fish with brussels on his back; the delicate amber-fish from his taste and finell, angel-fish, cony-fish, the small yellow tail from that natural painting; the great grouper from his odd and strange grunting, some of them yet known to the Americans, as the purgoofe, the cavallo, the gar-fifh, flying-fifh and morerays: the rest are common to other continents; as the whale in great numbers, the shark, the pilot-fish, the fea-bream, the oyster and lobster, with divers others; twenty tortoises have been taken in a day, and fome of them will afford half a bushel of eggs, and fuffice to feed forty men at a meal. And thus have you briefly epitomized mother Nature's benefits to this little, yet dainty, fpot of earth, neither were it ingenuity to conceal wherein the inclineth to the stepdame, especially fince the particulars are fo few, as rather requifite antidotes against idleness to rouse up industry, than any great cause of much distaste, much less despair; and of those, to speak truth, there are only two, viz. the winds, and the worms, especially in the spring and autumn; and thus conditioned as yet we will let rest these small islands, in the midst of this mighty and main ocean, fo environed on every fide by infinite numbers of uncertain fcattered rocks, lying shallowly hid under the furface of the water, a league, two, three, four, or five, to fea, to the which advantages added by art, as hereafter you shall hear at large, and find described in the map. It may well be concluded to be the most impregnable place in the world, and although the amber-gris, pearls, nor tobacco; are of that quantity and certainty to be relied upon to gain wealth, yet by practice and experience they find, by filk, faffron, indigo, madar, fugar-canes, wine, oil, and fuch like, great profit may be expected: yet were those hopeless in regard of their conveniency to nourish and maintain themselves and relieve them shall visit them with wood, water, and other necoffaries; besides what an eye-fore they are already become to them that have them not, and how dear and precious to them that have them, I think none will deny but they are well worth the keeping: and fo we will proceed to the accidents that befell the first finders: also the proceedings of the first planters and their fuccessors, Mr. Norrod, Thomas Sparkes, and divers others.

A brief Relation of the Shipwreck of Henry May.

HOW these isles came by the name of Bermudas, or the infinite number of black hogs, or so fearful to the world, that many called them the Isle of Devils, that all men did shun as hell and perdition; I will not expostulate, nor trouble your patience with those uncertain antiquities further than thus; our men found divers crosses, pieces of Spanish monies here and there. Two or three wrecks also they found by certain inscriptions to be some Spanish, some Dutch, some French; but the greatest rumour is, that a Spanish ship, called Bermudas, was there cast away, carrying hogs to the West Indies, that swam ashore, and there increased: how the Spaniards escaped is uncertain; but they say, from that ship those isles were first called Bermudas, which till then for six

thousand years had been nameless.

But the first Englishman that was ever in them was one Henry May, a worthy mariner that went with Captain Lancaster to the East Indies 1591; and in their return by the West Indics, being in some distress, fent this Henry May for England by one Monfieur de la Barbotier, to acquaint the merchants with their estate. The last of November, faith May, we departed from Laguna in Hispaniola, and the 17th of December following we were cast away upon the north-west of the Bermudas; the pilots about noon made themselves southwards of the isles twelve leagues, and demanded of the captain their wine of hight as out of all danger, which they had; but it feems they were either drunk, or careless of their charge, for through their negligence a number of good men were cast away. I being but a stranger amongst fifty and odd Frenchmen, it pleafed God to appoint me to be one of those should be faved. In this extremity we made a raft, which we towed with our boat; there were but fix-andtwenty of us faved; and I feeing scarce room for the one half, durst not pass in amongst them till the captain called me along with him, leaving the better half to the fea's mercy: that day we rowed till within two hours of night ere we could land, being near dead with thirst, every man took his way to feek fresh water; at length, by fearching amongst many weeds, we found some rain water; but in the main are many fair bays, where we had enough for digging.

Now it pleased God before our ship split we saved our carpenter's tools, some nails, fails, and tacklings, wherewith we went roundly to work, and built a bark of eighty tons: instead of pitch, we made lime, mixed with tortoise oil, and as the carpenters caulked her, I and ano her paid the seams with this plaster, which being in April, became

quickly dry, and as hard as a stone.

In April it was so hot we feared our water would fail, two great chests we made, which we caulked as our ship; those we stowed on each side our main-mast, silled them with water and thirty live tortoises; we found many hogs, but so lean we could not eat them; the tops of the palmetaberries was our bread, and the juice we got out of the trees we cut down our drink, and of the leaves, which are more than an ell long, we covered our cabins, and made our beds, and found many of those provisions as is related, but little foul weather. The eleventh of May it pleased God to set us clear of the isle, after we had lived there sive months; and the 20th we fell in with Cape Breton, near Newfoundland, where refreshing ourselves with wood and water, and such things as we could get of the savages, it seemed a good country; but we staid not past four hours before we set sail for the banks of Newfoundland, where we met many thips, but not any would take in a man of us, until it pleased God we met a bark of Falmouth, which received us for a little time, and with her we took a French ship,

wherein I left Captain de la Barbotier, my dear friend, and all his company, and in August arrived at Falmouth, in this honest English bark, 1594.

Written by me HENRY MAY.

The first English Ship known to have been east away upon the Bermudas 1609. From the Relation of Mr. Jordan, Mr. John Evans, Mr. Henry Shelly, and divers others.

YOU have heard that when Captain Smith was governor of Virginia, there were nine ships fent with Sir Thomas Gates, and Sir George Somers, and Captain Newport with five hundred people, to take in the old commission, and rectify a new government; they fet fail in May, and in the height of thirty degrees of northerly latitude, they were taken with an extreme florm, or rather a part of hericano, upon the fiveand-twentieth of July, which, as they write, did not only feparate them from the fleet, but with the violent working of the feas, their ship became so shaken, torn, and leaky, the received formuch water as covered two tier of hogsheads above the ballast, that they flood up to the middles with buckets, baricos, and kettles, to bail out the water. Thus bailing and pumping three days and three nights without intermission, and yet the water feemed rather to encrease than diminish, infomuch that being all utterly spent with labour, were even refolved without any hope to shut up the hatches, and commit themselves to the mercy of the sea, which is said to be merciles, or rather to the mercy of Almighty God, whose mercy far exceeds all his works; seeing no sense or hope in man's apprehension, but prefently to fink; some having some good and comfortable waters, fetched them, and drank one to another, as taking their last leaves until a more happy and a more joyful meeting in a more bleffed world, when it pleafed God out of his most gracious and merciful providence, so to direct and guide their ship for her

most advantage.

That Sir George Somers all this time fitting upon the poop, fcarce taking leifure to eat nor fleep, coving the flip to keep her as upright as he could, otherwise she must long ere that needs have foundered, most wishedly and happily descried land; whereupon he most comfortably encouraged them to follow their work, many of them being fast asleep: this unlooked-for welcome news, as if it had been a voice from Heaven, hurried them all above hatches, to look for that they durft fcarce believe, fo that improvidently forfaking that task which imported no less than their lives, they gave so dangerous advantage to their greedy enemy the falt water, which ftill entered at the large breaches of their poor wooden castle, as that in gaping after life, they had wellnigh swallowed their death. Surely it is impossible any should now be urged to do his best, and although they knew it, that place all men did so shun, yet they spread all the fail they could to attain them: for not long it was before they struck upon a rock, till a furge of the fea cast her from thence, and so from one to another, till most luckily at last fo upright betwirt two, as if she had been in the stocks, till this they expected but every blow a death; but now behold, fuddenly the wind gives place to a calm, and the billows, which each by overtaking her, would in an inftant have shivered her in pieces, become peaceable and fill, fo that with all conveniency and eafe, they unshipped all their goods, victuals, and persons into their boats, and with extreme joy, even almost to amazedness, arrived in fasety, though more than a league from the shore, without the loss of a man; yet were they in all one hundred and fifty; yet their deliverance was not more strange in falling so happily upon the land, as their feeding and prefervation was beyond their hopes; for you have heard, it hath been to the

Spaniards

Spaniards more fearful than an Utopian purgatory, and to all feamen no lefs terrible than an enchanted den of furies and devils, the most dangerous, unfortunate, and forlorn place in the world, and they found it the richest, healthfullest, and pleasantest

they ever faw, as is formerly faid.

Being thus fafe on shore, they disposed themselves to search the isles for food and water; others to get ashore what they could from the ship: not long Sir George wandered but found fuch a fishing, that in half an hour, with a hook and line, he took fo many as fufficed the whole company; in fome places they were fo thick in the coves, and fo great, they durft not go in left they should bite them; and these rock-fish are fo great that two will load a man, and fatter nor better fifth cannot be. Mr. Shelly found a bay near a quarter of a mile over, fo full of mullets, as none of them before had ever feen or heard of the like. The next day feeking to kill them with fis-gigs, they struck so many, the water in many places was red with blood, yet caught not one, but with a net they caught fo many as they could draw ashore, with infinite number of pilchards and divers other forts; great craw-fishes, in a night by making a fire, they have taken in great quantity. Sir George had twice his hook and line broke out of his hand, but the third time he made it fo ftrong he caught the fame fifh, which had pulled him into the fea, had not his men got hold of him, whereby he had his three hooks again which were found in her belly. At their first hunting for hogs they found such abundance, they killed thirty-two; and this hunting and fishing was appointed to Captain Robert Walfingham and Mr. Henry Shelly, for the company in general; they report they killed at least five hundred, besides pigs, and many that were killed by divers others; for the birds in their feafons, the facility to make their cabins of palmeta leaves, caufed many of them utterly forget or defire ever to return from thence, they lived in fuch plenty, peace and eafe.

But let us remember how the knights began to refolve in those desperate affairs: many projects they had, but at last it was concluded to deck their long-boat with their ship-hatches; which done, with all expedition they sent Mr. Raven, a very sufficient mariner, with eight more in her, to Virginia, to have shipping from thence to setch them away; three weeks or a month they expected her return, but to this day she was never more heard of: all this time was spent in searching the isles. New, although God still fed them with this abundance of plenty, yet such was the malice of envy or ambition, for all this good service done by Summers, such a great difference fell amongst their commanders, that they lived asunder in this distress, rather as mere strangers than distressed friends. But necessity so commanded; patience had the

victory.

Two ships at this time by those several parties were building; in the mean time two children were born; the boy was called Bermudas; the girl Bermuda, and amongst all those forrows they had a merry English marriage. The form of those isles you may fee at large in the map of Mr. Norwood, where you may plainly fee no place known hath better walls, nor a broader ditch. But having finished and rigged their two new cedar ships with such provisions they saved from the Sea-adventurer, they left amongst the rocks, they called the one the Patience, the other the Deliverance: they used lime and oil, as May did, for pitch and tar. Sir George Summers had in his bark no iron at all, but one bolt in her keel. Now having made their provisions of victuals, and all things ready, they fet fail the 10th of May 1610, only leaving two men behind them, called Christopher Carter and Edward Waters, that for their offences, or the fuspicion they had of their judgment, fled into the woods, and there rather defired to end their days, than stand to their trials and the event of justice; for one of their VOL. XIII. A A conforts

conforts was shot to death, and Waters being tied to a tree, also to be executed, had by chance a knife about him, and so fecretly cut the rope, he ran into the woods, where they could not find him. There were two savages also fent from Virginia by Captain Smith, the one called Namuntack, the other Matchumps; but some such differences fell between them, that Matchumps slew Namuntack, and having made a hole to bury him, because it was too short, he cut off his legs and laid them by him;

which murder he concealed till he was in Virginia.

The 24th of the same month they arrived in Virginia, at James Town, where they found but threescore persons, as you may read at large in the History of Virginia, of the five hundred left by Captain Smith; also of the arrival of Lord La Ware, that met them thus bound for England, returned them back, and understanding what plenty there was of hogs and other good things in the Bermudas, was desirous to send thither to supply his necessary occasions; whereupon Sir George Summers, the best acquainted with the place, whose noble mind ever regarded a general good more than his own ends, though above threescore years of age, and had means in England suitable to his rank, offered himself, by God's help, to perform this dangerous voyage again for the Bermudas, which was kindly accepted; so upon the 19th of June he embarked in his

cedar ship, about the burthen of thirty tons, and so fet fail.

Much foul and crofs weather he had, and was forced to the north parts of Virginia, where refreshing himself upon this unknown coast, he could not be diverted from the fearch of the Bermudas, where at last, with his company, he fafely arrived. But such was his diligence with his extraordinary care, pains, and industry to dispatch his businefs, and the strength of his body not answering the ever-memorable courage of his mind, having lived fo long in fuch honourable fervices, the most part of his wellbeloved and virtuous life, God and nature here determined should ever remain a perpetual memory of his much-bewailed forrow for his death. Finding his time but short, after he had taken the best course he could to settle his estate, like a valiant captain, he exhorted them with all diligence to be conftant to those plantations, and with all expedition to return to Virginia. In that very place which we now call Saint George's Town, this noble knight died, whereof the place taketh the name. But his men, as men amazed, feeing the death of him who was even as the life of them all, embalmed his body, and fet fail for England, being the first that ever went to seek those islands, which have been ever fince called Summer's Isles, in honour of his worthy memory, leaving three men behind them, that voluntarily staid, whose names were Christopher Carter, Edward Waters, there formerly left, as is faid, and Edward Chard. This cedar ship at last, with his dead body, arrived at Whitchurch in Dorsetshire, where, by his friends, he was honourably buried, with many vollies of shot, and the rites of a soldier, and upon his tomb was bestowed this epitaph:

> Hei mihi Virginia quod tam cito præterit æstas, Autumnus sequitur, sæviet inde & hicms; At ver perpetuum nascetur, & Anglia læta, Deccrpit slores slorida terra tuas.

In English thus:

Alas, Virginia's fummer fo foon past, Autumn succeeds and stormy winter's blast, Yet England's joyful spring with joyful showers, O Florida, shall bring thy sweetest slowers.

The honour of this refolution belongs principally to Carter, for through his importunity not to leave such a place abandoned, Chard and Waters were moved to stay with with him, and the rest promised, with all the speed they could, again to revisit them. But the ship once out of fight, those three lords, the sole inhabitants of all those islands, began to crect their little commonwealth for a while with brotherly regency, repairing the ground, planting corn and such seeds and fruits as they had, building a house, &c. Then making privy fearch amongst the crevices and corners of those craggy rocks, what this main ocean since the world's creation had thrown amongst them, at last they chanced upon the greatest piece of ambergris that was ever seen or heard of in one lump, being in weight sourseore pounds, besides divers other small pieces.

But now being rich, they grew fo proud and ambitious, contempt took fuch place, they fell out for fuperiority, though but three forlorn men, more than three thousand miles from their native country, and but fmall hope ever to fee it again. Notwithstanding, they fometimes fell from words to blows about mere trifles; in one of which fights one of them was bitten by his own dog, as if the dumb beast would reprove them of their folly: at last Chard and Waters, the two greater spirits, must try it out in the field; but Carter wifely stole away their weapons, affecting rather to live among his enemies, than by being rid of them live alone; and thus those miserable men lived full two years, fo that all their clothes were near worn clean from their backs, and their hopes of any foreign relief as naked as their bodies. At last they began to recover their wits, yet in a fashion perhaps would have cost them dearer than when they were mad; for concluding a tripartite peace of their Matachin war, they refolved to frame as good a boat as they could, and therein to make a desperate attempt for Virginia, or Newfoundland; but no fooner were they entered into that refolution, but they descried a fail standing in for the shore, though they neither knew what she was, nor what she would, they were fo overjoyed, with all possible speed they went to meet her, and according to their hearts' defire the proved an Englishman, whom they fafely conducted into their harbour.

Now you are to understand, that Captain Matthew Summers, nephew and heir to Sir George, that returned with his dead body, though both he and his company did their utmost in relating all those passages to their countrymen and adventurers, their relations were believed but as travellers' tales, till it came to be apprehended by some of the Virginia Company how beneficial it might be, and helpful to the plantation in Virginia, so that some one hundred and twenty of them bought the pretended right of all the Company, and had sent this ship to make a trial; but first they had obtained letters patents of the King's most Excellent Majesty. Sir Thomas Smith was elected treasurer and governor here, and Mr. Richard More to be governor of the isles and colony there.

The first beginning of a Colony in the Summer Isles, under the command of Mr. Richard More, extracted out of a Plot of Mr. Richard Norwood, Surveyor, and the Relations of divers others.

MR. MORE thus finding those three men not only well and lusty, but well stored with divers forts of provisions, as an acre of corn ready to be gathered, numbers of pumpeons and Indian beans, many tortoises ready taken, good store of hogs' sless falted, and made in slitches of bacon, were very good; and so presently landed his goods and fixty persons towards the beginning of July 1612, upon the south side of Smith's Isle.

Not long after his arrival, More having some private intelligence of this ambergris, took first Chard in examination, he being one of the three the most masterful spirit,

AA 2 wha

what ambergris, pearls, treasure, or other commodities they had found. Chard no lefs witty than resolute, directly answered, not any thing at all but the fruits of the isle, what his fellows had done he knew not, but if they had, he doubted not but to find it out, and then he should know it certainly. This he spoke only to win time to fwear his conforts to fecrecy, and he would find the means how they should all return in that ship with it all for England, otherwise they should be deceived of all. this was effected they thought every hour an age; now for the better conveyance of it aboard, they acquainted it to Captain Davis, master of the ship, and one Mr. Edwin Kendall, that for their fecrecy and transportation should participate with them: without further ceremony the match was accepted, and abfolutely concluded, the plot laid, time and place fet down to have it aboard. But Carter, were it for fear the governor at last should know of it, to whom so often they had denied it, or that the rest should deceive him, is uncertain, but most certain it is, he revealed all the plot to Mr. More: to get fo much wealth he knew would pleafe them in England, though it did displeafe all his company, and to lose such a prize he would not for hazarding a musiny. So first he revealed himself to Kendall in fair terms, reproving his dishonesty; but not being answered according to his expectation, he committed both Chard and him to prison. The next Sabbath-day Davis coming on shore, More also taxed with very hard language and many threats, to lay him fast also if he mended not his manners; Davis for the present replied little, but went with him to the place of prayer, but in the midft of divine fervice he goeth away, commanding all his feamen to follow him prefently aboard, where he encourageth them to fland to him like men, and he would free the prisoners, have all the ambergris for themselves, and so be gone.

The governor hearing of this refolution, prepares with his company to repulse force with force, so that a general expectance of a civil uncivil war possessed every man; but this threatening gust passed over more calmly than was expected, for Davis having better advised with himself, repented his rashness, and desired a reconcilement with the governor. Peace thus concluded, Kendall was set at liberty, but Chard was condemned, and upon the ladder to be hanged for his obstinacy; yet upon better consideration, More reprieved him, but kept him a prisoner all the time he staid in the country, which was generally thought a very bad reward for his great desert, and that there was more of this ambergris embezzled than would have contented all the sinders, that never had any consideration at all. The greatest part though More thus recovered, yet Davis and Kendall had so much, either by the ignorance or connivency of the governors, that arriving in England, they prepared themselves for a new voyage; at last they two falling out, the company having notice thereof, so tormented them both,

they gave over their voyage, and durst not be seen a long time after.

The governor, thus rid of the ship and those discontents, removed his seat from Smith's life to Saint George's, after he had sitted up some small cabins of palmata leaves for his wife and family, in that valley where now stands their prime town called Saint George's, he began to apply himself to fortify the country, and training his men in the exercise of arms; for although he was but a carpenter, he was an excellent artist, a good gunner, very witty and industrious: he built and haid the foundation of eight or nine forts, called the King's Castle, Charles Fort, Pembroke's Fort, Smith's Fort, Pagit's Fort, Gate's Fort, Warwick's Castle, Saint Katharine's Fort, &c. mounting in them all the ordnance he had, preparing the ground to build houses, plant corn, and such fruits as they had.

Being thus busied, and as the necessity of the time required, keeping his men somewhat hard at work, Mr. Keath his minister, were it by the secret provocation of some

drone

drones that grew weary of their tasks, or his affection to popularity is not certain, but he begins to tax the governor in the pulpit, he did grind the faces of the poor, oppressing his Christian brethren with Pharoah's taxes. More finding this in short time might breed ill blood, called the company together and also the minister, urging them plainly to tell him wherein he had deserved those hard accusations: whereupon, with an universal cry they affirmed the contrary, so that Keath down of his knees to ask him forgiveness. But Mr. More kindly took him up, willing him to kneel to God, and hereafter be more modest and charitable in his speeches; notwithstanding two other discontents so upbraided More with that doctrine, and stood to maintain it, he impannelled a jury, with a great deal of seeming much ado he would hang them being condemned, one of them with the very fear fell into a dead palfy; so that the other was set at liberty, and proved after a very good labourer.

Many conclusions he tried about the Sea-Venture, the wreck of Sir George Summers, but he got only for his pains but two pieces of ordnance. Having framed a church of timber, it was blown down by a tempest, so that he built another in a more close place

with palmeta leaves.

Before this year was expired, the adventurers fent them an adviso with thirty passengers and good provisions, to prepare with all expedition for their defence against the Spaniard, whom, they understood, ere long would visit them: this occasioned him to keep all his men together in that isle so hard at work, that wanting liberty to go abroad for food, living only on that they had, and expected daily to receive from England, they were so overtoiled, many fell sick, but none died. Very earnest this ship was to have all the ambergris, which Mr. More perceiving, was the chiefest cause of their coming, and that it was the only loadstone to draw from England still more supplies; for all the express command sent from the company, he returned this ship but with the one-third part; so from thence she went to Virginia, and not long after

arrived fafely in England.

But before her return the company fent the Martha with fixty passengers more; they arrived in June with one Mr. Bartlet to furvey the island, and the estate of the colony, with express command for all the ambergris, but More perceiving him not as he would have him, and that the company began to mistrust him, would fend no more but another third part, wherewith they returned, leaving a Frenchman to make trial of the mulberries for filk, but he did not bring any thing to perfection, excufing himfelf, they were not the right mulberries he expected. About this time they were in hope of a finall crop of tobacco, but it was most spoiled for want of knowledge to use it. Now in England Mr. More became amongst the merchants marvellous distasteful, for the detaining fo long the ambergris, which delays they fo much abhorred, they forthwith dispatched the Elizabeth the second time and forty passengers, much rebuking More for fo long detaining the ambergris, for the which, having now no more colourable excuses, he delivered it, wherewith the ship went to Virginia, and thence home. In this ship was brought the first potatoe roots, which sourished exceedingly for a time, till by negligence they were almost lost (all but two cast-away roots) that fo wonderfully have increased, they are a main relief to all the inhabitants. This ship was not long gone but there came two Spanish ships, founding with their boat, which attempted to come in, but from the King's Castle Mr. More made but two shot, which caused them prefently depart. Mark here the handy work of the Divine Providence, for they had but three quarters of a barrel of powder and but onethat more, and the powder by careleffness was tumbled down under the muzzles of the two pieces, were discharged, yet not touched with fire when they were discharged. This

This fear thus past, appears another much worse, which was the extremity of famine; in this extremity God fent Captain Daniel Elfrid with a carvel of meal which a little relieved them, but brought with all fo many rats, that within two years after near ruined all; now though Elfrid had deceived his friend Fisher of this carvel in the West Indies, they revenged Fisher's injury, for Elfrid had his passage for England, and they made use of all he had. Some two months after, came in the Bleffing, with an hundred passengers; and two days after the Starre, with a hundred and fourfcore more, amongst which were many gentlemen, as Mr. Lower for marshal, Mr. Barret, Mr. Felgate, and divers others; but very unproper for what they undertook. Within fourteen days after came in the Margaret and two frigates, and in them one hundred and threefcore paffengers; also Mr. Bartlet came now expressly to divide the country into tribes, and the tribes into shares. But Mr. More finding no mention made of any part for himself nor all them with him, as he was promifed in England, by no means would admit of any division, nor suffer his men from finishing their fortifications, which was so necessary, it was his main ambition to see that accomplished; but such unkindness grew betwixt this Mr. Bartlet and the governor, that the rude multitude with all the diffain they could devife caufed Bartlet's return for England as he came. About this time William Millington was drawn into the fea by a fish, but never after ever feen.

The neglect of this division was very hardly conceited in England, so that Mr. More, grew more and more in dislike with the company; notwithstanding he followed the building of these forts so earnestly, neglecting planting of corn, till their store was near all consumed, whereby they became so feeble and weak, some would not, others could not go abroad to seek relief, but starved in their houses, and many that went abroad, through weakness were subject to be suddenly surprised with a disease called feagues; which was neither pain nor sickness, but as it were the highest degree of weakness, depriving them of power and ability from the execution of any bodily exercises, whether it were working, walking, or what else; being thus taken, if any presently gave them food, many times they straight recovered, yet some after a little rest, would be able to

walk, but if they found not present succour, died.

About this time or immediately before, came in a company of ravens, which continued amongst them all the time of this mortality, and then departed, which for any thing known, neither before nor fince were ever seen or heard of: this with divers other reasons, caused Mr. More to go out to sea, to see if he could discover any other islands, but he went not far ere ill weather forced him back; and it were a noble adventure of him would undertake to make more perfect, all the dangers are about the

Summer Isles.

Thus famine and mifery caufed Governor More to leave all his works, and fend them abroad to get what they could; one hundred and fifty of the most weak and sick he sent to Couper's Isle, where were such infinite numbers of the birds called cahowes, which were so fearless they might take so many as they would, and that admired abundance of sish, that the extremity of their gluttony was such, those heavenly blessings they so consumed and wasted by carelesses and surfeiting, many of them died upon those silly birds that offered themselves to the slaughter, which the governor understanding, caused them for change of air to be removed to Port Royal, and a company of sishers with a boat to relieve them with fish, but the gang grew so lazy the poor weaklings still died; they that remained killed the cattle they found in the isle, seigning the heat caused them to run into the sea and so were drowned; so that the governor sent again for them home, but some obtained leave still to live abroad; one amongst the rest hid himself in the woods, and lived only on wilks and land-crabs, fat and lusty many months, but most

of them being at Saint George's, ordinarily was taken one hundred and fifty or two hundred great fishes daily for their food; for want of hooks and lines, the smith made hooks of old swords, and lines of old ropes, but finding all those poor engines also decay, they sent one of the two frigates last left with them for England, to tell them of this misery. All which was now attributed to Mr. More's perversenes, who at first when he got the ambergris had not such a general applause, but now all the worst could possibly be suggested was too good for him; yet not knowing for the present how to send a better, they let him continue still, though his time was near expired, and with all speed sent the Welcome fraught with provision, where she well arrived, and proved herself as welcome in deed as in name; for all those extremities, Mr. Lewes Hues writeth, not one of all of those threescore that first began this plantation was dead, which shews it was not impossible, but industry might have prevented a great part of the others sluggish carelessness.

This ship much refreshed this miserable colony, but Mr. More seeing they sent not for him, his time being now expired, understanding how badly they reputed him in England, and that his employment now was more for their own ends than any good for himself, resolved directly to return with his ship. Having settled all things in the best order he could, left the governor to the charge of the council of six, to succeed each other monthly, till they had further directions from England; whose names were Captain Miles Kendall, Captain John Manssield, Thomas Knight, Charles Caldycot, Edward Waters, and Christopher Carter, with twelve others, for their assistances. More thus taking leave of those islands, arrived in England; much wrangling they had, but at last they construed him, according to promise, eight shares of land; and so he was dis-

miffed of his charge, with fliew of favour, and much friendship.

The rule of the fix Governors.

THE first thing they did was casting of lots, who should rule first; which lot lighted upon Mr. Caldicot. This last supply somewhat abated the extremity of their miseries, and the better in that their fortifications being finished, they had the more leisure to go abroad with that means was brought to that purpole to fish. Chard, as you have heard, whom all this while More had kept prisoner, they fet at liberty: now by reason of their former miferies, little or nothing could be done; yet this governor having thus concluded his month, and prepared a frigate and two-and-thirty men, he embarked himfelf with two other of his fellow counsellors; namely, Knight and Waters, for the West Indies, to get fruits and plants, goats, young cattle, and fuch like. But this poor veffel, whether through ill weather, or want of mariners, or both, instead of the Indies fell with the Canaries, where taking a poor Portugal, the which they manned with ten of their own people, as foon after separated from her in a storm, and the next day was taken by a French pickaroon, fo that the frigate out of hope of her prize, makes a fecond time for the West Indies, where she no sooner arrived, but soundered in the sea; but the men in their boat recovered a defolate ifle, where after fome few months stay, an English pirate took them in, and some of them at last got for England, and some few years after returned to the Summer Isles.

Captain John Mansfield's month.

THE frigate thus gone, Captain Mansfield succeeded. Then was contrived a petition, as from the generality, unto the triumvirate governors, wherein they supplicated,

that by no means they should resign the government to any should come from England, upon what terms soever, until six months after the return of their ship sent to the West Indies; about this unwarrantable action Mr. Lewes Hues, their preacher, was so violent in suppressing it, that such discontents grew betwixt the governors and him, and divisions among the company, he was arraigned, condemned, and imprisoned, but not long detained before released. Then the matter fell so hotly again to be disputed betwixt him and one Mr. Keith, a Scotchman, that professed scholarship, that made all the people in a great combustion: much ado there was, till at last, as they sate in the church, and ready to proceed to judiciary course against Mr. Hues, suddenly such an extreme gust of wind and weather so russled in the trees and church, some cried out, a miracle; others, it was but an accident common in those isles, but the noise was so terrible it dissolved the assembly; notwithstanding, Mr. Hues was again imprisoned, and as suddenly discharged; but those factions were so consused, and their relations so variable, that such unnecessary circumstances were better omitted than any more disputed.

This man's month thus ended, begins Mr. Carter's, which was altogether spent in quietness; and then Captain Miles Kendall had the rule, whose month was also as quietly spent as his predecessor's. Then Captain Manssield begins his second month, when the ship called the Edwin, arrived with good supplies. About this time divers boats going to sea were lost, and some men drowned; and many of the company repaired to Mr. Hues, that there might be a council according to Mr. More's order, of six governors and twelve assistants, whereupon grew as many more such filly brawls as before, which at last concluded with as simple a reconciliation. In the interim, happened to a certain number of private persons as miserable and lamentable an accident

as ever was read or heard of, and thus it was:

In the month of March, a time most subject of all others to such tempests, on a Friday there went feven men in a boat of two or three tons, to fish. The morning being fair, fo eager they were of their journey, some went fasting; neither carried they either meat or drink with them, but a few palmeta berries, but being at their fishingplace some four leagues from the shore, such a tempest arose, they were quickly driven from the fight of land in an overgrown fea, despairing of all hope, only committing themselves to God's mercy, let the boat drive which way she would. On Sunday the ftorm being fomewhat abated, they hoisted fail, as they thought, towards the island. In the evening it grew stark calm, fo that being too weak to use their oars, they lay adrift that night. The next morning Andrew Hilliard, for now all his companions were past strength either to help him or themselves, before a small gale of wind spread his fail again. On Tuefday one died, whom they threw overboard. On Wednefday three, and on Thursday at night the fixth. All these but the last were buried by Hilliard in the fea, for fo weak he was grown he could not turn him over as the rest, whereupon he stripped him, ripping his belly with his knife, throwing his bowels into the water, he fpread his body abroad tilted open with a flick, and fo let it lie as a ciftern to receive some lucky rain water, and this God sent him presently after, so that in one fmall shower he recovered about four spoonfuls of rain-water to his unspeakable refreshment; he also preserved near half a pint of blood in a shoe, which he did sparingly drink of to moift his mouth: two feveral days he fed on his flesh, to the quantity of a pound; on the eleventh day from his losing the fight of land, two flying fishes fell in his boat, whose warm juicy blood he sucked to his great comfort. But within an hour after, to his greater comfort, you will not doubt, he once again descried the land, and within four hours after was cast upon a rock near to Port Royal, where his boat

was prefently split in pieces, but himself, though extremely weak, made shift to clamber up so steep and high a rock, as would have troubled the ablest man in the isse to have

done that by day he did by night.

Being thus aftride on a rock, the tumbling fea had gotten fuch possession in his brains, that a good while it was before his giddy head would suffer him to venture upon the forfaking it: towards the morning he crawls ashore, and then to his accomplished joy he discerns where he is, and travels half a day without any refreshment than water, whereof wisely and temperately he stinted himself, otherwise certainly he had drunk his last. In which case he attains a friend's house, where at the first they took him for a ghost, but at last acknowledged and received him with joy, his story (after some hours of recovery of strength to tell it) heard out with admiration. He was not long after conveyed to the town, where he received his former health, and was living in the year 1622.

The next news that happened in this time of ease, was, that a merry fellow having found some sew dollars against the Flemish wreek, the bruit went current the treasure was found, and they all made men. Much ado there was to prevent the purloining of it, before they had it; where after they had tired themselves with searching, that they sound amounted not to above twenty pounds sterling, which is not unlike but to be the remainder of some greater store, washed from some wreck not far from the shore.

The company by the Edwin receiving news of the revels were kept in Summer Isles, resolved to make choice of a new governor, called Mr. Daniel Tucker, that a long time had been a planter in Virginia in the government of Captain Smith. All things being furnished for his voyage, he set fail in the George, consorted with the Edwin, with many passengers, which being discovered by them in those isles, they supposed them the frigate sent to the West Indies; but when they understood what they were, much preparation they made to resist the new governor. Many great ostentations appeared on both sides, but when the quondam governor did see his men for most part forsake him, all was very well and quietly compounded, and with much kindness received and welcomed ashore, where his commission was no sooner read, than they accepted and acknowledged him for their governor.

The Government of Captain Daniel Tucker.

ABOUT the midst of May arrived this governor, where finding the inhabitants both abhorring all exacted labour, as also in a manner disdaining and grudging much to be commanded by him, it could not but passionate any man living. But at last, according to the Virginia order, he set every one was with him at Saint Georges, to his task, to clear grounds, fell trees, set corn, square timber, plant vines and other fruits brought out of England. These by their task-masters by break of day repaired to the wharf, from thence to be employed to the place of their employment, till nine of the clock, and then in the afternoon from three till sun-set. Beside meat, drink, and cloaths, they had for a time a certain kind of brass money with a hog on the one side, in memory of the abundance of hogs found at their first landing.

This course thus squared, imitating divers orders used in Virginia, by Sir Thomas Dale: he began by them to look into his instructions given by the company. Whereupon by one Mr. Richard Norwood a surveyor, sent over for that purpose, in the time of Mr. Moore, he began to lay out the eight tribes in the mair, which were to consist of fifty shares to a tribe; and twenty-five acres to every share. He also began to plant

yol. XIII. B B fome

fome colony men, on some of the especial shares. He swore also certain of the chief men of every tribe to be bailists thereof; and appointed as many men as he was able for all supplied shares. The goods landed in the store-houses he sent from thence, and dispersed it to his workmen in general: some boats also began to be built; but the pinnace called the Thomas suspected might make an escape, was laid up in a dock, where

the yet remaineth.

In the beginning of the fecond month of his government, he directed warrants to all the bailiffs, for the holding of a general affize at Saint Georges, and appointed Mr. Stokes lieutenant of the King's caftle at the Gurnet's Head. The Edwin came with him he fent to the West Indies, by directions from England, to trade with the natives for cattle, corn, plants, and other commodities. A course of great importance, which had it been pursued, would certainly have produced more hopeful effects for the good of the colony, than all the supplies and magazines from England hath or will in a long time.

Prefently after her departure began the affizes, executed by his deputy. The chief matter handled was the hanging one John Wood, a Frenchman, for speaking many distasteful and mutinous speeches against the governor, to shew the rest by that example the power of his authority, which after with his own hands he so often executed with a bastinado amongst the poorer fort; many termed it a cruelty, not

much less than tyranny; but the fequel is more than strange.

So it was that five of them, feeing by no means they could get passage for England, refolved to undergo all hazards but they would make an escape from such servitude. The chief mariner and plotter of this business was Richard Sanders, and his confederates, William Goodwin, a ship-carpenter, Thomas Harison, a joiner, James Barker, a gentleman, and Henry Puet. These repairing to the governor, and with pleasing infinuations told him, if he would allow them but things necessary, they would build him a boat of two or three tons, with a close deck, should go a-fishing all weathers. The governor half proud that he had brought his men to fo good a pass, as he conceived, to offer themselves to so necessary a work, instantly with all willingness furnished them with all things they could defire, and many fair promifes to encourage them to perform it with all expedition. Having made choice of a place most sit from moleflation, they went forward with that expedition, that in a fhort time she was brought to perfection. By this time, the ship that brought the governor being ready to depart, he fends a lufty gang to go fetch his new boat to carry him aboard, but arriving at the place where she was built, they could hear no more of her, but she was gone the last evening to fea, to try how she would fail. Much fearch and dispute was where this boat should be, but at last they found divers letters in the cabins to this. effect, directed to the governor, and other their friends, "that their hard and bad ufage was fo intolerable, and their hope fo fmall ever again to fee their country, or be delivered from fuch fervitude, they did rather choose to put themselves to that desperate hazard to go for England, in which if they miscarried, as it was much to be mistrufted, their lives and bloods should be required at their hands was the cause." compass dial Barker had borrowed of Mr. Hues, to whom he wrote that as he had often perfuaded them to patience, and that God would pay them though none did, he must now be contented with the loss of his dial, with his own doctrine. Such leisure they found to be merry when in the eye of reason they were marching into a most certain ruin. The governor being thus fatisfied of their escape, extremely threatened them no less than a hanging, but the storms of the ocean they now more feared than him; good provision by bartering they had got from the ship, where Goodwin in a. bravado

bravado, told the mariners, though he could not be permitted to go with them, yet peradventure he might be in England before them; whereat the mafter and his mate laughed merrily. But having now been under fail three weeks, the winds fo favoured them, they felt nothing of what they had cause to fear: then a blustering gale blowing in their teeth put them to much extremity for divers days, then becoming more gentle, away they past prosperously some eight or ten days more, till meeting a French piecaroon, of whom they defired fuceour, he, like himfelf, took from them what he liked, leaving them not fo much as a cross-staff to observe withal, and so cast them off: their courfe ftill they continued till their victuals began to fall to the lowest ebb, and the very knees of their small vessel were half hewed away for fire-wood. At last to their infinite joy they arrived in Ireland, where the Earl of Tomund honourably entertained them, and caused the boat to be hung up for a monument, and well she might, for she had failed more than three thousand three hundred miles by a right line through the main fea, without any fight of land, and I think, fince God made the world, the like navigation was never done, nor heard of. This fortunate Sanders going to the East Indies, in the rifling fome ships there took, it was his chance to buy an old chest for three or four shillings, but because it wanted a key he repented his bargain, and would gladly have fold it again for less: a certain time it lay toffed to and fro as a thing he little regarded, but at last having little to do, he broke it open, where he found a thousand pounds fterling, or fo much gold as bought him in England a good eftate, which

leaving with his wife he returned again to the East Indies.

The George fetting fail three days after this escape, the governor seized and confilcated all that those fugitives left behind them. Within a week after returned the Edwin from the West Indies, furnished with figs, pines, fugar-canes, plaintains, papanes, and divers other plants, which were prefently replanted, and fince increafed into greater numbers, also an Indian and a negro, and so much ligna vitæ as defrayed all the charge. The governor thus bufied amongst his plants, making hedges of figtrees and pomegranates, and feveral divisions by palifadoes for the defence of their guarding and keeping their cattle, for in fuch hulbandry qualities he well deferved great commendations. The adventurers, to fupply him, fent with all fpeed they could the Hopewell, a fmall bark, but an excellent failer, and in her one Captain Powell, an excellent mariner, and well acquainted in the Indies, where he was to go trade, after he had landed his passengers in the Summer Isles; but in his journey at the Western Isles meeting a Brazil-man, he liked the sugar and passengers so well, he manned the carvel with his own men, and continued his course; but bethinking himself how this would be entertained at the Summer Isles, he found such doubts, he went directly for the West Indies, to take time to resolve what to do: arriving there, he met a French rover, one every way as cunning as himfelf, but much more treacherous. A great league of kindness is soon made between them, upon considence whereof, Powell, and fome of the chief with him, being invited aboard him, is eafily enticed, and in the midst of their cups both he and his company treacherously made prisoners, and thus was forced to give him their prize, or hang at the yard-arm with all his company. Having fet them ashore, away goes the Frenchman; Powell's ship being but hard by, presently fetched them all aboard, but finding his victuals near spent, and no hope at all to recover his prize, fet his Portuguese on shore, and set sail for the Summer Isles; where fafely arriving, he declared the whole passage to the governor, left fome other in telling might make it worfe, of which the governor feemed well enough to approve.

This governor still spent his time in good husbandry, although some of the snarling fort here in England, whom nothing will please, writ to him, he was fitter to be a gardener than a governor: fome time he fpent in digging of a great pond, but that work proved altogether unprofitable. About that time was held the fecond affize. The greatest matter passed, was a proclamation against the spoil of Cahowes, but it came too late, for they were most destroyed before; a platform he caused to be erected by Pagit's Fort, where a good fort was very necessary. Captain Powell not having performed his fervice in the West Indies he conditioned with the company, is fent thither again by this governor, and thirteen or fourteen of his best men, furnished with all things necessary. In the mean time, the company understanding that in January, February, and March, there are many whales, for which fishing they fent the Neptune, a tall ship, well provided with every thing fitting for that purpose; but before she arrived, Captain Tuckar, who had brought also with him more provisions for that employment, fent three good shallops to try what could be done; but whether it was the swiftness of the whale in fwimming, or the condition of the place, certain it is, for all their labour and hazard, they could kill none, though they struck many.

To begin his fecond year, he called the third affize, where divers were punished as their faults deserved: three were condemned to die; two were reprieved, but the third was hanged: the next day there was also a levy for the repairing two forts; but that

labour took not fuch effect as was intended, for want of good directions.

But the great God of Heaven being angry at fomewhat happened in those proceedings, caused such an increase of filly rats in the space of two years so to abound, before they regarded them, that they filled not only those places where they were first landed, but fwimming from place to place, spread themselves into all parts of the country, infomuch that there was no island but it was pestered with them; and some fishes have been taken with rats in their bellies, which they caught in fwimming from ifle to ifle; their nefts they had almost in every tree, and in most places their burrows in the ground like conies; they spared not the fruits of the plants or trees, nor the very plants themselves, but ate them up. When they had fet their corn, the rats would come by troops in the night, and feratch it out of the ground. If by diligent watch any escaped till it came to earing, it should then very hardly escape them; and they became notione even to the very perfons of men. They used all the diligence they could for the destroying of them, nouriflying cats, both wild and tame, for that purpose; they used ratibane, and many times fet fire on the woods, that often ran half a mile before it was extinct; every man was enjoined to fet twelve traps, and fome of their own accord have fet near an hundred, which they ever vifited twice or thrice in a night; they also trained up their dogs to hunt them, wherein they became fo expert, that a good dog in two or three hours would kill forty or fifty. Many other devices they used to destroy them, but could not prevail, finding them still increasing against them; nay, they so devoured the fruits of the earth, that they were destitute of bread for a year or two; so that when they had it afterwards, they were fo weaned from it, they eafily neglected to eat it with their meat. Befides, they endeavoured fo much for the planting tobacco for prefent gain, that they neglected many things might more have prevailed for their good, which caused amongst them much weakness and mortality, since the beginning of these vermin.

At last it pleased God, but by what means it is not well known, to take them away, infomuch that the wild-cats and many dogs which lived on them, were famished, and many of them leaving the woods, came down to their houses, and to such places where

they use to garbish their fish, and became tame. Some have attributed the destruction of them to the increase of wild-cats, but that is not likely they should be so suddenly increased rather at that time than four years before; and the chief occasion of this supposition was, because they saw some companies of them leave the woods, and slew themselves for want of sood: others by the coldness of winter, which notwithstanding is never so great there as with us in March, except it be in the wind: besides, the rats wanted not the feathers of young birds and chickens, which they daily killed, and palmeta moss to build themselves warm nests out of the wind, as usually they did; neither doth it appear that the cold was so mortal to them, seeing they would ordinarily swim from place to place, and be very fat even in the midst of winter. It remaines then, that as God doth sometimes effect his will without subordinate and secondary causes, so we need not doubt, but that in the speedy increase of these vermin, as also by the prefervation of so many of them by such weak means as they then enjoyed, and especially in the so sudden removal of this great annoyance, there was joined with, and besides the ordinary and manifest means, a more immediate and secret work of God.

About this time, Henry Long, with feven others, in an extreme from were cast away, but three of them escaped: one of them being asked what he thought in the worst of that extremity? answered, he thought nothing but gallows claim thy right: and it seems, God well heard his heard his prayer, and rewarded his ingratitude, for he was hanged within half a year after. In that March also five men went to sea, but as yet was never heard of, and three more drowned in a boat. By Hilliard's house grew a very fair cedar, which by a thunder-clap was rent almost to small shivers, and a man stood by him, and Samuel Tanton, most fearfully blasted, yet neither they, the house, nor a little child, yet a pair of racks in the house was all torn to fitters. The Neptune not long after arriving to fish for whale, her fortune proved no better than the gover-

nor's, yet fome are of opinion, profit might be made by them.

In May they descried four fail, so that manning all their forts, they stood two days in arms, expecting what they were; at last they found it Mr. Powell, returned from the West Indies, in the Hopewell, where missing such trade as he expected, these three frigates coming in his way, he could not chuse but take them; meal, hides, and ammunition was their lading: fair weather the governor made with Powell, till he had got all the goods into his own possession, and then called Powell to a strict account for doing fuch an unwarrantable act; much ado then was betwixt the taker and receiver; but Powell was glad to be excufed to answer it in England, leaving all he had taken behind him in the iffes: the Neptune also returned with him, but noble Powell lost all his pay and pillage for this year's work. For which the company fent for to Tuckar, fo that he also lost his part as well as Powell: notwithstanding, the governor by this means being firong in shipping, fitted the carvel with twelve men, under the command of Edward Waters, formerly fpoken of, and fent them to Virginia about fuch bufiness as he had conceived. Arriving there, they obtained fome goats and hogs, and what they could spare, and so returned for the Summer Isles; but whether they could not find the ifles for want of fkill, or beaten off by ill weather, or the ill-will they bare the governor, it matters not much; but they bare up again for Virginia, where they all remained, and would return no more to Summer Isles.

The governor thinking to make fome use of the hides, set some that professed themfelves tanners, to make trial of their skill; but they lost their labours, and spoiled the hides. Also he called another assize, concerning a poor sellow called Gabriel, for concealing some speeches M. Pollard and M. Rich should use, tending to the disrepu-

tation

tation of the governor, and his injuffice and cruelties; which being brought within the compass of sedition and mutiny, though a year ago, many were called in question about it, although every one ordinarily had spoke as much. Yet Gabriel, for example sake, was condemned to be hanged, and was upon the ladder, but reprieved. The other two, M. Pollard and M. Rich, were imprisoned; but upon better consideration, the sact appeared so small and ridiculous, upon their submission, they were pardoned, and restored to their places.

The Division of the Summer Isles into Tribes, by Mr. Richard Norwood, Surveyor.

ACCORDING to the directions of the Council and Company, as they had determined by lot, Mr. Norwood took a plot of the isle, and divided it with as much faithfulness as he could, assigning to every adventurer his share or proportion; as namely, to lay out a large proportion, to be called the general land, and employed for public uses, as for the maintenance of the governor, ministers, commanders of forts, foldiers, and fuch like: and to this end was affigned Saint George's Island, Saint David's Island, Longbridge Island, Smith's Island, Cooper's Island, Cony Island, Nonesuch Island, part of the main, and fundry other small isles. The rest was to be divided into eight parts, each part to be called a tribe, and to have his denomination of fome principal person that was adventurer therein: and accordingly, the first tribe to be eastward was then called Bedford's Tribe, now Hamilton's; the second, Smith's tribe; the third, Cavendish, now Devonshire's; the fourth, Pembroke's; the fifth, Paget's; the fixth, Manfil's, now Warwick's; the feventh, Southampton; the eighth, Sands: in the honours of the Right Honourable the Marquis Hamilton, Sir Thomas Smith, the Earl of Devonshire, the Earl of Pembroke, the Lord Paget, the Earl of Warwick, the Earl of Southampton, and Sir Edwin Sands. Again, each of those tribes were to be divided into fifty parts, called fhares; and every adventurer to have his fhares in these tribes as was determined, by casting lots in England: the manner of it appears by the map, and more largely by his book of the furvey of the country, which is in the records of the colony. And then began this which was before as you have heard, but as an unfettled and confused chaos, to receive a disposition, form, and order, and become indeed a plantation.

The Names of the Adventurers, and their Shares in every Tribe, according to the Survey, and the best Information yet ascertained of any of their Alterations.

Touching the common ground in each tribe, as also the overplus, you may find that

at large in the book of furveys amongst their records.

Now, though the country was finall, yet they could not conveniently have been difposed and well settled, without a true description and a survey of it; and again, every man being settled where he might constantly abide, they knew their business, and sitted their household accordingly: then they built no more cabins, but substantial houses, they cleared their grounds, and planted not only such things as would yield them their fruits in a few months, but also such as would afford them profit within a few years; so that in a short time the country began to aspire, and nearly approach unto that hap-

pinefs and prosperity wherein now it flourisheth, &c.

But to follow the history, upon the best plot of ground could be found, the governor prevailed so much with the generality, they built a fair house of cedar, which being done, he appropriated it to himself, which occasioned exceeding much distaste. About this time arrived the Diana, with a good supply of men and provision, and the first magazine ever seen in those isses; which course is not so much commended here, as cursed and abhorred by reason of enhancements of all the inhabitants there; six or seven weeks this ship staid, then having towards her freight thirty thousand weight of tobacco; which proving good, and coming to a lucky market, gave great encouragement to the adventurers to go lustily forward in their plantation, and without such such such these is not ling but grudging and repining. But about the appropriation of this new-built house, many bad discontents grew betwixt the oppressed colony and the governor,

10

governor, especially betwixt him and the minister, and Lewes, who would neither be feared with threats nor imprisonment, that their malice continued till they met in England, of which the minister made the cause so plain, he very well and honestly, it seems,

discharged himself.

Now in those times of these endless uncivil broils, two desperate men and a proper gentlewoman got into a boat, and thinking to make an escape to Virginia, as appeared by fome letters they left behind them, were never more heard on. The very next month after, the like was attempted by fix others, fo defirous they were to be rid of their fervitude; but their plot being discovered by one of their fociety, they were apprehended, arraigned, and condemned to be hanged; the next day being led with halters about their necks to the place of execution; one was hanged, and the rest

reprieved.

The Diana arriving well in England, for all the infinite numbers of complaints, the tobacco did help to fweeten all manner of grievances, yet it bred a distaste in the opinions of fo many, they began to think of another governor; but for that time it was fo qualified by divers of his friends, they difpatched away the Bleffing, which arrived in the Summer Isles. Though their general letter was fair and courteous to the governor, yet by the report of the passengers and divers particular letters from his friends, it was affured him his cruelty and covetoufness, for all his pains and industry, was much disliked, nor was he like to enjoy his house, and that land he had planted for himself, by the extreme oppression of the commonalty. This caused so many jealousies to arise in his conceit, that at last he fully resolved to return by this ship, that no fooner fet fail from England, than they proceeded to the nomination of a new governor. Many were prefented according to the affections of those that were to give in their voices, but it chiefly rested betwixt one Captain Southwell, and one Mr. Nathaniel Butler, where we will leave them awhile to the confideration of the court and company. Now Captain Tuckar having instituted Captain Kendall one of the fix governors (before spoken of) for his substitute, returned with this ship directly for England, as well to excuse himself of those objections he suspected, as to get assured him the house and land he had allotted for himself, lest it might otherwise be disposed of in his absence.

Collected out of their records by N. B. and the relations of Mr. Pollard, and divers others.

The Government of Captain Miles Kendall, Deputy for Captain Tuckar.

THE unexpected return of Captain Tuckar caused a demur in the election of the new governor; fome perfuading thefe oft changes were fo troublefome, dangerous, and chargeable, it were best to continue Captain Kendall; others again stood for Captain Tuckar; but during the time of these opinions, the Gillislower was dispatched with a fupply. Now I should have remembered, Tuckar was no sooner out of the harbour, but he met Mr. Elfred, in a ship called the Treasurer, sent from Virginia to trade: by her he writ to his deputy, Mr. Kendall, to have a care of all things, and beware of too much acquaintance with this ship, which he suspected was bound for the West Indies. Notwithstanding, Elfred received what kindness the isle could afford; he promifed to revifit them at his return; this done, because they would not be governless when his deputyship was expired, there was a general assembly, and by that election Kendall was confirmed to fucceed still governor. Now they began to apply themselves to the finishing some platform about Smith's fort, and laying the foundation of a church VOL. XIII.

to be built of cedar, till the Gillislower arrived with some private letters to Kendall, how he was elected governor of those isles for three years. During her stay, they held their assizes, where, for some sew suspected facts, three were condemned, and the better to terrify the rest, led to the place of execution, but reprieved; divers of the rest had

their faults pardoned, and the Gilliflower fet fail for Newfoundland.

The love and kindnefs, honefty and industry of this Captain Kendall hath been very much commended, by others fomewhat disliked; but an angel in those employments cannot please all men; yet this consideration bred much ill blood as well here as there, so that the company directly concluded, Captain Butler should, with what expedition they could, go to be their governor: in the interim, they took the opportunity of a ship, called the Seashower, bound for Virginia, and by her sent a preacher and his family, with divers passengers, and news of a new governor. This bred a great distaste amongst many, that still they should have new officers and strangers for their governors they never heard of, and themselves still kept there whether they would or no, without any preferment, no, nor scarce any of them there inhabiting, to have any land at all of their own, but live all as tenants, or as other men's poor servants.

About this time came in Captain Kerby with a finall bark, from the West Indies, who having refreshed himself, was very kindly used by the governor, and so departed. Not long after, a Dutch frigate was cast away upon the western shore; yet, by the help of the English, they saved the men, though the ship perished amongst the rocks. A little after, one Ensign Wood being about the loading of a piece, by thrusting a pike into the concavity, grating upon the shot, or somewhat about the powder, struck fire within her, and so discharged, but wounded him cruelly, and blew him into the sea, though he was got out by some that stood by him, yet he died of those wounds. Within two or three days after, Captain Elfred now comes in a second time; but of that we shall say more in the government of Captain Butler, who presently after arrived with a good supply, and was kindly entertained by Captain Kendall and all the

colony.

From a relation of Tho. SPARKES, and divers others.

The Government of Captain Nathaniel Butler.

CAPTAIN Butler being arrived the 20th of October 1619, some mutterings there was how to maintain their election of Captain Kendall, but better remembering themfelves, that conceit quickly diffolved. The next day, Kendall, the ministers, and the council went aboard to falute the new governor, where, after they had dined with the best entertainment he could give them, they saw the redoubt belonging to the King's caftle by a mischance on fire, whither he repaired with all the means he could to quench it; but all the platform and carriages were confumed before their faces, and they could not help it. Two days after he went up to the town, had his commission publicly read, made a fhort speech to the company, and so took upon him the government. Then prefently he began to repair the most necessary defects: the next month came in the Garland, fent from England fix or feven weeks before him; fo that being feventeen weeks in her voyage, it was fo tedious and grievous to divers of the freshwater paffengers, that fuch a fickness bred amongst them, many died, as well failors as paffengers. Having taken the best order he could for their release, passed through all the tribes, and held his first affize in Captain Tuckar's house at the overplus. Towards the last of this month of November, there arose a most terrible storm or hericano, that blew up many great trees by the roots: the Warwick, that brought the governor, was

cast away, but the Garland rid by her, faved herfelf by cutting down her masts; and not long after, a second storm, no less violent than the first, wherein the mount, which was a frame of wood built by Mr. More, for a watch-tower to look out to sea, was blown up by the roots, and all that winter crop of corn blasted; and thus was the

new governor welcomed.

With the beginning of the new year he began his first piece of fortification upon a rock which flanks the King's caftle, and finding the ship called the Treasurer stark rotten and unserviceable, he took nine pieces of ordnance from her to serve other uses. The Garland, for want of means, could not make her voyage to Virginia, as fhe was appointed; wherefore he entertained her to return to England, with all the tobacco they had in the ifle. It was January before the departed, in which time the failed not much to have been twice cast away; but those strange and unavoidable mischances rather feemed to quicken the governor's industry than to dull it. Having finished the church begun by Captain Kendall, with an infinite toil and labour he got three pieces out of the wreck Warwick; having an excellent Dutch carpenter, he entertained of them that were cast away in the Dutch frigate, he employed him in building of boats, whercof they were in exceeding great want. In February they discovered a tall ship beating to and again, as it feemed by her working, being ignorant of the coast: some thought her a Spaniard, to view their forts, which stand most to that part she so nearly approached; fome English, but the most some Dutch man of war; the wind blew so high, they durft not fend out a boat, though they much doubted fhe would be foul of their rocks, but at last she bore up rommy for the sea, and we heard of her no more. That evening, a lucky fellow it should seem he was, that found a piece of ambergris of eight ounces, as he had twice before, which bringing to the governor, he had ready money for the one half, after three pounds an ounce, according to their order of court, to encourage others to look out for more, and prevent that mischief ensueth by concealing of it.

Within a few days after, they descried two frigates, that came close to the shore, and fent a letter to the governor, writ in Italian, that they were Hollanders, had been in the West Indies, and defired but to arrive, refresh themselves with wood and water, and fo begone. The governor forthwith fent them to understand, that being there under His Majesty of England, to command those isles, he was to carry himself a friend to his friends, and an enemy to his enemies; if therefore he could flew a lawful commission for his being honeftly and nobly employed, he and his should be kindly welcome, otherwife they were to adventure at their perils. But his commission was fo good, he staid there two months, and was fo well fitted with oil and bacon, they were all glad and happy of this Dutch Captain Scoutan's arrival, with many thanks to their old friend Captain Powell, that had conducted him thither: the colony being exceedingly in great want and diffrefs, bought the most part of it at reasonable rates; so Captain Scoutan returned to the West Indies, and Captain Powell, for his part, in the Low Countries. Whilft thefe things were in action, the adventurers in England made many a long look for their ships; at last, the Garland brought them all the news, but the tobacco was fo fpoiled, either in the leaking ship, or the making up, it caused a great suspicion there could be none was good come from those isles; where, (were they but perfect in the cure) questionless it would be much better than a great quantity of that they fell for verinas, and many a thousand of it in London hath been bought and

fold by that title.

The governor being clear of those distractions, falls upon the restoring of the burnt redoubt, where he cuts out a large new platform, and mounts seven great pieces of

C C 2

ordnance

ordnance upon new carriages of cedar. Now amongst all these troubles, it was not the least to bring the two ministers to subscribe to the Book of Common Prayer, which all the bishops in England could not do. Finding it high time to attempt some conformity, bethought himself of the Liturgy of Guernsey and Jersey, wherein all those particulars they so much stumbled at, were omitted. No sooner was this propounded, but it was gladly embraced by them both, whereupon the governor translated it verbatim out of French into English, and caused the eldest minister upon Easter-day to begin the use thereof at St. George's Town, where himself, most of the council, officers, and auditory, received the facrament; the which form they continued during the time of

his government.

Much about this time, in such a fair morning that had invited many boats far out to the sea to fish, did rife such a hurricane that much endangered them all, so that one of them with two boys was driven to sea, and never more heard of. The ministers thus agreed, a proclamation was published for keeping of the sabbath, and all the defective carriages he endeavoured to have renewed, built a small boat of cedar only to go with oars, to be ready upon any occasion to discover any shipping, and tock order every fort should have the like; also caused numbers of cedars to be brought from divers places in floats, to rebuild the mount, which with an unspeakable toil was raised seven feet higher than before, and a falcon mounted at the foot, to be always discharged for a warning to all the forts, upon the discovery of any shipping, and this he called Rich Mount. This exceeding toil and labour, having no cattle, but only men's strength, caused many petitions to the governor, that all those general works might cease till they had reaped their harvests, in that they were in great distress for victuals, which he so well answered, their own shames did cause them to desist from that importunity, and voluntarily perform as much as he required.

Finding accidentally a little cross erected in a bye-place, amongst a many of bushes, understanding there was buried the heart and entrails of Sir George Summers, he refolved to have a better memory for so worthy a soldier than that: so finding also a great marble stone brought out of England, he caused it by masons to be wrought handsomely, and laid over the place, which he environed with a square wall of hewn stone, tomb like; wherein he caused to be graven this epitaph he had composed,

and fixed it upon the marble stone; and thus it was:

In the year one thousand fix hundred and cleven, Noble Sir George Summers went hence to heaven; Whose well tried worth that held him still employed, Gave him the knowledge of the world so wide. Hence 'twas by heaven's decree, that to this place He brought new guests, and name to mutual grace, At last his foul and body being to part, He here bequeath'd his entrails and his heart.

Upon the fixth of June began the fecond affize, that reduced them to the direct form used in England. For besides the governor and council, they have the bailists of the tribes, in nature of the deputy-lieutenants of the shires in England, for to them are all precepts and warrants directed, and accordingly answered and respected; they perform also the duties of justices of peace, within their limits. The subordinate officers to these in every tribe, are the constables, head-boroughs, and church-wardens; these are the triers of the tobacco, which if they allow not to be merchantable, is burnt; and these are the executioners of their civil and politic causes.

For

For points of war and martial affairs, they have the governor for lieutenant-general, the ferjeant-major, mafter of ordnance, captains of companies, captains of forts, with their feveral officers, to train and exercise those numbers under their charge, in martial

discipline.

Concerning their courts for decifion of right and justice, the first, though last in constitution, is their general assembly; allowed by the state in England, in the nature of a parliament, consisting of about forty persons; viz. the governor, the council, the bailists of the tribes, and two burgesses of each tribe chosen by voices in the tribe, besides such of the clergy as the governor thinks most sit, to be held once a year, as you shall hear more thereof hereafter. The next court is the affize or jails of delivery, held twice every year, in Christmas and Whitsun week, for all criminal offenders, and civil causes betwixt party and party; as actions of debt, trespass, battery, slander, and the like; and these are determined by a jury of twelve men, and above them is also a grand jury to examine matters of greater consequence. The last day of the assize might also well be held a court, for hearing the transgressions in matters of contempt, misbehaviour towards any magistrate, riots, seditious speakers, contempers of warrants, and such like: there are also as occasion shall require, many matters heard by the governor, or his officers, and oft justice done in several places, but those are but as days of hearing, and as preparatives against their courts, &c.

At this last affize eighteen were arraigned for criminal causes, a number very extraordinary considering the place; but now occasioned by reason of the hard year, and the store of ill-chosen new comers; of these, some were censured to the whippingpost, some burned in the hand, but two were condemned to die, yet the one was reprieved, the other hanged; this done, every man returned to his home: many trials they made again about the Warwick, but to small purpose, her ordnance being lashed so fast they could not be unloosed, till the ropes and decks were rotten, yet some few butts of beer being sloated they got, which, though it had lain six months under water, was very good, notwithstanding the next year they recovered sive pieces of ord-

nance.

Upon the first of August, according to the company's instructions from England, began the general assembly at the town of St. George, which was the first these isses ever had; consisting, as is said, of the governor, council, bailists, and burgesses, and a secretary to whom all bills were presented, and by him openly read in the house, also a clerk to record the acts, being thirty-two in all; sisteen of which being sent into England, were by a general consent received and enacted, the titles whereof are these following: as for all the reasons for them, they would be too tedious to recite.

The first was against the unjust sale and letting of apprentices and other servants, and this was especially for the righting the undertakers in England. The second, concerning the disposing of aged, diseased, and impotent persons, for it being considered how careless many are in preferring their friends, or sending sometimes any they can procure to go, such unserviceable people should be returned back at their charge that sent them, rather than be burdensome to the poor inhabitants in the isles. The third, the necessary manning the King's Castle, being the key of the isle, that a garrison of twelve able men should be there always resident; and three thousand ears of corn, and one thousand pounds of tobacco paid them by the generality yearly, as a pension. The fourth, against the making unmerchantable tobacco, and officers sworn to make true trials, and burn that was naught. The fifth, enjoined the erection of certain public bridges, and the maintenance of them. The fixth, for a continual supply of victuals

for all the forts, to be preferved till foine great occasion to use it. The seventh was, for two fixed days every year for the affizes. The eighth, commands the making of highways, and prohibiting the paffage 'over men's grounds and planted fields, as well to prevent the spoiling of gardens, as convenience to answer any alarm. The ninth, for the preferving young tortoiles and birds, that were carelefsly destroyed. The tenth, provided against vagabonds, and prohibited the entertainment of other men's fervants. The eleventh, compelled the fetting of a due quantity of corn for every family. The twelfth, the care corn being fet, enjoined the keeping up of their poultry till it was past their reaches. The thirteenth, for the preservation of sufficient fences, and against the felling of marked trees appointed for bounds. The fourteenth, granted to a levy for a thousand pound weight of tobacco, towards the payment of public works, as the bridges and the mount. The fifteenth, for the enjoining an acknowledgment and acception of all refident governors, and the warranting him to continue, though his time be expired, till the arrival of a legitimate fucceffor from England, to prevent all unmeet and prefumptuous elections, befides it was defired by petition in England, the new governors should live two months as a private man after his arrival, if his predeceffor did flay fo long, the better to learn and observe his course. And these are the contents of those fifteen acts, applied as you may perceive, which the laws of England could not take notice of, because every climate hath somewhat to itself in that kind in particular; for otherwise as it is conceived, it hath been a high impudence and prefumption to have meddled with them, or indeed with any fuch as thefe laws, that had with fuch great juffice and judgment always provided for.

No fooner was this bufinefs over, but the magazine ship is discovered, and that night came into the harbour, but in a very weak and fickly cafe, having cast overboard twenty or thirty of her people; and so violent was the infection, that the most part of the sailors, as well as paffengers, were fo fick, or difmayed, or both, that the mafter confessed, had they flaid at the fea but a week longer, they had all perifhed. There arrived with this ship divers gentlemen of good fashion, with their wives and families; but many of them crazy by the tediousness of the voyage: howsoever, most of them, by the excellent falubrity of the air, than which the world hath not a better, foon after recovered: yet fome there were that died prefently after they got ashore, it being certainly the quality of the place, either to kill, or cure quickly, as the bodies are more or lefs corrupted. By this ship the company fent a supply of ten persons for the generality, but of fuch bad condition that it feemed they had picked the males out of Newgate, the females from Bridewell: as the governor found it his best course, to grant out the women to fuch as were fo greedy of wives, and would needs have them for better for worle; and the men he placed in the King's Castle for foldiers. But this bad, weak, fickly fupply being differfed for their best relief, by the much employment of his boats in removing them, many of his own men became infected, fo that for some weeks they were not able to do him any fervice at all. Strict instructions also they brought for the planting of fugar canes, for which the ifland being rocky and dry, is fo improper, that few as yet have been feen to prosper; yet there are others hold the contraily opinion, that there is rain fo ordinarily, the ifles are fo moift, as produceth all their plants in fuch infinite abundance; there is no great reason to suspect this, were it rightly used, more than the rest. Seventy thousand weight of tobacco being prepared towards her freight, the returned for England. No fooner was the gone than came in another, fent by the company and generality, well conditioned, but the failed not much to have been calt away among it those dangerous and terrible rocks; by her came also

express command, they should entertain no other ships, than were directly sent from the company: this caused much grudging, and indeed a general distraction and exclamation among the inhabitants, to be thus constrained to buy what they wanted, and sell what they had at what price the magazine pleased, and to debar true men from coming to them for trade or relief, that were daily received in all the harbours in England. So long this ship staid going for freight and wages, the master not caring how long he lay at that rate in a good harbour, the governor was ready to fend her away by procla-

mation. Thus ended the first year of the government of C. Butler.

With the first of the second year were held the assizes, where all the bailiffs were fined for not giving a beginning to the building of the bridges; there was also an order to restrain the excessive wages all handicrastimen would have; and that the churchwardens should meet twice a year, to have all their presentments made perfect against the assizes. The assizes done, all the ablest men were trained in their arms, and then departed to their own homes. The town thus cleared, he made certain new carriages for some demi-culverines, and a large new store-house of cedar for the yearly magazine goods; finished Warwick's fort, begun by Mr. More, and made a new platform at Paget's Fort, also a fair house of lime and stone for the town-house. The three bridges appointed by the general assembly, was followed with such diligence, though they were more than a hundred, or a hundred and twenty feet in length, having the soundation and arches in the sea, were raised and accomplished, so that man or beast with facility might pass them.

At Whitfunday was held the fourth general affize at Saint George's, where were tried twenty feveral causes; sour or five were whipped or burnt in the hand, for breaking of houses: also an order was made, that the party cast in the trial of any cause should pay to every of the jurors sour-pence; moreover, that not past ten leaves at the most should grow upon a plant of tobacco, and that also in the making it up, a distinction should diligently be observed of two kinds. a better and a worse: then they built a strong stone house for the captain of the King's castle and corps du guard, and

repaired what defects they could find in the platforms and carriages.

Captain Powell, fo oft mentioned, having been in the West Indies for the States of Holland, came to an anchor within that of their ordnance, defiring admittance for wood and water, of which he had great need but the governor would not permit him, fo he weighed and departed; whereat the company were fo mad, it was not possible to constrain them to cease their exclamations against the company's inhibition, till they were weary with exclaiming: but still for their better defence, not thinking themselves sufficiently secure, having finished two new platforms more, arrived the magazine ship, but her master was dead, and many of the passengers, the rest for most part very fick; and withal, a strange and wonderful report of much complaint made against the governor to the company in England, by some of them returned in the last year's shipping; but it was eight days before the could get in, by reason of ill weather, being forced again to fea; fo that time they kept every night continually great fires, the might fee the ifle as well by night as day; but at last the arrived, and he plainly understood he had more cause a great deal to look for misconstruction of all his fervice, than an acknowledgment, much less a recompence, any better than his predecessors; but it is no new thing to requite the best defert with the vilest of ingratitude.

The very next day's night after the arrival of the magazine-ship, news was brought the governor by a dismayed messenger from Sands's tribe, that one hundred Spaniards were landed in that part, and divers ships discovered at sea; whereupon he presently

manne

manned the forts, and inftantly made thitherward in perfon with twenty men, determining as he found cause to draw together more strength by the way. Being got thither by the break of the next day, instead of an enemy, which he expected, he met only with a company of poor distressed Portuguese and Spaniards, who in their passage from Carthagena in the West Indies, in confort with the Spanish sleet of Plate, by the same storm that had endangered the magazine ship, lost theirs upon those terrible rocks, being to the number of seventy persons, were strangely preserved, and the manner was thus:

About fun-fet their ship beating amongst the rocks, some twenty of the sailors got into the boat with what treasure they could, leaving the captain, the master, and all the rest to the mercy of the sea. But a boy not past fourteen years of age, that leaped after to have got into the boat, missing that hope, it pleased God he got upon a chest adrift by him, whereon, they report, he continued two days, and was driven near to the clean contrary part of the ifle, where he was taken up near dead, yet well recovered. All this night the ship sticking fast, the poor distressed in her the next day fpying land, made a raft, and were those gave the alarm first ashore about three of the clock in the afternoon. The morning after, about feven of the clock, came in the boat to a place called Mangrove Bay, and the fame day their carpenter was driven afhore upon a plank near Hog Bay. There was a gentlewoman that had flood wet up to the middle upon the raft, from the ship to the shore, being big with child, and although this was upon the 13th of September, fhe took no hurt, and was fafely delivered of a boy within three days after. The best comfort that could be given them in those extremities they had, although some of the baser fort had been risling some of them before the governor's arrival; also the Spanish captain and the chief with him much complained of the treachery of his men to leave him in that manner, yet hid conxeved with them the most of the money they could come by, which he easily missed; whereupon he fuddenly caufed all them he accufed to be fearched, and recovered to the value of one hundred and forty pounds fterling, which he delivered into the captain's hands, to be employed in a general purfe towards their general charge. During their fray in the ifies, fome of the better fort, nine or ten weeks dieted at his own table, the rest were billetted amongst the inhabitants at four shillings the week, till they found fnipping for their passage, for which they paid no more than the English paid themselves; and for the passage of divers of them, the governor was glad to stand bound to the master; some others that were not able to procure such friendship, were fo conftrained to stay in the isles, till by their labours they had got so much as would transport them; and thus they were preferved, relieved, and delivered.

In the month enfuing arrived the fecond ship, and she also had lost her master and divers of her passengers; in her came two Virginian women, to be married to some who would have them, that after they were converted and had children, they might be fent to their country and kindred to civilize them. Towards the end of this month came in the third ship, with a small magazine; having fold what she could, carried the rest to Virginia, and never did any of those passengers complain either of their good diet, or too good usage at sea; but the clean contrary still occasioned many of those extremities. The 5th of November the damnable plot of the powder treason was solemnized with prayers, fermons, and a great feast, whereto the governor invited the chief of the Spaniards, where drinking the King's health, it was honoured with a quick volley of small shot, which was answered from the fort with the great ordnance, and then again concluded with a second volley of small shot; neither was the asternoon without music

and dancing, and at night many huge bonfires of fweet wood.

The Spaniards to express their thankfulness at their departure, made a deed of gift to the governor of whatfoever he could recover of the wrecked ship; but the ships as they went out came fo dangerously upon a rock, that the poor Spaniards were fo difmayed, fwearing this place was ominous unto them, especially the women, that defired rather to go afhore and die howfoever than adventure any further in fuch a labyrinth of dangers, but at last she got clear without danger, and well to England; the other went to Virginia, wherein the governor fent two great chefts filled with all fuch kinds and forts of fruits and plants as their islands had, as figs, pomegranates, oranges, lemons, fugar-canes, plantains, potatoes, papaws, cassado roots, red pepper, the prickle-pear, and the like. The ships thus dispatched, he goeth into the main, and fo out to fca to the Spanish wreck. He had been there before prefently after her ruin, for never had ship a more sudden death, being now split in pieces, all under water. He found fmall hope to recover any thing, fave a cable and an anchor, and two good facres; but the wind was fo high, he was forced to return, being ten miles from the fhore, only with three murderers, which were known to be the fame Captain Kendall had fold to Captain Kerby, whose ship was taken by two men of war of Carthagena, the most of his men flain or hanged, and he being wounded, died in the woods. Now their pilot being at this fervice, got thus those three murderers to their ship, and their ship thus to the Bermudas, as the Spaniards remaining related to the

governor and others.

Having raifed three fmall bulwarks at Southampton's Fort, with two curtains and two ravelines, which indeed is only the true absolute piece of fortification in the ifles; Christmas being come, and the prefixed day of the affize, divers were whipped and burnt in the hand, only three young boys for flealing were condemned, and at the very point of hanging, reprieved. The governor then fent his lieutenant all over the main to distribute arms to those were found most fit to use them, and to give order for their rendezvous, which were hanged up in the church. About this time it chanced a pretty fecret to be discovered to preserve their corn from the fly or weavel, which did in a manner as much hurt as the rats. For the year before having made a proclamation that all corn fhould be gathered by a certain day, because many lazy persons ran fo after the ships, to get beer and aqua-vitæ, for which they will give any thing they have, much had been loft for want of gathering. This year having a very fair crop, fome of the inhabitants, none of the best husbands, hastily gathered it, for fear of the penalty, threw it in great heaps into their houses unhusked, and so let it lie four or sive months, which was thought would have spoiled it; where the good husbands husked it, and with much labour hung it up, where the flies did fo blow on it, they increased to fo many weavels, they generally complained of great loss: but those good fellows that never cared but from hand to mouth, made their boasts, that not a grain of theirs had been touched nor hurt, there being no better way to preferve it than by letting it lie in its hufk, and spare an infinite labour formerly had been used. There were also very luckily about this time found out divers places of fresh water, of which many of the forts were very destitute, and the churchwardens and fidesmen were very busy in correcting the prophaners of the fabbath, drunkards, gamefters, and fuch like. There came also from Virginia a small bark, with many thanks for the presents sent them; much aqua-vitæ, oil, fack, and bricks, they brought in exchange of more fruits and plants, ducks, turkies, and limestone, of which she had plenty, and so returned. During the abode of the flay of this ship, the marriage of one of the Virginia maids was confummated with a husband fit for her, attended with more than one hundred guests, and all the dainties for their dinner could be provided; they made VOL. XIII.

also another trial to fish for whales, but it took no more effect than the former: this was done by the master of the Virginia ship that professed much skill that way, but having freighted his ship with limessone, with twenty thousand weight of potatoes, and

fuch things as he defired, returned for Virginia.

April and May were front in building a ftrong new prifon, and perfecting fome of the fortifications, and by the labour of twenty men, in fourteen days was got from the-Spanish wreck four excellent good facres, and mounted them at the forts. Then began the general affize, where not fewer than fifty civil, or rather, uncivil actions were handled, and twenty criminal prisoners brought to the bar; fuch a multitude of fuch vile people were fent to this plantation, that he thought himself happy his time was fo near expired: three of the foulest acts were these; the first for the rape of a married woman, which was acquitted by a fenfeless jury; the fecond and the third for unnatural crimes, the one with a fow, the other with a boy, for which they were hanged; during the time of the imprisonment of this fecond criminal, a dunghill cock belonging to the same man, did continually haunt a pig of his alfo, and to the wonder of all them that faw it, who were many, did fo frequently tread the pig, as if it had been one of his hens, that the pig languished and died within a while after, and then the cock reforted to the very fame fow (that this fellow was accufed for) in the very fame manner; and as an addition to all this, about the fame time two chickens were hatched, the one whereof had two heads, the other crowed very loud and luftily within twelve hours after it was out of the shell. A desperate fellow being to be arraigned for stealing a turkey, rather than he would endure his trial, fecretly conveyed himfelf to fea in a little boat, and never fince was heard of, nor is he ever like to be, without an exceeding wonder, little left than a miracle. In June they made another trial about the Spanish wreck, and recovered another facre and a murderer; also he caused to be hewed out of the main rock, a pair of large stairs, for the convenient landing of goods and passengers, a work much to the beauty and benefit of the town. With twenty chosen men, and two excellent divers, the governor went himself to the wreck Warwick, but they could recover but one murderer; from thence he went to the Sea-adventure, the wreck of Sir George Summers; the hull, though two or three fathoms in the water, they found unperished, and with much ado weighed a facre, her sheet-anchor, divers bars of iron and pigs of lead, which flood the plantation in very great flead. Towards the end of July, he went to feek for a wreck, they reported, lay under water, with her hatches fpiked up, but they could not find her, but from the Spanish wreck lay there by, they weighed three fair facres more, and fo returned through the tribes to Saint George's: fome were also employed to feek out beds of oysters for pearl, some they found, some feed-pearl they got, but out of one little shell, above all the rest, they got about one hundred and twenty finall pearl, but fomewhat defective in their colour.

The time of Captain Butler's government drawing near an end, the colony prefented unto him divers grievances, to intreat him to remember to the lords and company in England at his return: also they appointed two to be joined with him, with letters of credence to solicit in their behalf those grievances following: first, they were defrauded of the food of their fouls; for being not fewer than one thousand and five hundred people, dispersed in length twenty miles, they had at that present but one minister, nor never had but two, and they so shortened of their promises, that but only for mere pity they would have forsaken them. Secondly, neglected in the safety of their lives, by wants of all forts of ammunition. Thirdly, they had been censured, contrary to His Majesty's laws, and not allowed them the benefit of their book, as they are in England, but by Captain Butler. Fourthly, they were frustrated of many of their cove-

nants, and most extremely pinched and undone by the extortion of the magazine, for although their tobacco was stinted but at two shillings and sixpence the pound, yet they pitched their commodities at what rate they pleased. Fifthly, their fatherless children are left in little better condition than slaves; for if their parents die in debt, their children are made as bondmen till the debt be discharged. These things being perfected, there grew a great question of one Heriot, for plotting of factions and abusing the governor, for which he was condemned to lose his ears, yet he was used so favour-

ably, he loft but the part of one in all.

By this time it being grown past the wonted season of the coming in of ships from England, after a general longing and expectation, especially of the governor, whose commission being near upon expiration, gave him cause to wish for a mean of deliverance from fo troublefome and thankless an employment as he had hitherto found it; a fail is discovered, and long it was not before the arrived in the King's Castle-Harbour; this bark was fet out by two or three private men of the company, and having landed her fupplies, was to go for Virginia; by her the governor received certain advertifements of the carriage and behaviour of the Spaniards, which he had relieved, as you have heard, the year before; that quite contrary both to his merit, their vow, and his own expectation, they made clamours against him, the which being seconded by the Spanish ambassador, caused the state to fall in examination about it; whereupon, having fully cleared their ingratitude and impudence, and being affured of the choice of a fucceffor that was to be expected within five or fix weeks, he was defirous to take the opportunity of this bark, and to visit the colony in Virginia in his return for England: leaving the government to Captain Felgat, Captain Stokes, Mr. Lewis Hewes, Mr. Nedom and Mr. Ginner, but now his time being fully expired, and the fortifications finished, viz. the King's Castle, wherein were mounted upon sufficient platforms fixteen pieces of ordnance; in Charles Fort two; in Southampton Fort five; betwixt which and the castle passeth the channel into the harbour, secured by three and twenty pieces of good artillery to play upon it. In Cowper's Isle is Pembrock's Fort, where is two pieces. The channel of Saint George is guarded by Smith's Fort, and Pagit's Fort, in which are eleven pieces of ordnance. Saint George's Town is half a league within the harbour, commanded by Warwick's Fort, where there are three great pieces, and on the wharf before the governor's house eight more, besides the warning piece by the mount, and three in Saint Katharines; fo that in all there are ten fortreffes, and two-and-fifty pieces of ordnance, fufficient and ferviceable: their forms and fituations you may fee more plainly defcribed in the map; and to defend those, he left one thousand five hundred persons, with near a hundred boats, and the isle replenished with store of such fruits, provisious, and poultry, as is formerly related; well, yet for fo departing and other occasions, much difference hath been betwixt him fome of the company, as any of his predeceffors, which I rather wish were reconciled, than to be a reporter of fuch unprofitable diffentions.

For

Till treachery and faction, and avarice be gone,
Till envy and ambition, and backbiting be none,
Till perjury and idleness, and injury be out,
And truly till that villainy the worst of all that rout;
Unless those vices banish'd be, whatever forts you have,
A hundred walls together put will not have power to save.

Mr. John Barnard fent to be Governor.

TO fupply this place was fent by the noble adventurers John Barnard, a gentleman both of good means and quality, who arrived within eight days after Butler's departure, with two fhips, and about one hundred and forty paffengers, with arms and all forts of ammunition, and other provisions fufficient; during the time of his life, which was but fix weeks, in reforming all things he found defective, he shewed himfelf fo judicial and industrious as gave great fatisfaction, and did generally promise vice was in great danger to be suppressed, and virtue and the plantation much advanced; but so it happened that both he and his wife died in such short time, they were both buried in one day and one grave, and Mr. John Harrison chosen governor till further order came from England.

What happened in the Government of Mr. John Harrison.

THEY are still much troubled with a great short worm that devours their plants in the night, but all the day they lie hid in the ground, and though early in the morning they kill so many they would think there were no more, yet the next morning you shall find as many. The caterpillars to their fruits are also as pernicious; and the land-crabs in some places are as thick in their burrows as conies in a warren, and do much hurt: besides all this, there happened this year a very heavy disaster, for a ship wherein there had been much swearing and blaspheming used all the voyage, and landed what she had to leave in those isles, jovially frolicking in their cups and tobacco, by accident fired the powder, that at the very instant blew up the great cabin, and some one way and some another, it is a wonder to think how they could be so blown out of the gun-room into the sea, where some were taken up living so pitifully burned, their lives were worse than so many deaths; some died, and some lived, but eighteen were lost at this statal blast, the ship also immediately sunk with threescore barrels of meal sent for Virginia, and all the other provision in her was thus lost.

Now how to confider how the Spaniards, French, and Dutch, have been loft and preserved in those invincible isles, yet never regarded them but as monuments of miferies, though at this prefent they all defire them. How Sir Thomas Gates and Sir George Summers being ready to fink in the fea were faved, what an incredible abundance of victuals they found; how it was first planted by the English; the strange increase of rats, and their fudden departure; the five men came from England in a boat; the escape of Hilliard, and the rest of those accidents there happened, a man would think it a tabernacle of miracles, and the world's wonder, that from fuch a paradife of admiration who would think should spring such wonders of afflictions, as are only fit to be facrificed upon the highest altars of forrow, thus to be set upon the highest pinnacles of content, and prefently thrown down to the lowest degree of extremity, as you fee have been the yearly fucceedings of those plantations, the which to overcome, as it is an incomparable honour, fo it can be no dishonour if a man do miscarry by unfortunate accidents in fuch honourable actions, the which renown and virtue to attain hath caused so many attempts by divers nations besides ours even to pass through the very amazement of adventures. Upon the relation of this news the -company hath fent one Captain Woodhouse, a gentleman of good repute and great experience in the wars, and no lefs provident than industrious and valiant, then

returned

returned report all goeth well there. It is too true in the absence of the noble treafurer, Sir Edward Sackvill, now Earl of Dorset, there have been such complaints betwixt the planters and the company, that by command the Lords appointed Sir Thomas Smith again treasurer, that since then according to their order of Court, he is also elected, where now we must leave them all to their good fortune and success, till we hear further of their fortunate proceedings.

THE

GENERAL HISTORY OF NEW ENGLAND.

TONCERNING this hiftory you are to understand the letters patents granted by His Majesty in 1606, for the limitation of Virginia, did extend from thirty-four to forty-four, which was divided in two parts, namely, the first colony and the second: the first was to the honourable city of London, and such as would adventure with them to discover and take their choice where they would, betwixt the degrees of 34 and 41. The fecond was appropriated to the cities of Briftol, Exeter, and Plymouth, &c., and the west parts of England, and all those that would adventure and join with them, and they might make their choice any where betwixt the degrees of 38 and 44, provided there should be at least one hundred miles distance betwixt these two colonies, each of which had laws, privileges, and authority for the government and advancing their feveral plantations alike. Now this part of America hath formerly been called Norumbega, Virginia, Nufkoncus, Penaquida, Canada, and fuch other names as those that ranged the coast pleased. But because it was so mountainous, rocky, and full of ifles, few have adventured much to trouble it, but as is formerly related; notwithftanding, that honourable patron of virtue, Sir John Popham, Lord Chief Justice of England, in the year 1606, procured means and men to possess it, and fent Captain George Popham for prefident, Captain Rawley Gilbert for admiral, Captain Edward Harlow, master of the ordnance, Captain Robert Davis, serjeant-major, Captain Elis Best, marshal, Mr. Seaman, secretary, Captain James Davis to be captain of the fort, Mr. Gome Carew, chief fearcher: all those were of the council, who with some hundreds more were to flay in the country: they fet fail from Plymouth the last of May, and fell with Monahigen the 11th of August. At Sagadahock, nine or ten leagues fouthward, they planted themselves at the mouth of a fair navigable river, but the coast all thereabouts most extreme stony and rocky: that extreme frozen winter was fo cold they could not range nor fearch the country, and their provision fo small, they were glad to fend all but forty-five of their company back again: their noble prefident, Captain Popham, died, and not long after arrived two ships well provided of all neceffaries to fupply them, and fome finall time after another, by whom understanding of the death of the Lord Chief Juftice, and also of Sir John Gilbert, whose lands there the prefident Rawley Gilbert was to poffefs according to the adventurers' directions, finding nothing but extreme extremities, they all returned for England in the year 1608; and thus this plantation was begun and ended in one year, and the country esteemed as a cold, barren, mountainous, rocky defart.

Notwithstanding, the Right Honourable Henry, Earl of Southampton, and those of the Isle of Wight, employed Captain Edward Harlow to discover an isle supposed about Cape Cod; but they found their plots had much abused them, for falling with 8 Monahigan,

Monahigan, they found only Cape Cod no ifle but the main, there they detained three favages aboard them, called Pechmo, Monopet, and Pekeninne, but Pechmo leaped overboard and got away, and not long after with his conforts cut their boat from their flern, got her on fhore, and so filled her with fand, and guarded her with bows and arrows, the English lost her: not far from thence they had three men forely woundedwith arrows. Anchoring at the Isle of Nohono, the favages in their canoes affaulted the ship till the English guns made them retire, yet here they took Sakaweston, that after he had lived many years in England went a foldier to the wars of Bohemia. At Capawe they took Coneconam and Epenow, but the people at Agawom used them kindly, so with five savages they returned for England, yet Sir Francis Popham sent divers times one Captain Williams to Monahigan only to trade and make core sish, but for any plantations there was no more speeches. For all this, as I liked Virginia well, though not their proceedings, so I desired also to see this country, and spends some time in trying what I could find for all those ill rumours and disasters.

From the relations of Captain EDWARD HARLOW and divers others.

In the month of April 1614, at the charge of Captain Marmaduke Roydon, Captain George Langam, Mr. John Buley and Mr. William Skelton, with two ships from. London, I chanced to arrive at Monahigan an ifle of America, in 434 of northerly latitude: our plot was there to take whales, for which we had one Samuel Cramton and divers others expert in that faculty, and also to make trials of a mine of gold and copper; if those failed, fish and furs were then our refuge to make ourselves savers howfoever: we found this whale-fifthing a coftly conclusion, we faw many and spent much time in chafing them, but could not kill any, they being a kind of imbartes, and not the whale that yields fins and oil, as we expected; for our gold it was rather the master's device to get a voyage that projected it, than any knowledge he had at all of any fuch matter; fifth and furs were now our guard, and by our late arrival and long lingering about the whale, the prime of both those feafons were past ere we perceived it, we thinking that their feafons ferved at all times, but we found it otherwife, for by the midft of June the fishing failed, yet in July and August some were taken,. but not fufficient to defray fo great a charge as our flay required: of dry fish we made about forty thousand, of cor-fish about seven thousand. Whilst the failors fished, myself with eight others of them might best be spared, ranging the coast in a fmall boat, we got for trifles near eleven thousand beaver-skins, one hundred martins, as many otters, and the most of them within the distance of twenty leagues: we ranged the coast both east and west much further, but eastward our commodities were not esteemed, they were so near the French who afforded them better, with whom the favages had fuch commerce that only by trade they made exceeding great voyages, though they were without the limits of our precincts: during the time we tried those conclusions, not knowing the coast, nor favages' habitations: with these furs, the train oil and cor-fish, I returned for England in the bark, where within fix months after our departure from the Downs, we fafely arrived back; the best of this fish was fold for five pounds the hundred, the rest by ill usage betwixt three pounds and sifty shillings. The other ship staid to fit herself for Spain with the dry such which was fold at Maligo at forty rials the quintal, each hundred weighing two quintals and a half. But one Thomas Hunt the mafter of this ship, (when I was gone) thinking to prevens

prevent that intent I had to make there a plantation, thereby to keep this abounding country still in obscurity, that only he and some few merchants more might enjoy wholly the benefit of the trade and profit of this country, betrayed four-and-twenty of those poor favages aboard his ship, and most dishonestly and inhumanly for their kind ufage of me and all our men, carried them with him to Maligo, and there for a little private gain fold those filly favages for rials of eight; but this wild act kept him ever after from any more employment to those parts. Now because at this time I had taken a draught of the coaft, and called it New England, yet so long he and his conforts drowned that name with the echo of Cannaday, and fome other ships from other parts also, that upon this good return the next year went thither, that at last I presented this discourse with the map, to our Most Gracious Prince Charles, humbly entreating His Highness he would please to change their barbarous names for such English as posterity might say Prince Charles was their godfather, which for your better understanding both of this discourse and the map, peruse this schedule, which will plainly flew you the correspondency of the old names to the new, as His Highness named them.

Th	ne old 1	Vames.				The new Names.
Cape Cod .	-	-		-	-	Cape James.
The Harbour a	t Cap	e Cod		-	-	Milforth Haven.
Chawum .	•	-	-	-	-	Berwick.
Accomack		-	-	-	•	Plymouth.
Sagoquas -	• ,		-	-	-	Oxford.
Massachuset's N	Tount		-	-	-	Chevit Hills.
Maffachufet's R	River		-	-	-	Charles River.
Totan -	-	-	-	-	-	Falmouth.
A great Bay by	Cap	e Ann	e	-	**	Briftol.
Cape Tragabigi					-	Cape Anne.
Naembeck	-	-		-	-	Barnstaple.
Aggawom	prin	-	-	-	-	Southampton.
Smith's Isles	-	-	-	-	-	Smith's Ifles.
Paffataquack	-	-	-	-	-	Hull.
Accominticus		-	-	un.	-	Boston.
Saffanow's Mou	ınt		-	-	-	Snowdon Hill.
Sowocatuck	10	-	-	-	**	Ipfwich.
Bahanna	-	-	-	-	-	Dartmouth.
A good harbou	ır wit	hin th	at Ba	y	-	Sandwich.
Ancocifcos Mo	ount	-	-	-	pa	Shuter's Hill.
Ancocifco	-	-	-	-	-	The Base.
Anmoughcawg	en	-	10	-	***	Cambridge.
Kenebecka	-	-	-	-	-	Edinburgh.
Sagadahock.	-	-	-	-	-	Leith.
Pemmyquid	-	-	-		-	Saint John's Town.
Segocket	-	~		-	-	Norwich.
Mecadacut	-	-	-	-	-	Dunbarton.
Pennoblcot	-		-	ph .	-	Aberdeen.
Nusket -	100	-	-	-		Low Mounds.

Those being omitted, I named myself:

	The	old Nai	mes.			The new Names.
Monahigan	-	-	-	-	**	Bartie's Ifles.
Matinack	-	-	-	-	-	Willoughby's Isles.
Metinacus	-	-	-	-	-	Haughton's Isles.

The rest of the names in the map, are places that had no names we did know.

But to continue the history succeedingly as near with the day and year as may be. Returning in the bark, as is faid, it was my ill chance to put in at Plymouth, where imparting those my purposes to divers I thought my friends, whom as I supposed were interested in the dead patent of this unregarded country, I was so encouraged and affured to have the managing their authority in those parts during my life, and fuch large promifes, that I engaged myfelf to undertake it for them. Arriving at London, though fome malicious perfons fuggefted there was no fuch matter to be had in that fo bad abandoned country, for if there had, others could have found it fo well as I; therefore it was to be suspected I had robbed the Frenchmen in New France or Canada, and the merchants fet me forth feemed not to regard it; yet I found fo many promifed me fuch affiftance, that I entertained Michael Couper the mafter of the bark, that returned with me and others of the company; how he dealt with others, or others with him, I know not; but my public proceeding gave fuch encouragement, that it became fo well apprehended by some few of the Virginia Company, as those projects for fishing only was fo well liked, they furnished Couper with four good ships to sea, before they at Plymouth had made any provision at all for me; but only a small bark fet out by them of the lile of Wight. Some of Plymouth, and divers gentlemen of the west country, a little before I returned from New England, in fearch for a mine of gold about an isle called Capawuck, fouthwards from the shoals of Cape James, as they were informed by a favage cailed Epenew; that having deluded them, as it feems, thus to get home, feeing they kept him as a prisoner in his own country, and before his friends, being a man of fo great a stature, he was shewed up and down London for money as a wonder, and it feems of no lefs courage and authority, than of wit, firength, and proportion; for fo well he had contrived his bufinefs, as many reported he intended to have furprized the ship; but seeing it could not be effected to his liking, before them all he leaped overboard. Many shot they made at him, thinking they had slain him, but so resolute they were to recover his body, the master of the ship was wounded, and many of his company; and thus they loft him, and not knowing more what to do, returned again to England with nothing, which fo had difcouraged all your west-country men, they neither regarded much their promifes, and as little either me or the country, till they faw the London ships gone and me in Plymouth according to my promise, as hereafter shall be related.

I must confess I was beholden to the setters forth of the four ships that went with Couper, in that they offered me that employment if I would accept it; and I find still my refufal incurred fome of their displeasures, whose love and favour I exceedingly defired; and though they do cenfure me opposite to their proceedings, they shall yet shill in all my words and deeds find, it is their error, not my fault that occasions their diflike; for having engaged myfelf in this bufinefs to the west country, I had been very dishonest to have broke my promise, nor will I spend more time in discovery or fishing, till I may go with a company for a plantation; for I know my grounds, yet every one to whom I tell them, or that reads this book, cannot put it in practice, though it EE

may help any that hath feen or not feen to know much of those parts; and though they endeavour to work me out of my own defigns, I will not much envy their fortunes; but I would be forry their intruding ignorance should by their defailments, bring those certainties to doubtfulness. So that the business prosper I have my defire, be it by whomsoever that are true subjects to our King and country: the good of my country is that I seek, and there is more than enough for all, if they could be contented.

New England is that part of America in the ocean fea, opposite to Nova Albion in the south fea, discovered by the most memorable Sir Francis Drake in his voyage about the world, in regard whereof this is styled New England, being in the same latitude New France of it is northward, southward is Virginia, and all the adjoining continent with New Granada, New Spain, New Andalusia, and the West Indies. Now because I have been so oft asked such strange questions of the goodness and greatness of those spaniards, and many such like demands; I entreat your pardon if I chance to be too plain or tedious in relating my knowledge for plain men's satisfaction.

Florida is the next adjoining to the Indies, which unprofperously was attempted to be planted by the French, a country far bigger than England, Scotland, France and Ireland, yet little known to any Christian, but by the wonderful endeavours of Ferdinando de Soto, a valiant Spaniard, whose writings in this age is the best guide known to search

those parts.

Virginia is no ifle, as many do imagine, but part of the continent adjoining to Florida, whose bounds may be stretched to the magnitude thereof, without offence to any Christian inhabitant, for from the degrees of thirty to forty-eight, His Majesty hath now enlarged his letters patent. The coast extending fouth-west and north-east about fixteen or feventeen hundred miles, but to follow it aboard, the shore may well be three thoufand miles at the least; of which twenty miles is the most gives entrance into the Bay of Chesapeak, where is the London plantation, within which is a country, as you may perceive by the map, of that little I discovered, may well suffice three hundred thoufand people to inhabit; but of it, and the discoveries of Sir Ralph Laine and Mr. Heriot, Captain Gofnold, and Captain Waymouth, they have writ fo largely, that posterity may be bettered by the fruits of their labour. But for divers others that have ranged those parts fince, especially this country now called New England, within a kenning fometimes of the fhore; fome touching in one place, fome in another; I must entreat them pardon me for omitting them, or if I offend in faying, that their true descriptions were concealed, or never were well observed, or died with the authors, fo that the coast is yet still but even as a coast unknown and undiscovered. I have had fix or feven feveral plots of those northern parts, fo unlike each to other, or refemblance of the country, as they did me no more good than fo much wafte paper, though they cost me more; it may be it was not my chance to fee the best; but lest others may be deceived as I was, or through dangerous ignorance hazard themselves as I did, I have drawn a map from point to point, ifle to ifle, and harbour to harbour, with the foundings, fands, rocks, and land-marks, as I paffed close aboard the shore in a little boat; although there be many things to be observed, which the hafte of other affairs did cause me to omit: for being fent more to get present commodities, than knowledge of any discoveries for any future good, I had not power to fearch as I would; yet it will ferve to direct any shall go that way to fafe harbours and the favages habitations; what merchandize and commodities for their labours they may find, this following difcourfe finall plainly demonstrate.

Thus

Thus you may fee of these three thousand miles more than half is yet unknown to any purpose, no not so much as the borders of the sea are yet certainly discovered: as for the goodness and true substance of the land, we are for most part yet altogether ignorant of them, unless it be those parts about the Bay of Chesapeak and Sagadanock, but only here and there where we have touched or feen a little, the edges of those large dominions which do stretch themselves into the main, God doth know how many thoufand miles, whereof we can yet no more judge, than a stranger that faileth betwixt England and France, can describe the harbours and dangers by landing here or there in some river or bay, tell thereby the goodness and substance of Spain, Italy, Germany, Bohemia, Hungary, and the rest; nay, there are many have lived forty years in London, and yet have fearce been ten miles out of the city: fo are there many have been in Virginia many years, and in New England many times, that do know little more than the place they do inhabit, or the port where they fished; and when they come home, they will undertake they know all Virginia and New England, as if they were but two parishes or little islands. By this you may perceive how much they err, that think every one that hath been in Virginia or New England, understandeth or knoweth what either of them are; or that the Spaniards know one half quarter of those large territories they posses; no, not so much as the true circumference of Terra Incognita, whose large dominions may equalize the goodness and greatness of America for any thing yet known. It is strange with what small power he doth range in the East Indies, and few will understand the truth of his strength in America; where having so much to keep with fuch a pampered force, they need not greatly fear his fury in Sommer Isles, Virginia, or New England, beyond whose bounds America doth stretch many thousand miles. Into the frozen parts whereof, one Mr. Hutson an English mariner, did make the greatest discovery of any Christian I know, where he unfortunately was left by his cowardly company, for his exceeding deferts, to end and die a most miferable death.

For Africa, had not the industrious Portuguese ranged her unknown parts, who would have fought for wealth amongst those fried regions of black brutish negroes, where notwithstanding all their wealth and admirable adventures and endeavours more than one hundred and forty years, they know not one-third part of those black habitations. But it is not a work for every one to manage fuch an affair, as make a difcovery and plant a colony; it requires all the best parts of art, judgment, courage, honefty, constancy, diligence, and industry, to do but near well; some are more proper for one thing than another, and therein best to be employed; and nothing breeds more confusion than misplacing and misemploying men in their undertakings. Columbus, Cortes, Pizarro, Zoto, Magilanus, and the rest served more than an apprenticeship to learn how to begin their most memorable attempts in the West Indies, which, to the wonder of all ages, fuccefsfully they effected, when many hundreds of others, far above them in the world's opinion, being instructed but by relation, came to shame and confusion in actions of small moment, who doubtless in other matters were both wife, difcreet, generous and courageous. I fay not this to detract any thing from their incomparable merits, but to answer those questionless questions, that keep us back from imitating the worthings of their brave spirits, that advanced themselves from poor foldiers to great captains, their posterity to great lords, their King to be one of the greatest potentates on earth, and the fruits of their labours his greatest power. glory, and renown.

The Description of New England.

THAT part we call New England is betwixt the degrees of forty-one and fortyfive, the very mean betwixt the north pole and the line; but that part this difcourfe speaketh of, stretcheth but from Penobscot to Cape Cod, some seventy sive leagues by a right line diftant each from other; within which bounds I have feen at least forty feveral habitations upon the fea coast, and sounded about five-and twenty excellent good harbours, in many whereof there is anchorage for five hundred fail of fhips of any burden; in fome of them for one thousand, and more than two hundred isles overgrown with good timber of divers forts of wood, which do make so many harbours,

as required a longer time than I had to be well observed.

The principal habitation northward we were at, was Penoblcot: fouthward along the coast and up the rivers, we found Mecadacut, Segocket, Pemaquid, Nuscoucus, Sagadahock, Aumoughcowgen, and Kenebeke; and to those countries belong the people of Segotago, Paghhuntanuck, Pocopassum, Taughtanakagnet, Warbigganus, Naffaque, Mafherofqueck, Wawrigweck, Mofhoquen, Wakccgo, Pafharanack, &c. To these are allied in confederacy, the countries of Ancocisco, Accomynticus, Passataquack, Aggawom, and Naemkeck: all thefe for any thing I could perceive, differ little in language, fashion, or government, though most of them be lords of themfelves, yet they hold the Bashabes of Penobscot the chief and greatest amongst them.

The next I can remember by name, are Mattahunts, two pleafant ifles of groves, gardens, and corn fields a league in the fea from the main. Then Totant, Maffachufet, Topent, Secassaw, Totheet, Nasnocomacack, Accomack, Chawum, Patuxet, Maffafoyts, Pakanokick; then Cape Cod, by which is Pawmet and the ifle Nawfet, of the language and alliance of them of Chawum; the others are called Maffachufets, and differ fomewhat in language, custom, and condition: for their trade and merchandize, to each of their principal families or habitations, they have divers towns and people belonging, and by their relations and descriptions, more than twenty several habitations and rivers that stretch themselves far into the country, even to the borders of divers great lakes, where they kill and take most of their otters from Penobscot to Sagadahoc. This coast is mountainous, and isles of huge rocks, but overgrown for most part with most forts of excellent good woods, for building houses, boats, barks or ships, with an incredible abundance of most forts of fish, much fowl, and fundry

forts of good fruits for man's ufe.

Betwixt Sagadahock and Sowocatuck, there is but two or three fandy bays, but betwixt that and Cape James very many; especially the coast of the Massachusets is so indifferently mixed with high clay or fandy clifts in one place, and the tracts of large long ledges of divers forts, and quarries of stones in other places, fo strangely divided with tinctured veins of divers colours; as free-stone for building, slate for tiling, fmooth ftone to make furnaces and forges for glafs and iron, and iron ore fufficient conveniently to melt in them; but the most part so resembleth the coast of Devonfhire, I think most of the clifts would make such lime-stone; if they be not of these qualities, they are so like they may deceive a better judgment than mine: all which are fo near adjoining to those other advantages I observed in these parts, that if the ore prove as good iron and fleel in those parts as I know it is within the bounds of the country, I dare engage my head (having but men skilful to work the simples there growing) to have all things belonging to the building and rigging of ships of any proportion and good

good merchandize for their freight, within a square of ten or sourteen leagues, and it

were no hard matter to prove it within a lefs limitation.

And furely by reason of those fandy clifts and clifts of rocks, both which we saw so planted with gardens and corn fields, and so well inhabited with a goodly, strong, and well-proportioned people, besides the greatness of the timber growing on them, the greatness of the fish, and the moderate temper of the air (for of five-and-forty not a man was sick but two, that were many years diseased before they went, notwithstanding our bad lodging and accidental diet), who can but approve this a most excellent place, both for health and fertility: and of all the four parts of the world I have yet feen not inhabited, could I have but means to transport a colony, I would rather live here than any where; and if it did not maintain itself, were we but once indifferently well fitted, let us starve.

The main staple from hence to be extracted for the present, to produce the rest, is fifh, which howbeit may feem a mean and a base commodity, yet who will but truly take the pains and confider the fequel, I think will allow it well worth the labour. It is ftrange to fee, what great adventures the hopes of fetting forth men of war to rob the industrious innocent would procure, or fuch massly promises in gross, though more are choaked than well fed by fuch hafty hopes. But who doth not know that the poor Hollanders, chiefly by fishing at a great charge and labour in all weathers in the open sea, are made a people so hardy and industrious, and by the venting this poor commodity to the Eafterlings for as mean, which is wood, flax, pitch, tar, refin, cordage, and fuch like, which they exchange again to the French, Spaniards, Portugueze, and English, &c. for what they want, are made so mighty, strong, and rich, as no state but Venice, of twice their magnitude, is fo well furnished with fo many fair cities, goodly towns, ftrong fortreffes, and that abundance of shipping and all forts of merchandize, as well of gold, filver, pearls, diamonds, precious stones, filks, velvets, and cloth of gold, as fifh, pitch, wood, or fuch gross commodities? What voyages and difcoveries, east and west, north and south, yea, about the world, make they? What an army by fea and land have they long maintained, in despite of one of the greatest princes of the world; and never could the Spaniard, with all his mines of gold and filver, pay his debts, his friends, and army, half fo truly as the Hollanders still have done by this contemptible trade of fish. Divers (I know) may alledge many other affiltances; but this is the chiefest mine, and the sea the source of those filver streams of all their virtue, which hath made them now the very miracle of industry, the only pattern of perfection for these affairs; and the benefit of fishing is that primum mobile that turns all their spheres to this height, of plenty, strength, honour, and exceeding great admiration.

Herring, cod, and ling is that triplicity that makes their wealth and shipping multiplicity such as it is; and from which (few would think it) they should draw so many millions yearly as they do, as more in particular in the trials of New England you may see; and such an incredible number of ships, that breeds them so many sailers, mariners, soldiers, and merchants, never to be wrought out of that trade, and sit for any other. I will not deny but others may gain as well as they that will use it, though not so certainly nor so much in quantity, for want of experience; and this herring they take upon the coast of England and Scotland, their cod and ling upon the coast of Iceland and in the North seas, if we consider what gains the Hamburghans, the Biscayners, and the French make by sishing; nay, but how many thousands this sisty or sixty years have been maintained by Newsoundland, where they take nothing but small cod whereof the greatest they make cor-sish, and the rest is hard dried, which we call

poor-john, would amaze a man with wonder. If then from all those parts such pains is taken for this poor gain of fish, especially by the Hollanders, that hath but little of their own, for building of thips and fetting them to fea; but at the fecond, third, fourth, or fifth hand, drawn from fo many parts of the world ere they come together to be used in those voyages: if these (I say) can gain, why should we more doubt than they; but do much better, that may have most of all those things at our doors for taking and making, and here are no hard landlords to rack us with high rents, or extorting fines, nor tedious pleas in law to confume us with their many years diffputation for justice; no multitudes to occasion such impediments to good order as in popular states: fo freely hath God and His Majesty bestowed those blessings on them will attempt to obtain them, as here every man be master of his own labour and land, or the greatest part (if His Majesty's royal meaning be not abused), and if he have nothing but his hands, he may fet up his trade; and by industry quickly grow rich, fpending but half that time well, which in England we abuse in idleness, worse, or as ill. Here is ground as good as any lieth in the height of forty-one, forty-two, fortythree, &c., which is as temperate and as fruitful as any other parallel in the world.

As for example, on this fide the line, west of it in the South Sea, is Nova Albion, discovered, as is faid, by Sir Francis Drake: east from it is the most temperate part of Portugal, the ancient kingdoms of Galicia, Biscay, Navarre, Arragon, Catalonia, Castillia the Old, and the most moderate of Castillia the New, and Valencia, which is the greatest part of Spain, which, if the histories be true, in the Roman's time abounded no less with gold and filver mines, than now the West Indies, the Romans then using the Spaniards to work in those mines, as now the Spaniards do the Indians. In France, the provinces of Gascony, Languedock, Avignon, Provence, Dauphiny, Pyamont, and Turenne, are in the same parallel, which are the best and richest parts of France. In Italy the provinces of Genoa, Lombardy, and Verona, with a great part of the most samous state of Venice, the dukedoms of Bononia, Mantua, Ferrara, Ravenna, Bolognia, Florence, Pisa, Sienna, Urbina, Ancona, and the ancient city and country of Rome, with a great part of the kingdom of Naples. In Sclavonia, Istria and Dalmatia, with the kingdoms of Albania. In Grecia, those famous kingdoms of Macedonia, Bullulgaria, Thessalia, Thracia, or Romania, where is feated

the most pleasant and plentiful city in Europe, Constantinople.

In Asia, in the same latitude, are the temperatest parts of Natolia, Armenia, Persia, and China, besides divers other large countries and kingdoms in those most mild and temperate regions of Asia. Southward in the fame height is the richest of gold mines, Chili and Baldinia, and the mouth of the great river Plate, &c., for all the rest of the world in that height is unknown. Befides thefe reasons, mine own eyes that have feen a great part of those cities and their kingdoms (as well as it) can find no advantage they have in nature but this, they are beautified by the long labour and diligence of industrious people and art; this is only as God made it when he created the world; therefore I conclude, if the heart and entrails of those regions were fought, if their land were cultured, planted, and manured by men of industry, judgment, and experience; what hope is there, or what need they doubt, having the advantages of the fea, but it might equalize any of thefe famous kingdoms in all commodities, pleafures, and conditions, feeing even the very hedges do naturally afford us fuch plenty, as no ship need return away empty, and only use but the season of the sea-fish will return an honest gain, besides all other advantages, her treasures having yet never been opened, nor her originals, waited, confumed, nor abufed.

And whereas it is faid the Hollanders ferve the Easterlings themselves, and other

parts that want, with herring, ling, and wet cod; the Easterlings, a great part of Europe with sturgeon and caviare, as the Black Sea doth Grecia, Podolia, Segovia, Natolia, and the Hellespont. Cape Blank, Spain, Portugal, and the Levant with mullet and puttargo. Newfoundland, the most part of the chief fouthern ports in Europe with a thin poor-john, which hath been fo long fo much overlaid with fifliers, as the fifthing decayeth, fo that many oft times are confrained to return with a fmall freight. Norway and Poland affords pitch and tar, masts and yards; Sweden and Ruslia, iron and ropes; France and Spain, canvas, wine, steel, iron, and oil; Italy and Greece, filks and fruits. I dare boldly fay, because I have seen naturally growing or breeding in those parts the same materials that all these are made of, they may as well be had here, or the most part of them, within the distance of seventy leagues for some few ages, as from all those parts, using but the same means to have them that they do; but furely in Virginia their most tender and daintiest fruits or commodities would be as perfect as theirs, by reason of the heat, if not in New England, and with all those advantages.

First, the ground is so fertile, that questionless it is capable of producing any grain, fruits, or feeds you will fow or plant, growing in the regions aforenamed; but it may not be to that perfection of delicacy, because the summer is not so hot, and the winter is more cold in those parts we have yet tried near the fea-side, than we find in the same height in Europe or Afia; yet I made a garden upon the top of a rocky ifle, in threeand-forty degrees and an half, four leagues from the main in May, that grew fo well, as it ferved us for fallads in June and July. All forts of cattle may here be bred and fed in the ifles or peninfulas fecurely for nothing. In the interim, till they increase (if need be) observing the seasons, I durst undertake to have corn enough from the savages for three hundred men, for a few trifles; and if they should be untoward, as it is most certain they will, thirty or forty good men will be fufficient to bring them all in fubjection, and make this provision, if they understand what to do; two hundred whereof may eight or nine months in the year be employed in helping the fishermen, till the rest

provide other necessaries, fit to furnish us with other commodities.

In March, April, May, and half June, here is cod in abundance; in May, June, July, and August, mullet and sturgeon, whose roes does make caviary and puttargo, herring if any defire them; I have taken many out of the bellies of cods, some in nets; but the favages compare the store in the sea with the hairs of their heads; and surely there are an incredible abundance upon this coast. In the end of August, September, October, and November, you may have cod again to make core-fish or poor-john: hake you may have when the cod fails in fummer, if you will fish in the night, which is better than cod. Now each hundred you take here is as good as two or three hundred in Newfoundland; fo that half the labour in hooking, splitting and towing is saved: and you may have your fish at what market you will, before they have any in Newfoundland, where their fishing is chiefly but in June and July, where it is here in March, April, May, September, October, and November, as is faid; fo that by reason of this plantation, the merchants may have their freight both out and home, which yield an advantage worth confideration. Your core fish you may in like manner transport as you see cause, to serve the ports in Portugal, as Lisbon, Avera, Porta-Port, and divers others (or what market you please), before your islanders return: they being tied to the season in the open sea, and you having a double season, and fishing before your doors, may every night fleep quietly ashore with good cheer, and what fires you will, or when you pleafe, with your wives and family: they only and their ships in the main ocean, that must carry and contain all they use, besides their freight. The mullets here are in that abundance you may take them with nets fometimes by hundreds,. dreds, where at Cape Blank they hook them; yet those are but a foot and a half in length; these two, three, or four, as oft I have measured, which makes me suspect they are some other kind of fish, though they seem the same, both in fashion and goodness. Much salmon some have found up the rivers as they have passed, and here the air is so temperate as all these at any time may be preserved. Now, young boys and girls, savages, or any other, be they never such idlers, may turn, carry, or return a fish, without either shame, or any great pain: he is very idle, that is past twelve years of age, and cannot do so much; and she is very old, that cannot spin a thread to make

engines to catch a fish.

For their transportation, the ships that go there to fish may transport the first; who for their passage will spare the charge of double manning their ships, which they must do in Newfoundland to get their freight; but one-third part of that company are only proper to ferve a stage, carry a barrow, and turn poor-john; notwithstanding, they must have meat, drink, clothes, and passage, so well as the rest. Now all I desire is but this, that those that voluntarily will fend shipping, should make here the best choice they can, or accept fuch as shall be prefented them to serve them at that rate: and their fhips returning, leave fuch with me, with the value of that they should receive coming home, in fuch provisions and necessary tools, arms, bedding, apparel, falt, nets, hooks, lines, and fuch like, as they fpare of the remainings; who till the next return may keep their boats, and do them many other profitable offices. Provided, I have men of ability to teach them their functions, and a company fit for foldiers to be ready upon any occasion, because of the abuses that have been offered the poor savages, and the liberty that both French and English, or any that will, have to deal with them as they please; whose disorders will be hard to reform, and the longer the worse. Now fuch order with facility might be taken, with every port, town, or city, with free power to convert the benefit of their freights to what advantage they pleafe, and increase their numbers as they see occasion, who ever as they are able to subsist of themfelves, may begin the new towns in New England, in memory of their old: which freedom being confined but to the necessity of the general good, the event (with God's help) might produce an honest, a noble, and a profitable emulation.

Salt upon falt may affuredly be made, if not at the first in ponds, yet till they be provided this may be used: then the ships may transport kine, horse, goats, coarse cloth, and fuch commodities as we want; by whose arrival may be made that provision of fish to freight the ships that they stay not; and then if the failors go for wages, it matters not, it is hard if this return defray not the charge: but care must be had they arrive in the fpring, or else that provision be made for them against winter. Of certain red berries called kermes, which is worth ten shillings the pound, but of these have been fold for thirty or forty shillings the pound, may yearly be gathered a good quantity. Of the muserat may be well raised gains worth their labour, that will endeavour to make trial of their goodness. Of beavers, otters, and martins, black foxes, and furs of price, may yearly be had fix or feven thousand, and if the trade of the French were prevented, many more: twenty-five thousand this year were brought from those northern parts into France, of which trade we may have as good part as the French, if we take good courfes. Of mines of gold and filver, copper, and probabilities of lead, crystal and allum, I could say much, if relations were good assurances; it is true indeed, I made many trials according to the inftructions I had, which doth perfuade me I need not despair but that there are metals in the country; but I am no alchymist, nor will promife more than I know: which is, who will undertake the rectifying of an iron forge, if those that buy meat and drink, coals, ore, and all necessaries at a

dear

dear rate, gain, where all these things are to be had for taking up, in my opinion, cannot lose.

Of woods, feeing there is such plenty of all forts, if those that build ships and boats buy wood at so great a price as it is in England, Spain, France, and Holland, and all other provisions for the nourishment of man's life, live well by their trade; when labour is all required to take these necessaries, without any other tax, what hazard will be here but to do much better, and what commodity in Europe doth more decay than wood? for the goodness of the ground, let us take it fertile or barren, or as it is, seeing it is certain it bears fruits to nourish and feed man and beast as well as England, and the sea those several forts of sishes I have related: thus seeing all good things for man's sustenance may with this facility be had by a little extraordinary labour, till that transported be increased, and all necessaries for shipping only for labour, to which may be added the assistance of the savages, which may easily be had, if they be discreetly handled in their kinds, towards sishing, planting, and destroying woods, what gains might be raised if this were followed (when there is but once men to fill your store-houses dwelling there, you may serve all Europe better and far cheaper than can the island sishers, or the Hollanders, Cape Blank, or Newsoundland, who must be at much

more charge than you) may eafily be conjectured by this example.

Two thousand will fit out a ship of 200 tons, and one of 100 tons, if of the dry fish they both make freight, that of 200, and go for Spain, fell it but at ten shillings aguintal. but commonly it gives fifteen or twenty, especially when it cometh first, which amounts to 3 or 4000l., but fay but ten, which is the lowest, allowing the rest for waste, it amounts at that rate to 2000l., which is the whole charge of your two ships and the equipage, then the return of the money and the freight of the ship for the vintage or any other voyage is clear gain, with your ship of 100 tons of train oil and cor-fish, besides the beavers and other commodities, and that you may have at home within fix months. if God pleafe to fend but an ordinary paffage; then faving half this charge by the not flaying of your ships, your victuals, overplus of men and wages, with her freight thither with necessaries for the planters, the falt being there made, as also may the nets and lines within a fhort time; if nothing may be expected but this, it might in time equalize your Hollanders' gains, if not exceed them, having their freights always ready against the arrival of the ships, this would so increase our shipping and failors, and so encourage and employ a great part of our idlers and others that want employment fitting their qualities at home, where they shame to do that they would do abroad, that could they but once tafte the fweet fruits of their own labour, doubtless many thoufands would be advised by good discipline to take more pleasure in honest industry than in their humours of dissolute idleness.

But to return a little more to the particulars of this country, which I intermingle thus with my projects and reasons, not being so sufficiently yet acquainted in those parts, to write sully the estate of the sea, the air, the land, the fruits, their rocks, the people, the government, religion, territories, limitations, friends and soes: but as I gathered from their niggardly relations in a broken language, during the time I ranged those countries, &c. the most northern part I was at, was the bay of Pennobscot, which is east and west, north and south, more than ten leagues: but such were my occasions, I was constrained to be fatisfied of them I sound in the bay, that the river ran far up into the land, and was well inhabited with many people, but they were from their habitations, either sissing amongst the isles, or hunting the lakes and woods for deer and beavers: the bay is full of great isles of one, two, six or eight miles in length, which divides it into many fair and excellent good harbours. On the east of it are the Tarrentines, their mortal

enemies, where inhabit the French, as they report, that live with those people as one nation or family; and northwest of Pennobscot is Mecaddacut, at the foot of a high mountain, a kind of fortress against the Tarrentines, adjoining to the high mountains of Pennobicot, against whose feet doth beat the fea; but over all the land, isles, or other impediments, you may well fee them fourteen or eighteen leagues from their fituation. Segocket is the next, then Nufkoucus, Pemmaquid, and Sagadaheck: up this river, where was the western plantation, are Aumoughcawgen, Kinnebeke, and divers others, where are planted some corn fields. Along this river, thirty or forty miles, I saw nothing but great high clifts of barren rocks overgrown with wood, but where the favages dwell there the ground is excellent falt, and fertile. Westward of this river is the country of Aucocifco, in the bottom of a large deep bay, full of many great ifles which divides it into many good harbours. Sawocotuck is the next, in the edge of a large fandy bay, which hath many rocks and ifles, but few good harbours, but for barks I yet know; but all this coast to Pennobscot, and as far as I could see eastward of it, is nothing but fuch high craggy clifty rocks and flony ifles, that I wonder fuch great trees could grow upon fo hard foundations. It is a country rather to affright than delight one, and how to describe a more plain spectacle of desolation, or more barren, I know not; yet are those rocky ifles so furnished with good woods, springs, fruits, fish and fowl, and the fea the ftrangest fish-pond I ever faw, that it makes me think, though the coast be rocky and thus affrightable, the vallies and plains and interior parts may well notwithstanding be very fertile. But there is no country so fertile hath not some part barren, and New-England is great enough to make many kingdoms and countries, were it all inhabited. As you pass the coast still westward, Accominations and Passataquack are two convenient harbours for fmall barks; and a good country within their craggy clifts. Augoan is the next: this place might content a right curious judgment, but there are many fands at the entrance of the harbour, and the worst is, it is embayed too far from the deep fea; here are many rifing hills, and on their tops and defcents are many corn fields and delightful groves: on the east is an isle of two or three leagues in length, the one-half plain marsh ground, fit for pasture or falt ponds, with many fair high groves of unulberry-trees and gardens; there is also oaks, pines, walnuts, and other wood to make this place an excellent habitation, being a good and fafe harbour.

Naicmkeck, though it be more rocky ground, for Augoan is fandy, not much inferior neither for the harbour, nor any thing I could perceive but the multitude of people: from hence doth firetch into the fea the fair head-land Tragabigzanda, now called Cape Anne, fronted with the three ifles we called the Three Turks Heads; to the north of this doth enter a great bay, where we found fome habitations and corn fields, they report a fair river, and at least thirty habitations doth possess this country. But because the French had got their trade, I had no leifure to difcover it: the ifles of Mattahunts are on the west side of this bay, where are many isles and some rocks that appear a great height above the water like the pyramids in Ægypt, and amongst them many good harbours, and then the country of the Maffachufets, which is the paradife of all those parts, for here are many ifles planted with corn, groves, mulberries, falvage gardens and good harbours; the coast is for the most part high clay fandy clifts, the sea coast as you pass fliews you all along large corn fields, and great troops of well-proportioned people: but the French having remained here near fix weeks, left nothing for us to take occasion to examine the inhabitants relations, viz. if there be three thousand people upon those ifles, and that the river doth pierce many days journey the entrails of that country: we found the people in those parts very kind, but in their fury no less valiant, for upon a quarrel we fought with forty or fifty of them, till they had fpent all their arrows, and

then we took fix or feven of their canoes, which towards the evening they ranfomed for beaver-fkins, and at Quonahafit falling out there but with one of them, he with three others croffed the harbour in a canoe to certain rocks whereby we must pass, and there let fly their arrows for our shot, till we were out of danger, yet one of them was slain,

and another shot through his thigh.

Then come you to Accomacke, an excellent good harbour, good land, and no want of any thing but industrious people: after much kindness, we fought also with them, though fome were hurt, fome flain, yet within an hour after they became friends. Cape Cod is the next prefents itself, which is only a headland of high hills, overgrown with shrubby pines, hurts and such trash, but an excellent harbour for all weathers. This cape is made by the main fea on the one fide, and a great bay on the other in form of a fickle; on it doth inhabit the people of Pawmer, and in the bottom of the bay them of Chawum; towards the fouth and fouth-west of this Cape is found a long and dangerous fhoal of rocks and fand, but fo far as I incircled it, I found thirty fathoms water and a strong current, which makes me think there is a channel about this shoal, where is the best and greatest fish to be had winter and fummer in all the country; but the favages fay there is no channel, but that the shoals begin from the main at Pawmet to the ifle of Nawfet, and fo extends beyond their knowledge into the fca. The next to this is Capawucke, and those abounding countries of copper, corn, people, and minerals, which I went to discover this last year, but because I miscarried by the way I will leave them till God please I have better acquaintance with them.

The Maffachufets, they report, fometimes have wars with the Bafhabes of Pennobfcot, and are not always friends with them of Chawum and their alliance; but now
they are all friends, and have each trade with other fo far as they have fociety on each
other's frontiers, for they make no fuch voyages as from Pennobfcot to Cape Cod,
feldom to Maffachufet. In the north, as I have faid, they have begun to plant corn,
whereof the fouth part hath fuch plenty as they have what they will from them of
the north; and in the winter, much more plenty of fifh and fowl; but both winter and
fummer hath it in one part or other all the year, being the mean and most indifferent
temper betwixt heat and cold, of all the regions betwixt the line and the pole; but
the furs northward are much better, and in much more plenty than fouthward.

The remarkablest isles and mountains for land-marks are these: the highest isle is Sorico in the bay of Pennobscot, but the three isles, and the isles of Matinack are much further in the sea: Metynacus is also three plain isles, but many great rocks: Monahigan is a round high isle, and close by it Monanis, betwixt which is a small harbour where we rid; in Dameril's Isles is such another, Sagadahocke is known by Satquin, and sour or sive isles in their mouth. Smith's Isles are a heap together, none near them against Accomintycus: the Three Turks Heads are three isles, seen far to seaward in regard of the headland. The chief headlands are only Cape Tragabigzanda and Cape Cod, now called Cape James and Cape Anno.

The chief mountains, them of Pennobscot, the twinkling mountain of Acocisco, the great mountain of Saslanow, and the high mountain of Massachuset; each of which you shall find in the map, their places, form, and aluitudes. The waters are most pure, proceeding from the entrails of rocky mountains; the herbs and fruits are of many forts and kinds, as alkermes, currants, mulberries, vines, respises, gooseberries, plumbs, walnuts, chesnuts, small nuts, pumpeons, gourds, strawberries, beans, peas, and maize; a kind or two of slaw, wherewith they make nets, lines, and ropes, both

finall and great, very strong for their quantities.

Oak is the chief wood, of which there is great difference, in regard of the foil where it groweth, fir, pine, walnut, chefnut, birch, ash, elm, cypress, cedar, mulberry, plumbtree, hazel, saffefras, and many other forts.

Eagles, grips, divers forts of hawks, cranes, geefe, brants, cormorants, ducks, cranes, fwans, fheldrakes, teal, mews, gulls, turkies, dive-doppers, and many other

forts whose names I know not.

Whales, grompus, porkpifces, turbet, flurgeon, cod, hake, haddock, cole, cufk or fmall ling, fhark, mackarel, herring, mullet, bafe, pinnacks, cunners, perch, eels, crabs,

lobsters, muscles, wilks, oysters, clamps, periwinkles, and divers others, &c.

Moos, a beaft bigger than a ftag, deer red and fallow, beavers, wolves, foxes both black and other, aroughounds, wild cats, bears, otters, martins, fitches, mufquaffus, and divers other forts of vermin whose names I know not: all these and divers other good things do here for want of use still increase and decrease with little diminution, whereby they grow to that abundance, you shall scarce find any bay, shallow, shore or cove of fand, where you may not take many clamps or lobsters, or both, at your pleafure, and in many places load your boat if you please; nor isles where you find not fruits, birds, crabs, and muscles, or all of them; for taking at a low water cod, cusk, hollibut, fcate, turbet, mackarel, or fuch like, are taken plentifully in divers fandy bays, store of mullet, bases, and divers other forts of such excellent fish as many as their net can hold: no river where there is not plenty of flurgeon, or falmon, or both, all which are to be had in abundance observing but their feasons: but if a man will go at Christmas to gather cherries in Kent, though there be plenty in fummer, he may be deceived; fo here these plenties have each their seasons, as I have expressed; we for the most part had little but bread and vinegar, and though the most part of July when the fishing decayed, they wrought all day, lay abroad in the ifles all night, and lived on what they found, yet were not fick: but I would wish none long put himfelf to fuch plunges, except necessity constrain it: yet worthy is that person to starve that here cannot live if he have sense, strength, and health, for there is no fuch penury of these blessings in any place but that one hundred men may in two or three hours make their provisions for a day; and he that hath experience to manage these affairs with forty or thirty honest industrious men, might well undertake (if they dwell in these parts) to subject the favages, and feed daily two or three hundred men with as good corn, fish and flesh as the earth hath of those kinds, and vet make that labour but their pleasure, provided that they have engines that be proper for their purposes. Who can defire more content that hath small means, or but only his merit to advance his fortune, than to tread and plant that ground he hath purchased by the hazard of his life; if he have but the taste of virtue and magnanimity, what to fuch a mind can be more pleafant than planting and building a foundation for his posterity, got from the rude earth by God's blessing and his own industry without prejudice to any, if he have any grain of faith or zeal in religion, what can he do less hurtful to any, or more agreeable to God, than to seek to convert those poor favages to know Christ and humanity, whose labours with discretion will triple require thy charge and pain; what fo truly fuits with honour and honefty, as the discovering things unknown, erecting towns, peopling countries, informing the ignorant, reforming things unjust, teaching virtue and gain to our native mother country; a kingdom to attend her, find employment for those that are idle, because they know not what to do: fo far from wronging any, as to cause posterity to remember thee, and remembering thee, ever honour that remembrance with praise? Confider what were the beginnings and endings of the monarchies of the Chaldeans, the Syrians, the Grecians and Romans, but this one rule; what was it they would not do for the good of their, commonwealth, or their mother city? For example, Rome, what made her fuch a monarchefs, but only the adventures of her youth, not in riots at home, but in dangers abroad, and the juffice and judgment out of their experience when they grew aged; what was their ruin and hurt but this, the excefs of idlenefs, the fondnefs of parents, the want of experience in magistrates, the admiration of their undeferved honours, the contempt of true merit, their unjust jealousies, their politic incredulities, their hypocritical feeming goodnefs and their deeds of fecret lewdnefs; finally in fine, growing only formal temporifts, all that their predecessors got in many years they lost in a few days: those by their pains and virtues became lords of the world, they by their ease and vices became flaves to their fervants. This is the difference betwixt the use of arms in the field and on the monuments of stones, the golden age and the leaden age, prosperity and misery, justice and corruption, substance and shadows, words and deeds, experience and imagination, making commonwealths, and marring commonwealths, the fruits of virtue, and the conclusions of vice.

Then who would live at home idly, or think in himfelf any worth to live, only to eat, drink, and fleep, and fo die; or by confuming that carelefsly, his friends got worthily, or by ufing that miferably that maintained virtue honeftly, or for being defeended nobly, and pine with the vain vaunt of great kindred in penury, or to maintain a filly flew of bravery, toil out thy heart, foul and time bafely, by fhifts, tricks, cards and dice, or by relating news of other men's actions, fhark here and there for a dinner or fupper, deceive thy friends by fair promifes and diffimulation, in borrowing where thou never meanest to pay, offend the laws, furfeit with excess, burthen thy country, abuse thyself, despair in want, and then cousin thy kindred, yea, even thy own brother and wish thy parents' death (I will not fay damnation), to have their estates, though thou feest what honours and rewards the world yet hath for them,

that will feek them and worthily deferve them.

I would be forry to offend, or that any flould mistake my honest meaning, for I wish good to all, hurt to none: but rich men for the most part are grown to that dotage through their pride in their wealth, as though there were no accident could end it or their life.

And what hellish care do such take to make it their own misery and their countries' fpoil, especially when there is most need of their employment, drawing by all manner of inventions from the prince and his honest subjects, even the vital spirits of their power and estate, as if their bags or brags were so powerful a defence, the malicious could not assault them, when they are the only bait to cause us not only to be assaulted, but betrayed and murdered in our own security ere we will perceive it.

May not the miferable ruin of Constantinople, their impregnable walls, riches and pleasures last taken by the Turk, which were then but a bit in comparison of their mightines now, remember us of the effects of private covetousness, at which time the good Emperor held himself rich enough, to have such rich subjects, so formal in all excess of vanity, all kind of delicacy and prodigality: his poverty when the Turk besieged the citizens (whose merchandizing thoughts were only to get wealth) little conceiving the desperate resolution of a valiant expert enemy, left the Emperor so long to his conclusions, having spent all he had to pay his young raw discontented soldiers, that suddenly he, they, and their city were all a prey to the devouring Turks, and what they would not spare for the maintenance of them who adventured their lives to defend them, did serve only their enemies to torment them, their friends and country, and all Christendom to this present day. Let this lamentable example remember

remember you that are rich (feeing there are fuch great thieves in the world to rob you) not grudge to lend fome proportion to breed them that have little, yet willing to

learn how to defend you, for it is too late when the deed is doing.

The Romans eftate hath been worfe than this, for the mere covetousness and extortion of a few of them fo moved the reft, that not having any employment but contemplation, their great judgments grew to fo great malice, as themselves were sufficient to destroy themselves by faction; let this move you to embrace employment, for those whose educations, spirits, and judgments, want but your purses, not only to prefent fuch accustomed dangers, but also to gain more thereby than you have; and you fathers that are either to foolifhly fond, or fo miferably covetous, or fo wilfully ignorant, or fo negligently carelefs, as that you will rather maintain your children in idle wantonness till they grow your masters, or become so basely unkind that they wish nothing but your deaths, fo that both forts grow diffolute, and although you would wish them any where to cscape the gallows and ease your cares, though they spend you here one, two, or three hundred pounds a year, you would grudge to give half to much in adventure with them to obtain an estate, which in a small time, but with a little affiftance of your providence, might be better than your own; but if an angel thould tell you any place yet unknown can afford fuch fortunes, you would not believe it, no more than Columbus was believed there was any fuch land as is now the well known abounding America, much less fuch large regions as are yet unknown,

as well in America as in Africa and Afia, and Terra Incognita.

I have not been fo ill bied but I have tafted of plenty and pleafure, as well as want and mifery; nor doth necessity yet, or occasion of discontent, force me to these endeayours, nor am I ignorant what finall thanks I shall have for my pains, or that many would have the world imagine them to be of great judgment, that can but blemish these my designs, by their witty objections and detraction, yet I hope my reasons with my deeds will fo prevail with fome, that I shall not want employment in these affairs, to make the most blind fee his own senselessiness and incredulity, hoping that gain will make them affect that which religion, charity, and the common good cannot. It were but a poor device in me to deceive myfelf, much more the King and state, my friends and country with these inducements, which seeing His Majesty hath given permission, I wish all forts of worthy, honest, industrious spirits would understand, and if they defire any further fatisfaction, I will do my best to give it, not to persuade them to go only, but go with them; not leave them there, but live with them there: I will not fay but by ill providing and undue managing, fuch courfes may be taken may make us miferable enough: but if I may have the execution of what I have projected, if they want to eat, let them eat or never digeft me; if I perform what I fay, I defire but that reward out of the gains may fuit my pains, quality, and condition, and if I abuse you with my tongue, take my head for satisfaction. If any dislike at the year's end, defraying their charge, by my confent they should freely return; I fear not want of company fufficient, were it but known what I know of these countries, and by the proof of that wealth I hope yearly to return, if God please to bless me from fuch accidents as are beyond my power in reason to prevent; for I am not so simple to think that ever any other motive than wealth will ever erect there a commonwealth, or draw company from their ease and humours at home, to stay in New England to effect my purpofes.

And left any flould think the toil might be insupportable, though these things may be had by labour and diligence, I affure myself there are who delight extremely in vain pleasure, that take much more pains in England to enjoy it, than I should do

here

here to gain wealth fufficient, and yet I think they should not have half such sweet content: for our pleafure here is still gain, in England charges and loss; here nature and liberty affords us that freely which in England we want, or it costeth us dearly. What pleafure can be more than being tired with any occasion ashore, in planting vines, fruits, or herbs, in contriving their own grounds to the pleafure of their own minds, their fields, gardens, orchards, buildings, thips, and other works, &c. to recreate themselves before their own doors, in their own boats, upon the sea, where man, woman, and child, with a finall hook and line, by angling, may take divers forts of excellent fifh at their pleasure; and is it not pretty sport to pull up twopence, sixpence, and twelvepence, as fast as you can hale and veer a line? He is a very bad fisher who cannot kill in one day, with his book and line, one, two, or three hundred cod, which, drefted and dried, if they be fold there for ten shillings a hundred, though in England they will give more than twency, may not both fervant, mafter, and merchant be well content with this gain? If a man work but three days in feven, he may get more than he can fpend, unless he will be exceedingly excessive. Now that carpenter, mason, gardener, tailor, finith, failor, forger, or what other, may they not make this a pretty recreation, though they fish but an hour in a day, to take more than they can eat in a week, or if they will not eat it, because there is so much better choice, yet sell it or change it with the fishermen or merchants for any thing you want; and what sport doth yield a more pleafing content, and lefs hurt and charge than angling with a hook, and croffing the fweet air from ifle to ifle, over the filent streams of a calin fea, wherein the most curious may find profit, pleasure, and content.

Thus though all men be not fishers, yet all men whatsoever may in other matters do as well, for necessity doth in these cases so rule a commonwealth, and each in their several functions, as their labours in their qualities may be as profitable because there is

a necessary mutual use of all.

For gentlemen, what exercise should more delight them than ranging daily these unknown parts, using sowling and fishing for hunting and hawking, and yet you shall see the wild hawks give you some pleasure in seeing them stop six or seven times after one another an hour or two together, at the skults of sish in the fair harbours, as those asshore at a sowl, and never trouble nor torment yourselves with watching, mewing, seeding, and attending them, nor kill horse and man with running and crying, See you not a hawk; for hunting also, the woods, lakes and rivers afford not only chace sufficient for any that delight in that kind of toil or pleasure, but such beasts to hunt, that besides the delicacy of their bodies for food, their skins are so rich, as they will recompence the daily labour with a captain's pay.

For labourers, if those that sow hemp, rape, turnips, parsnips, carrots, cabbage, and such like, give twenty, thirty, forty, fifty shillings yearly for an acre of land, and meat, drink, and wages to use it, and yet grow rich: when better, or at least as good ground may be had and cost nothing but labour; it feems strange to me any such should grow

poor.

My purpose is not to persuade children from their parents, men from their wives, nor servants from their masters; only such as with free consent may be spared: but that each parish, or village, in city or country, that will but apparel their fatherless children of thirteen or fourteen years of age, or young married people that have small wealth to live on here, by their labour may live exceeding well. Provided always, that first there be a sufficient power to command them, houses to receive them, means to defend them, and meet provisions for them, for any place may be over-lain: and it is most necessary to have a fortress (ere this grow to practice), and sufficient masters of

all necessary, mechanical qualities to take ten or twelve of them for apprentices; the master by this may quickly grow rich, these may learn their trades themselves to do the like, to a general and an incredible benefit for king and country, master and servant.

It would be a history of a large volume to recite the adventures of the Spaniards and Portuguele, their affronts and defeats, their dangers and miferies, which with fuch incomparable honour and constant resolution, so far beyond belief, they have attempted and endured in their discoveries and plantations, as may well condemn us of too much imbecility, floth, and negligence: yet the authors of these new inventions were held as ridiculous for a long time, as now are others that do but feek to imitate their unparalleled virtues; and though we fee daily their mountains of wealth (fprung from the plants of their generous endeavours) yet is our fenfuality and untowardness such and To great, that we either ignorantly believe nothing or fo curioufly contest to prevent we know not what future events, that we either fo neglect, or oppress and discourage the prefent, as we fpoil all in the making, crop all in the blooming; and building upon fair fand rather than upon rough rocks, judge that we know not, govern that we have not, fear that which is not; and for fear fome should do too well, force such against their wills to be idle, or as ill. And who is he hath judgment, courage, and any induftry or quality with understanding, will leave his country, his hopes at home, his certain estate, his friends, pleasures, liberty, and the preferment sweet England doth afford to all degrees, were it not to advance his fortunes by enjoying his deferts, whose prosperity once appearing, will encourage others: but it must be cherished as a child, till it be able to go and understand itself, and not corrected nor oppressed above its strength, ere it know wherefore. A child can neither perform the office nor deeds of a man of ftrength, nor endure that affliction he is able; nor can an apprentice at the first perform the part of a master, and if twenty years be required to make a child a man, feven years limited an apprentice for his trade: if fcarce an age be fufficient to make a wife man a statesman, and commonly a man dies ere he hath learned to be different; if perfection be fo hard to be obtained, as of necessity there must be practice as well as theorick: let no man then condemn this paradox opinion, to fay that half feven years is scarce sufficient for a good capacity to learn in these affairs how to carry himself. And whoever shall try in these remote places the erecting of a colony, shall find at the end of feven years occasion enough to use all his discretion: and in the interim, all the content, rewards, gains, and hopes will be necessarily required to be given to the beginning, till it be able to creep, to fland, and go, and to encourage defert by all possible means; yet time enough to keep it from running, for there is no fear it will grow too fast, or ever to any thing, except liberty, profit, honour, and prosperity there found, more bind the planters of those affairs in devotion to effect it, than bondage, violence, tyranny, ingratitude, and fuch double dealing as binds free men to become flaves, and honest men turn knaves, which hath ever been the ruin of the most popular commonwealths, and it is very unlikely ever well to begin anew.

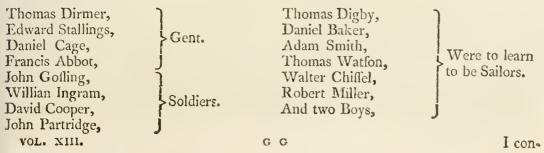

Who feeth not what is the greatest good of the Spaniards, but these new conclusions in fearching those unknown parts of this unknown world; by which means he dives even into the very secrets of all his neighbours, and the most part of the world; and when the Portuguese and Spaniards had sound the East and West Indies, how many did condemn themselves that did not accept of that honest offer of noble Columbus, who upon our neglect brought them to it, persuading ourselves the world had no such places as they had sound: and yet ever since we sind, they still (from time to time) have sound new lands, new nations, and trades, and still daily do sind, both in Asia, Africa, Terra Incognita,

and America, fo that there is neither foldier nor mechanic, from the lord to the beggar, but those parts affords them all employment, and discharges their native soil of so many thousands of all forts, that else by their sloth, pride, and imperfections, would long ere this have troubled their neighbours, or have eaten the pride of Spain itself.

Now he knows little that knows not England may well fpare many more people than Spain, and is as well able to furnish them with all manner of necessaries: and seeing for all they have, they ceafe not still to fearch for that they have not, and know not; it is strange we should be so dull, as not maintain that which we have, and pursue that we know: furely, I am fure many would take it ill, to be abridged of the titles and honours of their predeceffors; when if but truly they would judge themselves, look how inferior they are to their noble virtues, so much they are unworthy of their honours and livings, which never were ordained for shows and shadows, to maintain idleness and vice, but to make them more able to abound in honour, by heroical deeds of action, judgment, piety, and virtue. What was it both in their purse and person they would not do for the good of their common-wealth, which might move them prefently to fet out their spare children in these generous designs; religion above all things should move us, especially the clergy, if we are religious, to shew our faith by our works, in converting those poor favages to the knowledge of God, seeing what pains the Spaniards take to bring them to their adultered faith. Honour might move the gentry, the valiant, and indultrious, and the hope and affurance of wealth, all, if we were that we would feem, and be accounted; or be we fo far inferior to other nations, or our fpirits fo far dejected from our ancient predeceffors, or our minds fo upon fpoil, piracy, and fuch villainy, as to ferve the Portugal, Spaniard, Dutch, French, or Turk, (as to the cost of Europe too many do) rather than our God, our king, our country, and ourselves; excufing our idleness and our base complaints by want of employment, when here is fuch choice of all forts, and for all degrees, in the planting and discovering these North parts of American.

My fecond Voyage to New England.

IN the year of our Lord 1615, I was employed by many my friends of London, and Sir Ferdinando Gorges, a noble knight, and a great favourer of those actions, who persuaded the Reverend Dean of Exeter, Doctor Sutcliffe, and divers merchants of the West, to entertain this plantation. Much labour I had taken to bring the Londoners and them to join together, because the Londoners have most money, and the Western men are most proper for fishing, and it is near as much trouble, but much more danger, to sail from London to Plymouth, than from Plymouth to New England, so that half the voyage would thus be faved, yet by no means I could prevail, so desirous they were both to be lords of this fishing. Now to make my words more apparent by my deeds, to begin a plantation for a more ample trial of those conclusions, I was to have staid there but with fixteen men, whose names were;

I confess I could have wished them as many thousands, had all other provisions been in like proportion; nor would I have had fo few, could I have had means for more; vet would God have pleased we had safely arrived, I doubted not but to have performed more than I promifed, and that many thousands ere this would have been there ere now. The main affiftance, next God, I had to this finall number, was my acquaintance amongst the savages, especially with Dohoday, one of their greatest lords, who had lived long in England, and another called Tantum, I carried with me from England, and fet on fhore at Cape Cod; by the means of this proud favage I did not doubt but quickly to have got that credit amongst the rest of the savages and their alliance, to have had as many of them as I defired in any defign I intended, and that trade also they had by such a kind of exchange of their country commodities, which both with ease and security might then have been used with him and divers others: I had concluded to inhabit and defend them against the Tarentines, with a better power than the French did them, whose tyranny did enforce them to embrace my offer with no small devotion; and though many may think me more bold than wife, in regard of their power, dexterity, treachery, and inconstancy, having so desperately affaulted and betrayed many others; I fay but this, (because with so many, I have many times done much more in Virginia than I intended here, when I wanted that experience Virginia taught me), that to me it feems no more danger than ordinary; and though I know myfelf the meanest of many thousands, whose apprehensive infpection can pierce beyond the bounds of my abilities, into the hidden things of nature, art, and reason; yet I entreat such, give me leave to excuse myself of so much imbecility, as to fay, that in thefe eighteen years which I have been converfant with thefe affairs, I have not learned there is a great difference betwixt the directions and judgment of experimental knowledge, and the fuperficial conjecture of variable relation: wherein rumour, humour, or misprission have such power, that ofttimes one is enough to beguile twenty, but twenty not fufficient to keep one from being deceived. Therefore I know no reason but to believe my own eyes before any man's imagination, that is but wrested from the conceits of my own projects and endeavours, but I honor with all affection, the counsel and instructions of judicial directions, or any other honest advertisement, fo far to observe, as they tie me, not to the cruelty of unknown events. These are the inducements that thus drew me to neglect all other employments, and fpend my time and best abilities in these adventures, wherein though I have had many discouragements, by the ingratitude of some, the malicious slanders of others, the falseness of friends, the treachery of cowards, and slowness of adventurers.

Now you are to remember, as I returned first from New England at Plymouth, I was promised four good ships ready prepared to my hand the next Christmas, and what conditions and content I would desire, to put this business in practice, and arriving at London, four more were offered me with the like courtesy. But to join the Londoners and them in one, was most impossible; so that in January, with two hundred pounds in eash for adventure, and six gentlemen well furnished, I went from London to the four ships were promised me at Plymouth, but I found no such matter; and the most of those that had made such great promises, by the bad return of the thip went for gold, and their private emulations, were extinct and qualified. Notwithstanding, at last, with a labyrinth of trouble, though the greatest of the burden lay on me, and a few of my particular triends, I was surnished with a ship of two hundred tons, and another of sisty; but ere I had sailed one hundred and twenty leagues, she broke all her masts, pumping each watch five or six thousand strokes; only her sprit-sail remained to spoon before the wind, till we had re-accommodated a jury-mast to return for Plymouth, or

founder in the feas.

My vice-admiral being loft, not knowing of this, proceeded her voyage; now with the remainder of those provisions, I got out again in a small bark of fixty toes with thirty men: for this of two hundred, and provision for seventy, which were the fixteen before named, and sourteen other failors for the ship; with those I set sail again the sour-and-twentieth of June, where what befell me (because my actions and writings are so public to the world) envy still seeking to scandalize my endeavours, and seeing no power but death can stop the chat of ill tongues, nor imaginations of men's minds, lest my own relations of those hard events might by some constructors be made doubtful, I have thought it best to insert the examinations of those proceedings, taken by Sir Lewis Stukeley, a worthy knight, and vice-admiral of Devonshire, which was as followeth:

The Examination of Daniel Baker, late Steward to Captain John Smith, in the return of Plymouth, taken before Sir Lewis Stukely, Knight, the 8th of December, 1615.

THE effect in brief was this: being chaced by one Fry an English pirate, Edward Chambers the mafter, John Minter his mate, Thomas Digby the pilot, and divers others importuned him to yield; much swaggering we had with them, more than the pirates, who agreed upon fuch fair conditions as we defired, which if they broke, he vowed to fink rather than be abused. Strange they thought it, that a bark of threefcore tons with four guns should stand upon such terms, they being eighty expert seamen, in an excellent ship of one hundred and forty tons, and thirty-fix cast pieces and murderers. But when they knew our captain, fo many of them had been his foldiers, and they but lately run from Tunis, where they had stolen this ship, wanted victuals, and in combustion amongst themselves, would have yielded all to his protection, or wafted us any whither; but those mutinies occasioned us to reject their offer, which afterwards we all repented; for at Fuiall we met two French pirates, the one of two hundred tons, the other thirty: no difgrace would cause our mutineers fight, till the captain offered to blow up the ship rather than yield, till he had spent all his powder: fo that together by the ears we went, and at last got clear of them for all their shot. At Flowers we were again chased with four French men of war, the admiral one hundred and forty tons, and ninety men well armed; the rest good ships, and as well provided: much parly we had, but vowing they were Rochelers, and had a committion from the King only to fecure true men, and take Portuguefe, Spaniards, and pirates, and as they requefted, our captain went to flew his commission, which was under the broad feal, but neither it nor their vows they so much respected, but they kept him, rifled our ship, manned her with Frenchmen, and dispersed us amongst their fleet within five or fix days they were increased to eight or nine fail. At last they furrendered us our fhip, and most of our provisions, the defects they promifed the next day to fupply, and did. Notwithstanding, there was no way but our mutineers would for England, though we were as near New England, till the major part refolved with our captain to proceed. But the admiral fending his boat for our captain, they efpying a fail, prefently gave chace, whereby our mutineers finding an opportunity in the night ran away, and thus left our captain in his cap, breeches, and waiftcoat, alone among the Frenchmen: his clothes, arms, and what he had, our mutineers shared among them, and with a false excuse, seigning for fear lest he should turn man of war, they returned for Plymouth: fifteen of us being landmen, not knowing what they did. Daniel Cage, Edward Stalings, Walter Chifel, David Cooper, Robert Miller, and John Partridge, upon oath affirms this for truth before the vice-admiral.

Now the cause why the French detained me again, was the suspicion this Chambers and Minter gave them, that I would revenge myfelf upon the Bank, or in Newfoundland, of all the French I could there encounter, and how I would have fired the ship, had they not over-perfuaded me; and that if I had but again my arms, I would rather fink by them, than they should have from me but the value of a biscuit; and many other fuch like tales to catch but opportunity in this manner to leave me, and thus they returned to Plymouth, and perforce with the Frenchmen I thus proceeded. Being a fleet of eight or nine fail, we watched for the West India fleet, till ill weather separated us from the other eight: Itill we spent our time about the isles of the Azores, where to keep my perplexed thoughts from too much meditation of my miferable estate, I writ this discourse, thinking to have sent it to you of His Majesty's council by some thip or other, for I faw their purpose was to take all they could. At last we were chased by one Captain Barras an English pirate in a small ship, with some twelve pieces of ordnance, about thirty men, and near all flarved. They fought by courtefy relief of us, who gave them fuch fair promifes, as at last they betrayed Captain Wollistone, his Lieutenant, and four or five of his men aboard us, and then provided to take the rest perforce. Now my part was to be prisoner in the gun-room, and not to speak to any of them upon my life; yet had Barra knowledge what I was. Then Barra perceiving well those French intents, made ready to fight, and Wollistone as resolutely regarded not their threats, which caufed us demur upon the matter longer some fixteen hours. and then returned them again Captain Wollistone and all their prisoners, and some victuals also upon a finall composition; but whilst we were bartering thus with them, a carvill before our faces got under the eastle of Gratiosa, from whence they beat us with their ordnance.

The next we took was a fmall Englishman of Poole from Newfoundland: the great cabin at this prefent was my prison, from whence I could see them pillage these poor men of all that they had, and half their sish: when he was gone, they sold his poor clothes at the main-mast by an outcry, which scarce gave each man seven pence a

piece.

Not long after we took a Scot freighted from Saint Michael's to Bristow, he had better fortune than the other; for having but taken a boat's loading of sugar, marmelade, suckets, and such like, we descried four sail, after whom we stood, who surling their main-sails attended us to fight, but our French spirits were content only to perceive they were English red crosses. Within a very small time after we chased four Spanish ships that came from the Indies; we fought with them sour or sive hours, tore their sails and sides with many a shot betwixt wind and weather, yet not daring to board them, lost them, for which all the sailors ever after hated the captain as a professed coward.

A poor carvill of Brazil was the next we chased; and after a small fight, thirteen or fourteen of her men being wounded, which was the better half, we took her with three hundred and seventy chests of sugar, one hundred hides, and thirty thou-

fand rials of eight.

The next was a ship of Holland, which had lost her conforts in the Streights of Magellan, going for the South Sea: she was put roomy, she also these Frenchmen with fair promises cunningly betrayed to come aboard them to shew their commission, and so made prize of all: the most of the Dutchmen we took aboard the admiral, and manned her with Frenchmen, that within two or three nights after ran away with her for France; the wounded Spaniards we set on shore on the isse of Tercera, the rest we kept to fail the carvel.

Within

Within a day or two after, we met a West India man of war, of one hundred and fixty tons, a forenoon we fought with her, and then took her with one thousand one hundred hides, sifty chests of cochineal, fourteen coffers of wedges of silver, eight thousand rials of eight, and six cossers of the King of Spain's treasure, besides the good

pillage and rich coffers of many rich paffengers.

Two months they kept me in this manner to manage their fights against the Spaniards, and be a prisoner when they took any English. Now, though the captain had oft broke his promife, which was to put me on fhore the ifles, or the next ship he took; yet at the last he was contented I should go in the carvel of sugar for France, himself feeming as refolved to keep the feas; but the next morning we all fet fail for France, and that night we were feparated from the admiral and the rich prize by a ftorm. Within two days after we were hailed by two West India men; but when they saw us waive them for the King of France, they gave us their broadfides, shot through our main maft, and fo left us. Having lived now this fummer amongst those French men of war, with much ado we arrived at the Gulion, not far from Rochelle: where, instead of the great promifes they always fed me with, of double fatisfaction and full content, and ten thousand crowns was generally concluded I should have, they kept me five or fix days prisoner in the carvel, accusing me to be he that burnt their colony in New France; to force me to give them a discharge before the judge of the admiralty, and fland to their courtefies for fa isfaction, or lie in prison, or a worse mischief: indeed this was in the time of combustion, that the Prince of Condé was with his army in the field, and every poor lord, or men in authority, as little kings of themselves: for this injury was done me by them that fet out this voyage, (not by the failors) for they were cheated of all as well as I, by a few officers aboard, and the owners on shore.

But to prevent this choice, in the end of fuch a from that beat them all under hatches, I watched my opportunity to get ashore in their boat, whereunto, in the dark night, I fecretly got, and with a half-pike that lay by me put adrift for Rat Isle; but the current was fo ftrong, and the fea fo great, I went adrift to fea, till it pleafed God the wind fo turned with the tide, that although I was all this fearful night of gusts and rain in the fea, the space of twelve hours, when many ships were driven ashore, and divers fplit (and being with fculling and baling the water tired, I expected each minute would fink me): at last I arrived in any oozy isle by Charowne, where certain fowlers found me near drowned and half-dead with water, cold, and hunger. My boat I pawned to find means to get to Rochelle, where I understood our man of war and the rich prize, wherein was the capture called Monfieur Poyrune, and the thirty thousand rials of eight we took in the carvel, was split, the captain drowned and half his company the same night, within fix or seven leagues of that place, from whence I escaped in the little boat, by the mercy of God, far beyond all men's reason or my expectation arriving at Rochelle. Upon my complaint to the judge of the admiralty, I found many good words and fair promifes, and ere long many of them that escaped drowning told me the news they heard of my own death. These I arresting, their feveral examinations did fo confirm my complaint, it was held proof fufficient. All which being performed according to their order of justice, from under the judge's hand, I prefented it to Sir Thomas Edmonds, then ambaffador at Bourdeaux, where it was my chance to fee the arrival of the King's great marriage brought from Spain.

Here it was my good fortune to meet my old friend Mr. Crampton, that no lefs grieved at my lofs, than willingly to his power did supply my wants; and I must confess, I was more beholden to the Frenchmen that escaped drowning in the man of war, Madam Chanoyes at Rochelle, and the lawyers of Bourdeaux, than all the rest of

my countrymen I met in France. Of the wreck of the rich prize, fome three thoufand fix hundred crowns worth of goods came ashore, and was saved with the carvel, which I did my best to arrest: the judge promised I should have justice; what will be the conclusion as yet I know not. But under the colour to take pirates and the West Indiamen (because the Spaniards will not suffer the French to trade in the West Indies), any goods from thence, though they take them upon the coast of Spain, are lawful prize, or from any of his territories out of the limits of Europe; and as they betrayed me, though I had the broad feal, so did they rob and pillage twenty sail of Eng-

lishmen more, besides them I know not of the same year.

Leaving thus my business in France, I returned to Plymouth, to find them who had thus buried me amongst the French; and not only buried me, but with so much infamy as fuch treacherous cowards could fuggeft to excuse their villanies. The chieftains of this muciny that I could find, I laid by the heels, the rest like themselves confessed the truth, as you have heard. Now how I have or could prevent these accidents, having no more means, I rest at your censures; but to proceed to the matter, yet must I figh and fay, how oft hath fortune in the world (think I) brought flavery, freedom, and turned all diversely. Newfoundland, I have heard at the first, was held as desperate a fishing as this I project for New England, Placentia, and the banks near alfo, as doubtful to the French; but for all the difasters happened me, the business is the fame it was, and the five ships went from London, whereof one was reported more than three hundred tons, found fish fo much, that neither Iceland-man nor Newfoundland-man I could hear of hath been there, will go any more to either place, if they may go thither. So that upon the good return of my vice-admiral, this year are gone four or five fail from Plymouth, and from London as many, only to make voyages of profit; whereas if all the English had been there till my return, put all their returns together, they would fcarce make one a favour of near a dozen I could nominate, except one fentby Sir Francis Popham; though there be fish sufficient, as I am persuaded, to freight yearly four or five hundred fail, or as many as will go. For this fishing ftretcheth along the fea-coast from Cape James to Newfoundland, which is feven or eight hundred miles at the leaft, and hath his course in the deeps, and by the shore, all the year long, keeping their haunts and feedings as the beafts of the air, But all men are not fuch as they should be, that have undertaken those voyages. Romans were not Scipios, nor Carthagenians, Hannibals; nor all the Genoefe, Columbufes, nor all the Spaniards, Courtefes: had they dived no deeper in the fecrets of their discoveries than we, or stopped at such doubts and poor accidental chances, they had never been remembered as they are, yet had they no fuch certainties to begin as we.

But to conclude: Adam and Eve did first begin this innocent work to plant the earth to remain to posterity, but not without labour, trouble, and industry. Noah and his family began again the second plantation, and their seed, as it still increased, hath still planted new countries, and one country another, and so the world to that estate it is; but not without much hazard, travail, mortalities, discontents, and many disasters. Had those worthy fathers, and their memorable offspring, not been more diligent for us now in these ages, than we are to plant that yet is unplanted for the after-livers: had the seed of Abraham, our Saviour Christ and his apostles, exposed themselves to no more dangers to teach the gospel than we, even we ourselves had at this present time been as savage and as miserable as the most barbarous savage yet uncivilized. The Hebrews and Lacedemonians, the Goths, the Grecians, the Romans, and the rest, what was it they would not undertake to enlarge their territories, enrich their

fubjects, refift their enemies? Those that were the founders of those great monarchies and their virtues, were no filvered idle golden pharises, but industrious ironsteeled publicans. They regarded more provisions and necessaries for their people, than jewels, riches, case, or delight for themselves; riches were their servants, not their masters. They ruled (as fathers, not as tyrants) their people as children, not as slaves; there was no disaster could discourage them; and let none think they incurred not with all manner of incumbrances. And what hath ever been the work of the greatest princes of the earth but planting of countries, and civilizing barbarous and inhuman nations to civility and humanity, whose eternal actions fill our histories.

Laftly, the Portugueze and Spaniards, whose ever-living actions before our eyes will testify with them our idleness and ingratitude to all posterities, and the neglect of our duties in our piety and religion. We owe our God, our King, and country, and want of charity to those poor favages, whose country we challenge, use, and posses; except we be but made to use, and mar what our foresathers made, or but only tell what they did, or esteem ourselves too good to take the like pains. Was it virtue in them to provide that maintain us, and baseness in us to do the like for others? Surely, no. Then seeing we are not born for ourselves, but each to help other, and our ablities are much alike at the hour of our birth, and the minute of our death: seeing our good deeds or our bad by faith in Christ's merits, is all we have to carry our souls to heaven or hell. Seeing honour is our life's ambition, and our ambition after death to have an honourable memory of our life; and seeing by no means we would be abated of the dignity and glories of our predecessors, let us imitate their virtues to be worthily their successors. To conclude with Lucretius,

Its want of reason, or its reason's want Which doubts the mind and judgment, so doth daunt That those beginnings makes men not to grant.

JOHN SMITH writ this with his own hand.

Here followeth a brief Discourse of the Trials of New England, with certain Observations of the Hollanders' Use and Gain by sishing, and the present State of that happy Plantation, begun by sixty weak Men, in the Year of our Lord 1620; and how to build a Fleet of good Ships to make a little Navy Royal, by the former Author.

HE faith that it is more than four-and-forty years ago, and it is more than forty years ago fince he writ it, that the herring buffes out of the Low Countries, under the King of Spain, were five hundred, befides one hundred Frenchmen, and three or four hundred fail of Flemings. The coast of Wales and Lancashire was used by three hundred sail of spaniards, where King Edward the Sixth intended to have made a strong castle, because of the straight to have tribute for fishing. Black Rock was yearly fished by three or four hundred sail of Spaniards, Portuguese, and Biskaners.

The Hollanders raife yearly by herring, cod, and ling, thirty thousand pounds: English and French, by falt-fish, poor-john, falmons, and pilchards, three hundred thousand pounds: Hamburgh and the Sound, for sturgeon, lobsters, and eels, one hundred thousand pounds: Cape Blank, for tunny and mullet, by the Biskaners and

Spaniards, thirty thousand pounds.

That the Duke of Medina receiveth yearly tribute of the fishers, for tunny, mullet, and porgos, more than ten thousand pounds. Lubeck hath seven hundred ships.

Hamburgh

Hamburgh fix hundred. Embden, lately a fishing town, one thousand four hundred, whose customs by fishing hath made them so powerful as they be. Holland and Zealand, not much greater than Yorkshire, hath thirty walled towns, four hundred villages, and twenty thousand sail of ships and hoys; three thousand six hundred are fishermen, whereof one hundred are doggers, seven hundred pinks and well-boats, seven hundred fraud-boats, britters, and tode-boats, with thirteen hundred busses, besides three hundred that yearly sish about Yarmouth, where the sell their sish for gold: and sisteen years ago they had more than an hundred and sixteen thousand seafaring men.

These fishing-ships do take yearly two hundred thousand lasts of fish, twelve barrels to a last, which amounts to three hundred thousand pounds by the sishermen's price, that fourteen years ago did pay for their tenths three hundred thousand pounds, which venting in Pumerland, Sprustia, Denmark, Lefeland, Russia, Swethland, Germany, Netherlands, England, or elsewhere, &c. makes their returns in a year about three-score and ten hundred thousand pounds, which is seven millions; and yet in Holland there is neither matter to build ships, nor merchandize to set them forth, yet by their industry they as much increase as other nations decay; but leaving these uncertainties as they are, of this I am certain:

That the coast of England, Scotland, and Ireland, the North Sea, with Island and the Sound, Newfoundland and Cape Blank, do serve all Europe, as well the land towns as ports, and all the Christian shipping, with these forts of staple sish, which is transported from whence it is taken many thousand miles, viz. herring, salt-sish, poor-john, sturgeon,

mullet, tunny, porgos, caviare, buttargo.

Now feeing all these forts of fish, or the most part of them, may be had in a land more fertile, temperate, and plentiful of all necessaries, for the building of ships, boats, and houses, and the nourishment of man, the seasons are so proper, and the sublings so near the habitations we may there make, that New England hath much advantage of the most of those parts, to serve all Europe far cheaper than they can, who at home have neither wood, falt, nor food, but at great rates; at fea nothing but what they carry in their ships an hundred or two hundred leagues from the habitation. But New England's fishings is near land, where is help of wood, water, fruits, fowls, corn, or other refreshings needful, and the Terceras, Madeiras, Canaries, Spain, Portugal, Provaves, Savoy, Sicily, and all Italy, as convenient markets for our dry fish, green fish, flurgeon, mullet, caviare, and buttargo, as Norway, Swethland, Lithuania, or Germany, for their herring, which is here also in abundance for taking; they returning but wood, pitch, tar, foap-ashes, cordage, flax, wax, and such like commodities; we wines, oils, fugars, filks, and fuch merchandizes as the Straits afford, whereby our profit may equalize theirs, befides the increase of shipping and mariners; and for proof hereof,

In the year of our Lord 1614, you have read how I went from London; also the next year 1615, how four good ships went to London, and I with two more from Plymouth, with all our accidents, successes, and returns: in the year 1616, ere I returned from France, the Londoners, for all their loss by the Turks, sent four ships more; four more also went from Plymouth; after I returned from France, I was perfuaded again to go to Plymouth with divers of my friends, with one hundred pounds for our adventures, besides our charges, but we found all things as untoward as before, and all their great promises nothing but air: yet to prepare the voyage against the next year, having acquainted a great part of the nobility with it, and assumed to see the Prince His Highness, till I had done somewhat worthy his princely view, I spent that summer in visiting the cities and towns of Bristol, Exeter, Barnstaple, Bodmin,

Perin, Foy, Milborow, Saltash, Dartmouth, Absom, Totness, and the most of the gentry in Cornwall and Devonshire, giving them books and maps, shewing how in fix months the most of those ships had made their voyages, and some in less, and with what good success; by which incitation they seemed so well contented, as they promised twenty sail of ships should go with me next year, and in regard of my pains, charge, and former losses, the western commissioners, in behalf of themselves and the rest of the company, and them hereafter that shall be joined to them, contracted with me by articles indented under our hands, to be admiral of that country during my life, and in the renewing of their letters patent so to be nominated. Half the fruits of our endeavours to be theirs, the rest our own; being thus engaged, now the business is made plain and likely to prosper, some of them would not only forget me and their promises, but also obscure me, as if I had never been acquainted in the business, but I am not the first they have deceived.

There were four good ships prepared at Plymouth, but by reason of their disagreement, the season so wasted, as only two went forward, the one being of two hundred tons, returned well freighted to Plymouth, and her men in health, within five months: the other of sourscore tons went for Bilbow with dry sish, and made a good return. In this voyage Edward Rowcrost alias Stallings, a valiant soldier, that had been with me in Virginia, and was with me also when I was betrayed by the French, was fent again in those ships, and having some wrong offered him there by a Frenchman, he took him, and as he writ to me, went with him to Virginia with sish, to trade with them for such commodities as they might spare: he had not past ten or twelve men, and knew both those countries well; yet he promised me the next spring to meet me in New

England, but the ship and he both perished in Virginia.

This year again divers ships intending to go from Plymouth, so disagreed, there went but one of two hundred tons, who staid in the country about fix weeks, which with eight-and-thirty men and boys had her freight, which she fold at the first penny for two thousand one hundred, besides the furs, so that every poor sailor that had but a lingle share had his charges and fixteen pounds ten shillings for his seven months' work. Mr. Thomas Dirmire, an understanding and industrious gentleman, that was also with me amongst the Frenchmen, having lived about a year in Newfoundland, returning to Plymouth, went for New England in this ship, so much approved of this country, that he staid there with five or fix men in a little boat; finding two or three Frenchmen amongst the favages who had lost their ship, augmented his company, with whom he ranged the coast to Virginia, where having been a year, in his back return to Virginia, he was fo wounded by the favages, he died upon it. Let not men attribute these their great adventures and untimely deaths to unfortunateness, but rather wonder how God did fo long preferve them with fo fmall means to do fo much, leaving the fruits of their labours to be an encouragement to those our poor undertakings, and as warnings for us not to undertake fuch great works with fuch finall means, and this for advantage as they writ unto me, that God had laid this country open for us, and flain the most part of the inhabitants by civil wars and a mortal difease; for where I had seen one hundred or two hundred savages, there is scarce ten to be found, and yet not any one of them touched with any fickness but one poor Frenchman that died:

> They fay this plague upon them thus fore fell, It was because they pleased not Tantum well.

From the West-country, to make trial this year only to fish, are gone fix or seven fail, three of which I am certainly informed made so good a voyage, that every sailor vol. XIII.

that had a fingle share had twenty pounds for his seven months' work, which is more than in twenty months he should have gotten, had he gone for wages any where. Now although these former ships have not made such good voyages as they expected, by sending opinionated unskilful men, that had not experienced diligence to save that they took, nor take that there was, which now patience and practice hath brought to a reasonable kind of perfection; in despight of all detractors and calumniations the country yet hath satisfied all, the desect hath been in their using and abusing it, not in itself nor me: but,

A due defert, for fortune makes provision For knaves and fools, and men of base condition.

Now all these proofs and this relation I now called New England's trial. I caused two or three thousand of them to be printed; one thousand, with a great many maps both of Virginia and New England, I presented to thirty of the chief companies in London at their halls, desiring either generally or particularly (them that would) to embrace it, and by the use of a stock of five thousand pounds, to ease them of the superfluity of the most of their companies that had but strength and health to labour; near a year I spent to understand their resolutions, which was to me a greater toil and torment than to have been in New England about my business, but with bread and water, and what I could get there by my labour; but, in conclusion, seeing nothing would be effected, I was contented as well with this loss of time and charge as all the rest.

A Plantation in New England.

UPON these inducements some few well-disposed gentlemen and merchants of London and other places, provided two ships, the one of a hundred and threescore tons, the other of threescore and ten. They left the coast of England the 22d of August, with about a hundred and twenty persons; but the next day the lesser ship sprung a leak, that forced their return to Plymouth, where discharging her and twenty passengers, with the greater ship and one hundred passengers, besides failors, they set sail again the 6th of September; and the 9th of November fell with Cape James; but being peltered nine weeks in this leaking unwholesome ship, lying wet in their cabins, most of them grew very weak and weary of the fea; then, for want of experience, ranging two and again fix weeks before they found a place they liked to dwell on, forced to lie on the bare ground without coverture, forty of them died, and threefcore were left in very weak state at the ship's coming away about the 5th of April following, and arrived in England the 6th of May. Though the harbour be good, the shore is so shallow, they were forced to wade a great way up to the knees in water, and used that that did them much hurt; and little fifth they found but whales, and a great kind of muscle, fo fat that few did eat of them that were not fick. These miseries occasioned fome difcord, and gave fome appearance of faction; but all was fo reconciled, that they united themselves by common consent under their hands, to a kind of combination of a body politic, by virtue whereof to enact and conflitute laws and ordinances, and officers from time to time, as should be thought most convenient for their general good.

Sixteen or feventeen days they could do little for want of their shallop, which was mending, yet Captain Miles Standish, unto whom was joined in council William Bradfor, Stephen Hopkins, and Edward Tilly, went well armed ashore, and by that

time

time they had gone a mile, met five or fix Indians, that fled into the woods. We traced them by the footing eight or ten miles; then the night approaching, we made a fire, by which we lay that night, and the next morning followed the favages by their track, thinking to find their habitations, but by the way we found a deer among it many fair fprings of water, where we refreshed ourselves; then we went ashore and made a fire, that they at the ship might perceive where we were, and so marched to a place where we supposed was a river; by the way we faw many vines, faffafras, haunts of deer, and fowl, and fome fifty acres of plain ground had been planted by the Indians, where were fome of their graves; from thence we followed a path that brought us through three or four fields that had been planted that year; in one grave we digged we found a basket or two of Indian corn; fo much as we could carry we took with us, the rest we buried as we found it, and so proceeded to the place we intended, but we found it not such a harbour as we expected; and fo we returned, till the night caufed us to take up our lodging under a tree, where it rained fix or feven hours. The next morning as we wandered, we passed by a tree, where a young sprig was bowed down over a bough, and some acorns strewed under it, which was one of their gins to catch a deer, and as we were looking at it, Bradford was fuddenly caught by the leg in a noofed rope, made as artificially as ours; as we passed, we saw a leash of bucks, sprung some partridges, and great flocks of wild geefe and ducks, and so we returned well wearied to our ship.

Mr. Jones, our mafter, with four-and-thirty men, also went up and down in the frost and fnow, two or three days in the extremity of the cold, but could find no harbour; only among the old graves we got some ten bushels of corn, some beans, and a bottle of oil; and had we not thus happily found it, we had had no corn for feed, fo that place we ever called Corn-Hill. The next day Mr. Jones, with the corn and our weakest men, returned to the ship; but eighteen of us quartered there that night, and in the morning following the paths, we found in the snow, in a field, a greater hill, or grave, than the rest; digging it, we found first a mat, under that a board three quarters long, painted and carved, with three tins at the top like a coronet; between the mats also were bowls, trays, and dishes, and such trash; at length we found a fair new mat, and under that two bundles, the one bigger, the other lefs; in the greater we found a great quantity of fine red powder, like a kind of embalmment, and yielded a strong but no offensive smell, with the bones and skull of a man that had fine yellow hair still on it, and some of the slesh unconsumed, a knife, a pack-needle, and two or three old iron things were bound up in a failor's canvas caffock, also a pair of cloth breeches; in the less bundle we found likewise of the same powder, and the bones and head of a little child; about the legs and other parts of it were bound ftrings and bracelets of white beads; there was also a little bow, and some other odd knacks; the prettieft we took, and covered again the corps as they were. Not far from thence were two of their houses, where were a great deal of their miserable household fluff, which we left as we found, and fo returned to our boat, and lay aboard that night.

Many arguments we had to make here our plantation or not; in the interim, Mrs. White was brought to bed of a young fon, which was called Perigrine: and a failor shooting at a whale, his piece slew in pieces stock and all, yet he had no hurt. A foolish boy discharging his father's piece hard by half a barrel of powder, and many people by

it, it pleafed God it escaped firing, so that no hurt was done.

But to make a more certain discovery where to feat ourselves, Captain Standish, Mr. Carver, William Branford, Edward Winsloe, John Tilly, Edward Tilly, with divers

others to the number of feventeen, upon the 6th of December fet fail; and having failed fix or feven leagues, we espied eight or ten savages about a dead grampus: still following the shore we found two or three more cast up by the ill weather, many we see in the water, therefore we called it Grampus Bay. Ships may ride well in it, but all the shore is very shallow slats of sand: at last seven or eight of us went ashore, many fields we saw where the savages had inhabited, and a burial place incompassed with a palizado, so we returned to our shallop; in the night we heard a hideous cry and howling of wolves and soxes: in the morning as we were ready to go into our shallop, one of our men being in the woods, came running crying, Indians, Indians; and with all their arrows slying amongst us, some of our men being in the boat, and their arms ashore, so well it chanced, Captain Standish with two or three more discharged their pieces till the rest were ready; one savage more stout than the rest kept under a tree, till he had shot three or four arrows, and endured three or four musket shot; but at last they all sled: this was about break of day in the morning when they saw us, and we not them.

Having the wind fair, we failed along the coast eight or ten leagues, thinking to have got to a harbour where one of our company had been, within eight leagues of Cape Cod, for neither creek nor harbour in this bay we could find; and the wind fo increafed, our rudder broke, and our mast slew overboard, that we were in danger to be cast away; but at last it pleased God we were in an harbour we knew not, thinking it one we were acquainted with; this we found to be an ifle where we rode that night, and having well viewed the land about it, and founded the bay to be a good harbour for our ship, compassed with good land, and in it two fair isles, where there is in their feasons innumerable store of all forts of fish and fowl, good water, much plain land, which hath been planted; with this news we returned to our ship, and with the next fair wind brought her thither, being but within the fight of Cape Cod; in the mean time Goodwife Alderton was delivered of a fon, but dead born. Upon the 28th of December, fo many as could went to work upon the hill, where we purposed to build our platform for our ordnance, which doth command all the plain and the bay, and from whence we may fee far into the fea, and be eafily impaled; fo in the afternoon we went to measure out the grounds, and divided our company into nineteen families, allotting to every person half a pole in breadth and three in length, and so we cast lots where every man should lie, which we staked out, thinking this proportion enough at the first to impale for lodgings and gardens.

Francis Billington, from the top of a tree, feeing a great water fome three miles from us in the land, went with the mafter's mate, and found it two great lakes of fresh water, the bigger five or fix miles in circuit, and an isle in it of a cable's length square; the other three miles in compass, full of fish and fowl, and two brooks isluing from it, which will be an excellent help in time for us, where they saw seven or eight Indian houses, but no people. Four being sent a mile or two from our plantation, two of them straggling into the woods was lost, for coming to a lake of water they found a great deer; having a mastiff bitch and a spaniel with them, they followed so far they could not find the way back; that afternoon it rained, and did freeze and snow at night: their apparel was very thin, and had no weapons but two sickles, nor any victuals, nor could they find any of the savages habitations; when the night came they were much perplexed that they had no other bed than the earth, nor coverture than the skies, but that they heard, as they thought, two lions roaring a long time together very nigh them, so not knowing what to do, they resolved to climb up into a tree, though that would be an intolerable cold lodging, expecting their coming they stood at the tree

root, and the bitch they held fast by the neck, for she would have been gone to the lions or what they were, that as it chanced came not nigh them, so they watched the tree that extreme cold night, and in the morning travelling again, passing by many lakes, brooks and woods, and in one placewhere the savages had burnt four or sive miles in length, which is a fine champaign country, in the afternoon they discovered the two isses in their bay, and so that night near famished they got to their plantation, from whence they had sent out men every way to seek them; that night the house they had built and thatched, where lay their arms, bedding, powder, &c. took fire and was burnt. The coast is so should the ship rides more than a mile from the fort, but God be

thanked no man was hurt though much was burnt. All this time we could not have conference with a favage, though we had many times feen them and had many alarms, fo that we drew a council, and appointed Captain Standish to have the command of all martial actions, but even in the time of confultation the favages gave an alarm: the next day also as we were agreeing upon his orders, came a tall favage boldly amongft us, not fearing any thing, and kindly bid us welcome in English; he was a Sagamo, towards the north, where the ships use to fish, and did know the names of most of the masters that used thither: such victuals as we had we gave him, being the first favage we yet could speak with, he told us this place where we were was called Patuxet, and that all the people three or four years ago there died on the plague: in a day or two we could not be rid of him, then he returned to the Maffafoyts from whence he came, where is fome fixty people, but the Nawfits are one hundred strong, which were they encountered our people at the first. Two days after this Samolet, for fo was his name, came again, and brought five or fix of the Massafoyts with him, with certain skins, and certain tools they had got that we had left in the woods at their alarms: much friendship they promifed, and so departed, but Samoset would not leave us, but feigned himfelf fick, yet at last he went to entreat the favages come again to confirm a peace: now the third time, as we were confulting of our martial orders, two favages appeared, but when we went to them they vanished: not long after came Samofet' and Squanto, a native of Patuxet, where we dwell, and one of them carried into Spain by Hunt, thence brought into England, where a good time he lived; and now here fignified unto us, their great Sachem of Maffafoyt, with Quadaquina his brother, and all their men, was there by to fee us: not willing to fend our governor, we fent Edward Wollislo with presents to them both, to know their minds, making him to understand by his interpreters, how King James did salute him, and was his friend; after a little conference with twenty of his men, he came over the brook to our plantation, where we fet him upon a rug, and then brought our governor to him with drums and trumpets; where after fome circumstances, for they use few compliments, we treated of peace with them to this effect.

That neither he nor any of his should injure or do hurt to any of us; if they did, he should fend us the offender, that we might punish him, and we would do the like to him: if any did unjustly war against him, we would aid him, as he should us against our enemies, and to fend to his neighbour confederates to certify them of this, that they might likewise be comprised in these conditions, that when any of them came to us, they should leave their bow and arrows behind them, as we would our pieces when we came to them, all which the King seemed to like well of, and was applauded of his followers. In his person he is a very lusty man, in his best years, an able body, grave of countenance, and spare of speech; in his attire little differing from the rest after all was done, the governor conducted him to the brook, but kept our hostage

till our messengers returned: in like manner we used Quaddaquina; so all departed

good friends.

Two of his people would have staid with us, but we would not permit them, only Samoset and Squanto we entertained kindly; as yet we have found they intend to keep promise, for they have not hurt our men they have found straggling in the woods, and are astraid of their powerful adversaries the Narrohiggansets, against whom he hopes to make use of our help. The next day Squanto went a fishing for eels, and in an hour he did tread as many out of the oose with his feet as he could lift with his hand,

not having any other instrument.

But that we might know their habitations so well as they ours, Stephen Hopkins and Edward Winslo had Squantum for their guide and interpreter; to Packanoki, the habitation of the King of Massasyt, with a red horseman's coat for a present, to entreat him by reason we had not victuals to entertain them as we would, he would defend his people so much from visiting us; and if he did send, he should always send with the messenger a copper chain they gave him, that they might know he came from him, and also give them some of his corn for seed: that night they lodged at Namascet, some sifteen miles off; by the way we found ten or twelve women and children that still would pester us till we were weary of them, perceiving it is the matter of them, where victuals is to be gotten with most ease, there they will live; but on that river of Namaschot have been many habitations of the savages that are dead, and the land lies waste, and the river abounding with great plenty of fish, and hath been much frequent-

ed by the French.

The next day travelling with fix or feven Indians, where we were to wade over the river, did dwell only two old men of that nation then living, that thinking us enemies, fought the best advantage they could to fight with us, with a wonderful shew of courage; but when they knew us their friends they kindly welcomed us. came to a town of the Massasoyts; but at Pakanoki the King was not: towards night he arrived, and was very proud both of our meffage and prefents, making a great oration to all his people, Was not he Massafoyt, commander of the country about him, was not fuch a town his, and the people of it, and twenty towns more he named was his? and should they not bring their skins to us? To which they answered, they were his and they would, victuals they had none, nor any lodging, but a poor plank or two, a foot high from the ground, whereon his wife and he lay at the one end, we at the other, but a thin mat upon them, two more of his chief men prefied by and upon us, fo that we were worse weary of our lodging than of our journey. Although there is fuch plenty of fifth and fowl and wild beafts, yet are they fo lazy they will not take pains to catch it till mere hunger constrain them, for in two or three days we had scarce a meal's meat, whereby we were fo faint, we were glad to be at home; besides what for the fleas, and their howling and finging in the night in their houses, and the musquitoes without doors, our heads were as light for want of sleep, as our bellies empty for want of meat. The next voyage we made was in a shallop with ten men to Nawfit, fixteen miles from us, to fetch a boy was loft in the woods we heard was there, whom Afpinet their King, had bedecked like a favage, but very kindly he brought him to us, and so returned well to Patuyet.

Immediately after the arrival of the last ship, they sent another of five-and-sifty tons to supply them; with seven-and-thirty persons they set sail in the beginning of July, but being crossed by westerly winds, it was the end of August ere they could pass Plymouth, and arrived in New England at New Plymouth, now so called, the 11th of

November,

November, where they found all the people they left fo ill, lufty and well for all their poverty, except fix, that died: a month they flaid ere they returned to England, loaded with clap-board, wainfcot and wallnut, with about three hogfheads of beaver fkins the 13th of December; and drawing near our coast was set on by a Frenchman set out by the Marquis of Cera, governor of Isle Dieu, where they kept the ship, imprisoned the master and company, took from them to the value of sive hundred pounds, and after sourceen days sent them home with a poor supply of victuals, their

own being devoured by the Marquis and his hungry fervants. Now you are to understand this thirty-seven brought nothing, but relied wholly on us to make us more miferable than before, which the Sachem Couanacus no fooner underflood, but fent to Tufquantum our interpreter, a bundle of new arrows in a fnake's fkin; Tufquantum being abfent, the meffenger departed; but when we understood it was a direct challenge, we returned the fkin full of powder and fhot, with an absolute defiance, which caused us finish our fortification with all expedition. Now betwixt our two favages, Tufquantum and Hobbamock, grew fuch great emulation, we had much ado to know which best to trust. In a journey we undertook, in our way we met a favage of Tufquantums, that had cut his face fresh bleeding, to assure us Massasoyt, our Supposed friend, had drawn his forces to Packanokick to affault us. Hobbamock as confidently affured us it was falfe, and fent his wife as a fpy to fee; but when she perceived all was well, she told the King Massafoyt how Tusquantum had abused him, divers favages also he had caused to believe we would destroy them, but he would do his best to appeafe us; this he did only to make his countrymen believe what great power he had with us to get bribes on both fides, to make peace or war when he would; and the more to possess them with fear, he persuaded many we had buried the plague in our store-house, which we could fend when we listed whither we would; but at last all his knavery being discovered, Massafoyt sent his knife with messengers for his head or him, being his subject; with much ado we appealed the angry King and the rest of the favages, and freely forgave Tufquantum, because he speaking our language we could not well be without him.

A Journey to the Town of Namaschet, in defence of the King of Massasoyt, against the Narrobigganses, and the supposed Death of Squantum.

A GREAT difference there was betwixt the Narrohigganses and the Massaoyts, that had always a jealousy; Coubatant, one of their petty Sachems, was too conversant with the Narrohigganses: this Coubatant lived much at Namaschet, and much stormed at our peace with his King and others; also at Squantum, and Tokamahamon, and Hobbamock our friends, and chief occasioners of our peace, for which he sought to murder Hobbamock; yet Tokamahamon went to him upon a rumour he had taken Massaoyt prisoner, or forced him from his country, but the other two would not, but in private to see if they could hear what was become of their King; lodging at Namaschet they were discovered to Coubatant, who surprized the house and took Squantum, saying, if he were dead the English had lost their tongues; Hobbamock seeing that, and Coubatant held a knife at his breast, being a strong lusty fellow, broke from them, and came to New Plymouth, full of sorrow for Squantum, who he thought was slain.

The next day we fent ten men with him armed, to be revenged of Coubatant, who conducted us near Namaschet, where we rested and refreshed ourselves till midnight, and then we beset the house as we had resolved; those that entered the house demanded for Coubatant; but the savages were half dead with fear: we charged them not to

8

ftir, for we came to hurt none but Coubatant, for killing Squantum; fome of them feeking to escape were wounded: but at last perceiving our ends, they told us Coubatant was gone, and all his men, and Squantum was yet living, and in the town; in this hurly-burly we discharged two pieces at random, which much terrified all the inhabitants, except Squantum and Tokamahamon, who, though they knew not the end of our coming, yet affured themselves of our honesty, that we would not hurt them. The women and children hung about Hobbamock, calling him, friend; and when they faw we would hurt no women, the young youths cried, We are women: to be fhort, we kept them all, and whilft we were fearching the house for Coubatant, Hobbamock had got to the top, and called Squantum and Tokamahamon, which came unto us accompanied with others, fome armed, others naked, those that had bows we took them from them, promifing them again when it was day; the house we took for our quarter that night, and discharged the prisoners, and the next morning went to breakfast at Squantum's house; thither came all them that loved us to welcome us, but all Coubatant's faction was fled: then we made them plainly know the cause of our coming, and if their King Massafoyt were not well, we would be revenged upon the Narrohiggansets, or any that fhould do injury to Hobbamock, Squantum, or any of their friends; as for those were wounded we were forry for it, and offered our furgeon should heal them; of this offer a man and a women accepted, that went home with us, accompanied with Squantum and many other known friends, that offered us all the kindness they could.

From the west of England there are gone ten or twelve ships to fish, which were all well freighted; those that came first at Bilbow, made seventeen pounds a single share, besides beavers, otters, and martin's skins; but some of the rest that came to the same ports, that were all ready surnished, so glutted the market, that the price was abated;

yet all returned fo well contented, that they are preparing to go again.

There is gone from the West Country only to fish, five-and-thirty ships, and about the last of April two more from London, the one of one hundred tons, the other of thirty, with some fixty passengers to supply the plantation. Now though the Turks and French have been somewhat too busy in taking our ships, would all the Christian princes be truly at unity, as His Royal Majesty our Sovereign King James desireth, seventy sail of good ships were sufficient to fire the most of his coasts in the Levant, and make such a guard in the Straits of Hellespont, as would make the great Turk himself more afraid in Constantinople; than the smallest red-cross that crosses the seas would be, either of any French pickaroon, or the pirates of Algiers.

An Abstract of divers Relations sent from the Colony in New England, July 16, 1622.

SINCE the maffacre in Virginia, though the Indians continue their wonted friendship, yet we are more wary of them than before; for their hands hath been imbrued in much English blood, only by too much confidence, but not by force, and we have had small supplies of any thing but men. Here I must intreat a little your favour to digress, they did not kill the English in Virginia, because they were Christians, but for their weapons and copper, which were rare novelties; but now they fear we may beat them out of their dens, which lions and tigers will not admit but by force. But must this be an argument for an Englishman, and discourage any in Virginia or New England? No; for I have tried them both, as you may read at large in the History of Virginia: notwithstanding since I came from thence, the honourable company hath been humble suitors to His Majesty, to get vagabonds and condemned men to go thither; nay, so the business wath been so abused, that so much scorned was the name of Virginia,

ginia, some did chuse to be hanged ere they would go thither, and were: yet for all the worst of spite, detraction, and discouragement, and this lamentable massacre, there is more honest men now suitors to go, than ever hath been constrained knaves. And it is not unknown to most men of understanding, how happy many of those Columners have thought themselves that they might be admitted; and yet pay for their passage to go now to Virginia, and I fear me there goeth too many of those that have shifted here till they could no longer; and they will use that quality there till they hazard all.

To range this country of New England in like manner, I had but eight, as is faid, and amongft their bruit conditions, I met many of their filly encounters, and I give God thanks, without any hurt at all to me, or any with me. When your west-country men were so wounded and tormented with the savages, though they had all the politic directions that had been gathered from all the secret informations could be heard of, yet they found little, and returned with nothing. I speak not this out of vain-glory, as it may be some gleaners, or some who were never there may censure me; but to let all men be affured by those examples, what those savages are that thus strangely do

murder and betray our countrymen: but to the purpofe.

The Paragon, with thirty-feven men fent to relieve them, mifcarried twice upon our English coast, whereby they failed of their supplies. It is true, there hath been taken one thousand bases at a draught; and in one night twelve hogsheads of herrings: but when they wanted all necessaries both for fishing and sustenance, but what they could get with their naked industry, they endured most extreme wants, having been now near two years without any fupply to any purpose, it is a wonder how they should subfift, much less so to resist the favages, fortify themselves, plant fixty acres of corn, befides their gardens that were well replenished with many usual fruits. But in the beginning of July came in two ships of Mr. Weston's, though we much wanted ourfelves, yet we relieved them what we could; and to requite us, they destroyed our corn and fruits then planted, and did what they could to have done the like to us. At last they were transported to Wichaguscusset at the Massachusets, where they abused the favages worfe than us. We having neither trade, nor fcarce any thing remaining, God fent in one Mr. Jones, and a ship of Weston's had been at Monahigan amongst the fishermen, that for beaver-skins and such merchandize as we had, very well refreshed us, though at dear rates. Weston left also his men, a small bark, and much good provifion, and fo fet fail for England: then we joined with them to trade to the fouthward of Cape Cod, twice or thrice we were forced to return; first by the death of their governor, then the fickness of Captain Standish. At last our governor Mr. Bradford undertook it himself to have found the passage betwixt the shoals and the main, then Tufquantum our pilot died, fo that we returned to the Maffachufets, where we found the trade spoiled, and nothing but complaints betwixt the favages and the English. At Nawfet we were kindly used, and had good trade, though we lost our barge, the savages carefully kept both her wreck and some ten hogsheads of corn three months, and fo we returned, fome by land, fome in the ship.

Captain Standish being recovered, went to fetch them both, and traded at Namasket and Monomete, where the people had the plague, a place much frequented with Dutch and French. Here the Sachem put a man, to death for killing his fellow at play, wherein they are so violent, they will play their coats from their backs, and also their wives, though many miles from them. But our provision decaying, Standish is sent to Mattachist, where they pretended their wonted love; yet it plainly appeared they intended to kill him. Escaping thence, we went to Monomete, where we found nothing but bad countenances. Here one Wittuwamat, a notable villain, would boast

how many French and English he had slain: this champion presenting a dagr to the Sachem Canacum he had got from the English, occasioned us to understand how they had contrived to murder all the English in the land, but having such a fair opportunity, they would begin here with us. Their scornful usage made the captain so passionate to appease his anger and choler, their intent made many fair excuses for satisfaction: Scar, a lusty savage, always seeming the most to affect us, bestowed on us the best presents he had without any recompence, saying he was rich enough to bestow such favours on his friends, yet had undertaken to kill the captain himself; but our vigilances so prevented the advantage they expected, we safely returned, little suspect-

ing in him any fuch treachery.

During this time a Dutch ship was driven ashore at Massasowat, whose King lay very fick, now because it is a general custom then for all their friends to visit them, Mr. Winflow and Mr. Hamden, with Habamock for their guide, were fent with fuch cordials as they had to falute him; by the way they fo often heard the King was dead, Habbamock would break forth in thefe words, "My loving Sachem, my loving Sachem, many have I known, but never any like thee, nor shall ever fee the like amongst the favages; for he was no liar, nor bloody and cruel like other Indians, in anger foon reclaimed, he would be ruled by reason, not scorning the advice of mean men, and governed his men better with a few strokes than others with many: truly loving where he loved, yea, he feared we had not a faithful friend left amongst all his countrymen. shewing how oft he had restrained their malice:" much more with much passion he fpoke to this purpose, till at last we arrived where we found the Dutchmen but newly gone, and the house so full we could hardly get in. By their charms they distempered us that were well, much more him that was fick, women rubbing him to keep heat in him; but their charms ended, understanding of us, though he had lost his fight, his understanding failed not; but taking Winslow by the hand, said, Art thou Winflow, oh Winflow, I shall never sec thee again! Habamock telling him what restoratives they had brought, he defired to taste them; with much ado they got a little confection of many comfortable conferves into his mouth, as it diffolved he fwallowed it, then diffolving more of it in water, they feraped his tongue, which was all furred and fwoln, and washed his mouth, and then gave him more of it to eat, and in his drink, that wrought fuch an alteration in him in two or three hours, his eyes opened to our great contents; with this and fuch broths as they there provided for him, it pleased God he recovered: and thus the manner of his sickness and cure caused no fmall admiration amongst them.

During the time of their flay to fee his recovery, they had fent to New Plymouth for divers good things for him, which he took fo kindly, that he fully revealed all the former confpiracies againft us, to which he had oft been moved; and how that all the people of Powmet, Nawfet, Succonet, Mattachift, Manamet, Augawam, and Capawac, were joined to murder us; therefore as we respected our lives, kill them of Massachuset that were the authors; for take away the principals and the plot will cease; thus taking our leaves, and arriving at our fort, we found our brave liberal friend of Pamet drawing Standish to their ambuscadoes, which being thus discovered, we fent him away, as though he knew nor suspected any thing. Them at the Massachusets, some were so wild they served the savages for victuals, the rest sent us word the savages were so insolent they would assault them though against their commission, so fearful they were to break their commission, so much time was spent in consultations, they all were famished, till Wassapinewat again came and told them the day of their

execution was at hand.

Then they appointed Standish with eight chosen men, under colour of trade to catch them in their own trap at Maffachufet, and acquaint it with the English in the town, where arriving, he found none in the bark, and most of the rest without arms, or fcarce cloaths, wandering abroad, all fo fenfelefsly fecure, he more than wondered they were not all flain; with much ado he got the most of them to their town. The favages suspecting their plots discovered, Pecksnot, a great man, and of as great a spirit, came to Habamok, who was then amongst them, saying, Tell Standish we know he is come to kill us, but let him begin when he dare. Not long after many would come to the fort and whet their knives before him, with many braving speeches. One amongst the rest was by Wittawamat, bragging he had a knife that on the handle had the picture of a woman's face; but at home I have one hath killed both French and English, and that hath a man's face on it, and by-and-by these two must marry; but this here by and-by shall fee, and by-and-by eat, but not speak; also Pecksnot being of a greater stature than the captain, told him, though he were a great captain he was but a little man, and I, though no Sachem, yet I am of great strength and courage. These things Standish bore patiently for the present; but the next day seeing he could not get many of them together, but these two roarers, and two more being in a convenient room, and his company about him, Standish seized on Pecksnot's knife then hanging about his neck, wherewith he flew him, and the rest slew Wittawamat and the other favage; but the youth they took, who being brother to Wittawamat, and as villainous as himfelf, was hanged. It is incredible how many wounds they endured, carcing at their weapons without any fear or bruit, till the last gasp. Habamok flood by all this time very filent; but all ended, he faid, "Yesterday Pecksnot bragged of his strength and stature, but I see you are big enough to lay him on the

The town he left to the guard of Weston's people: three savages more were stain; upon which rumour they all sled from their houses. The next day they met with a file of savages that let sly their arrows, shot for shot, till Habamok shewed himself, and then they sled. For all this, a savage boy, to shew his innocency, came boldly unto us, and told us, had the English fugitives but sinished the three canoes they were making, to have taken the ship, they would have done as much to all the English, which was only the cause they had forborne so long. But now consulting and considering their estates, those that went in the pinnace to Barty Isles to get passage for England, the rest to New Plymouth, where they were kindly entertained. The Sachem Obtakeest, and Powas, and divers others were guilty, the three fugitives in their fury there slew; but not long after so distracted were those poor scattered people, they left their habitations, living in swamps, where with cold and infinite diseases they endured much mortality, suing for peace, and crying, The God of England is angry with them. Thus you see where God pleases, as some slourish, others perish.

Now on all hands they prepare their ground, and about the middle of April, in a fair feafon, they begin to plant till the latter end of May; but so God pleased, that in fix weeks after the latter setting their scarce fell any rain; so that the stalk was first set, began to ear ere it came to half growth, and the last not like to yield any thing at all. Our beans also seemed so withered, we judged all utterly dead; that now all our hopes were overthrown, and our joy turned into mourning. And more to our forrow, we heard of the twice return of the Paragon, that now the third time was sent us three months ago, but no news of her: only the signs of a wreck we saw on the coast which we judged her. This caused not every of us to enter into a private consideration betwixt God and our consciences, but most solemnly to humble ourselves before the

Lord by fasting and praying, to relieve our dejected spirits by the comforts of his mercy. In the morning when we affembled all together, the fkies were as clear, and the drought as like to continue as ever; yet our exercife continued eight or nine hours. Before our departure, the fkies were all over-cast, and on the next morning distilled such fost, fweet, moderate showers, continuing fourteen days, mixed with such seasonable weather, as it was hard to fay, whether our withered corn or drooping affections were most quickened and revived; fuch was the bounty and mercy of God. Of this the Indians, by the means of Habamok, took notice, who feeing us use this exercise in the midst of the week, faid; It was but three days fince Sunday, and defired to know the reason; which when he understood, he and all of them admired the goodness of God towards us, shewing the difference betwixt their conjurations and our prayers, and what storms and dangers they oft receive thereby. To express our thankfulness, we affembled together another day, as before, and either the next morning, or not long after, came in two ships to supply us, and all their passengers well except one, and he presently recovered. For us, notwithstanding all these wants, there was not a fick person amongst us. The greater ship we returned freighted; the other we sent to the fouthward, to trade under the command of Captain Altom. So that God be thanked, we defire nothing, but what we will return commodities to the value.

> Thus all men find our great God he, That never wanted nature, To teach his truth, that only he, Of every thing is author.

For this year from England is gone about forty fail of ships, only to fish; and as I am

informed, have made a far better voyage than ever.

Now some new great observers will have this an island, because I have written it is the continent: others report, that the people are fo bruit, they have no religion, wherein furely they are deceived; for my part, I never heard of any nation in the world which had not a religion, deer, bows and arrows. They believe, as do the Virginians, of many divine powers, yet of one above all the rest, as the Southern Virginians call their chief god Kewassa, and that we now inhabit Oke; but both their kings Werowance. Massachusets call their great god Kiehtan, and their kings thereabouts Sachems: the Penobleotes their greatest power Tantum, and their kings Sagomos. Those where is this plantation, fay Kiehtan made all the other gods: also one man and one woman. and of them all mankind, but how they became fo dispersed they know not. They fay, at first there was no king but Kiehtan that dwelleth far westerly above the heavens, whither all good men go when they die, and have plenty of all things. The bad men go thither also and knock at the door, but he bids them go wander in endless want and inifery, for they shall not stay there. They never saw Kichtan, but they hold it a great charge and duty, that one age teach another; and to him they make feafts, and cry and fing for plenty and victory, or any thing is good. They have another power they call Hobamock, which we conceive the devil; and upon him they call to cure their wounds and difeases: when they are curable, he perfuades them he fent them, because they have displeased him; but if they be mortal, then he saith, Kiehtan sent them, which makes them never call on him in their fickness. They fay this Hobamock appears to them fometimes like a man, a deer, or an eagle, but most commonly like a inake; not to all, but only to their Powahs to cure diseases, and Undeses, which is one of the chief next the King, and fo bold in the wars, that they think no weapon can kill them: and those are such as conjure in Virginia, and cause the people to do what they lift.

For

For their government: every Sachemis is not a king, but their great Sachems have divers Sachem under their protection, paying them tribute, and dure make no wars without his knowledge; but every Sachem taketh care for the widows, orphans, the aged and maimed, nor will they take any to first wife, but them in birth equal to themfelves, although they have many inferior wives and concubines that attend on the principal; from whom he never parteth, but any of the rest when they list; they inherit by fuccession, and every one knows their own bounds. To his men, he giveth them land, also bounded, and what deer they kill in that circuit, he hath the fore-part; but if in the water, only the skin: but they account none a man till he hath done some notable exploit: the men are most employed in hunting, the women in flavery; the younger obey the elders: their names are variable; they have harlots and honest women; the harlots never marry, or elfe are widows. They use divorcement, and the King commonly punisheth all offenders himself: when a maid is married, she cutteth her hair, and keeps her head covered till it be grown again. Their arts, games, music, attire, . burials, and fuch like, differ very little from the Virginians, only for their chronicles they make holes in the ground, as the others fet up great stones.

Out of the relations of Mr. EDWARD WINSLOW.

Now I know the common question is, for all those miseries, where is the wealth they have got, or the gold or filver mines? To such greedy unworthy minds I say once again: the sea is better than the richest mine known, and of all the fishing-ships that went well provided, there is no complaint of loss nor misery, but rather an admiration of wealth, profit, and health. As for the land, were it never so good, in two years so sew of such small experience living without supplies so well, and in health, it was an extraordinary blessing from God. But that with such small means they should subsist and do so much, to any understanding judgment is a wonder. Notwithstanding, the vain expectation of present gain in some, ambition in others, that to be great would have all else slaves, and the carelessiness in providing supplies, hath caused those defailments in those plantations, and however some bad conditions will extol the actions of any nation but their own; yet if we may give credit to the Spaniards, Portuguese, and French writings, they endured as many miseries, and yet not in twenty years effected

fo much, nay fcarce in forty.

Thus you may fee plainly the yearly fuccess from New England by Virginia, which hath been fo costly to this kingdom, and fo dear to me, which either to fee perish, or but bleed: Pardon me, though it passionate me beyond the bounds of modesty, to have been fufficiently able to foresee their miseries, and had neither power nor means to prevent it. By that acquaintance I have with them, I call them my children: for they have been my wife, my hawks, hounds, my cards, my dice, and in total, my best content, as indifferent to my heart as my left hand to my right. And notwithstanding, all those miracles of disasters have crossed both them and me, yet were there not an Englishman remaining, as God be thanked, notwithstanding the massacre, there are some thousands; I would yet begin again with as small means as I did at first, not that I have any fecret encouragement (I protest) more than lamentable experience; for all their difcoveries I have yet heard of, are but pigs of my own fow, nor more strange to me than to hear one tell me he hath gone from Billingigate and discovered Gravesend, Tilbury, Queenborough, Lee, and Margate, which to those did never hear of them, though they dwell in England, might be made fome rare fecrets and great countries unknown, except fome few relations of Mr. Dirmer. In England fome are held great travellers that have feen Venice and Rome, Madrid, Toledo, Seville, Algiers, Prague or Ragoufa, Constantinople or Jerusalem, and the pyramids of Egypt; that think it nothing to go to Summer Isles or Virginia, which is as far as any of them, and I hope in time will prove a more profitable and a more laudable journey; as for the danger, you see our ladies and gentlemen account it nothing now to go thither; and therefore I hope all good men will better apprehend it, and not suffer them to languish in despair, whom God so

wonderfully and oft hath preserved.

What here I have writ by relation, if it be not right I humbly entreat your pardons, but I have not spared any diligence to learn the truth of them that have been actors, or sharers in those voyages; in some particulars they might deceive me, but in the substance they could not: for sew could tell me any thing, except where they sished. But seeing all those have lived there, do confirm more than I have writ, I doubt not but all those testimonies with these new-begun examples of plantation, will move both city and country freely to adventure with me more than promises.

But because some fortune-tellers say, I am unfortunate; had they spent their time as I have done, they would rather believe in God than their calculations, and peradventure have given as bad an account of their actions; and therefore I entreat leave to answer those objectors, that think it strange, if this be true, I have made no more use of it, rest so long without employment, nor have no more reward nor preferment;

to which I fay;

I think it more strange they should tax me, before they have tried as much as I have, both by land and sea, as well in Asia and Africa, as Europe and America, where my commanders were actors or spectators, they always so freely rewarded me, I never needed be importunate, or could I ever learn to beg: what there I got, I have spent; yet in Virginia I staid, till I lest sive hundred behind me better provided than ever I was, from which blessed Virgin (ere I returned) sprung the fortunate habitation of Summer Isles.

This Virgin's Sifter, now called New England, at my humble fuit, by our most gracious Prince Charles, hath been near as chargeable to me and my friends: for all which, although I never got a shilling but it cost me a pound, yet I would think my-

felf happy could I fee their prosperities.

But if it yet trouble a multitude to proceed upon these certainties, what think you I undertook when nothing was known but that there was a vast land? I never had power and means to do any thing, though more hath been fpent in formal delays than would have done the business, but in such a penurious and miserable manner, as if I had gone a begging to build an univerfity; where had men been as forward to adventure their purses, and perform the conditions they promised me, as to crop the fruits of my labours, thousands ere this had been bettered by these designs. Thus betwixt the spur of defire and the bridle of reason, I am near ridden to death in a ring of despair; the reins are in your hands, therefore I entreat you case me; and those that think I am either idle or unfortunate, may fee the caufe and know; unless I did fee better dealing, I have had warning enough not to be fo forward again at every motion upon their promifes, unlefs I intended nothing but to carry news; for now they dare-adventure a fhip, that when I went first would not adventure a great, so they may be at home again by Michaelmas, which makes me remember and fay with Mr. Hackluit; Oh incredulity, the wit of fools, that flovingly do fpit at all things fair; a fluggard's cradle, a coward's castle: how easy it is to be an insidel! But to the matter: By this all men may perceive, the ordinary performance of this voyage in five or fix months; the plenty of fish is most certainly approved; and it is certain, from Canada and New England, within these fix years hath come near twenty thousand beaver-skins. Now had each of these ships transported but some small quantity of the most increasing beasts, fowls, fruits, plants, and feeds, as I projected, by this time their increase might have been sufficient for more than one thousand men; but the defire of present gain in many is so violent, and the endeavours of many undertakers so negligent, every one so regarding their private gain, that it is hard to effect any public good, and impossible to bring them into a body, rule, or order, unless both honesty, as well as authority and money, assist experience. But your home-bred engrossing projectors will at last find, there is a great difference betwixt faying and doing, or those that think their directions can be as soon and easily performed, as they can conceit them; or that their conceits are the fittest things to be put in practice, or their countenances maintain plantations. But to conclude, the fishing will go forward whether you plant it or no; whereby a colony may be then transported with no great charge, that in short time might provide such freights, to buy on us there dwelling, as I would hope no ship should go or come empty from New England.

The charge of this is only falt, nets, hooks, lines, knives, Irish rugs, coarse cloth, beads, glass, and such trash, only for sishing and trade with the savages, besides our own necessary provisions, whose endeavours would quickly defray all this charge; and the savages did entreat me to inhabit where I would. Now all those ships, till these last two years, have been sishing within a square of two or three leagues, and scarce any one yet will go any further in the port they sish in, where questionless sive hundred may have their freight as well as elsewhere, and be in the market ere others can have the fish in their ships, because New England's sishing begins in February, in Newsoundland not till the midst of May; the progression hereof tends much to the advancement of Virginia and the Summer Isles, whose empty ships may take in their freights there, and would be also in time of need a good friend to the inhabitants of

Newfoundland.

The returns made by the western men, are commonly divided in three parts; one for the owner of the ship; another for the master and his company; the third for the victuallers, which course being still permitted, will be no hindrance to the plantation, as yet go there never so many, but a means of transporting that yearly for little or nothing, which otherwise will cost many hundreds of pounds. If a ship can gain twenty, thirty, fifty in the hundred; nay three hundred for one hundred in seven or ten months, as you see they have done, spending twice so much time in coming and going as in staying there: were I there planted, seeing the variety of the sishings serve the most part of the year, and with a little labour we might make all the falt we need use, as is formerly said, and conceive no reason to distrust of good success by God's affistance; besides for the building of ships, no place hath more convenient harbours, ebb, nor slood, nor better timber; and no commodity in Europe doth more decay than wood.

Mr. Dee's Opinion for the building of Ships.

MR. DEE recordeth in his British Monarchy, that King Edgar had a navy of four thousand fail, with which he yearly made his progress, about this famous monarchy of Great Britain, largely declaring the benefit thereof; whereupon he projected to our most memorable Queen Elizabeth, the erecting of a fleet of fixty fail, he called a little navy royal: imitating that admired Pericles Prince of Athens, that could never secure that tormented estate, until he was lord and captain of the sea. At this none need wonder, for who knows not Her Royal Majesty during her life, by the incredible adventures of her royal navy, and valiant soldiers and seamen, notwithstanding all trea-

cheries at home, the protecting and defending France and Holland, and reconquering Ireland; yet all the world by fea and land both feared or loved, and admired good Queen Elizabeth. Both to maintain and increase that incomparable honour (God be thanked) to her incomparable fuccessor, our most Royal Lord and Sovereign King James, this great philosopher hath left this to His Majesty and his kingdom's consideration: that if the tenths of the earth be proper to God, it is also due by sea. The King's highways are common to pass, but not to dig for mines or any thing: so Eng-

land's coasts are free to pass but not to fish, but by His Majesty's prerogative.

His Majesty of Spain permits none to pass the Pope's order for the East and West Indies, but by his permission, or at their perils; if all that world be so justly theirs, it is no injustice for England to make as much use of her own shores as strangers do, that pay to their own lords the tenth, and not to the owner of those liberties any thing to speak of, whose subjects may neither take nor sell any in their territories; which small tribute would maintain this little Navy Royal, and not cost His Majesty a penny, and yet maintain peace with all foreigners, and allow them more courtesy than any nation in the world affords to England. It were a shame to alledge, that Holland is more worthy to enjoy our sishing as lords thereof, because they have more skill to handle it than we, as they can our wool and undressed cloth, notwithstanding all their wars and troublescene disorders.

To get money to build this navy, he faith, who would not spare the one-hundredth penny of his rents, and the five-hundredth penny of his goods; each fervant that taketh forty fhillings wages, four-pence; and every foreigner of feven years of age, four-pence for feven years; not any of these but they will spend three times so much in pride, wantonness, or some superfluity; and do any men love the security of their estates, that of themselves would not be humble suitors to His Majesty to do this of free will as a voluntary benevolence, or but the one-half of this (or fome fuch other course, as I have prounded to divers of the companies), free from any constraint, tax, lottery, or imposition; so it may be as honestly and truly employed as it is projected, the poorest mechanic in this kingdom would gain by it. Then you might build ships of any proportion and numbers you pleafe, five times cheaper than you can do here, and have good merchandize for their freight in this unknown land, to the advancement of God's glory, his church and gospel, and the strengthening and relief of a great part of Christendom without hurt to any, to the terror of pirates, the amazement of enemies, the affiftance of friends, the fecuring merchants, and fo much increase of navigation, to make England's trade and shipping as much as any nations in the world, befides a hundred other benefits, to the general good of all true fubjects, and would cause thousands yet unborn to bless the time, and all them that first put it

Now lest it should be obscured as it hath been to private ends, or so weakly undertaken by our overweening incredulity, that strangers may possess it, whilst we contend for New England's good; I have presented it, as I have said, to the Prince and nobility, the gentry and commonalty, hoping at last it will move the whole land to know it and consider of it; since I can find them wood and half victuals, with the aforesaid advantages: were this country planted, with what facility they may build and maintain this little navy royal, both with honour, profit, and content, and inhabit as good a country as any in the world within that parallel, which with my life and what I have, I will endeavour to effect, if God please and you permit. But no man will go from hence to have less freedom there than here, nor adventure all they have to prepare the way for them, will scarce thank them for it;

and

and it is too well known there have been fo many undertakers of patents, and fuch fharing of them, as hath bred no less discouragement than wonder to hear such great promifes and fo little performance; in the interim, you fee the French and Dutch already frequent it, and God forbid they in Virginia, or any of His Majefty's fubjects, should not have as free liberty as they. To conclude, were it not for Mr. Cherley, and a few private adventurers with them, what have we there for all these inducements? As for them whom pride or covetoufness lulleth afleep in a cradle of flothful carelessness, would they but confider how all the great monarchies of the earth have been brought to confusion, or but remember the late lamentable experiences of Constantinople, and how many cities, towns, and provinces, in the fair rich kingdoms of Hungaria, Tranfylvania, Wallachia, and Moldavia, and how many thousands of princes, earls, barons, knights, merchants, and others, have in one day loft goods, lives, and honours, or fold for flaves like beafts in a market-place, their wives, children, and fervants flain, or wandering they knew not whither, dying or living in all extremities of extreme miferies and calamities, furely they would not only do this, but give all they have to enjoy peace and liberty at home, or but adventure their perfons abroad, to prevent the conclusions of a conquering foe, who commonly affaulteth, and best prevaileth where he findeth wealth and plenty most armed with ignorance and fecurity.

Though the true condition of war is only to suppress the proud and defend the innocent, as did that most generous Prince Sigisfmundus, Prince of those countries,
against them whom, under the colour of justice and piety, to maintain their superfluity
of ambitious pride, thought all the world too little to maintain their vice, and undo
them, or keep them from ability to do any thing that would not admire and adore their
honours, fortunes, covetousness, falsehood, bribery, cruelty, extortion, and ingratitude, which is worse than cowardice or ignorance, and all manner of vileness, clean

contrary to all honour, virtue, and noblenefs.

JOHN SMITH writ this with his own hand.

Here follow certain notes and observations of Captain Charles Whitbourne concerning Newfoundland, which although every master trained up in fishing can make their proportions of necessaries according to their custom, yet it is not much amiss here to insert them, that every one which desires the good of those actions know them also. Besides in his book, entitled 'A Discovery of Newfoundland, and the Commodities thereof,' you shall find many excellent good advertisements for a plantation, and how that most years this coast hath been frequented with two hundred and fifty sail of His Majesty's subjects, which supposing but sixty tons a-piece, one with another, they amount to sifteen thousand tons, and allowing twenty-sive men and boys to every bark, they will make five thousand persons, whose labours return yearly to about one hundred and thirty-sive thousand pounds sterling, besides the great numbers of brewers, bakers, coopers, ship-carpenters, net-makers, rope-makers, hook-makers, and the most of all other mechanical trades in England.

The charge of setting forth a ship of one hundred tons with forty persons, both to make a fishing voyage, and increase the plantation.

All these provisions the master or purser is to be accountable what is spent and what is left, with those which shall continue there to plant; and of the forty thus provided for the voyage, ten may well be spared to leave behind them, with five hundred weight of biscuit, sive hogsheads of cyder or beer, half a hogshead of bees, four sides of dry bacon, four bushels of pease, half a firkin of butter, half a hundred weight of cheese, a peck of mustard-seed, a barrel of vinegar, twelve pounds of candles, two pecks of oatmeal, half a hogshead of aqua-vitæ, two copper kettles, one brass crock, one fryingpan, a grindstone, and all the hatches, wood-hooks, saws, augers, &c., and all other iron tools, with the eight boats and their implements, and spare salt, and what else they use, not in a readiness from year to year, and in the mean time served them to help to build their houses, cleanse land, and surther their sishing whilst the ships are

wanting.

By his estimation and calculation these eight boats with twenty-two men in a summer do ufually kill twenty-five thousand fish for every boat, which may amount to two hundred thousand, allowing a hundred and twenty fishes to the hundred; sometimes they have taken above thirty-five thousand for a boat; so that they load not only their own ship, but provide great quantities for facks, or other spare ships which come thither only to buy the overplus: if fuch ships come not, they give over taking any more, when fometimes there hath been great abundance, because there are no fit houses to lay them in till another year; now most of those facks goeth empty thither, which might as well transport men's provision and cattle at an easy rate as nothing, either to New England or Newfoundland, but either to transport them for nothing, or pay any great matter for their liberty to fish, will hardly effect fo much as freedom as yet; nor can this be put in practice, as I before faid, till there be a power there well planted and fettled to entertain and defend them, affift and relieve them as occasion shall require, otherwise those small divisions will effect little, but such miserable conclusions as both the French and we too long have tried to our costs. Now commonly two hundred thousand fish will load a ship of one hundred tons in Newfoundland, but half so many will near do it in New England, which carried to Toulon or Marfeilles, where the custom is small, and the quintal less than ninety English pounds weight, and the price, when least, twelve shillings the quintal, which at that rate amounts to one thousand three hundred and twenty pounds fterling; and the ship may either there be discharged or employed, as hath been faid, to re-freight for England, fo that the next year she may be ready to go her fishing-voyage again at a far cheaper rate than before.

To this add but twelve tons of train-oil, which delivered in Newfoundland, is ten pounds the ton, makes one hundred and twenty pounds, then it is hard if there be not ten thousand of core-fish, which also fold there at five pounds the thousand, makes fifty pounds, which brought to England, in some places yields near half so much more; but if at Marfeilles it be fold for fixteen pounds the quintal, as commonly it is, and much dearer, it amounts to one thousand seven hundred and fixty pounds; and if the boats follow the fishing till the 15th of October, they may take eighty thousand more, which with their train in Newfoundland, at four pounds the thousand, will amount to three hundred and twenty pounds, which added to one thousand three hundred and twenty pounds, with one hundred and twenty pounds for oil, and ten thousand of core-fish fifty pounds, and the overplus at Marfeilles, which will be four hundred and forty pounds, make the total two thousand two hundred and fifty pounds, which divided in three parts, according to their custom, the victualler hath for the former particulars, amounting to four hundred and twenty pounds, seven hundred and fifty-one pounds; so all the charge defrayed, he gains three hundred and thirty-

one pounds eleven shillings; then for the freight of the ship there is seven hundred and sifty-one pounds, and so much for the master and his company; which comparing with the voyages hath been made to New England, you may easily find which is the better though both be good. But now experience hath taught them at New Plymouth, that in April there is a fish much like a herring that comes up into the small brooks to spawn, and where the water is not knee-deep, they will press up through your hands, yea, though you beat at them with cudgels, and in such abundance as is incredible, which they take with that facility, they manure their land with them when they have occasion; after those the cod also presieth in such plenty, even into the very harbours, they have caught some in their arms, and hook them so fast, three men oft loadeth a boat of two tons in two hours, where before they used most to fish in deep water.

The present State of New Plymouth.

AT New Plymouth there is about one hundred and eighty perfons, some cattle and goats, but many swine and poultry, thirty-two dwelling-houses, whereof seven were burnt the last winter, and the value of sive hundred pounds in other goods; the town is impailed about half a mile compass. In the town upon a high mount they have a fort well built with wood, loam, and stone, where is planted their ordnance; also a fair watch-tower, partly framed for the sentinel: the place, it seems, is healthful, for in these last three years, notwithstanding their great want of most necessaries, there hath not one died of the first planters; they have made a falt-work, and with that salt preserve the fish they take, and this year hath freighted a ship of one hundred and eighty tons. The governor is one Mr. William Bradford; their captain, Miles Standish, a bred soldier, in Holland; the chief men for their assistance is Mr. Isaac Alderton, and divers others, as occasion serveth; their preachers are Mr. William Bruster and Mr. John

Layford.

The most of them live together as one family or household, yet every man followeth his trade and profession both by sea and land, and all for a general stock, out of which they have all their maintenance, until there be a dividend betwixt the planters and the adventurers. Those planters are not fervants to the adventurers here, but have only councils of directions from them, but no injunctions or command, and all the mafters of families are partners in land or whatfoever, fetting their labours against the flock, till certain years be expired for the divifin: they have young men and boys for their apprentices and fervants, and fome of them special families, as ship-carpenters, falt-makers, fish-masters, yet as fervants upon great wages. The adventurers which raifed the flock to begin and fupply this plantation were about feventy, fome gentlemen, fome merchants, fome handicrafts men, fome adventuring great fums, fome fmall, as their effaces and affection ferved. The general stock already employed is about feven thousand pounds, by reason of which charge and many crosses, many of them would adventure no more, but others, that know fo great a defign cannot be effected without both charge, lofs and croffes, are refolved to go forward with it to their powers, which deferve no finall commendations and encouragement. Thefe dwell most about London; they are not a corporation, but knit together by a voluntary combination in a fociety without conftraint or penalty, aiming to do good and to plant religion; they have a prefident and treafurer, every year newly chosen by the most voices, who ordereth the affairs of their courts and meetings, and with the affent of the most of them, undertaketh all ordinary businesses, but in more weighty affairs, the affent of the whole company is required. There hath been fishing this year upon the coast about fifty English ships: and by Cape Anne there is a plantation a beginning by the Dorchester men, which they hold of those of New Plymouth, who also by them have set up a fishing work; some talk there is some other pretended plantations, all whose good proceedings the eternal God protest and preserve. And these

have been the true proceedings and accidents in those plantations.

Now to make a particular relation of all the acts and orders in the courts belonging unto them, of the annihilating old patents and procuring new, with the charge, pains, and arguments, the reafons of fuch changes, all the treaties, confultations, orations, and diffentions about the fharing and dividing those large territories, confirming of counfellors, electing all forts of officers, directions, letters of advice, and their answers, disputations about the magazines and impositions, suiters for patents, positions for freedoms, and confirmations with complaints of injuries here, and also the mutinies, examinations, arraignments, executions, and the caufe of the fo often revolt of the favages at large, as many would have had, and it may be, fome do expect it would make more quarrels than any of them would willingly answer, and such a volume as would tire any wife man but to read the contents; for my own part, I rather fear the unpartial reader will think this rather more tedious than necessary: but he that would be a practitioner in those affairs, I hope will allow them not only needful but expedient: but however, if you please to bear with those errors I have committed, if God please I live, my care and pains shall endeavour to be thankful; if I die, accept my good will: if any defire to be further fatisfied, what defect is found in this, they shall find supplied in me, that thus freely have thrown myself with my mite into the treasury of my country's good, not doubting but God will stir up some noble spirits to consider and examine if worthy Columbus could give the Spaniards any fuch certainties for his defign, when Queen Isabel of Spain, set him forth with fifteen fail, and though I promife no mines of gold, yet the warlike Hollanders let us imitate but not hate, whose wealth and strength are good testimonies of their treasury gotten by fishing; and New England hath yielded already by general computation one hundred thousand pounds at the leaft. Therefore honourable and worthy countrymen, let not the meanness of the word fish distaste you, for it will afford as good gold as the mines of Guiana or Potofi, with less hazard and charge, and more certainty and facility.

TRAVELS IN CANADA;

BY THE BARON LAHONTAN.

TO HIS GRACE WILLIAM DUKE OF DEVONSHIRE,

Lord Steward of Her Majesty's Houshold, Lord Lieutenant of the County of Derby, Chief Justice in Eyre of all Her Majesty's Forests, Chaces, Parks, &c. Trent-North; one of the Lords of Her Majesty's Most Honourable Privy Council, and Knight of the Most Noble Order of the Garter.

My Lord,

SINCE I had the honour to prefent the King of Denmark with the first part of this book, I presume to make a present of the latter to Your Grace. In making the first dedication, I had no other inducement, than a due regard to the benefits I receiv'd from His Majesty's favour; and the same motive with reference to Your Grace, has prompted me to make this acknowledgment of the undeserved favours you kindly vouch-safed me.

I did not dare to launch out into the praise of His Danish Majesty, who has a just title to all forts of encomiums; by reason that the little French I had has been forgot among a fort of people, that take panegyrics to be affronts. 'Tis with the same view, my Lord, that I decline the pleasure of publishing those distinguishing qualities, that place Your Lordship at the head of the most accomplished Grandees of the world, and the most zealous patriots of their country.

I am, with all gratitude and veneration,

My Lord,

Your Grace's most humble, and most obedient servant,

LAHONTAN.

THE PREFACE.

HAVING flattered myself with the vain hopes of retrieving the King of France's favour, before the declaration of this war, I was so far from thinking to put these letters and memoirs to the press, that I designed to have committed 'em to the slames, if that Monarch had done me the honour of reinstating me in my former places, with the good leave of Messirs. de Pontchartrain†, the sather and the son. 'Twas with that

^{* 2}d Edition, London 1735, 2 vols. 8vo.

⁺ The one Chancellor of France, and the other Secretary of State; both of them vallly rich.

view that I neglected to put 'em in fuch a dress as might now be wished for, for the

fatisfaction of the reader that gives himself the trouble to peruse 'em.

Between the fifteenth and fixteenth year of my age I went to Canada, and there took care to keep up a constant correspondence by letters with an old relation, who had required of me a narrative of the occurrences of that country, upon the account of the yearly assistance he gave me. 'Tis these very letters that make the greatest part of the first volume. They contain an account of all that pass'd between the English, the French, the Iroquese, and the other savage nations, from the year 1683 to 1694. Together with a great many curious remarks, that may be of use to those who have any knowledge of the English or French colonies.

The whole is writ with a great deal of fidelity; for I represent things just as they are. I neither flatter nor spare any person whatsoever; I attribute to the Iroquese*, the glory they have purchased on several occasions, though at the same time I hate that rascally people, as much as horns and law-suits. Notwithstanding the veneration I have for the clergy, I impute to them all the mischief the Iroquese have done to the French colonies, in the course of a war that had never been undertaken, if it had not been for

the councils of these pious churchmen.

The reader is defired to take notice that the towns of New York are known to the French by their old names only, and for that reafon I was oblig'd to make use of the same in my letters, as well as my maps. They give the name of New York to all that country, that reaches from the source of its river to the mouth, that is, to the island, upon which there stands a city call'd in the time of the Dutch, Manathe, and now by the English, New York. In like manner the plantation of Albany, that lies towards.

the head of the river, is call'd by the French, Orange.

Farther; I would not have the reader to take it amifs, that the thoughts of the favages are fet forth in an European drefs. The occasion of that choice proceeded from the relation I corresponded with; for that honest gentleman ridiculed the metaphorical harangue of the Grangula†; and intreated me not to make a literal translation of a language that was so stuffed with sictions and savage hyperboles. It is for this reason that all the discourses and arguments of those nations are here accommodated to the European style and way of speaking; for having complied with my friend's request, I contented myself in keeping only a copy of the letters I writ to him, during my pil-

grimage in the country of these naked philosophers.

It will not be improper to acquaint the reader, by the bye, that those who know my faults, do as little justice to these people, as they do to me, in alleging I am a savage myself, and that that makes me speak so favourably of my fellow-savages. These observers do me a great deal of honour, as long as they do not explain themselves, so as to make me directly of the same character with that which is tacked to the word savage by the Europeans in their way of thinking: for in saying only that I am of the same temper with the savages, they give me, without design, the character of the honestest man in the world. It is an uncontested truth, that the nations which are not debauched by the neighbourhood of the Europeans, are strangers to the measures of meum and tuum, and to all laws, judges, and priests. This cannot be called in question, since all travellers that visit those countries, vouch for its truth; and a great many of different professions have given the world repeated assurances that it is so. Now this being granted, we ought not to scruple to believe, that these are such wise

[·] Called by the English in New York, Mahak.

and reasonable people. I take it, a man must be quite blind who does not see that the property of goods (I do not speak of the ingrossing of women) is the only source of all the disorders that perplex the European societies. Upon that consideration it will be easy to perceive, that I have not spoke wide in describing that wisdom and acuteness which shines through the words and actions of these poor Americans. If all the world had access to the books of voyages that are found in some weil-stocked libraries, they would find in above a hundred descriptions of Canada, an infinity of discourses and arguments offered by the savages, which are incomparably stronger, and more nervous than those I have inserted in my memoirs.

As for fuch as doubt of the inftinct and wonderful capacity of beavers, they need only to cast their eyes upon the great map of America, drawn by the Sieur de Fer, and engraved at Paris in the year 1698; where they will meet with several surprizing things

relating to these animals.

While my book was printing in Holland, I was in England; and as foon as it appeared, feveral English gentlemen of distinguished merit, who understand the French as well as their mother tongue, gave me to know, that they would be glad to fee a more ample relation of the manners and customs of the people of that continent, whom we call by the name of favages. This obliged me to communicate to these gentlemen the fubstance of the feveral conferences I had in that country with a certain Iluron, whom the French call Rat. While I stayed at that American's village, I employed my time very agreeably in making a careful collection of all his arguments and opinions; and as foon as I returned from my voyage upon the lakes of Canada, I shewed my manuscript to Count Frontenac, who was so pleased with it, that he took the pains to affift me in digeffing the dialogues, and bringing them into the order they now appear in: for, before that, they were abrupt conferences without connexion. Upon the folicitation of these English gentlemen, I have put these dialogues into the hands of the person who translated my letters and memoirs: and if it had not been for their pressing instances, they had never seen the light; for there are but sew in the world that will judge impartially, and without prepoffession of some things contained in them.

I have likewise entrusted the same translator with some remarks that I made in Portugal and Denmark, when I sled thither from Newsoundland. There the reader will meet with a description of Lisbon and Copenhagen, and of the capital city of

Arragon.

To the translation of my first volume, I have added an exact map of Newfoundland, which was not in the original. I have likewise corrected almost all the cuts of the Holland impression, for the Dutch gravers had murdered them, by not understanding their explications, which were all in French. They have engraved women for men, and men for women; naked persons for those that are clothed, and è contra. As for the maps, the reader will find them very exact; and I have taken care to have the

tracts of my voyages more nicely delineated than in the original.

I understand by letters from Paris, that the two Messieurs de Pontchartrain endeavour by all means to be revenged upon me for the assront they say I gave them in publishing jome trisling stories in my book, that ought to have been concealed. I am likewise informed, that I have reason to be apprehensive of the resentment of several ecclesiastics, who pretend I have insulted God in consuring their conduct. But since I expected nothing less than the surious resentment both of the one and the other, when I put this book to the press; I had time enough to arm myself from top to toe, in order to make

head

head against them. It is my comfort, that I have writ nothing but what I make good by authentic proofs; besides, that I could not have said less of them than I have done; for if I had not tied myself up to the direct thread of my discourse, I could have made digressions, in which the conduct both of the one and the other would have appeared to be prejudicial to the repose of the society, and the public good. I had provocation enough to have treated them in that manner; but my letters being addressed to an old bigotted relation of mine, who sed upon devotion, and dreaded the influence of the court; he still beseched me to write nothing to him that might disoblige the clergy or the courtiers, for fear of the intercepting of my letters. However, I have advice from Paris, that some pedants are set at work to lash me in writing; and so I must prepare to stand the brunt of a shower of affronts, that will be poured upon me in a few days. But it is no matter; I am so good a conjurer, that I can ward off any storm from the side of Paris. I laugh at their threats; and since I cannot make use of my

fword, I'll wage war with my pen.

This I only mention, by the by, in this my Preface to the Reader, whom I pray the Heavens to crown with prosperity, in preserving him from having any business to adjust with most of the ministers of state, and priests; for let them be never so faulty, they'll still be faid to be in the right, till such time as anarchy be introduced amongst us, as well as the Americans, among whom the forryest fellow thinks himself a better man than a Chancellor of France. These people are happy in being screen'd from the tricks and shifts of ministers, who are always masters wherever they come. I envy the state of a poor savage, who tramples upon laws, and pays homage to no sceptre. I wish I could spend the rest of my life in his hut, and so be no longer exposed to the chagrin of bending the knee to a fet of men that facrifice the public good to their private interest, and are born to plague honest men. The two ministers of state I have to do with, have been folicited in vain, by the Duchess of Lude, Cardinal Bouillon, Count Guiscar, Mr. De Quiros, and Count D'Avaux: nothing could prevail, though all that is laid to my charge confifts only in not bearing the affronts of a governor, whom they protect; at a time when a hundred other officers who live under the imputation of crimes, infinitely greater than mine, are excused for three months absence from court. Now the reason is, that they give less quarter to those who have the misfortune to displease the two Messieurs De Ponchartrain, than to such as act contrary to the King's orders.

But after all my misfortunes, I have this to folace me, that I enjoy in England a fort of liberty that is not met with elfewhere: for one may juftly fay, that of all the countries inhabited by civilized people, this alone affords the greatest perfection of liberty; nay, I do not except the liberty of the mind, for I am convinced that the English maintain it with a great deal of tenderness: so true it is, that all degrees of slavery are abhorred by this people, who shew their wisdom in the precautions they

take to prevent their finking into a fatal fervitude.

LETTER I.

Dated at the Port of Quebec, Nov. 8, 1683.

Containing a Description of the Passage from France to Canada, with some Remarks upon the Coasts, Channels, &c., and the Variation of the Needle.

SIR,

I AM furprized to find that a voyage to the New World is fo formidable to those who are obliged to undertake it; for I folemnly protest, that it is far from being what the world commonly takes it for. It is true the passage is in some measure long, but then the hopes of viewing an unknown country, atones for the tediousness of the voyage. When we broke ground from Rochelle, I acquainted you with the reasons that moved Mr. Le Fevre de la Barre, governor-general of Canada, to fend the Sieur Mahu, a Canadese, to France; and at the same time gave you to know, that he had resolved upon the utter destruction of the Iroquese, who are a very warlike and savage people. These barbarians befriend the English, upon the account of the succours they receive from them; but they are enemies to us, upon the apprehension of being destroyed by us some time or other. The General I spoke of but now, expected that the King would send him seven or eight hundred men; but when we set out from Rochelle, the season was so far advanced, that our three companies of marines were reckoned a sufficient venture.

I met with nothing in our passage that was disagreeable, abating for a storm that alarmed us for fome days, upon the precipice of the bank of Newfoundland, where the waves fwell prodigiously, even when the winds are low. In that storm our frigate received fome rude shocks from the fea; but in regard that such accidents are usual in that voyage, they made no impression upon the old seasoned failors. As for my part, I could not pretend to that pitch of indifference, for having never made fuch a voyage before, I was fo alarmed in feeing the waves mount up to the clouds, that I made more vows to Neptune than the brave Idomenaus did in his return from the wars of Troy. After we made the bank, the waves funk, and the wind dwindled, and the fea became fo fmooth and eafy, that we could not work our flip. You can fcarce imagine what quantities of cod-fish were caught there by our feamen in the fpace of a quarter of an hour, for though we had thirty-two fathom water, yet the hook was no fooner at the bottom than the fifth was caught, fo that they had nothing to do but to throw in and take up without interruption: but after all, fuch is the miffortune of this fishery, that it does not succeed but upon certain banks, which are commonly past over without stopping. However, as we were plentifully entertained at the cost of these fishes, so such of them at continued in the sea made sufficient reprifals upon the corple of a captain and of feveral foldiers, who died of the fcurvy, and were thrown overboard three or four days after.

In the meantime the wind veering to the west-north-west, we were obliged to lay by for five or fix days; but after that it chopped to the north, and so we happily made-Cape Rase, though indeed our pilots were at a loss to know where we were, by reason that they could not take the latitude for ten or twelve days before. You may easily imagine that it was with great joy that we heard one of our sailors call from the top-mast, Land, land, just as St. Paul did when he approached to Malta, $\Gamma_{n\nu}^{\alpha} \delta_{\rho} \tilde{\omega}$, $\Gamma_{n\nu}^{\alpha} \delta_{\rho} \tilde{\omega}$; for you must know that when the pilots reckon they approach to land, they

use the precaution of sending up failors to the top-mast, in order to some discovery, and thefe failors are relieved every two hours till night comes, at which time they furl their fails if the land is not yet descried, so that in the night-time they scarce make any way. From this it appears how important it is to know the coast, before you approach to it; nay, the paffengers put fuch a value upon the discovery, that they present the first discoverer with some pistoles. In the meantime you'll be pleased to observe, that the needle of the compass, which naturally points to the north, turns upon the bank of Newfoundland, 23° towards the north-west, that is, it points there a degree nearer to the west than north-north-west. This remark we made by our com-

pals of variation.

We deferied the cape about noon, and in order to confirm the difcovery, stood in upon it with all fails aloft. At laft, being affured that it was the promontory we looked for, an universal joy was spread throughout the ship, and the sate of the wretches that we had thrown overboard was quite forgot. Then the failors fet about the christening of those who had never made the voyage before; and indeed they had done it sooner, if it had not been for the death of our above-mentioned companions. The christening I speak of, is an impertinent ceremony, practifed by feafaring men, whose humours are as strange and extravagant as the element itself, upon which they foolishly trust themselves. By virtue of a custom of old standing, they profane the sacrament of baptism in an unaccountable manner. Upon that occasion the old failors being blackened all over, and difguifed with rags and ropes, force the greener fort that have never passed some certain degrees of latitude before, to fall down on their knees, and to fwear upon a book of fea-charts, that upon all occasions they will practife upon others, the same ceremony that is then made use of towards them. After the administering of this ridiculous oath, they throw fifty buckets full of water upon their head, belly, and thighs, and indeed, all over their bodies, without any regard to times or feafons. This piece of folly is chiefly practifed under the equator, under the tropics, under the polar circles, upon the bank of Newfoundland, and in the Streights of Gibraltar, the Sund, and the Dardanelles. As for persons of note or character, they are exempted from the ceremony, at the expence of five or fix bottles of brandy for the flip's crew.

Three or four days after the performance of this folemnity, we discovered Cape Raye, and fo made up to St. Lawrence Bay, in the mouth of which we were becalmed for a little while, and during that calm we had a clearer and pleafanter day than any we had feen in the passage. It looked as if that day had been vouchsafed us by way of recompence for the rains, fogs, and high winds that we encountered by the way. There we faw an engagement between a whale and a fword-fish*, at the distance of a gun-flot from our frigate. We were perfectly charmed when we saw the sword-fish jump out of the water in order to dart its spear into the body of the whale, when obliged to take breath. This entertaining show lasted at least two hours, sometimes to the starboard and sometimes to the larboard of the ship. The sailors, among whom fuperstition prevails as much as among the Egyptians, took this for a presage of some mighty from; but the prophecy ended in two or three days of contrary winds, during which time we traverfed between the island of Newfoundland and that of Cape Breton. Two days after we came in fight of the island of Fowls, by the help of a north-east wind, which drove us from the mouth of St. Lawrence Bay to the Isle of Anticosti,

^{*} Espadon, a fish between ten and fifteen feet long, being four feet in circumference, and having in its frout a fort of faw which is four feet long, four inches broad, and fix lines thick. LL2

upon the bank of which we thought to have been cast away, by nearing it too much. In the mouth of that river we fell into a second calm, which was followed by a contrary wind, that obliged us to lie by for some days. At last we made Tadoussac, by

gradual approaches, and there came to an anchor.

This river is four leagues broad where we then rode, and twenty-two at its mouth, but it contracts itself gradually as it approaches to its source. Two days after the wind standing east, we weighed anchor, and being favoured by the tide, got safe through the channel of the Red Island, in which the currents are apt to turn a vessel on one fide, as well as at the island of Coudress, which lies some leagues higher. But upon the coast of the last island, we had certainly struck upon the rocks if we had not dropped an anchor. Had the ship been cast away at that place we might easily have faved ourselves: but it proved so, that we were more afraid than hurt. Next morning we weighed with a fresh gale from the east, and the next day after came to an anchor over against Cape Tourmente, where we had not above two leagues over, though at the same time it is a daugerous place to those who are unacquainted with the channel. From thence we had but feven leagues failing to the port of Quebec, where we now ride at anchor. In our passage from the Red Island to this place, we saw fuch floats of ice, and fo much fnow upon the land, that we were upon the point of turning back for France, though we were not then above thirty leagues off our defired port. We were afraid of being stopped by the ice, and so lost; but thank God we escaped.

We have received advice, that the governor has marked our quarters for our troops in some villages or cantons adjacent to this city; so that I am obliged to prepare to go ashore, and therefore must make an end of this letter. I cannot as yet give you any account of the country, excepting that it is already mortally cold. As to the river, I mean to give you a more ample description of it, when I come to know it better. We are informed that Mr. De la Salle is just returned from his travels, which he undertook upon the discovery of a great river that falls into the Gulf of Mexico, and that he embarks to-morrow for France. He is perfectly well acquainted with Canada, and for that reason you ought to visit him if you go to Paris this winter. I am,

Sir, yours, &c.

LETTER II.

Dated at the Canton of Beauprè, May 2, 1684.

Containing a Description of the Plantations of Canada, and the Manner in which they were first formed: as also an Account of the Transportation of Whores from France to that Country; together with a View of its Climate and Soil.

SIR,

AS foon as we landed last year, Mr. De la Barre lodged our three companies in fome cantons or quarters in the neighbourhood of Quebec. The planters call these places Cotes, which in France fignises no more than the sea-coast; though in this country, where the names of town and village are unknown, that word is made use of to express a seignory or manor, the houses of which lie at the distance of two or three hundred paces one from another, and are seated on the brink of the river of St. Laurence. In earnest, Sir, the boors of those manors live with more case and conveniency than an infinity of the gentlemen in France. I am out indeed in calling them boors, for

that name is as little known here as in Spain; whether it be that they pay no taxes, and enjoy the liberty of hunting and fishing, or that the easiness of their life, puts them upon a level with the nobility. The poorest of them have for arpents * of ground in front, and thirty or forty in depth: the whole country being a continued forest of lofty trees, the stumps of which must be grubbed up before they can make use of a plough. It is true, this is a troublesome and chargeable task at first; but in a short time after they make up their losses; for when the virgin ground is capable of receiving feed, it yields an increase to the rate of an hundred-fold. Corn is there sown in May, and reaped about the middle of September. Instead of threshing the sheafs in the field, they convey them to barns, where they lie till the coldest season of the winter, at which time the grain is more easily disengaged from the ear. In this country they likewise sow pease, which are much esteemed in France. All forts of grain are very cheap here, as well as butchers meat and sowl. The price of wood is almost nothing, in comparison with the charge of its carriage, which after all is very inconsiderable.

Most of the inhabitants are a free fort of people that removed hither from France, and brought with them but little money to set up withal: the rest are those who were soldiers about thirty or forty years ago, at which time the regiment of Carignan was broke, and they exchanged a military post for the trade of agriculture. Neither the one nor the other paid any thing for the grounds they posses, no more than the officers of these troops, who marked out to themselves certain portions of unmanured and woody lands; for this vast continent is nothing else than one continued forest. The governors-general allowed the officers three or four leagues of ground in front, with as much depth as they pleased; and at the same time the officers gave the soldiers as much ground as they pleased, upon the condition of the payment of a crown per arpent, by

way of fief.

After the reform of these troops, several ships were sent hither from France, with a cargo of women of an ordinary reputation, under the direction of some old stale nuns. who ranged them in three classes. The vestal virgins were heaped up, (if I may so fpeak) one above another, in three different apartments, where the bridegrooms fingled out their brides, just as a butcher does an ewe from amongst a flock of sheep. In these three feraglios, there was fuch variety and change of diet as could fatisfy the most whimfical appetites; for here was some big, some little, some fair, some brown, some fat and fome meagre; in fine, there was fuch accommodation that every one might be fitted to his mind: and indeed the market had fuch a run, that in fifteen days time, they were all disposed of. I am told, that the fattest went off best, upon the apprehenfrom that these being less active, would keep truer to their engagements, and hold out better against the nipping cold of the winter: but after all, a great many of the headventurers found themselves mistaken in their measures. However, let that be as it will, it affords a very curious remark, namely, that in some parts of the world, to which the vicious European women are transported, the mob of those countries does feriously believe that their fins are so defaced by the ridiculous christening I took notice of before, that they are looked upon ever after as ladies of virtue, of honour, and of untarnished conduct of life. The sparks that wanted to be married made their addresses to the above mentioned governesses, to whom they were obliged to give an account of their goods and estates before they were allowed to make their choice in the three feraglios. After the choice was determined, the marriage was concluded upon the fpot, in the

^{*} An arpent is a fpot of ground containing one hundred perches square, each of which is eighteen feet long.

presence

presence of a priest, and a public notary; and the next day the governor-general bestowed upon the married couple a bull, a cow, a hog, a sow, a cock, a hen, two barrels of salt meat, and eleven crowns; together with a certain coat of arms called by the Greeks * * \(\xi_0 \alpha \alpha \alpha \alpha \). The officers having a nicer taste than the soldiers, made their application to the daughters of the ancient gentlemen of the country, or those of the richer fort of inhabitants; for you know, that Canada has been possessed by the

French above an hundred years.

In this country every one lives in a good and a well furnished house; and most of the houses are of wood, and two stories high. Their chimnies are very large, by reason of the prodigious fires they make to guard themselves from the cold, which is there beyond all measure, from the month of December to that of April. During that space of time, the river is always frozen over, notwithstanding the flowing and ebbing of the sea; and the snow upon the ground is three or four feet deep; which is very strange in a country that lies in the latitude of 47° and some odd minutes. Most people impute the extraordinary snow to the number of mountains with which this vast continent is replenished. Whatever is in that matter, I must take notice of one thing, that seems very strange, namely, that the summer days are longer here than at Paris. The weather is then so clear and serene, that in three weeks time you shall not see a cloud in the horizon. I hope to go to Quebec with the first opportunity; for I have orders to be in a readiness to embark within sisten days for Monreal, which is the city of this country, that lies farthest up towards the head of the river. I am,

Sir, yours, &c.

LETTER III.

Dated at Quebec, May 15, 1684.

Containing an ample Description of the City of Quebec, and of the Island of Orleans.

BEFORE I fet out for Monreal, I had the curiofity to view the island of Orleans, which is feven leagues in length, and three in breadth: it extends from over against Cape Tourmente, to within a league and a half of Quebec, at which place the river divides itself into two branches. The ships fail through the South Channel; for the North Channel is fo foul with shelves and rocks, that the small boats can only pass that way. The island belongs to a General Farmer of France, who would make out of it a thousand crowns of yearly rent, if himself had the management of it. It is surrounded

with plantations that produce all forts of grain.

Quebec is the metropolitan of New France, being almost a league in circumference; it lies in the latitude of 47° 12′. The longitude of this place is uncertain, as well as that of several other countries, with the leave of the geographers, that reckon you up one thousand two hundred leagues from Rochelle to Quebec, without taking the pains to measure the course: however, I am sure that it lies but at too great a distance from France for the ships that are bound hither; for their passage commonly lasts for two months and a half, whereas the homeward-bound ships may in thirty or forty days failing easily make the Belle Isle, which is the surest and most usual land that a ship makes upon a long voyage. The reason of this difference is, that the winds are easterly for one hundred days of the year, and westerly for two hundred and fixty.

Ouebec is divided into the upper and lower city. The merchants live in the latter, for the conveniency of the harbour: upon which they have built very fine houses, three ftory high, of a fort of stone that is as hard as marble. The upper or high city is full as populous and as well adorned as the lower. Both cities are commanded by a castle, that stands upon the highest ground. This castle is the residence of the governors, and affords them not only convenient apartments, but the nobleft and most extensive prospect in the world. Quebec wants two effential things, namely, a key and fortifications: though both the one and the other might be eafily made, confidering the conveniency of flones lying upon the fpot. It is incompassed with several springs, of the best fresh water in the world, which the inhabitants draw out of wells; for they are fo ignorant of the hydrostatics, that not one of them knows how to convey the water to certain basins, in order to raise either flat or spouting fountains. Those who live on the riverfide, in the lower city, are not half fo much pinched with the cold as the inhabitants of the upper; befides that the former have a peculiar conveniency of transporting in boats, corn, wood, and other necessaries to the very doors of their houses: but as the latter are more exposed to the injuries of the cold, so they enjoy the benefit and pleasure of a cooler fummer. The way which leads from the one city to the other is pretty broad, and adorned with houses on each fide; only it is a little steep. Quebec stands upon a very uneven ground; and its houses are not uniform. The intendant lives in a bottom, at some small distance from the side of a little river, which, by joining the river of St. Lawrence, coops up the city in a right angle. His house is the palace in which the fovereign council affembles four times a week; and on one fide of which we fee great magazines of ammunition and provisions. There are fix churches in the high city: the cathedral confifts of a bishop, and twelve prebendaries, who live in common in the chapter-house, the magnificence and architecture of which is truly wonderful. These poor priefts are a very good fort of people; they content themselves with bare necesfaries, and meddle with nothing but the affairs of the church, where the fervice is performed after the Roman way. The fecond church is that of the Jesuits, which stands in the center of the city; and is a fair, stately, and well lighted edifice. The great altar of the Jefuits' church is adorned with four great cylindrical columns of one ftone; the stone being a fort of Canada prophyry, and black as jet, without either spots or veins. These fathers have very convenient and large apartments, beautified with pleasant gardens, and feveral rows of trees, which are fo thick and buffy, that in fummer one might take their walks for an ice-house: and indeed we may say without stretching, that there is ice not far from them, for the good fathers are never without a referve in two or three places, for the cooling of their drink. Their college is fo fmall, that at the best they have scarce fifty scholars at a time. The third church is that of the Recollects, who, through the intercession of Count Frontenac, obtained leave of the King to build a little chapel, (which I call a church) notwithstanding the remonstrances of Mr. De Laval, our bishop, who, in concert with the Jesuits, used his utmost efforts for ten years together to hinder it. Before the building of this chapel, they lived in a littlehospital that the bishop had ordered to be built for them; and some of them continue there still. The fourth church is that of the Urselines, which has been burned down two or three times, and still rebuilt to advantage. The fifth is that of the Hospitalorder, who take a particular care of the fick, though themselves are poor, and but illi lodged.

The fovereign council is held at Quebec. It confifts of twelve counfellors of Capaly de Spada *, who are the supreme judicature, and decide all causes without appeals.

^{*} See the explication table.

The intendant claims a right of being prefident to the council; but in the justice-hall the governor-general places himself so as to face him, the judges being set on both sides of them, so that one would think they are both presidents. While Monsieur de Frontenac was in Canada, he laughed at the pretended precedency of the intendants; nay, he used the members of that assembly as roughly as Cromwell did the parliament of England. At this court every one pleads his own cause, for solicitors or barristers never appear there; by which means it comes to pass, that law-suits are quickly brought to a period, without demanding court-sees or any other charges from the contending parties. The judges, who have but four hundred livres a year from the King, have a dispensation of not wearing the robe and the cap. Besides this tribunal, we have in this country a lieutenant-general, both civil and military, an attorney-gene-

ral, the great provoft, and a chief-justice in eyre.

The way of travelling in the winter, whether in town or country, is that of fledges drawn by horses; who are so insensible of the cold, that I have seen sifty or fixty of them in January and February stand in the snow up to their breast, in the midst of a wood, without ever offering to go near their owner's house. In the winter-time they travel from Quebec to Monreal upon the ice, the river being then frozen over; and upon that occasion these sledges will run you fifteen leagues a day. Others have their fledges drawn by two mastiff dogs, but then they are longer by the way. As for their way of travelling in fummer, I shall transmit you an account of it, when I come to be better informed. I am told that the people of this country will go a thousand leagues in canoes of bark; a description of which you may expect, as soon as I have made use of them. The easterly winds prevail here commonly in the spring and autumn; and the westerly have the ascendant in winter and summer. Adieu, Sir: I must now make an end of my letter, for my matter begins to run short. All I can say is, that as foon as I am better instructed in what relates to the commerce, and the civil and ecclefiaftical government of the country, I will transmit you such exact memoirs of the fame, as shall give you full fatisfaction. These you may expect with the first opportunity; for in all appearance our troops will return after the conclusion of the campaign that we are now going to make in the country of the Iroquefe, under the command of Monsieur de la Barre. In seven or eight days time I mean to embark for Monreal; and in the meantime am going to make a progress to the villages to the Scilleri, of Saut de la Chaudiere, and of Lorete, which are inhabited by the Abenakis and the Hurons. These places are not above three or four leagues off; so that I may return with eafe next week. As for the manners of the people, I cannot pretend to describe them so soon; for a just observation and knowledge of these things cannot be compassed without time. I have been this winter at hunting with thirty or forty young Algonkins, who were well-made clever fellows. My defign in accompanying them was to learn their language, which is mightily esteemed in this country; for all the other nations for a thousand leagues round (excepting the Iroquese and the Hurons) understand it perfectly well; nay, all their respective tongues come as near to this, as the Portuguese does to the Spanish. I have already made myself master of fome words with a great deal of facility; and they being mightily pleafed in feeing a stranger study their tongue, take all imaginable pains to instruct me.

I am, Sir, yours, &c.

LETTER IV.

Dated at Monreal, June 14, 1684.

Containing a brief Description of the Habitations of the Savages in the Neighbourhood of Quebec: of the River of Saint Lawrence, &c. as far up as Monreal: of a curious way of fishing Eels, and of the Cities of Fois Rivieres and Monreal: together with an Account of the Conduct of the Forest Rangers* or Pedlars.

SIR,

BEFORE my departure from Quebec, I visited the adjacent villages inhabited by the favages. The village of Lorete is peopled by two hundred families of Hurons, who were converted to Christianity by the Jesuits, though with a great deal of reluctancy. The villages of Sillery and of Saut de la Chaudiere, are composed of three hundred families of Abenakis, who are likewife Christians, and among whom the Jesuits have settled missionaries. I returned to Quebec time enough, and embarked under the conduct of a master, that would rather have had a lading of goods than of foldiers. The north-east winds wafted us in five or fix days to Trois Rivieres, which is the name of a small city, seated at the distance of thirty leagues from hence. That city derives its name from three rivers, that fpring from one channel, and after continuing their division for some space, re-unite into a joint stream, that falls into the river of Saint Lawrence, about half a quarter of a league below the town. Had we failed all night the tides would have carried us thither in two days time; but in regard that the river is full of rocks and shelves, we durst not venture upon it in the dark; fo we came to an anchor every night, which did not at all displease me; for in the course of thirty leagues (notwithstanding the darkness of the night) it gave me an opportunity of viewing an infinite number of habitations on each fide of the river, which are not above a musket-shot distant one from another. The inhabitants that are fettled between Quebec and fifteen leagues higher, diverted me very agreeably with the fishing of eels. At low water they stretch out hurdles to the lowest water-mark; and that space of ground being then dry by the retreat of the water, is covered over and thut up by the hurdles. Between the hurdles they place at certain distances inftruments called ruches, from the refemblance they bear to a bee-hive; befides bafkets and little nets belagged upon a pole, which they call bouteux and bouts de quievres. Then they let all stand in this fashion for three months in the spring, and two in the autumn. Now as often as the tide comes in, the eels looking out for shallow places, and making towards the shore, croud in among the hurdles, which hinder them afterwards to retire with the ebb-water; upon that they are forced to bury themselves in the above-mentioned engines, which are fometimes fo overcrammed, that they break. When it is low water the inhabitants take out thefe eels, which are certainly the biggest and the longest in the world. They falt them up in barrels, where they will keep a whole year without spoiling: and, indeed, they give an admirable relish in all sauces; nay, there is nothing that the council of Quebec defires more, than that this fishery should be equally plentiful in all years.

Trois Rivieres is a little paltry town, feated in the latitude of 46°; it is not fortified neither with stone nor pales. The river to which it owes its name takes its rise an hundred leagues to the north-west, from the greatest ridge of mountains in the uni-

^{*} Courcurs de Bois. See the explication table.

verse. The Algonkins, who are at present an erratic fort of savages, and, like the Arabs, have no settled abode; that people, I say, seldom straggle far from the banks of this river, upon which they have excellent beaver-hunting. In former times the Iroquese cut off three-fourths of that nation; but they have not dared to renew their incursions, since the French have peopled the countries that lie higher up upon the river of Saint Lawrence. I called Trois Rivieres a little town, with reference to the paucity of the inhabitants; though at the same they are very rich, and live in stately houses. The King has made it the residence of a governor, who would die for hunger, if he did not trade with the natives for beavers, when his small allowance is out: besides, a man that would live there must be of the like temper with a dog, or at least he must take pleasure in scratching his skin, for the sleas are there more numerous than the grains of fand. I am informed, that the natives of this place make the best solutions.

diers in the country.

Three leagues higher we entered St. Peter's Lake, which is fix leagues long, and had difficulty enough in croffing it; for the frequent calms obliged us to cast anchor several times. It receives three or four rivers that abound with fish; upon the mouth of which I descried with my telescope very fine houses. Towards the evening we sailed out of that lake with a fresh easterly gale; and though we hoisted up all our sails, the current run so strong against us, that it was three hours before we could make Sorel, which was two small leagues off. Sorel is a canton of four leagues in front, in the neighbourhood of which, a certain river conveys the waters of Champlain Lake to the river of St. Lawrence, after having formed a water-sall of two leagues at Chambli. Though we reckon but eight leagues from Sorel to Monreal, yet we spent three days in failing between them, by reason partly of slack winds, and partly of the strength of the currents. In this course we saw nothing but islands; and both sides of the river all along, from Quebec to this place, are so replenished with inhabitants, that one may justly call them two continued villages of fixty leagues in

length.

This place, which goes by the name of Villemarie, or Monreal, lies in the latitude of 45° and fome minutes, being feated in an island of the same name, which is about five leagues broad, and fourteen leagues long. The directors of the feminary of Saint Sulpitius, at Paris, are the proprietors of the island, and have the nomination of a bailiff, and feveral other magistrates; nay, in former times, they had the privilege of nominating a governor. This little town lies all open without any fortification either of stone or wood: but its situation is so advantageous, notwithstanding that it stands upon an uneven and fandy ground, that it might eafily be made an impregnable post. The river of Saint Lawrence, which runs just by the houses on one fide of this town, is not navigable further, by reason of its rapidity; for about half a quarter of a league higher, it is full of rapid falls, eddies, &c. M. Perot, the governor of the town, who has but a thousand crowns a year falary, has made shift to get fifty thousand in a few years, by trading with the favages in skins and furs. The bailiff of the town gets but little by his place, no more than his officers; fo that the merchants are the only perfons that make money here; for the favages that frequent the great lakes of Canada come down hither almost every year with a prodigious quantity of beavers skins, to be given in exchange for arms, kettles, axes, knives, and a thousand such things, upon which the merchants clear two hundred per cent. Commonly the governor-general comes hither about the time of their coming down, in order to share the profit, and receive presents from that people. The pedlars, called Coureurs de Bois, export from hence every year feveral canoes full of merchandize, which they dispose of among among all the favage nations of the continent, by way of exchange for beaver skins. Seven or eight days ago I saw twenty-five or thirty of these canoes return with heavy cargoes; each canoe was managed by two or three men, and carried twenty hundred weight, i. e. forty packs of beaver skins, which are worth a hundred crowns a-piece. These canoes had been a year and eighteen months out. You would be amazed if you saw how lewd these pedlars are when they return; how they scalt and game, and how prodigal they are, not only in their cloaths, but upon women. Such of them as are married have the wisdom to retire to their own houses; but the bachelors act just as our East Indiamen and pirates are wont to do; for they lavish, cat, drink, and play all away, as long as the goods hold out; and when these are gone, they even fell their embroidery, their lace, and their cloaths. This done, they are forced to go upon a

new voyage for subfiftence.

The directors of the feminary of St. Sulpitius, take care to fend mislionaries hither from time to time, who live under the direction of a fuperior, that is very much refpected in the country. They have apartments allotted for them in a stately, great, and pleafant house, built of freestone. This house is built after the model of that of St. Sulpice at Paris, and the altar stands by itself, just like that at Paris. Their seignories or cantons that lie on the fouth fide of the island, produce a confiderable revenue; for the plantations are good, and the inhabitants are rich in corn, cattle, fowl, and a thoufand other commodities, for which they find a market in the city; but the north part of the island lies waste. These directors would never suffer the Jesuits or Recollects to display their banners here; though it is conjectured that at the long run they will be forced to confent to it. At the diffance of a league from the town, I faw at the foot of a mountain, a plantation of Iroquese Christians, who are instructed by two priefts of the order of Sulpitius; and I am informed of a larger and more populous plantation on the other fide of the river, at the distance of two leagues from hence, which is taken care of by Father Bruyas the Jesuit. I hope to set out from hence, as foon as M. de la Barre receives advice from France; for he defigns to leave Quebec upon the arrival of the first ship. I resolve to go to Fort Frontenac, upon the lake that goes by the fame name. If I may credit those who have been formerly in action against the Iroquese, I shall be able upon my return from this campaign, to inform you of fome things that will feem as strange to you, as they will be disagreeable to myfelf.

I am, Sir, yours, &c.

LETTER V.

Dated at Monreal, June 18, 1684.

In which is contained a short Account of the Iroquese, with a View of the War and Peace they made with the French, and of the Means by which it was brought about.

SIR,

I WROTE to you but four days ago, and did not think to have heard from you fo foon; but this morning I met with a very agreeable furprifal, in receiving a packet addressed to me by your brother. You may be fure I was infinitely well pleased, in being given to understand what has passed in Europe since I left it. The knowledge of the affairs of Europe is comfortable to one that is doomed to another world, such as this is; and I cannot but acknowledge myself infinitely indebted to you, for the

exactnels of your intelligence. Inafmuch as you require of me an account of the Iroquese, and would have me to present you with a just view of their temper and government; I would willingly satisfy and oblige you in that or any other point: but in regard that I am obliged to set out for Fort Frontenac the day after to-morrow, I have not time to inform myself of things, or to consult those who have been in the country before: so that all I can do at present, is only to acquaint you with what I have learned this winter, from persons that have sojourned twenty years among them. As soon as I have an opportunity of enlarging my knowledge upon that head, by a more immediate conversation with themselves, you may affure yourself that I will impart it to you-

In the mean time be pleafed to accept of what follows.

These barbarians are drawn up in five cantons, not unlike those of the Swisses. Though these cantons are all of one nation, and united in one joint interest, yet they go by different names, viz. the Tfonontouans, the Goyogoans, the Onnotagues, the Onoyouts, and the Agnies. Their language is almost the same, and the five villages or plantations in which they live, lie at the distance of thirty leagues one from another, being all feated near the fouth fide of the lake of Ontario, or of Frontenac. Every year the five cantons fend deputies to affift at the Union feaft, and to fmoak in the great calumet, or pipe, of the five nations. Each village or canton contains about fourteen thousand fouls, i. e. fifteen hundred that bear arms, two thousand superannuated men, four thousand women, two thousand maids, and four thousand children: though indeed some will tell you, that each village has not above ten or eleven thousand souls. There has been an alliance of long flanding between these nations and the English, and by trading in furs to New York they are supplied by the English with arms, ammunition, and all other necessaries at a cheaper rate than the French can afford them at. They have no other confideration for England or France, than what depends upon the occasion they have for the commodities of these two nations; though after all they give an over-purchase, for they pay for them four times more than they are worth. They laugh at the menaces of our kings and governors, for they have no notion of dependance, nay, the very word is to them insupportable. The look upon themselves as fovereigns, accountable to none but God alone, whom they call the Great Spirit. They waged war with us almost always, from the first settlement of our colonies in Canada, to the first years of the Count of Frontenac's government. Messieurs de Courselles and de Traci, both of them governors-general, made head against the Agnics upon the Champlain Lake, in winter as well as in fummer; but they could not boaft of any great fuccess. They only burnt their villages, and carried off some hundreds of their children, of whom the above-mentioned Iroquese Christians are sprung. It is true, they cut off ninety or an hundred warriors; but in compensation for that, several Canadans, and several soldiers of the regiment of Carignan, being unprovided against the unsufferable cold of the climate, lost their limbs, and even their life itself. Count Frontenac, who fucceeded M. Courfelle, perceiving that the barbarians had the advantage of the Europeans, as to the waging of war in that country; upon this apprehension, I say, he declined such fruitless expeditions, which were very chargeable to the King, and used all his efforts to dispose the savages to a fincere and lasting peace. This judicious governor had three things in view: the first was to encourage the greatest part of the French inhabitants, who would have abdicated the colony, and returned to France, if the war had continued. His fecond topic was, that the conclufion of a peace would dispose an infinity of people to marry, and to grub up the trees, upon which the colony would be better peopled and enlarged. The third argument that diffuaded him from carrying on the war, was a defign of purfuing the difcovery

discovery of the lakes, and of the favages that live upon their banks, in order to settle a commerce with them, and at the fame time to engage them in our interests, by good alliances, in case of a rupture with the Iroquese. Upon the consideration of these reasons, he fent some Canadans by way of a formal embassy to the Iroquese villages, in order to acquaint them, that the King being informed that a groundlefs war was carried on against them, had sent him from France to make peace with them. At the fame time the ambaffadors had orders to ftipulate all the advantages they could obtain with reference to the commerce. The Iroquese heard this proposal with a great deal of fatisfaction; for Charles II. King of England, had ordered his governor in New York to represent to them, that if they continued to wage war with the French, they were ruined, and that they would find themselves crushed by the numerous forces that were ready to fail from France. In effect, they promifed to the ambaffadors that four hundred of their number should meet Count Frontenac, attended by an equal number of his men, at the place where Fort Frontenac now stands. Accordingly, some months after, both the one and the other met at the place appointed, and fo a peace was concluded. M. de la Salle was very ferviceable to this governor, in giving him good and feafonable advice, which I cannot now enter upon, being obliged to make fome preparations for my voyage. When the campaign is over, you may expect to hear from me. In the mean time,

I am, Sir, yours, &c.

LETTER VI.

Dated at Monreal, June 20, 1684.

Being an ample Description of the Canoes made of Birch-Bark, in which the Canadans perform all their Voyages; with an Account of the Manner in which they are made and managed.

SIR,

I THOUGHT to have fet out as this day; but in regard that our complement of great canoes is not yet brought up, our voyage is put off for two days. Having fo much leifure time upon my hands, I have a mind to employ it in prefenting you with a short view of these slender contrivances in which the Canadans perform all their voyages: and this will furnish you an idea of the voiture of this country. I faw but now above an hundred canoes, some great and some little; but considering that the former are only proper for martial expeditions, and long voyages, I shall confine my description to that fort. Even the great ones are of different fizes; for they run from ten to twentyeight feet long. Indeed the least of all hold but two persons set upon their breech, as in a cossin, and are apt to overset, if the passengers move to one side or the other: but those of a larger fize will easily afford stowage for fourteen persons; though they are commonly manned only with three men, when they are employed in transporting provisions and merchandize; and even then they will carry twenty hundred weight. The largest fort are safe and steady, when they are made of the bark of the birch-tree, which comes off with hot water in the winter time. The greatest trees afford the best barks for canoes: but oftentimes the bark of one tree is not fufficient. The bottom of the boat is all of one piece, to which the fides are fo artfully fewed by the favages, that the whole boat appears as one continued bark. They are trimmed and strengthened with wicker wreaths, and ribs of cedar wood, which are almost as light as cork; the wreaths

are as thick as a crown-piece; but the bark has the thickness of two crowns, and the ribs are as thick as three. On the two fides of the boat there run from one end to the other two principal head-bars, in which the ends of the ribs are enchased, and in which the spars are made fast, that run across the boat and keep it compact. These boats have twenty inches in depth, that is from the upper edge to the platform of the ribs; their length extends to twenty-eight feet, and the width at the middle rib is computed to be four feet and a half. They are very convenient upon the account of their extreme lightness, and the drawing of very little water; but at the same time, their brittle and tender fabrick, is an argument of an equivalent inconveniency; for if they do but touch or grate upon stone or fand, the cracks of the bark fly open, upo n which the water gets in, and spoils the provisions and merchandize: every day there is some new chink or feam to be gummed over. At night there are always unloaded, and carried on shore, where they are made fast with pegs, lest the wind should blow them away: for they are fo light that two men carry them upon their shoulders with ease. This conveniency o' lightness and easy carriage renders them very serivceable in the rivers of Canada, which are full of cataracts, water-falls, and currents: for in thefe rivers we are obliged either to transport them over-land where such obstructions happen, or else to tow them along where the current is not over rapid, and the shore is accessible. These boats are of no ufe for the navigation of lakes; for the waves would fwallow them up, if they could not reach the shore when a wind arises. It is true the inhabitants venture in them for four or five leagues from one island to another; but then it is always in calm weather, and nothing is made use of but oars; for besides the risque of being over-set, the goods are in danger of being damaged by the water, especially the furs which are the most valuable part of the cargo. When the feafon ferves, they carry little fails; but if the wind be but a little brifk, though they run right afore it, it is impossible to make any use of it without running the risk of shipwreck. If their course lies directly south, they cannot put up fail without the wind flands at one of the eight points, between north-west and north-east; and if a wind happens to spring any where else, (unless it comes from the land which they coast along) they are obliged to put into the shore with all possible expedition, and unload the boat out of hand till fuch time as a calm returns.

As for the working of these boats, the canoe-men ply sometimes on their knees, namely, when they run down the small water-falls; sometimes standing when they stem a current, by setting the boat along with poles, and sometimes sitting, viz. in smooth and stagnating water. The oars they make use of are made of maple-wood, (there is a rude print in the original.) The blade of the oar is twenty inches long, six inches broad, and sour lines thick, the handle is about three foot long and as big as a pigeon's egg. When they have occasion to run up against rapid currents, they make use of poles made of pine-wood, and the setting of the boat along with these is what they call piquer de fond. The canoes have neither stern nor prow, for they run to a point at both ends, neither have they keels, nails, or pegs, in the whole structure. The steersman, or he who couns the boats, rows without interruption as well as the rest. The common purchase of such a boat is eighty crowns; but it

does not last above five or fix years.

This day I have received advice that M. de la Barre has raifed the militia in the neighbourhood of Quebec, and that the governor of this illand has received orders to have that of the adjacent cantons in readiness to march.

LETTER VII.

Dated at Monreal, Nov. 2, 1684.

Describing the Course of the River of St. Lawrence, from Monreal to the first great Lake of Canada; with the Water-falls, Cataracts, and Navigation of that River: as also Fort Frontenac, and the Advantages that accrue from it. Together with a circumstantial Account of the Expedition of M. de la Barre, the governor-general against the Iroquese; the Speeches he made, the Replies he received, and the final Accommodation of the Difference.

SIR,

THANK God I have finished this campaign, and I am now returned in safety to this place. To present you with the history of our campaign, be pleased to know that in two or three days after the date of my last, I embarked on board of a canoe that was worked by three expert canoe-men. Every canoe contained two foldiers, and we all rowed up against the current of the river till we arrived at Saut de St. Louis, about three leagues above this town, which is a little water-fall, but fo rapid that our watermen were forced to stand in the water up to their middle, in order to drag the canoes against the stream for half a quarter of a league. We re-embarked above this pass, and rowed about twelve leagues up the river, and through the lake of St. Louis, till we arrived at a place called the Cafcades, where we were forced to turn out and carry our boats and baggage overland about half a quarter of a league. It is true, we might have towed our boats against the stream in this place with some labour, but there was a cataract a little above it, which they call le Cataracte du Trou. I had taken up a notion that the only difficulty of failing up the river confifted in the trouble of land-carriage: but when I came to be a spectator of the matter, I found that the stemming of the currents whether in towing of the canoes, or in setting them along with poles was equally laborious. About five or fix leagues higher we came to the water-falls called Sauts des Cedres, and du Buisson, where we were forced to transport our boats five hundred paces overland. Some leagues above that we entered the lake of St. Francis, which is faid to be twenty leagues in circumference, and having croffed it, met with as strong currents as before, particularly at a fall called Long Saut, where we had recourse to land-carriage for half a league. Then we were forced to drag up the boats against the rapid stream, and after a great deal of fatigue came at last to a pass called la Galete, from whence we had but twenty leagues failing to Fort Frontenac. This pass was the last difficulty we had to furmount, for above it the water was as still as that of a pool, and then our watermen plied with their oars instead of poles.

The Maringouins, which we call Midges, are unfufferably troublesome in all the countries of Canada. We were haunted with such clouds of them, that we thought to be eat up, and smoking being the only artistice that could keep them off, the remedy was worse than the disease: in the night-time the people shelter themselves from them in bowers or arbours, made after the following manner: they drive into the ground stakes or little branches of trees, at a certain distance one from another, so as to form a semicircular sigure, in which they put a quilt and bed-cloaths, covering it above with a large sheet that falls down to the ground on all sides, and so hinders the infects to

enter.

We landed at Fort Frontenac after twenty days failing, and immediately upon our arrival, M. Duta, our commander-in-chief, viewed the fortifications of the place, and three large barks that lay at anchor in the port. We repaired the fortifications in a very little time, and fitted up the three barks. This fort was a fquare, confifting of large curtains flanked with four little bastions; these slanks had but two battlements, and the walls were fo low, that one might eafily climb upon them without a ladder. After M. de la Salle concluded the peace with the Iroquese, the King bestowed upon him and his heirs the property of this place: but he was fo negligent, that inflead of enriching himself by the commerce it might have afforded, he was considerably out of pocket upon it. To my mind this fort is fituated very advantageously for a trade with the five Iroquese nations, for their villages lie in the neighbourhood of the lake, upon which they may transport their furs in canoes with more ease than they can carry them overland to New York. In time of war I take it to be indefenfible, for the cataracts and currents of the river are fuch, that fifty Iroquese may there stop five hundred French, without any other arms but stones. Do but consider, Sir, that for twenty leagues together the river is fo rapid, that we dare not fet the canoe four paces off the shore; besides, Canada being nothing but a forest, as I intimated above, it is impossible to travel there without falling every foot into ambuscades, especially upon the banks of this river, which are lined with thick woods, that render them inacceffible. None but the favages can skip from rock to rock, and scour through the thickets as it were an open field. If we were capable of fuch adventures, we might march five or fix hundred men by land to guard the canoes that carry the provisions; but at the fame time it is to be confidered, that before they arrived at the fort, they would confume more provisions than the canoes can carry, not to mention that the Iroquefe would still out-number them. As to the particulars relating to the fort, I shall take notice of them when I come to give a general description of New France.

While we continued at Fort Frontenac, the Iroquese who live at Ganeousse and Quente, at the distance of seven or eight leagues from thence, threw in upon us harts, roebucks, turkies, and fish, in exchange for needles, knives, powder and ball. Towards the end of August, M. de la Barre joined us, but he was dangerously ill of a fever, which raged in like manner among most of his militia, so that only our three companies were free from fickness. This fever was of the intermitting kind, and the convulfive motions, tremblings, and frequency of the pulse that attended the cold fit, were fo violent, that most of our fick men died in the fecond or third fit; their blood was of a blackish brown colour, and tainted with a fort of yellowish ferum, not unlike pus or corrupt matter. M. de la Barre's phyfician, who, in my opinion, knew as little of the true causes of fevers as Hippocrates or Galen, and a hundred thousand befides; this mighty physician, I fay, pretending to trace the cause of the fever I now fpeak of, imputed it to the unfavourable qualities of the air and the aliment. His plea was, that the exceflive heat of the feafon put the vapours or exhalations into an over-rapid motion; that the air was fo over-rarified, that we did not fuck in a fufficient quantity of it, that the finall quantity we did receive was loaded with infects and impure corpufculums, which the fatal necessity of respiration obliged us to swallow, and that by this means nature was put into diforder: he added, that the use of brandy and falt meat foured the blood, that this fourness occasioned a fort of coagulation of the chyle and blood, that the coagulation hindered it to circulate through the heart with a due degree of celerity, and that thereupon there enfued an extraordinary fermentation, which is nothing else but a fever. But after all, to my mind, this gentleman's fystem was too much upon the Iroquese strain; for at that rate the distemper must have seized all without distinction, whereas neither our soldiers nor the seasoned Canadans were troubled with it, for it raged only among the militia, who being unacquainted with the way of setting the boats with poles, were forced at every turn to get into the water and drag them up against the rapid stream: now, the waters of that country being naturally cold, and the heat being excessive, the blood might thereupon freeze by way of antiperistasis, and so occasion the sever I speak of, pursuant to the common maxim, omnis repentina mutatio est periculosa, i. e. 'All sudden changes are of dangerous consequence.'

As foon as M. de la Barre recovered, he embarked in order to continue his march. though he might have easily known, that after halting fourteen or fifteen days at that fort, when the feafon was fo far advanced, he could not pretend to compass the end of his expedition. We rowed night and day, the weather being very calm, and in five or fix days came before the river of Famine, where we were forced to put in upon the apprehension of a storm. Here we met with a canoe that M. Dulhut had sent from Miffilimakinac, with advice, that purfuant to orders he had engaged the Hurons, Outaouas, and fome other people, to join his army; in which he had above two hundred brave forest rangers*. This news was very acceptable to M. de la Barre; but at the fame time he was very much perplexed; for I am perfuaded he repented oftener than once, of his entering upon an expedition that he forefaw would prove fuccefslefs; and to aggravate the danger of his enterprize, the Iroquefe had at that time an opportunity to fall upon us: in fine, after a mature confideration of the confequences, and of the difficulties that stood in the way, he fent back the canoe to M. Dulhut, with orders to difmifs the forest rangers and favages immediately, wherever he was, and by all means to avoid the approaching to his troops. By good luck M. Dulhut had not yet reached Niagara, when he received these orders; with which the favages that accompanied him were fo diffatisfied, that they threw out all manner of invectives against the French nation.

As foon as M. de la Barre had dispatched this canoe, he fent M. le Moine to the village of the Onnantagues, which lay about eighteen leagues up the river. This M. le Moine was a gentleman of Normandy, and highly esteemed by the Iroquese, who called him Akouessan, i.e. the Partridge. His orders were, to endeavour by all means to bring along with him fome of the old-standers of that nation; and accordingly he returned in a few days, accompanied with one of their most confiderable grandees, who had a train of thirty young warriors, and was diftinguished by the title of the grangula. As foon as he debarked, M. de la Barre sent him a present of bread and wine, and of thirty falmon-trouts, which they fished in that place in such plenty that they brought up a hundred at one cast of a net: at the same time he gave the Grandee to understand, that he congratulated his arrival, and would be glad to have an interview with him after he had rested himself for some days. You must know that he had used the precaution of fending the fick back to the colony, that the Iroquese might not perceive the weakness of his forces; and to favour the stratagem, M. le Moine represented to the Grangula, that the body of the army was left behind at Fort Frontenac, and that the troops he faw in our camp, were the general's guards; but unhappily one of the Iroquefe that had a fmattering of the French tongue, having strolled in the night-time towards our tents, overheard what we faid, and so revealed the fecret. Two days after their arrival, the Grangula gave notice to M. de

la Barre, that he was ready for an interview; and accordingly an hour being appointed,

the whole company appeared.

The Grangula fat on the east fide, being placed at the head of his men, with his pipe in his mouth, and the great calumet of peace before him. He was very attentive to the following harangue, pronounced by our interpreters; which you cannot well understand, without a previous explication of the calumet, and the coliers that it mentions.

The calumet of peace is made of certain stones, or of marble, whether red, black, or white. The pipe or stalk is four or five foot long; the body of the calumet is eight inches long, and the mouth or head in which the tobacco is lodged, is three inches in length; its figure approaches to that of a hammer. The red calumets are most esteemed. The favages make use of them for negotiations and state affairs, and especially in voyages; for when they have a calumet in their hand, they go where they will in fafety. The calumet is trimmed with yellow, white and green feathers, and has the fame effect among the favages that the flag of friendship has amongst us; for to violate the rights of this venerable pipe, is among them a flaming crime, that will draw down mischief upon their nations. As for the coliers, they are certain fwathes of two or three foot in length, and fix inches in breadth; being decked with little beads made of a certain fort of shells that they find upon the sea-shore, between New York and Virginia. These beads are round, and as thick as a little pea: but they are twice as long as a grain of corn: their colour is either blue or white; and they are bored through just like pearl, being run after the same manner upon strings that lye fideways one to another. Without the intervention of these coliers, there is no business to be negotiated with the savages; for being altogether unacquainted with writing, they make use of them for contracts and obligations. Sometimes they keep for an age the coliers that they have received from their neighbours; and in regard that every colier has its peculiar mark, they learn from the old persons, the circumfrances of the time and place in which they were delivered; but after that age is overthey are made use of for new treaties.

M. de la Barre's Harangue was to this Purpose.

The King, my master, being informed that the five Iroquese nations have for along time made infractions upon the measures of peace, ordered me to come hither with a guard, and to send Akouessan to the canton of the Onnotagues, in order to an interview with their principal leaders, in the neighbourhood of my camp. This great Monarch means, that you and I should smoak together in the great calumet of peace, with the proviso, that you engage in the name of the Tsonnontouans, Goyoguans, Onnotagues, Onnoyoutes, and Agnies, to make reparation to his subjects, and to be guilty of nothing for the suture that may occasion a statal rupture.

The Tfonnontouans, Goyogouans, Onnotagues, Onnoyoutes and Agnics, have ftripped, robbed, and abufed all the forest rangers, that travelled in the way of trade to the country of the Illinese, of the Oumanis, and several other nations, who are my master's children. Now this usage being in high violation of the treaties of peace concluded with my predecessor, I am commanded to demand reparation, and at the same time to declare, that in case of their resultal to comply with my demands, or of

relapfing into the like robberies, war is positively proclaimed."

This

This Colier makes my Words good.

"The warriors of these five nations have introduced the English to the lakes, belonging to the King, my master, and into the country of those nations to whom my master is a father: This they have done with a design to ruin the commerce of his subjects, and to oblige these nations to depart from their due allegiance; notwithstand the remonstrances of the late governor of New York, who saw through the danger that both they and the English exposed themselves to. At present I am willing to forget those actions; but if ever you be guilty of the like for the future, I have express orders to declare war."

This Colier warrants my Words.

"The fame warriors have made feveral barbarous incursions upon the country of the Illinese and the Oumamis. They have massacred men, women, and children; they have taken, bound, and carried off an infinite number of the natives of those countries, who thought themselves secure in their villages in a time of peace. These people are my master's children, and therefore must hereafter cease to be your slaves. I charge you to restore them to their liberty, and to send them home without delay; for if the sive nations results to comply with this demand, I have express orders to declare war."

This Colier makes my Words good.

"This is all I had to fay to the Grangula, whom I defire to report to the five nations, this declaration, that my master commanded me to make. He wishes they had not obliged him to fend a potent army to the Fort of Cataracouy*, in order to carry on a war that will prove fatal to them: and he will be very much troubled, if it so falls out, that this fort, which is a work of peace, must be employed for a prison to your militia. These mischies ought to be prevented by mutual endeavours: the French who are the brethren and friends of the five nations, will never disturb their repose, provided they make the satisfaction I now demand, and prove religious observers of their treaties. I wish my words may produce the desired effect; for if they do not, I am obliged to join the governor of New York, who has orders from the King, his master, to assist me to burn the five villages, and cut you off."

This Colier confirms my Word.

While M. de la Barre's interpreter pronounced this harangue, the Grangula did nothing but look upon the end of his pipe: After the fpeech was finished, he rose, and having taken five or fix turns in the ring that the French and the savages made, he returned to his place, and standing upright, spoke after the following manner to the general, who sat in his chair of state:

"Onnontio†, I honour you, and all the warriors that accompany me do the fame:

^{*} The French call it Fort Frontenac.

[†] This title they give to the governor-general of Canada.

Your interpreter has made an end of his discourse, and now I come to begin mine.

My voice glides to your ear; pray liften to my words.

"Onnontio, in fetting out from Quebec, you must needs have fancied that the fcorching beams of the fun had burnt down the forests which render our country unaccessible to the French; or else that the inundations of the lake had furrounded our cottages, and confined us as prisoners. This certainly was your thought; and it could be nothing else but the curiofity of seeing a burnt or drowned country, that moved you to undertake a journey hither. But now you have an opportunity of being undeceived; for I and my warlike retinue come to assure you, that the Tsonontouans, Geyogouans, Onnotagues, Onnoyoutes and Agnies, are not yet destroyed. I return you thanks in their name, for bringing into their country the calumet of peace that your predecessor received from their hands. At the same time I congratulate your happiness in having left under ground* the bloody axe, that has been so often dyed with the blood of the French. I must tell you, Onnontio, I am not asleep, my eyes are open; and the fun that vouchfafes the light, gives me a clear view of a great captain at the head of a troop of foldiers, who speaks as if he were asleep. He pretends that he does not approach to this lake with any other view than to finoak with the Onnotagues in the great calumet; but the Grangula knows better things, he fees plainly that the Onnontio meant to knock them on the head, if the French arms had not been fo much weakened.

"I perceive that the Onnontio raves in a camp of fick people, whose lives the great fpirit has faved, by vifiting them with infirmities. Do you hear, Onnontio, our women had taken up their clubs; and the children and the old men had vifited your camp with their bows and arrows, if our warlike men had not stopped and disarmed them, when Akoueffan, your ambaffador, appeared before my village. But I have done,

I'll talk no more of that.

"You must know, Onnontio, we have robbed no Frenchmen, but those who fupplied the Illinese and the Oumamis (our enemies) with fuzees, with powder, and with ball: these indeed we took care of, because such arms might have cost us our life. Our conduct in that point is of a piece with that of the Jefuits, who stave all the barrels of brandy that are brought to our cantons, left the people getting drunk should knock them in the head. Our warriors have no beavers to give in exchange for all the arms they take from the French; and as for the old superannuated people, they do not think of bearing arms.

This Colier comprehends my Word.

"We have conducted the English to our lakes †, in order to traffic with the Outaouas, and the Hurons; just as the Algonkins conducted the French to our five cantons, in order to carry on a commerce that the English lay claim to as their right. We are born freemen, and have no dependence either upon the Onnontio or the Corlar . We have a power to go where we please, to conduct who we will to the places we refort to, and to buy and fell where we think fit. If your allies are your flaves or children, you may even treat them as fuch, and rob them of the liberty of entertaining any other nation but your own."

* Burying the axe fignifies peace. + They pretend to the property of the lakes. I Corlar is the title of the governor of New York.

This Colier contains my Word.

We fell upon the Illinese and the Oumamis, because they cut down the trees of peace that served for limits or boundaries to our frontiers. They came to hunt beavers upon our lands; and contrary to the custom of all the savages, have carried off whole stocks *, both male and semale. They have engaged the Chaouanons in their interest, and entertained them in their country. They supplied them with fire-arms, after the concerting of ill designs against us. We have done less than the English and the French, who without any right have usurped the grounds they are now possessed of; and of which they have dislodged several nations, in order to make way for their building of cities, villages, and forts."

This Colier contains my Word.

"I give you to know, Onnontio, that my voice is the voice of the five Iroquese cantons. This is their answer; pray incline your ear, and listen to what they represent.

"The Tfonontouans, Goyogouans, Onnotagues, Onnoyoutes, and Agnies declare, that they interred the axe† at Cataracouy, in the prefence of your predecessor, in the very centre of the fort, and planted the tree of peace in the same place, that it might be carefully preserved; that it was then stipulated, that the fort should be used as a place of retreat for merchants, and not a refuge for soldiers; and that instead of arms and ammunition, it should be made a receptacle of only beaver-skins and merchandize goods. Be it known to you, Onnontio, that for the future you ought to take care, that so great a number of martial men as I now see being shut up in so small a fort, do not stille and choak the tree of peace. Since it took root so easily, it must needs be of pernicious consequence to stop its growth, and hinder it to shade both your country and ours with its leaves. I do assure you, in the name of the five nations, that our warriors shall dance the calumet dance under its branches; that they shall rest in tranquillity upon their mats \$\frac{1}{2}\$, and will never dig up the axe to cut down the tree of peace, till such time as the Onnontio and the Corlar do either jointly or separately offer to invade the country, that the Great Spirit has disposed of in the favour of our ancestors."

This Colier contains my Word; and the other comprehends the Power granted to me by the five Nations.

Then the Grangula addressed himself to Mr. Le Moine, and spoke to this pur-

"Akouessan, take heart, you are a man of sense; speak and explain my meaning; be sure you forget nothing, but declare all that thy brethren and thy friends represent to thy chief Onnontio, by the voice of the Grangula, who pays you all honour and respect, and invites you to accept of this present of beavers, and to affist at his feast immediately.

"This other prefent of beavers is fent by the five nations to the Onnontio."

· Among the favages it is a capital crime to destroy all the beavers of a fettlement.

† Interring the axe, fignifies the making of a peace; and the digging of it up, imports a declaration of war.

‡ This phrase fignisses keeping the peace.

As foon as the Grangula had done, M. Le Moine and the Jesuits that were present explained his answer to M. De la Barre, who thereupon recired to his tent, and flormed and bluftered, till fomebody came and represented to him that Iroca progenics nefcit habere modos: i. e. 'The Iroquefe are always upon extremes.' The Grangula danced after the Iroquefe manner, by way of prelude to his entertainment, after which he regaled several of the French. Two days after, he and his martial retinue returned to their own country, and our army fet out for Monreal. As foon as the General was on board, together with the few healthy men that remained, the canoes were difperfed, for the militia straggled here and there, and every one made the best of his way home. Our three companies, indeed, kept together, because all of us, both officers and foldiers, were carried in flat-bottomed boats, made of deal, on purpose for our use. However, I could have wished to have run down the falls and cataracts in the fame canoe that brought me up, for every body thought we should have been cast away at these passes, which are full of eddies and rocks; and it was never heard before that fuch precipices were passed with deal boats, either upwards or downwards. But we were forced to run all hazards, and had certainly been fwallowed up in those mountains of water, if we had not obliged feveral canoes to floot the cataracts at the head of our boats, in order to shew us the way, at the same time we had prepared our foldiers for rowing and shieving upon occasion. Do but consider, sir, that the currents run as fast as a cannon-ball, and that one false stroke of the oar would have run us unavoidably upon the rocks; for we are obliged to steer a zig-zag course, purfuant to the thread of the stream, which has fifty windings. The boats which are loaded are fometimes lost in those places; but after all, though the risk we run be very great, yet by way of compensation one has the satisfaction of running a great way in a little time; for we run from Galete to this town in two days' time, notwithstanding that we croffed the two flagnating lakes I took notice of before.

As foon as we landed we received advice that the Chevalier de Calliers was come to fupply the room of M. Perrot, the governor of this place. M. Perrot has had feveral fcuffles with M. De Frontenac and Mr. De la Barre, of which you may expect a further account, when I am better informed. All the world blames our General for his bad fucces: it is talked publicly, that his only design was to cover the sending of several canoes to traffic with the savages in those lakes for beaver-skins. The people here are very busy in wasting over to court a thousand calumnies against him; both the clergy and the gentlemen of the long robe write to his disadvantage. Though, after all, the whole charge is false, for the poor man could do no more than he did. Just now I was informed, that Mr. Hainaut, Mr. Montortier, and Mr. Durivau, three captains of ships, are arrived at Quebec, with a design to pass the winter there, and to affish him as counsellors; and that the last of these three has brought with him an

independent company, to be commanded by himfelf.

I shall have no opportunity of writing again before the next spring; for the last ships that are to return for France this year, are now ready to fail. I am, Sir,

Yours, &c.

LETTER VIII.

Dated at Monreal, June 28, 1685.

Representing the Fortifications of Monreal, and the indiferent Zeal of the Priests, who are Lords of that Town: with a Description of Chambli, and of the Commerce of the Savages upon the great Lake.

SIR,

I HAVE just received yours, by a small vessel of Bourdeaux, loaded with wine; which is the first that came to Quebec this year. I am mightily pleased to hear that the King has granted to M. de la Salle sour ships, to go upon the discovery of the Mouth of the Mississpi; and cannot but admire your curiosity in desiring to know

the occurrences of this place, and how I spent my time in the winter.

M. de Callieres was no fooner possessed of his government, than he ordered all the inhabitants of this town, and of the adjacent country, to cut down and bring in great flakes of fifteen feet in length, to fortify the town. During the winter, these orders were purfued with fo much application, that all things are now ready for making the inclosure; in which five or fix hundred men are to be employed. I spent part of the winter in hunting with the Algonkins, in order to a more perfect knowledge of their language, and the rest I spent in this place, with a great deal of uneafiness; for here we cannot enjoy ourselves either at play or visiting the ladies, but it is presently carried to the curate's ears, who takes public notice of it in the pulpit. His zeal goes fo far as even to name the persons; and since he refuses the sacrament of the holy supper to ladies of quality, upon the most flender pretences, you may easily guess at the other steps of his indifcretion. You cannot imagine to what a pitch these ecclesiastical lords have fcrewed their authority: they excommunicate all the masks; and wherever they fpy them, they run after them to uncover their faces, and abuse them in a reproachfulmanner; in fine, they have a more watchful eye over the conduct of the girls and married women than their fathers and husbands have. They cry out against those that' do not receive the facrament once a month; and at Easter they oblige all forts of perfons to give in bills to their confessors. They prohibit and burn all the books thattreat of any other subject but devotion. When I think of this tyranny, I cannot but be enraged at the impertinent zeal of the curate of this city. This inhuman fellow came one day to my lodging, and finding the romance of the Adventures of Petronius upon my table, he fell upon it with an unimaginable fury, and tore out almost all the leaves. This book I valued more than my life, because it was not castrated; and indeed I was fo provoked when I faw it all in wreck, that if my landlord had not held me, I had gone immediately to that turbulent pastor's house, and would have plucked out the hairs of his beard with as little mercy as he did the leaves of my book. These animals cannot content themselves with the studying of men's actions, but they must likewife dive into their thoughts. By this fketch, Sir, you may judge what a pleafant life we lead here.

The 30th of the last March the ice melted; and the river being then open, I was fent with a small detachment to Chambli: for commonly the sun resumes its vigour here much about that time. Chambli stands on the brink of a basin, about five or six leagues off this place: that basin is two leagues in circumference, and receives the lake of Champlain by a water-sall that is a league and a half in length; out of which there

arises a river that disembogues at Sorel into the river of St. Lawrence, as I intimated above in my fourth letter. In former times this place had a great trade in beaver-skins. which is now decayed: for the Soccokis, the Mahingans, and the Openangos, used formerly to refort thither in shoals, to exchange their furs for other goods; but at prefent they are retired to the English colonies, to avoid the pursuit of the Iroquese. The Champlain lake, which lies above that water-fall, is eighty leagues in circumference. At the end of this lake we met with another, called St. Sacrament, by which one may go very eafily to New York, there being but a land-carriage of two leagues from thence to the river Du Fer, which falls into the Manathe. While I was at Chambli, I faw two canoes loaded with beaver-skins pass privately by that way; and it was thought they were fent thither by M. de la Barre. This fmuggling way of trade is expressly prohibited: for they are obliged to carry these skins before the office of the company, where they are rated at an hundred and fixty per cent. lefs than the English buy them at in their colonies. But the little fort that stands at the bottom of the water-fall, upon the brink of the bafin of Chambli, being only fingle pallifadoes, it cannot hinder people to pass that way; especially considering that the prospect of so great a profit renders the paffengers the more daring. The inhabitants of the adjacent villages are very much exposed to the incursions of the Iroquese in time of war. Notwithstanding the weakness of the fort, I continued in that place a month and a half, and then I returned hither. where M. de la Barre arrived fome days after; being accompanied with M. Hennaut, M. Montortier, and M. du Rivau. Much about the same day there arrived twenty-five or thirty canoes, belonging to the Coureurs de Bois, being homeward-bound from the great lakes, and laden with beaver-fkins. The cargo of each canoe amounted to forty packs, each of which weighs fifty pounds, and will fetch fifty crowns at the farmer's office. These canoes were followed by fifty more of the Outaouas and Hurons. who come down every year to the colony, in order to make a better market than they can do in their own country of Missilimakinac, which lies on the banks of the lake of Hurons, at the mouth of the lake of the Illinese. Their way of trading is as follows:

Upon their first arrival, they encamp at the distance of five or fix hundred paces from the town. The next day is fpent in ranging their canoes, unloading their goods, and pitching their tents, which are made of birch bark. The next day after, they demand audience of the governor-general; which is granted them that faine day in a public place. Upon this occasion, each nation makes a ring for itself; the savages fit upon the ground with their pipes in their mouths, and the governor is feated in an armed chair; after which, there starts up an orator or speaker from one of these nations, who makes an harangue, importing, "that his brethren are come to vifit the governorgeneral, and to renew with him their wonted friendship: that their chief view is, to promote the interest of the French, some of whom being unacquainted with the way of traffick, and being too weak for the transporting of goods from the lakes, would be unable to deal in beaver-skins if his brethren did not come in person to deal with them in their own colonies: that they knew very well how acceptable their arrival is to the inhabitants of Monreal, in regard of the advantage they reap by it: that in regard the beaver-skins are much valued in France, and the French goods given in exchange are of an inconfiderable value, they mean to give the French fufficient proof of their readiness to furnish them with what they defire so carnestly: that by way of preparation for another year's cargo, they are come to take in exchange fusces, powder and ball, in order to hunt great numbers of beavers, or to gall the Iroquefe, in case they offer to diffurb the brench fettlements; and, in fine, that in confirmation of their words, they throw a purcelian colier with fome beaver-skins, to the Kitchi-Okima (so they call the

governor general) whose protection they lay claim to in case of any robbery or abuse

committed upon them in the town.

The fpokefman having made an end of his fpeech, returns to his place, and takes up his pipe; and then the interpreter explains the fubfiance of the harangue to the governor, who commonly gives a very civil answer, especially if the present be valuable: in consideration of which, he likewise makes them a present of some trisling things. This done, the savage rises up, and return to their huts to make suitable preparations for the ensuing truck.

The next day the favages make their flaves carry the fkins to the houses of the merchants, who bargain with them for fuch cloaths as they want. All the inhabitants of Monreal are allowed to traffic with them in any commodity but wine and brandy; thefe two being excepted upon the account that when the favages have got what they wanted, and have any skins left, they drink to excess, and then kill their flaves; for when they are in drink, they quarrel and fight; and if they were not held by those who are fober, would certainly make havock one of another. However, you must observe, that none of them will touch either gold or filver. It is a comical fight, to fee them running from fhop to fhop, stark naked, with their bow and arrow. The nicer fort of women are wont to hold their fans before their eyes, to prevent their being frightened with the view of their ugly parts. But these merry companions, who know the brisk fhe-merchants as well as we, are not wanting in making an offer, which is fometimes accepted of, when the prefent is of good mettle. If we may credit the common report, there are more than one or two of the ladies of this country, whose constancy and virtue has held out against the attacks of several officers, and at the same time youchfafed a free access to these nasty lechers. It is presumed their compliance was the effect of curiofity, rather than of any nice relish; for, in a word, the favages are neither brisk nor constant. But whatever is in the matter, the women are the more excusable upon this head, that fuch opportunities are very unfrequent.

As foon as the favages have made an end of their truck, they take leave of the governor, and fo return home by the river of Outaouas. To conclude, they did a great deal of good both to the poor and rich; for you will readily apprehend, that every body

turns merchant upon fuch occasions.

I am, Sir, yours, &c.

LETTER IX.

Dated at Boucherville, October 2, 1685.

Being an Account of the Commerce and Trade of Monreal: of the Arrival of the Marquis of Denonville with some Troops; and of the Recalling of M. de la Barre. With a curious Description of certain Licenses for trading in Beaver-skins in the remote Countries.

SIR,

I RECEIVED your fecond letter three weeks ago, but could not fend a speedier answer, by reason that none of our ships have set sail for France. Since you want to know the nature of the trade of Monreal, be pleased to take the following account:

Almost all the merchants of that city act only on the behalf of the Quebec merchants, whose factors they are. The barks which carry thither dry commodities, as well as wine and brandy, are but few in number; but then they make several voyages in one VOL. XIII.

year from the one city to the other. The inhabitants of the island of Monreal, and the adjacent cantons, repair twice a year to the city of Monreal, where they buy commodities fifty per cent. dearer than at Quebec. The savages of the neighbouring countries, whether settled or erratic, carry thither the skins of beavers, elks, caribous, soxes and wild cats; all which they truck for sufees, powder, lead and other necessaries. There every one is allowed to trade; and indeed it is the best place for the getting of an estate in a short time. All the merchants have such a perfect good understanding one with another, that they all sell at the same price. But when the inhabitants of the country find their prices exorbitant, they raise their commodities in proportion. The gentlemen that have a charge of children, especially daughters, are obliged to be good husbands, in order to bear the expence of the magnificent cloaths with which they are set off; for pride, vanity, and luxury reign as much in New France as in Old France. In my opinion, it would do well, if the King would order commodities to be rated at a reasonable price, and prohibit the selling of gold or silver brocadoes, fringes, and rib-

bands, as well as points and rich laces.

The Marquis of Denonville is come to fucceed M. de la Barre in the quality of governor-general; for the King has recalled M. de la Barre, upon the accufation laid against him by his enemies. To be fure, you who are in France, know better than I, that M. de Denonville was maitre de camp to the Queen's regiment of dragoons. which place he fold to M. Mercey when the King bestowed this government upon him; and, that he brought with him some companies of marines, besides his lady and his children; for it feems, the danger and inconveniencies that attend fuch a long and troublesome voyage, made no impression upon her. This governor stayed at first some weeks at Quebec, after which he came to Monreal, with five or fix hundred men of regular troops, and fent back the Captains Hainaut, Montortier, and Du Rivo, with feveral other officers. His army is now in winter quarters all round Monreal. My quarters are at a place called Boucherville, which lies at the diffance of three leagues from Monreal. I have been here fifteen days, and in all appearance shall live more happily than in the town, abating for the folitude; for at least I shall have no other opposition to encounter in the case of balls, gaming, or feating, but the zealous freaks of a filly prieft. I am informed, that the governor has given orders to complete the fortifications of Monreal, and is now ready to embark for Quebec, where our governors commonly pass the winter. The savages I spoke of in my last, met the Iroquese upon the great river of the Outaouas, who informed them that the English were making preparations to transport to their villages in Missilimakinac, better and cheaper commodities than those they had from the French. This piece of news did equally alarm the gentlemen, the pedlars called coureurs de bois, and the merchants; who at that rate, would be confiderable lofers; for you must know, that Canada subsist only upon the trade of fkins or furs, three-fourths of which come from the people that live round the great lakes: fo that if the English should put such a design in execution, the whole country would fuffer by it; especially confidering, that it would fink certain licenses; an account of which will be proper in this place.

These licenses are granted in writing by the governors-general to poor gentlemen and old officers who have a charge of children. They are disposed of by the King's orders; and the design of them is to enable such persons to send commodities to these lakes. The number of the persons thus impowered ought not to exceed twenty-sive in one year; but God knows how many more have private licenses. All other persons, of what quality or condition soever, are prohibited to go or send to these lakes, without such licenses, under the pain of death. Each license extends to the lading of two great

canoes; and whoever procures a whole or a half license for himself, may either make use of it himself or fell it to the highest bidder. Commonly they are brought at fix hundred crowns a piece. Those who purchase them, are at no trouble in finding pedlars or forest-rangers to undertake the long voyages, which fetch the most considerable gains, and commonly extend to a year and fometimes more. The merchants put into the two canoes stipulated in the license, fix men with a thousand crowns worth of goods, which are rated to the pedlars at fifteen per cent. more than what they are fold for in ready moncy in the colony. When the voyage is performed, this fum of a thousand crowns commonly brings in feven hundred per cent. clear profit, and fometimes more, fometimes less; for these sparks called coureurs de bois bite the savages most dexteroully, and the lading of two canoes, computed at a thouland crowns, is a purchase for as many beaver-skins as will load four canoes: now, four canoes will carry a hundred and fixty packs of fkins, that is, forty a piece; and reckoning each pack to be worth fifty crowns, the value of the whole amounts to eight thousand crowns. As to the re-partition of this extravagant profit, it is made after the following manner: in the first place, the merchant takes out of the whole bulk fix hundred crowns for the purchase of his license; then a thousand crowns for the prime cost of the exported commodities. After this, there remains fix thousand four hundred crowns of surplusage, out of which the merchant takes forty per cent. for bottomry, which amounts to two thousand five hundred and fixty crowns; and the remainder is divided equally among the fix coureurs de bois, who get little more than fix hundred crowns a piece; and indeed I must say it is fairly earned; for their satigue is inconceivable. In the mean time, you must remark, that over and above the foregoing profit, the merchant gets twenty-five per cent. upon his beaver-skins by carrying them to the office of the farmers general, where the price of four forts of beaver-skins is fixed. If the merchant fells these skins to any private man in the country for ready money, he is paid in the current money of the country, which is of less value than the bills of exchange that the director of that office draws upon Rochel or Paris; for there they are paid in French livres, which are twenty fols, whereas a Canada livre is but fifteen fols. This advantage of twenty-five per cent. is called *le benefice*; but take notice, that it is only to be had upon beaverskins; for if you pay to a Quebec merchant four hundred Canada livres in filver, and take from him a bill of exchange upon his correspondent in France, his correspondent will pay no more than three hundred French livres, which is a just equivalent.

This is the last intelligence I shall give you for this year, which has already brought in a very cold autumn. The Quebec ships must fet fail in the middle of November,

purfuant to the wonted custom.

I am, Sir, yours, &c.

LETTER X.

Dated at Boucherville, July 8, 1686.

Relating the Arrival of M. de Champigni, in the room of M. de Meules, who is recalled to France; the Arrival of the Troops that came along with him; the Curiosity of the Rackets, and the way of hunting Elks; with a Description of that Animal.

THOUGH I have not heard from you this year, yet I will not flight this opportunity of writing to you. Some ships from France are arrived at Quebec, and have oo 2

trought over M. de Champigni Noroua, with fome companies of marines. He comes to fupply the place of M. de Meules, whom the King recalls upon the unjust complaints that are made of him. He is charged with preferring his private interest to the public good; but the charge is false, and he will easily clear himself. I am apt to believe he may have carried on some underhand commerce, but in so doing he injured nobody; nay, on the contrary, he has procured bread for a thousand poor creatures, that without his assistance would have starved for hunger. This new intendant is descended of one of the most illustrious families of the robe in France. He is said to be a man of honour, and same entitles his lady to a distinguishing merit. I understand, he and M. Denonville are bound speedily for Monreal, where they mean to take a review of the inhabitants of this island, and of the neighbouring cantons. Probably, they take such precautions, in order to some new effort against the Iroquese. Last winter we had no new occurrences in the colony. I spent the whole winter at the hunting of originals or elks along with the savages, whose language I am learning, as I have intimated to you several times.

The hunting of elks is performed upon the fnow, with a kind of rackets adapted to the purpose. These rackets are two feet and a half long, and fourteen inches broad; their ledges are made of a very hard wood, about an inch thick, that fastens the net just like a tennis-racket, from which they differ only in this, that those for the tennis are made of gut-ftrings, whereas the others are made of little thongs of the skins of harts or elks. In the cut you may perceive two little spars of wood, which run across, to render the net firmer and stiffer. The hole that appears by the two latchets is the place in which they put the toes and fore-part of the foot; fo that it is tied fast by the two latchets, which run twice round about the heel, and every step they make upon the fnow, the fore-part of the foot finks into that hole, as often as they raife their heel. By the help of this contrivance they walk fafter upon the fnow than one can do with shoes upon a beaten path; and indeed it is so necessary for them, that would be otherwise impossible not only to hunt and range the woods, but even to go to church, notwithstanding they are so near, for commonly the snow is three or four fect deep in that country during the winter. Being obliged to march thirty or forty leagues in the woods, in purfuit of the above-mentioned animals, I found that

the fatigue of the journey equalled the pleafure of it.

The original is a fort of elk, not much different from that we find in Mufcovy; it is as big as an Auvergne moyle, and much of the fame shape, abating for its muzzle, its tail, and its great flat horns, which weigh fometimes three hundred and fometimes four hundred weight, if we may credit those who pretend to have weighed them; this animal ufually reforts to planted countries; its hair is long and brown, and the 'fkin is strong and hard, but not thick. The flesh of the original, especially that of the female fort, cats deliciously, and it is faid, that the far hind foot of the female kind is a cure for the falling-fickness; it neither runs nor skips, but its trot will almost keep up with the running of a hart. The favages assure us, that in summer it will trot three days and three nights without intermission. These fort of animals commonly gather into a body towards the latter end of autumn, and the herds are largest in the beginning of the fpring, at which time the flie-ones are in rutting, but after their heat is over they all disperse themselves. We hunted them in the following manner: first of all, we went forty leagues to the northward of the river of St. Lawrence, where we found a little lake of three or four leagues in circumference, and upon the banks of that lake we made huts for ourselves of the barks of trees, having first cleared the ground of the fnow that covered it. In our journey thither we killed as many hares and wood-hens

as we could eat. When we had fitted up our huts the favages went out upon the difcovery of the elks, fome to the northward and fome to the fouth, to the distance of two or three leagues from the huts. As foon as they discovered any fresh foot-steps, they detached one of their number to give us notice, to the end, that the whole company might have the pleafure of feeing the chace. We traced these foot-steps sometimes for one and formetimes for two leagues, and then fell in with five, ten, fifteen or twenty elks in a body; which prefently betook themselves to slight, whether a part or in a body and funk into the fnow up to their breaft. Where the fnow was hard and condenfated, or where the frost following wet weather had glazed it above, we came up with them after the chace of a quarter of a league; but when the fnow was foft or just fallen, we were forced to purfue them three or four leagues before we could catch them, unless the dogs happened to flop them where the fnow was very deep. When we came up with them, the favages fired upon them with fusees. If the elks be much enraged, they will sometimes turn upon the favages, who cover themselves with boughs in order to keep off their feet, with which they would crush them to pieces. As foon as they are killed, the favages make new huts upon the fpot, with great fires in the middle; while the flaves are employed in flaying them, and stretching out the skins in the open air. One of the foldiers that accompanied me, told me one day, that to withstand the violence of the cold, one ought to have his blood composed of brandy, his body of brass, and his eyes of glass; and I must say, he had some ground for what he spoke, for we were forced to keep a fire all round us, all the night long. As long as the flesh of these animals last, the favages feldom think of flirring; hut when it is all confumed, they then look out for a new discovery. Thus they continue to hunt, till the fnow and the ice are melted. As foon as the great thaw commences it is impossible for them to travel far; fo that they content themselves with the killing of hares and partridges, which are very numerous in the woods. When the rivers are clear of the ice, they make canoes of the elkskins, which they fow together very easily, covering the seams with a fat fort of earth instead of pitch. This work is over in four or five days time, after which they return home in the canoes with all their baggage.

This, Sir, was our diversion for three months in the woods. We took fifty-fix elks, and might have killed twice as many, if we had hunted for the benefit of the skins. In the summer season the savages have two ways of killing them, both of which are equally troublesome. One confits in hanging a rope-gin between two trees, upon a pass surrounded with thorns; the other is compassed by crawling like snakes among the trees and thickets, and approaching to them upon the leeward side, so that they may be shot with a fuzee. Harts and caribous are killed both in summer and winter after the same manner with the elks, excepting that the caribous, which are a kind of wild asses, make an easy escape when the snow is hard, by virtue of their broad seet, whereas the elk sinks as fast as he rises. In sine, I am so well pleased with the hunting of this country, that I have resolved to employ all my leisure-time upon that exercise. The savages have promised, that in three months time I shall see other forts of chaces, which will prove less fatiguing, and more agreeable.

Lam, Sir, yours, &c.

LETTER XI.

Dated at Boucherville, May 28, 1687.

Being a curious Description of the Hunting of divers Animals.

SIR,

YOU complain that the last year you received but one of my letters, dated July 8, and with the same breath assure me, that you writ two to me, neither of which is come to hand. I received a letter from you this day, which is so much the more acceptable, that I thought you had been dead, and that I find you continue to give proof of your remembrance of me. I find, by your letter, that you have an agreeable relish for the curious elk-hunting in this country, and that a further account of our other hunting adventures would meet with a welcome reception. This curiosity, indeed, is worthy of so great a huntsman as yourself; but at present I must beg your excuse as to the

beaver-hunting, for I know nothing of it yet but by hearfay.

In the beginning of September, I fet out in a canoe upon feveral rivers, marshes, and pools, that difembogue in the Champlain Lake, being accompanied with thirty or forty of the favages that are very expert in shooting and hunting, and persectly well acquainted with the proper places for finding water-fowl, deer, and other fallow beafts. The first post we took up was upon the fide of a marsh or fen of four or five leagues in circumference; and after we had fitted up our huts, the favages made huts upon the water in feveral places. These water-huts are made of the branches and leaves of trees, and contain three or four men: for a decoy, they have the skins of geefe, buftards, and ducks, dried and ftuffed with hay, the two feet being made fast with two nails to a small piece of a light plank, which floats round the hut. This place being frequented by wonderful numbers of geefe, ducks, buftards, teals, and an infinity of other fowl unknown to the Europeans; when these fowls see the stuffed fkins fwimming with the heads erected, as if they were alive, they repair to the fame place, and fo give the favages an opportunity of fhooting them, either flying or upon the water; after which the favages get into their canoes and gather them up. They have likewife a way of catching them with nets, firetched upon the furface of the water at the entries of the rivers. In a word, we eat nothing but water-fowl for fifteen days; after which we refolved to declare war against the turtle-doves, which are fo numerous in Canada, that the bishop has been forced to excommunicate them oftener than once, upon the account of the damage they do to the product of the earth. With that view, we embarked and made towards a meadow, in the neighbourhood of which the trees were covered with that fort of fowl, more than with leaves; for just then it was the feafon in which they retire from the north countries, and repair to the fouthern climates; and one would have thought, that all the turtle-doves upon earth had chose to pass through this place. For the eighteen or twenty days that we staid there, I firmly believe that a thousand men might have fed upon them heartily, without putting themselves to any trouble. You must know, that through the middle of this meadow there runs a brook, upon which I and two young favages shot feveral snipes, rayles, and a certain fort of fowl called bateus de faux, which is as big as a quail, and eats very delicioufly.

In the fame place we killed fome musk-rats, or a fort of animals which resemble a rat in their shape, and are as big as a rabbit. The skins of these rats are very much

valued,

valued, as differing but little from those of beavers. Their testicles smell so strong of musk, that no civet or antelope that Asia assords, can boast of such a strong and sweet fmell. We fpied them in the mornings and evenings, at which time they usually appear upon the water with their nofe to the windward, and betray themselves to the huntfinen, by the curling of the water. The fouteraux, which are an amphibious fort of little pole-cats, are catched after the fame manner. I was likewife entertained upon this occasion, with the killing of certain little beafts, called fiffleurs, or whiftlers, with allufion to their wonted way of whiftling or whizzing at the mouth of their holes in fair weather. They are as big as hares, but somewhat shorter; their sless is good for nothing, but their fkins are recommended by their rarity. The favages gave me an opportunity of hearing one of these creatures whistle for an hour together, after which they shot it. To gratify the curiofity I had to fee such diversity of animals, they made a diligent fearch for the holes or dens of the carcaioux, and having found fome at the distance of two or three leagues from the fen upon which we were posted, they conducted me to the place. At the break of day we planted ourselves round the holes, with our bellies upon the ground; and left some flaves to hold the dogs a musket-shot behind us. As soon as these animals perceived day-light, they came out of their holes, which were immediately stopped up by the favages, and upon that the dogs fetched them up with eafe. We faw but two of them, which made a vigorous defence against the dogs, but were strangled after a dispute of half an hour. These animals are not unlike a badger, only they are bigger, and more mischievous. Though our dogs shewed a great deal of courage in attacking the carcaioux, they betrayed their cowardice the next day in a rencounter with a porcupine, which we fpied upon a little tree. To obtain the pleafure of feeing the porcupine fall, we cut down the tree; but neither the dogs nor we durst go near it. The dogs only barked and jumped round it; for it darted its long and hard hair, like fo many bodkins, three or four paces off. At last we pelted it to death, and put it upon the fire to burn off its darts; after which we fealded it like a pig, took out the entrails, and roafted it; but though it was very fat, I could not relish it fo well as to comply with the affertion of the natives, who allege, that it eats as well as a capon or a partridge.

After the turtle-doves had all passed over the place, in quest of their southern retreats, the favages offered to fend fome of their number with canoes to conduct me home, before the rivers and lakes were frozen over; for themselves were to tarry out for the elk-hunting; and they imagined that the cold and hardship attending that exercife had made me fick of it the year before. However, we had then a month good before the commencement of the frost, and in that interval of time, they proffered to entertain me with more diverting game than any I had feen before. They proposed to go fifteen or fixteen leagues further up the country, affuring me, that they knew of a certain place that had the most advantageous situation in the world, both for pleafure and profit, and that afforded great plenty of otters, of the skins of which they meant to make a great cargo. Accordingly we pulled down our huts, and having embarked in our canoes, failed up the river, till we came to a little lake of two leagues in circumference, at the end of which we faw another greater lake, divided from this by an ifthmus of one hundred and fifty paces in length. We pitched our huts at the distance of a league from that isthmus; and some of the savages sished for trouts, while the rest were employed in laying traps for the otters upon the brinks of the lake. These traps are made of five stakes placed in the form of an oblong quadrangle, so as to make a little chamber, the door of which is kept up, and supported by a stake. To the middle of this flake they tie a firing which passes through a little fork, and has

a trout well fastened to the end of it. Now, when the otter comes on shore, and secs this bait, he puts above half his body into that fatal cage, in order to swallow the fish; but he no fooner touches, than the ftring to which it is made fast, pulls away the stake that fupports the door, upon which an heavy and loaded door falls upon his reins and quashes him. During our pilgrimage in that part of the country, the favages took above two hundred and fifty Canada otters, the skins of which are infinitely prettier than those of Muscovy or Sweden. The best of them, which are not worth two crowns in this place, are fold in France for four or five, and fometimes for ten, if they are black and very rough. As foon as the favages had fet their traps, they gave orders to their flaves to go round the lake every morning, in order to take out the amphibious animals. After that they conducted me to the above-mentioned ifthmus, where I was furprized to fee a fort of a park or fence made of trees, felled one upon another, and interlaced with thorns and branches; with a quadrangular inclosure of stakes at the end of it, the entry of which was very narrow. They gave me to know, that they used to hunt harts in that place, and promifed to divert me with the shew as foon as the inclosures were a little mended. In effect, they carried me two or three leagues off, upon fuch roads as had nothing on either fide but fens and marshes; and after they had dispersed themselves, some on one hand and some on the other, with a dog for every man, I faw a great many harts running to and again, in quest of places of fafety. The favage that I kept company with, affured me, that he and I had no occasion to walk very fast, because he had taken the straightest and the nearest road. Before us we faw above ten harts, which were forced to run back, rather than throw themselves into the marsh, of which they could never get clear. At last, after walking a great pace, and running now and then, we arrived at the park, and found the favages lying flat upon the ground all round it, in order to shut up the entry of the Lake inclosure as foon as the harts entered. We found thirty-five harts in the place, and if the park had been better fenced, we might have had above fixty; for the nimblest and lightest of them skipped over before they came to enter the inclosure. We killed a great many of them, but fpared the dams, because they were great with young. I asked of the favages the tongues and the marrow of the harts, which they gave me very readily. The flesh was very fat, but not delicious, excepting some few bits about the ribs. But after all, this was not our only game; for two days after we went a bear-hunting, and the favages, who fpend three parts of four of their life in hunting in the woods, are very dexterous at that exercise, especially in fingling out the trunks of the trees upon which the bears neftle. I could not but admire their knowledge in that point, when, as we were walking up and down in a forest, at the distance of an hundred paces one from another, I heard one favage call to another, Here's a bear. I asked them how he knew there was a bear upon the tree which he knocked with his axe; and they all replied, that it was as eafily diffinguished as the print of an elk's foot in the fnow. For five or fix times they never milled; for after they had knocked two or three times upon the trunk of the tree, the bear came out of its hole, and was prefently fhot. The Canada bears are extreme black, but not mifchievous, for they never attack one, unless they be wounded or fired upon. They are fo fat, especially in the autumn, that they can scarce walk. Those which we killed were extremely fat, but their fat is good for nothing but to be burnt, whereas their flesh, and, above all, their feet, are very nice victuals. The favages affirm, that no flesh is so delicious as that of bears; and indeed, I think they are in the right of it. While we ranged up and down in quest of bears, we had the pleasure of spying fome martins and wild-cats upon the branches of the trees, which the favages shot in 5

the head to preserve their skin. But the most comical thing I saw, was the stupidity of the wood-hens, which fit upon the trees in whole flocks, and are killed one after another, without ever offering to flir. Commonly the favages shoot at them with arrows, for they fay they are not worth a shot of powder, which is able to kill an elk or an hart. I have plied this fort of fowling in the neighbourhood of our cantons or habitations in the winter time, with the help of a dog who found out the trees by fcent, and then barked; upon which I approached to the tree, and found the fowls upon the branches. When the thaw came, I went two or three leagues further up the lake, in company with fome Canadefe, on purpose to see that fowl flap with its wings. Believe me, Sir, this fight is one of the greatest curiofities in the world; for their flapping makes a noise much like that of a drum all about, for the space of a minute or thereabouts; then the noise ceases for half a quarter of an hour, after which it begins again. By this noise we were directed to the place where the unfortunate moor-hens fat, and found them upon rotten mosly trees. By flapping one wing against the other, they mean to call their mates; and the humming noise that ensues thereupon may be heard half a quarter of a league off. This they do only in the months of April, May, September and October; and, which is very remarkable, the moor-hen never flaps in this manner, but upon one tree. It begins at the break of day, and gives over at nine o'clock in the morning, till about an hour before funfet that it flutters again and continues fo to do till night; I protest to you, that I have frequently contented myfelf with feeing and admiring the flapping of their wings without offering to shoot at them.

Befides the pleafure of fo many different forts of diversion, I was likewise entertained in the woods with the company of the honest old gentlemen that lived in former ages. Honest Homer, the amiable Anacreon, and my dear Lucian, were my inseparable companions. Aristotle too desired passionately to go along with us, but my canoe was too little to hold his bulky equipage of peripatetic syllogisms: so that he was even fain to trudge back to the Jesuits, who vouchsafed him a very honourable reception. I had a great deal of reason to rid myself of that great philosopher's company; for his ridiculous jargon and his senseless terms would have frighted the savages out of their wits. Farewell, Sir, I am now arrived at once at the end of my game and my letter. I have heard no news from Quebec, where they continue to make mighty preparations for some considerable enterprize. Time will discover a great many things, an account of which I mean to transmit to you by the ships that are to leave this harbour in the end of autumn. I conclude with my usual compliment,

Yours, &c.

LETTER XII.

Dated at St. Helens, over against Monreal, June 8, 1687.

The Chevalier de Vaudreil arrives in Canada with some Troops. Both the Regular Troops and the Militia are posted at St. Helens, in readiness to march against the Iroquese.

SIR,

I HAVE such a budget-full of news, that I know not where to begin. I received letters but now from M. Senelay's office; by which I have advice, that orders are fent to M. Denonville to allow me to go for France upon my private concerns. No vol. XIII.

longer fince than yesterday, he told me I should have leave to go after the campaign is over. My relations write, that the procuring this leave cost them a great deal of pains;

and that the fooner I come to Paris, it will be the better for me.

The governor arrived at Monreal three or four days ago, with all the militia of the country, who lie now encamped along with our troops in that island. M. D'Amblemont has been at Quebec this month, with five or fix fecond-rate ships, having sailed from Rochelle thither in twenty-eight days. He brought over with him ten or twelve companies of marines, who are to guard the colony, while we invade the lroquefe country. It is faid, that last year M. Denonville fent several Canadese, that were known and efteemed by the favages, our allies, who live upon the banks of the lakes, and the adjacent countries, with orders to engage them to favour our defign of extirpating the Iroquefe. In the winter he made magazines of ammunition and provisions, and now he has fent feveral canoes, laden with provisions, to Fort Frontenac, and given orders for the building of an infinite number of fuch boats as I described in my fourth letter, for the transporting of our twenty companies of marines. The militia who are encamped in this island along with our troops, make fifteen hundred men, and are joined by five hundred of the converted favages that live in the neighbourhood of Quebec and the island of Monreal. The Chevalier Vaudreuil, who is come from France to command our troops, is resolved to appear in the field, notwithstanding the fatigue of his paffage to Canada; and the governor of Monreal is of the fame mind. M. de Champigni, the intendant of this country, went from hence to Fort Frontenac two days ago. The day after to-morrow M. de Denonville means to march at the head of his little army, being accompanied with an ancient Iroquefe, that is very much respected by the Five Cantons. The history and various adventures of this old gentleman are too tedious to bear a relation in this place. Every body is apprehenfive that this expedition will prove as fuccessless as that of M. de la Barre: and if their apprehensions are not disappointed, the King lays out his money to no purpose. For my own part, when I reflect upon the attempt we made three years ago, I cannot but think it impossible for Time will discover the consequences of this expedition; and perhaps we may come to repent, though too late, of our complying with the advice of fome disturbers of the public peace, who project to enlarge their private fortunes in a general commotion. I lay this down for an uncontested truth, that we are not able to destroy the Iroquefe by ourfelves: befides, what occasion have we to trouble them, fince they give us no provocation? However, let the event be what it will, I shall not fail, upon my return, to transmit you a journal of our actions, unless it be, that I embark for Rochelle, and deliver it myself. In the mean time, believe me to be, Sir,

Yours, &c.

LETTER XIII.

Dated at Niagara, Aug. 2, 1687.

Representing the unfavourable Issue of the Campaign made in the Iroquese Country; the Discovery of an Ambuscade; and the issuing of Orders for the Author to march with a Detachment to the great Lakes.

Sir,

IT has been a maxim in all ages, that the events of things are not always answerable to men's expectations: when men form to themselves a promising prospect of compassing

passing their ends, they frequently meet with the mortification of seeing themselves disappointed. This I speak by way of application to myself; for instead of going for France, pursuant to the contents of the letter I writ to you two months ago, I am now obliged to straggle to one end of the world, as you will find by the following

journal of our expedition.

We broke up from St. Helens much about the time I fpoke of in my last. M. de Champigni went before us with a strong guard, and arrived in a canoe at Fort Frontenac, eight or ten days before we came up. As foon as he arrived, he fent two or three hundred Canadese to surprize the villages of Kente and Ganeousse, which lie at the distance of seven or eight leagues from the fort, and are inhabited by a fort of Iroquefe, that deferved no other ufage than what they met with. Our Canadese had no great difficulty in mastering them; for they surprifed them when they least thought of any alarm, and brought them prisoners to Fort Frontenac, where they were tied to posts, with cords round their necks, hands, and feet. We arrived at the fort on the first of July, after the encountering of several difficulties among the water-falls, cataracts, and currents, that I formerly described to you in my account of M. de la Barre's expedition. We were more perplexed in this voyage than the former; for our boats were fo heavy, that we could not transport them over land as we did the canoes, but were obliged to drag them up through the impracticable passes with the force of men and ropes. Immediately upon our debarking, I went straight to the fort, where I faw the miserable prisoners in the above-mentioned posture. The fight of this piece of tyranny filled me at once with compassion and horror; but, in the mean time, the poor wretches fung night and day, that being the customary practice of the people of Canada when they fall into the hands of their enemies. They complained, "that they were betrayed without any ground; that in compensation for the care they had taken ever fince the peace to furnish the garrison with fish and venison, they were bound and tied to posts, and whipped in such a manner, that they could neither sleep, nor guard off the flies; that the only requital they met with for procuring to the French a commerce in the skins of beavers and other animals, was, to be doomed to flavery, and to see their fathers, and the ancient men of their country, murdered beforetheir eyes. "Are thefe the French," faid they, "that the Jesuits cried up so much for men of probity and honour? Even the cruellest fort of death that imagination itself can reach, would be nothing to us in comparison with the odious and horrible spectacle of the blood of our ancestors, that is fied fo inhumanly before our eyes. Affuredly, the five villages will revenge our quarrel, and entertain an everlafting and just refentment of the tyrannical usage we now meet with." I made up to one of these wretches that was about five-and-twenty years old, and had frequently regaled me in his hut, not far from the fort, during my fix weeks fervice in that place, in the year of M. de la Barre's expedition. This poor man being mafter of the Algonkin language, I gave him to know, that I was heartily grieved to fee him in that difmal posture; that I would take care to have victuals and drink conveyed to him twice a day, and would give him letters for my friends at Monreal, in order to his being used more favourably than his companions. He replied, that he faw and was very well acquainted with the horror that most of the French were affected with, upon the view of the cruelty they underwent; and that he fcorned to be fed, or used more civilly than his fellow-prisoners. He gave me an account of the manner in which they were furprifed, and how their ancestors were masfacred; and truly, I do not believe that any one can be touched with more cutting and bitter reflections than this poor man was, when he recounted the many fervices he had done the French, during the whole course of his life: at last, after many fighs

and groans, he bowed down his head, and wrapped himself up in filence. Quaque potest narrat, restabant ultima flevit. But this was not the only thing that affected me, when I beheld the mifery of these innocent creatures: I saw some young savages of our fide burn their fingers with fire in their lighted pipes; which provoked me to thresh them foundly; but I was severely reprimanded for my pains, and confined to my tent for five or fix days, where I only repented that I had not dealt my blows in a double measure. These favages resented the matter so highly, that they ran presently to their huts, and flew to their fusees, in order to kill me; nay, all that could be done was fearce fufficient to appeale them; for the dispute came to that height, that they would have left us, if it had not been that our men affured them I was drunk *. that all the French were prohibited to give me either wine or brandy, and that I should certainly be imprisoned as foon as the campaign was over.. However, the poor wretches, the prisoners, were carried to Quebec; from whence they are to be fent to the French gallies. Much about that time, the Sieur de la Forest, one of M. de la Salle's officers, arrived at the fort in a great canoe, being conducted thither by eight or ten coureurs de bois. He gave M. de Denonville to understand, that a party of the Illinese and the Oumanis waited for the Hurons and the Outaouas at the lake of St. Claire, in order to join them, and to march with joint forces to the river of the Tfonontouans, that being the place of their general rendezvous. He added, that in the lake of the Hurons near Miffilimakinac, M, de la Durantais, affifted by the favages, our allies, had taken an English company, conducted by some Iroquese, who had fifty thousand crowns worth of goods in their canoes, to be disposed of in exchange with the nations that dwell upon these lakes; as also, that M. Dulhut had taken another English convoy, being assisted by the courseurs de bois, and the favages, who had shared the former capture; and that he had kept the English and Iroquese as prifoners, as well as their commander, who was called Major Gregory; in fine, he represented to M. de Denonville, that it was high time for him to set out from Fort Frontenac, if he meant to appear at the general rendezvous, where the auxiliary troops fent from the lakes, would arrive very speedily. The next day, being the third of July, the Sieur de la Forest embarked again for Niagara, and steered to the north side of the lake. At the fame time we embarked and stood to the opposite side of the lake, being favoured by the calms which in that month are very common.

By good luck our whole body arrived almost at one and the same time in the river of the Tsonontouans; and upon that occasion, the savages, our allies, who draw predictions from the most trisling accidents, shewed their wonted superstition in taking this for an infallible presage of the utter destruction of the Iroquese. Though after all, they proved false prophets, as you will find by the sequel of this letter. The same night that we landed, we hauled our canoes and boats out of the water, and set a strong guard upon them. This done, we built a fort of stakes or pales, where we left the Sieur Dorvillers with four hundred men to guard our shipping and baggage. The next day, a young Canadese, called Fontaine Marion, was unjustly shot to death. His case stood thus: having travelled frequently all over this continent, he was perfectly well acquainted with the country, and with the savages of Canada; and after the doing of several good services to the King, desired leave from the governor-general to continue his travels, in order to carry on some little trade; but his request was never granted. Upon that, he resolved to remove to New England, the two crowns being then in peace. The planters of New England gave him a very welcome recep-

^{*} Among the favages drunken persons are always excused; for the bottle atones for all crimes.

tion; for he was an active fellow, and one that understood almost all the languages of the favages. Upon this consideration, he was employed to conduct the two English convoys I spoke of but now, and had the misfortune to be taken along with them. Now, to my mind, the usage he met with from us was extreme hard; for, we are in peace with England; and besides, that crown lays claim to the property of the Lakes of Canada.

The next day we began our march towards the great village of the Tfonontouans, without any other provisions than ten biscuits a man, which every one carried for himfelf. We had but feven leagues to march in a great wood of tall trees, upon a fmooth even ground. The coureurs de bois, with a party of the favages, led the van, and the rest of the savages brought up the rear, our regular troops and our militia being posted in the middle. The first day the army marched four leagues, and the advanced guards made no difcovery. The fecond day our advanced parties marched up to the very fields of the village without perceiving any thing, though they past within a piftol-shot of five hundred Tsonontouans, who lay flat upon the ground, and suffered them to pass and repass without molestation. Upon their intelligence we marched up with equal precipitation and confusion, being buoyed up with the apprehension that the Iroquefe had fled, and that, at least, their women, children, and superannuated persons would fall into our hands. When we arrived at the bottom of the hill, upon which the ambufcade was placed, at the diftance of a quarter of a league from the village, they began to raife their wonted cry, which was followed by the firing of fome muskets. Had you but feen, Sir, what diforder our troops and militia were in amidst the thick trees, you would have joined with me, in thinking that feveral thousands of Europeans are no more than a fufficient number to make head against five hundred barbarians. Our battalions were divided into ftraggling parties, who fell into the right and left, without knowing where they went. Instead of firing upon the Iroquese, we fired upon one another. It was to no purpose to call in the soldiers of such and such a battalion, for we could not fee thirty paces off; in fine, we were fo difordered, that the enemy were going to close in upon us with their clubs in their hands, when the favages of our fide having rallied, repulfed the enemy, and purfued them to their villages with fo much fury that they brought off the heads of eighty, and wounded a great many. In this action we loft ten favages, and a hundred French. We had twenty or two-and-twenty wounded, in which number was the good Father Angeleran the Jefuit, who received a mufket-fhot in those parts which Origen chose to lop off in order to qualify himself for instructing the fair fex without the disturbance of passion, or the danger of fcandal. When the favages brought in the heads of their enemies to M. de Denonville, they asked him why he halted, and did not march up? He made answer, that he could not leave his wounded men behind, and that he thought it properto encamp, that the furgeons might have time to drefs their wounds. To obviate this pretence, the favages offered to make litters for the transporting of them to the village, that lay but a little way off. But our general did not approve of their advice; upon which, notwithstanding his remonstrances, they drew up into a body, and though they confisted of ten different nations, agreed in a joint resolution of pursuing their enemy, in hopes of taking, at least, their women, their old men, and their children. Our general being acquainted with their refolution, gave them to know, that he earnestly defired they would rest for one day, and not depart from his camp, and that the next day he would burn their villages, and flarve them to death by spoiling their crops. But they took this compliment foill, that most of them returned to their own country; remonstrating, "That the French came out to fetch a walk, rather than to wage war,

fince they would not take the advantage of the best opportunity in the world; that their ardour, like a flash of fire, was extinguished as foon as kindled; that it was a fruitless adventure to draw together so many warriors, from all parts, to burn some huts of bark, that the enemy could rebuild in four days; that the Tionontouans did not matter the spoiling of their corn, for that the other Iroquese nations were able to Supply them; and in fine, that fince they had joined the French twice together to no purpose, they would never trust them for the future, in spite of all the remonstrances they could make." Some are of opinion, that M. de Denonville ought to have gone farther; and others affirm, that it was impossible for him to do more than he did; for my part, I shall not venture upon any decision of the matter; those who sit at the helm, are most liable to be perplexed. To pursue the bare matter of fact; we marched next day to the great village, and carried our wounded men upon litters, but we found nothing there but ashes; for the Iroquese had burnt the village themfelves, by way of precaution. Then we fpent five or fix days in cutting down the Indian corn with our fwords. From thence we marched to the two little villages of the Thegaronhies and the Danoncaritaoui, which lay about two or three leagues off. Having done the like exploits there, we returned to the lake fide. In all these villages we found plenty of horses, black cattle, fowl and hogs. All the country round afforded us a very charming, pleafant, and even profpect, The forests through which

we marched were replenished with oak, wallnut, and wild chefnut-trees.

Two days after we embarked for Niagara, which lay thirty leagues off, and arrived there in four days. As foon as the troops had debarked, we employed them in making a fort of pales with four bastions, which was finished in three days. Here we mean to leave an hundred and twenty foldiers under the command of M. des Bergeres, with ammunition and provisions for eight months. The fort stands on the fouth side of the streight of Herrie Lake, upon a hill; at the foot of which, that lake falls into the lake of Frontenac. Yesterday the favages, our allies, took leave of M. de Denonville, and made a speech after their usual manner; in which, among other things, they infinuated, that they were pleafed to fee a fort fo conveniently placed, which might favour their retreat upon any expedition against the Iroquese; that they depended upon his promife, of continuing the war till the five nations should be either destroyed or dispossessed of their country; that they earnestly desired that part of the army should take the field out of hand, and continue in it both winter and fummer, for that they would certainly do the fame on their part; and in fine, that forafmuch as their alliance with France was chiefly grounded upon the promifes the French made of liftening to no proposals of peace, till the five nations should be quite extirpated, they therefore hoped they would be as good as their word; especially considering that a ceffation of arms would fully the honour of the French, and infallibly difengage their allies. M. de Denonville gave them fresh affurances of his intention to carry on the war, in fpite of all the efforts of the Iroquese; and in a word, protested that he would profecute this defign fo vigoroufly, that in the end thefe barbarians should be either quite cut off, or obliged to shift their seats.

The general called for me that very day, and acquainted me, that in regard I underflood the language of the favages, I was to go with a detachment to cover their country, purfuant to their request. At the same time he assured me, he would inform the court of the reasons that moved him to detain me in Canada, notwithstanding that he had orders to give me leave to go home. You may cafily guefs, Sir, that I was thunder-struck with this news, when I had fed myself all along with the hopes of returning to France, and promoting my interest, which is now so much thwarted. However,

I was

I was forced to be contented; for the greater power bears the sway all the world over. Pursuant to my orders, I made all suitable preparations for my voyage, without loss of time. I took leave of my friends, who fingled out the best foldiers for me; and made me prefents of cloaths, tobacco, books, and an infinity of other things that they could fpare without any inconveniency, because they were then upon their return to the colony, which affords every thing that one can defire. By good luck, I brought my aftrolabe with me from Monreal, which will enable me to take the latitudes of this lake, and to make feveral other ufeful observations; for, in all appearance, I shall be be out two years or fuch a matter. The men of my detachment are brisk proper fellows, and my canoes are both new and large. I am to go along with M. Dulhut, a Lyons gentleman, who is a person of great merit, and has done his King and his country very considerable services. M. de Tonti makes another of our company; and a company of favages is to follow us. M. de Denonville will fet out for the colony by the north fide of the lake of Frontenac, in two or three days. He defigns to leave at Fort Frontenac a number of men and ammunition equal to what he leaves here. I herewith transmit some letters for my relations, which I beg you would convey to their hands. If I meet with any opportunity, I'll fend you a journal of my voyage the next year. In the mean time,

I am, Sir, yours, &c.

LETTER XIV.

Dated at Missilimakinac, May 26, 1688.

The Author leaves Niagara, and has an Encounter with the Iroquese at the end of the Land-carriage. The After-part of his Voyage. A Description of the Country. He arrives at Fort St. Joseph in the Mouth of the Lake of Hurons. A Detachment of the Hurons arrive at the same Place. After an Engagement, they set out for Missilimakinac. A strange Adventure of M. de la Salle's Brother. Missilimakinac described.

SIR,

I AM at a loss to determine whether it is owing to stupidity, or greatness of mind, that the loss of my estate, which I infallibly foresee, doos not at all affect me. Your letter is but too shrewd a confirmation of my prophecy. However, I cannot but pursue your seasonable advice in writing to court; in the mean time suffer me to satisfy

my promife, in prefenting you with a relation of my voyages.

I embarked at Niagara August 3d, on board a canoe manned with eight soldiers of my detachment; and after running three leagues against the current of the streight, came that same day to the place where the navigation stops. There I met with the Sieur Grisolon de la Tourette, brother to M. Dulhut, who had ventured to come from Missilimakinac with a single canoe to join the army. The 4th we commenced our great land-carriage to the southward, being obliged to transport our canoes from a league and a half below the great Fall of Niagara, to half a league above it. Before we got at any beaten or level path, we were forced to climb up three mountains, upon which an hundred Iroquese might have knocked us all on the head with stones. While we were employed in this transport service, we were alarmed twice or thrice; which cautioned us to keep a strict guard, and to transport our baggage with all possible expedition. Nay, after all our precautions, we were forced to leave one-half of our baggage about half-

half-way, upon the discovery of a thousand Iroquese that marched towards us. Do you judge, Sir, if we had not some reason to be alarmed; and whether we would stand to facrifice all to the natural principle of self-preservation; though indeed we were in danger of losing our lives as well as our baggage; for we had not embarked above the Fall half a quarter of an hour, when the enemy appeared upon the streight side. I assure you, I escaped very narrowly; for about a quarter of an hour before, I and three or four savages had gone sive hundred paces out of our road, to look upon that fearful cataract; and it was as much as I could do, to get at the canoes before they put off. To be taken by such cruel sellows was to me no trisling thing. Il morir e niente, ma il vivere brugiando e troppo. "To die is nothing; but to live in the midst of sire is too much."

As for the water-fall of Niagara; it is seven or eight hundred foot high, and half a league broad. Towards the middle of it we descry an island that leans towards the precipice, as if it were ready to fall. All the beasts that cross the water within half a quarter of a league above this unfortunate island, are sucked in by force of the stream; and the beasts and fish that are thus killed by the prodigious fall, serve for food to sifty Iroquese, who are settled about two leagues off, and take them out of the water with their canoes. Between the surface of the water that shelves off prodigiously, and the soot of the precipice, three men may cross abreast without any other damage than

a sprinkling of some few drops of water.

To return to the flory of the thousand Iroquese; I must tell you, that we crossed the ftreight with all the vigour we were mafters of, and after rowing all night arrived next morning at the mouth of the lake, which appeared to be indifferently rapid. Then we were fecure from all danger, for the Iroquese canoes are so dull and large, that they cannot fail near fo quick as those made of birch-bark. The former are made of elm-bark, which is very heavy, and their form is very awkward, for they are fo long and broad that thirty men row in them, two abreast, whether sitting or standing, and the fides are fo low that they dare not venture them upon the lakes, though the wind be very flack. We coasted along the north coast of the Lake of Erie, being favoured by the calms, which are in a manner conftant in that feafon, especially in the fouthern countries. Upon the brink of this lake we frequently faw flocks of fifty or fixty turkies, which run incredibly fast upon the fands; and the savages of our company killed great numbers of them, which they gave to us in exchange for the fish that we caught. The 25th we arrived at a long point of land which shoots out 14 or 15 leagues into the lake; and the heat being excessive, we chose to transport our boats and baggage two hundred paces over land, rather than coast about for thirty-five leagues. September 6, we entered the streight of the Lake of Hurons, where we met with a flack current of half a league in breadth, that continued till we arrived in the Lake of St. Claire, which is twelve leagues in circumference. The 8th of the fame month we fleered on to the other end, from whence we had but fix leagues to run against the stream, till we arrived in the mouth of the Lake of Hurons, where we landed on the 14th. You cannot imagine the pleafant prospect of this streight, and of the little lake; for their banks are covered with all forts of wild fruittrees. It is true, the want of agriculture finks the agreeableness of the fruit; but their plenty is very furprifing. We fpied no other animals upon the shore, but herds of harts and roe-bucks: and when we came to little islands, we fcoured them in order to oblige these beasts to cross over to the continent, upon which they offering to swim

^{*} The prisoners taken by the Iroquese are frequently burnt.

over, were knocked on the head by our canoe-men that were planted all round the islands. After our arrival at the fort, of which I was ordered to take possession, M. Dulhut and M. de Tonti had a mind to reft themselves for some days, as well as the favages that accompanied us. This fort, which was built by M. Dulhut, was garrifoned upon his own charges by the coureurs de bois, who had taken care to fow in it some bushels of Turkey wheat, which assorded a plentiful crop, that proved of great use to me. The garrison surrendered their post very cheerfully to my detachment; and then purfued their commerce with our favages, for every one had leave to go where he pleafed. This gave me an opportunity of fending two canoes under a guard of foldiers, to dispose of a great roll of tobacco of two hundred weight. that M. Dulhut had kindly prefented me with; for that honest gentleman informed me, that my foldiers might eafily purchase corn in exchange for tobacco, sooner than for any other commodities. I am obliged to him as long as I live; but I am much afraid the treasurer of the navy will make him no better compensation for this piece of fervice, than for a thousand other disbursements upon the King's account. The foldiers I fent with the tobacco, returned in the latter end of November, and brought with them the Reverend Father Avenau the Jesuit, who found no occasion to trouble himself with preaching up abstinence from meat in the time of Lent. They brought advice, that a party of the Hurons being prepared to march out of their villages, to attack the Iroquese beaver-hunters, would speedily repair to the fort to rest themselves. the mean time I waited with impatience for the arrival of one Turcot, and four more of the coureurs de bois, who were to come to me in the beginning of December, along with fome other huntimen that M. de Denonville had promifed to fend me; but hearing nothing of them, and our commons being at that time very fhort, I should have been very much pinched if four young Canadese who were expert huntsmen, had not tarried with me all winter. The above mentioned party of the Hurons arrived December 2d, being headed by one Saentsouan, who left me his canoe and his baggage, to keep till he returned; for he could not possibly continue his navigation longer, upon the account that the furface of the water began then to be covered with ice. These favages chose to march over land to the fort of Niagara, where they expected to receive intelligence before they entered the country of the Iroquefe. They marched ten days, i. e. fifty leagues without feeing one foul. But at last their scouts perceived the footsteps of some huntsmen, which they traced at a great pace for a whole night, the fnow being then a foot deep. Towards the break of day they returned, and gave notice to their fellow-adventurers, that they had difcovered fix huts, with ten men lodged in each of them. Upon this intelligence the whole party made a halt, in order to paint their faces, to prepare their arms, and to concert proper measures. The attack was fo formed that two men made foftly up to the two doors of the huts with their clubs in their hands, to knock down any one that offered to come out, while the rest were employed in firing their pieces. And the action was crowned with wonderful fuccess; for the Iroquese being surprised and shut up in their bark prisons, there were but two out of fixty-four that made their escape; and these two being naked and destitute of fire-arms, could not but perish in the woods. Three of the Hurons indeed were killed upon the fpot, but to atone for that lofs, the aggreffors carried off fourteen prisoners, and four women. This done, they marched back to my fort with all possible expedition. Among the captive flaves, there were three who had made part of the number of the one thousand Iroquese that thought to have furprifed us the year before, when we were employed in the great land-carriage at Niagara. They gave us to understand, that the fort of Niagara was blocked VOL. XIII.

Q Q

up by eight hundred Iroquese, who meant to appear before my post without any delay. This troublesome piece of news galled me to the last degree, for fear of being reduced to extremities; and with that view I was a very nice husband of what corn I had left. I was not apprehensive of being attacked by them, for the savages never fight fairly, neither do they ever attempt to pull up pallisadoes; but I was afraid that they would starve us out by cramping our huntsmen in their due range. However, the Hurons continuing sisteen days in my fort to refresh themselves, I used the precaution of engaging them to assist my huntsmen in providing meat: but as soon as they took leave of me in order to return home, our hunting was at an end, and the gates

were kept shut.

At laft, finding that my provisions were almost out, I resolved to go to Missilimakinac, to luy up corn from the Hurons and the Outaouans. Accordingly, having left fome foldiers to guard the fort in my absence, I embarked with the rest of my detachment on the first of April, with a gentle south-east gale; by the help of which we infensibly croffed the bay of Saguinan. That little gulph is fix hours over, and in the middle of of it there are two little islands, which afford a very feasonable shelter when a wind arifes in the crofling over. Before you have croffed this bay, the coast is all along full of rocks and shelves, one of which that I faw was fix leagues broad: but above it the coast is clean and low, especially towards the fand-river, which lies half-way between that bay and a place called l' Anse du Tonnere. Now this last place is reckoned thirty leagues off the bay. Having passed that, we had but thirty leagues more to fail; which we did without any danger, but the help of an east-south-east gale, that swelled the waves prodigiously. In the mouth of the Illinese lake we met the party of the Hurons that I mentioned before; and four or five hundred Outaouas, who were bound home, after having fpent the winter in hunting of beavers upon the river of Saguinan. Both they and we were forced to lie by in that place for three or four days, by reason of the ice: after which the lake was cleared, and we croffed it together. When the Hurons came ashore, they consulted among themselves how to dispose of their slaves: after which they made a present of one of them to M. de Juchereau, who commanded in that place; but the poor wretch was prefently flot to death. Another of them was prefented to the Outaouas, who granted him his life, for fuch reasons as you would eafily apprehend, if you were better acquainted with the policy and cunning of that fort of men, whom you now take for beafts.

I arrived in this place on the 18th of April, and my uneafiness and trouble took date from the day of my arrival; for I found the Indian corn so scarce by reason of the preceding bad harvests, that I despaired of finding half so much as I wanted; but after all, I am hopeful, that two villages will furnish me with almost as much as I have occasion for. M. Cavelier arrived here May 6, being accompanied with his nephew, Father Anastase the recollect, a pilot, one of the savages, and some few Frenchmen, which made a fort of a party-coloured retinue. These Frenchmen were some of those that M. de la Salle had conducted upon the discovery of Mississipi. They gave out, that they are sent to Canada, in order to go to France, with some dispatches from M. de la Salle to the King: but we suspect that he is dead, because he does not return along with them. I shall not spend time in taking notice of their great journey over-land; which, by the account they give, cannot be less than eight hundred

eagues.

Miffilimakinac, the place I am now in, is certainly a place of great importance. It lies in the latitude of forty-five degrees, and thirty minutes: but as for its longitude, I have nothing to fay of it, for reasons mentioned in my second letter. It is not above

half

half a league diftant from the Illinese lake, an account of which, and indeed of all the other lakes, you may expect elfewhere. Here the Hurons and Outaouas have cach of them a village; the one being fevered from the other by a fingle pallifadoe: but the Outaouas are beginning to build a fort upon a hill, that stands but one thousand or twelve hundred paces off. This precaution they were prompted to by the murder of a certain Huron, called Sandaouires, who was affaffinated in the Saguinan river by four young Outaouas. In this place the Jesuits have a little house, or college adjoining to a fort of a church, and inclosed with pales that separate it from the village of the Hurons. These good fathers lavish away all their divinity and patience to no purpose, in converting such ignorant insidels; for all the length they can bring them to, is, that oftentimes they will defire baptifm for their dying children, and fome few fuperannuated perfons confent to receive the facrament of baptifm, when they find themselves at the point of death. The coureurs de bois have but a very small settlement here; though at the fame time it is not inconfiderable, as being the ftaple of all the goods that they truck with the fouth and the west savages; for they cannot avoid passing this way, when they go to the seats of the Illinese, and the Oumamis, or to the Bay des Puants, and to the river of Missispi. The skins which they import from these different places, must lie here some time before they are transported to the colony. Missilimakinac is situated very advantageously; for the Iroquese dare not venture with their forry canoes, to cross the streight of the Illinese lake, which is two leagues over; befides that the lake of the Hurons is too rough for fuch flender boats: and as they cannot come to it by water, fo they cannot approach to it by land, by reason of the marshes, sens, and little rivers, which it would be very difficult to cross; not to men-

tion that the streight of the Illinese lake lies still in their way.

You can fcarce believe, Sir, what valt shoals of white fish are caught about the middle of the channel, between the continent and the ifle of Missilimakinac. The Outaouas and the Hurons could never fubfift here without that fishery; for they are obliged to travel about twenty leagues in the woods, before they can kill any harts or elks, and it would be an infinite fatigue to carry their carcafes fo far over-land. This fort of white fish, in my opinion, is the only one in all these lakes that can be called good; and indeed it goes beyond all other forts of river fish. Above all, it has one fingular property, namely, that all forts of fauces fpoil it, fo that it is always eat either boiled or broiled, without any manner of feafoning. In the channel I now speak of, the currents are fo strong, that they fometimes suck in the nets, though they are two or three leagues off. In fome feafons, it fo falls out that the currents run three days eastward, two days to the west, one to the fouth, and four northward; fometimes more, and fometimes lefs. The cause of this diversity of currents could never be fathomed, for in a calm, they will run in the space of one day, to all the points of the compass, i. e. sometimes one way, sometimes another, without any limitation of time; fo that the decision of the matter must be left to the disciples of Copernicus. Here the favages catch trouts as big as one's thigh, with a fort of fishing hook made in the form of an awl, and made fast to a piece of brass wire, which is joined to the line that reaches to the bottom of the lake. This fort of fifthery is carried on not only with hooks, but with nets, and that in winter, as well as in fummer: for they make holes in the ice at a certain distance one from another, through which they conduct the nets with poles. The Outaouas and the Hurons have very pleafant fields, on which they fow Indian corn, peafe, and beans, befides a fort of citruls, and melons, which differs much from ours, and of which I shall take occasion to speak to another place. Sometimes these savages fell their corn very dear, especially when the beaver-hunters happens not to take well. Upon which occasion they make sufficient reprisals upon us for the ex-

travagant price of our commodities.

As foon as I have brought up fixty facks of corn, each of which may weigh fifty pound, I am to march with my detachment alone to St. Mary's Fort, in order to engage the Sauteurs or the inhabitants of Saut Saint Marie, to join the Outaouas; after which we mean to march with joint forces to the country of the Iroquefe. Befides thefe, there is a party of a hundred Hurons ready to march, under the command of the great leader Adario, whom the French call the Rat; but they do not march our way. I shall write to you with the first opportunity after my return from this expedition. Perhaps the Jesuits will fend your letters for me along with M. Denonville's to Fort St. Joseph, where I am to reside, I shall expect their arrival with the utmost impatience. In the mean time I fend you a letter directed to M. de Seignelay, the purport of which I have here subjoined. It will be a very fensible obligation laid upon me, if you vouchsafe to believe that I always am,

Sir, yours, &c.

The Letter directed to M. De Seignelay.

HONOURED SIR,

I AM the fon of a gentleman that spent three hundred thousand crowns in deepening the water of the two Gaves of Bearn: he had the good luck to compass his end by conveying a great many brooks to these two rivers; and the current of the Adour was by that means fo far strengthened as to render the bar of Bayonne passable by a fifty-gun thip, whereas in former times a frigate of ten guns durft not venture over it. It was in confideration of this great and fuccessful attempt that His Majesty granted to my father and his heirs for ever, certain duties and taxes, amounting to the fum of three thousand livres a year. This grant was confirmed by an act of the council of state, dated January 9, 1658, figned Boffuet, collated, &c. Another advantage accruing to the King and the province from my father's fervices, confifts in the bringing down of mafts and yards from the Pyrenean mountains, which could never have been effected if he had not by his care, and by the difburfing of immenfe fums, enlarged the quantity of water in the Gave of Oleron to a double proportion. These duties and taxes, which had been justly entailed upon him and his heirs, ceased to be ours when he died; and to inflame the diffrace, I loft his place, viz. that of being an honorary judge of the parliament of Pau, and chief justice in eyre for the province of Bearn; all which were mine by inheritance. Thefe losses are now followed by an unjust seizure that some pretended creditors have made of the barony of La Hontan, of a piece of ground that lies contiguous to it, and of a hundred thousand livres that lay in the hands of the chamber of Bayonne. These faithless creditors have no other reason to sue me, but that I am now in the fag end of the world, and that they are rich, and supported by the credit and protection of the parliament of Paris, where they hope to make good their unjust pretentions in my abfence. Last year I obtained leave to return to France, in order to take care of this matter; but now M. de Denonville has fent me with a detachment to these lakes; from whence I humbly petition that your honour would vouchfafe me leave to come home the next year, and at the fame time honour me with your protection.

I am, with all possible respect, Your Honour's, &c.

LETTER XV.

Dated at Missilimakinac, Sep. 18, 1688.

Describing the Fall called Saut St. Marie, where the Author persuades the Inhabitants to join the Outaouas, and march against the Iroquese. And containing an Account of the Occurrences of the Voyage between that Place and Missilimakinac.

SIR,

I AM now returned from the Iroquese country, and have quitted the Fortof St. Joseph against my will. I cannot allow myself to doubt, but that you took care of the letter

directed for M. de Seignelay, which I transmitted to you three months ago.

I fet out from hence in my canoc, June 2; and after my arrival at the water-fall called Saut Sainte Marie, I perfuaded forty young warlike fellows to join the party of the Outaouas that I mentioned in my last. This Saut Sainte Marie is a cataract, or rather a water-fall of two leagues in length, which gives vent to the waters of the upper lake, and at the bottom of which, not far from the Jesuit's house, there is a village of the Outchipoues, alias Sauteurs. This place is a great thoroughfare for the coureurs de bois that trade with the northern people, who usually repair to the brinks of that lake in the fummer. The continual fog that rifes from the upper lake, and spreads over the adjacent country, renders the ground fo barren that it bears no corn. The 13th of the fame month I fet out from the above-mentioned village, being accompanied by the forty young Sauteurs, who embarked in five canoes, each of which held eight men. The 16th we arrived at the ifle of Detour, where my foldiers and the party of the Outaouas had tarried for me two days. The first day was spent by the Outaouas and the Sauteurs in warlike feafts, dancing, and finging, purfuant to their wonted custom: the next day we all embarked, and traversing from isle to isle, made the ifland of Manitoualin in four days. This ifland is twenty-five leagues long, and feven or eight broad. In former times it was possessed by the Outaouas of Talon, called the Otontagans; who were diflodged by the progress of the Iroquese, that has ruined so many nations. We coasted upon that isle a whole day; and being favoured by a calm, croffed from ifle to ifle till we made the east fide of the lake. In this passage we croffed between two islands that were fix leagues distant the one from the other; and upon that occasion our watermen, who were not used to venture so far out in their slender boats, were fain to tug hard at their oars. The favages stood out at first, and refused to venture fo far from land, for they would rather have gone fifty leagues about; but at laft I over perfuaded them, by reprefenting that I would have been very loth to venturemy own person, if I had not been sufficiently provided against all danger by an exact knowledge of the winds and the storms. The calm continuing, we made the river of Theonontate on the 25th. The next day there forung up a gale from the west-southwest, which kept us back for four or five days; but our stop was of no great advantage to us, for it rained so heavily, that we could not hunt. This country is the ancient feat of the Hurons, as it appears from the name they give to their nations in their own language, viz. Theonontateronons, i. e. the inhabitants of Theonontate. But after the Iroquese had upon divers occasions, taken and defeated great numbers of them, the rest quitted the country to avoid the like fate. We re-embarked on the 29th, and on the 1st of July arrived at Fort St. Joseph, where the foldiers I had left waited for us with great impatience. Having landed fome facks of corn at the fort, we fet out again on the 3d of July, and purfued our course with all diligence, in order to an early appearance in

the Iroquese country. We sailed through the strait or neck, and stood to the south side of the lake Eric; and being savoured by the weather, arrived on the 17th in the river Conde, which I shall have occasion to take notice of in describing the lakes of Canada. Immediately, upon our landing, the savages sell to work in cutting down trees, and making a redoubt of stakes, or pales, for the security of our canoes and bag-

gage, and for a fafe retreat to ourselves in case of necessity.

The 20th they marched, each man being provided with a light covering, a bow, and fome arrows, (or elfe a fusee) and a little bag containing ten pound weight of the flour of the Indian corn. They thought it most convenient to keep to the banks of the river, upon which the Goyogoans are wont to fish for sturgeon; for that fish, which is fix feet in length, comes out of the lakes in hot weather, and fwims up the rivers. They had refolved likewife, if they found the country clear to march up and furprize the villages of the Goyogoans: but they were foon eafed of that trouble, for they had not marched two days when their fcouts defcried three hundred Iroquefe; and on the other hand, the Iroquefe spied them to such purpose, that the scouts escaped very narrowly, and had much ado to return to the body of the party, which immediately betook themselves to slight. I was mightly surprized when I heard the centinel of our redoubt cry out, Aux armes, our men are beaten and pursued; but I was yet more surprized when I faw the fugitives run at full fpeed, when there was nobody behind them. When they came up, they were all filent for half an hour, purfuant to their use and wont; after which their leader recounted to me the particulars of the adventure. I thought at first that their advanced guards had mistook the number of the enemies; for I knew that the Outaouas had not the reputation of too much courage; but the next day a party of the Iroquese appeared in fight of our redoubt, which gave the occasion to believe that they were in the right of it. Nay, this truth was afterwards confirmed by a certain flave called Chaouanon, who made his escape to the redoubt, and affured me, that the Iroquefe were not less than four hundred; to which he added, that they expected to be joined by fixty more that had marched fome months before to the country of the Oumamis. He informed us farther, that while the Marquis de Denonville was concerting measures for a peace with the five nations, an Englishman, of the name of Aria, accompanied with some others, endeavoured to disfuade them from peace, by orders from the governor of New York. In the mean time the favages having pressed me to affist at a council of war, they proposed to lie by for a fair wind, and then to embark. They represent, that they defigned to fail to the end of the lake, where they would infallibly light upon the fixty lroquese that I mentioned above; but withal, that they could not agree to fet out in a calm, because that after their quitting the redoubt, and launching out, a contrary wind might force them ashore, where their throats might be cut if the enemy purfued them. I replied, that it was then fuch fine weather, that we had nothing to expect but calms; that if we tarried longer in this place, our enemies would thereby gain time to make canoes in order to a pursuit: that fince the favourableness of the wind was so uncertain, we ought to embark without loss of time; that we might fail in the night and fculk in the day time behind rocks and points of land; and, that by this means the enemy would be at a loss to know whether we flood to the fouth or to the north fide of the lake. The favages made answer, that it was true their tarrying might be every way prejudicial; but it was equally true, that my expedient was dangerous: however, they confented to embark along with us, and for that end gummed their canoes. We embarked on the 24th at night, and the weather being fair, clear, and calm, made a great deal of way that night, and the fucceeding day. The next evening we came to an anchor, defigning to fleep for three or four hours, but not to stir out of the canoes. About midnight we weighed our little wooden anchors, and one half of the men rowed while the other was at rest. Thus did we continue to steer with a great deal of precaution and care, rowing all night, and lying by all day.

July 28th, when we were lying almost all asleep in a creek of a little island, the watch descrying some canoes that made towards us, waked some savages that had gone ashore to fleep the more conveniently. The noise having alarmed us all, we presently made ourselves ready to get in head of these canoes; but at the same time, though we were but half a league off, we could not distinguish who they were, by reason that the funbeams falling perpendicularly, made the furface of the water look like a looking-glafs. Indeed there being but two of them, we reckoned they were manned with Iroquefe, and that each of them contained at least twenty men; upon which suspicion, the leader of the Sauteurs offered to go ashore with his men, and post himself at the entry of a wood, from whence he would foftly follow the causes without being discovered, until fuch time as we forced them ashore. At the same time he proposed that the Outaouas and my detachment should suffer them to be within a musket-shot of the island before we discovered ourselves, or offered to give them chase, upon the apprehension that if we followed them closer, they would be fo far from getting on shore, that they would fight as desperate, and chuse rather to be killed or drowned than to be taken. This propofal was liked, and every thing was managed accordingly. As foon as our unknown enemy perceived us, they made the shore with all imaginable precipitation; and just when they were going to knock their prisoners on the head, the Sauteurs fell upon them, but miffed of their aim in taking them all alive; for they fought to the last gasp, like men that knew no medium betwixt conquest and death. Una falus victis nullam sperare salutem. This engagement happened while we landed; however, the Sauteurs came off with honour, for they loft only four men, and of twenty Iroquese they killed three, wounded five, and took the rest prisoners, so that not one of them escaped. The Iroquese had along with them eighteen flaves of the Oumamis, who were all wounded, and feven big-bellied women, from whom we had intelligence that the rest of their party were then upon their return by land upon the banks of the lake, having thirty-four prisoners, of both fexes; and that they could not then be far off. When this intelligence was laid before us, the Outaouas were of the opinion that we should rest satisfied with the feats we had done, upon the plea that the above-mentioned four hundred Iroquese would certainly get before us. On the other hand, the Sauteurs maintained that they had rather perish than fail to attempt the rescue of these prisoners, and the defeat of the whole party; and that if nobody would fecond them, they would make the attempt by themselves. The bravery of this resolution obliged me to encourage and edge on the Outaouas. I remonstrated to them, that in regard the Sauteurs engroffed the glory of the former action, they had more reason than we to decline the rifque of a fecond engagement, that if we refused to back them, our cowardice would cover us with everlasting infamy; and, that in order to render the attack more fecure, we ought to use a speedy precaution in finding out some point or elbow of land where our canoes, our baggage, and our prisoners might be lodged fafe. The Outaouas had a great deal of reluctancy to the matter; however, after confulting among themselves, they complied with the proposal, more for shame, than out of true courage. Having laid down that joint resolution, we made up a little fort of a fence in seven or eight hours, and then sent out scouts on all hands, while the main body was kept in readiness to march upon the first alarm.

August 4, two of our spies returned upon full speed, to acquaint us that the Iroquese were not above three leagues off, and that they advanced towards us; and withat, that

upon the road there was a little brook, upon which an ambuscade might be conveniently laid. This advice animated our favages fo much, that they run immediately to take possession of that advantageous post; but they knew not how to make the right use of it. The Outaouas were too hafty in firing; and by shooting at too great a distance, gave all the enemies an opportunity of making their escape, abating for ten or twelve whose heads were brought into the little fort where I staid. The slaves indeed were all retaken, and fo refcued from the cruelty of these tigers; which encouraged us to reft fatisfied. When the expedition was over, we showed these poor wretches in our canoes, and fleered with all expedition to the first or neck of the lake of Huron, which we made on the 13th. We enjoyed a great deal of pleasure in stemming the current of that streight; the islands of which, that I mentioned above, were covered with roe-bucks. This opportunity we did not flight; nor did we grudge our flopping upon these islands for eight days; during which time we were busied in hunting, and refreshed ourselves with plenty of excellent fruit that was fully ripe. Here the wounded and retaken prisoners had an opportunity of resling, and of drinking the broth of feveral forts of meat; and we had time to broil as much meat as we could flow in our canoes, not to mention the great number of turkeys that we were obliged to eat upon

the fpot, for fear that the heat of the feafon would fpoil them.

In that fpace of time the poor wounded favages were carefully purged with fuch roots as the Americans are well-versed in; which I mean to explain to you in its proper time and place; and they wanted not good reftoratives of jelly-broth. The 24th we re-embarked, and arrived at night at Fort St. Joseph, where I found a party of eighty Oumamis, commanded by one Michitonka, who being lately returned from Niagara, expected my arrival with the utmost impatience. When I landed, I was surprized to fee the fort crammed with favages; but on the other hand, they were equally aftonished to find in our company their countrymen, to whose hard fortune they had been altogether strangers. The joyful meeting filled the air with acclamations, and panegyrics rung all about to an extravagant degree. I wish, Sir, you had been there to partake of the pleafure of fo fine a flow; had you been prefent, you would have joined with me in owning that all our French rhetoric cannot reach such pithy and fignificant figures, effecially upon the fcore of hyperboles, as made up the bulk of the harangues and fongs that thefe poor people uttered with rapture and transport. Michitonka acquainted me, that after he went to the fort of Niagara, with a defign to make fome expedition into the country of the Tfonontouans, he found that the fcurvy had made fuch a terrible havoc in that fort, that it had fwept off the commander, and all the foldiers, bating twelve, who had the good luck to get over it, as well as M. de Bergeres, who by the advantage of a hale conflitution, had flemmed the raging violence of that diffemper. He informed me farther, that M. Bergeres having refolved to fet out with his twelve men for the fort of Frontenac, had defired of him a reinforcement of fome young Oumainis, which was granted him; that after M. Bergeres had embarked, himfelf marched over-land to the country of the Onnontagues, where he rejoined the reinforcement he had granted to M. de Bergeres, and understood from them, that during the winter the feurvy had carried off as many foldiers at Fort Frontenac as at Niagara; and, that M. de Denonville was negociating a peace with the Iroquefe.

The governor of fort Frontenac had requested Michitonka to engage in no enterprise, and to return home with his men; upon which that leader being in full march homeward, was attacked by three hundred Onnontagues, whom he durst not engage otherwise than in a running fight, by which he lost four men. Being informed of all

thefe

thefe circumftances, I confulted with the three different nations that were then posted in my fort. After a mature reflection upon the intelligence that was laid before them, they came to this resolution; that fince the Marquis de Denonville had a mind to clap up a peace, and the fort of Niagara was abdicated, the fort I then commanded would be of no use; that fince I had neither provisions nor ammunition for above two months, I should be obliged at the end of these two months to retreat to the place from whence I now write; that at that time of the year our navigation would be uncasy and dangerous; that in regard I lay under an indifpenfible necessity of making my retreat, it was of no great moment whether I marched off two months fooner or later; and, in fine, that fince I had received no fresh orders, nor no succours, it was my business to go off along with them. This refolution, which was a fufficient argument to fway me, afforded matter of joy to the foldiers, who were afraid of being obliged to a more rigorous course of abstinence in that post than they had formerly undergone; for the measures of a critical abstinence do not sit well upon a soldier's stomach; in sine, pursuant to our joint resolution, we set fire to the fort on the 27th, and embarked that fame day, and keeping close to the fouth shore of the lake that I took notice of in my last, arrived here on the 10th of September. The Oumamis marched over-land to their own country, and carried with them the wounded, who were then in a condition to march.

Upon my arrival in this place, I found here M. de la Durantay, whom M. Denonville has invested with the commission of commander of the coursers de bois that trade upon the lakes, and in the fouthern countries of Canada. The governor has fent me orders to return to the colony if the feafon and other circumstances permit; or to tarry here till the fpring, if I foresee infurmountable difficulties in the passage. In the mean time he has fent me effects to answer the pay of my detachment, and to subfift them in the winter. These orders would be extremely acceptable to me, if I could but contrive how to return to the colony; but that feems to be abfolutely impossible; and both the French and the favages agree that it is fo. There are in that passage fo many water-falls, cataracts, and places where there is a necessity of tedious land-carriages, that I dare not run fuch hazards with my foldiers, who cannot work the boats but upon flagnant' water. Upon that confideration I have thought it more proper to halt here till the next year; at which time I defign to take the advantage of the company of some Frenchmen and favages, that promife to take into each of their canoes one of my men. In the mean time, I am upon the point of undertaking another voyage, for I cannot mew myfelf up here all this winter. I defign to make the best use of my time, and to travel through the fouthern countries that I have fo often heard of, having engaged four or five good huntimen of the Outaouas to go along with

The party of the Hurons that I mentioned in the beginning of my letter, returned hither two months ago, and brought with them an Iroquese slave, whom their leader presented to M. de Inchereau, the late colonel of the coureurs de bois, and whom that colonel ordered to be immediately shot. The crafty leader acted upon that occasion a very cunning and malicious part, the fatal consequences of which I easily foresee: he entrusted nobody with the secret but myself; for he is my true friend, and he knows that I am his; however, I must go no farther upon this matter, lest my letter should be intercepted. Though after all, if the blow were not already given, or if it were possible to remedy it, my friendship should not hinder me from acquainting M. de Denonville with the intrigue, that he might get clear of it as well as he yol. XIII.

could. If it pleafes God to allow me a fafe return to France, I shall tell you the story

by word of mouth.

I understand by your last, that the King has preferred his almoner, the abbot of St. Valiers, to the bishoprick of Quebec; and that this bishop was confectated in St. Sulpice's church. This piece of news would be very welcome to me, if I thought he would be less rigid than M. de Laval, his predecessor. But what likelihood is there that the new bishop will be of a tractable temper? If it is true that he has refused other good bishopricks, he must be as scrupulous as the monk Dracontius, that St. Athanastius censures for not accepting of a presentation to a bishoprick that was offered him; in fine, if he is of that scrupulous temper, his critical strictness will scarce go down in this country; for the people are already tired out with his predecessor's excommunications.

I am, Sir, yours, &c.

LETTER XVI.

Dated at Missilimakinae, May 28. 1689.

Containing an Account of the Author's Departure from and Return to Missilimakinac. A Description of the Bay of Puants, and its Villages. An ample Description of the Beavers; followed by the Journal of a remarkable Voyage upon the Long River, and a Map of the adjacent Country.

SIR,

THANK God, I am now returned from my voyage upon the Long River, which falls into the river of Miffifipi. I would willingly have traced it up to its fource if feveral obstacles had not stood in my way. I set out from hence the 24th of September accompanied with my own detachment, and the five huntsmen I mentioned in my last; who indeed did me a great deal of service. All the soldiers were provided with new canoes loaded with provisions and ammunition, and such commodities as are proper for the savages. The wind, which stood then in the north, wasted me in three days to the bay of Pouteouatamis, that lay forty leagues off. The mouth of that bay is in a manner choaked with isles, and the bay itself is ten leagues broad, and twenty-

five leagues long.

The 29th we came to a little deep fort of a river, which difembogues at a place where the water of the lake swells three foot high in twelve hours, and decreases as much in the fame compass of time. Our tarrying there three or four days gave me an opportunity of making this remark: the villages of the Sakis, the Pouteouatamis, and fome Malominis, are feated on the fide of that river, and the Jefuits have a house or college built upon it. This is a place of great trade for skins and Indian corn, which these savages sell to the coureurs de bois, as they come and go, it being the nearest and most convenient passage to the river of Mississipi. The soil of this country is so fertile that it produces (in a manner without agriculture) our European corn, peafe, beans, and feveral other fruits that are not known in France. As foon as I landed, the warriors of these three nations came by turns to my apartment, to regale me with the calumet dance, and with the captain's dance; the former being a fignification of peace and friendship, and the latter of respect and esteem. I returned the compliment with a present of some rolls of Brasil tobacco, which they value mightily, and some firings of Venice beads, with which they embroider their coats. Next morning I was invited invited to a feast with one of the three nations; and after having fent to them some dishes and plates, pursuant to the custom of the country, I went accordingly about noon. They began with congratulating my arrival, and after I had returned them thanks, fell a singing and dancing one after another, in a particular manner, of which you may expect a circumstantial account when I have more leisure. The singing and dancing lasted for two hours, being seasoned with acclamations of joy and jests, which made up part of their ridiculous music. After that the slaves came to serve, and all the company sat down after the Eastern fashion, every one being provided with

his mefs, just as our monks are in the monastery halls.

First of all, four platters were set down before me, in the first of which there were two white fish only boiled in water; in the fecond, the tongue and breast of a roebuck boiled; in the third, two wood-hens, the hind feet or trotters of a bear, and the tail of a beaver, all roafted; and the fourth contained a large quantity of broth made of feveral forts of meat. For drink they gave me a very pleafant liquor, which was nothing but a fyrup of maple beat up with water; but of this more elsewhere. The feast lasted two hours; after which I intreated one of the grandees to sing for me; for in all the ceremonies made use of among the favages, it is customary to employ another to act for them. I made this grandee a prefent of some pieces of tobacco, in order to oblige him to act my part till night. Next day, and the day after, I was obliged to go to the feasts of the other two nations, who observed the same formalities. The most curious thing I faw in the villages was ten or twelve tame beavers, that went and came like dogs from the rivers to the cottages, without straggling out of the road. I asked the savages if these animals could live out of the water; and received this answer, that they could live ashore as well as dogs, and that they had kept some of them above a year, without fuffering them to go near the rivers: from whence I conclude, that the casuilts are out in not ranging ducks, geese, and teals in the number of amphibious animals, as the naturalists are wont to do. I had heard the fame story from feveral Americans before; but being apprehensive that there were different species of beavers, I had a mind to be better informed: and indeed there is a particular kind of them, which the favages call the terrestrial, or land-beaver; but at the same time they tell you, these are of a different species from the amphibious fort; for they make holes or dens in the earth, like rabbits or foxes, and never go near the water, unless it be to drink. They are likewife called by the favages, the lazy or idle kind, as being expelled by the other beavers from the kennels in which these animals are lodged, to the number of eighty. These kennels I mean to describe afterwards; in the mean time I only take occasion to acquaint you, that the idle fort being unwilling to work, are expelled by the others, just as wasps are by bees; and are so teased by them, that they are forced to quit the kennels, which the better and more industrious race huddles up to themselves in the fens. This supine beaver resembles the other fort in its figure, excepting that the hair is rubbed off the back and the belly, which is occasioned by their rubbing against the earth when they return to, or stir out from their holes.

The writers of natural history are very much out, in fancying that the beavers cut off their own testicles, when pursued by the huntsmen; for that which the physicians call castoreum, is not lodged in the testicles, but in a certain bag that nature seems to have formed on purpose for these animals, and this bag they make use of to clear their teeth, after the biting of some gummy shrub. But supposing the testicles to be the proper receptacle of the castor, we must still conceive that it is impossible for a beaver to pull out his testicles, without rending the nerves of the groin, in which they

are feated just by the sharebone. It is manifest that Elian and several other naturalists, were fcarce acquainted with beaver-hunting; for had they known any thing of the matter, they would never have talked of the purfuing of these animals, which never go from the fide of the pond where the kennels are built; and which dive under water upon the least noife, and return to their dens when the danger is over. If these creatures were but fenfible of the reason for which war is declared against them, they would flea themselves alive; for it is the skin only that the huntsmen want, the value of the caftor being nothing in comparison with that. A great beaver is twenty-fix inches long, from the hind head to the root of the tail. It is about three foot and eight inches round, its head is feven inches long and fix broad; its tail is fourteen inches long, and fix broad, and about the middle it has the thickness of an inch and two lines. figure of the tail is oval; the scale with which it is covered, and which performs the office of what the physicians call the epidermis, or scarf-skin, is an irregular hexagon. The beaver carries upon its tail the clay, the earth and other materials of which they make their banks and kennels, or huts, by a wonderful inftinct. Its ears are fhort, round and hollow; its legs are five inches long, its feet fix inches and eight lines, and its paws are three inches and a half from the heel to the end of the great toe. Its paws are formed much like a man's hand, and they make use of them in feeding as apes do. The five toes are joined like those of a duck, with a membrane of a flate colour. It eyes are of the leffer fize, in proportion to the bulk of its body, and bear the figure of a rat's eyes. Before its muzzle there are four fore-teeth or cutters, viz. two in each jaw, as in a rabbit, befides which it has fixteen grinders, that is, eight in the upper, and as many in the lower mandible. The cutters are above an inch long, and a quarter of an inch broad, being very strong and sharp like a cutlas; for a beaver affifted by its affociates, (if I may fo call its fellow-beavers) cuts down trees as big as a hogshead; which I could never have believed, if I had not observed with my own eyes, about twenty trunks of trees cut down in that fashion. A beaver has two lays of hair; one is long, and of a shining black colour, with a grain as big as that of man's hair; the other is fine and fmooth, and in winter fifteen lines long: in a word, the last is the finest down in the world. The skin of such a beaver as I have now described, will be two pound weight, but the price varies according to the goodness. In winter and autumn the slesh of a beaver eats very well, if it be roasted. Thus, Sir, I have prefented you with an exact description of these reputed amphibious animals which make fuch structures, that all the art of man can fcarce equal. Upon another occasion perhaps I may give you a circumstantial account of their wonderful structure, which I decline at present, because the digression would be too tedious.

To return to my voyage. After our arrival in the bay of Ponteouatamis, we bid adieu to the navigation upon the lakes of Canada; and fetting out September 30, arrived October 2, at the foot of the fall of Kakalin, after stemming some little currents in the river of Puants. The next day we accomplished the small land-carriage, and on the 5th arrived before the village of Kikapous, in the neighbourhood of which I encamped the next day, in order to receive intelligence. That village stands upon the brink of a little lake, in which the savages sish great quantities of pikes and gudgeons. I found only thirty or forty men sit for war in the place, for the rest were gone a beaver-hunting some days before. The 7th I reimbarked, and rowing hard, made in the evening the little lake of Malominis, where we killed bucks and bustards enough for supper. We went ashore that night, and built huts for ourselves upon a point of land that shoots out; by break of day I went in a canoe to the village, and after an hour's conference

conference with fome of the favages, prefented them with two rolls of tobacco, and they, by way of acknowledgement, made me a prefent of two or three facks of oatmeal: for the fides of the lake are covered with a fort of oats, which grow in tufts, with a tall ftalk, and of which the favages reap plentiful crops. The 9th I arrived at the foot of Outagamis fort, where I found but few people; however, they gave me a very kind reception, for after dancing the calumet before the door of my hut, they made me a prefent of venison and fish. Next day they conveyed me up the river, to the place where their folks were hunting the beavers. The 11th we embarked, and landed the 13th upon the fliore of a little lake, where the head of that nation refided. After we had reared up our huts, that general gave me a vifit, and enquired which way I intended to move. I made answer, that I was so far from designing to march toward the Nadoueslious, his enemies, that I should not come near them by one hundred leagues; and to confirm the innocence of my intentions, I prayed him to fend fix warriors to accompany me to the Long River, which I defigned to trace up to its fource. He replied, that he was extremely glad to find that I carried neither arms nor cloaths fo the Nadoueslious; that he saw I had not the equipage of a coureur de bois, but that on the contrary, I had fome discovery in my view. At the same time he cautioned me not to venture too far up that noble river, by reason of the multitudes of people that I would find there, though they have no stomach for war: he meant, that some numerous party might furprize me in the night-time. In the mean time, instead of the fix warriors that I defired, he gave me ten, who understood the lingua, and knew the country of the Eokoros, with whom his nation had maintained a peace of twenty years flanding. I flaid two days with this general, during which time he regaled me nobly, and walked about with me to give me the fatisfaction of observing the disposure of the cottages of the beaver-hunters; a description of which you may expect in another place; I prefented him with a fusee, twelve flint stones, two pounds of powder, four pounds of ball, and a little axe, and I gave each of his two fons a great coat, and a roll of Brafil tobacco. Two of the ten warriors that he gave me, could fpeak the language of the Outaouas, which I was well pleafed with; not that I was a stranger to their own language, for between that and the Algonkin there is a great difference, but in regard that there were feveral words that puzzled me. My four Outaouas were transported with this little reinforcement, and were then fo encouraged, that they told me above four times, that we might venture fafely fo far as the plantation of the fun. I embarked with this fmall guard the 16th about noon, and arrived that night at the landcarriage of Ouisconfine, which we finished in two days, that is, we left the river of Puants, and transported our canoes and baggage to the river Ouisconfine, which is not above three quarters of a league distant, or thereabouts. I shall fay nothing of the river we left, but that it was muddy, full of shelves, and inclosed with a steep coast, marshes, and frightful rocks.

The 19th we embarked upon the river Ouisconsinc, and being favoured by a slack current, arrived in four days at the place where it empties itself into the river Missipi; which is about half a league broad in that part. The force of the current, and the breadth of that river is much the same as that of the Loire. It lies north-east and south-west, and its sides adorned with meadows, losty trees and firs. I observed but two islands upon it, though there may be more, which the darkness of the night hid from us as we came down. The 23d we landed upon an island in the river Mississipi, over against the river I spoke of but now, and were in hopes to find some wild-goats there, but had the ill-fortune to find none. The day after we crossed to the other side of the river, sounding it every where, as we had done the day before, and sound nine

feet water in the shallowest place. The 2d of November we made the mouth of the Long River, having first stemmed several rapid currents of that river, though it was then at the lowest ebb. In this little passage we killed several wild beeves, which we broiled, and catched feveral large dabs. On the 3d we entered the mouth of the Long River, which looks like a lake full of bull-rushes; we found in the middle of it a narrow channel, upon which we fteered till night, and then lay by to fleep in our canoes. In the morning I enquired of my ten Outagamis, if we had far to fail before we were clear of the rushes, and received this answer, that they had never been in the mouth of that river before, though at the fame time they affured me, that about twenty leagues higher the banks of it were clad with wood and meadows. But after all, we did not fail fo far, for about ten o'clock next morning the river became pretty narrow; and the fhore was covered with lofty trees; and after continuing our course the rest of that day, we had a prospect of meadows now and then. That same night we landed at a point of land, with a defign to drefs our broiled meat, for at that time we had none fresh. The next day we stopped at the first island we saw, in which we found neither man nor beaft; and the evening drawing near, I was unwilling to venture far into it. fo we even contented ourselves with the catching of some forry fish. The 6th a gentle gale fprung up, which wafted us to another ifland about twelve leagues higher, where we landed. Our passage to this place was very quick, notwithstanding the great calm that always prevails upon the river, which I take to be the least rapid river in the world. But the quickness of the passage was not the only surprisal, for I was amazed that I saw no harts, nor bucks, nor turkies, having met with them all along in the other parts of my discovery. The 7th the same wind drove us to a third island, that lay ten or twelve leagues off the former, which we quitted in the morning. In this third island our

favages killed thirty or forty pheafants, which I was not ill pleafed with.

The 8th the wind proving unferviceable to us, by reason that it was intercepted by hills covered with firs, we plied our oars: and about two in the afternoon, descried on the left hand large meadows, and fome huts at the diftance of a quarter of a league from the river. Upon this difcovery, our favages and ten of the foldiers jumped upon the shore, and directed their course to the houses, where they found fifty or fixty huntsmen prepared to receive them, with their bows and arrows. As foon as the huntimen heard the voice of the Outagamis, they threw down their arms, and prefented the company with fome deer that they had just killed, which they likewise helped to carry to my canoes. The benefactors were fome of the Eokoros, who had left their villages, and come thither to hunt. I prefented them, more out of policy, than acknowledgment, with tobacco, knives and needles, which they could not but admire. Upon this, they repaired with expedition to their villages, and gave their affociates to understand, what a good fort of people they had met with; which had fo much influence, that the next day towards the evening, there appeared upon the river fide above two thousand savages, who fell a dancing as foon as they descried us; thereupon, our Outagamis went afhore, and after a short conference, some of the principal savages embarked on board of our canoes, and fo we all fleered to the chief village, which we did not reach till midnight. I ordered our huts to be made up on a point of land near a little river, at the distance of a quarter of a league from the village. Though the favages pressed me extremely to lodge in one of their villages, yet none went with them but the Outagainis, and the four Outaouas, who at the fame time cautioned the favages not to approach to our camp in the night time. Next day I allowed my foldiers to refresh and rest themfelves; and went myfelf to vifit the grandees of this nation, to whom I gave prefents of knives, fciffars, needles and tobacco. They gave me to understand, that they were infinitely

infinitely well pleafed with our arrival in their country, for that they had heard the favages of other nations speak very honourably of the French. I took leave of them on the 12th, and fet out with a convoy of five or fix hundred favages, who marched upon the shore, keeping pace with our canoes. We passed by another village that lay to the right hand, and stopped at a third village that was five leagues distant from the first, but did not difembark; for all that I defigned, was to make a prefent to the leading men of the village, from whom I received more Indian corn, and broiled or dried meat, than I occasion for. In fine, I passed from village to village without stopping, unless it were to incamp all night, or to prefent the favages with some trinkets; and so steered on to the last village, with a design to get some intelligence. As foon as we arrived at the end of this village, the great governor, who indeed was a venerable old gentleman, fent out hunters to bring us good cheer. He informed me, that fixty leagues higher I should meet with the nation of the Essanapes, who waged war with him; that if it had not been for their being at war, he would have given me a convoy to their country; that, however, he meant to give up to me fix flaves of that country, which I might carry home, and make use of as I saw occasion; and that in failing up the river, I had nothing to fear, but the being furprized in the night-time. In fine, after he had instructed me in feveral very useful circumstances, I immediately made every thing ready for my departure. The commanders of this people acquainted me that they had twelve villages peopled by twenty thousand warriors; that their number was much greater before the war, which they waged at one time with the Nadonessis, the Panimoha, and the Essanapes. The people are very civil, and fo far from a wild favage temper, that they have an air of humanity and fweetness. Their huts are long, and round at the top, not unlike those of our sayages, but they are made of reeds and bulrushes, interlaced and cemented with a fort of fat earth. Both the men and women go naked all over excepting their privities. The women are not fo handsome as those who live upon the lakes of Canada. There feems to be fomething of government and fubordination among this people; and they have their houses fortified with the branches of trees, and fascines strengthened with fat earth.

The 21st we embarked at the break of day, and landed that night in an island covered with stones and gravels, having passed by another at which I would not put in, because I would not slight the opportunity of the wind, which then stood very fair. Next day the wind standing equally fair, we set out and continued our course all that day, and the following night; for the fix Essanapes informed us, that the river was clean, and free from rocks and beds of fand. The 23d we landed early in the morning on the right fide of the river, in order to careen one of our boats that fprung a leak. While that was doing, we dreft fome venifon that had been prefented me by the commander of the last village of the Eokoros; and the adjacent country being replenished with woods, the favages of our company went a shooting in the forests; but they faw nothing but fmall fowls, that they did not think fit to shoot at. As soon as we re-embarked, the wind fell all of a fudden, and fo we were forced to ply the oars; but most of the crew having slept but little the night before, they rowed but very faintly, which obliged me to put in at a great ifland two leagues higher; the fix Effanapes flaves having informed me, that this island afforded great plenty of hares, which I found to be true. These animals had a lucky instinct in taking shelter in this island, for there the woods are fo thick, that we were forced to fet fire to feveral places, before we could

diflodge them.

Having made an end of our game, my foldiers fed heartily, and thereupon fell fo found afleep that I could fcarce get them waked upon a false alarm, occasioned by a

herd of wolves that made a noise among the thickets upon the continent. We reembarked next day at ten o'clock in the morning, and did not run above twelve leagues in two days, by reason that the savages of our company would needs walk along the river side with their guns, to shoot geese and ducks; in which they had very good success. After that we encamped just by the mouth of a little river on the right hand, and the Essanapes slaves gave me notice, that the first of their villages was not above sixteen or eighteen leagues off. Upon this information, I sent, by the advice of the savages of our company, two of the slaves to give notice of our arrival. The 26th we rowed briskly, in hopes to reach the first village that day; but being retarded by the huge quantities of sloating wood that we met in several places, we were forced to continue all night in our canoes. The 27th about ten or eleven o'clock we approached to the village, and after putting up the great calumet of peace upon the prow of our canoes,

lay upon our oars.

Upon our first appearance, three or four hundred Essanapes came running to the shore, and, after dancing just over against us, invited us ashore. As soon as we came near the shore, they began to jump into our canoes; but I gave them to know by the four Essanapes slaves, that I desired they should retire, which they did immediately. Then I landed, being accompanied with the favages of our company, namely, the Outagamis and the Outaouas, and with twenty foldiers. At the fame time I gave orders to my ferjeants to land and post centries. As we stood upon the shore, all the Essanapes prostrated themselves three or four times before us, with their hands upon their foreheads; after which we were conveyed to the village with fuch acclamations of joy as perfectly stunned us. Upon our arrival at the gate, our conductors stopped us, till the governor, a man of fifty years of age, marched out with five or fix hundred men armed with bows and arrows. The Outagamis of my company perceiving this, charged them with insolence in receiving strangers with their arms about them, and called out in the Eokoros language, that they ought to lay down their arms. But the Essanapes slaves that I had sent in the day before, came up to me, and gave me to understand, that it was their custom to stand to their arms on such occasions, and that there was no danger in the cafe. However, the obstinate Outagamis obliged us to retire immediately to our canoes: upon which the leading officer, and the whole battalion, flung their bows and arrows afide all on a fudden. Then I returned, and our whole company entered the village with their fusees in their hands, which the savages admired mightily. The leader of the favages conducted us to a great hut, which looked as if nobody had lived in it before. When I and my twenty foldiers had entered the place, they stopped the Outagamis, affirming, that they did not deferve the privilege of entering within the cottage of peace, fince they had endeavoured to create a difference, and occasion a war between us and the Effanapes. In the mean time I ordered my men to open the door, and to call out to the Outagamis, that they flould offer no manner of injury: but the Outagamis instead of coming in, pressed me to return with all expedition to the canoes, which accordingly I did without lofs of time, and carried with me the four Essanapes flaves, in order to leave them at the first village we came to. We had no sooner embarked, than the two other flaves came to acquaint me that the governor would ftop me in his river; but the Outagamis made answer, that he could not do that without throwing a mountain into it; in fine, we did not fland to difpute the matter; and though it was then late, we rowed straight to the next village, which lay about three leagues off. During the time of this passage, I used the precaution of taking from my fix flaves an exact information of the conftitution of their country, and particularly of the principal village. They having affured me, that the capital canton was feated upon a fort fort of a lake, I took up a refolution of not stopping at the other villages, where I should only lose time, and lavish my tobacco, and steering directly to the metropolitan,

in order to complain to their generalissimo.

We arrived at the capital canton on the 3d of November, and there met with a very honourable reception. The Outagamis of our company complained of the affront they had received; but the head general being already informed of the matter, made answer, that they ought to have carried off the governor or leading officer, and brought him along with them. In passing from the first village to this, we run fifty leagues, and were followed by a procession of people, that were much more fociable than the governor that offered us that affront. After our men had fitted up our huts at the distance of a cannon-shot from the village; we went in a joint body with the Outagamis and the Outaguas, to the cacique of that nation; and in the mean time the Effanapes flaves were brought before him by ten of my foldiers. I was actually in the presence of this petty King, when these slaves spent half an hour in proftrating themselves several times before him. I made him a present of tobacco, knives, needles, feiflars, two firelocks with flints, fome hooks, and a very pretty cutlas. He was better fatisfied with thefe trifling things, which he had never feen before, than I could have been with a plentiful fortune. He tellified his acknowledgement of the gift, by a counter-prefent that was more folid, though not much more valuable, as confishing of peale, beans, harts, roe-bucks, geefe and ducks, of which he fent great plenty to our camp; and indeed, we were extremely well fatisfied with fuch a feafonable prefent. He gave me to know, that, fince I defigned to vifit the Gnachtares, he would give me a convoy of two or three hundred men: that the Gnachtares were a very honest fort of people; and that both they and his people were linked by a common interest in guarding of the Mozeemlek, which were a turbulent and warlike nation. He added, that the nation last mentioned were very numerous; that they never took the field without twenty thousand men at least: that to repress the incursions and insults of that dangerous enemy, the Gnacsitares and his nation had maintained a confederacy for fix-and-twenty years; and that his allies (the Gnachtares) were forced to take up their habitation in islands, where the enemy cannot reach them. I was glad to accept of his convoy, and returned him many thanks. I asked four pirogues of him, which he granted very frankly, allowing me to pick and chuse that number out of fifty. Having thus concerted my measures, I was resolved to lose no time; and with that view ordered my carpenters to plane the pirogues; by which they were thinner and lighter by one half. The poor innocent people of this country could not conceive how we worked with an axe; every stroke we gave they cried out, as if they had feen fome new prodigy; nay, the firing of piftols could not divert them from that amazement, though they were equally strangers both to the pistol and the axe. As foon as my pirogues were got ready, I left my canoes with the governor or prince, and begged of him that they might remain untouched by any body; in which point he was very faithful to me.

I cannot but acquaint you in this place, that the higher I went up the river, I met with more discretion from the savages. But in the mean time I must not take leave of the last village, without giving some account of it. It is bigger than all the rest, and is the residence of the great commander or generalissimo, whose apartment is built by itself towards the side of the lake, and surrounded with sisty other apartments, in which all his relations are lodged. When he walks, his way is strewed with the leaves of trees; but commonly he is carried by six slaves. His royal robes are of the same magnificence with those of the commander of the Okoros: for he is naked all over,

excepting

excepting his lower parts, which are covered with a large fearf made of the bark of trees. The large extent of this village might justly entitle it to the name of a city. The houses are built almost like ovens, but they are large and high; and most of them are of reeds cemented with fat earth. The day before I lest this place, as I was walking about, I saw thirty or forty women running at full speed; and being surprized with the spectacle, spoke to the Outagamis to order my four slaves to see what the matter was; for these slaves were my only interpreters in this unknown country. Accordingly they brought me word, that it was some new married women, who were running to receive the foul of an old fellow that lay dying. From thence I concluded, that the people were Pythagoreaus: and upon that apprehension, asked them how they came to eat animals, into which their souls might be transfused; but they made answer, that the transmigration of souls is always confined to the respective species, so that the soul of a man cannot enter into a fowI, as that of a fowl cannot be lodged in a quadruped, and so on. The Okoros, of both sexes, are fully as handsome and as clever,

as this people.

December the 4th, I took leave of this village, having ten foldiers on board of my pirogue, besides the ten Ouniamis, the four Outaouas, and the four Essanges flaves, that I have mentioned fo often. Here ended the credit and authority of the calumet of peace, for the Gnachtares are not acquainted with that fymbol of concord. The first day we had enough to do to run fix or seven leagues, by reason of the bulrushes with which the lake is encumbered. The two following days we failed twenty leagues. The 4th day a west-north-west wind surprized us with such a boisterous violence, that we were forced to put ashore, and lay two days upon a sandy ground, where we were in danger of flarving for hunger and cold; for the country was fo barren, that we could not find a chip of wood wherewith to warm ourfelves, or to drefs our victuals; and as far as our eye could reach, there was nothing to be feen but fens covered with reeds and clay, and naked fields. Having endured this hardthip we fet out again, and rowed to a little ifland, upon which we encamped, but found nothing there but green fields; however, to make fome amends, we fished up great numbers of little trouts, upon which we fed very heartily. At last, after failing fix days more, we arrived at the point, or lands-end, of that island which you fee marked in my map with a flower-de-luce. It was then the 19th day of December, and we had not yet felt all the rigorous hardships of the cold. As soon as I had landed and fitted up my tents or huts, I detached my Essanapes slaves to the first of the three villages that lay before us; for I had avoided stopping at some villages in an island upon which we coasted in the night-time. The flaves returned in a great alarm, occasioned by the unfavourable answer they received from the Gnacfitares, who took us for Spaniards, and were angry with them for conducting us to their country. I shall not be minute in every particular that happened, for fear of tiring your patience. It is fufficient to acquaint you, that upon the report of my flaves, I immediately embarked, and posted myself in another island that lay in the middle between the great island and the continent; but I did not fuffer the Essanges to be in my camp. In the mean time the Gnachtares fent expeditious couriers to the people that live eighty leagues to the fouthward of them, to defire they would fend fome of their number to examine us; for that people were supposed to be well acquainted with the Spaniards of New Mexico. The length of the journey did not difcourage them, for they came as cheerfully as if it had been upon a national concern; and after taking a view of our clothes, our fwords, our fuzees, our air, complexion, and manner of speech, were forced to own that we were not true Spaniards. These confiderations, joined to the account I gave them of the reasons upon which I undertook the voyage, of the war we were engaged in against Spain,

windings

Spain, and of the country to the eastward that we possessed; these, I say, had so much influence, as to undeceive them. Then they invited me to encamp in their ifland, and brought me a fort of grain not unlike our lentils, that grows plentifully in that country. I thanked them for their invitation, and told them, that I would not be obliged to diftruff them, nor give them any occasion to distrust me. However, I crossed with my favages and ten foldiers well armed; and after breaking the ice in certain places (for it had frozen hard for ten or twelve days,) I landed within two leagues of one of their villages, to which I walked up by land. It is needless to mention the particulars of the ceremony with which I was received, it being the fame with what I described upon other occasions; I shall only take occasion to acquaint you, that my presents made a wonderful impression upon the minds of these people, whom I shall call a rascally rabble, though at the fame time they are the politest nation I have yet seen in this country. Their governor bears the figure of a king more than any of the other commanders of the favages. He has an absolute dominion over all the villages which are described in my map. In this and the other islands I saw large parks, or inclosures, stocked with wild beeves for the use of the people. I had an interview for two hours together with the governor, or the cacique; and almost our whole conference related to the Spaniards of New Mexico, who, as he affured me, were not distant from his country above eighty tazous, each of which is three leagues. I must own indeed, I was as curious upon this head as he was; and I wanted an account of the Spaniards from him, as much as he did from me; in fine, we reciprocally informed one another of a great many particulars relating to that head. He requested me to accept of a great house that was prepared for me; and his first piece of civility confisted in calling in a great many girls, and pressing me and my retinue to serve ourselves. Had this temptation been thrown in our way at a more feafonable time it had proved irrefifible; but it was not an agreeable mess for passengers that were enseebled by labour and want. Sine Cerere et Baccho friget Venus. After he made us fuch a civil proffer, the favages, upon my instance, represented to him, that my detachment expected me at a certain hour, and that if I staid longer, they would be in pain for me. This adventure happened on the 7th of January.

Two days after, the cacick came to fee me, and brought with him four hundred of his own fubjects, and four Mozeemlek favages, whom I took for Spaniards. My mistake was occasioned by the great difference between these two American nations; for, the Mozeemlek favages were clothed, they had a thick bushy beard, and their hair hung down under their ears; their complexion was fwarthy, their address was civil and fubmiffive, their mien grave, and their carriage engaging. Upon these confiderations I could not imagine that they were favages, though after all I found myfelf mistaken. These four slaves gave me a description of their country, which the Gnacsitares represented by way of a map upon a deer's skin; as you see it drawn in this map. Their villages stand upon a river that springs out of a ridge of mountains, from which the long river likewife derives its fource, there being a great many brooks there which by a joint confluence form the river. When the Gnachtares have a mind to hunt wild beeves, they fet out in pirogues, which they make use of till they come to the cross marked thus (+) in the map, at the confluence of two little rivers. The hunting of the wild bulls, with which all the valleys are covered in fummer, is fometimes the occafion of a cruel was: for the other cross (+) which you fee in the map, is one of the boundaries or limits of Mozeemlek; and if either of these two nations advances but a little beyond their limits, it gives rife to a bloody engagement. The mountains I fpoke of but now, are fix leagues broad, and fo high that one must cast an infinity of

S S 2

windings and turnings before he can crofs them. Bears and wild beafts are their only inhabitants.

The Mozeemlek nation is numerous and puissant. The four flaves of that country informed me, that at the distance of one hundred and fifty leagues from the place where I then was, their principal river empties itself into a falt lake of three hundred leagues in circumference, the mouth of which is about two leagues broad: that the lower part of that river is adorned with fix noble cities, furrounded with stone cemented with fat earth: that the houses of these cities have no roofs, but are open above like a platform, as you fee them drawn in the map: that besides the above mentioned cities, there were above an hundred towns, great and small, round that fort of sea, upon which they navigate with fuch boats as you fee drawn in the map: that the people of that country made stuffs, copper, axes, and feveral other manufactures, which the Outagamis and my other interpreters could not give me to understand, as being altogether unacquainted with fuch things: that their government was despotic, and lodged in the hands of one great head, to whom the rest paid a trembling submission: that the people upon that lake call theinfelves Tahuglauk, and are as numerous as the leaves of trees, (fuch is the expression that the favages used for an hyperbole:) that the Mozeemlek people fupply the cities or towns of the Tahuglauk with great numbers of little calves which they take upon the above-mentioned mountains; and, that the Tahuglauk make use of these calves for several ends; for, they not only eat their slesh, but bring them up to labour, and make cloaths, boots, &c. of their fkins. They added, that it was their misfortune to be taken prisoners by the Gnachtares in the war which had lasted for eighteen years; but, that they hoped a peace would be speedily concluded, upon which the prisoners would be exchanged, pursuant to the usual custom. They gloried in the possession of a greater measure of reason than the Gnachtares could pretend to, to whom they allow no more than the figure of a man; for they look upon them as beafts otherwife. To my mind, their notion upon this head is not fo very extravagant; for I observed so much honour and politeness in the conversation of these four flaves, that I thought I had to do with Europeans: but, after all, I must confess that the Gnacsitares are the most trastable nation I met with among all the favages. One of the four Mozeemlek flaves had a reddish fort of a copper medal hanging upon his neck, [from the figure it appears to be Japanese.] I had it melted by M. De Ponti's gunfmith, who understood something of metals; but it became thereupon heavier, and deeper coloured, and withal fomewhat tractable. I defired the flaves to give me a circumstantial account of these medals; and accordingly they gave me to understand, that they are made by the Tahuglauk, who are excellent artizans, and put a great value upon fuch medals. I could pump nothing farther out of them, with relation to the country, commerce and customs of that remote nation. All they could fay was, that the great river of that nation runs all along westward, and that the falt lake into which it falls, is three hundred leagues in circumference, and thirty in breadth, its mouth firetching a great way to the fouthward. I would fain have fatisfied my curiofity in being an eye-witness of the manners and customs of the Tahuglauk; but that being impracticable, I was forced to be instructed at second hand by these Mozeemlek slaves; who assured me, upon the faith of a favage, that the Tahuglauk wear their beards two fingers breadth long: that their garments reach down to their knees; that they cover their heads with a sharp pointed cap; that they always wear a long stick or cane in their hands, which is tipped, not unlike what we use in Europe; that they wear a fort of boots upon their legs which reach up to the knee; that their women never shew themselves, which perhaps proceeds from the fame

fame principle that prevails in Italy and Spain; and, in fine, that this people are always at war with the puissant nations that are feated in the neighbourhood of the lake; but withal, that they never disquiet the strolling nations that fall in their way, by reason of their weakness: an admirable lesson for some princes in the world, who are so much

intent upon the making use of the strongest hand.

This was all I could gather upon that fubject. My curiofity prompted me to defire a more particular account; but unluckily I wanted a good interpreter; and having to do with feveral perfons that did not well understand themselves, I could make nothing of their incoherent suffian. I presented the poor miserable slaves with something in proportion to the custom of that country, and endeavoured to persuade them to go with me to Canada, by making them such offers as in their esteem would appear like mountains of gold; but the love they had for their country stifled all persuasions;

fo true it is, that nature reduced to its just limits cares but little for riches.

In the mean time it began to thaw, and the wind chopped about to the fouth-west; upon which I gave notice to the great cacique of the Gnachtares, that I had a mind to return to Canada. Upon that occasion I repeated my presents; in compensation of which, my pirogues were flowed with beef as full as they could hold. This done, I embarked, and croffed over from the little island to the continent, where I fixed a great long pole, with the arms of France done upon a plate of lead. I fet out the 26th of January, and arrived fafe on the 5th of February in the country of the Essanapes. - We had much more pleafure in failing down the river than we had in going up; for we had the agreeable diversion of feeing feveral huntimen shooting the water-fowl, that are plentiful on that river. You must know, that the stream of the long river is all along very flack and easy, abating for about three leagues between the fourteenth and fifteenth village; for there indeed its current may be called rapid. The channel is fo straight, that it scarce winds at all from the head to the lake. It is true it is not very pleafant; for most of its banks have a difinal prospect, and the water itself has an ugly taste; but then its usefulness atones for such inconveniencies; for, it is navigable with the greatest case, and will bear barks of fifty ton, till you come to that place which is marked with a fleur-de-lis in the map, and where I put up the post that my foldiers christened La Hontan's Limit. March 2, I arrived in the Mississipi, which was then much deeper and more rapid than before, by reason of the rains and land-floods. 'To save the labour of rowing; we then left our boats to the current, and arrived on the 10th in the island of Rencontres, which took its name from the defeat of four hundred Iroquese accomplished there by three hundred Nadouessis. The story of the encounter is briefly this: a party of four hundred Iroquefe having a mind to furprife a certain people in the neighbourhood of the Otentas (of whom more anon) marched to the country of the Illinese, where they built canoes, and were furnished with provisions. After that they embarked upon the river Miffifipi, and were discovered by another little fleet that was failing down the other fide of the fame river. The Iroquefe croffed over immediately to that island, which is since called Aux Rencontres, The Nadouessis, i. e. the other little fleet, being fuspicious of fome ill defign, without knowing what people they were, (for they had no knowledge of the Iroquefe but by hear-fay); upon this fuspicion, I fav. they tugged hard to come up with them. The two armies posted themselves upon the point of the island, where the two crosses are put down in the map; and as foon as the Nadouessis came in fight, the Iroquese cried out in the Illinese language, Who are ye? to which the Nadouessis answered, Some body: and putting the like question to the Iroquese, received the same answer. Then the Iroquese put this question to them, Where are you going? To hunt beeves, replied the Nadouessis. But.

But, pray, fays the Nadouessis, what is your business? To hunt men, replied the Iroquefe. It is well, fays the Nadouessis, we are men, and so you need go no farther. Upon this challenge the two parties difembarked, and the leader of the Nadoueflis cut his canoes to pieces; and after reprefenting to his warriors that they behaved either to conquer or die, marched up to the Iroquese; who received them at first onfet with a cloud of arrows: but the Nadouessis having stood their first discharge, which killed them eighty men, fell in upon them with their clubs in their hands, before the others could charge again; and fo routed them entirely. This engagement lasted for two hours, and was so hot, that two hundred and fixty Iroquese fell upon the spot, and the rest were all taken prisoners. Some of the Iroquese indeed attempted to make their escape after the action was over; but the victorious general fent ten or twelve of his men to pursue them in one of the canoes that he had taken; and accordingly they were all overtaken and drowned. The Nadouessis having obtained this victory, cut off the nofes and ears of two of the cleverest prisoners; and fupplying them with fufees, powder and ball, gave them the liberty of returning to their own country, in order to give their countrymen to understand that they ought

not to employ women to hunt after men any longer.

The 12th we arrived at the village of the Otentas, where we took in a plentiful provision of Turkey corn, of which these people have great store. They informed us, that their river was pretty rapid, and took its rife from the neighbouring mountains; and that the upper part of it was adorned with feveral villages inhabited by the people called Panimaha, Paneaffa, and Panetonka. But confidering that I was ftraitened for time, and that I faw no probability of learning what I wanted to know with reference to the Spaniards, I took leave of them the next day, which was the 13th, and in four days time, by the help of the current and our oars, made the river of the Miffouris. This done, we run up against the stream of that river, which was at least as rapid as the Missisppi was at that time; and arrived on the 18th at the first village of the Misfouris, where I only flopped to make the people fome prefents that procured me a hundred turkeys, with which that people are wonderfully well stocked. After that, we rowed hard against the stream, and landed next night near the second village. As foon as I arrived, I detached a ferjeant with ten foldiers to convoy the Outagamis to the village, while the rest of my crew were busied in fitting up our huts and unloading our canoes. It happened unluckily that neither the foldiers nor the Outagamis could make the favages understand them; and the latter were just ready to fall upon them, when an old fellow cried out, that the strangers were not without more company, for that he had discovered our huts and canoes. Upon this, the foldiers and the Outagamis retired in a great confernation, and advised me to keep a strong guard all night. About two o'clock in the morning two men approached to our little camp, and called, in Illinese, that they wanted an interview; upon which the Outagamis, being extremely well fatisfied that there was fomebody among them who could understand what they faid, replied in Illinefe, that they should be very welcome as foon as the fun appeared in the horizon. Nevertheless, the Outagamis refented the former affront so much, that they importuned meall night long to fet fire to the village, and put all the scoundrel inhabitants to the fword. I made answer to them, that it was our business to be wifer than they, and to bend our thoughts, not upon a fruitless revenge, but upon the discovery that we were then in quest of. At the break of day the two adventurers of the night came up to us, and after putting interrogatories to us for the space of two hours, invited us to come up to their village. The Outagamis replied, that the head or governor of their nation ought to have faluted us fooner; and this obliged

obliged them to go back to give him notice. After that we faw nobody for three hours; but at last, when our impatience was just beginning to boil, we perceived the governor, who accorded us in a trembling posture. He was accompanied with some of his own men, who were loaded with broiled or dried meat, facks of Turkey or Indian corn, dried raifins, and fome speckled or party-coloured buck-skins. In consideration of this prefent, I made them another of less consequence. Then I brought on a conference between the Outagamis of my company and the two night-meffengers, in order to make fome discovery of the nature of the country; but they still stopped our mouths with this answer, that they knew nothing of the matter, but that the other nations that lived higher up, were able to inform us. Had I been of the fame mind with the Outagamis, we had done noble exploits in this place; but I confidered that it was my bufiness to purchase the knowledge of several things, which I could not obtain by burning the village. To be flort, we re-embarked that fame day, about two o'clock in the afternoon, and rowed about four leagues up the river, where we made the river of the Ofages, and encamped by its mouth. That night we had feveral falfe alarms from the wild beeves, upon which we made fufficient reprifals afterwards; for the next day we killed many of them notwithstanding that it rained so heavily that we could fcarce ftir out of our huts. Towards the evening, when the rain was over, and while we were transporting two or three of these beeves to our little camp, we espied an army of the favages upon a full march towards us. Upon that, my men began to entrench themselves, and to unload their pieces with worms, in order to charge them afresh; but one of the pieces happening to go off, the whole body of the enemy disappeared, fome straggling one way and some another; for these people were upon the same foot with the nations that live upon the Long River, forafmuch as neither of them had ever feen or handled fire-arms. However, this adventure moved the Outagamis fo much, that to fatisfy them, I was obliged to re-embark that very night, and return the fame way that I came. Towards midnight we came before a village, and kept a profound filence till day-break, at which time we rowed up to their fort; and upon our entering there, and difcharging our pieces in the air, the women, children, and fuperannuated men were put into fuch a consternation, that they run from place to place calling out for mercy. You mult know, all their warriors were abroad, and it was a body of them that offered to attack us the day before. The Outagamis perceiving the confternation of the women and children, called out, that they behoved to depart the village, and that the women should have time to take up their children. Upon that the whole crew turned out, and we fet fire to the village on all fides. This done, we purfued our course down that rapid river, and entered the river Missipi on the 25th, early in the morning; the 26th, about three o'clock in the afternoon, we defcried three or four hundred favages employed in the hunting of beeves, which fwarmed in all the meads to the westward. As foon as the hunters spied us, they made a sign that we should make towards them. Being ignorant who, or how numerous they were, we made a halt at first, but at last we put in about a musket-shot above them, calling out to them that they should not approach to us in a body. Upon that, four of their number came up to us with a finiling countenance, and gave us to know, in the Illinese language, that they were Akanfas. We could not but credit their report, for they had knives and scissars hanging upon their necks, and little axes about them, which the Illinese present them with when they meet; in fine, being assured that they were of that nation, which M. de la Salle and feveral other Frenchmen were intimately acquainted with, we landed at the fame place; and they entertained us first with dancing and finging, and then with all forts of meat. The next day they shewed us a crocodile that

they had knocked on the head two days before, by a ftratagem that you'll find described in another place: after that they gave us the diversion of a hunting-match; for it is customary with them, when they mean to divert themselves, to catch the beeves by the different methods laid down in this cut. I put some questions to them relating to the Spaniards, but they could not resolve them. All that I learned from them was, that the Missouris and the Osages are numerous and mischievous nations, equally void both of courage and honesty; that their countries were watered with very great rivers;

and, in a word, were too good for them.

After we had fpent two days with them, we purfued our voyage to the river Ouabach, taking care to watch the crocodiles very narrowly, of which they had told us incredible ftories. The next day we entered the mouth of that river, and founded it, to try the truth of what the favages reported of its depth. In effect, we found there three fathom and a half water; but the favages of our company alledged, that it was more fwelled than ufually. They all agreed, that it was navigable an hundred leagues up, and I wished heartily, that my time had allowed me to run up to its source; but that being unseasonable, I failed up against the stream, till we came to the river of the Illinese, which we made on the 9th of April with some difficulty, for the wind was against us the first two days, and the currents were very rapid.

All I can fay of the river Missippi, now that I am to take leave of it, is, that its narrowest part is half a league over, and the shallowest is a fathom and a half deep; and that according to the information of the savages, its stream is pretty gentle for seven or eight months of the year. As for shelves or banks of sand, I met with none in it. It is sull of isles which look like groves, by reason of the great plenty of trees, and in the verdant season of the year afford a very agreeable prospect. Its banks are woods, meadows and hills. I cannot be positive, whether it winds much in other places; but as far as I could see, its course is very different from that of our rivers in France; for I must tell you, by the way, that all the rivers of America run pretty

straight.

The river of the Illinese is intitled to riches, by virtue of the benign climate, and of the great quantity of deer, roe-bucks, and turkies that feed upon its banks; not to mention several other beasts and sowls, a description of which would require an entire volume. If you saw but my journal, you would be sick of the tedious particulars of our daily adventures both in hunting and sishing divers species of animals, and in rencounters with the savages. In short, the last thing I shall mention of this river, is, that the banks are replenished with an infinity of fruit-trees, which we saw in a dismal condition, as being stripped of their verdure; and that among these fruit-trees there are many vines which bear most beautiful clusters of very large grapes. I ate some of these grapes dried in the sun, which had a most delicious taste. The beavers are as unfrequent in this, as in the long river, where I saw nothing but otters, of which the people make surs for the winter.

I fet out from the Illinese river on the 10th of April, and by the help of a west-south-west wind, arrived in fix days at the fort of Crevecoeur, where I met with M. de Tonti, who received me with all imaginable civility, and is justly respected and honoured by the Iroquese. I stayed three days in this fort, where there were thirty coureurs de bois that traded with the Illinese. The 20th I arrived at the village of the Illinese; and to lessen the drudgery of a great land-carriage of twelve great leagues, engaged four hundred men to transport our baggage, which they did in the space of four days, being encouraged by a bribe of a great roll of Brazil tobacco, an hundred pound weight of powder, two hundred weight of ball, and some arms, which I gave to the most consider-

able

rable men of their number. The 24th I arrived at Chekakou, where my Outagamis took leave of me in order to return to their own country, being very well fatisfied with a prefent I made them of fome fusees, and some pistols. The 25th I re-embarked, and by rowing hard in a calm, made the river of the Oumamis on the 28th, there I met sour hundred warriors, upon the very same place where M. de la Salle had formerly built a fort. These warriors were then employed in burning three Iroquese, who, as they said, deserved the punishment; and invited us to share in the pleasure of the show: for the savages take it very ill if one resuses the diversion of such real tragedies. The tragical spectacle made me shrink, for the poor wretches were put to inconceivable torture; and upon that I resolved to re-embark with all expedition; alledging for an apology, that my men had great store of brandy with them, and would certainly make themselves drunk; in solemnising their victory, upon which they would be apt to commit disorders, that I could not possibly prevent. Accordingly I went immediately on board, and after coasting along the lake, crossed the bay de l'Ours, and landed at Missilimakinac the 22d.

I am informed by the Sieur de S. Pierre de Rapantigni, who travelled from Quebec hither upon the ice, that M. de Denonville has taken up a refolution of making a peace with the Iroquefe, in which he means to comprehend the other nations that are his allies; and with that view-had given notice to his allies, that they should not infest the Iroquefe. He acquaints me further, that M. de Denonville has sent orders to the governor of this place, to persuade the Rat, (one of the commanders of the Hurons,) to go down to the colony, with a design to have him hanged; and that the savage general being aware of the design, has made a public declaration, that he will go thither on purpose to desy him. Accordingly, he designs to set out to-morrow with a great body of Outaouas, and some coureurs de bois, under the command of M. Dulhut. As for the soldiers of my detachment, I have dispersed them in several canoes among the savages and the coureurs de bois; but having some business to adjust in this place, I am obliged to tarry myself seven or eight days longer.

This, Sir, is the true account of my little voyage. I have related nothing but the effential circumstances; choosing to overlook the rest, which are so trisling as to be unworthy of your curiosity. As for the Illinese lake, it is three hundred leagues in circumsterence, as you may see by the scale of leagues upon the map. It is seated in an admirable climate; its banks are cloathed with fine and tall trees, and have but sew meads. The river of the Oumamis is not worth your regard. The bay de l'Ours qui dort, is of an indifferent large extent, and receives the river upon which the Outaouas are wont to hunt beavers every third year; in short, it has neither shelves, rocks, nor bank of fand. The land which bounds it on the fouth side, is replenished with roebucks, deer, and turkeys. Farwell, good Sir, and assure yourself, that it will always be a sensible pleasure to me, to amuse you with an account of the greatest curiosities I meet with.

But now, Sir, I hope you will not take it ill, that the relation I here give you, is only an abridgment of my voyage; for, in earnest, to be minute upon every particular curiosity, would require more time and leisure than I can spare. I have here fent you a view of the substantial part, and shall after wards hope for an opportunity of recounting to you by word of mouth, an infinity of adventures, rencounters, and observations, which may call up the reslecting faculty of thinking men. My own thought is too superficial to philosophize upon the origin, the belief, the manners and customs of so many savages, or to make any advances with reference to the extent of this continent to the westward. I have contented myself with offering some thoughts upon the causes

of the bad fuccess of the discoveries, that several experienced men have attempted in America, both by fea and land: and I flatter myfelf, that my thoughts upon that head are just. The fresh instances of M. de la Salle, and several other unlucky discoverers, may afford a sufficient and seasonable caution to those, who for the future shall undertake to discover all the unknown countries of this new world. It is not every one that is qualified for fuch an enterprize, non licct omnibus adire Corinthum. It were an easy matter to trace the utmost limits of the country that lies to the west of Canada, provided it be gone about in a proper method. In the first place, instead of canoes, I would have such adventurers to make use of certain sloops of a peculiar structure, which might draw but little water, and be portable, as being made of light wood, and withal carry thirteen men, with thirty-five or forty hundred weight of stowage, and be able to bear the shock of the waves in the great lakes. Courage, health, and vigilance, are not fufficient of themselves to qualify a man for such adventures; he ought to be possessed of other talents, which are rarely met with in one and the fame person. The conduct of the three hundred men that accompanied me upon this discovery, gave me a great deal of trouble. It requires a large stock of industry and patience to keep fuch a company up to their duty. Sedition, mutinies, quarrels, and an infinity of diforders frequently take place among those, who being in remote and folitary places, think they have a right of using force against their superiors. One must diffemble, and even that his eyes upon occasion, least the growing evil should be inflamed: the gentlest methods are the surest for him that commands in chief; and if any mutiny or feditious plot is in view, it is the business of the inferior officers to stifle it, by perfuading the mutineers that the discovery of such things to the commanding officer would create a great deal of uneafinefs. So, the chief officer must still make as if he were ignorant of what passes, unless it be, that the slame breaks out in his prefence; then indeed he lies under an indispensible obligation of inflicting speedy and private punishment, without his prudence directs him to put off the execution, upon an apprehension of some pernicious consequences that may ensue thereupon. In such voyages he must overlook a thousand things, which upon other occasions he has all reason to punish. He must counterfeit a downright ignorance of their intrigues with the fhe-favages, of their quarrels among themselves, of their negligence in not mounting the guard, and not observing the other points of duty; in a word, he must pretend to know nothing of an infinity of fuch diforders, as have no direct tendency to a revolt. He ought to use the precaution of fingling out a fpy in his little army, and reward him handfomely for a dexterous intelligence as to all that happens; to the end that he may remedy the growing diforders either directly or indirectly. This fpy may, by good management, and due secrecy, find out the ringleader of a club or cabal; and when the commanding officer has received fuch fatisfaction upon the matter, that there is no room left to doubt of the criminal's demerit, it will then be very convenient to make away with him, and that with fuch management, that nobody should know what became of him.

Farther, he ought to give them tobacco and brandy now and then, to ask their advice upon some occasions, to fatigue them as little as possible, to call them up to dance and make merry, and at the same time to exhort them to live in a good understanding with one another. The best topic he can make use of for enforcing their duty, is religion, and the honour of their country, and this he ought to descant upon himself; for though I have a great deal of faith in the power of the clergy, yet I know that fort of men does more harm than good in voyages of this nature; and for that reason I would choose to be without their company. The person who undertakes to go upon a discovery

covery ought to be very nice and cautious in the choice of his men; for every one is not fit for his business. His men ought to be between thirty and forty years of age, of a dry constitution, of a peaceable temper, of an active and bold spirit, and inured to the fatigues of voyages. The whole retinue must consist of three hundred men; and of that number there must be some ship-carpenters, gunsmiths, and sawyers, with all their tools; befides huntimen and fiftermen, with their tackling. You must likewise have furgeons among them; but their cheft ought to contain nothing but razors, lancets, external medicines for wounds, orvietan and fenna. All the men of the detachment ought to be provided with buff-coats and boots to turn the arrows; for, as I intimated above, the favages of the unknown countries are strangers to fire-arms. They must be armed with a double-barrelled gun, a double-barrelled pistol, and a good long fword. The commanding officer must take care to provide a sufficient quantity of the skins of deer, elks, and beeves, in order to be fewed together, and hung round his camps upon certain stakes fixed at convenient distances from one another. I had as many as would go round a square of thirty feet every way, for each skin being five feet deep, and almost four feet broad, I made two pieces of eight skins a-piece, which were raised and extended in a minute. Befides thefe, he ought to carry with him foine pot-guns of eight foot in length, and fix in breadth; with two hand-mills for grinding the Indian corn, nails of all fizes, pickaxes, fpades, hatchets, hooks, foap, and cotton to make candles of; above all, he must not forget to take in good store of powder, brandy, Brafil tobacco, and fuch things as he must present to the savages whose country he discovers; add to this cargo, an astrolabe, a semicircle, several sea-compasses, some fimple and fome of variation, a loadstone, two large watches of three inches diameter; pencils, colours, and paper for making journals and maps, for the defigning of landcreatures, fowl, fish, trees, plants, grain, and, in a word, whatever feems worthy of his curiofity. I would likewife advife him to carry with him fome trumpeters and fiddlers, both for animating his retinue, and raifing the admiration of the favages. With this equipage, Sir, a man of fense, conduct, and action, I mean, a man that is vigilant, prudent, cautious, and above all, patient and moderate, and qualified for contriving expedients upon all occasions; a man, I fay, thus qualified, and thus fitted out, may boldly go to all the countries that lie to the west of Canada, without any apprehension of danger. As for my own part, I feriously declare, that if I were possessed of all these qualities, I should esteem it my happiness to be employed upon such an enterprise, both for the glory of His Majesty, and my own satisfaction: for the continued diversity of objects did fo charm me in my voyages, that I had fcarce time to reflect upon the fatigue and trouble that I underwent. I am, Sir,

Yours, &c.

LETTER XVII.

Dated at Quebec, Sept. 28, 1689.

The Author sets out from Missilimakinac to the Colony, and describes the Country, Rivers, and Passes, that he saw by the Way. The Iroquese make a fatal Incursion into the Island of Monreal; Fort Frontenac is abandoned; Count Frontenac is sent to Canada, and the Marquis of Denonville is recalled.

SIR,

I WRIT to you from Missilimakinac on the 28th of May. I left that place June the 8th, and set out for Monreal, accompanied with twelve Outaouas, who were divided

divided into two canoes, and rowed very hard. The 23d I overtook the coureurs de bois in the river Creuse, who had got the start of me for some days. Mr. Dalhuz used his utmost efforts to dissuade me from going further with so weak a retinue. He would have had me to go down along with him, and remoralizated to me, that if my twelve conductors perceived either in the land-carriage or upon the rivers, any thing that might call up an apprehension of falling into the hands of the Iroquese, they would defert me and the canoes, and fly to the woods to avoid the enemy. I rejected his advice, though I had like to have repented of my refolution not long after; for according to his prediction, my canoe-men threatened to run away to the forests, at the fall called Long Saut: and, indeed, if they had done it, I had followed them, upon the reflection, that of two evils a man ought to choose the least; but this storm blew over. In the great river of the Outaouas, not far from the river of Lievre, I met M. de St. Helene at the head of a party of the coureurs de bois, who was bound for Hudfon's Bay, in order to retake fome forts that the English had seized upon. He acquainted me with the Prince of Orange's expedition for England; and gave me to understand, that upon his arrival, King James retired to France, and that the Prince was proclaimed King; which feemed to prefage a bloody and fharp war in Europe. I assure you, Sir, this piece of news surprized me extremely; and notwithstanding that I had it from the mouth of a man whose word I rely very much upon, yet I had all the difficulty in the world to make myfelf believe that a revolution of fuch importance could be accomplished in fo short a time, without the effusion of blood; especially, confidering what a first alliance there was between our court and the court of England, and how much it was the interest of both these monarchs to give mutual assistance to one another. July the 9th I arrived at Monreal, after venturing down feveral fearful cataracts in the river of the Outaouas, and enduring the hardships of fifteen or twenty land-carriages, fome of which are above a league in length.

The navigation is pretty fure from Missilimakinac to the river des François; for in coasting along the Lake of Hurons, we meet with an infinity of islands, which serve for a shelter. But in going up that river, there is some difficulty; for it has five cataracts which oblige us to turn out and carry all over-land for thirty, fifty, and a hundred paces. Having passed that river, we entered the lake of the Nepicerinis, from whence we are forced to transport our canoes and baggage two leagues over-land, to another river which has fix or feven water-falls that we commonly shoot. From that river we have another land-carriage to the river Creuse, which falls with rapid currents into the great river of the Outaouas, near a place called Mataouan. We continue our courfe upon this great river, till we come to the point of the island of Monreal, where it is loft in the great river of St. Lawrence. These two rivers join one another with very gentle streams, and quitting their fearful channels, form the little Lake of St. Louis. I thought to have loft my life at the fall, called the Fall of St. Louis, about three leagues from Monreal; for our canoe having overfet in the eddy, I was carried by the current to the foot of that cataract, from whence the Chevalier de Vaudreuil dragged me out by a great chance. The canoes and the skins belonging to the fix favages were loft; and one of the favages was drowned. This is the only time I was in dang r through the whole course of my voyages. As foon as I landed here, I repaired with diligence to a tayern to refresh myself, and to make up the losses I had fullained by a necessary abstinence. The next day I waited upon M. de Denonville and M. de Champigni, to whom I gave an account of my voyages, and withal, gave in the news that a great company of the coursurs de bois and favages would arrive very speedily; which they did accordingly, after fifteen days. The Rat I mentioned above,

came down hither, and returned home notwithstanding the threats that were levelled against him. By this adventure, he shewed that he laughed at their intrigues. But now that I have mentioned his name, I cannot forbear mentioning a malicious stratagem that this cunning savage made use of last year, to prevent the conclusion of a peace between

M. de Denonville and the Iroquefe.

This favage is the general and chief counfellor of the Hurons; he is a man of forty years of age, and brave in his way. When he found himself pressed and importuned by M. de Denonville, to enter into the alliance concluded in the year 1687, that I took notice of before; he at last complied with his defire, with this referve, that the war should not be put to an end till the Iroquese were totally routed. This clause the governor promifed to make good, and gave him affurances to that purpose on the 3d of September, in the fame year, which happened about two days before I fet out from Niagara upon my voyage to the great lakes. This favage general relying upon M. de Denonville's promife, marched from Miffilimakinac at the head of an hundred warriors, as I infinuated in my 14th letter, in order to invade the Iroquese country, and atchieve some glorious feats among them. In the mean time, to carry on his defign the more cautiously, he thought it proper to pass by the way of Fort Frontenac, where he might receive some intelligence. Upon his arrival at this fort, the governor told him, that M. de Denonville was negotiating a peace with the five Iroquefe nations, whose ambassadors and hostages he expected in a short time in order to conclude and ratify the peace, he having orders to conduct them to Monreal: and that upon that confideration, it was most proper for him and his warriors to return home, and to pass no further. The savage general was mightily furprifed with this unexpected piece of news; especially considering that by the means of that peace he and his nation would be given up as a facrifice for the welfare of the French. When the governor had made an end of his remonstrance, the Rat acknowledged, that what he offered was very reasonable, but withal, that instead of following his advice, he would go and tarry for the Iroquefe ambaffadors and hoftages at the cataracts, by which they were obliged to pass. He had not tarried there above five or fix days before the unhappy deputies arrived with a train of forty young men, who were all either killed or taken as they difembarked. The prifoners were no fooner fettered than this crafty general of the Hurons represented to them, that the French governor had fent him notice to take up that post, in order to lie in wait for a party of fifty warriors, that were to pass that way at a certain set time. The Iroquese being much furprifed with the apprehension of the perfidiousness that he charged upon M. de Denonville, acquainted the Rat with the defign upon which they came. Upon that the Rat counterfeited a fort of rage and fury; and to play his cards the better, flew out in invectives against M. de Denonville, declaring, that some time or other he would be revenged upon that governor, for making him the inftrument of the most barbarous treachery that ever was acted. Then he fixed his eyes upon all the prifoners. among whom was the chief ambassador called Theganeforens, and spoke to this purpose; Go, my brethren, though I am at war with you, yet I release you, and allow you to go home. It is the governor of the French that put me upon this black action, which I shall never be able to digest, unless your five nations revenge themselves, and make their just reprisals. This was fufficient to convince the Iroquese of the sincerity of his words; and they affured him upon the fpot, that if he had a mind to make a feparate peace, the five nations would agree to it: however, the Rat having loft one man in this adventure, kept an Iroquefe flave to fupply the place of the man he had loft: and after furnishing the prisoners with guns, powder, and ball, in order to their return homeward, marched to Miffilimakinac, where he prefented the French governorwith the flave that he brought off. The poor wretch was no fooner delivered than he was condemned to be shot; for at that time the French garrison did not know that M. de Denonville defigned to clap up a peace with the Iroquefe. The condemned prisoner gave an account of his adventure, and that of the ambassadors; but the French thought that the fear of death made the fellow talk idly, and were confirmed in that thought, by hearing the Rat and his men fay, that he was light-headed; infomuch, that the poor fellow was put to death notwithstanding all the reasons he could offer. The fame day that he was fhot, the Rat called an old Iroquefe flave that had ferved him a long while, and told him, he had refolved to allow him the liberty of returning to his own country, and fpending the rest of his days among his friends and countrymen. At the fame time he gave him to know, that fince he had been an eye-witness of the barbarous usage that his countryman had met with from the French, notwithstanding what he offered in his own defence, it behoved him to acquaint his countrymen with the blackness of that action. The manumitted flave obeyed his orders for punctually, that foon after the Iroquefe made an incursion, at a time when the governor did not dream of any fuch thing, for he had used the precaution of giving the Iroquese to understand, that he disallowed of the Rat's treachery, insomuch that he had a mind to have him hanged; and upon this prospect, expected hourly ten or twelve

deputies to conclude the peace he fo much defired.

In effect the deputies did come, but neither their number nor their defign was fuitable to what the governor had promifed to himself. Twelve hundred warriors landed at the lands-end of the ifland of Monreal, and burnt and facked all the plantations in that quarter: they maffacred men, women, and children; and Madame de Denonville, who was then at Monreal with her hufband, did not think herfelf fafe in that place. A general consternation was spread all about; for the barbarians were not above three leagues from Monreal. They burnt all the adjacent fettlements, and blocked up two forts. M. de Denonville sent out a detachment of a hundred foldiers and fifty favages to oppose them, being unwilling to spare a greater number out of the city: but all the men of the detachment were either taken or cut in pieces, excepting twelve favages, one foldier, and M. de Longueil who commanded the party, and was carried off by the twelve favages after his thigh was broke: the other officers, namely, the Sieurs de la Raberre, Denis, la Plante, and Villedenè, were all taken prifoners. In a word, the barbarians laid almost the whole island waste, and lost only three men. who having drank to excess of the wine they found in the plantations, were decoyed into a fort by a Canadele cow-keeper, that had been their flave for fome years. As foon as the three unfortunate Iroquese arrived in the fort, they were thrown into a cellar to fleep themselves sober; and questionless, as soon as they waked they repented of their excessive drinking. When they waked, they fell immediately to singing; and when the garrifon offered to fetter them, and carry them to Monreal, they flew to fome clubs that lay in the cellar, and made fuch a vigorous and brave defence, that the garrifon was forced to fhoot them upon the fpot. The cow-keeper being brought before M. de Denonville, he told him, that the breach made by the Rat's contrivance was irreparable; that the five Iroquefe nations referred that adventure with fo much warmth, that it was impossible to dispose them to a peace in a short time; that they were fo far from being angry with that Huron for what he did, that they were willing to enter into a treaty with him, owning that he and his party had done nothing but what became a brave man and a good ally. Doubtless this fatal incursion was a great furprifal to M. de Denonville, and afforded him a copious field for reflection. It was already impossible to continue the possession of Fort Frontenac; where they began to want

want provisions, and which could not be relieved without exposing a great many men to the danger of the passes or cataracts, which I have mentioned so often. There was a downright necessity of calling out the garrison and blowing up the fort: but the difficulty lay in finding a man to carry orders to that effect to the governor, for nobody durst undertake it, till the Sieur Peter de Arpentigni offered to go all alone through the forests; and accordingly he went and did his business successfully. The orders were extremely welcome to M. de Valrenes, the governor of the fort for the time; who, upon the receiving them, run a mine under the four bastions, which, with the powder he put in, was reckoned fufficient to blow it up. This done, he embarked, and came down the river through the cataracts to Monreal, where he found M. de Denonville, and accompanied him hither. That officer did not only abdicate the Fort of Frontenac, but fet fire to the three great barks that they used to ply with upon the lake, both to awe the Iroquese in time of war, and to convey commodities to them in time of peace. M. de Denonville acted a prudent part in relinquishing both this fort and that of Niagara; for, in earnest, these two posts are indefensible, by reason of the inaccessible cataracts, upon which an ambufcado of ten Iroquefe may repulfe a thoufand Frenchmen by the throwing of stones. But after all I must own, that the welfare and preservation if our colonies had an absolute dependance upon these two forts, which seemed to infure the utter destruction of the Iroquese; for they could not stir out of their villages to hunt or to fish, without running the rifque of having their throats cut by the favages in alliance with us, who being then affured of a fafe retreat, would have made continual incursions into the country of those barbarians: and by this means, the Iroquese being unprovided with beaver-skins to be given in exchange for guns, powder, ball, and nets, would be starved to death, or at least, be obliged to depart their country.

In the end of September M. de Bonaventure, captain and owner of a merchant flip, arrived in this port, and brought the news of M. de Frontenac's reinstalment in the place of governor-general of Canada, and of the recalling of M. de Denonville, whom the Duke de Beauvilliers has recommended to the King, for the place of fubgovernor to the princes his grandfons. Some people are uneafy at the recalling of this governor; and it is faid, that the reverend fathers the Jesuits, fall under the number of the malcontents; for if we may credit the reports of the country, they contributed in a great measure to the recalling of M. de Frontenac seven or eight years ago, by acting in concert with the intendant of Chesneau, and supreme council, and drawing up accufations against him which had the defired effect; though now the King shews that he is undeceived, by reinstating that gentleman once more in this government. In the mean time the statesmen of the country that are most guilty, know not how to dress this kettle of fish; for they make no question but the new governor will retain a just refentment of what is past; but the gentlemen, merchants, and other inhabitants, are making preparations for folemnizing his arrival, which they expect with as much impatience as the Jews do the Messiah's. The very savages that live in the skirts of the colony, shew an uncommon joy upon the hopes of his return; and indeed, we need not think it strange, for that governor drew esteem and veneration not only from the French but from all the nations of this vast continent, who looked upon him as their guardian angel. M. de Denonville begins to pack up his baggage, and that in effect, is all I can fay of him. It is none of my bufinefs to meddle with an infinity of affairs that relate to the gentleman's private interest. As to the question, whether he has managed well or ill, during the course of his government, or whether he was

loved or hated, I know nothing of the matter. I am at a loss to know whether he kept a good or forry table, for indeed I was never at it. Adicu.

I make account to fet out for Rochel, when the veffel that brings our new governor

returns for France.

I am, Sir, yours, &c.

LETTER XVIII.

Dated at Quebec, Nov. 15, 1689.

Giving an Account of M. de Frontenac's Arrival, his Reception, his Voyage to Monreal, and the repairing of Fort Frontenac.

THE intelligence you give me of the adjudging of the lands of Lahontan, would have driven me to despair, if you had not assured me at the same time, that I might recover it after a century of years, (if I had the misfortune to live fo long,) upon the condition of reimburfing to the poffesfor the sum that he paid for it, and of proving that I was actually in the King's fervice in the remote parts of the world when that estate was fold. To speak to the purpose, M. de Frontenac has countermanded the leave I had to go for France, and has offered me a free access to his pocket and his table. All the arguments I offered have no influence upon him, and fo I am bound

to obey.

This new governor arrived at Quebec the 15th of October. He came on shore at eight o'clock at night, and was received by the supreme council, and all the inhabitants in arms, with flambeaux both in the city, and upon the harbour, with a triple discharge of the great and fmall guns, and illuminations in all the windows of the city. That fame night he was complimented by all the companies of the town, and above all, by the Jefuits, who upon that occasion made a very pathetic speech, though the heart had less hand in it than the mouth. The next day he was visited by all the ladies, whose inward joy appeared in their countenances, as much as in their words. Several perfons made fire-works, while the governor and his retinue fung Te Deum in the great church. These folemn demonstrations of joy increased from day to day, till the new governor fet out for Monreal; and the conduct of the people upon this head afforded fignal proofs of the fatisfaction they had in his return, and of their refting affured that his wife conduct and noble fpirit would preferve the repofe and tranquillity that he always kept up during his first ten years' government. All the world adored him, and stiled him Redemptor Patriæ; to which title he had a just claim, for all the inhabitants of these colonies agree, that when he came first to Canada, he found all things in confusion and distress. At that time the Iroquese had burnt all the plantations, and cut the throats of fome thousands of the French; the farmer was knocked on the head in his field; the traveller was murdered upon the road, and the merchant ruined for want of commerce: all the planters were pinched with famine, the war rendered the country desolate; and, in a word, New France had infallibly perished, if this governor had not made that peace with the barbarians, that I spoke of in my fifth letter. The bringing of that peace to bear was an action of greater importance than you can well imagine; for these barbarians grounded all their wars upon a personal enunity, whereas the European ruptures depend more upon interest than upon pure revenge.

M. de

M. de St. Valiers, the Bishop of Quebec, arrived likewise on the 15th at the same port. He had embarked in the preceding spring, on board of a bark that he had hired to transport him to Acadia, to Newfoundland, and to the other countries of his diocefe. M. de Frontenae, our governor, fet out for Monreal in a canoe, four or five days after his arrival; and I had the honour to accompany him. All endeavours were used to diffuade him from undertaking that voyage, when the season was so cold, and so far advanced: for, as I informed you before, the ice is thicker and stronger here in October than it is at Paris in January, which is very strange. Notwithstanding all the remonstrances drawn from the hardships and inconveniencies of the voyage, he slighted the fatigues of the water, and threw himself into a canoe in the fixty-eighth year of his age; nay, he took the abdication of Fort Frontenac fo much to heart, that he had gone straight thither, if the nobility, the priests, and the inhabitants of Monreal, had not entreated him, with joint supplications, not to expose his person to the danger of the falls and cataracts that lie in that passage. In the mean time some gentlemen of Canada, followed by a hundred coureurs de bois, under the command of M. Mantet, ventured upon the voyage, with intent to learn the flate of the fort. I acquainted you in my last letter, that M. de Valrenes had blown up the walls of the fort, when he made his retreat; but by good luck, the damage was not fo great as it was taken to be; for the party commanded by M. Mantet, have already reared up the ruinous wall to the height of fome fathoms, and will continue to work upon the repair of the fort all this This news M. de Frontenac received last night, which was the fixth after his return to this city.

I had forgot to tell you, that he brought with him out of France, some of those Iroquefe that M. de Denonville had fent to the galleys, as I intimated in my thirteenth letter; the rest having perished in their chains. Of all these unfortunate barbarians that he has brought back, the most considerable is one that goes by the name of Oreouahè. He was not used as a galley flave, in regard that he was the leader of the Goyoguans, and the governor has lodged him in the castle, in consideration of the esteem he shews both for M. de Frontenac, and for the French nation. Some flatter themselves with the hopes, that some accommodation with the five Iroquese nations may be effected by his mediation; and for that end proposals of peace are now in agitation; but I have three good reasons for predicting, that such a defign will prove abortive. I have already laid thefe reasons before M. de Frontenac, who gave me to know, that after the departure of the ships, he would discourse with me upon that head. I shall not offer at the particulars of his interview, with Monfieur and Madam de Denonville, till fuch time as you and I have an opportunity of talking under the rofe. Some officers accompany M. de Denonville and his Lady to France, in hopes of being preferred. In all probability the ships will set fail to-morrow, for we have now a fair and gentle

westerly gale; besides, that the season for quitting this port, is almost spent.

I am, Sir, yours, &c.

LETTER XIX.

Dated at Monreal, October 2, 1690.

Relating the Attempts upon New England and New York; a fatal Embassy fent by the French to the Iroquese; and an ill-concerted Enterprise of the English and the Iroquese, in marching by Land to attack the French Colony.

SIR,

ABOUT fifteen days fince, a ship of Rochel, laden with wine and brandy, arrived in this harbour; and the captain took care to convey a letter from you to my hands. As to your desire of having a circumstantial account of the trade of Canada, I cannot satisfy it at present, for I am not as yet so thoroughly acquainted with all its branches. But I affure you, that some time or other I shall send you such memoirs, as will give you satisfaction upon that head. In the mean time, I hope you will be contented with an account of what passed in this country since the date of my last.

As foon as M. Denonville fet out from Quebec upon his return to France, M. de Frontenac took possession of the fort, which is the common residence of our governor-general, and ordered one of our best architects to make preparations for re-

building it as foon as he could.

In the beginning of this year, M. D'Iberville attempted to pillage a small village in New York, called by the Iroquefe Corlar, which name they likewife give to all the governors of that English colony. This gentleman, who is a Canadese, was attended by five hundred courcurs de bois, and the like number of favages; and the whole party made the expedition over fnow and ice, notwithstanding they had three hundred leagues to march backward and forward, and that the roads were very rugged and troublefome. M. D'Iberville met with wonderful fuccess, for after he had pillaged, burnt, and facked that little village, with the adjacent cantons, he fell in with a party of an hundred Iroquese, and defeated them entirely. Much about the same M. de Portneuf, another Canada gentleman, marched out at the head of three hundred men, one half favages, and the other half coureurs de bois, with intent to possess himself of a fort belonging to the English, called Kenebeki, which stands upon the sea coast of New England, towards the frontiers of Acadia. The garrison of this fort made a brave defence, but there being great quantities of grenadocs and other fireworks thrown in upon them, while the favages (contrary to their custom) fcaled the palifadoes on all hands, the governor was obliged to furrender upon diferetion. It is faid, that in this action the coureurs de bois did their duty very bravely, but the enterprize had proved fuccefsless without the affistance of the savages.

As foon as the rivers were navigable, M. de Frontenac offered to fend me with proposals of peace to the Iroquese; but I made answer, that since his pocket and table had been free to me during the winter, I could not imagine that he had a mind to be rid of me so soon. Being obliged by this reply to unfold my meaning, I remonstrated to him, that the King of England having lost his crown, and war being proclaimed, the governors of New England and New York, would infallibly use their utmost efforts to excite these banditti to redouble their incursions; that for that end they would furnish them with ammunition gratis, and even join them, in order to attack our towns; and above all, that the intrigue of the Rat had so provoked them, that, in my opinion, it was impossible to appease them. Upon these considerations, I humbly beseched

him to have fome other person in his view, in case he persisted in his design of making a trial of that nature. The Chevalier Do was fingled out for this fatal embaffy, being attended by one Colin, as interpreter of the Iroquefe language, and two young Canadans. They fet out in a canoe, and when they came in fight of the village of the Onnontagues, were received with the honourable falvo of feveral good blows, and conducted with the fame ceremony to the village. Such a reception could not but be difagreeable to the gentleman that came to make offers of peace. The ancient men, being quickly affembled, thought it most proper to fend them back with a favourable answer, and in the mean time to engage fome of the Agnies and Onnoyotes, to lie in wait for them at the cataracts of the river, and there kill two, fending the third back to Quebec, and carrying the fourth to their village, where there would be found fome English that would shoot them, that is, that would give them the same usage as the Rat did to their ambasfadors: fo true it is, that that action sticks in their stomachs. This project had actually been put in execution, if it had not been for fome of the planters of New York, who were then among the barbarians, having come thither on purpose to animate them against us. These planters knew so well how to influence the barbarians, that were already bent upon revenge, that a company of young barbarians burnt them all alive, excepting the Chevalier Do, whom they tied hand and foot, and fent him bound to Boston, with a design to pump out of him a view of the condition of our colonies and forces. This piece of news we received two months after by some slaves that made their escape from the Iroquese; and M. de Frontenac, when surprized with such dismal news, declared, that out of twenty captains that offered to execute that commission, and would have taken the employment for an honour, I was the only one that had been

capable of forefeeing its bad fuccefs.

June the 24th, I embarked for this place in a fluggish brigantine, that the captain of the governor's guards had caused to be built the foregoing winter. This venerable veffel had the honour to lodge the intendant and his lady; and all of us being in no haste, spent ten or twelve days by the way, and feasted like kings every night. M. de Frontenac marked out a fort in his passage to the city of Trois Rivieres, which I spoke of before. Fifteen days after our arrival in this place, a certain favage whose name was Plake, came and gave us notice, that he had discovered a body of a thousand English, and five hundred Iroquefe, that marched up to attack us. Upon this intelligence, all our troops croffed over to the meadow of Medalaine, opposite to this city, and there encamped, in conjunction with three or four hundred favages that were our allies, in order to give the enemy a warm reception. Our camp was no fooner formed, than M. de Frontenac detached two or three small parties of the favages to observe the enemy. These parties came foon back, after having furprized fome straggling Iroquese at hunting on the confines of Champlaine lake: the prisoners informed us, that the English being unable to encounter the fatigues of the march, and unprovided with a sufficient stock of provisions, both they and the Iroquese were returned to their own country. This account being confirmed by other favages, our troops decamped, and marched back to this place, from whence I was detached fome days after to command a party that was to cover the reapers of fort Roland, which lies in this island. When the harvest was over I returned to this place, along with the Hurons and the Outaouas, who had come down from their own country, in purfuit of their ufual trade in skins; an account of which you had in my eighth letter. These traders continued here fifteen days, and then marched home.

This, Sir, is a fummary of all our occurrences of moment fince the last year. About fifteen days hence I think to set out for Quebec, in M. de Frontenac's brigantine. I conclude with my usual compliment,

Sir, yours, &c.

LETTER XX.

Dated at Rochel, January 12, 1691.

Being a Relation of a Second and very important Expedition of the English by Sea; in which is contained a Letter written by the English Admiral to Count Frontenac, with the Governor's verbal Answer. As also an Account of the Author's Departure for France.

SIR,

I AM arrived at last at Rochel, from whence I now transmit you a relation of all that passed in Canada, fince the date of my last letter. In the space of a few days after that date, M. de Frontenac received advice that a strong fleet of English ships amounting to thirty-four fail, was feen near Tadoussac. Immediately he got on board of his brigantine, and ordered all the troops to embark in canoes and boats, and to row night and day to prevent the enemy; all of which was happily put in execution. At the fame time he gave orders to M. de Callieres, to bring down as many of the inhabitants as possibly he could. We rowed with fuch expedition, and diligence, that we arrived the 3d day at Quebec. As foon as M. de Frontenac debarked, he viewed the weakest posts, and ordered them to be fortified without loss of time: he raised batteries in several places, and though in that capital city we had but twelve great guns, and but little ammunition, yet he feemed to be refolutely bent upon an obstinate refistance to the efforts of the enemy's fleet, which in the mean time stood catching of slies, at the distance of two leagues from Quebec. We took the advantage of their flow approaches, and worked inceffantly to put ourfelves in a posture of defence. Our troops, our militia, and our confederate favages, came up to us on all hands. It is certain, that if the English admiral had made his descent before our arrival at Quebec, or even two days after, he had carried the place without striking a blow; for at that time there was not two hundred French in the city, which lay open, and exposed on all hands; but instead of doing that, he cast unchor towards the point of the island of Orleans, and lost three days in confulting with the captains of the ships, before they came to a resolution. He took the Sieur Joliet with his lady and his mother-in-law, in a bark in the river of St. Laurence. Three merchantmen from France, and one laden with beaver-skins from Hudson's Bay, entered the river of Saguenay, by the way of Tadouslac, where they fculked, and after hauling their guns ashore, raised very good batteries. To be short, the officers of the enemy's fleet came to a resolution after the loss of three or four days in ufeless consultations, during which time we were joined on all hands by great numbers of inhabitants and foldiers. Purfuant to the refolution of the councils of war, the English admiral, namely, Sir William Phips, fent out his sloop with a French flag upon its prow, which made up to the city with found of trumpet. Upon this, M. de Frontenac fent out another with a French officer to meet it, who found an English major in the floop, who gave him to understand, that he had the charge of a letter from his general, to the governor of Canada, and hoped he might be allowed to deliver it himself. Upon that

that the French officer took him into his floop, and having blindfolded him, conducted him to the governor's chamber; where his face being uncovered, he delivered him a letter, the fubftance of which was this:

"I, Sir William Phips, general of the forces of New England, by fea and land, to Count Frontenac, governor-general of Quebec, by orders from, and in the name of William III. and Mary, King and Queen of England, am come to make myfelf mafter of this country. But in regard that I have nothing fo much in view, as the preventing of the effusion of blood, I require you to furrender at discretion, your cities, castles, forts, towns, as well as your persons; assuring you at the same time, that you shall meet with all manner of good usage, civility and humanity. If you do not accept of this proposal without any restriction, I will endeavour, by the assistance of Heaven, on which I rely, and the force of my arms, to make a conquest of them. I expect a positive answer in writing in the space of an hour; and in the mean time give you notice, that after the commencement of hostilities, I shall not entertain any thoughts of accommodation.

(Signed,) "WILLIAM PHIPS."

After the interpreter had translated the letter to M. de Frontenac, who was then furrounded with officers, he ordered the captain of his guards to make a gibbet before the fort, in order to hang the poor major, who in all appearance understood French, for upon the pronouncing of this fatal fentence, he was like to fwoon away; and indeed I must say, the major had some reason to be affected, for he had certainly been hanged if the bishop and the intendant, who, to his good luck, were then prefent, had not interceded on his behalf. M. de Frontenac pretended, that they were a fleet of pirates, or of persons without commission, for that the King of England was then in France. But at last the governor being appealed, ordered the major to repair forthwith on board of his admiral, against whom he could defend himself the better, for not being attacked. At the same time he declared, that he knew of no other King of Great Britain than James II., that his rebellious subjects were pirates, and that he dreaded neither their force nor their threats. This faid, he threw Admiral Phips's letter in the major's face, and then turned his back upon him. Upon that the poor ambaffador took fresh courage, and looking upon his watch, took the liberty to ask M. de Frontenac, if he could not have his answer in writing before the hour elapsed. But the governor made answer with all the haughtiness and disdain imaginable, that his admiral deferved no other answer than what flew from the mouth of cannons and These words were no sooner pronounced, than the major was forced to take his letter again, and being blindfolded, was reconducted to his floop, in which he rowed towards the fleet with all expedition.

The next day about two in the afternoon, fixty floops were fent ashore with ten or twelve hundred men, who stood upon the sand in very good order. After that the sloops went back to the ships, and brought ashore the like complement of men, which was-afterwards joined by a third complement of the same number. As soon as these troops were landed, they began to march towards the city with drums beating and colours slying. This descent was made over against the isle of Orleans, about a league and a half below Quebec; but it was not so expeditious but that our confederate savages, with two hundred coureurs de bois, and sifty officers, had time to post themselves in a copse of thick brambles, which lay half a league off the place of landing. It being impossible for so small a party to come to an open battle with a numerous

enemy, they were forced to fight after the manner of the favages, that is, to lay ambufcadoes from place to place in the copfe, which was a quarter of a league broad. This way of waging war proved wonderfully fuccessful to us, for our men being posted in the middle of the copfe, we suffered the English to enter, and then fired upon them, lying slat upon the ground till they fired their pieces; after which we sprung up, and drawing into knots here and there, repeated our fire with such success that the English militia perceiving our savages, fell into consustion and disorder, and their battalions were broke; insomuch, that they betook themselves to slight, crying out, Indians, Indians, and gave our savages the opportunity of making a bloody slaughter among them; for we found three hundred men left upon the spot, without any other loss on

our fide than that of ten coureurs de bois, four officers, and two favages.

The next day the English landed four pieces of brass cannon mounted like fieldpieces, and fought very bravely, though they were very ill disciplined. It is certain there was no want of courage on their fide, and their want of success must be imputed to their unacquaintance with military discipline, to their being enfeebled by the fatigues of the fea, and to the ill conduct of Sir William Phips, who upon this enterprize could not have done less than he did, if he had been engaged by us to stand still with his hands in his pockets. This day passed over more peaceably than the next, for then the English made a fresh attempt to force their passage through the copse, by the help of their artillery; but they loft three or four hundred more in the attempt, and were forced to retire with all diligence to the landing-place. On our fide we loft M. de St. Helene, who died of a wound in his leg, and about forty Frenchmen and favages. This victory animated us fo much, that we purfued the English to their camp, and lay all night flat upon the ground just by it, with a defignto attack it by break of day; but they faved us the labour, for they embarked about midnight with fuch confusion, that we killed fifty more of them, rather by chance than by dexterity, while they were getting into their boats. When day came, we transported to Quebec their tents and their cannon, which they had left behind them; the favages being in the mean time employed in ftripping the dead in the wood.

The same day that the descent was made, Sir William Phips weighed and came to an anchor with sour great ships, at the distance of a musket-shot from the lower city, where we had only one battery of six or eight pounders. There he cannonaded for twenty-four hours so handsomely, that the sire of the great guns equalled that of the small arms. The damage they did to the roofs of the houses amounted to sive or six pistoles; for, as I informed you in my first letter, the walls of the houses are so hard

that a ball cannot pierce them.

When Sir William Phips had made an end of these glorious exploits, he sent to demand of M. de Frontenac some English prisoners in exchange for the Sieur Joliet, with his wife and his mother, and some seamen, which was forthwith put in execution. This done, the fleet weighed anchor and steered homeward. As soon as the three merchantmen that lay skulking in the river of Saguenay, saw the fleet running below Tadoussac with full sail before a westerly gale, they put their guns aboard, and pursuing their voyage with great satisfaction, arrived at Quebec on the 12th of November. They had scarce put their cargo on shore, when the bitter cold covered the river with ice, which damaged their ships so much, that they were forced to run them ashore. This troublesome frost was as uneasy to me as to M. de Frontenac, for then I saw that I was obliged to pass another winter in Canada, and M. de Frontenac was at a loss to contrive a way of sending the King advice of this enterprize; but, by good luck, there came all of a sudden a downfall of rain, which was sollowed by a thaw, and was

equally

equally acceptable to us both. Immediately the governor ordered an unrigged frigate to be rigged and fitted out; which was done accordingly with fuch dispatch that the ballast, fails, ropes, and masts were all in order almost as soon as the orders were given out. When the frigate was ready to fail, the governor told me, that the making of France as soon as ever I could, would be a piece of important service; and that I ought rather to perish than to suffer myself to be taken by the enemy, or to put in at any port whatsoever by the way: at the same time he gave me a particular letter to M. de Seignelay, the purport of which was much to my advantage.

I put to fea the 20th of November, the like of which was never feen in that place before. At the isle of Coudres we escaped luckily, for there the north-east wind blew so hard upon us, that after we had dropped anchor, we thought to have been split in pieces in the night-time. The rest of our passage was good enough, for we encountered but one storm till we arrived at this place. Indeed we met with contrary wind, about an hundred and sifty leagues off the coast of France, which obliged us to traverse, and lie by for a long time; and it was for this reason that our passage was so long.

I hear you are now in Provence, and that M. de Seignelay is gone upon a voyage to the other world, which is of a quite different nature from that I have just performed. In earnest, Sir, his death is the last misfortune to the navy of France, to the colonies of the two Americas, and to me in particular, since M. de Frontenac's recommendatory letter is thereby rendered useless to me.

I am, Sir, yours, &c.

MEMOIRS OF NORTH AMERICA;

CONTAINING

A GEOGRAPHICAL DESCRIPTION OF THAT VAST CONTINENT; THE CUSTOMS AND COMMERCE OF THE INHABITANTS, &c.

N my former letters I prefented you with a view of the English and French colonies, the commerce of Canada, the navigation upon the rivers and lakes of that country, the course of failing from Europe to North America, the several attempts made by the English to master the French colonies, the incursions of the French upon New England, and upon the Iroquese country: in a word, Sir, I have revealed a great many things, that for reasons of state or politics, have been hitherto concealed; informuch, that if you were capable of making me a facrisce to your resentment, it is now

in your power to ruin me at court, by producing my letters.

All that I writ in the foregoing letters, and the whole fubitance of the memoirs I now fend you, is truth as plain as the fun-shine. I flatter no man, and I spare nobody. I fcorn to be partial; I bestow due praise upon those who are in no capacity to serve me, and I censure the conduct of others, that are capable of doing me an injury by indirect methods. I am not influenced by that principle of interest and party-making, that is the rule of fome folks words. I facrifice all to the love of truth, and write with no other view, than to give you a just representation of things as they are. It is beneath me to mince or alter the matter of fact, contained either in the letters I fent you fome ten or twelve years ago, or in these memoirs. In the course of my voyages and travels, I took care to keep particular journals of every thing; but a minute relation of all particulars would be irksome to you, besides, that the trouble of taking a copy of the journals, before I have an opportunity of shewing you the original, would require more time than I can well fpare. In these memoirs you will find as much as will ferve to form a perfect idea of the vast continent of North America. In the course of our correspondence from the year 1683, to this time, I sent you fiveand-twenty letters, of all which I have kept a double very carefully. My only view in writing of these letters, was to inform you of the most effential things; for I was unwilling to perplex and confound your thoughts, with an infinity of uncommon things, that have happened in that country. If you will confult my maps, as you read the abovementioned letters, you will find a just representation of all the places I have fpoken of. These maps are very particular, and I dare assure you, they are the correctest yet extant. My voyage upon the Long River, gave me an opportunity of making that little map, which I fent you from Missilimakinac in 1699, with my fixteenth letter. It is true, it gives only a bare description of that river, and the river of the Missouris; but it required more time than I could spare, to make it more complete, by a knowledge of the adjacent countries, which have hitherto been unknown to all the world,

world as well as that great river, and which I would never have vifited, if I had not been fully inftructed in every thing that related to it, and convoyed by a good guard. I have placed the map of Canada at the front of these memoirs, and desire that favour of you, that you would not shew it to anybody under my name. To the latter part I have subjoined an explication of the marine, and other difficult terms, made use of in my letters, as well as in these memoirs; which you will please to consult, when you meet with a word that you do not understand.

A short Description of Canada.

You will think, Sir, that I advance a paradox, when I acquaint you that New France, commonly called Canada, comprehends a greater extent of ground than the half of Europe: but pray mind what proof I have for that affertion. You know that Europe extends fouth and north, from the 35th to the 72nd degree of latitude, or, if you will, from Cadiz to the North Cape on the confines of Lapland; and that its longitude reaches from the 9th to the 94th degree, that, is from the River Oby to the West Cape in Yslandia. But at the same time, if we take the greatest breadth of Europe, from east to west, from the imaginary canal, (for instance) between the Tanais and the Volga, to Dinglebay in Ireland, it makes but 66 degrees of longitude, which contain more leagues than the degrees allotted to it towards the polar circle, though these are more numerous, by reason that the degrees of longitude are unequal; and fince we are wont to measure provinces, islands, and kingdoms by the space of ground, I am of the opinion, that we ought to make use of the same standard with respect to the four parts of the world. The geographers who parcel out the earth in their closets, according to their fancy; these gentlemen, I say, might have been aware of this advance, if they had been more careful. But, to come to Canada.

All the world knows, that Canada reaches from the 39th to the 65th degree of latitude, that is, from the fouth fiide of the lake Errie, to the north fide of Hudson's Bay; and from the 284th to the 336th degree of longitude, viz. from the river Missispi to Cape Rase, in the island of Newsoundland. I affirm, therefore, that Europe has but 11 degrees of latitude and 33 of longitude more than Canada, in which I comprehend the island of Newsoundland, Acadia, and all the other countries that lie to the northward of the river St. Laurence, which is the pretended great boundary that severs the French colonies from the English. Were I to reckon in all the countries that lie to the north-west of Canada, I should find it larger than Europe: but I confine myself to what is discovered, known, and owned; I mean, to the countries in which the French trade with the natives for beavers, and in which they have forts, magazines,

missionaries, and small settlements. .

It is above a century and a half fince Canada was discovered. John Verasan was the first discoverer, though he got nothing by it, for the savages eat him up. James Cartier was the next that went thither; but after sailing with his ship above Quebec, he returned to France, with a forry opinion of the country. At last, better failors were employed in the discovery, and traced the river of St. Laurence more narrowly: and about the beginning of the last century, a colony was fent thither from Rouen, which settled there after a great deal of opposition from the natives. At this day the colony is so populous, that it is computed to contain one hundred and eighty thousand souls. I have already given you some account of that country in my letters, and therefore shall now only point to the most noted places, and take notice of what may gratify your curiosity beyond what you have yet heard.

We are at a loss to find the head of the river of St. Laurence, for though we have traced it feven or eight hundred leagues up, yet we could never reach its fource; the remotest place that the coureurs de bois go to, being the lake. Lenemipigon, which difembogues into the Upper Lake, as the Upper Lake does into the lake of Hurons, the lake of Hurons into that of Erriè alias Conti, and that of Erriè into the lake of Frontenac, which forms this last great river, that runs for twenty leagues with a pretty gentle stream, and sweeps through thirty more with a very rapid current, till it reaches the city of Monreal; from whence it continues its course with some moderation to the city of Quebec; and after that, spreads out, and enlarges itself by degrees to its mouth, which lies a hundred leagues further. If we may credit the north-country favages, this river takes its rife from the great lake of the Affinipouals, which they give out to be larger than any of the lakes I mentioned but now, being fituated at the diftance of fifty or fixty leagues from the lake of Lenemipigon. The river of St. Laurence is twenty or twenty-two leagues broad at its mouth, in the middle of which there is an island called Anticosti, which is twenty leagues long. This island belongs to the Sieur Joliet, a Canadan, who has built a little fortified magazine upon it, to guard his goods and his family from the incursions of the Eskimaux, of whom more anon. He deals with the other favage nations, namely, the Mantagnois and the Papipanachois in arms and ammunition, by way of exchange for the skins of sca-wolves or sea-calves, and fome other furs.

Over against this island, to the fouthward of it, we find the isle called L'Isle Percèe, which is a great rock with a passage bored through it, in which the sloops can only pass. In time of peace the Biscayans of France, and the Normans, used to fish for cod at this place; for here that sish are very plentiful, and at the same time larger, and more proper for drying than those of Newfoundland. But there are two great inconveniencies that attend the sishing upon this island; one is, that the ships ride in great danger, unless they have good anchors and strong cables; another inconvenience is, that this place affords neither gravel nor slint-stones to stretch out the fish upon before the sun, and that the sishermen are forced to make use of a fort of hurdles.

There are other fifthing places befides this, which lie fome leagues higher up upon the fame fide of the river. Such is that called Gaspè, where the ships' crews sometimes trade in skins with the Gaspesians, to the prejudice of the proprietors of this river. The other places for cod-fish lie toward Monts Notre Dame, in the little bays

or rivers that empty themselves into the river of St. Laurence.

On the other fide of the river there lies the wide-extended country of Labrador, or of the Eskimaux, who are such a wild barbarous people, that no means whatsoever have hitherto been able to civilize them. One would think that good old Homer had this people in his view when he speaks of the Cyclops; for the character of the one suits the other admirably well, as it appears from these four verses, in the ninth book of his Odysty, which are so pretty, that I cannot forbear inferting them in this place.

Τοῖ το δ΄ ὅτ΄ ἀροςαὶ βωληθόςοι ὅτε θιμιδες.
Αλλ' ὅτρ' εἰπλῶν ὀξέων νάκισι κάπα
Εν σπέωι γλαθυςοῖσι θεμικὶυτι δὲ ἐκακος
Παίδων 'nδ' ἀλόχων ὅδ' ἀλλή ων ἀλέρεισι.

That is; this people do not perplex themselves with voluminous laws, and vexatious suits; they delight only in the tops of mountains, and deep caves, and every one con-

fines

fines his care to the management of his own family, without troubling his head about his neighbour. The Danes were the first discoverers of this country, which is full of ports, havens and bays, that the Quebec barks refort to in the fummer, in order to truck with the favages for the skins of sea-calves. The commerce I speak of, is carried on after this manner. As foon as the Quebec barks come to an anchor, these devils come on board of them in their little canoes made of the skins of sea-calves, in the form of a weaver's fluttle, with a hole in the middle of it, refembling that of a purfe, in which they flow themselves with ropes, fitting squat upon their breech. Being set in this fashion, they row with little slices, fometimes to the right, and fometimes to the left, without bending their body for fear of overfetting. As foon as they are near the bark, they hold up their skins upon the end of the oar, and at the same time make a demand of fo many knives, powder, ball, fufees, axes, kettles, &c.; in fine, every one shews what he has, and mentions what he expects in exchange: and fo when the bargain is concluded, they deliver and receive their goods upon the end of a stick. As these pitiful fellows use the precaution of not going on board our boats, so we take care not to fuffer too great a number of canoes to furround us; for they have carried off oftener than once, fome of our fmall veffels, at a time when our feamen were bufied in hauling in the skins, and delivering out the other goods. Here, we are obliged to be very vigilant in the night-time, for they know how to make great floops, that will hold thirty or forty men, and run as fast as the wind: and it is for this reason that the Malouins, who fish for cod at Petit Nord, and the Spaniards who follow the same fishery at Portochoua, are obliged to fit in long barks to fcour the coast and pursue them; for almost every year they surprize some of the crew on shore, and cut their throats, and fometimes they carry off the veffel. We are affured that their number of warriors, or men that bear arms, amount to thirty thousand; but they are such cowardly fellows that five hundred Cliftinos from Hudson's bay, used to defeat five or fix thousand of them. They are possessed of a very large country, extending from over against the isles of Mingan to Hudson's Streight. They cross over to the island of Newfoundland every day, at the streight of Belle Isle, which is not above seven leagues over; but they never come fo far as Placentia, for fear of meeting with other favages there.

Hudson's Bay adjoins to this terra of Lambrador, and extends from the 52° 30' to the fixty-third of latitude. The origin of its name was this Captain Henry Hudson, an Englishman by birth, obtained a ship from the Dutch, in order to trace a passage to China through an imaginary streight to the northward of North America. He had first formed a defign of going by the way of Nova Zembla; but upon feeing the memoirs of a Danish pilot, who was a friend of his, he dropped that thought. This pilot, namely, Frederick Anschild, had set out from Norway, or Yslandia, some years before, with a defign to find out a passage to Japan by Davis's Streight, which is the chimerical streight I spoke of. The first land he descried was Savage Bay, seated on the north side of the terra of Labrador; then sweeping along the coast, he entered a streight, which about twenty or thirty years afterwards, was christened Hudson's Streight. After that, steering to the westward, he came upon some coasts that run north and south; upon which he flood to the north, flattering himfelf with the hopes of finding an open passage to cross the sea of Jesio; but after failing to the latitude of the polar circle, and running the risk of perishing upon the ice, (I do not know how often,) without meeting with any paffage or open fea, he took up a resolution of turning back; but the feason was then fo far advanced, and the ice so covered up the surface of the water, that he was forced to put into Hudson's Bay, and winter there in a harbour, where feveral favages furnished his crew with provisions and excellent skins. As foon as the fea was open, he returned to Denmark. Now, Captain Hudson being afterwards acquainted with this Dane, X X 2

undertook upon his journals to attempt a passage to Japan through the streight of Davis; but the enterprize failed, as well as that of one Button, and some others. However, Hudfon put into the bay that now goes by his name, where he received a great quantity of tkins from the favages; after that, he discovered New Holland, which is now called New York, and fome other countries retaining to New England: upon the whole, it is not fair to call this streight and this bay by the name of Hudson; in regard that the abovementioned Dane, Frederick Anschild, was the first discoverer of them: he being the first European that descried the countries of North America, and chalked out the way to the others. Upon this Hudson's journals, the English made several attempts to fettle a commerce with the Americans. The great quantity of beaver-skins and other furs that he purchased of the savages while he wintered in the bay, put the notion into the heads of some English merchants, who thereupon formed a company for the carrying on of this new commerce. With this view, they fitted out some ships under the command of Captain Nelson, who lost fome of them in the ice not far from the streight having escaped narrowly himself. However, he entered the bay, and placed himself at the mouth of a great river, which rifes towards the lake of the Asimpouals, and falls into the bay at a place where he built a redoubt, and mounted some cannon upon it. In the space of three or four years after the English made some other little forts near that river, which proved a confiderable baulk to the commerce of the French, who found that the favages who used to deal with them in furs on the north side of the Upper Lake, were not then to be feen.

It came to pass in process of time, but how I cannot tell, that one Ratisson, and one Grezileer, met, in that great lake, some Clistinos, who promised to conduct them to the bottom of the bay, where the English had not yet penetrated. In effect, the Cliftinos were as good as their word; for they shewed them the place they spoke of, befides feveral other rivers upon which there was a fair prospect of making such settlements as would carry on a great trade in skins with several savage nations. These two Frenchmen returned to the Upper Lake, the same way that they went, and from thence made the best of their way to Quebec, where they offered to the chief merchants of the place, to carry ships to Hudson's Bay; but their project was rejected; in fine, having met with this repulse, they went to France, in hopes of a more favourable hearing at court: but after the presenting of memorial upon memorial, and spending a great deal of money, they were treated as whimfical fellows. Upon that occasion the King of England's ambassador did not lose the opportunity of persuading them to go to London, where they met with fuch a favourable reception, that they got feveral ships, which they carried to the bay, not without difficulty, and built feveral forts in different places, that did great férvice in promoting the commerce. Then the court of France repented, though too late, that they did not give ear to their memorials; and finding no other remedy, refolved to diflodge the English at any rate. In effect, they attacked them vigorously by sea and land, and dispossessed them of all their forts, excepting Fort Nelson, where they could not expect fuch an eafy conquest. Some years after, the English resolved to use their utmost efforts to retake these posts; and their resolution was crowned with fuccess, for they dislodged the French in their turn; and at this day the French are making preparations to repay them in their own coin.

That country is so cold for seven or eight months of the year, that the sea freezes ten seet deep, the trees and the very stones split; the snow is ten or twelve seet deep upon the ground, for above six months of the year, and during that season no body can stir out of doors, without running the risk of having their nose, ears and seet mortisted by the cold. The passage from Europe to that country is so dissicult and dogerous, by reason

of the ice and the currents, that one must be reduced to the last degree of milery, or be

blind to a foolish height, that undertakes such a wretched voyage.

It is now time to pass from Hudson's Bay, to the Superior or Upper Lake. It is easier to make this voyage upon paper than to go actually through it; for you must fail almost a hundred leagues up the river of Machakandibi, which is so rapid and full of cataracts, that a light canoe worked by fix watermen, shall not fail them under thirty or thirty-five days. At the head of this river we meet with a little lake of the fame name, from whence we are obliged to a land-carriage of feven leagues, to get at the river of Michipikoton, which we run down in ten or twelve days; though at the fame time we have feveral land-carriages upon it: for going down this river we pass several cataracts, where we are obliged either to carry our canoes by land, or to drag them back again. Thus we arrive at the Upper Lake, which is reckoned to be five hundred leagues in circumference, including the windings of the creeks and little gulphs. This little freshwater fea is calm enough from the beginning of May to the end of September. The fouth fide is the fafest for the canoes, by reason of the many bays and little rivers, where one may put in, in case of a storm. There is no settled savage nation upon the brinks of the lake, that I know of. It is true indeed, that in fummer, feveral northern nations come to hunt and fish in these parts, and bring with them the beaver-skins they have got in the winter, in order to truck with the coureurs de bois, who do not fail to meet them there every year. The places where the interview happens, are Bagouafch, Lemipifaki, and Chagouanigon. It is some years since M. Dulhut built a fort of pales or stakes upon this lake, where he had large magazines of all forts of goods. That fort was called Camanistigoyan, and did considerable differvice to the English settlements in Hudfon's Bay; by reason that it saved several nations the trouble of transporting their fkins to that bay. Upon that lake we find copper mines, the metal of which is fo fine and plentiful, that there is not a feventh part loft from the ore. It has fome pretty large islands, which are replenished with elks and wild asses; but there is scarce any that goes to hunt upon them, by reason of the danger of crossing over: in fine, this lake abounds with flurgeons, trouts, and white fish. The climate is almost unsufferably cold for fix months of the year; and the fnow joined to the frost, commonly freezes the water of the lake for ten or twelve leagues over.

From the Superiour or Upper Lake, I steered to that of Hurons, to which I allot four hundred leagues in circumference. Now to make this lake, you must fail down by the fall called Saut St. Mary, which I described in my sifteenth letter. This lake is fituated in a fine climate, as you will perceive from the map. The north fide of it is best for the navigation of canoes, by reason of the frequency of isses which afford shelter in bad weather. The south side is pleasanter and more convenient for the hunting of deer, which are there very plentiful. The figure of this lake comes near to an equilateral triangle. Of all its ifles, that called Manitoualin is the most confiderable, being above twenty leagues long, and ten broad. In former times, the Outaouas of the nations of Talon and Sable dwelt in it; but the dread they were under upon the account of the Iroquese, obliged both them and their neighbours to retire to Miffilimakinac. That part of the continent that faces this ifland, is inhabited by the Nockes and the Missitagues, in two different villages which are twenty leagues distant the one from the other. Towards the east end of this island, we fall in with the river des François, which I took notice of in my fixteenth letter. It is as broad as the Seine is at Paris, and runs not above forty leagues in length from its fource in the lake Nepicerini, to its mouth. To the north-west of this river there lies the bay of Toranto, which is twenty or five-and-twenty leagues long, and fifteen broad at its mouth .- mouth. This bay receives a river that springs from a little lake of the same name, and form several cataracts that are equally impracticable both upon the ascent and descent. Upon the side of this river you will see a man's head marked in my map, which signifies a large village of the Hurons, that was destroyed by the Iroquese. You may go from the source of this river to the Lake Frontenac, by making a land-carriage to the river of Tanaouate, that salls into that lake. Upon the south side of the Bay of Toronto, you see the fort called Fort Suppose, which I mentioned in my twenty-third letter, and about thirty leagues to the southward of that, you find the country of Theonontate, which being formerly inhabited by the Hurons, was entirely depopulated by the Iroquese.

From thence I pass directly to my fort, without amufing you with the different landscapes I met with in the space of thirty leagues. That fort I have spoke so often of already, that without stopping there, I shall run directly to the Bay of Sakinac, reckoning it needless at the same time to take any notice of the many shelves and rocks that lie hid under the water for two leagues off the coast. This bay is fixteen or feventeen leagues long, and fix broad at its mouth; in the middle of which we meet with two little islands, that are very serviceable to the passengers; for if it were not for the conveniency of putting in there, they would be obliged for the most part, rather to march quite round the bay, than to run the hazard of croffing directly over in a canoe. The river of Sakinac falls into the bottom of the bay. This river runs fixty leagues in length, with a gentle current, having only three little cataracts that one may shoot without danger. It is as broad as the Seine is at Seve bridge. Once in two years the Outaouas and the Hurons are wont to hunt great quantities of beavers upon the confines of the river of Sakinac. Between the river I now speak of, and Missilimakinac, we meet with no place that is worth our regard. As for Miffilimakinac itself, I have already imparted to you all that I can fay of that post, which is of so great importance to our commerce, and at the fame time fent you a draught of it. I shall therefore purfue my course to the Lake Errie, remembering that I described the Illinese lake in my fixteenth letter.

The lake Errie is justly dignified with the illustrious name of Conti; for affuredly it is the finest lake upon earth. You may judge of the goodness of the climate, from the latitudes of the countries that furround it. Its circumference extends to two hundred and thirty leagues; but it affords every where fuch a charming profpect, that its banks are decked with oak-trees, elms, chefnut-trees, walnut-trees, apple-trees, plum-trees, and vines which bear their fine clusters up to the very top of the trees, upon a fort of ground that lies as fmooth as one's hand. Such ornaments as these are sufficient to give rife to the most agreeable idea of a landscape in the world. I cannot express what vast quantities of deer and turkies are to be found in these woods, and in the vast meads that lie upon the fouth fide of the lake. At the bottom of the lake, we find wild beeves upon the banks of two pleafant rivers that difembogue into it, without cataracts or rapid currents. It abounds with flurgeon and white fish; but trouts are very scarce in it, as well as the other fish that we take in the lakes of Hurons and Illinese. It is clear of shelves, rocks, and banks of fand; and has fourteen or sifteen fathom water. The favages affure us, that it is never difturbed with high winds, but in the months of December, January, and February, and even then but feldom, which indeed I am very apt to believe, for we had but very few florms when I wintered in my fort in 1688, though the fort lay open to the Lake of Hurons. The banks of this lake are commonly frequented by none but warriors, whether the Iroquese, the Illinese, the Oumamis, &c. and it is very dangerous to stop there. By this means it comes to pass, that the stags,

roe-bucks, and turkies run in great bodies up and down the shore, all round the lake. In former times the Errieronous and the Andastogueronous, lived upon the confines of the lake, but they were extirpated by the Iroquese, as well as the other nations marked

in the map.

Upon the north fide of the lake we descry a point of land that shoots sisten leagues into the main; and about thirty leagues beyond that to the eastward, we meet with a small river that takes its rise near the Bay of Ganaraske, in the Lake of Frontenac; and would afford a short passage from the one lake to the other, if it were not encumbered with catarasts. From thence to the streight or mouth of the lake, you have thirty leagues; the streight being a league over, and source leagues long. Upon this streight you see Fort Suppose marked in the map, which is one of the forts that I mentioned in my 23d letter. From that imaginary fort to the river of Condè, we have

twenty leagues.

The river of Condè runs fixty leagues in length without cataracts, if we may credit the favages; who affured me, that one may go from its fource to another river that falls into the fea, without any other land-carriage than one of a league in length, between the river and the other. I faw only the mouth of the first river, where our Outaouas tried their limbs, as I told you in my fifteenth letter. The islands that you see marked in the map at the bottom of the Lake Errie, are replenished with roe-bucks and with fruit trees which nature has generously provided, in order to entertain the turkies, pheasants, and deer with their fruit. In fine, if there were a clear and free passage for vessels from Quebec to this lake, it might be made the finest, the richest, and the most fertile kingdom in the world; for over and above all the beauties I have mentioned, there are excellent filver mines about twenty leagues up the country, upon a certain hill, from whence the savages brought us great lumps, that have yielded that precious metal with little waste.

From the Lake Erric, I fleer my course to that of Frontenac, which I could not forbear to speak of in my seventh and seventeenth letters. This lake (as I intimated above) is two hundred and eighty leagues in circumference, its figure is oval, and its depth runs between twenty and twenty five fathom. On the fouth fide it receives feveral little rivers, particularly those of the Tsonontouans, of the Onnontagues, and of the Famine; on the north fide it is joined by the rivers of Ganaraske and of Teonontate. Its fides are decked with tall trees, and the ground is indifferent even and level, for it has no fleep coasts. On the north fide we meet with feveral little gulfs. You may go from this lake to that of Hurons, by going up the river Tanaouate, from whence you have a land-carriage of fix or eight leagues to the river of Toronto, which falls into it. You may likewife have a passage from the Lake of Frontenac, to that of Erric, through the Bay of Ganaraske, by making a land-carriage from thence to a little river that is full of cataracts. The villages of the Onnontagues, Tionontouans, Goyogouans, and Onnoyoutes, are not far distant from the Lake of Frontenac. These Iroquese nations are very advantageously seated. They have a pleasant and fertile country; but they want roe-bucks and turkies, as well as fish, of which their rivers are altogether destitute, infomuch that they are forced to fish in the lake, and to broil or dry their fish with a fire, in order to keep them and transport them to their villages. They are in like manner forced to range out of their own territories, in quest of beaver in the winter time, either towards Ganaraske, or to the sides of the Lake of Toronto, or else towards the great river of the Outaouas; where it would be an cafy matter to cut all their throats. by purfuing the course I laid down in my letters. I have already touched upon the Forts of Frontenac and Niagara; as well as upon the river of St. Lawrence, which here

takes leave of the lakes, and pursues a more compact course to Monreal and Quebec, where its waters mingling with those of the sea become so brackish that they are not drinkable.

It remains only to give you a description of Acadia, and the island of Newfoundland, which are two countries that differ widely from one another. The coast of Acadia extends from Kenebeki, one of the frontiers of New-England, to l'Isle Percée, near the mouth of the river of St. Laurence. This fea-coast runs almost three hundred leagues in length, and has upon it two great navigable bays, namely, the bay called Francoife, and the bay des Chaleurs. It has a great many little rivers, the mouths of which are deep, and clean enough for the greatest ships. These rivers would afford a plentiful falmon-fishery, if there was any body to undertake it; and most of them as well as the gulphs that lie before them, furnish such cods as we take at the isle Pereee. For in the fummer time, that fort of fish make into the coast in shoals, especially about the islands of Cape Breton and of St. John. It is true, the latter has no harbours, and the former has none that receive any vessel above the burden of a bark; but if these two islands were peopled, the inhabitants might fit out sloops to manage the fishery; and towards the latter end of August, when the fish are cured and ready, the ships might come to an anchor near the land, and so take them in. Two gentlemen of the name of Amour of Quebec, have a fettlement for beaver-hunting upon the river of St. John; which is a very pleasant river, and adorned with fields that are very fertile in grain. It is navigable for twelve leagues up, from its mouth. Between the point of Acadia, and the island of Cape Breton, there is a channel or streight about two leagues in breadth, which is deep enough to carry the greatest ships in France. It is called the Pass des Canceaux, and would be much more frequented than it is, if the merchantmen bound to Canada, would fet out from France about the 15th of March; for then they might pass that way, being assured of a clear passage at all feasons of the year, whereas the channel of Cape de Raye, is oftentimes covered with ice in April: and by this contrivance, the ships would arrive at Quebec in the beginning of May.

Most of the countries of Acadia abound with corn, pease, fruit and pulse; and have a plain distinction of the four seasons of the year, not with standing that it is extremely cold for three months in winter. Several places of Acadia afford masts as strong as those we have from Norway; and if there were occasion, all forts of ships might be built there: for if you will believe the carpenters, the oak of that country is better than ours in Europe. In a word, it is a very fine country; the climate is indifferently temperate, the air is pure and wholesome, the waters clear and light, and there is good accommodation for hunting, shooting and fishing. The animals that we meet with there most commonly are beavers, otters, and fea-calves, all of them being very numerous. Those who love meat are indebted to the doctors, who perfuaded the popes to metamorphose these terrestial animals into fish; for they are allowed to eat of them without feruple in the time of Lent. To be plain, the knowledge I have of that country makes me foresee that the English will be masters of it some time or other. I could give very plaufible reasons for the prophecy. They have already begun to ruin the commerce that the French had with the favages, and in a short time, they will compass its intire destruction. The French they will prize their goods too high, though they are not fo good as those of the English; and yet the English fell their commodities cheaper. It were a pity that we should tainely leave to the English a country, the conquest of which they have attempted so often, in consideration of our fir-trade and cod-fishing. It is impossible to hinder them to possess themselves of the settlements upon

upon the coast of Acadia, by reason that they lie at such a distance from one another; fo that they will certainly fucceed in fuch enterprizes, as indeed they have done already. The French governors, they act with the fame view as many of those who are employed in posts beyond sea. They look upon their place as a gold-mine given them, in order to enrich themselves; so that the publick good must always march behind private interest. M. de Meneval suffered the English to possess themselves of Port Royal, because that place was covered with nothing but fingle pallifadoes. But why was it not better fortified? I can tell you the reason; he thought he had time enough to fill his pockets before the English would attack it. This governor fucceeded to M. Perrot, who was broke with difgrace, for having made it his chief bufinefs to enrich himfelf; and after returning to France, went back again with leveral ships laden with goods, in order to set up for a private merchant in that country. While M. Perrot was governor, he fuffered the English to possess themselves of feveral advantageous posts, without offering to stir. His chief business was to go in barks from river to river, in order to traffic with the favages: and after he was difgraced, he was not contented with a commerce upon the coasts of Acadia, but would needs extend it to the English plantations; but it cost him dear, for some pirates fell in with him, and after feizing his barks, ducked himfelf, upon which he died

immediately.

The three principal favage nations that live upon the coasts of Acadia are the Abenakis, the Mikemak, and the Canibas. There are fome other erratic nations, who go and come from Acadia to New England, and go by the names of Mahingans, Soccokis, and Openango. The first three (having fixed habitations) are entirely in the interests of the French; and I must fay, that in time of war they gall the English colonies with their incursions fo much that we ought to take care to perpetuate a good understanding between them and us. The baron of Saint Casteins, a gentleman of Oleron in Bearn, having lived among the Abenakis after the favage way, for above twenty years, is fo much respected by the favages, that they look upon him as their tutelar god. He was formerly an officer of the Carignan regiment in Canada; and upon the breaking of that regiment, threw himfelf among the favages, whose language he had learned. He married among them after their fashion, and preferred the forests of Acadia to the Pyrenæan mountains that encompass the place of his nativity: for the first years of his abode with the savages he behaved himself so as to draw an inexpressible esteem for them. They made him their great chief or leader, who is in a manner the fovereign of the nation; and by degrees he has worked himfelf into fuch a fortune, which any man but he would have made use of, as to draw out of that country above two or three hundred thousand crowns, which he has now in his pocket, in good dry gold. But all the use he makes of it is, to buy up goods for presents to his fellow favages, who upon their return from hunting, prefent him with beaver-fkins to a treble value. The governors-general of Canada keep in with him, and the governors of New England are afraid of him. He has feveral daughters, who are all of them married very handfomely to Frenchmen, and had good dowries. He has never changed his wife; by which means he meant to give the favages to understand, that God does not love inconstant folks. It is faid, that he endeavoured to convert these poor people, but his endeavours proved fuccefsless; fo that it is in vain for the Jesuits to preach up the truths of Christianity to them; though after all, these good fathers are not difcouraged; nay, they think that the administering of baptiful to a dying child is worth ten times the pains and uneafiness of living among that people.

Port Royal, the capital or the only city of Acadia, is in effect no more than a little paltry town, that is somewhat enlarged fince the war broke out in 1689, by the accession of the inhabitants that lived near Boston, the metropolitan of New England. A great many of these people retired to Port Royal upon the apprehension that the English would pillage them, and carry them into their country. M. de Meneval furrendered this place to the English, as I said before; he could not maintain such a post with the handful of men that he had, because the pallifadoes were low, and out of order. He made a capitulation with the commander of the party that made the attack; but the English officer broke his word to him, and used him both ignominously and harshly. Port Royal is feated in the latitude of 44 degrees and 40 minutes, upon the edge of a very fine bafin, which is a league broad, and two leagues long, having at the entry about fixteen or eighteen fathoms water on one fide, and fix or feven on the other; for you must know that the island called l'Isle aux Chevres, which stands in the middle, divides the channel into two. There is excellent anchorage all over the basin; and at the bottom of it there is a cape or point of land that parts two rivers, at which the tide rifes ten or twelve feet. These rivers are bounded by pleasant meads, which in fpring and autumn are covered with all forts of fresh water-fowl. In fine, Port Royal is only a handful of houses two story high, and has but few inhabitants of any note. It fubfifts upon the traffick of the fkins which the favages bring thither to truck for European goods. In former times the farmer's company had magazines in this place, which were under the care of the governors. I could eafily mention fome of them, if I were not apprehensive that these memoirs may be seen by others besides yourfelf.

The island of Newfoundland is three hundred leagues in circumference. It lies at the distance of fix hundred and fifty leagues from France, and forty or fifty leagues from the bank of the fame name. The fouth fide of the ifland belongs to the French, who have feveral fettlements there for the fifthing of cod. The east fide is inhabited by the English, who are possessed of several considerable posts, situated in certain ports, bays, and havens, which they have taken care to fortify. The west of the island is waste, and it was never yet possessed. The island is of a triangular figure, and is full of mountains and impracticable forests. It has some great meadows, or rather heaths, which are covered with a fort of mofs instead of grass. The foil of this country is good for nothing, as being a mixture of gravel, fand and flones; fo that the fifthery was the only motive that induced the French and the English to settle there. It affords great store of game, water-fowl, partridges and hares; but as for the stags, it is almost impossible to come at them, by reason that the mountains are so high, and the woods so thick. In this island, as well as in that of Cape Breton, we find porphyry of feveral colours; and care has been taken to fund to France fome pieces of it for a pattern, which were found to be very pretty, only they were hard to cut. I have feen fome of them that were red streaked with green, and feemed to be extremely fine; but the mischief is, it splits fo when it is taken out of the quarries, that it cannot be made use of, but by way of

incrustation.

This island of Cape Breton affords likewise black marble, or a fort of bresche with grey veins, which is hard and not easily polished. This stone is apt to split, for it is not equally hard, and it has knots in it. There are no settled savages in the island of Newfoundland. It is true, the Eskimaux do sometimes cross over to it at the streight of Belle Isle in great sloops, with intent to surprise the crew of the sistemen upon the coast called Petit Nord. Our settlements are at Placentia, at the island of St. Peter, and

in the bay of Trepassez. From Cape Rase to Chapcau Rouge the coast is very clean, but from Chapcau Rouge to Cape Raye the racks render it dangerous. There are two considerable inconveniences, that attend the landing upon this island. In the first place, the fogs are here so thick in the summer, for twenty leagues off into the main, that the ablest and most expert sailor dare not stand into the land while they last; so that all ships are obliged to lie by for a clear day, in order to make the land. The second inconveniency, which is yet greater, proceeds from the currents which run to and again, without any perceivable variation, by which means the ships are sometimes drove in upon the coast, when they reckon upon ten leagues offing. But, which is worst of all, the insensible motion of the rolling waves throws them insensibly upon the rocks, which they cannot possibly avoid, for want of ground to anchor upon. It was by this means that the King's ship, the Pretty, was lost in 1692,

as well as a great many others upon feveral occasions.

Of all our fettlements in North America Placentia is the post of the greatest importance and fervice to the King, in regard that it is a place of refuge to the ships that are obliged to put into a harbour, when they go or come from Canada, and even to those which come from South America, when they want to take in fresh water or provisions, and have fprung their masts, or been damaged in a storm. This place is situated in the latinde of 47 degrees and some minutes, almost at the bottom of the bay that goes by the fame name. The bay is ten or twelve leagues broad, and twenty odd leagues long. The fort flands upon the fide of a neck or narrow flreight, which is fixty paces over and fix fathoms water deep. The ships that enter into the port are obliged to graze (so to fpeak), upon the angle of the baftions. The port or harbour is a league long, and a quarter of a league over: before the port there is a large, fine road, which is a league and a half wide: but lies fo bleak to the north-west and west-north-west winds, the ftrongest and most boisterous winds that are, that neither cables nor anchors, nor large from flows flower flowe feldom happen but in the latter end of autumn. The fame year that the Pretty was loft, the King loft another of 69 guns, called the Good, in this road; and if the four or five other ships that belong to the same squadron, had not taken the precaution of steering into the port, they had certainly underwent the fame fate. This road then which is only exposed to the north-west and west-north-west winds, has some hidden rocks on the north fide, befides those at Point Verte, where several of the inhabitants are wont to fish. All these things you may see plainly upon the plan that I fent you along with my 23d letter.

Commonly there comes thirty or forty ships from France to Placentia every year, and sometimes sixty. Some come with intent to fish, and others have no other design than to truck with the inhabitants, who live in the summer-time on the other side of the fort. The ground upon which their houses stand, is called La grand Grave, for in effect they have nothing but gravel to spread their cod-fish upon, in order to have them dried by the sun after they are salted. The inhabitants and the French sishermen send their sloops every day two leagues off the port to pursue the sishery; and sometimes the sloops return so over-loaded, that they are in a manner buried in the water. You cannot imagine how deep they sink, and it is impossible you should believe it unless you saw it. The sishery commences in the beginning of June, and is at an end about the middle of August. In the harbour they catch a little fort of a sish, which they put upon

their hooks as a bait for the cod.

Placentia is in great want of gravel, which occasions the thinness of the inhabitants. If the governors preferred the King's service to avarice they might make it a confiderable

fiderable post, and a great many would make gravel-walks at their own charge; but as long as the governors prey upon the fortunes of private men under the fair pretence of the King's fervice, which is always in their mouths, I cannot fee that this fettlement will ever be enlarged or improved. Does not the governor difgrace his Prince, and fink the character of his post, in turning fisherman, merchant, vintner, and acting in the way of a thousand meaner and more mechanical trades? Is not this a piece of tyranny? To force the inhabitants to buy what goods they want out of fuch and fuch a ship, and to fell their cod to fuch other ships as the governor is interested in, and that as a principal owner; to appropriate to himself the rigging and tackle of the ships that are cast away upon the coast, to stop the crew of merchantmen for his own fishery, to fell habitations or fettlements, to stifle the bidding up for effects fold by way of auction that he may ingross them by his fole authority, to change the provisions laid up in magazines for his Majesty's troops, to carry off the good biscuit and put bad in the room of it, to make so much beef and bacon for the subfishence of the garrison, to force the inhabitants to fend their fervants and carpenters to some work in which his Majesty's fervice is less concerned than his own pocket: these, I say, are things that I take to be plain infractions of the orders iffued forth by Lewis the XIV.; thefe are abuses that must be redressed, if we would have the King to be well served: and yet there is nothing done in it. For my part, I am unacquainted with the reason of the delay; those that have a mind to know had best ask the deputies of Monsieur de P ***. I am fully perfuaded, that all these piracies do not come to the King's ears, for he is too just to suffer them.

To conclude, Placentia bearsneither corn, nor rye, nor peafe, for the foil is good for nothing; not to mention, that if it were as good and as fertile as any in Canada, yet nobody would give themselves the trouble to cultivate it; for one man earns more in cod-sishing in one summer than ten would do in the way of agriculture. In the great bay of Placentia there are some little harbours, (besides that of the fort) which the Biscay sishermen resort to. Such are the little and the great Burin, St. Laurence, Martir, Chapeau Rouge, &c.

A List of the Savage Nations of Canada. Those in Acadia.

The Abenakis.
The Micmac.
The Canibas.
The Mahingans.
The Openangos.
The Soccokis.
The Etechemins.

These are all of them good warriors: they are more active and less cruel than the Iroquese. Their language differs a little from that of the Algonkins.

The Nations that lie upon the River of St. Laurence, from the Sea to Monreal.

The Papinachois.
The Mountaneers.
The Gaspesians.
The Hurons of Loreto, the Iroquese tongue.
The Abenakis of Scilleri.
The Algonkins.
The Algonkins.

The

The Agnies of the fall called Saut St. Louis; they fpeak the Iroquese language, and are good warriors.

The Iroquese of the mountain of Monreal; they speak the Iroquese language, and

are a brave people.

White hares.

Beavers.

Otters.

Musk-rats.

Suisse squirrels, or a sort of squirrels whose hair resembles a Suisse's doublet.

Great harts.

Sea-wolves or calves.

A Description

A Description of Such Animals or Beasts as are not mentioned in the Letters.*

THE Michibichi is a fort of tiger, only it is less than the common tiger, and not so much speckled. As soon as it descries a man, it runs away, and climbs up the first tree it meets with. It attacks all brute animals whatsoever, and conquers them with ease; and, which is very singular and peculiar to it above all other animals, it runs in to the assistance of the savages, when they pursue bears and wild beeves; upon such occasions it makes as if it were assaid of nobody, and sallies out with sury upon the hunted animal. The savages call these animals fort of manitous, that is, spirits that love men; and it is upon that score they esteem and respect them to such a degree that they would choose rather to die than to kill one of them.

The white beavers are much valued upon the account of their being uncommon, though, at the fame time, their hair is neither fo large nor fo fine as that of the common beavers. As there are but few of these white beavers, so those which are quite

black are very fcarce.

The reddish bears are mischievous creatures, for they fall fiercely upon the huntsmen, whereas the black ones fly from them. The former fort are less, and more nimble than the latter.

The crocodiles of Miffifipi are exactly the fame with those of the Nile and other places. I have feen that crocodile that is at Engolisma in Aquitaine, and find that it has the fame figure with these, only it is somewhat less. The most usual method that the savages have for taking them alive is to throw great wreaths or cords made of the bark of trees with a running-knot upon their neck, the middle of their body, their paws, &c. After they are thus seized, they shut them up between ten or twelve stakes, and there tie them after their belly is turned upwards. While they lie in this posture they slay them without touching their head or their tail, and give them a coat of sirbark, to which they set fire, having cut the ropes that kept them fast. Upon such occasions these animals make a fearful howling and crying. To conclude, the savages are frequently swallowed up by these creatures, whether in swimming over a river, or in sleeping upon its banks. Ariosto in the 68th diapason of his 15th song, gives this description of a crocodile:

Vive sub lito è deutro a la Riviera, Ei Corpi Umani son le sue vivande, De le persone misere è incaute, Di viandauti è d'inselice naute.

That is, it lives both in the river and upon its banks; it fquashes people with its murdering tooth; it feeds upon the bodies of poor travellers, of unfortunate passengers and failors.

The offa are little animals like hares, and refemble them in everything excepting the ears and hind-feet. They run, and cannot climb. Their females have a bag under their belly, where their young ones enter upon a purfuit, in order to fave themselves along with the mother, who immediately betakes herself to slight.

^{*} The animals of the fouth countries.

The filver-coloured foxes* are of the fame shape with those of Europe, as well as the black ones. The black ones are very scarce, and whoever catches one, is sure to fell it for its weight in gold. This species is met with only in the coldest countries.

The white bears are a monstrous animal, and extraordinary long; their head has a formidable aspect, and their hair is very large and thick; they are so fierce, that they will come and attack a sloop in the sea, with seven or eight men in it. It is said, that they will swim six or seven leagues without being tired. They live upon sish and shell upon the sea-shore, from whence they seldom straggle far. I never saw but one of them in my life-time, which had certainly torn me to pieces if I had not spied it at a distance, and so had time to run back for shelter to Fort Lewis at Placentia.

The flying-squirrels are as big as a large rat, and of a greyish white colour. They are as drowly as those of the other species are watchful. They are called flying-squirrels, in regard that they fly from one tree to another, by the means of a certain skin which stretches itself out in the form of a wing when they make these little flights.

The white hares are only fuch in winter, for as foon as the fpring comes on, they begin to turn greyish, and by degrees recover the same colour as our hares have in France, which they hold till the end of autumn.

The Suisse squirrels are little animals, resembling little rats. The epithet of Suisse is bestowed upon them, in regard that the hair which covers their body is streaked with black and white, and resembles a Suisse's doublet; and that these streaks make a ring on each thigh, which bears a great deal of resemblance to a Suisse's cap.

The large stags are neither larger nor thicker than those we have in Europe; but they are called large in proportion to two other species of harts that frequent the southern countries. The lesser fort affords the most delicious meat.

The fea-wolves, which fome call fea-calves, are as big as mastisfis. They are almost always in the water, or at least they never go far from the fea-side. These animals do not walk so much as they crawl, for when they raise themselves out of the water, they only creep upon the sand or clay. Their head has the form of an otter's head, and their feet, which have no legs, resemble those of a goose. The semale kind bring forth their young ones upon the rocks, or upon some little islands, just by the sea. The sea-wolves live upon fish, and resort to cold countries. There is a prodigious number of them about the mouth of the river of St. Lawrence.

As for the remaining animals of Canada, I gave you an account of them in my letters. I will not offer to shew you what methods the savages take to catch or kill all these animals, for such an undertaking would be endless. This I can assure you of in the general, that they rarely go a hunting to no purpose, and that they make no use of their dogs but in the hunting of elks, and sometimes in hunting of beavers, as you shall see under the head of the diversions of hunting and shooting among the savages.

Brulots, or burning hand-worms.

A Description of fuch Birds as are not accounted for in my Letters.

THE huards* are a fresh-water sowl as big as a goose, and as dull and heavy as an ass. They have black and white feathers, a pointed beak, and a very short neck. They only duck or dive in the summer, for they cannot use their wings; and in that season the savages take the diversion of surrounding them with seven or eight canoes, dispersed here and there, and so obliging them to dive down, when they offer to come up to take breath. The savages have entertained use several times with this agreeable amusement, during the course of the voyages I made with them.

The red partridges are wild and little, and much different from the red partridge we have in Europe, as well as the pheafant, whose feathers being of a white colour

with black fpecks, make a very agreeable diverfity.

The largest eagles we find in this country are no bigger than swans. Their head and their tail is white, and they have frequent engagements with a fort of vultures, that commonly have the better of it. In our voyages we had frequent occasions of feeing these engagements, which last as long as the eagle can keep up the force of its wings.

The parrots are met with in the Ilinese country, and upon the river of Mississipi. They are very small, and are the same with those that we bring from Brazil and

Cayenne.

That fort of nightingale that I faw is of a peculiar form; for it is of a leffer fize than the European, and of a bluish colour, and its notes are more diversified; besides, that it lodges in the holes of trees, and four or five of them do commonly keep together

upon the thickest trees, and with joint notes warble over their songs.

The flylike bird is no bigger than one's thumb, and the colour of its feathers is fo changeable, that it is hard to fasten any one colour upon it. They appear sometimes red, sometimes of a gold colour, at other times they are blue and red; and properly speaking, it is only the brightness of the fun that makes us insensible of the change of its gold and red colours. Its beak is as sharp as a needle. It slies from slower to

^{*} The fowl or birds of the Southern Countries.

flower, like a bee, and by its fluttering fucks the flowery fap. Sometimes about noon it pitches upon the little branches of plum-trees or cherry-trees. I have fent fome of them dead to France, it being impossible to keep them alive; and they were looked

upon as a great curiofity.

There are ten or twelve forts of ducks * in this country. Those called branchus, are the smallest indeed, but they are much the prettiest. The feathers upon their neck look so bright, by virtue of the variety and liveliness of their colours, that a fur of that nature would be invaluable in Muscovy or Turkey. They owe the name of branchus to their resting upon the branches of trees. There is another species of ducks in this country, that are as black as jackdaws, only their beak and the circle of their eyes are red.

The fea-mews, grelans and fterlets, are fowls that fly inceffantly over feas, lakes, and rivers, in order to catch little fish. Their flesh is good for nothing, besides that,

they have no fubftance of body, though they feem to be as big as pigeons.

The fea-parrots bear the name of parrots, upon the account that their beak is of the fame form with that of the land-parrot. They never quit the fea or the fhore; and are always flying upon the furface of the water, in quest of little fish. Their colour is black, and their fize is much the fame with that of a pullet. There are great numbers of them upon the bank of Newfoundland, and near the coast of the island, which the feamen catch with hooks covered with a cod's roe, and hung over the prow of the ship.

The moyacks are a fort of fowl, as big as a goose, having a short neck, and a broad foot; and which is very strange, their eggs are half as big again as a swan's, and yet they are all yolk, and that so thick, that they must be diluted with water before

they can be used in pancakes.

The white partridges are as big as our red partridges. Their feet are covered with fuch a thick down that they refemble those of a young rabbit. They are only seen in the winter time, and some years they are scarce seen at all; though on the other hand, in other years they are so plentiful, that you may buy a dozen for ninepence. This is the most stupid animal in the world; it sits upon the snow, and suffers itself to be knocked on the head with a pole, without offering to stir. I am of the opinion, that this unaccountable numbness is occasioned by its long slight from Greenland to Canada. This conjecture is not altogether groundless, for it is observed, that they never come in slocks to Canada, but after the continuance of a north or north-east wind.

The black partridges are truly very pretty. They are bigger than ours; and their beak, together with the circle of the eyes and the feet, are red; their plumage being of a fining black colour. These animals are very proud, and seem to have a sense of their beauty as they walk. They are but very uncommon, as well as the reddish

partridges, which refemble quails in their bulk and brifkness.

The white ortolans are only met with in winter; but I am of the opinion, that their feathers are naturally of a white colour, and that they retrieve their natural colour in the places they retire to, when they disappear in Canada. They are indifferent good to eat when they are fat, but that they feldom are. In the winter great quantities of them are catched about the barns, with nets stretched out upon the straw.

^{*} The birds of the Northern Countries.

A Description of the Insects of Canada.

THE adders of Canada do no harm at all. The asps indeed are very dangerous, when the people bathe in the stagnating water towards the fouth countries. The rattlefnake or founding ferpent is fo called, in regard that at the extremity of its tail it has a fort of a case, containing certain bones which make such a noise when the serpent creeps along, that it is heard thirty paces off. These serpents betake themselves to slight when they hear the sound of men's feet, and commonly sleep in the sun either in green fields, or open woods. They never fting but when they are trod upon.

The lowing-frogs are fo called with respect to their croaking, which founds like the lowing of an ox. These frogs are twice as large as those we have in Europe. The Canada gad-bees are a fort of flies about twice as big as bees, but of the fame form with a common fly. They sting only between noon and three o'clock in the afternoon; but then they do it so violently that they fetch blood. However it is only upon

certain rivers that they are met with.

The brulots are a fort of hand-worms, which cleave so hard to the skin, that their pricking occasions the same sense, as if it were a burning coal, or a spark of fire. These little animals are imperceivable, though at the same time they are pretty numerous.

The Names of the Fish in the River of St. Lawrence, from its Mouth to the Lakes of Canada.

Balenots, or little whales.

A fish almost as big as a whale, called

fouffleur.

White-fish.
A fort of herrings.

Gull-fish. Gudgeons.

The Fish found in the River of Missispi.

Pikes, fuch as we have in Europe.

Tench.

Carps.

Perches.

Dabs, and feveral others that are not known in Europe.

A Description of the Fish that are not mentioned in the Letters.

THE balenot * is a fort of a whale, only it is less and more fleshy, and does not yield oil in proportion to the northern whales. This fish goes fifty or fixty leagues up the river.

The fouffleurs are much of the fame fize, only they are shorter and blacker. When they mean to take breath after diving, they squirt out the water through a hole behind their head after the same manner with the whales. Commonly, they doge the ships in the river of St. Lawrence.

The white porpoises are as big as oxen. They always go along with the current; and go up with the tide till they come at fresh water, upon which they retire with the ebb water. They are a ghastly fort of animals, and are frequently taken before Quebec.

The gasperots are a small sish, not unlike a herring. In the summer time they make into the shore in such shoals, that the cod-sishers take as many of them as serves for bait for that sishery. These sishermen do likewise make use of herrings, when the season obliges them to put into the shore to spawn. In a word, all the sish that are made use of for a bait to make the codsish bite at the hook, are called boete in the sishermen's dialect.

The gold-coloured fifth are nice food. They are about fifteen inches long; their

scales are yellow, and they are valued very high.

The fea-cows, which are a fort of porpoiles, are bigger than the Normandy beeves. They have a fort of paws cut like a goofe's foot, their head refembles that of an otter; and their teeth, which are two inches thick, and nine inches long, are reckoned the fineft ivory that is. It is faid that they range wide of the fhore, towards fandy and marshy places.

The lobsters of this river feem to be exactly the same with those we have in Europe. The cockles are of a piece with those we have upon the coast of France, excepting that they are larger, and have a more agreeable taste, though their slesh seems to par-

take more of crudity and indigestion.

The muscles of this river are prodigious large, and taste very well; but it is next to an impossibility to eat them without breaking one's teeth, by reason of their being stuffed with pearl; I call it pearl, though the name of gravel or sand may be more proper, with respect to its value, for I brought to Paris sisty or fixty of the largest and finest, which were rated only at a penny a-piece; notwithstanding that we had broke above two thousand muscles to make up that number.

The lake-sturgeons are commonly five or fix foot long; but I once faw one of ten foot, and another of twelve in length. The favages catch them with nets in the

^{*} Those between the mouth of the river and the lakes.

winter, and grapples in the fummer. It is faid, they have a certain fort of flesh about their head, that tastes like beef, mutton, and veal; but I have eat of it several times, and never could observe any such thing; which makes me look upon the allegation as chimerical.

The fish-in-armour is about three foot and a half long. It is defended by such strong and hard scales, that it is impossible for any other fish to hurt it. Its enemies are trouts and roaches, but it is admirably well provided for the repulsing of their attacks, by virtue of its pointed snour, which is a foot long, and as hard as its skin.

It eats very well, and its flesh or substance is as firm as it is white.

The lake dabs or fandings are not above a foot long, but they are very thick all over. They are called barbues in French, which an allufion to a certain fort of beards that hang down from the fide of their muzzle, and are as big as ears of corn. Those which we find in the river of Miffishi are 6f a monstrous fize. Both the one and the other are catched with a hook, as well as with a net; and make very good victuals.

The Missippi carps are likewise of an extraordinary size, and admirably well tasted. They are of the same form with ours. In the autumn they put in towards the shore,

and are eafily catched with a net.

The largest trouts we meet with in the lakes are five foot and a half long, and of one foot diameter. Their flesh is red, and they are catched with great hooks made

fast to pieces of wire.

The fifth catched in the lakes are better than those we take at sea, or in the rivers, particularly the white fish, which, for goodness and nice eating, are far beyond all the other species. The savages that live upon the sides of those little fresh-water seas, prefer the broth of sish, to meat-broth, when they are indisposed. This choice they ground upon experience; whereas the French, on the other hand, find that venison broth is at once more substantial and restorative.

The rivers of Canada are replenished with an infinity of other fishes, that are not known in Europe. The fish catched in the north country rivers are different from those of the south; and those taken in the Long river, which disembogues into the river of Mississip, favour so rank of mud and clay, that it is impossible to eat of them; abating for a fort of little trouts that the savages take in the adjacent lakes, which make a tolerable mess.

The rivers of the Otentats and the Miffouris produce fuch odd fhaped fifthes that it is impossible to describe them without they were drawn upon paper. These fishes taste but forrily, and yet the savages love it mightily, which I take to proceed from their

knowing no better.

The Trees and Fruits of the South Countries of Canada.

Beech trees, and as we have in Europe. Red oak, bitter cherry-trees. Ash-trees.

Elms, but as we have in Europe. Linden-trees, but fuch as we have in Europe. Nut-trees of two forts. Chesnut-trees.

Alder-trees.
Maiden-hair.
Strawberries.
Rafpberries.
Goofeberries.
Bluets.

Peruffes.

Blue

A Description of the above-mentioned Trees and Fruits.

YOU must remark, that all the wood of Canada is good of its kind. The trees that stand exposed to the north winds are apt to be influenced by the frost, as it appears from the chops and chinks that it occasions.

The bitter cherry-tree has a hard and whitish wood with a grey bark. Some of them are as tall as the lostiest oaks, and as big as a hogshead. This tree grows straight; it has an oval leaf, and is made use of in beams, rafters, and other carpenter's work.

The mapple-tree is much of the fame height and bulk; but it has a brown bark, and the wood is reddish. It bears no refemblance to that fort we have in Europe. It yields a fap, which has a much pleafanter tafte than the best lemonade or cherry-water, and makes the wholfomest drink in the world. This liquor is drawn by cutting the tree two inches deep in the wood, the cut being run floping to the length of ten or twelve inches; at the lower end of this gath, a knife is thrust into the tree flopingly, fo that the water running along the cut or gash, as through a gutter, and falling upon the knife that lies across the channel, runs out upon the knife, which has veffels placed underneath to receive it. Some trees will yield five or fix bottles of this water a day; and some inhabitants of Canada might draw twenty hogsheads of it in one day, if they would thus cut and notch all the mapples of their respective plantations. The gash does no harm to the tree. Of this fap they make fugar and fyrup, which is fo valuable, that there cannot be a better remedy for fortifying the stomach. It is but few of the inhabitants that have the patience to make mapple-water; for as common and usual things are always flighted, fo there is fcarce anybody but children that give themselves the trouble of gashing those trees. To conclude, the north country mapples have more fap than those of the fouth countries; but at the fame time the fap is not fo

There are two forts of nut-trees in this country. The one bears round, and the other long, nuts; but neither of them is good for any thing, no more than the wild

chesnuts that grow in the Ilinese country.

The apples that grow upon some of their apple-trees eat well when they are coddled, but they are good for nothing when they are raw. Upon the Missipi, indeed, there is a fort of apples that have a taste not unlike that of some European apples: the pears are good, but very scarce.

The

The cherries are finall, and extremely red; and though their taste is not good, yet the roe-bucks like them so well, that in the summer-time they scarce ever miss to lie under the cherry-trees all night long, especially if it blows hard.

This country affords three forts of excellent plums, which bear no refemblance to ours either in figure or colour. Some are long and finall, fome are round and thick,

and fome very little.

The vines twine round the trees to the very top; and the branches of those trees are so covered with grapes, that one would take the grape to be the fruit of the tree. In some countries of North America the grape is little, but very well tasted; but towards the Mississipi it is long and thick, and so is the cluster. There has been some wine pressed from the grapes of that country, which, after long standing, became as

fweet as canary, and as black as ink.

The citrons of North America are fo called only because their form resembles that of our citron. Instead of a rind, they have only a single skin. They grow upon a plant that rises three feet high, and does not bear above three or four at a time. This fruit is as wholesome as its root is dangerous; for the one is very healthy, and the juice of the other is a mortal subtile poison. While I staid at Fort Frontenac, in the year 1684, I saw an Iroquese woman take down this satal potion, with a design to follow her deceased husband; after she had taken leave of her friends, and sung the death-song, with the formalities that are usual among these blind wretches. The poison quickly worked the desired effect; for this widow, who in Europe would be justly looked upon as a miracle of constancy and sidelity, had no sooner swallowed the murdering juice, then she fell into two or three shivering sits, and so expired.

The water-melons, called by the Spaniards Algiers melons, are round and thick like a ball; fome are red, and fome white; and the kernels, which are very large, are fome-times black, fometimes red; as for their tafte it is exactly the fame with that of the

Spanish or Portuguese melons.

The citruls of this country are fweet, and of a different nature from those of Europe; and I am informed, that the American citruls will not grow in Europe. They are as big as our melons, and their pulp is as yellow as fassion. Commonly they are baked in ovens, but the better way is to roast them under the embers as the savages do. Their taste is much the same with that of the marmelade of apples, only they are sweeter. One may eat as much of them as he pleases, without fearing any disorder from them.

The wild goofeberries are good for nothing but for comfits; but that fort of comfits are feldom made, for fugar is too dear in Canada to be employed for fuch uses.

A Description of the Trees and Fruits of the Northern Countries.

THE Canada birch-trees are much different from those we have in some provinces of France; both for bulk and quality. The savages make canoes of their bark, some of which is red, and some white; but both are equally proper for that use. That which has the sewest veins and chaps is the best; but the red bark makes the sinest show. There are some little baskets made of the young birches, that are much esteemed in France; and books may be made of them, the leaves of which will be as sine as paper. This I can speak by experience, for I have frequently made use of them for want of paper, in writing the journal of my voyages; nay, I remember I have seen, in a certain library in France, a manuscript of the gospel of St. Matthew, written in Greek upon this fort of bark; and which is yet more surprising, I was then told, that it had

been written above a thousand years; and at the same time I dare swear, that it was the genuine birch-bark of New France, which in all appearance was not then discovered.

The pine-trees are very tall, ftrait, and thick; and are made use of for masts, which the King's pinks do oftentimes transport to France. It is said, that some of these trees are big enough to serve for a mast of a first-rate ship.

The Epinette is a fort of a pine, with a sharper and thicker leaf. It is made use of in

carpenters work, and the matter which drains from it, fmells as fweet as incenfe.

There are three forts of firs in this country, which are fawed into deals by certain

mills, that the Quebec merchants have caused to be built in some places.

The Perusse is the prosperest of all green woods for the building of ships, upon the consideration that it is compacter and has closer pores, so that it does not soak or drink in the moisture as much as others.

Here are two forts of cedar, namely, the white and the red; but one must view them narrowly before he can distinguish them, by reason that both of them have much the same fort of bark. These trees are low, bushy, and full of branches and little leaves, resembling the tag of a lace. The wood of this tree is almost as light as cork; and the savages make use of it in the wreaths and ribs of their canoes. The red fort looks admirably well, and may be made into household goods, which will retain an agreeable smell for ever.

The asps are little shrubs which grow upon the sides of pools or rivers; and in a word, in moist and marshy countries. This wood is the common food of the beavers, who, in imitation of the ants, take care to make a collection of it round their huts in the autumn, which serves them for sustenance when the ice imprisons them in winter.

The white wood is a middling fort of a tree, that is neither too big nor too little. It is almost as light as cedar and as easily worked upon. The inhabitants of Canada make

little canoes of it, for fishing and crossing the rivers.

Maidenhair is as common in the forests of Canada, as fern is in those of France, and is esteemed beyond that of other countries; insomuch, that the inhabitants of Quebec prepare great quantities of its syrup, which they fend to Paris, Nants, Rouan, and several other cities in France.

Strawberries and rafberries are wonderfully plentiful in Canada, and tafte extremely well. We meet likewife with fome white goofeberries in this country; but they ferve

for no use, unless it be to make a fort of vinegar of them, that is very strong.

The bluets are certain little berries not unlike fmall cherries, only they are black, and perfectly round. The plant upon which they grow is as big as a rafberry-bush. These berries serve for several uses, after they are dried in the sun, or in an oven; for then they make confits of them, or put them into pies, or insuse them in brandy. The north country savages make a crop of them in the summer, which affords them very seasonable relief, especially when their hunting comes short.

A General View of the Commerce of Canada.

I COME now to give a brief and general account of the commerce of Canada, which I have already touched upon in my letters. The Normans were the first that set up this trade, and usually they set out from Havre de Grace or Dieppe; but the Rochellers have now worked them out of it, for as much as the Rochel ships surnish the inhabitants of the continent with the necessary commodities. There are likewise some ships sent to Canada from Bourdeaux and Bayonne, with wines, brandy, tobacco, and iron.

The ships bound from France to that country pay no custom for their cargo, whether vol. XIII.

in clearing in France, or in their entries at Quebec; abating for the Brazil tobacco which pays five fols a pound; that is to fay, a roll of four hundred pound weight pays

a hundred livres by way of entry, to the office of the farmers general.

Most of the ships go laden to Canada, and return light or empty. Some indeed bring home peafe when they are good cheap in the colony, and others take in a cargo of plants and boards: others again go to the island of Cape Breton, and there take in a cargo of pit-coal, which they carry to the islands of Martinico or Gaudaloupe, where the refining of fugars occasions a great confumption of coals. But those ships which either belong, or are recommended to the topping merchants of the colony, are freighted with skins, which turn to a great account. I have seen some ships unload at Ouebec, and then freer to Placentia, to take in cod-fish, which they purchased with ready money; but generally speaking, there is more lost than got by that way of trading. The merchant that has carried on the greatest trade in Canada is the Sieur Samuel Bernon of Rochel, who has great warehouses at Quebec, from which the inhabitants of the other towns are supplied with such commodities as they want. It is true, there are some merchants at Quebec who are indifferently rich, and fit out ships upon their own bottom, that ply to and again between France and Canada; and these merchants have their correspondents at Rochel, who send out and take in every year the cargoes of their ships.

There is no difference between the pirates that fcour the feas and the Canada merchants, unlefs it be this, that the former fometimes enrich themselves all of a sudden by a good prize; and that the latter cannot make their fortune without trading for five or fix years, and that without running the hazard of their lives. I have known twenty little pedlars that had not above a thousand crowns stock when I arrived at Quebec, in the year 1683, and when I left that place had got to the tune of twelve thousand crowns. It is an unquestioned truth, that they get sifty per cent. upon all the goods they deal in, whether they buy them up upon the arrival of the ships at Quebec, or have them from France, by way of commission; but over and above that, there are some little gaudy trinkets, such as ribbands, laces, embroideries, tobacco-boxes, watches, and an infinity of other baubles of iron-ware, upon which they get a hundred and fifty

per cent. all costs clear.

In this country a hogshead of Bourdeaux wine, which contains two hundred and fifty bottles, is worth about forty French livres, in time of peace, and fixty in time of war. A hogshead of Nants or Bayonne brandy, will fetch eighty or a hundred livres. In the taverns a bottle of wine costs fix French sous, and a bottle of brandy is sold for twenty. As for dry commodities, their price rises and falls upon occasion. Brazil tobacco is worth forty sous a pound by way of retail, and thirty-sive by wholesale. Sugar will

fetch at least twenty fous a pound, and sometimes twenty-five or thirty.

The earlieft ships that come from France, set out commonly in the latter end of April, or the beginning of May; but to my mind, they might shorten their voyage by one half, if they put to sea about the middle of March, and then sweeped along the north coast of the Azores islands; for in those seas the south and south-east winds commonly blow from the beginning of April to the end of May. I have mentioned this several times to the most expert pilots; but they still put me off with the plea, that they dare not steer that course for fear of some rocks: and yet these rocks are not to be met with but in their charts. I have read some descriptions of the ports, roads, and coasts of these islands, and of the adjacent seas, done by the Portuguese, which make no mention of the shelves that are chalked down in all our charts: on the contrary, they affirm that the coast of these islands is altogether clear, and that for twenty leagues off into the main these imaginary rocks were never met with.

As foon as the French ships arrive at Quebec, the merchants of that city, who have their factors in the other towns, load their barks with goods in order to transport them to these other towns. Such merchants as act for themselves at Trois Rivieres, or Monreal, they come down in person to Quebec to market for themselves, and then put their effects on board of barks, to be conveyed home. If they pay for their goods in Ikins, they buy cheaper than if they made their payments in money or letters of exchange; by reason that the seller gets considerably by the skins when he returns to France. Now, you must take notice, that all these skins are bought up from the inhabitants, or from the favages, upon which the merchants are confiderable gainers. To give you an instance of this matter; a person that lives in the neighbourhood of Quebec carries a dozen of martin's skins, five or six fox's skins, and as many skins of wild cats, to a merchant's house, in order to sell them for woollen cloth, linen, arms, ammunition, In the truck of these skins the merchant draws a double profit, one upon the fcore of his paying no more for the skins than one-half of what he afterwards fells them for in the lump to the factors, for the Rochel ships; and the other by the exorbitant rate he puts upon the goods that the poor planter takes in exchange for his skins. If this be duly weighed, we will not think it strange, that these merchants have a more beneficial trade than a great many other tradefmen in the world. In my feventh and eight letters I related the particulars of the commerce of this country, especially that which the inhabitants carry on with the favages, who supply them with the skins of beavers and other animals. So that now it remains only to give you an inventory of the goods that are proper for the favages, and of the skins which they give in exchange, together with their neat prices.

Short and light fusees. Powder. Ball and cut lead, or fmall shot. Axes, both great and fmall. Knives with their sheaths. Sword-blades to make darts of. Kettles of all fizes. Shoemaker's awls. Fish-hooks of all fizes. Flint stones. Caps of blue ferge. Shirts made of the common Britany linen.

Woolsted stockings short and coarse.

Brazil tobacco. Coarfe white thread for nets. Sewing thread of feveral colours. Pack-thread. Vermillion.

Needles, both large and fmall.

Venice beads.

Some iron heads for arrows, but few of

A fmall quantity of foap.

A few fabres or cutlaffes.

Brandy goes off incomparably well.

The Names of the Skins given in Exchange with their Rates.

To conclude, you must take notice, that these skins are upon some particular occasions dearer than I rate them, but the difference is but very small, whether under or over.

An Account of the Government of Canada in general.

IN Canada, the politic, civil, ecclefiaftical and military goverments, are all in a manner one thing, in regard that the wifeft governors have subjected their authority to that of the ecclefiastics; and such governors as would not embark in that interest, have found their post so uneasy that they have been recalled with disgrace. I could instance in several, who for not adhering to the sentiments of the bishop and the Jesuits, and for refusing to lodge their power in the hands of these infallible gentlemen, have been turned out, and treated at court like hot-headed incendiaries. M. de Frontenac was one of this number who made such an unhappy exit; for he fell out with M. Duchesnau, intendant of that country, who finding himself protected by the clergy, industriously insulted that illustrious general, and the general was forced to give way, under the weight of an ecclesiastical league, by reason of the springs they set at work against him, in opposition to all the principles of honour and conscience.

The governor-generals that mean to neglect no opportunity of advancing or enriching themselves, do commonly hear two masses a-day, and are obliged to consess once in four-and-twenty hours. He has always clergymen hanging about him wherever he goes, and indeed, properly speaking, they are his counsellors. When a governor is thus backed by the clergy, the intendants, the under-governors, and the sovereign council, dare not censure his conduct, let it be never so faulty; for the protection of

the ecclefiaftics fhelters him from all the charges that can be laid againft him.

The governor-general of Quebec has twenty thousand crowns a-year, including the pay of his company of guards, and the particular government of the fort. Over and above

above this income, the farmers of the beaver-skins make him a present of a thousand crowns a-year; his wines, and all his other provisions imported from France, pay no freight; not to mention, that by certain ways and means he sucks as much money out of the country as all the above-mentioned articles amount to. The intendant has eighteen thousand livres a-year, but the Lord knows what he makes otherwise. I have no mind to touch there, for fear of being ranked among those detractors who speak the truth too sincerely. The bishop's incomes are so small, that if the King were not graciously pleased to add to his bishopric some other benefices in France, that reverend presate would be reduced to as short commons as a hundred of his character are in the kingdom of Naples. The major of Quebec has six hundred crowns a-year; the governor of Trois Rivieres has a thousand, and the governor of Monreal is allowed two thousand. A captain has a hundred and twenty livres a-month, a lieutenant ninety livres; a reformed lieutenant is allowed but forty, and a common soldier's pay is six sous a-day, of the current money of the country.

The people repose a great deal of confidence in the clergy in this country as well as elsewhere. Here the outward shew of devotion is strictly observed, for the people-dare not absent from the great masses and sermons without a lawful excuse. But after all, it is at the time of divine service that the married women and maids give their humours a full loose, as being affured that their husbands and mothers are busy at church. The priests call people by their names in the pulpit; they prohibit under the pain of excommunication, the reading of romances and plays, as well as the use of masks, and playing at ombre or lansquenet. The Jesuits and the Recollets agree as ill as the Molinists and the Jansenists. The former pretend that the latter have no right to confess. Do but look back to my eighth letter, and there you will see some instances

of the indifcreet zeal of the ecclefiaftics.

The governor-general has the disposal of all military posts. He bestows companies, lieutenancies, and under-lieutenancies, upon who he plcases, with His Majesty's gracious approbation; but he is not allowed to dispose of particular governorships, or of the place of a lord lieutenant of a province, or of the major of any town. He is empowered to grant to the gentry and the other inhabitants, lands and settlements all over Canada; but these grants must be given in concert with the intendant. He is likewise authorized to give five-and-twenty licences a-year to whom he thinks sit, for trading with the savage nations of that vast continent. He is invested with the power of suspending the execution of sentences against criminals; and, by virtue of this reprieve, can casily procure them a pardon if he has a mind to savour them. But he cannot dispose of the King's money without the consent of the intendant, who is the only man that can call it out of the hands of the treasurer of the navy.

The governor-general cannot be without the fervice of the Jesuits, in making treaties with the governors of New England and New York, as well as with the Iroquese. I am at a loss to know whether these good fathers are employed in such services upon the score of their judicious counsels, and their being perfectly well acquainted with the country and the King's true interests; or upon the consideration of their speaking to a miracle, the languages of so many different nations, whose interests are quite opposite; or out of a sense of that condescension and submission that is due to

these worthy companions of our Saviour.

The members of the fupreme council of Canada, cannot fell or convey their places to their heirs, or to any body elfe, without the King's approbation; though at the fame time their places may be worth not fo much as the place of a lieutenant to a company of foot. When they have nice points under their confideration, they usually consult the

priefts or Jesuits: and if any cause comes before them, in which these good fathers are interested, they are fure not to be cast, unless it be so very black that the cunningest lawyer cannot give it a plaufible turn. I have been informed by feveral perfons, that the Jesuits drive a great trade in European commodities, and Canada skins; but I can fcarce believe it, or at least, if it be so, they must have correspondents and factors that

are as close and cunning as themselves; which can never be.

The gentlemen of that country are obliged to be very cautious in carrying even with the ecclefiaftics, in respect to the good or harm that the good fathers can indirectly throw in their way. The bishop and the Jesuits have such an influence over the governors-general, as is fufficient to procure places to the children of the noblemen or gentlemen that are devoted to their fervice, or to obtain the licences that I fpoke of in my eighth letter. It is likewise in their power to serve the daughters of such gentlemen, by finding them agreeable and rich hufbands. The meanest curates must be managed cautiously, for they can either ferve or differve the gentlemen in whose feignories they are no more than missionaries, there being no fixed cures in Canada, which indeed is a grievance that ought to be redreffed. The officers of the army are likewise obliged to keep up a good correspondence with the ecclesiastics, for without that it is impossible for them to keep their ground. They must not only take care that their own conduct be regular, but likewise look after that of the soldiers, by preventing the disorders they

might commit in their quarters.

Commonly the troops are quartered upon the inhabitants of the cotes, or feignories of Canada, from October to May. The master of the house furnishes his military guest only with utenfils, and employs him all the while at the rate of ten fous a day, besides his victuals, in the cutting of wood, grubbing up of grounds, rooting out flumps, or the threshing of corn in a barn. The captain gets likewise by their work, for to make them discount the half of their pay to him, he orders them to come thrice a week to exercife their arms at his quarters. Now their habitations being distant four or five arpents from one another, and one cote or feignory being two or three leagues in front, the foldiers choose rather to give the captain a spill, than to walk so far in the fnow and the dirt: and the captain takes it very confcientiously, upon the plea that Volenti non fit injuria. As for fuch foldiers as are good tradefmen, he is fure of putting their whole pay in his pocket, by virtue of a licence that he gives them to work in the towns, or any where elfe. In fine, most of the officers marry in this country, but God knows what fort of marriages they make, in taking girls with a dowry, confifting of eleven crowns, a cock, a hen, an ox, a cow, and fometimes a calf. I knew feveral young women, whose lovers, after denying the fact, and proving before the judges the fcandalous conversation of their mistresses, were forced, upon the persuasion of the ecclefiaftics, to fwallow the bitter pill, and take the very fame girls in marriage. Some officers indeed marry well, but there are few fuch. The occasion of their marrying fo readily in that country proceeds from the difficulty of converting with the foft fex. After a man has made four vifits to a young woman, he is obliged to unfold his mind to her father and mother; he must then either talk of marriage, or break off all correspondence; or if he does not, both he and she lies under a scandal. In this country a man cannot vifit another man's wife, without being cenfured as if her husband was a cuckold. In fine, a man can meet with no diversion here, but that of reading, or eating, or drinking. Though after all, there are fome intrigues carried on but with the fame caution as in Spain, where the virtue of the ladies confifts only in difguifing the matter handfomely.

Now

Now, that I am upon the subject of marriage, I cannot forbear to acquaint you with a comical adventure that happened to a young captain, who was preffed to marry against his will, because all his companions and acquaintances were already buckled: This young officer having made fome vifits to a counfellor's daughter, he was defired to tell what errand he came upon; and M. de Frontenac himself being related to the young lady, who is certainly one of the most accomplished ladies of this age, used his utmost efforts to engage the captain to marry her. The captain being equally well pleafed with a free access to the governor's table, and the company of the lady whom he met there not unfrequently; the captain, I fay, being equally fond of these two advantages, endeavoured to ward off the defign, by asking some time to consider Accordingly, two months were granted him; and after that time was expired he had still a mind to let out his traces, and so defired two months more, which were granted him by the bishop's intercession. When the last of these two was at an end, the cavalier began to be apprehensive that he was in danger of losing both his good cheer and the agreeable company of the lady. However he was obliged to be prefent at a treat that Mr. Nelson (the English gentleman I spoke of in my twenty-third letter) gave to the two lovers, as well as the governor, the intendant, the bishop, and some other persons of note: and this generous English gentleman having a kindness for the young lady's father, and her brethren, upon the score of their trading with one another, made an offer of a thousand crowns to be paid on the wedding-day, which, added to a thousand that the bishop offered, and a thousand more which she had of her own, besides feven or eight thousand that M. de Frontenac offered in licences, not to mention the certain prospect of preferment; all these items, I say, made the marriage very advantageous to the captain. After they had done eating, he was pressed to sign the contract, but made answer, that he had drank some bumpers of heady wine, and his head was not clear enough for weighing the conditions of the contract; fo that they were forced to put off the matter till the next day. Upon this delay he kept his chamber, till M. de Frontenac, at whose table he used to eat, fent for him, in order to know his mind immediately. Then there was no room left for shuffling; there was a necessity of giving a positive answer to the governor, who spoke to him in plain and precise terms, and at the same time reminded him of the favour they had shewn him, in allowing him fo much time to confider of the proposed marriage. The young officer replied very fairly, That any man that was capable of marrying after four month's deliberation, was a fool in buckling too. "I now fee," fays he, "what I am; the eager defire-1 had of going to church with Mademoifelle D- has now convinced me of my folly : if you have a respect for the lady, pray do not suffer her to marry a young spark that is fo apt to take up with extravagant and foolish things. As for my own part, Sir, I protest fincerely, that the little reason and free judgment that is left me, will serve to comfort me upon the loss of her, and to teach me to repent of having defired to make her as unhappy as myfelf." This discourse surprised the bishop, the governor, the intendant, and in general all the other married officers, who defired nothing more than that he should be caught in the noofe as well as they; so true it is, that Solamen miferis focios habuisse doloris. As they were far from expecting any such retractation, fo the poor reformed captain fuffered for it; for some time after M. de Frontenac did him a piece of injustice, in bestowing a vacant company over his head, upon Madam de Pouchartrain's nephew, notwithstanding that the court had fent orders on his behalf; and this obliged him to go for France along with me, in the year 1692.

To refume the thread of my discourse, you must know, that the Canadese or Creoles, are a robust brawny well-made people; they are strong, vigorous, active, brave and indefatigable; in a word, they want nothing but the knowledge of polite letters. They are presumptuous, and very full of themselves; they value themselves beyond all the nations of the earth, and, which is to be regretted, they have not that veneration for their parents that is due. Their complexion is wonderfully pretty. The women are generally handsome; sew of them are brown, but many of them are at once wise and lazy. They love luxury to the last degree, and strive to out-do one another in catching

hulbands in the trap. There is an infinity of diforders in Canada that want to be reformed. The first flep of a true reformation must be that of hindering the ecclesiastics to visit the inhabitants fo often, and to pry with fuch impertinence into the minutest affairs of the family; for fuch practices are frequently contrary to the good of the fociety, and that for reasons that you are not ignorant of. The next thing to be done, is to prohibit the officers to flop the foldiers pay, and to enjoin them to discipline their men every holy-day, and every Sunday. In the third place, the commodities ought to be rated at a reasonable price, so that the merchant may have his profit, without exacting upon the inhabitants and the favages. A fourth article of reformation, would confift in prohibiting the exporting from France to Canada, of brocados, gold and filver galloons or ribbands, and rich laces. In a fifth place, the governor-general ought not to fell licences for trading with the favages of the great lakes. Sixthly, there ought to be fixed courts. In the feventh place, they want to have their militia modelled and disciplined, that, upon occasion, they may be as serviceable as the regular troops. For an eighth article, the fetting up manufactories for linen, stuffs, &c. would be very useful. But the most important alteration would confift in keeping the governors, the intendants, the fupreme council, the bishops and the Jesuits, from splitting into factions, and making clubs one against another; for the consequences of such divisions cannot but thwart His Majesty's fervice, and the peace of the public. Were this but happily effected, that country would be as rich again as it is now.

I wonder, that instead of banishing the Protestants out of France, who in removing to the countries of our enemies, have done fo much damage to the kingdom, by carrying their money along with them, and fetting up manufactories in those countries; I wonder, I fay, that the court did not think it more proper to transport them to Canada. I am convinced, that if they had received positive assurances of enjoying a liberty of conscience, a great many of them would have made no scruple to go thither. Some have replied upon this head, that the remedy had been worse than the disease; in regard that fome time or other they would not have failed to expel the catholics by the affiftance of the English: but I represented to them, that the Greeks and Armenians, who are fubject to the grand feignior, and at the fame time are of a nation and religion that is different from that of the Turks; I represented, I say, that these differenting subjects did fearce ever implore the aid of foreign powers, in order to rebel and shake off the yoke. In fine, we have more reason to believe, that if the Huguenots had been transported to Canada, they had never departed from the fealty they owed to their natural fovereign. But let that be as it will, I do but speak as that king of Arragon did, who boalted, that if God had deigned to confult him, he could have given him feafonable advice with reference to the fymmetry and the courses of the stars; for, in like manner I do affirm, that if the council of state had followed my scheme, in the fpace of thirty or forty years, New France would have become a finer and more flourishing kingdom than feveral others in Europe.

A Discourse

A Discourse of the Interest of the French, and of the English, in North America.

SINCE New France and New England fubfift only upon the cod fiftery and the fur trade, it is the interest of these two colonies to enlarge the number of the ships employed in the fishery, and to encourage the savages to hunt and shoot beavers, by furnishing them with what arms and ammunition they have occasion for. It is well known, that there is a great consumption of cod-sish in the southern countries of Europe, and that sew commodities meet with a better and readier market, especially if they are good and well cured.

Those who alledge that the destruction of the Iroquese would promote the interest of the colonies of New France, are strangers to the true interest of that country; for if that were once accomplished, the savages, who are now the French allies, would turn their greatest enemies, as being then rid of their other sears. They would not fail to call in the English, by reason that their commodities are at once cheaper and more esteemed than ours; and by that means the whole commerce of that wide country

would be wrested out of our hands.

I conclude therefore, that it is the interest of the French to weaken the Iroquese, but not to see them entirely deseated. I own, that at this day they are too strong, insomuch that they cut the throats of the savages, our allies, every day. They have nothing less in view than to cut off all the nations they know, let their fituation be never so remote from their country. It is our business to reduce them to one half of the power they are now possessed of, if it were possible; but we do not go the right way to work. Above these thirty years their ancient counsellors have still remonstrated to the warriors of the sive nations, that it was expedient to cut off all the savage nations of Canada, in order to ruin the commerce of the French, and after that to dislodge them of the continent. With this view they have carried the war above four or five hundred leagues off their country, after the destroying of several different na-

tions in feveral places, as I shewed you before.

It would be no difficult matter for the French to draw the Iroquefe over to their fide, to keep them from plaguing the French allies, and at the fame time to engrofs all the commerce with the five Iroquefe nations, that is now in the hands of the English in New York. This might be eafily put in execution, provided the King would allow ten thousand crowns a-year for that end. The method of effecting it is this: in the first place, the barks that were formerly made use of about Fort Frontenac, must be rebuilt, in order to convey to the rivers of the Tfonontouans and the Onontagues, fuch commodities as are proper for them, and to fell them for the prime cost in France. Now this would put the King to the charge of about ten thousand crowns for freight; and I am perfuaded, that upon that foot the Iroquese would not be such fools as to carry fo much as one beaver to the English colonies, and that for four reasons. The first is, that whereas they must aransport them fixty or eighty leagues upon their backs to New York, they have not above feven or eight leagues travelling from their own villages to the banks of the lake of Frontenac. For a fecond reason, it is manifest that the English cannot possibly let them have their commodities so cheap, without being confiderable losers, and that thereupon every merchant would drop that fort of trade. The third is drawn from the difficulty of having fubfiftence upon the road between the Iroquese villages and New York; for the Iroquese go thither in great bodies, for fear of being furprized; and I acquainted you before feveral times, that there is no venison in that fide of the country. The fourth reason is this, in marching VOL. XIII.

fo far from their villages, they expose their wives, their children, and their superannuated men, for a prey to their enemies, who upon that occasion may either kill them or carry them off; and of this we have two instances already. Over and above the cheapness of our commodities, it would likewise be requisite that we made them prefents every year, and at the same time entreated them not to disturb the repose of our confederate savages, who are such fools as to wage war one with another, instead of entering into a joint league in opposition to the Iroquese, the most redoubted of their enemies, and those whom they have most reason to fear. In a word, if we would manage our affairs with the Iroquese to the best advantage, we ought to put in execu-

tion that project that I mentioned in my twenty-third letter.

To alledge that these barbarians have a dependance upon the English is a foolish plea; for they are so far from owning any dependance, that when they go to New York to truck their skins, they have the confidence to put rates upon the goods they have occasion for, when the merchants offer to raise their price. I have intimated already feveral times that their refpect for the English is tacked to the occasion they have to make use of them; that this is the only motive which induces them to treat the English as their brethren, and their friends; and that if the French would fell them the necessaries of life, as well as arms and ammunition, at easier rates, they would not make many journies to the English colonies. This is a consideration that ought to be chiefly in our view; for if we minded it to the purpose, they would be cautious of infulting our favage confederates, as well as ourfelves. The governors-general of Canada would do well to employ the fenfible men of the country that are acquainted with our confederates, in preffing them to live in a good correspondence with one another, without waging war among themselves; for most of the southern nations worm out one another infenfibly, which affords matter of joy to the Iroquefe. Now, it were an eafy matter to prevent this fatal mouldering, by threatening to give them no further fupplies of commodities in their villages. To this precaution, we ought to add that of endeavouring to engage two or three nations to live together; the Outaouas, for inftance, with the Hurons; the Sakis with the Pouteouatamis alias Puants. If all those nations who are embarked in a confederacy with us, would but agree one with another, and put up their quarrels, they would give themselves wholly to the hunting of beavers, which would tend to the enlarging of our commerce; and befides, they would be in a condition of making one joint body, when the Iroquefe offered to attack either one or the other.

It is the interest of the English to persuade these nations that the French have nothing less in view than to destroy them as soon as they meet with an opportunity; that the growing populousness of Canada is a sufficient ground of alarm, that they ought to avoid all commerce with the French, for sear of being betrayed in any way whatsoever; that to hinder the repairing of Fort Frontenac, and the rebuilding of barks for that lake, is to them a thing of the last importance, by reason that the French might in sour-and-twenty hours make a descent from thence to their villages, and carry off their ancient men, their women, and their children, at a time when the warriors might be engaged in the hunting of beavers; that they would promote their own interest by waging war with the French from time to time, by ravaging the seignories and settlements in the upper part of the country, in order to oblige the inhabitants to abdicate the colony, and to discourage those who would otherwise remove out of France, and settle in Canada; and in sine, that in time of peace it would be very proper to stop the coureurs de bois at the cataracts of the Outaouas river, and to seize the arms and ammunition that they carry to

the favages upon the lakes.

Farther, if the English would pursue their measures to the best advantage, they ought to engage the Tfonontouans or the Goyoguans to go and fettle upon the banks of the lake Erriè, near the mouth of the river of Condè; and at the fame time they ought to build a fort there, with fome long barks or brigantines: for this is the most convenient and advantageous post of all that country, and that for an infinity of reasons which I am obliged to conceal. Befides this fort, they should build another at the mouth of the River des François; and then it would be abfolutely impossible for the coursers de bois to reach the lakes.

They ought likewife to engage the favages of Acadia in their interest; which they may do with little charge. The planters of New England should mind this, as well as the fortifying of the ports in which they fish their cod. As for the fitting out of fleets to destroy the colony, I would not advise the English to give themselves that trouble; for supposing they were assured of success, it is but some places that can be

reckoned worth the while.

To conclude, I must say the English in these colonies are too careless and lazy; the French coureurs de bois are much readier for enterprizes, and the Canadefe are certainly more vigilant and more active. It behoves the inhabitants of New York to enlarge their fur trade by well concerted enterprizes; and those of New England, to render the cod fishing more beneficial to the colony, by taking such measures as many other people would, if they were as advantageously feated. I do not intend to speak of the limits of New France and New England, for they were never well adjusted; though indeed it would feem that in feveral treaties of peace between thefe two kingdoms, the boundaries were in a manner marked out in fome places. Whatever is in that matter, the decision of it is too nice a point for one that cannot open his mind without pulling an old house upon his head.

A TABLE EXPLAINING SOME TERMS.

ASTROLABE is a mathematical instrument that can scarce be used in the ocean by reason of the waves. There are two forts of them. The first are made use of by East-India masters, at a time when the fea is as fmooth as the face of a lookingglafs. This fort is ferviceable in taking the height of the fun, by the means of two little pins, which are bored fo as to have two dioptrick perforations, that ferve to conduct the rays of light mathematicians commonly make use of for aftronomical observations, and are furnished with azimuths, almucantaras, loxodromick tables, and the concentrick and excentrick tables of the Sphere.

Bank of Newfoundland, or bank in general, is a rifing ground in the sea, which shoots like a hat beyond the other brims. The bank of Newsoundland has thirty or forty fathom water, and is paved with cod-fish.

Bafin, is a head of stagnating water, not unlike a pool or lake.

Bouteux fignifies little nets belagged to the end of a flick. The fishermen make use of them to catch fish upon a fandy ground, and especially eels, upon the fide of St. Laurence river.

Bouts de Quivres are nets not unlike bouteux, which ferve for the fame use.

Breaking ground fignifies the weighing anchor and putting to fea.

to that luminary The latter are such as the Erigantine, a small vessel of one deck, built of light

wood, which plies both with oars and fails. It is equally sharp at prow and poop, and is built for a quick failer.

Calumet in general fignifies a pipe, being a Norman word, derived from chalumeau. The favages do not understand this word, for it was introduced to Canada by the Normans when they first fettled there; and nas still continued in use amongst the French planters. The calumet or pipe is called

other savage nations poagan.

Canadese or Canadans, are the natives of Canada, fprung from a French father and mother. In the islands of South America, the natives born of

French parents are called Creoles.

Capa y d'espada, a Gascogne title which the people of that province gave in former times by way of irony to the members of the supreme council of Canada, because the first counsellors wore neither robe nor sword, but walked very gravely, with a cane in their hands, both in the city of Quebec, and in the hall.

Oaffa tite, fignifies a club, or a head-breaker: the favages call it affan oullick, oufliek fignifying the

head, and affan to break.

Channel is a space of pretty deep water, between two banks, or between two shores. Commonly the channels are inclosed by flats, and for that reason buoys or masts are fixed upon them, in order to direct the pilots, who steer either by these marks, or by founding, for they would run the risque of loosing their ships, if they did not keep exactly to the channel.

Coast along, see Sweep.

It is larger than the or-Compass of Variation. dinary compasses, and serves to point out the inequal motions of the needle, which leans always to the north-east in the other hemisphere, whereas it still plies to the north-west in this, I mean on The needle this fide the equinoctial line. touched with the loadstone departs from the true north a certain number of degrees to the right and left; and mariners compute the degrees of its departure by the means of an alhidada, and a thread which divides the glass of the compass into two equal parts, and fo shews the variation of the needle at funfet, that being the true proper time for making the observation; for at sun-rising, and at noon, one may be deceived by refractions, &c.

Coureurs de Bois, i. e. Forest Rangers, are French or Canadese, so called from employing their whole life in the rough exercise of transporting merchandize goods to the lakes of Canada, and to all the other countries of that continent, in order to trade with the savages; and in regard that they run in canoes a thousand leagues up the country, notwithstanding the danger of the seand enemies, I take it, they should rather be called coureurs de risques, than coureurs de bois.

E

Eddy, or boiling water, is little watery mountains that rife at the foot of water-falls or cataracts, just as we see the water plays in the eisterns of water-works.

Edge of a bank, is the shelving part of it that runs steep like a wall.

F

Fathom, among the French is the measure of fix feet. Feast of Union, a term used by the Iroquese to signify the renewing of the alliance between the five Iroquese nations.

Flats, are a ridge of rocks running under water from one station to another, and riling within sive or fix foot at least of the surface of that element, so as to hinder ships, barks, &c. to sloat upon them.

Freight, fignifies in this book the cargo, though in other cases it fignifies likewise the hire or fare.

Furl the Sails, fignifies the drawing them up to a heap towards the topmast, not long ways as we do the curtains of a bed, but from below upwards. This is done by two ropes, that draw up the fail as a string does a purse.

 \mathbf{H}

Head Bars are two round pieces of wood, reaching on each fide from one end of a canoe to the other. These are the supporters of the canoe, for the ribs and spars are made fast upon them.

Keel of a ship, is a long piece of the strongest wood, or at least several pieces joined together, to bear the great weight of all the other timber.

Kitchi Okima, is the general name for the governorgeneral of Canada among all the favages, whose languages approach to that of the Algonkins. Kitchi fignifies great, and Okima, captain. The Iroquese and Hurons call the governor-general Onnontio.

L

Latitude. Every body knows that it imports the elevation of the pole, or the distance from a fixed point of the equator.

Land carriage fignifies the transporting of canoes by land from the foot to the head of a cataras, or from one river to another.

Light Ships are fuch as are empty without any cargo

Ρ.

Poop is the stern or after-part of the ship, in which the rudder is fixed.

Precipice of a bank, see Edge.

Prow is the head or fore-part of a ship, which cuts the water sirst.

Q

Quarter. Though the word quarter in a maritime fense is not well explained, I put the meaning of it to be this. The north quarter comprehends the space that lies between north-west and north-east. The cast quarter runs from north-east to south-east. The fouth quarter comprehends that part of the heavens that falls between fouth-east and south-west and the west quarter extends from south-west to north-west.

Resitting

R

Refitting of aship, fignishes the repairing and dressing of it, and putting it into a condition to fail, by putting

in new planks, caulking the feams, &c.

Ribs of a Canoe, are much like those of a pink, only there is this difference, that they line the canoe only on the inside from one head-barto another, upon which they are inchased. They have the thickness of three crowns, and the breadth of four inches.

Ruche, an instrument for fishing resembling a bee-

hive.

S

Scurvy, is a corruption of the mass of blood. There are two forts of it; one called the land scurvy, which loads a man with infirmities that gradually bring him to his grave; the other is the sea scurvy, which infallibly kills a man in eight days unless he gets assore.

Shieve, i. e. row the wrong way, in order to affift the fleersman to sleer the boat, and to keep the boat

in the channel.

Shoot. To shoot a water-fall or cataract, implies the running a boat down these dangerous precipices, following the stream of the water, and steering very

nicely.

Sledges are a conveniency for travelling, built in an oblong quadrangular form, upon two pieces of wood, which are four feet long, and fix feet broad; upon the wood there are feveral pieces of cloth or hide nailed to keep the wind off. These two pieces of wood are very hard, and well smoothed, that they may slide the better on snow or ice. Such are the horse-sledges. But those drawn by dogs are open, and made of two little pieces of hard, smooth, and shining wood, which are half an inch thick, sive feet long, and a foot and a half broad.

Spars, are little pieces of cedar wood, of the thicknefs of a crown, and the breadth of three inches, and as long as they can be made. They do the fame fervice to a canoe, that a good lining does to a coat.

Stand in for Land, fignifies to fail directly towards

Steer a flip, imports the managing of a ship by the means of a rudder, (as we do a horse with a bridle) when there is wind enough to work her; but if there be no wind, a ship is more unmoveable than a gouty person in an elbow-chair.

Stem a tide or the current of a river, i. e. to fail against the current, or to steer for the place from

whence the tides or currents come-

Strike, to strike the fails or flag fignifies the lowering of them, whether it be to submit to an enemy, or by reason of high winds.

Sweep a coast, fignishes to fail along the coast side

at a reasonable distance.

T

Top-gallani-mass are two little mass set upon the two top-mass, and have two fails fitted for them.

Top fails are two fails fitted for the two top mass, which stand directly above the two great masts.

Traverse. To traverse signifies sailing zigzag, or from side to side as a drunken man reels, when the wind is contrary, for then they are obliged to tack sometimes to the right and sometimes to the left, keeping as near to the wind as they can, in order to make what way they can, or at least to prevent their losing ground.

Tree of Peace, a symbolick metaphor for peace

itfelf.

TRAVELS INTO NORTH AMERICA;

CONTAINING

ITS NATURAL HISTORY, AND A CIRCUMSTANTIAL ACCOUNT OF ITS PLANTATIONS AND AGRICULTURE IN GENERAL,

WITH THE

Civil, Ecclefiastical, and Commercial state of the Country, the Manners of the Inhabitants, and several curious and important Remarks on various Subjects.

BY PETER KALM,

Professor of Oeconomy in the University of Mo in Swedish Finland, and Member of the Swedish Royal Academy of Sciences.

Translated into English by John Reinhold Forster, F. A. S.

THE PREFACE.

PROFESSOR KALM's Travels through North America, were originally written in the Swedish language, but soon after translated into German by the two Murray's, both of whom are Swedes, and one a pupil of Dr. Linnæus, from which we may conclude that this translation corresponds exactly with the original.

Baron Sten Charles Bielke, Vice-prefident of the Court of Justice in Finland, was the first who made a proposal to the Royal Academy of Sciences at Stockholm, to fend an able man to the northern parts of Siberia and Iceland, as places which are partly under the same latitude with Sweden, and to make there such observations and collections of feeds and plants, as would improve the Swedish husbandry, gardening, manufactures, arts and sciences. Dr. Linnæus sound the proposal just, but he thought that a journey through North America would be yet of a more extensive utility, than that through the before-mentioned countries; for the plants of America were then little known, and not scientifically described; and by several trials, it seemed probable that the greatest part of the North American plants would bear very well the Swedish winters; and what was more important, a great many American plants promised to be very useful in husbandry and physic.

Thus far this journey was a mere fcheme; but as Captain Triewald, a man well known for his abilities in England, gave his Observations on the Cultivation of Silk in a series of Memoirs to the Royal Academy of Sciences, and mentioned therein a kind of mulberry-tree, which was discovered by Dr. Linnæus, and which bore the

rigours of the Swedish climate as well as a fir or pine tree; this circumstance revived the proposal of such a journey in the year 1745. Count Tessin, a nobleman of established merit both in the political and learned world, becoming president of the Royal Academy, it was unanimously agreed upon to send Professor Kalm to North America. The expences were at first a great obstacle; but the Royal Academy wrote to the three universities to assist them in this great and useful undertaking. Abob sent first her small contribution, Lund had nothing to spare, but Upsala made up this deficiency by a liberal contribution.

Count Piper was entreated to give a family exhibition to Mr. Kalm, which he readily promifed; but as the academy had obtained from the convocation of the univerfity of Upfala and the magistrates of Stockholm, another exhibition of the family of Helmsfield for Mr. Kalm, Count Piper refused to grant his exhibition, as being contrary to the statutes of the university and without any precedent, that one person should enjoy two exhibitions. The present King of Sweden being then Prince Royal, successor to the throne, and chancellor of the university, wrote to the convocation, and expressed his wishes to have from the treasury of the university for so useful a purpose, about one thousand plates, or about one hundred and fifty pounds sterling. The university complied generously with the desire of her chancellor, and gave orders that the money should be paid to the Royal Academy. The board for promoting manufactures gave three hundred plates, or about forty-sive pounds. Mr. Kalm spent in this journey his falary, and besides very near one hundred and thirty pounds of his own fortune; so that at his return he found himself obliged to live upon a very small pittance. The rest of the expences the academy made up from her own fund.

We on purpose have given this detail from Mr. Kalm's long preface, to shew the reader with what public fpirit this journey has been supported in a country where money is fo fcarce, and what a patriotic and laudable ardour for the promotion of fciences in general, and especially of natural history and husbandry, animates the universities, the public boards, and even the private perfons, in this cold climate, which goes fo far, that they chuse rather to spend their own private fortunes, than to give up so beneficial and useful a scheme. We have the same instance in Dr. Hasselquist, who with a fickly and confumptive conflitution, went to Afia Minor, Egypt, and Palestine, and collected fuch great riches in new plants and animals, that Dr. Linnæus's fyftem would never have contained fo many species, had he not made use of these treasures, which the Queen of Sweden generously bought, by paying the debts of Dr. Hasselquist, who died in his attempt to promote natural history. The reverend Mr. Osbeck, in his voyage to China, made an infinite number of ufeful and intereiting observations at the expence of his whole falary, and published them by the contributions of his parish. The reverend Mr. Toreen died by the fatigues of the fame voyage, and left his letters published along with Osbeck, as a monument of his fine genius, and spirit for promoting natural history. We here look upon the expences as trifling, but they are not fo in Sweden, and therefore are certainly the best monuments to the honour of the nation and the great Linnæus, who in respect to natural history is the primum mobile of that country.

Professor Kalm having obtained leave of his Majesty to be absent from his post as professor, and having got a passport, and recommendations to the several Swedish ministers at the courts of London, Paris, Madrid, and at the Hague, in order to obtain passports for him in their respective states, set out from Upsala, the 16th of October 1747, accompanied by Lars Yungstroem, a gardener well skilled in the knowledge of plants and mechanics, and who had at the same time a good hand for drawing

drawing, whom he took into his fervice. He then fet fail from Gothenburgh, the 11th of December, but a violent hurricane obliged the ship he was in to take shelter in the harbour of Groemstad in Norway, from which place he made excursions to Arendal and Christiansand. He went again to sea February the 8th, 1748, and arrived at London the 17th of the fame month. He staid in England till August 15th, in which interval of time he made excursions to Woodford in Essex, to Little Gaddefden in Hertfordshire, where William Ellis, a man known by his publications in husbandry, lived, but whose practical husbandry Mr. Kalm found not to be equal to the theory laid down in his writings; he likewife faw Ivinghoe in Buckinghamshire, Eton, and feveral other places, and all the curiofities and gardens in and about London: at iast he went on board a ship, and traversed the ocean to Philadelphia in Pensylvania. which was formerly called New Sweden, where he arrived September the 26th. The rest of that year he employed in collecting seeds of trees and plants, and sending them up to Sweden; and in feveral excursions in the environs of Philadelphia. The winter he paffed among his countrymen at Raccoon in New Jerfey. The next year, 1749, Mr. Kalm went through New Jerfey and New York, along the river Hudfon, to Albany, and from thence, after having croffed the lakes of St. George and Champlain, to Montreal and Quebec, he returned that very year, against winter, to Philadelphia, and fent a new cargo of feeds, plants, and curiofities to Sweden. In the year 1750, Mr. Kalm faw the western parts of Pensylvania and the coast of New Jersey; Yungstroem staid in the former province all the summer for the collection of seeds; and. Professor Kalin in the mean time passed New York and the Blue Mountains, went to Albany, then along the river Mohawk to the Iroquefe nations, where he got acquainted with the Mohawks, Oneidas, Tufkaroras, Onandagas, and Kayugaws. He then viewed and navigated the great lake Ontario, and fawthe celebrated fall at Niagara. In his return from his fummer expedition, he croffed the Blue Mountains in a different place, and in October again reached Philadelphia.

In 1751, he went at Newcastle on board a ship for England, and after a passage, fubject to many dangers in the most dreadful hurricanes, he arrived March the 27th, in the Thames, and two days after in London. He took passage for Gothenburgh May the 5th, and was the 16th of the fame month at the place of his destination, and the 13th of June he again arrived at Stockholm, after having been on this useful expedition three years and eight months. He has fince affumed the professorship at Aobo, where, in a finall garden of his own, he cultivates many hundreds of American plants, as there is not yet a public botanical garden for the use of the university; and he with great expectation wishes to fee what plants will bear the climate, and bear good and ripe feeds fo far north. He published the account of his journey by intervals, for want of encouragement, and fearing the expenses of publishing at once, in a country where few bookfellers are found, and where the author does very often embrace the bufinefs of bookfeller, in order to reimburfe himfelf for the expences of his publication. A passage cross the Atlantic ocean is a new thing to the Swedes, who are little used to it, unless they go in the few East India ships of their country. Every thing therefore was new to Mr. Kalm, and he omitted no circumftance unobserved which are repeated in all the navigators from the earlier times down to our own age. It would be a kind of injuffice to the public, to give all this at large to the reader. All that part defcribing England and its curiofities and hufbandry we omitted. The particulars of the passage from England to Penfylvania we abridged: no circumstance interesting to natural hiftory or to any other part of literature has been omitted. From his arrival at Philadelphia we give the original at large, except where we omitted fome trifling circumstances,

viz. the way of eating oysters, the art of making apple-dumplings, and some more of

the fame nature, which struck that Swedish gentleman with their novelty.

Mr. Kalm makes use of the Swedish measure; its foot is to the English foot, as 1134 to 1350. For his meteorological observations he employed the thermometer of Professor Celsius, generally made use of in Sweden, and his was of Celsius's own making; the interval from the point of freezing to the point of boiling water, is equally divided in this thermometer into one hundred parts. In the names of plants, we have chiefly employed after his directions the Linnaean names, in the last edition of his Spec. Plantarum, and Systema Natura, vol. ii. But as his descriptions of animals, plants, and minerals are very short, he promises to give them at large some time hence in a Latin work.

He gives you his observations as they occurred day after day, which makes him a faithful relater, notwithstanding it takes away all elegance of style, and often occasions

him to make very fudden transitions from subjects very foreign to one another.

At last he arms himself with a very noble indifference against the criticism of several people, founded on the great aim he had in view by his performance, which was no less than public utility. This he looks upon as the true reward of his pains and expences.

The map, and drawings of the American birds and animals were not in the original, but copied from original drawings, and real birds and animals from North America.

We find it necessary here to mention, that as many articles in Mr. Kalm's travels required illustrations, the publisher has taken the liberty to join here and there some notes, which are marked at the end with F. The other notes not thus marked were kindly communicated by the publisher's friends.

PETER KALM'S TRAVELS.

A UGUST the 5th, 1748, I with my fervant Lars Yungstræm (who joined to his abilities as gardener, a tolerable skill in mechanics and drawing) went at Gravefend on board the Mary gally, Captain Lawson, bound for Philadelphia; and though it was so late as fix o'clock in the afternoon, we weighed anchor and failed a good way down the Thames before we again came to anchor.

Aug. 6th. Very early in the morning we refumed our voyage, and after a few hours failing we came to the mouth of the Thames, where we turned into the channel and failed along the Kentish coast, which consists of steep and almost perpendicular chalk hills, covered at the top with some soil and a fine verdure, and including strata of slints, as it frequently is found in this kind of chalk hills in the rest of England; and we were delighted in viewing ont hem excellent corn fields, covered for the greatest part with wheat, then ripening.

At fix o'clock at night, we arrived at Deal, a little well known town, fituate at the entrance of a bay exposed to the southern and easterly winds. Here commonly the outward-bound ships provide themselves with greens, fresh victuals, brandy, and many more articles. This trade, a fishery, and in the last war the equipping of privateers,

has enriched the inhabitants.

Aug. 7th. When the tide was out, I faw numbers of fishermen reforting to the fandy shallow places, where they find round small eminences caused by the excrements of the log worms, or sea worms, (lumbrici marini Linn.) who live in the holes leading to these hillocks, sometimes eighteen inches deep, and they are then dug out with a

fmall three-tacked iron fork, and used as baits.

Aug. 8th. At three o'clock we tided down the channel, passed Dover, and saw plainly the opinion of the celebrated Camden in his Britannia confirmed, that here England had been formerly joined to France and Flanders by an isthmus. Both shores form here two opposite points; and both are formed of the same chalk hills, which have the same configuration, so that a person acquainted with the English coasts and approaching those of Picardy afterwards, without knowing them to be such, would certainly take them to be the English ones.**

Aug. 9th—12th. We tided and alternately failed down the channel, and paffed Dungeness, Fairlight, the Isle of Wight, Portsmouth, the peninsula of Portland and Bolthead, a point behind which Plymouth lies; during all which time we had very

little wind.

Aug. 13th. Towards night we got out of the English channel into the Bay of

Biscay.

Aug. 14th. We had contrary wind, and this increased the rolling of the ship, for it is generally remarked that the Bay of Biscay has the greatest and broadest waves, which are of equal size of those between America and Europe; they are commonly half an English mile in length, and have a height proportionable to it. The Baltic and the German ocean has on the contrary short and broken waves.

Whenever an animal is killed on board the ship, the sailors commonly hang some

fresh pieces of meat for a while into the sea; and it is said, it then keeps better.

Aug. 15th. The fame swell of the sea still continued, but the waves began to smooth, and a foam swimming on them was said to forebode in calm weather a con-

tinuance of the fame for fome days.

About noon a north-easterly breeze sprung up, and in the asternoon it blew more, and this gave us a fine spectacle; for the great waves rolled the water in great sheets, in one direction, and the north-easterly wind curled the surface of these waves quite in another. By the beating and dashing of the waves against one another, with a more than ordinary violence, we could see that we passed a current, whose direction the

captain could not determine.

Aug. 16th—21ft. The fame favourable breeze continued to our great comfort and amazement, for the captain observed that it was very uncommon to meet with an easterly or north-easterly wind between Europe and the Azores (which the failors call the Western Islands) for more than two days together; for the more common wind is here a westerly one; but beyond the Azores they find a great variety of winds, especially about this time of the year; nor do the westerly winds continue long beyond these isles; and to this it is owing, that when navigators have passed the Azores, they think they have performed one-half of the voyage, although in reality it be but one-third part. These isles come seldom in sight; for the navigators keep off them, on account of the dangerous rocks under water surrounding them. Upon observation and comparison of the journal, we found that we were in forty-three degrees twenty-four minutes north latitude, and thirty and a half degrees west longitude from London.

^{*} The same opinion has been confirmed by Mr. Buston in his Hist. Naturelle.

Aug. 22d. About noon the captain affured us, that in twenty-four hours we should have a fouth-west wind; and upon my enquiring into the reasons of his fortelling this with certainty, he pointed at fome clouds in the fouth-west, whose points turned towards north-east, and faid they were oceasioned by a wind from the opposite quarter. At this time I was told we were about half way to Penfylvania.

Aug. 23d. About feven o'clock in the morning the expected fouth-west wind fprung up, and foon accelerated our courfe fo much that we went at the rate of eight

knots an hour.

The wind shifted and was in our teeth. We were told by some of the Aug. 24th. crew to expect a little fform, the higher clouds being very thin and ftriped and feattered about the sky like parcels of combed wool, or so many skains of yarn, which they faid forbode a storm. These striped clouds ran north-west and south-east, in the direction of the wind we then had. Towards night the wind abated and we had a perfect calm, which is a fign of a change of wind.

Aug. 25th and 26th. A west wind sprung up and grew stronger and stronger, so

that at last the waves washed our deck.

Aug. 27th. In the morning we got a better wind, which went through various

points of the compass, and brought on a storm from north-east, towards night.

Our captain told me an observation founded on long experience, viz. that though the winds changed frequently in the Atlantic ocean, especially in summer time, the most frequent, however, was the western; and this accounts for the passage from America to Europe commonly being fhorter than that from Europe to America. Befides this, the winds in the Atlantic during fummer are frequently partial, fo that a fform may rage on one part of it, and within a few miles of the place little or no storm at all may be felt. In winter the winds are more constant, extensive, and violent; so that the fame wind reigns on the greater part of the ocean for a good while, and causes greater waves than in fummer.

Aug. 30th. As I had observed the night before some strong slashes of lightening without any subsequent clap of thunder, I enquired of our captain, whether he could affign any reasons for it. He told me these phænomena were pretty common, and the confequence of a preceding heat in the atmosphere; but that when lightenings were observed in winter, prudent navigators were used to reef their fails, as they are by this fign certain of an impendent from; and fo likewise in that season, a cloud rising from

the north-west is an infallible forerunner of a great tempest.

Sept. 7th. As we had the first day of the month contrary wind, on the second it fhifted to the north, was again contrary the third, and fair the fourth and following days. The fifth we were in forty degrees, three minutes, north latitude, and between fifty-three and fifty-four degrees west longitude from London.

Befides the common waves rolling with the wind, we met on the fourth and fifth instant with waves coming from fouth-west, which the captain gave as a mark of a

former from from that quarter in this neighbourhood.

Sept. 8th. We croffed by a moderate wind, a fea with the highest waves we met on the whole passage, attributed by the captain to the division between the great ocean and the inner American gulf; and foon after we met with waves greatly inferior to those we observed before.

Sept. 9th. In the afternoon we remarked that in fome places the colour of the fea (which had been hitherto of a deep blue) was changed into a paler hue; fome of thefe fpots were narrow stripes of twelve or fourteen fathoms breadth, of a pale green colour, which is supposed to be caused by the sand, or, as some say, by the weeds under water Sept.

3 C 2

Sept. 12th. We were becalined that day, and as we in this fituation observed a ship, which we suspected to be a Spanish privateer, our fear was very great; but we saw, some days after our arrival at Philadelphia, the same ship arrive, and heard that they

feeing us, had been under the fame apprehenfions with ourfelves.

Sept. 13th. Captain Lawfon, who kept his bed for the greater part of the voyage, on account of an indifposition, assured us yesterday we were in all appearance very near America: but as the mate was of a different opinion, and as the sailors could see no land from the head of the mast, nor find ground by the lead, we steered on directly towards the land. About three o'clock in the morning, the captain gave orders to heave the lead, and we found but ten fathom; the second mate himself took the lead, and called out ten and sourteen sathoms; but a moment after the ship struck on the sand, and this shock was followed by four other very violent ones. The consternation was incredible, and very justly might it be so; for there were above eighty persons on board, and the ship had but one boat: but happily our ship got off again, after having been turned. At day-break, which followed soon after, (for the accident happened half an hour past four) we saw the continent of America within a Swedish mile before us; the coast was whitish, low, and higher up covered with firs. We found out, that the sand we struck on, lay opposite Arcadia, in Maryland, in thirty-seven degrees, sifty minutes, north latitude.

We coasted the shores of Maryland all the day, but not being able to reach Cape Hinlopen, where we intended to take a pilot on board, we cruized all night before the bay of Delaware. The darkness of the night made us expect a rain, but we found that only a copious fall of dew ensued, which made our coats quite wet, and the pages of a book, accidentally left open on the deck, were in half an hour's time after fun-setting likewise wet, and we were told by the captain and the sailors, that both in England and

America a copious dew was commonly followed by a hot and fultry day.

Sept. 14th. We faw land on our larboard in the west, which appeared to be low, white, fandy, and higher up the country covered with firs. Cape Hinlopen is a head of land running into the sea from the western shore, and has a village on it. The eastern shore belongs here to New Jersey, and the western to Pensylvania. The bay

of Delaware has many fands, and from four to eleven fathom water.

The fine woods of oak, hiccory, and firs, covering both flores, made a fine appearance, and were partly employed in fhip-building at Philadelphia; for which purpose every year some English captains take a passage in autumn to this town, and superintend the building of new ships during winter, with which they go to sea next spring; and at this time it was more usual than common, as the French and Spanish privateers had taken many English merchant ships.

A little after noon we reached the mouth of Delaware river, which is here about three English miles broad, but decreases gradually so much, that it is scarcely a mile

broad at Philadelphia.

Here we were delighted in feeing now and then between the woods fome farm-houses, furrounded with corn-fields, pastures well stocked with cattle, and meadows covered with fine hay; and more than one sense was agreeably assected, when the wind brought to us the finest essluvia of odoriferous plants and slowers, or that of the fresh made hay: these agreeable sensations and the sine scenery of nature on this continent, so new to us, continued till it grew quite dark.

Here I will return to fea, and give the reader a fhort view of the various occurrences

belonging to natural history, during our crossing the ocean.

Of fea-weeds (Fucus Linn.) we faw, August the 16th and 17th, a kind which had a fimilarity

fimilarity to a bunch of onions tied together; these bunches were of the fize of the fill, and of a white colour. Near the coast of America, within the American gulf, September the 11th, we met likewife with feveral fea-weeds, one species of which was called by the failors rock-weed; another kind looked like a ftring of pearls, and another was white, about a foot long, narrow, every where equally wide and quite strait. From August the 24th to September the 11th, we faw no other weeds but those commonly going under the name of gulf-weed, because they are supposed to come from the Gulf of Florida; others call it Sargazo, and Dr. Linnæus, fucus natans. Its stalk is very flender, rotundato-angulated, and of a dark green; it has many branches, and each of them has numerous leaves disposed in a row; they are extremely thin, are ferrated, and are a line or a line and a half wide, fo that they bear a great refemblance to the leaves of Iceland mofs, their colour is a yellowish green. Its fruit, in a great meafure, refembles unripe juniper berries, is round, greenish yellow, almost smooth on the outfide, and grows under the leaves on fhort footftalks of two or three lines length; under each leaf are from one to three berries, but I never have feen them exceed that number. Some berries were fmall, and when cut were quite hollow, and confifted of a thin peel only, which is calculated to communicate their buoyancy to the whole plant. The leaves grow in proportion narrower, as they approach the extremities of the branches: their upper fides are fmooth, the ribs are on the under fides, and there likewife appear fmall roots of two, three, or four lines length. I was told by our mate, that gulf-weed, dried and pounded, was given in America to women in childbed, and befides this, it is also used there in fevers. The whole ocean is as if it were covered with this weed, and it must also be in immense quantities in the Gulf of Florida, from whence all this driving on the ocean is faid to come. Several little shells, pointed like horns, and efcharæ or horn-wracks are frequently found on it: and feldom is there one bundle of this plant to be met with, which does not contain either a minute shrimp or a finall crab, the latter of which is the cancer minutus of Dr. Linnæus. Of these I collected eight, and of the former three, all which I put in a glafs with water: the little fhrimp moved as fwift as an arrow round the glass, but sometimes its motion was flow, and fometimes it flood still on one fide, or at the bottom of the glass. If one of the little crabs approached, it was feized by its fore paws, killed and fucked; for which reason they were careful to avoid their fate. It was quite of the shape of a shrimp; in fwimming it moved always on one fide, the fides and the tail moving alternately. It was capable of putting its fore paws entirely into its mouth; its antennæ were in continual motion. Having left these little shrimps together with the crabs during night, I found in the morning all the crabs killed and eaten by the shrimps. The former moved when alive with incredible fwiftness in the water. Sometimes, when they were quite at the bottom of the glass, with a motion fomething like to that of a puceron or podura of Linnæus, they came in a moment to the furface of the water. In fwimming they moved all their feet very close, fometimes they held them down as other crabs do, fometimes they lay on their backs, but as foon as the motion of their feet ceased, they always funk to the bottom. The remaining shrimps I preserved in spirits, and the lofs of my little crabs was foon repaired by other specimens which are so plentiful in each of the floating bundles of gulf-weed. For a more minute description of which I must refer the reader to another work I intend to publish. In some places we faw a crab of the fize of the fift, fwimming by the continual motion of its feet, which being at rest, the animal began immediately to fink. And one time I met with a great red crawfish or lobster, floating on the surface of the sea.

Blubbers, or medufæ Linn., we found of three kinds: the first is the medufa aurita Linn.;

Linn.; it is round, purple-coloured, opens like a bag, and in it are as if it were four white rings; their fize varies from one inch diameter to fix inches; they have not that nettling and burning quality which other blubbers have, fuch for instance as are on the coast of Norway, and in the ocean. These we met chiefly in the channel, and in the

Bay of Bifcay.

After having croffed more than half of the ocean between Europe and America, we met with a kind of blubber, which is known to failors by the name of the Spanish or Portugueze man of war; it looks like a great bladder, or the lungs of a quadruped, compressed on both sides, about six inches in diameter, of a sine purple-red colour, and when touched by the naked skin of the human body, it causes a greater burning than any other kind of blubber. They are often overturned by the rolling of the waves, but they are again standing up in an instant, and keep the sharp or narrow side uppermost.

Within the American gulf we faw not only these Spanish men of war, but another kind too, for which the failors had no other name but that of a blubber. It was of the fize of a pewter plate, brown in the middle, with a pale margin, which was in continual

motion.

Of the lepas anatifera Linn. I faw on the 30th of August a log of wood, which sloated on the ocean, quite covered. Of infects I faw in the channel, when we were in fight of the Isle of Wight, several white butterslies, very like to the Papilio Brassieæ Linn. They never settled; and by their venturing at so great a distance from land they caused us just associated.

Some common flies were in our cabbin alive during the whole voyage, and it cannot therefore be determined whether they were originally in America, or whether they

came over with the Europeans.

Of cetaceous fish we met with porpesses, or as some failors call them, sea-hogs* (delphinus phocæna Linn.) first in the channel, and then they continued every where on this side the Azores, where they are the only sish navigators met with; but beyond these isles they are seldom seen, till again in the neighbourhood of America we saw them equally frequent to the very mouth of Delaware river. They always appeared in shoals, some of which consisted of upwards of an hundred individuals; their swimming was very swift, and though they often swam along side of our ship, being taken as it were with the noise caused by the ship cutting the waves, they however soon outwent her, when they were tired with staring at her. They are from sour to eight feet long, have a bill like in shape to that of a goose, a white belly, and leap up into the air frequently sour feet high, and from sour to eight feet in length; though their snoring indicates the effort which a leap of that nature costs them. Our sailors made many vain attempts to strike one of them with the harp iron from the forecastle, when they came within reach, but their velocity always eluded their skill.

Another cetaceous fish, of the dolphin kind †, with which we met, is called by the

+ Mr. Kalm is certainly mistaken in reckoning the bottle-nose amongst the Dolphin kind; it has no teeth in its mouth as all the fish of that class have, and therefore belongs to the first order of the whales, or those that are without teeth. See Mr. Pennant's British Zoology, vol. iii. p. 43., where it is called the beaked whale, and very well described; a drawing is seen in the explanatory table, n. I. Perhaps it would not

be improper to call it Balæna ampullata. F.

failors

^{*}The name of porpesse is certainly derived from the name Porcopesce, given to this genus by the Italians; and it is remarkable that almost all the European nations conspired in calling them sea-hogs, their name being in German meer schwein; the Danish, Swedish, and Norvegian, marsuin, from whence the French borrowed their marsonin. The natives of Iceland call them suinhual, i. e. a swine-whale, and so likewise the Slavonian nations have their Swinia Morskaya. Whether this consent arises from their rooting the fand at the bottom of the sea in quest of sand-eels and sea-worms like swine, or from the vast quantity of lard surrounding their bodies, is uncertain. F.

failors bottle-nose; it swims in great shoals, has a head like a bottle, and is killed by a harpoon, and is sometimes eaten. These sish are very large, and some fully twelve feet long; their shape, and manner of tumbling and swimming, make them nearly related to porpesses. They are to be met with every where in the ocean from the channel to the very neighbourhood of America.

One whale we faw at a distance, and knew it by the water which it spouted up.

A dog-fish of a considerable fize followed the ship for a little while, but it was soon out of sight, without our being able to determine to which species it belonged: this was the only cartilaginous fish we saw on the whole passage.

Of the boney fish, we saw several beyond the Azores, but never one on this side of those isles; one of them was of a large size, and we saw it at a distance; the sailors

called it an albecor, and it is Dr. Linnæus's fcomber thynnus.

The dolphin of the English is the dorado of the Portuguese, and Dr. Linnæus calls it coryphæna hippuris; it is about two feet and a half long, near the head fix inches deep, and three inches broad; from the head the dolphin decreases on all sides towards the tail, where its perpendicular depth is one inch and a half, and its breadth hardly one The colour of the back near the head is a fine green on a filver ground, but near the tail of a deep blue; the belly is white, and fometimes mixed with a deep yellow, on the fides it has fome round pale brown fpots. It has fix and not feven fins as was imagined; two of them are on the breast, two on the belly, one at the tail extending to the anus, and one along the whole back, which is of a fine blue: when the fish is just taken the extremities of the most outward rays in the tail were eight inches, one from another. Their motion when they swam behind, or along fide of the ship, was very flow, and gave a fair opportunity to hit them with the harpoon, though fome are taken with a hook and line, and a bait of chicken bowels, finall fish, or pieces of his own species, or the flying fish, which latter are their chief food: and it is by their chasing them, that the flying fifh leave their element to find shelter in one to which they are strangers. The dolphins fometimes leap a fathom out of the water, and love to fwim about casks and logs of wood, that fometimes drive in the fea. They are eaten with thick butter, when boiled, and fometimes fried, and afford a palatable food, but rather fomewhat dry. In the bellies of the fifh of this species which we caught, several animals were found, viz. an oftracion; a little fish with blue eyes, which was yet alive, being just the moment before swallowed, and measuring two inches in length; another little fish; a curious marine infect, and a flying fish, all which not yet being damaged by digestion, I preferved in fpirits.

The flying fish (exocoetus volitans Linn.) are always seen in great shoals, sometimes of an hundred or more getting at once out of the water, being pursued by greater fish, and chiefly by dolphins; they rise about a yard, and even a fathom above the water in their flight, but this latter height they only are at, when they take their flight from the top of a wave; and sometimes, it is said, they fall on the deck of ships. The greatest distance they sly is a good musket shot, and this they perform in less than half a minute's time; their motion is somewhat like that of the yellow-hammer, (Emberiza Citrinella Linn.) It is very remarkable that I found the course they took always to be against the wind, and though I was contradicted by the sailors, who assirmed that they went at any direction, I nevertheless was consirmed in my opinion by a careful observation during the whole voyage, according to which they sly constantly either directly

against the wind, or somewhat in an oblique direction*.

^{*} In Mr. Pennant's British Zoology, vol. iii. p. 282., is the best account of this sish to be met with; and in his British Zoology, illustrated by plates and brief explanations, is plate xliv., a good and exact drawing of the sish, the upper figure representing it in front, the lower sideways. F.

We faw likewife the fish called Bonetos, (Scomber Pelamys Linn.) they were like-wife in shoals, hunting some smaller fish, which chase caused a noise like to that of a cascade, because they were all swimming close in a body; but they always kept out of the reach of our harpoons.

Of amphibious animals, or reptiles; we met twice with a turtle, one of which was fleeping, the other fwam without taking notice of our fhip; both were of two feet

diameter.

Birds are pretty frequently feen on the ocean, though aquatic birds are more common than land birds.

The Petrel (Procellaria Pelagica Linn.) was our companion from the channel to the shores of America. Flocks of this bird were always about our ship, chiefly in that part of the sea, which being cut by the ship, forms a smooth surface, where they frequently seem to settle, though always on the wing. They pick up or examine every thing that salls accidentally from the ship, or is thrown over-board: little sish seem to be their chief sood; in day-time they are silent, in the dark, clamorous; they are reputed to forebode a storm, for which reason the sailors disliking their company, complimented them with the name of witches; but they are as frequent in fair weather, without a storm following their appearance. To me it appeared as if they staid sometimes half an hour and longer under the waves, and the sailors assured me they did. They look like swallows, and like them, they skim sometimes on the water.

The Shearwater (Procellaria Puffinus Linn.) is another fea-bird, which we faw every where on our voyage, from the channel to the American coasts; it has much the appearance and fize of the dark gray fea-gull, or of a duck; it has a brown back, and commonly a white ring round its neck, and a peculiar flow way of flying. We plainly faw

fome of these birds feed on fish.

The Tropic Bird (Phaëton æthereus Linn.) has very much the shape of a gull, but two very long feathers, which it has in its tail, distinguish it enough from any other bird; its slight is often exceedingly high: the first of this kind we met was at about forty degrees north latitude and forty-nine or sifty degrees of west longitude from London.

Common Gulls (Larus canus Linn.) we faw, when we were opposite the Land's End, the most westerly cape of England, and when, according to our reckoning, we were

opposite Ireland.

Terns (Sterna hirundo Linn.) though of a fomewhat darker colour than the common ones, we found after the forty-first degree of north latitude and forty-seventh degree west longitude from London, very plentifully, and sometimes in slocks of some hundreds; sometimes they settled, as if tired, on our ship.

Within the American gulph we discovered a fea-bird at a little distance from the

ship, which the failors called a Sea-hen.

Land-birds are now and then feen at fea, and fometimes at a good distance from any land, so that it is often difficult to account for their appearance in so uncommon a place. August the 18th, we saw a bird which settled on our ship, and was perfectly like the great titmouse, (Parus major Linn.) upon an attempt to catch it, it got behind the

fails, and could never be caught.

Sept. 1st. We observed some land-birds slying about our ship, which we took for Sand Martins (Hirundo riparia Linn.) sometimes they settled on our ship, or on the sails; they were of a greyish brown colour on their back, their breast white, and the tail somewhat surcated; a heavy shower of rain drove them afterwards away. September the 2d a swallow sluttered about the ship, and sometimes it settled on the mast; it seemed to be very tired; several times it approached our cabin windows, as if it was willing to take shelter there. These cases happened about forty degrees of north latitude and

between

between forty-feven and forty-nine degrees west longitude from London, and also about twenty degrees longitude or more than nine hundred and twenty sea miles from any land whatsoever.

Sept. 10th. Within the American gulph a large bird, which we took for an owl,

and likewife a little bird, fettled on our fails.

Sept. 12th. A wood-pecker fettled on our rigging: its back was of a speckled grey, and it seemed extremely fatigued. And another land-bird of the passerine class, endeavoured to take shelter and rest on our ship.

Before I entirely take leave of the fea I will communicate my observations on two

curious phænomena.

In the channel and in the ocean we faw, at night-time, sparks of fire, as if flowing on the water, especially where it was agitated, sometimes one single spark swam for the space of more than one minute on the ocean before it vanished. The failors observed them commonly to appear during and after a florm from the north, and that often the sea is as if it were full of fire, and that some such shining sparks would likewise stick to the masts and fails.

Sometimes this light had not the appearance of sparks, but looked rather like the

phosphorescence of putrid wood.

The Thames water which made our provision of fresh water, is reputed to be the best of any. It not only settled in the oak casks it is kept in, but becomes in a little time stinking, when stopped up; however, this nauseous smell it soon loses, after being silled into large stone jugs, and exposed to the open fresh air for two or three hours together. Often the vapours arising from a cask which has been kept close and stopped up for a great while take sire, if a candle is held near them when the cask is opened; and the Thames water is thought to have more of this quality than any other; though I was told that this even happened with any other water in the same circumstances.

Now I can refume my narrative; and therefore observe, that we afterwards failed on the river with a fair wind, pretty late at night. In the dawn of the evening we passed by Newcastle, a little town on the western shore of the river Delaware. It was already so dark that we could hardly know it, but by the light which appeared through some of the windows. The Dutch are said to have been the first sounders of this place, which is therefore reckoned the most ancient in the country, even more ancient than Philadelphia. But its trade can by no means be compared with the Philadelphia trade, though its situation has more advantages in several respects; one of which is, that the river seldom freezes before it, and consequently ships can come in and go out at any time. But near Philadelphia it is almost every winter covered with ice, so that navigation is interrupted for some weeks together. But the country about Philadelphia and farther up, being highly cultivated, and the people bringing all their goods to that place, Newcastle must always be inferior to it.

I mentioned that the Dutch laid the foundations of this town. This happened at the time when this country was as yet fubject to Sweden. But the Dutch crept in, and intended by degrees to disposses the Swedes, as a people who had taken possession of their property. They succeeded in their attempt, for the Swedes not being able to bear with this encroachment, came to a war in which the Dutch got the better. But they did not enjoy the fruits of their victory long; for a few years after, the English came and deprived them of their acquisition, and have ever since continued in the undisturbed possession of the country. Somewhat later at night we cast anchor, the pilot not venturing to carry the ship up the river in the dark, several sands being in

the way.

Sept. 15th. In the dawn of the morning we weighed anchor, and continued our voyage up the river. The country was inhabited almost every where on both sides. The farm-houses were however pretty far asunder. About eight o'clock in the morning we failed by the little town of Chester, on the western side of the river. In this town, our mate, who was born in Philadelphia, shewed me the places which the Swedes still inhabit.

At last we arrived in Philadelphia about ten o'clock in the morning. We had not been more than fix weeks, or (to speak more accurately) not quite forty-one days on our voyage from Gravesend to this place, including the time we spent at Deal, in supplying ourselves with the necessary fresh provisions, &c.; our voyage was therefore reckoned one of the shortest, for it is common in winter-time to be fourteen or more weeks in coming from Gravesend to Philadelphia. Hardly any body ever had a more pleasant voyage over this great ocean than we had; Captain Lawson affirmed this several times, nay, he assured us he had never seen such calm weather in this ocean, though he had crossed it very often. The wind was generally so favourable that a boat of a middling size night have sailed in perfect safety. The sea never went over our cabin, and but once over the deck, and that was only in a swell. The weather indeed was so clear that a great number of the Germans on board slept on the deck. The cabin windows needed not the shutters. All these are circumstances which show the uncommon goodness of the weather.

Captain Lawfon's civility increased the pleasure of the voyage.

As foon as we came to the town and had cast anchor, many of the inhabitants came on board, to enquire for letters. They took all those which they could carry, either for themselves or for their friends. Those which remained, the captain ordered to be carried on shore and left at a coffee-house; by this means he was rid of the trouble of delivering them himself. I afterwards went on shore with him; but before he went, he strictly charged the second mate to let no one of the German refugees out of the ship, unless he paid for his passage, or somebody else paid for him, or bought him.

On my leaving London, I received letters of recommendation from Mr. Abraham Spalding, Mr. Peter Collinson, Dr. Mitchel, and others, to their friends here. It was easy for me therefore to get acquaintance. Mr. Benjamin Franklin, to whom Pensylvania is indebted for its welfare, and the learned world for many new discoveries in electricity, was the first who took notice of me, and introduced me to many of his friends. He gave me all necessary instructions, and shewed me his kindness on many

oceafions.

I went to-day, accompanied by Mr. Jacob Bengston, a member of the Swedish confistory, and the sculptor Gustavus Hesselius, to see the town and the fields which lay before it. (The former is brother to the Rev. Messes. Andrew and Samuel Hesselius, both ministers at Christiana in New Sweden, and of the late Dr. John Hesselius in the provinces of Nerik and Wermeland). My new friend had followed his brother Andrew in 1711 to this country, and had since lived in it. I found that I was now come into a new world. Whenever I looked to the ground, I every where found such plants as I had never seen before; when I saw a tree, I was forced to stop, and ask those who accompanied me, how it was called. The first plant which struck my eyes was an andropogon, or a kind of grass; and grass is a part of botany I always delighted in. I was seized with terror at the thought of ranging so many new and unknown parts of natural history. At first I only considered the plants, without venturing on a more accurate examination.

At night I took up my lodging with a grocer who was a quaker; and I met with very good honest people in this house, such as most people of this profession appeared to me. I and my Yungstræm, the companion of my voyage, had a room, candles, beds, attendance, and three meals a-day, if we chose to have so many, for twenty shillings per week in Pensylvania currency. But wood, washing, and wine, if required, were to be paid for besides.

Sept. the 16th. Before I proceed I must give a short description of Philadelphia, which I shall frequently mention in the sequel of my travels. I here put down several particulars which I marked during my stay at that place, as a help to my

memory.

Philadelphia, the capital of Penfylvania, a province which makes part of what formerly was called New Sweden, is one of the principal towns in North America; and next to Boston the greatest. It is situated almost in the centre of the English colonies, and its lat. is thirty-nine deg. and sitty min. but its west long. from London near

feventy-five deg.

This town was built in the year 1683, or as others fay, in 1682, by the well-known quaker William Pen, who got this whole province by a grant from Charles the Second, King of England, after Sweden had given up its claims to it. According to Pen's plan, the town was to have been built upon a piece of land which is formed by the union of the rivers Delaware and Skulkill, in a quadrangular form, two English miles long and one broad. The eastern fide would therefore have been bounded by the Delaware, and the western by the Skulkill. They had actually begun to build houses on both these rivers, for eight capital streets, each two English miles long, and fixteen leffer ffreets (or lanes) acrofs them, each one mile in length, were marked out with a confiderable breadth, and in straight lines. The place was at that time almost an entire wilderness covered with thick forests, and belonged to three Swedish brothers called Sven's Sæner (fons of Sven) who had fettled in it. They with difficulty left the place; the fituation of which was very advantageous. But at last they were persuaded to it by Pen, who gave them a few English miles from that place, twice the space of country they inhabited. However Pen himfelf, and his descendants after him, have confiderably leffened the ground belonging to them, by repeated menfurations, under pretence that they had taken more than they ought.

But the inhabitants could not be got in fufficient number to fill a place of fuch extent. The plan therefore about the river Skulkill was laid afide till more favourable circumftances should occur, and the houses were only built along the Delaware. This river flows along the eastern fide of the town, is of great advantage to its trade, and gives a fine prospect. The houses which had already been built upon the Skulkill were transplanted hitherto by degrees. This town accordingly lies in a very pleasant country from north to south along the river. It measures somewhat more than an English mile in length; and its breadth in some places is half a mile or more. The ground is stat and consists of sand mixed with a little clay. Experience has shewn that

the air of this place is very healthy.

The streets are regular, fine, and most of them are fifty foot, English measure, broad. Arch-street measures sixty-six feet in breadth, and Market-street, or the principal street where the market is kept, near a hundred. Those which run longitudinally, or from north to south are seven, exclusive of a little one, which runs along the river, to the south of the market, and is called Water-street. The lanes which go across, and were intended to reach from the Delaware to the Skulkill, are eight in number. They do not go quite from east to west, but deviate a little from that direction. All

the

the streets except two which are nearest to the river, run in a straight line, and make right angles at the intersections; some are paved, others are not, and it seems less necessary, since the ground is sandy, and therefore soon absorbs the wet. But in most of the streets is a pavement of slags, a fathom or more broad, laid before the houses, and posts put on the outside three or four fathom asunder. Under the roofs are gutters which are carefully connected with pipes, and by this means, those who walk under them when it rains, or when the snow melts, need not fear being wet by the dropping from the roofs.

The houses make a good appearance, are frequently several stories high, and built either of bricks or of stone; but the former are more commonly used, since bricks are made before the town, and are well burnt. The stone which has been employed in the building of other houses is a mixture of black or grey glimmer, running in undulated veins, and of a loose, and quite small grained limestone, which runs scattered between the bendings of the other veins, and are of a grey colour, excepting here and there some single grains of sand of a paler hue. The glimmer makes the greatest part of the stone, but the mixture is sometimes of another kind, as I shall relate hereafter under the article, eleventh of October. This stone is now got in great quantities in the country, is easily cut, and has the good quality of snot attracting the moisture in a wet scason.

Very good lime is burnt every where hereabouts for majorry.

The houses are covered with shingles. The wood for this purpose is taken from the cupreffus thyoides Linn. or a tree which Swedes here call the white juniper tree, and the English, the white cedar. Swamps and moraffes formerly were full of them, but at prefent these trees are for the greatest part cut down, and no attempt has as yet been made to plant new ones. The wood is very light, rots lefs than any other in this country, and for that reason is exceeding good for roofs, for it is not too heavy for the walls, and will ferve for forty or fifty years together. But many people already begin to fear, that these roofs will in time be looked upon as having been very detrimental to the city. For being fo very light, most people who have built their houses of stone or bricks, have been led to make their walls extremely thin. But at prefent this kind of wood is almost entirely destroyed. Whenever therefore in process of time these roofs decay, the people will be obliged to have recourse to the heavier materials of tiles, or the like, which the walls will not be ftrong enough to bear. The roof will therefore require supports, or the people be obliged to pull down the walls and to build new ones, or to take other fleps for fecuring them. Several people have already in late years begun to make roofs of tiles.

Among the public buildings I will first mention churches, of which there are several,

for God is ferved in various ways in this country.

1. The English established church stands in the northern part of the town, at some distance from the market, and is the finest of all. It has a little inconsiderable steeple, in which is a bell to be rung when it is time to go to church, and on burials. It has likewise a clock which strikes the hours. This building which is called Christ Church, was founded towards the end of the last century, but has lately been rebuilt and more adorned. It has two ministers who get the greatest part of their salary from England. In the beginning of this century, the Swedish minister the Rev. Mr. Rudmann, performed the functions of a clergyman to the English congregation for near two years, during the absence of their own clergyman.

2. The Swedish church, which is otherwise called the church of Weekacko, is on the southern part of the town, and almost without it on the river's side, and its situation is therefore more agreeable than that of any other. I shall have an opportunity of

defcribing

describing it more exactly, when I shall speak of the Swedes in particular, who live in

this place.

3. The German Lutheran church is on the north-west side of the town. On my arrival in America it had a little fleeple, but that being put up by an ignorant architect, before the walls of the church were quite dry, they leaned forwards by its weight, and therefore they were forced to pull it down again in the autumn of the year 1750. About that time the congregation received a fine organ from Germany. They have only one minister, who likewife preaches at another Lutheran church in Germantown. He preaches alternately one Sunday in that church, and another in this. The first clergyman which the Lutherans had in this town, was the Rev. Mr. Muhlenberg, who laid the foundations of this church in 1743, and being called to another place afterwards, the Rev. Mr. Brunholz from Slefwick, was his fucceffor, and is yet here. Both these gentlemen were sent to this place from Hall in Saxony, and have been a great advantage to it by their peculiar talent of preaching in an edifying manner. A little while before this church was built, the Lutheran Germans had no clergyman for themselves, so that the every-where beloved Swedish minister at Weekacko, Mr. Dylander, preached likewife to them. He therefore preached three fermons every Sunday; the first early in the morning to the Germans; the second to the Swedes; and the third in the afternoon to the English; and besides this, he went all the week into the country, and instructed the Germans who lived separately there. He therefore frequently preached fixteen fermons a-week. And after his death, which happened in November 1741, the Germans first wrote to Germany for a clergyman for themselves. This congregation is at present very numerous, so that every Sunday the church is very much crowded. It has two galleries, but no vestry. They do not fing the collects, but read them before the altar.

4. The old Presbyterian church is not far from the market, and on the south side of Market-street. It is of a middling size, and built in the year 1704, as the inscription on the northern pediment shews. The roof is built almost hemispherical, or at least forms a hexagon. The whole building stands from north to south, for the Presbyterians do not regard, as other people do, whether their churches look towards a cer-

tain point of the heavens or not.

5. The new Presbyterian church was built in the year 1750, by the new-lights in the north-western part of the town. By the name of new-lights, are understood the people who have, from different religions, become profelytes to the well known Whitefield, who in the years 1739, 1740, and likewife in 1744 and 1745, travelled through almost all the English colonies. His delivery, his extraordinary zeal, and other talents fo well adapted to the intellects of his hearers, made him fo popular that he frequently, especially in the two first years, got from eight thousand to twenty thousand hearers in the fields. His intention in these travels was to collect money for an orphans' hospital which had been erected in Georgia. He here frequently collected feventy pounds fterling at one fermon; nay, at two fermons which he preached in the year 1740, both on one Sunday, at Philadelphia, he got an hundred and fifty pounds. The profelytes of this man, or the above-mentioned new-lights, are at present merely a sect of Presbyterians. For though Whitefield was originally a clergyman of the English church, yet he deviated by little and little from her doctrines; and on arriving in the year 1744 at Boston in New England, he disputed with the Presbyterians about their doctrines so much that he almost entirely embraced them. For Whitefield was no great disputant, and could therefore easily be led by thefe

these cunning people, whithersoever they would have him. This likewise during his latter stay in America caused his audience to be less numerous than during the first. The new-lights built first, in the year 1741, a great house in the western part of the town, to hold divine service in. But a division arising amongst them after the departure of Whitesield, and besides on other accounts, the building was sold to the town in the beginning of the year 1750, and destined for a school. The new-lights then built a church which I call the new Presbyterian one. On its eastern pediment is the sollowing inscription in golden letters: Templum Presbyterianum, annuente Numine, erec-

tum, Anno Dom. MDCCL. 6. The old German reformed church is built in the west-north-west part of the town, and looks like the church in the Ladugoordfield near Stockholm. It is not yet finished, though for feveral years together, the congregation has kept up divine fervice in it. These Germans attended the German service at the Swedish church, whilst the Swedish minister, Mr. Dylander, lived.—But as the Lutherans got a clergyman for themselves on the death of the last, those of the reformed church made likewise preparations to get one from Dordrecht; and the first who was sent to them, was the Rev. Mr. Slaughter, whom I found on my arrival. But in the year 1750, another clergyman of the reformed church arrived from Holland, and by his artful behaviour fo infinuated himself into the favour of the Rev. Mr. Slaughter's congregation, that the latter loft almost half his audience. The two clergymen then disputed for several Sundays together about the pulpit; nay, people relate that the new comer mounted the pulpit on a Saturday, and staid in it all night. The other being thus excluded, the two parties in the audience, made themselves the subject both of the laughter and of the scorn of the whole town, by beating and bruising each other, and committing other excesses. The affair was inquired into by the magistrates, and decided in favour of the Rev. Mr. Slaughter, the perfon who had been abused.

7. The new reformed church was built at a little distance from the old one by the party of the clergyman who had lost his cause. This man however had influence enough to bring over to his party almost the whole audience of his antagonist, at the

end of the year 1750, and therefore this new church will foon be useless.

8. 9. The Quakers have two meetings, one in the market, and the other in the northern part of the town. In them are, according to the custom of this people, neither altars, nor pulpits, nor any other ornaments usual in churches; but only seats and some sconces. They meet thrice every Sunday in them, and besides that at certain times every week or every month. I shall mention more about them hereafter.

10. The Baptists have their fervice in the northern part of the town.

11. The Roman Catholics have in the fouth-west part of the town a great house,

which is well adorned within, and has an organ.

12. The Moravian Brethren have hired a great house, in the northern part of the town, in which they performed the service both in German and in English; not only twice or three times every Sunday, but likewise every night after it is grown dark. But in the winter of the year 1750, they were obliged to drop their evening meetings; some wanton young fellows having several times disturbed the congregation, by an instrument sounding like the note of a cuckoo; for this noise they made in a dark corner, not only at the end of every stanza, but likewise at that of every line, whilst they were singing a hymn.

Thofe

Those of the English church, the New-lights, the Quakers, and the Germans of the reformed religion, have each of them their burying-places on one fide out of town, and not near their churches, though the first of these sometimes make an exception. All the others bury their dead in their church-yards, and the Moravian Brethren bury where they can. The negroes are buried in a particular place out of town.

I now proceed to mention the other public buildings in Philadelphia.

The town-hall, or the place where the affemblies are held, is fituated in the western part of the town; it is a fine large building, having a tower with a bell in the middle, and is the greatest ornament to the town. The deputies of each province meet in it commonly every October, or even more frequently, if circumstances require it, in order to consider of the welfare of the country, and to hold their parliaments or diets in mi-

niature. There they revife the old laws, and make new ones.

On one fide of this building stands the library, which was first begun in the year 1742, on a public spirited plan, formed and put in execution by the learned Mr. Franklin; for he perfuaded first the most substantial people in the town to pay forty shillings at the outfet, and afterwards annually ten shillings, all in Penfylvania currency, towards purchasing all kinds of useful books. The subscribers are entitled to make use of the books. Other people are likewife at liberty to borrow them for a certain time, but must leave a pledge, and pay eight-pence a week for a folio volume, fix-pence for a quarto, and four-pence for all others of a fmaller fize. As foon as the time allowed a person for the perusal of the volume is elapsed, it must be returned, or he is fined. The money arising in this manner is employed for the falary of the librarian, and for purchasing new books. There is already a fine collection of excellent works, most of them English, many French and Latin, but few in any other language. The subscribers were fo kind to me, as to order the librarian, during my stay here, to lend me every book which I should want, without requiring any payment. The library was open every Saturday from four to eight o'clock in the afternoon. Besides the books, several mathematical and physical inftruments, and a large collection of natural curiofities, were 10 be feen in it. Several little libraries were founded in the town on the fame footing or nearly with this.

The court-house stands in the middle of Market-street, to the west of the market; it is a fine building, with a little tower in which there is a bell. Below and round

about this building the market is properly kept every week.

The building of the academy is in the western part of the town. It was formerly, as I have before mentioned, a meeting-house of the followers of Whitesield; but they sold it in the year 1750, and it was destined to be the seat of an university, or to express myself in more exact terms, to be a college; it was therefore fitted up to this purpose. The youths are here only taught those things which they learn in our common schools; but in time, such lectures are intended to be read here as are usual in real universities.

At the close of the last war, a redoubt was erected here, on the south side of the town, near the river, to prevent the French and Spanish privateers from landing. But this was done after a very strong debate. For the Quakers opposed all fortifications, as contrary to the tenets of their religion, which allow not Christians to make war, either offensive or defensive, but direct them to place their trust in the Almighty alone. Several papers were then handed about for and against the opinion. But the enemy's privateers having taken several vessels belonging to the town, in the river, many of the Quakers, if not all of them, found it reasonable to forward the building of the fortification as much as possible, at least by a supply of money.

Of

Of all the natural advantages of the town its temperate climate is the most considerable, the winter not being over severe, and its duration but thort, and the summer not too hot; the country round about bringing forth those fruits in the greatest plenty, which are raised by husbandry. Their September and October are like the beginning of the Swedish August. And the first days in their February are frequently as pleasant as the end of April and the beginning of May in Sweden. Even their coldest days in some winters have been no severer than the days at the end of autumn are in the middlemost parts of Sweden, and the southern ones of Finland.

The good and clear water in Philadelphia is likewife one of its advantages. For though there are no fountains in the town, yet there is a well in every house, and several in the streets, all which afford excellent water for boiling, drinking, washing, and other uses. The water is commonly met with at the depth of forty seet. The water of the river Delaware is likewise good. But in making the wells, a fault is frequently committed, which in several places of the town spoils the water, which is naturally

good; I shall in the sequel take an opportunity of speaking further about it.

The Delaware is exceeding convenient for trade. It is one of the greatest rivers in the world: is three English miles broad at its mouth, two miles at the town of Wilmington, and three quarters of a mile at Philadelphia. This city lies within ninety or an hundred English miles from the fea, or from the place where the river Delaware discharges itself into the bay of that name. Yet its depth is hardly ever less than five or fix fathoms. The greatest ships therefore can fail quite up to the town, and anchor in good ground in five fathoms of water, on the side of the bridge. The water here has no longer a faltish taste, and therefore all destructive worms which have fastened themselves to the ships in the fea, and have pierced holes into them, either die, or drop off, after the ship has been here for a while.

The only disadvantage which trade labours under here is the freezing of the river almost every winter for a month or more. For during that time the navigation is entirely stopped. But this does not happen at Boston, New York, and other towns

which are nearer the fea.

The tide comes up to Philadelphia, and even goes thirty miles higher, to Trenton.

The difference between high and low water is eight feet at Philadelphia.

The cataracts of the Delaware, near Trenton, and of the Skulkill, at fome distance from Philadelphia, make these rivers useless further up the country, in regard to the conveyance of goods either from or to Philadelphia. Both must therefore be carried on waggons or carts. It has therefore already been thought of to make these two rivers navigable in time, at least for large boats and small vessels.

Several ships are annually built of American oak, in the docks which are made in different parts of the town and about it; yet they can by no means be put in com-

parison with those built of European oak, in point of goodness and duration.

The town carries on a great trade both with the inhabitants of the country, and to other parts of the world, especially to the West Indies, South America, and the Antilles; to England, Ireland, Portugal, and to several English colonies in North America.

Yet none but English ships are allowed to come into this port.

Philadelphia reaps the greatest profits from its trade to the West Indies: for thither the inhabitants ship almost every day a quantity of slour, butter, sless, and other victuals, timber, plank, and the like. In return they receive either sugar, molasses, rum, indigo, mahogany, and other goods, or ready money. The true mahogany, which grows in Jamaica, is at present almost all cut down.

They

They fend both West India goods and their own productions to England; the latter are all forts of woods, especially black walnut, and oak planks for ships; ships ready built, iron, hides, and tar. Yet this latter is properly bought in New Jersey, the forests of which province are consequently more ruined than any others. Ready money is likewise sent over to England; from whence in return they get all sorts of goods there manufactured, viz. since and coarse cloth, linen, iron ware, and other wrought metals, and East India goods; for it is to be observed, that England supplies Philadelphia with almost all stuffs and manufactured goods which are wanted here.

A great quantity of linfeed goes annually to Ireland, together with many of the ships which are built here. Portugal gets wheat corn, flour, and maize which is not ground. Spain fometimes takes some corn. But all the money which is got in these several countries, must immediately be sent to England, in payment for the goods which are

got from thence, and yet those sums are not sufficient to pay all the debts.

But to fhew more exactly what the town and province have imported from England, in different years, I shall here insert an extract from the English custom-house books, which I got from the engineer Lewis Evans, at Philadelphia. This gentleman had defired one of his friends in London to send him a complete account of all the goods shipped from England to Pensylvania in several years. He got this account, and though the goods are not enumerated in it, yet their value in money is calculated. Such extracts from the custom-house books have been made for every North American province, in order to convince the English parliament, that those provinces have taken greater quantities of the goods in that kingdom ever since they have turned their money into bills.

I have taken the copy from the original itself; and it is to be observed that it begins with the Christmas of the year 1722, and ends about the same time of the year 1747. In the first column is the value of the foreign goods, the duty for which has already been paid in England. The second column shews the value of the goods manufactured in England, and exported to Pensylvania. And in the last column these two sums are added together, but at the bottom each of the columns is cast up.

But this table does not include the goods which are annually shipped in great quantities to Pensylvania from Scotland and Ireland, among which is a great quantity of

linen.

1	The Value of the Goods annually shipped from England to Penfylvania.									
	The Year, from one Christmas to another.	Foreign Goods for which the duty has already been paid, and which therefore only require receipts.			English manufactured Goods.			The Sums of thefe two preceding co- lumns added together.

The whole extent of the Philadelphia trade may be comprehended from the number of ships which annually arrive at and sail from this town. I intend to insert here a table of a few years, which I have taken from the gazettes of the town. The ships coming and going in one year, are to be reckoned from the twenty-sifth of March of that year to the twenty-sifth of March of the next.

The Year.			Ships arrived.					Ships failed.

1746.	-	-	-	273	-	**	-	293		

But it is much to be feared that the trade of Philadelphia, and of all the English colonies, will rather decrease than increase, in case no provision is made to prevent it. I shall hereaster plainly shew upon what foundation this decrease of trade is likely to take place.

The

The town not only furnishes most of the inhabitants of Pensylvania with the goods which they want, but numbers of the inhabitants of New Jersey come every day and

carry on a great trade.

The town has two great fairs every year; one in May, and the other in November, both on the fixteenth days of those two months. But besides these fairs, there are every week two market days, viz. Wednesday and Saturday. On those days the country people in Pensylvania and New Jersey bring to town a quantity of victuals, and other productions of the country, and this is a great advantage to the town. It is therefore to be wished that the like regulation might be made in our Swedish towns. You are sure to meet with every produce of the season, which the country assorbs, on the market-days. But on other days they are in vain sought for.

Provisions are always to be got fresh here, and for that reason most of the inhabitants never buy more at a time than what will be sufficient till the next market-day. In summer there is a market almost every day; for the victuals do not keep well in the great heat. There are two places in the town where these markets are kept; but that near the court-house is the principal. It begins about four or five o'clock in the

morning, and ends about nine o'clock in the forenoon.

The town is not enclosed, and has no other custom-house than the great one for the

ships.

The governor of the whole province lives here; and though he is nominated by the heirs of Pen, yet he cannot take that office without being confirmed by the King of England.

The quakers of almost all parts of North America, have their great affembly here

once a year

In 1743, a fociety for the advancement of the sciences was erected here. Its objects would have been the curiosities of the three kingdoms, of nature, mathematics, physic, chemistry, economy, and manufactures. But the war, which ensued immediately, stopped all designs of this nature, and since that time, nothing has been done towards establishing any thing of this kind.

The declination of the needle was here observed on the thirtieth of October 1750, old style, to be five degrees and forty-five minutes west. It was examined by the new meridian, which was drawn at Philadelphia in the autumn of the same year, and extended a mile in length. By experience it appears, that this declination lesses about a

degree in twenty years' time.

The greatest difference in the rising and falling of the barometer is, according to the observations made for several years together by Mr. James Logan, found at 28" 59 and 30" 78.

Here are three printers; and every week two English, and one German newspaper

is printed.

In 1732, on the fifth of September, old style, a little earthquake was felt here about noon, and at the same time at Boston in New England, and at Montreal in Canada,

which places are above fixty Swedish miles afunder.

In November 1737, the well known Prince from Mount Lebanon, Sheich Sidi, came to Philadelphia, on his travels through most of the English American colonies. And in the same year a second earthquake was felt about eleven o'clock at night, on the seventh of December. But it did not continue above half a minute, and yet it was felt, according to the accounts of the gazettes, at the same hour in Newcastle, New York, New London, Boston, and other towns of New England. It had therefore likewise reached several miles.

The Count Sinzendorf * arrived here in the December of the year 1741, and continued till the next fpring. His uncommon behaviour perfuaded many Englishmen

of rank, that he was difordered in his head.

I have not been able to find the exact number of the inhabitants of Philadelphia. In the year 1746, they were reckoned above ten thousand, and fince that time their number is incredibly increased. Neither can it be made out from the bills of mortality, fince they are not kept regularly in all the churches. I shall, however, mention some of those which appeared either in the gazettes or in bills printed on purpose.

Year.	Dead.	Year.	Dead.	Year.	Dead.
173c.	227	1741.	345	1745.	420
1738.	250	1742.	409	1748.	672
1739.	350	1743.	425	1749.	758
1740.	290	1744.	410	1750.	716

From these bills of mortality it also appears, that the diseases which are the most fatal, are consumptions, severs, convulsions, pleurisies, hæmorrhages, and dropsies.

The number of those that are born cannot be determined, since in many churches no order is observed with regard to this affair. The Quakers, who are the most numerous in this town, never baptize their children, though they take a pretty exact account of all who are born among them.

It is likewise impossible to guess at the number of inhabitants from the dead, because the town gets such great supplies annually from other countries. In the summer of the year 1749, near twelve thousand Germans came over to Philadelphia, many of whom staid in that town. In the same year the houses in Philadelphia were counted, and

found to be two thousand and seventy-six in number.

The town is now quite filled with inhabitants, which in regard to their country, religion, and trade, are very different from each other. You meet with excellent mafters in all trades, and many things are made here full as well as in England. Yet no manufactures, especially for making fine cloth, are established. Perhaps the reason is, that it can be got with so little difficulty from England, and that the breed of sheep which is brought over, degenerates in process of time, and affords but a coarse wool.

Here is great plenty of provisions, and their prices are very moderate. There are

no examples of an extraordinary dearth.

Every one who acknowledges God to be the creator, preferver, and ruler of all things, and teaches or undertakes nothing against the state, or against the common peace, is at liberty to settle, stay, and carry on his trade here, be his religious principles ever so strange. No one is here molested on account of the crroneous principles of the doctrine which he follows, if he does not exceed the above-mentioned bounds. And he is so well secured by the laws in his person and property, and enjoys such liberties, that a citizen of Philadelphia may in a manner be said to live in his house like a king.

On a careful confideration of what I have already faid, it will be eafy to conceive how this city should rife so suddenly from nothing, into such grandeur and perfection, without supposing any powerful monarch's contributing to it, either by punishing the wicked, or by giving great supplies in money; and yet its fine appearance, good regulations, agreeable situation, natural advantages, trade, riches and power, are by no means inferior to those of any, even of the most ancient towns in Europe. It has

not been necessary to force people to come and settle here; on the contrary, foreigners of disserent languages have left their country, houses, property, and relations, and ventured over wide and stormy seas, in order to come hither. Other countries, which have been peopled for a long space of time, complain of the small number of their inhabitants. But Pensylvania, which was no better than a defart in the year 1681, and hardly contained sive hundred people, now vies with several kingdoms in Europe in number of inhabitants. It has received numbers of people, which other

countries, to their infinite lofs, have either neglected or expelled.

A wretched old wooden building, on a hill near the river fomewhat north of the Wickako church, belonging to one of the Sons of Sven, of whom, as before mentioned, the ground was bought for building Philadelphia upon, is preferved on purpose, as a memorial of the poor state of that place before the town was built on it. Its antiquity gives it a kind of superiority over all the other buildings in town, though in itself the worst of all. This hut was inhabited, whilst as yet stags, deers, elks, and beavers, at broad day-light, lived in the future streets, church-yards, and market-places of Philadelphia. The noise of a spinning wheel was heard in this house, before the manusactures now established were thought of, or Philadelphia built. But with all these advantages, this house is ready to fall down, and, in a few years to come, it will be as difficult to find the place where it stood, as it was unlikely at the time of its erection, that one of the greatest towns in America should in a short time stand close up to it.

Sept. 7th. Mr. Peter Cock, a merchant of this town, affured me that he had last week himself been a spectator of a snake's swallowing a little bird. This bird, which from its cry has the name of cat-bird, (muscicapa carolinensis, Linn.) slew from one branch of a tree to another, and was making a doleful tune. At the bottom of the tree, but at a fathom's distance from the stem, lay one of the great black snakes, with its head continually upright, pointing towards the bird, which was always fluttering about, and now and then settling on the branches. At first it only kept in the topmost branches, but by degrees it came lower down, and even slew upon the ground, and hopped to the place where the snake lay, which immediately opened its mouth, caught the bird, and swallowed it; but it had scarce sinished its repast before Mr. Cock came up and killed it. I was afterwards told that this kind of snakes was frequently observed to pursue little birds in this manner. It is already well known that

the rattle-fnake does the fame.

As I walked out into the fields I found feveral European and even Swedish plants growing there. But those which are peculiar to America, are much more numerous.

The Virginian maple grows in plenty on the shores of the Delaware. The English in this country call it either buttonwood, or waterbeech, which latter name is most usual. The Swedes call it wattenbok, or wasbok. It is Linnæus's platanus occidentalis. See Catesby's Nat. Hist. of Carolina, vol. i. p. 56. t. 56. It grows for the greatest part in low places, but especially on the edge of rivers and brooks. But these trees are easily transplanted to more dry places, if they be only silled with good soil; and as their leaves are large, and their soliage thick, they are planted about the horses and in gardens, to afford a pleasant shade in the hot season. Some of the Swedes had boxes, pails, and the like, made of the bark of this tree by the native Americans. They say that those people, whilst they were yet settled here, made little dishes of this bark for gathering whortleberries. This tree likewise grows in marshes, or in swampy stelds, where ash and red maple commonly grow. They are frequently as tall and thick

thick as the best of our fir trees. The seed stays on them till spring, but in the middle of April the pods open and shed the seeds. Query, Whether they are not ripe before that time, and consequently sooner sit for sowing? This American maple is remarkable for its quick growth, in which it exceeds all other trees. There are such numbers of them on the low meadows between Philadelphia and the ferry at Gloucester, on both sides of the road, that in summer time you go as it were through a shady walk. In that part of Philadelphia which is near the Swedish church, some great trees of this kind stand on the banks of the river. In the year 1750, on the 15th of May, I saw the buds still on them; and in the year 1749 they began to slower on the eighth of that month. Several trees of this fort are planted at Chelsea, near

London, and they now, in point of height, vie with the tallest oak.

Sept. 18th. In the morning I went with the Swedish painter, Mr. Hesselius, to the country feat of Mr. Bartram, which is about four English miles to the fouth of Philadelphia, at some distance from the high road to Maryland, Virginia, and Carolina. I had therefore the first opportunity here of getting an exact knowledge of the state of the country, which was a plain covered with all kinds of trees with deciduous leaves. The ground was fandy, mixed with clay; but the fand feemed to be in greater quantity. In fome parts the wood was cut down, and we faw the habitations of fome country people, whose corn-fields and plantations were round their farm-houses. wood was full of mulberry-trees, walnut-trees of feveral kinds, chefnut-trees, faffafras, and the like. Several forts of wild vines clasped their tendrils round, and climbed up to the fummits of the highest trees; and in other places they twined round the enclosures, fo thick, that the latter almost funk down under their weight. The perfimon, or diofpyros Virginiana, Linn. sp. pl. p. 1510, grew in the marshy fields and about fprings. Its little apples looked very well already, but are not fit for eating, before the frost has affected them, and then they have a very fine taste. Hesselius gathered fome of them, and defired my fervant to taste of the fruits of the land; but this poor credulous fellow had hardly bit into them, when he felt the qualities they have before the frost has penetrated them. For they contracted his mouth so that he could hardly speak, and had a very disagreeable taste. This disgusted him so much that he was with difficulty perfuaded to tafte of it during the whole of our flay in America, notwithflanding it lofes all its acidity, and acquires an agreeable flavour in autumn and towards the beginning of winter. For the fellow always imagined, that though he should eat them ever so late in the year, they would still retain the same difagreeable tafte.

To fatisfy the curiofity of those who are willing to know how the woods look in this country, and whether or no the trees in them are the same with those found in our forests, I here insert a small catalogue of those which grow spontaneously in the woods which are nearest to Philadelphia. But I exclude such shrubs as do not attain any considerable height. I shall put that tree first in order, which is most plentful, and so on with the rest, and therefore trees which I have found but single, though near the town,

vill be laft.

1. Quercus alba, the white oak, in good ground.

2. Quercus rubra, or the black oak.

3. Quercus Hispanica, the Spanish oak, a variety of the preceding.

4. *luglans alba*, hiccory, a kind of walnut tree, of which three or four varieties are to be me with.

5. Rucus occidentalis, or American blackberry shrub.

6. Acer rubrum, the maple tree with red flowers, in fwamps.

7. Rhus glabra, the fmooth leaved fumach, in the woods, on high glades, and old corn fields.

8. Vitis labrusca and Vulpina, vines of several kinds.

9. Sambucus Canadensis, American elder tree, along the hedges and on glades.

10. Quercus phellos, the fwamp oak, in moraffes.

- 11. Azalca lutea, the American upright honey-fuckle, in the woods in dry places.
- 12. Cratægus Crus galli, the Virginian azarole, in woods.
 13. Vaccinium ———, a species of whortleberry shrub.

14. Quercus prinus, the chesnut oak, in good ground.

15. Cornus florida, the cornelian cherry, in all kinds of ground. 16. Liriodendron Tulipifera, the tulip tree, in every kind of foil.

17. Prunus Virginiana, the wild cherry tree.

18. Vaccinium ———, a frutex whortleberry, in good ground.

19. Prinos verticillatus, the winterberry tree, in swamps.

20. Platanus occidentalis, the water-beech.

21. Ny sa aquatica, the tupelo tree, on fields and mountains. *

22. Liquidambar styraciflua, sweet gum tree, near springs.

- 23. Betula Alnus, alder, a variety of the Swedish; it was here but a shrub. 24. Fagus castanea, the chesnut tree, on corn-fields, pastures, and in little woods.
- 25. Juglans nigra, the black walnut tree, in the fame place with the preceding tree:

26. Rhus radicans, the twining fumach, climbed along the trees.

27. Acer Negundo, the ash-leaved maple, in morasses and swampy places.

28. Prunus domestica, the wild plum tree. 29. Ulmus Americana, the white elm.

30. Prunus spinosa, sloe shrub, in low places.

31. Laurus sassafras, the sassafras tree, in a loose soil mixed with sand.

32. Ribes nigrum, the currant tree, grew in low places and in marshes.

33. Fraxinus excelfior, the ash tree, in low places.

- 34. Smilax laurifolia, the rough bind weed with the bay leaf, in woods and on pales or enclosures.
- 35. Kalmia latifolia, the American dwarf laurel, on the northern fide of mountains.
 - 36. Morus rubra, the mulberry tree, on fields, hills, and near the houses.
 - 37. Rhux vernix, the poisonous sumach, in wet places. 38. Quercus rubra, the red oak, but a peculiar variety.
 - 39. Hamamelis virginica, the witch hazel. 40. Diopspyros Virginiana, the persimon. 41. Pyrus coronaria, the anchor tree.

42. Juniperus Virginiana, the red juniper, in a dry poor foil.

43. Laurus astivalis, spice wood, in a wet soil.

44. Carpinus oftrya, a species of horn beam, in a good soil.

45. Carpinus betulus, a horn beam, in the fame kind of foil with the former.

46. Fagus fylvatica, the beech, likewife in good foil.

^{*} Dr. Linnæus mentions only one species of Nyssa, namely Nyssa aquatica; Mr. Kalm does not mention the name of the species, but it his is not a different species, it must at least be a variety, since he says it grows on hills, whereas the aquatica grows in the water. F.

- 47. Yuglans ——, a species of walnut tree, on hills near rivers *, called by the Swedes butternustræ.
- 48. Pinus Americana, Penfylvanian fir tree, on the north fide of mountains, and in vallies †.
 - 49. Betula lenta, a species of birch, on the banks of rivers. 50. Cephalantus occidentalis, button wood, in wet places.
 - 51. Pinus tæda, the New Jersey fir tree, on dry fandy heaths.

52. Cercis Canadensis, the fallad tree, in a good soil.

53. Robinia pseudacacia, the locust tree, on the corn-fields.

54. Magnolia glauca, the laurel-leaved tulip tree, in marshy soil.

55. Tilia Americana, the lime tree, in a good foil.

56. Gleditsia triacanthos, the honey locust tree, or three-thorned acacia, in the same soil.

57. Celtis occidentalis, the nettle tree, in the fields.

58. Annona muricata, the custard apple, in a fruitful soil.

We vifited feveral Swedes, who were fettled here, and in very good circumstances. One of them (Andrew Rambo) has a fine house built of stone, two stories high, and a great orchard near it. We were every where well received, and stayed over night with the above-mentioned countryman. We faw no other marks of autumn than that feveral fruits of this feafon were already ripe. For befides this, all the trees were yet as green, and the ground still as much covered with flowers, as in our fummer. Thousands of frogs croaked all the night long in the marshes and brooks. The locusts and grashoppers made likewise such a great noise, that it was hardly posfible for one person to understand another. The trees too were full of all sorts of birds, which by the variety of their fine plumage delighted the eye, while the infinite variety of their tunes were continually re-echoed.

The orchards, along which we paffed to-day, were only enclosed by hurdles. But they contained all kinds of fine fruit. We wondered at first very much when our leader leaped over the hedge into the orchards, and gathered fome agreeable fruit for But our assonishment was still greater, when we saw that the people in the garden were fo little concerned at it, as not even to look at us. But our companion told us, that the people here were not fo exact in regard to a few fruits, as they are in other countries where the foil is not fo fruitful in them. We afterwards found very frequently that the country people in Sweden and Finland guarded their turnips

more carefully, than the people here do the most exquisite fruits.

Sept. 19th. As I walked this morning into the fields, I observed that a copious dew was fallen; for the grass was as wet as if it had rained. The leaves of the plants and trees had contracted fo much moisture that the drops ran down. I found on this occasion that the dew was not only on the superior, but likewise on the inferior side of the leaves. I therefore carefully confidered many leaves both of trees and of other plants; both of those which are more above, and of those which are nearer to the ground. But I found in all of them, that both fides of the leaves were equally bedewed, except those of the verbascum thapfus, or great mullein, which, though their fuperior fide was pretty well covered with the dew, yet their inferior had but a little.

^{*} Quere. Is this the Juglans baccata of Linnæus? F. + This species is not to be met with in Linn. spec. plant. F.

Every countryman, even a common peafant, has commonly an orchard near his house, in which all forts of fruit, such as peaches, apples, pears, cherries, and others, are in plenty. The peaches were now almost ripe. They are rare in Europe, particularly in Sweden; for in that country hardly any people besides the rich taste them. But here every countryman had an orchard full of peach trees, which were covered with such quantities of fruit, that we could scarcely walk in the orchard without treading upon those peaches which were fallen off; many of which were usually left on the ground, and only part of them sold in town, and the rest was consumed by the

family and strangers. Nay this fine fruit was frequently given to the swine.

This fruit is however formetimes kept for winter use, and prepared in the following manner. The fruit is cut into four parts, the stone thrown away, and the fruit put upon a thread, on which they are exposed to the funshine in the open air, till they are fufficiently dry. They are then put into a veffel for winter. But this manner of drying them is not very good, because the rain of this season very easily spoils and purifies them, whilft they hang in the open air. For this reason a different method is followed by others, which is by far the most eligible. The peaches are as before cut into four parts, are then either put upon a thread, or laid upon a board, and fo hung up in the air when the fun finnes. Being dried in fome measure, or having lost their juice by this means, they are put into an oven, out of which the bread has but just been taken, and are left in it for a while. But they are foon taken out and brought into the fresh air; and after that they are again put into the oven, and this is repeated feveral times, till they are as dry as they ought to be. For if they were dried up at once in the oven, they would firrivel up too much, and lofe part of their flavour. They are then put up and kept for the winter. They are either baked into tarts and pyes, or boiled and prepared as dried apples and pears are in Sweden. Several people here dry and preferve their apples in the fame manner as their peaches.

The peach trees were, as I am told, first planted here by the Europeans. But at present they succeed very well, and require even less care than our apple and pear trees.

The orchards have feldom other fruit than apples and peaches. Pear trees are fearce in this province. They have cherry trees in the orchards, but commonly on the fides of them towards the house, or along the enclosures. Mulberry trees are planted on some hillocks near the house, and sometimes even in the court-yards of the house. The black walnut trees, or Juglans nigra, grow partly on hills, and in fields near the farm-houses, and partly along the enclosures; but most commonly in the forests. No other trees of this kind are made use of here. The chefnuts are left in the fields; here and there is one in a dry field, or in a wood.

The Hibifcus esculentus, or Okra*, is a plant which grows wild in the West Indies, but is planted in the gardens here. The fruit, which is a long pod, is cut whilst it is green, and boiled in soups, which thereby become as thick as pulse. This dish is

reckoned a dainty by fome people, and especially by the negroes.

Capficum annuum, or Guinea pepper, is likewise planted in gardens. When the fruit is ripe it is almost entirely red, it is put to a roasted or boiled piece of meat, a little of it being strewed upon it, or mixed with the broth. Besides this, cucumbers are pickled with it. Or the pods are pounded whilst they are yet tender, and being mixed with salt are preserved in a bottle; and this spice is strewed over roasted or boiled meat, or fried sish, and gives them a very sine taste. But the fruit by itself is as biting as common pepper.

^{*} In Miller's Gardener's Dictionary, it is called Ketmia Indica folio ficus, fructu pentagono, recurvo, esculento, graciliori, et longiori.

This country contains many species of the plant which Dr. Linnæus calls Rhus, and the most common is the Rhus foliis pinnatis serratis lanceolatis retrinque nudis, or the Rhus glabra. The English call this plant Sumach. But the Swedes here have no particular name for it, and therefore make use of the English name. Its berries or fruits are red. They are made use of for dying, and afford a colour like their own. This tree is like a weed in this country, for if a corn-field is left uncultivated for fome few years together, it grows on it in plenty, fince the berries are fpread every where by the birds. And when the ground is to be ploughed, the roots stop the plough very much. The fruit flays on the shrub during the whole winter. But the leaves drop very early in autumn, after they are turned reddish, like those of our Swedish mountain ash. The branches boiled with the berries afford a black ink like tincture. The boys eat the berries, there being no danger of falling fick after the repail; but they are very They feldom grow above three yards high. On cutting the ftem, it appears that it contains nothing but pith. I have cut feveral in this manner, and found that fome were ten years old; but that most of them were above one year old. When the cut is made, a yellow juice comes out between the bark and the wood. One or two of the most outward circles are white, but the innermost are of a yellowish green. It is eafy to diftinguish them one from another. They contain a very plentiful pith, the diameter of which is frequently half an inch, and fometimes more. It is brown, and fo loofe that it is eafily pushed out by a little stick, in the same manner as the pith of the elder tree, rafpberry, and blackberry, bushes. This fumach grows near the enclofures, round the corn-fields, but especially on fallow ground. The wood feemed to burn well, and made no great crackling in the fire.

Sept. 20. In the morning we walked in the fields and woods near the town, partly for gathering feeds, and partly for gathering plants for my herbal, which was our principal occupation; and in the autumn of this year, we fent part of our collection to

England and Sweden.

A species of Rhus, which was frequent in the marshes here, was called the poison tree by both English and Swedes. Some of the former gave it the name of swampfumach, and my countrymen gave it the fame name. Dr. Linnæus in his botanical works calls it Rhus Vernix. Sp. pl. 1. 380. Flor. Virgin. 45. An incifion being made into the tree, a whitish yellow juice, which has a nauseous smell, comes out between the bark and the wood. This tree is not known for its good qualities, but greatly fo for the effect of its poilon, which though it is noxious to fome people, yet does not in the least affect others. And therefore one person can handle the tree as he pleases, cut it, peel off its bark, rub it or the wood upon his hands, smell at it, spread the juice upon his skin, and make more experiments, with no inconvenience to himself; another person, on the contrary, dares not meddle with the tree while its wood is fresh, nor can be venture to touch a hand which has handled it, nor even to expose himself to the fmoke of a fire which is made with this wood, without foon feeling its bad effects; for the face, the hands, and frequently the whole body, fwells exceffively, and is affected with a very acute pain. Sometimes bladders or blifters arife in great plenty, and make the fick person look as if he was infected by a leprosy. In some people the external thin skin, or cuticle, peels off in a few days, as is the case when a person has scalded or burnt any part of his body. Nay, the nature of fome perfons will not even allow them to approach the place where the tree grows, or to expose themselves to the wind, when it carries the effluvia or exhalations of this tree with it, without letting them feel the inconvenience of the fwelling, which I have just now described. Their eyes are sometimes thut up for one, or two and more days together, by the fwelling. I know two brothers,

one of whom could without danger handle this tree in what manner he pleafed, whereas the other could not come near it without fwelling. A perfon fometimes does not know that he has touched this poisonous plant, or that he has been near it, before his face and hands shew it by their swelling. I have known old people who were more asraid of this tree than of a viper; and I was acquainted with a person who, merely by the noxious exhalations of it, was swelled to such a degree that he was as stiff as a log of wood, and was turned about in his bed.

On relating, in the winter of the year 1750, the poisonous qualities of the fwamp fumuch to my Yungstroem, he only laughed, and looked upon the whole as a fable, in which opinion he was confirmed by his having often handled the tree the autumn before, cut many branches of it, which he had carried for a good while in his hand, in order to preferve its feeds, and put many into the herbals, and all this without feeling the least inconvenience. He would therefore, being a kind of philosopher in his own way, take nothing for granted of which he had no fufficient proofs, especially as he had his own experience in the fummer of the year 1749, to support the contrary opinion. But in the next fummer his fystem of philosophy was overturned, for his hands fwelled, and he felt a violent pain and itching in his eyes, as foon as he touched the tree, and this inconvenience not only attended him when he meddled with this kind of fumach, but even when he had any thing to do with the rhus radicans, or that species of fumach which climbs along the trees, and is not by far so poisonous as the former. By this adventure he was so convinced of the power of the poison tree, that I could not eafily perfuade him to gather more feeds of it for me. But he not only felt the noxious effects of it in fummer, when he was very hot, but even in winter, when both he and the wood were cold. Hence it appears, that though a perfon be fecured against the power of this poison for some time, yet, that in length of time, he may be affected with it, as well as people of a weaker conftitution.

I have likewise tried experiments of every kind with the poison tree on myself. I have spread its juice upon my hands, cut and broke its branches, peeled off its bark, and rubbed my hands with it, finelt at it, carried pieces of it in my bare hands, and repeated all this frequently without feeling the baneful effects fo commonly annexed to it; but I however once experienced that the poifon of the fumach was not entirely without effect upon me. On a hot day in fummer, as I was in fome degree of perspiration, I cut a branch of the tree, and carried it in my hand for about half an hour together, and finelt at it now and then. I felt no effects from it till in the evening; but next morning I awoke with a violent itching of my eye-lids, and the parts thereabouts; and this was fo painful, that I could hardly keep my hands from it. It ceafed after I had washed my eyes for a while with very cold water; but my eye-lids were very stiff all that day; at night the itching returned; and in the morning as I awoke, I felt it as ill as the morning before, and I used the same remedy against it. However, it continued almost for a whole week together, and my eyes were very red, and my eye-lids were with difficulty moved during all that time. My pain ceafed entirely afterwards. About the fame time, I had fpread the juice of the tree very thick upon my hand. Three days after they occasioned blifters, which soon went off without affecting me much. I have not experienced any thing more of the effects of this plant, nor had I any defire so to do. However, I found that it could not exert its power upon me when I was not perspiring.

I have never heard that the poison of this fumach has been mortal; but the pain ceases after a few days duration. The natives formerly made their flutes of this tree, because it has a great deal of pith. Some people assured me, that a person suffering

3 F 2

from its noisome exhalations, would easily recover by spreading a mixture of the wood burnt to charcoal, and hog's lard, upon the swelled parts. Some afferted that they had really tried this remedy. In some places this tree is rooted out, on purpose that its

poilon may not affect the workmen.

I received, as a present, several curiosities belonging to the mineral kingdom, which were collected in the country. The following were those which were most worth attention. The first was a white and quite transparent chrystal*. Many of this kind are found in Pensylvania, in several kinds of stone, especially in a pale-grey limestone. The pieces are of the thickness and length of the little singer, and commonly as transparent as possible. But I have likewise got crystals here, of the length of a foot, and of the thickness of a middle-sized man's leg. They were not so transparent as the former.

The cubic pyrites of Bishop Browallius †, was of a very regular texture; but its cubes were different in fize, for in some of the cubes the planes of the fides only amounted to a quarter of an inch, but in the biggest cubes they were full two inches. Some were exceedingly glittering, so that it was very easy to be perceived that they consisted of sulphureous pyrites; but in some, one or two sides only glittered so well, and the others were dark-brown. Yet most of these marcasites had this same colour on all the sides. On breaking them they shewed the pure pyrites. They are found near Lancaster in this province, and sometimes lie quite above the ground; but commonly they are found at the depth of eight feet or more from the surface of the ground, on digging wells and the like. Mr. Hesselius had several pieces of this kind of stone, which he made use of in his work. He first burnt them, then pounded or ground them to a powder, and at last rubbed them still siner in the usual way; and this afforded him a fine reddish-brown colour.

Few black pebbles are found in this province, which on the other hand, yields many kinds of marble, efpecially a white one, with pale-grey bluish spots, which is found in a quarry at the distance of a few English miles from Philadelphia, and is very good for working, though it is not one of the finest kind of marbles. They make many tombstones and tables, enchase chimneys and doors, sloors of marble slags in the rooms, and the like, of this kind of marble. A quantity of this commodity is shipped to different parts of America.

Muscovy glast is found in many places hereabouts, and some pieces of it are pretty large, and as fine as those which are brought from Russia. I have seen some of them which were a foot and more in length; and I have several in my collection that are nearly nine inches square. The Swedes on their first arrival here made their windows

of this native glass.

A pale grey fine limestones, of a compact texture, lies in many places hereabouts, and affords a fine lime. Some pieces of it are so full of fine transparent crystals, that

al most

almost half of the stone consists of nothing clse. But besides this limestone, they make lime near the sea-shore from oyster shells, and bring it to town in winter, which is said to be worse for masonry, but better for white-washing than that which is got from the limestone.

Coals have not yet been found in Penfylvania, but people pretend to have feen thein higher up in the country among the natives. Many people however agree that they are

met with in great quantity more to the north, near Cape Breton *.

The ladies make wine from some of the fruits of the land. They principally take white and red currants for that purpose, since the shrubs of this kind are very plentiful in the gardens, and succeed very well. An old failor, who had frequently been in Newfoundland, told me that red currants grew wild in that country in great quantity. They likewise make a wine of strawberries, which grow in great plenty in the woods, but are source than the Swedish ones. The American blackberries, or rubus occidentalis, are likewise made use of for this purpose, for they grow every where about the fields, almost as abundantly as thistles in Sweden, and have a very agreeable taste. In Maryland a wine is made of the wild grapes, which grow in the woods of that province. Raspberries and cherries which are planted on purpose, and taken great care of, likewise afford a very fine wine. It is unnecessary to give an account of the manner of making the currant wine, for in Sweden this art is in higher perfection than in North America.

Sept. 21st. The common privet, or ligustrum vulgare, Linn. grows among the bushes in thickets and woods; but I cannot determine whether it belongs to the indigenous plants, or to those which the English have introduced, the fruits of which the birds may have dispersed every where. The enclosures and pales are generally made here of wooden planks and posts; but a few good economists, having already thought of sparing the woods for future times, have begun to plant quick-hedges round their fields; and to this purpose they take the above-mentioned privet, which they plant in a little bank, which is thrown up for it. The soil every where hereabouts is a clay mixed with sand, and of course very loose. The privet-hedges however, are only adapted to the tameness of the cattle and other animals here; for the hogs all have a triangular yoke about their necks, and the other cattle are not very unruly. But in such places where the cattle break through the enclosures, hedges of this kind would make but a poor defence. The people who live in the neighbourhood of Philadelphia, are obliged to keep their hogs enclosed.

In the afternoon, I rode with Mr. Cock to his country feat, about nine miles from

the town, to the north-west.

The country on both fides of the road was covered with a great forest. The trees were all with annual leaves, and I did not see a single fir or pine. Most of the trees were different forts of oak; but we likewise saw chesnut, walnut, locust, and apple trees, with hiccory, blackberry bushes, and the like. The ground ceased to be so even as it was before, and began to look more like the English ground, diversified with hills and vallies. We found neither mountains nor great stones, and the wood was so much thinned, and the ground so uniformly even, that we could see a great way between the trees, under which we rode without any inconvenience, for there

^{*} This has been confirmed, fince Cape Breton is in the hands of the English; and it is reported that the strata of coals run through the whole isle, and some basset out to-day near the sea-shore, so that this isle will afford immense treasures of coals, when the government will find it convenient to have them dug for the benefit of the nation. F.

were no bushes to stop us. In some places, where the foil was thrown up, we saw some little stones of that kind of which the houses here are so generally built. I intend

to describe them in the sequel.

As we went on in the wood, we continually faw, at moderate distances, little fields which had been cleared of the wood. Each of these was a farm. These farms were commonly very pretty, and a walk of trees frequently led from them to the high-road. The houses were all built of brick, or of the stone which is here commonly met with. Every countryman, even though he were the poorest peasant, had an orchard with apples, peaches, chesnuts, walnuts, cherries, quinces, and such fruits, and sometimes we saw the vines climbing along them. The vallies were frequently provided with little brooks which contained a cryssal stream. The corn, on the sides of the road, was almost all mown, and no other grain besides maize and buckwheat was standing. The former was to be met with near each farm, in greater or lesser quantities; it grew very well and to a great length, the stalks being from fix to ten feet high, and covered with fine green leaves. Buckwheat likewise was not very uncommon, and in some places the people were beginning to reap it. I intend, in the sequel, to be more particular about the qualities and use of these kinds of corn.

After a ride of fix English miles, we came to Germantown; this town has only one street, but is near two English miles long. It is for the greatest part inhabited by Germans, who from time to time come from their country to North America, and settle here, because they enjoy such privileges, as they are not possessed of any where else. Most of the inhabitants are manufacturers, and make almost every thing in such quantity and perfection, that in a short time this province will want very little from England, its mother country. Most of the houses were built of the stone which is mixed with glimmer, and found every where towards Philadelphia, but is more scarce further on. Several houses however were made of brick. They were commonly two stories high, and sometimes higher. The roofs consisted of shingles of the white cedar wood. Their shape resembled that of the roofs in Sweden, but the angles they formed at the top were either obtuse, right angled, or acute, according as the slopes were steep or easy. They sometimes formed either the half of an octagon, or the half of a dodecagon.

Many of the roofs were made in fuch a manner that they could be walked upon, having a baluftrade round them. Many of the upper flories had balconies before them, from whence the people had a profpect into the ftreet. The windows, even those in the third flory, had flutters. Each house had a fine garden. The town had three churches, one for the Lutherans, another for the Reformed Proteslants, and the third for the Quakers. The inhabitants were so numerous, that the street was always

full. The Baptists have likewise a meeting-house.

Sept. 22d. After I had been at church, I employed the remainder of the day in converfing with the most considerable people in town, who had lived here for a long

while, and I enquired into the curiofities hereabouts.

Mr. Cock had a fine fpring near his house; it came from a fandy hill, and afforded water enough constantly to fill a little brook. Just above this spring Mr. Cock had erected a building from those above-mentioned glittering stones, into which were put many jugs and other earthern vessels full of milk: for it kept very well in cold water during the great heat with which the summer is attended here.

I afterwards met with many houses which were situated like this, on springs, and

therefore were defined to keep the meat and milk fresh.

Almost all the enclosures round the corn-fields and meadows hereabouts, were made

6

of planks fastened in a horizontal direction. I only perceived a hedge of privet in one fingle place. The enclosures were not made like ours; for the people here take posts from four to fix feet in height, and make two or three holes into them, fo that there was a distance of two feet and above between them. Such a post does the same fervice as two, and fometimes three poles are fcarce fufficient. The posts were fastened in the ground, at two or three fathoms distance from each other, and the holes in them kept up the planks, which were nine inches, and fometimes a foot broad, and lay above each other from one post to the next. Such an enclosure therefore looked at a diffance like the hurdles in which we enclose the sheep at night in Sweden. They were really no closer than hurdles, being only destined to keep out the greater animals, fuch as cows and horfes. The hogs are kept near the farm-houfes every where about Philadelphia, and therefore this enclosure does not need to be made closer on their account. Chefnut-trees were commonly made use of for this purpose, because this wood keeps longest against putrefaction; and an enclosure made of it can stand for thirty years together. But where no chefnut wood was to be got, the white and likewife black oaks were taken for that purpose. Of all kinds of wood, that of the red cedar holds out the longest. The greatest quantity of it is bought up here; for near Philadelphia it is not plentiful enough to be made use of for enclosures; however,

there are many enclosures near the town made of this wood.

The best wood for fuel, in every body's opinion, is the hiccory, or a species of walnut; for it heats well, but is not good for enclosures, fince it cannot well withstand putrefaction when it is in the open air. The white and black oaks are next in goodness for fuel. The woods with which Philadelphia is furrounded, would lead one to conclude, that fuel must be cheap there. But it is far from being fo, because the great and high forest near the town is the property of fome people of quality and fortune, who do not regard the money which they could make of them. They do not fell fo much as they require for their own use, and much lefs would they fell it toothers. But they leave the trees for times to come, expecting that wood will become much more scarce. However, they fell it to joiners, coach makers, and other artifts, who pay exorbitantly for it. For a quantity of hiccory of eight feet in length, and four in depth, and the pieces being likewife four feet long, they paid at prefent eighteen shillings of Pensylvanian currency. But the same quantity of oak only came to twelve shillings. The people who came at present to sell wood in the market were peafants, who lived at a great diffance from the town. Every body complained that fuel, in the space of a few years, was rifen in price to many times as much again as it had been; and to account for this, the following reasons were given: the town is increased to such a degree, as to be four or six times bigger and more populous than what fome old people have known it to be, when they were young. Many brick-kilns have been made hereabouts, which require a great quantity of wood. The country is likewise more cultivated than it used to be, and consequently, great woods have been cut down for that purpose, and the farms built in those places likewife confume a quantity of wood. Laftly, they melt iron out of the ore, in feveral places about the town, and this work always goes on without interruption. For thefe reasons it is concluded, in future times, Philadelphia will be obliged to pay a great price for wood.

The wine of blackberries, which has a very fine tafte, is made in the following manner. The juice of the blackberries is pressed out and put into a vessel, with half a gallon of this juice, an equal quantity of water is well mixed. Three pounds of brown sugar are added to this mixture, which must then stand for a while, and after that it is

fit for use. Cherry wine is made in the same manner; but care must be taken that when the juice is pressed out, the stones be not crushed, for they give the wine a bad taste.

They make brandy from peaches here, after the following method: the fruit is cut afunder, and the stones are taken out; the pieces of fruit are then put into a vessel, where they are left for three weeks or a month, till they are quite putrid; they are then put into a distilling vessel, and the brandy is made and afterwards distilled over again. This brandy is not good for people who have a more refined taste, but it is only for the common kind of people, such as workmen and the like.

Apples yield a brandy, when prepared in the fame manner as the peaches. But for this purpose those apples are chiefly taken which fall from the tree before they

are ripe.

The American night-shade, or phytolacca decandra, Linn. S. N. grows abundantly near the farms, on the high road, in hedges and bushes, and in several places in the fields. Whenever I came to any of these places I was sure of finding this plant in great abundance. Most of them had red berries, which grew in bunches, and looked very tempting, though they were not at all fit for eating. Some of these plants were yet in flower. In some places, such as in the hedges, and near the houses, they sometimes grow two fathoms high, but in the fields were always low; yet I could no where perceive that the cattle had eaten of it. A German of this place, who was a consectioner, told me, that the dyers gathered the roots of this plant and made a fine red dye of them.

Here are feveral species of squirrels. The ground squirrels, or sciurus striatus Linn. S. N. are commonly kept in cages, because they are very pretty; but they cannot be entirely tamed. The greater fquirrels, or fciurus cinereus, Linn. S. N. frequently do a great deal of mischief in the plantations, but particularly destroy the maize. For they climb up the stalks, cut the cars in pieces, and eat only the loofe and sweet kernel, which lies quite in the infide. They fometimes come by hundreds upon a maize-field, and then deftroy the whole crop of a countryman in one night. In Maryland therefore every one is obliged annually to bring four fquirrels, and their heads are given to the furveyor, to prevent deceit. In other provinces every body that kills fquirrels received twopence a-piece for them from the public, on delivering the heads. Their flesh is eaten and reckoned a dainty. The fkins are fold, but are not much effected. Squirrels are the chief food of the rattle-fnake and other fnakes; and it was a common fancy with the people hereabouts, that when the rattle-fnake lay on the ground, and fixed its eyes upon a squirrel, the latter would be as it were fascinated, and that though it were on the uppermost branches of a tree, yet it would come down by degrees, till it leaped into the fnake's mouth. The fnake then licks the little animal feveral times, and makes it wet all over with its spittle, that it may go down the throat easier. It then fwallows the whole fquirrel at once. When the fnake has made fuch a good meal, it lics down to rest without any concern.

The quadruped, which Dr. Linnæus, in the Memoirs of the Royal Academy of Sciences, has described by the name of ursus cauda elongata, and which he calls ursus lotor, in his Systema Naturæ, is here called raccoon. It is found very frequently, and destroys manychickens. It is hunted by dogs; and when it runs upon a tree to save itself, a man climbs upon the tree after it and shakes it down to the ground, where the dogs kill it. The slesh is caten, and is reputed to taste well. The bone of its male parts is made use of for a tobacco-stopper. The hatters purchase their skins, and make hats out of the hair, which are next in goodness to beavers. The tail is worn round the neck in winter,

and therefore is likewise valuable. The raccoon is frequently the food of snakes.

Some

Some Englishmen afferted that near the river Potomack in Virginia, a great quantity of oyster-shells were to be met with, and that they themselves had seen whole mountains of them. The place where they are found is said to be about two English miles distant from the sea-shore. The proprietor of that ground burns lime out of them. This stratum of oyster-shells is two fathoms and more deep. Such quantities of shells have likewise been found in other places, especially in New York, on digging in the ground, and in one place, at the distance of some English miles from the sea, a vast quantity of oyster-shells, and of other shells, was found. Some people conjectured that the natives had formerly lived in that place, and had left the shells of the oysters which they had consumed, in such great heaps. But others could not conceive how it hap-

pened that they were thrown in fuch immense quantities all into one place.

Every one is of opinion that the American favages were a very good-natured people, if they were not attacked. Nobody is fo strict in keeping his word as a favage. If any one of their allies come to visit them, they shew him more kindness, and greater endeavours to serve him, than he could have expected from his own countrymen. Mr. Cock gave me the following relation, as a proof of their integrity. About two years ago an English merchant travelling amongst the favages, in order to sell them necessaries, and to buy other goods, was secretly killed, without the murderer's being found out. But about a year after, the savages found out the guilty person amongst themselves. They immediately took him up, bound his hands on his back, and thus fent him with a guard to the governor at Philadelphia, and fent him word, that they could no longer acknowledge this wretch (who had been so wicked towards an Englishman) as their countryman, and therefore would have nothing more to do with him, and that they delivered him up to the governor, to be punished for his villany as the laws of England direct. This Indian was afterwards hanged at Philadelphia.

Their good natural parts are proved by the following account, which many people have given me as a true one. When they fend their ambassadors to the English colonies, in order to settle things of consequence with the governor, they sit down on the ground, as soon as they come to his audience, and hear with great attention the governor's demands, which they are to make an answer to. His demands are sometimes many; yet they have only a stick in their hand, and make their marks on it with a knife, without writing any thing else down. But when they return the next day to give in their resolutions, they answer all the governor's articles in the same order in which he delivered them, without leaving one out, or changing the order; and give such accurate answers, as if they had an account of them at full length in writing.

Mr. Sleidorn related another story, which gave me great pleasure. He said he had been at New York, and had found a venerable old American savage amongst several others in an inn. This old man began to talk with Sleidorn as soon as the liquor was getting the better of his head, and boasted that he could write and read in English. Sleidorn therefore desired leave to ask a question, which the old man readily granted. Sleidorn then asked him, whether he knew who was first circumcised? and the old man immediately answered, Father Abraham; but at the same time asked leave to propose a question in his turn, which Sleidorn granted; the old man then said, who was the first quaker? Sleidorn said it was uncertain, that some took one person for it, and some another; but the cunning old fellow told him, you are mistaken, sir; Mordecai was the first quaker, for he would not take off his hat to Haman. Many of the savages, who are yet heathens, are said to have some obscure notion of the deluge. But I am convinced, from my own experience, that they are not at all acquainted with it.

I met with people here who maintained that giants had formerly livedn these parts, and the following particulars confirmed them in this opinion. A few years ago fome people digging in the ground, met with a grave which contained human bones of an aftonishing fize. The tibia is faid to have been fourteen feet long, and the os femoris to have measured as much. The teeth are likewise said to have been of a fize proportioned to the rest. But more bones of this kind have not yet been found. Persons fkilled in anatomy, who have feen thefe bones, have declared that they were human bones. One of the teeth has been fent to Hamburgh, to a perfon who collected natural curiofities. Among the favages, in the neighbourhood of the place where the bones were found, there is an account handed down through many generations from fathers to children, that in this neighbourhood, on the banks of a river, there lived a very tall and strong man, in ancient times, who carried the people over the river on his back, and waded in the water, though it was very deep. Every body to whom he did this fervice gave him fome maize, fome skins of animals, or the like. In fine, he got his livelihood by this means, and was, as it were, the ferryman of those who wanted to pass the river.

The foil here confifts for the greatest part of fand, which is more or less mixed with clay. Both the fand and the clay are of the colour of pale bricks. To judge by appearance the ground was none of the best; and this conjecture was verified by the inhabitants of the country. When a corn-field has been obliged to bear the same kind of corn for three years together, it does not after that produce any thing at all, if it be not well manured, or fallowed for some years. Manure is very difficult to be got, and therefore people rather leave the field uncultivated. In that interval it is covered with all forts of plants and trees; and the countryman, in the meanwhile, cultivates a piece of ground which has till then been fallow, or he chuses a part of the ground which has never been ploughed before, and he can in both cases be pretty sure of a plentiful crop. This method can here be used with great convenience; for the soil is loose, so that it can easily be ploughed, and every countryman has commonly a great deal of land for his property. The cattle here are neither housed in winter, nor tended in the fields, and for this reason they cannot gather a sufficient quantity of dung.

The cattle were originally brought from Europe. The natives have never had any, and at prefent, few of them care to get any. But the cattle degenerate by degrees here, and become smaller; for the cows, horses, sheep, and hogs, are all larger in England, though those which are brought over are of that breed. But the first generation decreases a little, and the third and fourth is of the same size with the cattle already common here. The climate, the soil, and the food, altogether contribute their share

towards producing this change.

It is remarkable that the inhabitants of the country, commonly fooner acquire understanding, but likewise grow sooner old than the people in Europe. It is nothing uncommon to see little children giving sprightly and ready answers to questions that are proposed to them, so that they seem to have as much understanding as old men. But they do not attain to such an age as the Europeans; and it is almost an unheard of thing, that a person born in this country, should live to be eighty or ninety years of age. But I only speak of the Europeans that settled here; for the savages, or first inhabitants, frequently attained a great age, though at present such examples are uncommon, which is chiefly attributed to the great use of brandy, which the savages have learnt of the Europeans. Those who are born in Europe attain a greater age here

than

than those who are born here of European parents. In the last war it plainly appeared that these new Americans were by far less hardy than the Europeans in expeditions, sieges, and long sca-voyages, and died in numbers. It is very difficult for them to use themselves to a climate different from their own. The women cease bearing children sooner than in Europe. They seldom or never have children after they are forty or forty-five years old, and some leave off in the thirtieth year of their age. I enquired into the causes of this, but no one could give me a good one. Some said it was owing to the assume in which the people live here. Some ascribed it to the inconstancy and changeableness of the weather, and believed that there hardly was a country on earth in which the weather changes so often in a day as it does here. For if it were ever so hot, one could not be certain whether in twenty-four hours there would not be a piercing

cold; nay, fometimes the wea her will change five or fix times a day.

The trees in this country have the fame qualities as its inhabitants. For the ships which are built of American wood, are by no means equal in point of strength, to those which are built in Europe. This is what nobody attempts to contradict. When a ship, which is built here, has served eight or twelve years, it is worth little; and if one is to be met with which has been in use longer, and is yet serviceable, it is reckoned very astonishing. It is difficult to find out the causes from whence this happens. Some lay the fault to the badness of the wood; others condemn the method of building the ships, which is to make them of trees which are yet green and have had no time to dry. I believe both causes are joined, for I found oak, which at the utmost had been cut down about twelve years, and was covered by a hard bark; but upon taking off this bark, the wood below it was almost entirely rotten, and like flour, so that I could rub it into powder between my singers. How much longer will not our European oak stand before it moulders!

European oak stand before it moulders
At night we returned to Philadelphia.

Sept. 23d. Their are no hares in this country, but fome animals which are a medium between our hares and rabbits, and make a great devastation whenever they get into

fields of cabbages and turnips.

Many people have not been able to find out why the North American plants, which are carried to Europe and planted there, for the greatest part flower so late, and do not get ripe fruit before the frost overtakes them, although it appears from several accounts of travels, that the winters in Pensylvania, and more so those in New York, New England, and Canada, are full as severe as our Swedish winters, and therefore are much severer than those which are felt in England. Several men of judgment charged me for this reason to examine and enquire into this phænomenon with all possible care. But I shall, instead of an answer rather give a few remarks which I made upon the climate and upon the plants of North America, and leave my readers at liberty to draw the conclusions.

I. It is true, that the winters in Penfylvania, and much more those in the more northern provinces, are frequently as severe as our Swedish winters, and much colder than the English ones, or those of the southern parts of Europe. For I found at Philadelphia, which is above twenty degrees more southerly than several provinces in Sweden, that the thermometer of professor Celsius sell twenty-sour degrees below the freezing point in winter. Yet I was affured that the winters I spent here were none of the coldest, but only common ones, which I could likewise conclude from the Delaware's not being frozen strong enough to bear a carriage at Philadelphia during my stay, though this often happens. On considering the breadth of the river, which I have already mentioned it my description of Philadelphia, and the difference between

3 G 2 high

high and low water, which is eight English feet; it will pretty plainly appear, that a

very intense frost is required to cover the Delaware with such thick ice.

2. But it is likewise true, that though the winters are severe here, yet they are commonly of no long duration; and I can justly say, that they do not continue above two months, and sometimes even less at Philadelphia; and it is something very uncommon when they continue for three months together, insomuch that it is put into the gazettes. Nearer the pole the winters are somewhat longer, and in the quite northern parts they are as long as the Swedish winters. The daily meteorological observations which I have made during my stay in America, and which are annexed to

this work, will give more light in this matter. 3. The heat in fummer is excessive, and without intermission. I own I have seen the thermometer rife to nearly the fame degree at Aobo in Finland. But the difference is, that when the thermometer of professor Celsius rose to thirty degrees above the freezing point, once in two or three fummers at Aobo, the fame thermometer did not only, for three months together, ftand at the same degree, but even fometimes rose higher, not only in Pensylvania, but likewise in New York, Albany, and a great part of Canada. During the fummers which I fpent at Philadelphia, the thermometer has two or three times rifen to thirty-fix degrees above the freezing point. It may therefore with great certainty be faid, that in Penfylvania, the greatest part of April, the whole of May, and all the following months till October, are like our Swedish months of June and July. So excessive and continued a heat must certainly have very great effects. I here again refer to my meteorological observations. It must likewise be ascribed to the effects of this heat that the common melons, the water melons, and the pumpions of different forts, are fown in the fields without any bells or the like put over them, and yet are ripe as early as July; further, that cherries are ripe at Philadelphia about the 25th of May, and that in Penfylvania the wheat is

frequently reaped in the middle of June.

4. The whole of September, and half, if not the whole of October, are the finest months in Penfylvania; for the preceding ones are too hot. But these represent our July and half of August. The greatest part of the plants are in slower in September, and many do not begin to open their flowers before the latter end of this month. I make no doubt that the goodness of the season, which is enlivened by a clear sky and a tolerable hot fun-shine, greatly contributes towards this last effort of Flora. Yet though these plants come out so late, they are quite ripe before the middle of October. But I am not able to account for their coming up so late in autumn; and I rather ask, why do not the centaurea jacea, the gentiana, amarella, and centaurium of Linnæus, and the common golden rod, or folidago virgaurea, flower before the end of fummer? or why do the common noble liverwort, or anemone hepatica, the wild violets (viola martia, Linn.) the mezereon (daphne mezereum, Linn.) and other plants show their flowers so early in spring? At has pleased the Almighty Creator to give to them this disponuon. The weather at Philadelphia during these months is shewn by my meteorological tables. I have taken the greatest care in my observations, and have always avoided putting the thermometer into any place where the fun could fine upon it, or where he had before heated the wall by his beams; for in those cases my observations would certainly not have been exact. The weather during our September and October is too well known to want an explanation. *

5. However

^{*} The English reader, who is perhaps not so well acquainted with the weather of the Swedish autumn, may form an idea of it, by having recourse to the Calendarium Flore, or the botanical and economical almanack

5. However there are some spontaneous plants in Pensylvania, which do not every year bring their feeds to maturity before the cold begins. To these belong some species of gentiana, of afters, and others. But in these too the wisdom of the Creator has wifely ordered every thing in its turn. For almost all the plants which have the quality of flowering fo late in autumn, are perennial, or fuch as, though they have no feed to propagate themselves, can revive by shooting new branches and stalks from the same root every year. But perhaps a natural cause may be given to account for the late growth of these plants. Before the Europeans came into this country, it was inhabited by favage nations, who practifed agriculture but little, or not at all, and chiefly lived upon hunting and fishing. The woods, therefore, have never been meddled with, except that fometimes a finall part was destroyed by fire. The accounts which we have of the first landing of the Europeans here, shew that they found the country all over covered with thick forests. * From hence it follows, that, excepting the higher trees, and the plants which grow in the water or near the shore, the rest must, for the greateft part, have been obliged to grow, perhaps for a thoufand years together, in a shade, either below or between the trees, and they therefore naturally belong to those which are only peculiar to woody and flady places. The trees in this country drop their leaves in fuch quantities in autumn, that the ground is covered with them to the depth of four or five inches. These leaves lie a good while in the next summer before they moulder, and this must of course hinder the growth of the plants which are under the trees, at the fame time depriving them of the few rays of the fun, which can come down to them through the thick leaves at the top of the trees. These causes joined together make fuch plants flower much later than they would otherwife do. May it not therefore be faid, that in fo many centuries these plants had at last contracted a habit of coming up very late, and that it would now require a great space of time to make them lose this habit, and use them to quicken their growth?

Sept. 24th. We employed this whole day in gathering the feeds of plants of all

kinds, and in putting scarce plants into the herbal.

Sept. 25th. Mr. Hesselius made me a present of a little piece of petrified wood, which was found in the ground here. It was four inches long, one inch broad, and three lines thick. It might plainly be seen that it had formerly been wood. For in the places where it had been polished, all the longitudinal fibres were easily distinguishable, so that it might have been taken for a piece of oak which was cut smooth. My piece was part of a still greater piece. It was here thought to be petrified hiccory. I afterwards got more of it from other people. Mr. Lewis Evans told me, that on the boundaries of Virginia, a great petrified block of hiccory had been found in the ground, with the bark on it, which was likewise petrified.

Mr. John Bartram, an Englishman, who lives in the country, about four miles from Philadelphia, has acquired a great knowledge of natural philosophy and history, and feems to be born with a peculiar genius for these sciences. In his youth he had no opportunity of going to school. But by his own diligence and indefatigable application he got, without instruction, so far in Latin, as to understand all Latin books, and even those which were filled with botanical terms. He has, in several successive years, made frequent excursions into different distant parts of North America, with an intention of gathering all forts of plants which are scarce and little known. Those which he found

almanack of Sweden, in Dr. Linnaus's Amon. Academ. and in Mr. Stillingsleet's Swedish tracts, translated from the Amon. Acad ad edition. F.

he has planted in his own botanical garden, and likewise sent over their seeds or fresh roots to England. We owe to him the knowledge of many scarce plants, which he first found, and which were never known before. He has shewn great judgment, and an attention which lets nothing escape unnoticed. Yet with all these great qualities, he is to be blamed for his negligence; for he did not care to write down his numerous and ufeful observations. His friends at London once obliged him to fend them a short account of one of his travels, and they were very ready, with a good intention, though not with fufficient judgment, to get this account printed. But this book did Mr. Bartram more harm than good; for as he is rather backward in writing down what he knows, this publication was found to contain but few new observations. It would not however be doing justice to Mr. Bartram's merit, if it were to be judged of by this performance. He has not filled it with a thousandth part of the great knowledge which he has acquired, in natural philosophy and history, especially in regard to North America. I have often been at a loss to think of the sources, from whence he got many things which came to his knowledge. I likewife owe him many things, for he possessed that great quality of communicating every thing he knew. I shall, therefore, in the fequel, frequently mention this gentleman. For I should never forgive myself if I were to omit the name of the first inventor, and claim that as my own invention which I learnt from another person.

Many muscle-shells, or mytili anatini, are to be met with on the north-west side of the town, in the clay-pits, which were at present filled with water from a little brook in the neighbourhood. These muscles seem to have been washed into that place by the tide, when the water in the brook was high. For these clay-pits are not old, but were lately made. Poor boys sometimes go out of town, wade in the water, and gather great quantities of these shells, which they fell very easily, they being reckoned a dainty.

The Virginian azarole, with a red fruit, or Linnæus's cratægus crus galli, is a fpecies of hawthorn, and they plant it in hedges, for want of that hawthorn, which is commonly used for this purpose in Europe. Its berries are red, and of the same size, shape, and taste, with those of our hawthorn. Yet this tree does not seem to make a good hedge, for its leaves were already fallen, whilst other trees still preserved theirs. Its spines are very long and sharp; their length being two or three inches. These spines are applied to some inconsiderable use. Each berry contains two stones.

Mr Bartram affured me, that the North American oak cannot refift putrefaction for near fuch a fpace of time as the European. For this reason, the boats (which carry all forts of goods down from the upper parts of the country) upon the river Hudson, which is one of the greatest in these parts, are made of two kinds of wood. That part which must always be under water, is made of black oak; but the upper part, which is now above and now under water, and is therefore more exposed to putrefaction, is made of red cedar, or juniperis Virginiana, which is reckoned the most hardy wood in the country. The bottom is made of black oak, because that wood is very tough. For the river being full of stones, and the boats frequently running against them, the black oak gives way, and therefore does not easily crack. But the cedar would not do for this purpose, because it is hard and brittle. The oak likewise is not so much attacked by putrefaction, when it is always kept under water.

In autumn, I could always get good pears here; but every body acknowledged that

this fruit would not fucceed well in the country.

All my observations and remarks on the qualities of the rattle-snake, are inserted in the memoirs of the Swedish academy of sciences, for the year 1752, p. 316, and for the year 1753, p. 54, and thither I refer the reader.*

• Vide medical, &c. cases and experiments, translated from the Swedish, London 1758. p. 282. P.

Bears are very numerous higher up in the country, and do much mischief. Bartram told me, that when a bear catches a cow, he kills her in the following manner: he bites a hole into the hide, and blows with all his power into it, till the animal fwells excessively and dies; for the air expands greatly between the slesh and the hide.* An old Swede, called Nils Gustave's fon, who was ninety-one years of age, faid, that in his youth, the bears had been very frequent hereabouts, but that they had feldom attacked the cattle: that whenever a bear was killed, its flesh was prepared like pork, and that it had a very good tafte; and the flesh of bears is still prepared like ham, on the river Morris. The environs of Philadelphia, and even the whole province of Penfylvania in general, contain very few bears, they having been extirpated by degrees. In Virginia they kill them in feveral different ways. Their flesh is eaten by both rich and poor, fince it is reckoned equal in goodness to pork. In some parts of this province, where no hogs can be kept, on account of the great numbers of bears, the people are used to catch and kill them, and to use them instead of hogs. The American bears, however, are faid to be less fierce and dangerous than the European ones.

Sept. 26th. The broad plantain, or plantago major, grows on the high-roads, foot-paths, meadows, and in gardens, in great plenty. Mr. Bartram had found this plant in many places on his travels, but he did not know whether it was an original American plant, or whether the Europeans had brought it over. This doubt had its rife from the favages (who always had an extensive knowledge of the plants of the country) pretending that this plant never grew here before the arrival of the Europeans. They therefore gave it a name which fignifies, the Englishman's foot; for they fay, that where a European had walked, there this plant grew in his foot-steps.

The chenopodium album, or goofefoot with finuated leaves, grows in plenty in the gardens. But it is more fcarce near the houses, in the streets, on dunghills, and cornfields. This feems to flew, that it is not a native of America, but has been brought over amongst other feeds from Europe. In the same manner it is thought that the tanfey, (tanacetum vulgare, Linn) which grows here and there in the hedges, on the roads, and near houses, was produced from European seeds.

The common vervain, with blue flowers, or verbena officinalis, was shewn to me by Mr. Bartram, not far from his house, in a little plain near Philadelphia. It was the only place where he had found it in America; and for this reason I suppose it was likewise

fown here amongst other European seeds.

Mr. Bartram was at this time building a house in Philadelphia, and had funk a cellar to a confiderable depth, the foil of which was thrown out. I here observed the following strata: the upper loofe foil was only half a foot deep, and of a dark brown colour. Under it was a stratum of clay, so much blended with sand, that it was in greater quantity than the clay itself; and this stratum was eight feet deep. These were both brick coloured. The next stratum consisted of little pebbles mixed with a coarse sand. The stones consisted either of a clear, or of a dark quartz; †

* This has all the appearance of a vulgar error: neither does the succeeding account of the American bears being carnivorous, agree with the observations of the most judicions travellers, who deny the sact. P.

But however, it might he feafible to reconcile both opinions. For Europe has two or three kinds of bears, one species of which is carnivorous, the other lives only on vegetables: the large brown species, with its small variety, are reputed to be carnivorous, the black species is merely phytivorous. In case therefore both species are found in North America, it would be very casy to account for their being both carnivorous and not. F.

† Quartzum hyalinum, Linn. Syst. Nat. 3. p. 65. Quartzum solidum pellucidum, Wallerii Miner. 91. The common quartz, Fosster's Mineralogy, p. 16. And quartzum coloratum, Linn. Syst. Nat. 3. p. 65. Quartzum solidum opacum coloratum, Wall. Min. 99. The impure quartz, Fosst. Min. p. 16.

they were quite smooth and roundish on the outside, and lay in a stratum which was a foot deep. Then the brick-coloured clay mixed with fand appeared again. But the depth of this stratum could not be determined. Query, Could the river formerly

have reached to this place and formed these strata?

Mr. Bartram has not only frequently found oyster-shells in the ground, but likewise met with such shells and snails, as undoubtedly belong to the sea, at the distance of a hundred and more English miles from the shore. He has even found them on the ridge of mountains which separate the English plantations from the habitations of the savages. These mountains, which the English call the blue mountains, are of considerable height, and extend in one continued chain from north to south, or from Canada to Carolina. Yet in some places they have gaps, which are as it were broke through, to afford a passage for the great rivers, which roll down into the lower country.

The cassia chamæcrista grew on the roads through the woods, and sometimes on uncultivated fields, especially when shrubs grew in them. Its leaves are like those of the sensitive plant, or mimosa, and have likewise the quality of contracting when

touched, in common with the leaves of the latter.

The crows in this country are little different from our common crows in Sweden. Their fize is the fame with that of our crows, and they are as black as jet in every part of their body. I faw them flying to-day in great numbers together. Their voice is not quite like that of our crows, but has rather more of the cry of the rook, or

Linnæus's corvus frugilegus.

Mr. Bartram related, that on his journies to the northern English colonies, he had discovered great holes in the mountains on the banks of rivers, which, according to his description, must exactly have been such giants' pots, * as are to be met with in Sweden, and which I have described in a particular differtation read in the Royal Swedish Academy of Sciences. Mr. Bartram has likewise addressed some letters to the Royal Society at London upon this fubject. For some people pretended that these holes were made by the savages, that they might in time of war hide their corn and other valuable effects in them. But he wrote against this opinion, and accounted for the origin of these cavities in the following manner: When the ice fettles, many pebbles flick in it; in fpring, when the fnow melts, the water in the rivers fwells fo high that it reaches above the place where these holes are now found in the mountains. The ice therefore will of course float as high. And then it often happens that the pebbles which were contained in it ever fince autumn, when it first settled on the banks of the river, fall out of the ice upon the rocky bank, and are from thence carried into a cleft or crack by the water. These pebbles are then continually turned about by the water, which comes in upon them, and by this means they gradually form the hole. The water at the fame time polishes the stone by its circular motion round it, and helps to make the hole or cavity round. It is certain that by this turning and toffing the stone is at last unfit for this purpose: but the river throws commonly every spring other stones instead of it into the cavity, and they are turned round in the fame manner. By this whirling, both the mountain and the stone afford either a fine or a coarse fand, which is washed away by the water, when in fpring, or at other times, it is high enough to throw its waves into the cavity. This was the opinion of Mr. Bartram about the origin of these cavities. The Royal

Societ

^{*} In Sweden, and in the north of Germany, the round holes in rivers, with a flony or rocky bed, which the whirling of the water has made, are called giants' pots; these holes are likewise mentioned in Mr Grosley's new observations on Italy, Vol. i. p. 8. F.

Society of Sciences at London, has given a favourable reception to, and approved of them *. The remarks which I made in the fummer of the year 1743, during my flay at Land's-Ort, in my country, will prove that I was at that time of the fame opinion, in regard to these holes. I have fince further explained this opinion in a letter to the Royal Academy of Sciences; and this letter is still preserved in the Academy's Memoirs, which have not yet been published. But there is great reason to doubt,

whether all cavities of this kind, in mountains, have the fame origin.

Here are different species of mulberry trees, which grow wild in the forests of North and South America. In these parts the red mulberry trees are more plentiful than any other. However, Mr. Bartram affured me, that he had likewife feen the white nulberry trees growing wild, but that they were more fcarce. I asked him, and feveral other people of this country, why they did not fet up filk manufactures, having fuch a quantity of mulberries, which fucceed fo eafily? For it has been obferved, that when the berries fall upon the ground, where it is not compact, but loofe, they foon put out feveral fine delicate floots. But they replied, that it would not be worth while to erect any filk manufactures here, because labour is so dear. For a man gets from eighteen pence to three shillings and upwards, for one day's work, and the women are paid in proportion. They were therefore of opinion, that the cultivation of all forts of corn, of hemp, and of flax, would be of greater advantage, and that at the fame time it did not require near fo much care as the feeding of filk-worms. By the trials of a governor in Connecticut, which is a more northern province than New York, it is evident, however, that filk-worms fucceed very well there, and that this kind of mulberry trees is very good for them. The governor brought up a great quantity of filk worms in his court-yard; and they fucceeded fo well, and fpun to much filk, as to afford him a fufficient quantity for clothing himself and all his family.

Several forts of vines likewife grow wild hereabouts. Whenever I made a little excursion out of town, I saw them in numerous places climbing up trees and hedges. They class around them, and cover them sometimes entirely, and even hang down on the sides. This has the same appearance, at a distance, as the tendrils of hops climbing along trees. I enquired of Mr. Bartram, why they did not plant vineyards, or press wine from the grapes of the wild vine? But they answered, that the same objection lay against it, which lies against the erection of a silk manufacture, that the necessary hands were too scarce, and it therefore was more rational to make agriculture their chief employment. But the true reason undoubtedly is, that the wine which is pressed out of most of the North American wild grapes, is sour and sharp, and has not near such an agreeable taste as that which is made from European grapes.

The Virginian wake robin, or arum virginicum, grows in wet places. Mr. Bartram told me, that the favages boiled the fpadix and the berries of this flower, and devoured it as a great dainty. When the berries are raw, they have a harfh, pungent tafte,

which they lofe in great measure upon boiling.

The farothra gentianoides grows abundantly in the fields, and under the bushes, in a dry fandy ground near Philadelphia. It looks extremely like our whortleberry bushes when they first begin to green, and when the points of the leaves are yet red. Mr. Bartram has fent this plant to Dr. Dillenius; but that gentleman did not know where he should range it. It is reckoned a very good traumatic, and this quality Mr.

^{*} How far this approbation of the Royal Society ought to be credited, is to be understood from the advertisements published at the head of each new volume of the Philosophical Transactions. F. Vol. XIII.

3 H

Bartram

Bartram himself experienced; for being thrown and kicked by a vicious horse, in such a manner as to have both his thighs greatly hurt, he boiled the farothra, and applied it to his wounds. It not only immediately appealed his pain, which before had

been very violent, but he likewife, by its affiftance, recovered in a fhort time.

Having read, in Mr. Miller's botanical dictionary, that Mr. Peter Collinson had a particular larch tree from America in his garden, I asked Mr. Bartram whether he was acquainted with it? He answered, that he had sent it himself to Mr. Collinson; that it only grew in the eastern parts of New Jersey, and that he had met with it in no other English plantation. It differs from the other species of larch trees, its cones being much lefs. I afterwards saw this tree in great plenty in Canada.

Mr. Bartram was of opinion, that the apple tree was brought into America by the Europeans, and that it never was there before their arrival. But he looked upon peaches as an original American fruit, and as growing wild in the greatest part of America. Others again were of opinion, that they were first brought over by the Europeans. But all the French in Canada agreed, that on the banks of the river Missifippi, and in the country thereabouts, peaches were found growing wild in great

quantity*.

Sept. 27th. The tree which the English here call persimon, is the diospyros virginiana of Linnæus. It grows for the greatest part in wet places round the waterpits. I have already mentioned, that the fruits of this tree are extremely bitter and tharp before they are quite ripe, and that being eaten in that flate, they quite contract one's mouth, and have a very difagreeable tafte. But as foon as they are ripe, which does not happen till they have been quite foftened by the frost, they are a very agreeable fruit. They are here eaten raw, and feldom any other way. But in a great book, which contains a description of Virginia, you meet with different ways of preparing the perfimon, under the article of that name. Mr. Bartram related, that they were commonly put upon the table amongst the sweet-meats, and that some people made a tolerably good wine of them. Some of these persimon fruits were dropped on the ground in his garden, and were almost quite ripe, having been exposed to a great degree of the heat of the fun. We picked up a few and tasted them, and I must own that those who praised this fruit as an agreeable one, have but done it justice. It really deferves a place among the most palatable fruit of this country, when the frost has thoroughly conquered its acrimony.

The verbascum thapfus, or great white mullein, grows in great quantity on roads, in hedges, on dry fields, and high meadows of a ground mixed with fand. The Swedes here call it the tobacco of the favages, but owned, that they did not know whether or no the Indians really used this plant instead of tobacco. The Swedes are used to tie the leaves round their feet and arms when they have the ague. Some of them prepared a tea from the leaves, for the dysentery. A Swede likewise told me, that a decoction of the roots was injected into the wounds of the cattle which are full

of worms, which killed these worms, and made them fall out †.

• Thomas Herriot, fervant to Sir Walter Raleigh, who was employed by him to examine into the productions of North America, makes no mention of the peach among the other fruits he deferibes; and M. du Pratz, who has given a very good account of Louisiana and the Missispi, says, that the natives got their peaches from the English colony of Carolina, before the French settled there. P.

† These worms are the sarvas of the oestrus or gadsly, which deposits its eggs on the back of cattle, and the larvas being hatched from these eggs, cause great fores, wherein they live till they are ready for their change. In the fouth of Russia they use, for the same purpose, the decoction of veratrum, or the white

hellcbore. F.

Sept. 28th. The meadows which are furrounded by wood, and were at prefeut mown, have a fine lively verdure. On the contrary, when they lie on hills, or in open fields, or in fome elevated fituation, especially so that the sun may be able to act upon them without any obstacles, their grass looks brown and dry. Several people from Virginia told me, that on account of the great heat and drought, the meadows and pastures almost always had a brown colour, and looked as if they were burnt. The inhabitants of those parts do not therefore enjoy the plcasure which an European feels at the fight of our verdant, odoriferous meadows.

The American nightfhade, or the phytolacca decandra, grows abundantly in the fields, and under the trees, on little hills. Its black berries are now ripe. We obferved to-day fome little birds with a blue plumage, and of the fize of our hortulans and yellow hammers (emberiza citrinella and emberiza hortulanus) flying down from

the trees, in order to fettle upon the nightshade and eat its berries.

Towards night I went to Mr. Bartram's country feat.

Sept. 29th. The gnaphalium margaritaceum grows in aftonishing quantities upon all uncultivated fields, glades, hills, and the like. Its height is different according to its different foil and fituation. Sometimes it is very ramofe, and fometimes very little. It has a strong, but agreeable fmell. The English call it life everlasting; for its flowers, which confift chiefly of dry, shining, filvery leaves (folia calycina) do not change when dried. This plant is now every where in full bloffom. But fome have already loft the flowers, and are beginning to drop the feeds. The English ladies were used to gather great quantities of this life everlasting, and to pluck them with the stalks. For they put them into pots with or without water, amongst other fine flowers which they had gathered both in the gardens and in the fields, and placed them as an ornament in the The English ladies in general are much inclined to have fine flowers all the fummer long, in or upon the chimneys, fometimes upon a table, or before the windows, either on account of their fine appearance, or for the fake of their fweet fcent. The gnaphalium abovementioned was one of those which they kept in their rooms during the winter, because its flowers never altered from what they were when they stood in the ground. Mr. Bartram told me another use of this plant. A decoction of the flowers and stalks is used to bathe any pained or bruised part, or it is rubbed with the plant itself tied up in a bag.

Instead of flax several people made use of a kind of dog's bane, or Linnæus's apocynum cannabinum. The people prepared the stalks of this plant, in the same manner as we prepare those of hemp or flax. It was spun, and several kinds of stuffs were woven from it. The savages are said to have had the art of making bags, sishingnets, and the like, for many centuries together, before the arrival of the Europeans.

I asked Mr. Bartram whether he had observed in his travels that the water was fallen, and that the sea had formerly covered any places which were now land. He told me, that from what he had experienced he was convinced that the greatest part of this country, even for several miles together, had formerly been under water. The reasons which led him to give credit to this opinion were the following:

1. On digging in the blue mountains, which are above three hundred English miles distant from the sea, you find loose oyster and other forts of shells; and they are also

likewife to be met with in the vallies formed by these mountains.

2. A vast quantity of petrified shells are found in limestone, slint, and fandstone, on the same mountains. Mr. Bartram assured me at the same time, that it was incredible what quantities of them there were in the different kinds of stones of which the mountains consist.

3. The same shells are likewise dug in great quantity, quite entire and not mouldered, in the provinces of Virginia and Maryland, as also in Philadelphia and in New York.

4. On digging wells (not only in Philadelphia, but likewife in other places) the people have met with trees, roots, and leaves of oak, for the greatest part not yet rotten, at

the depth of eighteen feet.

5. The best foil and the richest mould is to be met with in the vallies hereabouts. These vallies are commonly crossed by a rivulet or brook; and on their declivity a mountain commonly rises, which in those places, where the brook passes close to it, looks as if it were cut on purpose. Mr. Bartram believed that all these vallies formerly were lakes; that the water had, by degrees, hollowed out the mountain, and opened a passage for itself through it; and that the great quantity of slime which is contained in the water, and which had subsided to the bottom of the lake, was the rich soil which is at present in the vallies, and the cause of their great fertility. But such vallies and cloven mountains are very frequent in the country, and of this kind is the peculiar gap between two mountains, through which a river takes its course, on the boundaries of New York and Pensylvania. The people, in a jest, say, that this opening was made by the devil, as he wanted to go out of Pensylvania into New York.

6. The whole appearance of the blue mountains plainly shews, that the water formerly covered a part of them. For many are broken in a peculiar manner, but the

highest are plain.

7. When the favages are told that shells are found on these high mountains, and that from thence there is reason to believe that the sea must formerly have extended to them, and even in part flown over them; they answer, that this is not new to them, they having a tradition from their ancestors among them, that the sea formerly surrounded these mountains.

8. The water in rivers and brooks likewise decreases. Mills, which fixty years ago were built on rivers, and at that time had a sufficient supply of water almost all the year long, have at present so little, that they cannot be used, but after a heavy rain, or when the snow melts in spring. This decrease of water, in part, arises from the great quantity of land which is now cultivated, and from the extirpation of great forests for that purpose.

9. The fea-shore increases likewise in time. This arises from the quantity of fand continually thrown on shore from the bottom of the sea, by the waves.

Mr. Bartram thought that some peculiar attention should be paid to another thing relating to these observations. The shells which are to be sound petrissed on the northern mountains, are of such kinds as at present are not to be got in the sea, in the same latitude, and they are not sissed on the shore, till you come to South Carolina. Mr. Bartram from hence took an occasion to desend Dr. Thomas Burnet's opinion, that the earth, before the deluge, was in a different position towards the sun. He likewise asked whether the great bones, which are sometimes sound in the ground in Siberia, and which are supposed to be elephants bones and tusks, did not confirm his opinion. For at present those animals cannot live in such cold countries; but if, according to Dr. Burnet, the sun once formed different zones about our earth, from those it now makes, the elephant may easily be supposed to have lived in Siberia*. However, it seems that all which we have hitherto mentioned, may have

^{*} The bones and tusks of elephants are not only found in Russia, but also in the canton of Basil in Swifferland, in the dominions of the Marquis of Bareuth in Franconia, and more inflances are found in the Protogue of the celebrated Leibnitz. Lately, near the river Ohio, have been discovered a great number

been the effect of different causes. To those belong the universal deluge, the increase of land, which is merely the work of time, and the changes of the course of rivers, which, when the snow melts, and in great sloods, leave their first beds, and form new ones.

At fome distance from Mr. Bartram's country house, a little brook flowed through the wood, and likewise ran over a rock. The attentive Mr. Bartram here shewed me several little cavities in the rock, and we plainly saw that they must have been generated in the manner I before described, that is, by supposing a pebble to have remained in a cleft of the rock, and to have been turned round by the violence of the water, till it had formed such a cavity in the mountain. For on putting our hands into one of these cavities, we found that it contained numerous small pebbles, whose surface was quite smooth and round. And these stones we found in each of the holes.

Mr. Bartram shewed me a number of plants which he had collected into a herbal on his travels. Among these were the following, which likewise grow in the northern parts of Europe, of which he had either got the whole plants or only broken branches.

- 1. Betula alba, the common birch tree, which he had found on the Cats Hills.
- 2. Betula nana. This species of birch grows in several low places towards the hills.
 - 3. Comarum palustre, in the meadows, between the hills in New Jersey.
- 4. Gentiana lutea, the great Gentian, from the fields near the mountains. It was very like our variety, but had not fo many flowers under each leaf.

of skeletons of elephants, with their tusks, and very remarkable grinders, still sticking in their jaw-bones, were fent to the British Museum; the late Dr. Littleton, bishop of Carlisle, also lodged some teeth, flicking in their jaw-bones, in the Museum of the Royal Society, which were brought from Peru. The rivers Chatunga and Indighirka, in Siberia, are remarkable for affording, on their banks, great quantities of bones and tolks of elephants, which being prescrived there by the great frost, and in the short summer of a few weeks, the rain being rare, these tulks are commonly so fresh that they are employed in Russia as common ivory, on account of the great quantity brought from these places to Russia; some of them were eight feet long, and of three hundred pounds weight. There have been found grinders of nine inches diameter. But the American grinders of elephants from near the Ohio are yet more remarkable, on account of their being provided with crowns at their tops, such as are only found in the carnivorous animals, and fuch as feed on hard bones or nuts; whilit, on the contrary, elephants, at prefent feeding on graffes and fost vegetables, have no such crowns at the tops of their grinders. Livy, it is true, makes a distinction between the Asiatic or Indian elephants, and the African ones: and remarks the latter to be inferior to the former in fize and vigour; but whether the teeth in these animals are so much different from those of the other variety, has never been attended to. This circumstance of the difference in the fosfil grinders of elephants, from those in the living ones, and the place where these skeletons were found in, viz. Siberia, Germany, and America, where at present no elephants are to be met with, opens a wide field to conjectures, in regard to the way by which these animals were carried to those spots. The flood in the deluge perhaps has carried them thither: nor is it contrary to reason, history or revelation, to believe these skeletons to be the remainders of animals which lived on the surface of this globe anterior to the Mosaic creation; which may be confidered only as a new modification of the creatures living on this globe, adapted to its present state, under which it will remain until circumstances will make a new change necessary, and then our globe will, by a new creation or revolution, appear more adapted to its state, and be stocked with a set of animals more suitable to that state. Every man used to philosophy and reasoning will find that this plan gives a grand idea of the Creator, his economy and management of the universe; and moreover, it is conformable to the meaning of the words of a facred writer, who says: Psal. civ. 29, 30. "Thou hidest thy face and they (small and great heasts) are troubled; thou takest away their breath, they die, and return to their dust. Thou sendest forth thy spirit, they are created; and thou renewest the sace of the earth." See Dr. Hunter's remarks on the above-mentioned teeth in the Philosophical Tranf. Vol. lviii. F. 5. Linnæa 5. Linnaa borealis, from the mountains in Canada. It creeps along the ground.

6. Myrica gale, from the neighbourhood of the river Susquehanna, where it grows in a wet foil.

7. Potentilla fruticosa, from the fwampy fields and low meadows between the river Delaware, and the river New York.

S, Trientalis Europæa, from the Cats Hills.

9. Triglochin maritimum, from the falt springs towards the country of the five nations.

Mr. Bartram shewed me a letter from East Jersey, in which he got the following account of the discovery of an Indian grave. In the April of the year 1744, as some people were digging a cellar, they came upon a great stone, like a tomb-stone, which was at last got out with great difficulty; and about four feet deeper under it, they met with a large quantity of human bones and a cake of maize. The latter was yet quite untouched, and feveral of the people prefent tasted it out of curiosity. From these circumstances it was concluded, that this was a grave of a person of note among the favages. For it is their custom to bury along with the deceased meat and other things which he liked best. The stone was eight feet long, four feet broad, and even fome inches more, where it was broadeft, and fifteen inches thick at one end, but only twelve inches at the other end. It confifted of the fame coarfe kind of ftone that is to be got in this country. There were no letters nor other characters visible on it.

The corn which the Indians chiefly cultivate is the maize, or zea mays, Linn. They have little corn fields for that purpose. But besides this, they likewise plant a great quantity of fquashes, a species of pumpions or melons, which they have always cultivated, even in the remotest ages. The Europeans settled in America got the feeds of this plant, and at prefent their gardens are full of it; the fruit has an agreeable taste when it is well prepared. They are commonly boiled, then crushed (as we used to do with turnips when we make a pulse of them) and some pepper or other fpice thrown upon them, and the dish is ready. The Indians likewise fow feveral kinds of beans, which for the greatest part they have got from the Europeans. But peafe, which they likewife fow, they have always had amongst them, before any foreigners came into the country. The fquashes of the Indians, which now are likewife cultivated by the Europeans, belong to those kinds of gourds (cucurbita) which ripen before any other. They are a very delicious fruit, but will not keep. I have_ however feen them kept till pretty late in winter.

Sept. 30th. Wheat and rye are fown in autumn about this time, and commonly reaped towards the end of June, or in the beginning of July. These kinds of corn, however, are fometimes ready to be reaped in the middle of June, and there are even examples that they have been mown in the beginning of that month. Barley and oats are fown in April, and they commonly begin to grow ripe towards the end of July. Buck-wheat is fown in the middle or at the end of July, and is about this time, or fomewhat later, ready to be reaped. If it be fown before the above-mentioned

time, as in May, or in June, it only gives flowers and little or no corn.

Mr. Bartram and other people affured me, that most of the cows, which the English have here, are the offspring of those which they bought of the Swedes, when they were mafters of the country. The English themselves are faid to have brought over but few. The Swedes either brought their cattle from home, or bought them of the

Dutch, who were then fettled here.

Near the town, I faw an ivy or hedera helix, planted against the wall of a stone building, which was so covered by the sine green leaves of this plant, as almost to conceal the whole. It was doubtless brought over from Europe, for I have never perceived it any where else on my travels through North America. But in its stead I have

often feen wild vines made to run up the walls.

l asked Mr. Bartram whether he had observed that trees and plants decreased in proportion as they were brought further to the north, as Catesby pretends; he answered, that the question should be more limited, and then his opinion would prove the true one. There are some trees which grow better in southern countries, and become less as you advance to the north. Their seeds or berries are sometimes brought into colder climates by birds and by other accidents. They gradually decrease in growth, till at last they will not grow at all. On the other hand, there are other trees and herbs which the wise Creator destined for the northern countries, and they grow there to an amazing size. But the further they are transplanted to the south the less they grow, till at last they degenerate so much as not to be able to grow at all. Other plants love a temperate climate, and if they be carried either south or north they will not succeed well, but always decrease. Thus for example, Pensylvania contains some trees which grow exceedingly well, but always decrease in proportion as they are carried further off either to the north or to the south.

I afterwards, on my travels, had frequent proofs of this truth. The faffafras, which grows in Penfylvania, under forty degrees of latitude, and becomes a pretty tall and thick tree, was fo little at Ofwego and Fort Nicholfon, between forty-three and forty-four degrees of latitude, that it hardly reached the height of two or four feet, and was feldom fo thick as the little finger of a full grown perfon. This was likewife the cafe with the tulip tree. For in Penfylvania it grows as high as our tallest oaks and firs, and its thickness is proportionable to its height. But about Ofwego it was not above twelve feet high, and no thicker than a man's arm. The fugar maple, or acer faccharinum, is one of the most common trees in the woods of Canada, and grows very tall. But in the fouthern provinces, as New Jersey and Penfylvania, it only grows on the northern side of the blue mountains, and on the steep hills which are on the banks of the river, and which are turned to the north. Yet there it does not attain to a third or fourth part of the height which it has in Canada. It is needless to mention

more examples.

Oct. 1st. The gnats, which are very troublesome at night here, are called musquetoes. They are exactly like the gnats in Sweden, only fomewhat lefs; and the description which is to be met with in Dr. Linnæus's Systema Naturæ, and Fauna Suecica, fully agrees with them, and they are called by him culex pipiens. In daytime or at night they come into the houses, and when the people are gone to bed they begin their disagreeable humming, approach always nearer to the bed, and at last suck up so much blood, that they can hardly sly away. Their bite causes blisters in people of a delicate complexion. When the weather has been cool for fome days, the musquetoes disappear; but when it changes again, and especially after a rain, they gather frequently in fuch quantities about the houses that their numbers are astonishing. The chimneys of the English, which have no valves for shutting them up, afford the gnats a free entrance into the houses. In fultry evenings, they accompany the cattle in great fwarms from the woods to the houses, or to town, and when they are drove before the houses the gnats fly in wherever they can. In the greatest heat of fummer they are fo numerous in some places that the air seems to be quite full of them, especially near swamps and stagnate waters, such as the river Morris, in Nevr Jerfey. The inhabitants therefore make a fire before their houses, to expel these disagreeable guests by the smoke. The old Swedes here said that gnats had formerly been much more; numerous that even at present they swarmed in vast quantities on the sea shore, near the salt water; and that those which troubled us this autumn in Philadelphia were of a more venomous kind than they commonly used to be. This last quality appeared from the blisters which were formed on the spots where the gnats had inserted their sting. In Sweden I never selt any other inconvenience from their sting than a little itching, whilst they sucked. But when they stung me here at night, my sace was so dissigured by little red spots and blisters, that I was almost assumed to show myself.

I have already mentioned fomewhat about the enclosures usual here; I now add, that most of the planks which are put horizontally, and of which the enclosures in the environs of Philadelphia chiefly confist, are of the red cedar wood, which is here reckoned more durable than any other. But where this could not be got either white or black oak supplied its place. The people were likewise very glad if they could get cedar wood for the posts, or else they took white oak or chesnut, as I was told by Mr. Bartram. But it seems that that kind of wood in general does not keep well in the ground for a considerable time. I saw some posts made of chesnut wood, and put into the ground only the year before, which were already for the greatest part rotten

below.

The fassafras-tree, or laurus fassafras, Linn. grows in abundance in the country, and flands feattered up and down the woods, and near bushes and enclosures. On old grounds which are left uncultivated, it is one of the first that comes up, and is as plentiful as young birches are on those Swedish fields, which are formed by burning the trees which grew on them *. The fassafras grows in a dry loose ground, of a pale brick colour, which confifts, for the greatest part, of fand, mixed with some clay. It feems to be but a poor foil. The mountains round Gothenburg, in Sweden, would afford many places rich enough for the faffafras to grow in, and I even fear they would be too rich. I here faw it both in the woods amidst other trees, and more frequently by itself along the enclosures. In both it looks equally fresh. I have never feen it on wet or low places. The people here gather its flowers, and use them instead of tea; but the wood itself is of no use in ecconomy; for when it is set on fire, it causes a continual crackling without making any good fire. The tree fpreads its roots very much, and new shoots come up from them in some places; but these shoots are not good for transplanting, because they have so few fibres besides the root which connects them to the main stem that they cannot well strike into the ground. If therefore any one would plant faffafras-trees, he must endeavour to get their berries, which, however, is difficult, fince the birds eat them before they are half ripe. The cows are very greedy after the tender new shoots, and look for them every where.

The bark of this tree is used by the women here in dying worsted a fine lasting orange colour, which does not fade in the sun. They use urine instead of alum in dying, and boil the dye in a brass boiler, because in an iron vessel it does not yield so fine a colour. A woman in Virginia has successfully employed the berries of the saffafras against a great pain in one of her seet, which for three years together, she had to

^{*} In Mr. Ofbeck's Voyage to China, vol. i. p. 50, in a note, an account is given of this kind of land, which the Swedes call Swedieland; where it is observed, that the trees being burnt, their ashes afford manure sufficient for three years, after which they are lest uncultivated again, till, after twenty or more years, a new generation of trees being produced on them, the country people burn them, and cultivate the country for three years again. F.

fuch a degree, that it almost hindered her from walking. She was advised to broil the berries of fassafras, and to rub the painful parts of her foot with the oil, which by this means would be got from the berries. She did so, but at the same time it made her vomit; yet this was not sufficient to keep her from following the prescription three times more, though as often as she made use thereof, it always had the same effect.

However, the was entirely freed from that pain, and perfectly recovered.

A black woodpecker with a red head, or the picus pileatus, Linn. is frequent in the Penfylvanian forests, and stays the winter, as I know from my own experience. It is reckoned among those birds which destroy the maize, because it settles on the ripe ears, and destroys them with its bill. The Swedes call it tillkroka; but all other woodpeckers, those with gold yellow wings excepted, are called hackspickar in the Swedish language. I intend to describe them all together more exactly in a particular work. I only observe here, that almost all the different species of woodpeckers are very noxious to the maize, when it begins to ripen; for by picking holes in the membrane round the ear, the rain gets into it, and causes the ear, with all the corn it contains, to rot.

Oct. 3. In the morning I fet out for Wilmington, which was formerly called Chriftina by the Swedes, and is thirty English miles to the south-west of Philadelphia. Three miles behind Philadelphia I paffed the river Skulkill in a ferry, beyond which the country appears almost a continual chain of mountains and vallies. The mountains have an eafy flope on all fides, and the vallies are commonly croffed by brooks, with crystal streams. The greater part of the country is covered with several kinds of deciduous trées; for I fearcely faw a fingle tree of the fir kind, if I except a few red cedars. The forest was high, but open below, so that it left a free prospect to the eye, and no under-wood obstructed the passage between the trees. It would have been easy in some places to have gone under the branches with a carriage for a quarter of a mile, the trees standing at great distances from each other, and the ground being very level. In some places little glades opened, which were either meadows, pastures, or corn-fields; of which latter fome were cultivated and others not. In a few places feveral houses were built close to each other; but for the greatest part they were fingle. In part of the fields the wheat was already fown in the English manner without trenches, but with furrows pretty close together. I fometimes faw the country people very bufy in fowing their rye. Near every farm-house was a little field with maize. The inhabitants hereabouts were commonly either English or Swedes.

All the day long I faw a continual variety of trees; walnut-trees of different forts, which were all full of nuts; chefnut-trees quite covered with fine chefnuts; mulberries,

faffafras, liquidambar, tulip trees, and many others.

Several species of vines grew wild hereabouts. They run up to the summits of the trees, their clusters of grapes and their leaves covering the stems. I even saw some young oaks five or six fathoms high, whose tops were crowned with vines. The ground is that which is so common hereabouts, which I have already described, viz. a clay mixed with a great quantity of sand, and covered with a rich soil or vegetable earth. The vines are principally seen on trees which stand single in corn-sields, and at the end of woods, where the meadows, pastures, and fields begin; and likewise along the enclosures, where they cling with their tendrils round the trees which stand there. The lower parts of the plant are full of grapes, which hang below the leaves, and were now almost ripe, and had a pleasant sourish taste. The country people gather them in great quantities, and sell them in the town. They are eaten without further preparation; and commonly people are presented with them when they come to pay a visit.

The foil does not feem to be deep hereabouts, for the upper black stratum is hardly two inches. This I had an occasion to see, both in such places where the ground is dug up, and in such where the water, during heavy showers of rain, has made cuts, which are pretty numerous here. The upper soil has a dark colour, and the next a pale colour like bricks. I have observed every where in America, that the depth of the upper soil does not by far agree with the computation of some people, though we can almost be sure, that in some places it never was stirred since the deluge. I shall be more particular in this respect afterwards *.

The datura stramonium, or thorn apple, grows in great quantities near all the villages. Its height is different according to the soil it is in; for in a rich soil it grows eight or ten feet high, but in a hard and poor ground, it will seldom come up to six inches. This datura, together with the phytolacca, or American nightshade, grow here in those places near the gardens, houses, and roads, which in Sweden are covered with nettles and goose-foot, which European plants are very scarce in America. But the datura and phytolacca are the worst weeds here, nobody knowing any particular use of them.

* The learned Dr. Wallerius, in his Mincralogy, § 8. in the note to the article humus communis atra, mentions, that some people were of opinion, that the mould of our globe increased gradually from the yearly putrefaction of plants and their parts, especially in fuch places as had been uncultivated ever fince the deluge; and that thus, in a hundred years, half an inch of mould was produced. But he observes, in the fame time, that this observation was not at all exact; for as the common mould seldom exceeds a foot, it must from thence follow, that fince the deluge no more than 2400 years were elapfed, though the feripture chronology reckons upwards of 4000 years fince that event: befides this, he remarks, that mould always becomes more dry and compressed, where it is out of the reach of rain and snow; and where it is exposed to rain, it is carried off to lower places, and therefore increases and decreases according to the qualities of its local lituation. Moreover, vegetables, it is known, prosper the best where mould is found. As the furface of our globe has been covered with vegetables fince the deluge, they must have had a mould to grow in ever fince that time; confequently it is highly probable, that there must have been a mould covering the furface of our globe ever fince the first origin. I should be led, by sume other considerations, to doubt of the infallibility of this rule for the increase of mould. In Russia, on this side the river Volga, are high and extensive plains, which have been uncultivated ever fince the deludge; for, we know from history, that the Scythians, Sarmatians, Huns, Chazers, and Mogols, were fuccessively the masters of these vast countries, and were altogether nomadic nations, who lived without agriculture: the country has been without wood fince time immemorial, nor could there even spring up any wood whatfoever, fince its rambling possessions every spring set sire to the old dry grafs, in order to make room for the new grafs, which, in the latter end of May, I found came up very near to my waste. And these vast defart plains I saw every where covered with at least two feet mould; nay, in fome places it amounted to four feet; this would give, according to the former rule of half an inch per century, 4800 years, in the first instance; and, in the second, 9600 years; and therefore shews, that this rule for calculating the increase of mould is very preca-The chemical analysis of plants shews, that they consist of water, earth, acid, alkali, oil, and an inflammable principle, independent of the last fubstance, and called by a late German chemist, the caustic: these substances must enter yearly the new plants, and make their substance, and are as it were regenerated in these new plants, after being set at liberty from the structure of the last year's plants by putiefaction, or by fire. Mould, chemically examined, has the fame analogous parts. Acid and caustic are plentifully contained in the common air, and may also easily be restored to the mould, and thus circulate through a new fystem of plants. Water comes likewife from rain and fnow, out of our atmosphere; alkaline and oily particles, or a kind of foap, are the only things wanting, which, when added with the former to any fubtle earth, will make a good mould; and these are produced by putrefaction or fire, from vegetable and animal fubflances, and are the great promoters of vegetation.

But the great question is, from whence these various substances, necessary for vegetation, originally came? To believe they are produced from putrished vegetables, is begging the question, and making a circulus vitios in the argument. There is therefore no evasion; they were certainly produced by the great Creator of the universe, and endowed with such qualities as make them capable of producing in various mixtures new bodies; and when they are introduced by moissure into the first stamina of a plant, or a seed, they expand these stamina, and constitute a new being, capable of affording food to the animal creation. It is evident, Mr. Kalm hinted at the above-mentioned opinion of the increase of mould; and this gave me an opportunity of confirming his argument, and of stating fairly the great question on

which agriculture, the most necessary branch of human arts, depends. F.

Turnip-fields are fometimes to be feen. In the middle of the high road I perceived a dead black fnake, which was four feet fix inches long, and an inch and a half in thick-

nefs. It belonged to the viper kind.

Late at night a great halo appeared round the moon. The people faid that it prognosticated either a storm or rain, or both together. The smaller the ring is, or the nearer it comes to the moon, the fooner this weather fets in. But this time neither of thefe changes happened, and the halo had foretold a coldness in the air.

I faw to day the chermes of the alder (chermes alni) in great abundance on the branches of that tree, which for that reason looks quite white, and at a distance appears

as it were covered with mould.

Oct. 4th. I continued my journey early in the morning, and the country still had the fame appearance as I went on. It was a continual chain of pretty high hills, with an eafy afcent on all fides, and of vallies been them. The foil confifted of a brick-coloured mould, mixed with clay and a few pebbles. I rode fometimes through woods of feveral forts of trees, and fometimes amidst little fields, which had been cleared of the wood, and which at prefent were corn-fields, meadows, and paftures. The farm-houses flood fingle, fometimes near the roads, and fometimes at a little diftance from them, fo that the space between the road and the houses was taken up with little sields and meadows. Some of the houses were built of stone, two stories high, and covered with fhingles of the white cedar. But most of the houses were wooden, and the crevices ftopped up with clay, instead of moss, which we make use of for that purpose. No valves were to be met with in the chimneys, and the people even did not know what I meant by them. The ovens were commonly built up at some distance from the houses, and were either under a roof, or without any covering against the weather. The fields bore partly buck-wheat, which was not yet cut, partly maize, and partly wheat, which was but lately fown; but fometimes they lay fallow. The vines climbed to the top of feveral trees, and hung down again on both fides. Other trees again were furrounded by the ivy (hedera quinquefolia) which, with the fame flexibility, ascended to a great height. The smilax laurifolia always joined with the ivy, and, together with it, twifted itself round the trees. The leaves of the ivy were at this time commonly reddish, but those of the vine were still quite green. The trees which were surrounded with them, looked at a diffrance like those which are covered with hops in our country; and on feeing them from afar off, one might expect to find wild hops climbing upon the trees. Walnut and chefnut-trees were common near enclosures, in woods, and on hills, and at prefent were loaded with their fruit. The perfimon was likewife plentiful near the roads and in the woods. At fome distance from Wilmington, I passed a bridge over a little river, which falls north into the Delaware. The rider pays here twopence toll for himself and his horse.

Towards noon I arrived at Wilmington.

Wilmington is a little town, about thirty English miles fouth-west from Philadelphia. It was founded in the year 1733. Part of it stands upon the grounds belonging to the Swedish church, which annually receives certain rents, out of which they pay the minifter's falary, and employ the rest for other uses. The houses are built of stone, and look very pretty; yet they are not built close together, but large open places are left between them. The quakers have a meeting-house in this town. The Swedish church, which I intend to mention in the fequel, is half a mile out of town eastwards. The parfonage is under the fame roof with the church. A little river called Christina-kill passes by the town, and from thence falls into the Delaware. By following its banks, one goes three miles before one reaches the Delaware. The river is faid to be fuffi-

ciently

ciently deep, so that the greatest vessel may come quite up to the town; for at its mouth or juncture with the Delaware it is shallowest, and yet its depth even there, when the water is lowest, is from two fathoms to two and a half. But as you go higher, its depth encreases to three, three and a half, and even four fathoms. The largest ships therefore may safely, and with their full cargoes, come to and from the town with the tide. From Wilmington you have a fine prospect of a great part of the river Delaware, and the ships sailing on it. On both sides of the river Christina-kill, almost from the place where the redoubt is built to its juncture with the Delaware, are low meadows, which afford a great quantity of hay to the inhabitants. The town carries on a considerable trade, and would have been more enlarged if Philadelphia and Newcastle, which are both towns of a more ancient date, were not so near on both sides of it.

The redoubt, upon the river Christina-kill, was erected this fummer, when it was known that the French and Spanish privateers intended to fail up the river, and to attempt a landing. It stands, according to the accounts of the late Rev. Mr. Tranberg, on the fame fpot where the Swedes had built theirs. It is remarkable, that on working in the ground this fummer, to make this redoubt, an old Swedish silver coin of Queen Christina, not quite so big as a shilling, was found, at the depth of a yard, among some other things. The Rev. Mr. Tranberg afterwards prefented me with it. On one fide were the arms of the house of Wasa, with the inscription: CHRISTINA, D. G. DE. RE. SVE.that is, Christina, by the grace of God, elected Queen of Sweden; and near this the year of our Lord 1633. On the reverse were these words: MONETA NOVA REGNÍ SVEC. or, a new coin of the kingdom of Sweden. At the fame time, a number of old iron tools, fuch as axes, shovels, and the like, were discovered. The redoubt, that is now erected, confifts of bulwarks of planks, with a rampart on the outfide. Near it is the powder mazagine, in a vault built of bricks. At the erection of this little fortification, it was remarkable, that the Quakers, whose tenets reject even defensive war, were as busy as the other people in building it. For the fear of being every moment fuddenly attacked by privateers conquered all other thoughts. Many of them scrupled to put their own hands to the work, but forwarded it by supplies of money, and by getting ready every thing which was necessary.

Oct. 5th. It was my defign to cross the Delaware, and to get into New Jersey, with a view to get acquainted with the country; but as there was no ferry here to bring my horse over, I set out on my return to Philadelphia. I partly went along the high road, and partly deviated on one or the other side of it, in order to take more exact

observations of the country, and of its natural history.

The maize was fown in feveral places. In fome its stalks were cut fomewhat below the ear, dried, and put up in narrow high stacks, in order to keep them as a food for the cattle in winter. The lower part of the stalk had likewise leaves, but as they commonly dry of themselves, the people do not like to feed the cattle with them, all their slavour being lost; but the upper ones are cut whilst they are yet green.

The valleys between the hills commonly contain brooks; but they are not very broad, and require no bridges, fo that carriages and horse can easily pass through them; for

the water is feldom above fix inches deep.

The leaves of most trees were yet quite green, such as those of oaks, chesnut-trees, black walnut-trees, hiccory, tulip-trees, and sassassass. The two latter species are found in plenty on the sides of the little woods, on hills, on the fallow fields, near hedges, and on the road. The persimon likewise had still its leaves; however, some trees of this kind had dropt them. The leaves of the American bramble were at present

almost entirely red, though some of these bushes yet retained a lively green in the leaves. The cornelian cherry likewise had already a mixture of brown and pale leaves. The leaves of the red maple were also red.

I continued my journey to Chichester, a borough upon the Delaware, where travellers pass the river in a ferry. They build here every year a number of small ships for sale. From an iron work which lies higher in the country, they carry iron bars to

this place, and ship them.

Canoes are boats made of one piece of wood, and are much in use with the farmers, and other people upon the Delaware, and fome little rivers. For that purpose a very thick trunk of a tree is hollowed out: the red juniper, or red cedar-tree, the white cedar, the chefnut-tree, the white oak, and the tulip-tree, are commonly made use of for this purpose. The canoes made of red and white cedar are reckoned the best, because they swim very light upon the water, and last twenty years together. But of thefe the red cedar canoes are most preferable. Those made of chesnut-trees will likewife last for a good while. But those of white oak are hardly serviceable above fix years, and also fwim deep, because they are so heavy. The liquidambar tree, or liquidambar styracislua, Linn. is big enough, but unfit for making canoes, because it imbibes the water. The canoes which are made of the tulip-tree, fcarce last so long as those of white oak. The fize of the canoes is different, according to the purposes they are destined for. They can carry fix persons, who, however, must by no means be unruly, but fit at the bottom of the canoe in the quietest manner possible, lest the boat overfet. The Swedes in Penfylvania and New Jerfey, near the rivers, have no other boats to go to Philadelphia in, which they commonly do twice a week on the market days, though they be feveral miles distant from the town, and meet fometimes with fevere florms; yet misfortunes from the overfetting, &c. of these canoes, are feldom heard of, though they might well be expected, on account of the finall fize of this kind of boats. However, a great deal of attention and care is necessary in managing the canoes, when the wind is somewhat violent; for they are narrow, round below, have no keel, and therefore may eafily be overfet. Accordingly, when the wind is more brisk than ordinary the people make for the land.

The common garden creffes grow in feveral places on the roads about Chichefter, and undoubtedly come from the feeds, which were by chance carried out of the many

gardens about that town.

The American brambles are here in great plenty. When a field is left uncultivated, they are the first plants that appear on it; and I frequently observed them in such fields as are annually ploughed, and have corn sown on them. For when these bushes are once rooted, they are not easily extirpated. Such a bush runs out tendrils sometimes four fathoms off its root, and then throws a new root, so that on pulling it up, you meet with roots on both ends. On some old grounds, which had long been uncultivated, there were so many bushes of this kind, that it was very troublesome and dangerous walking in them. A wine is made of the berries, as I have already mentioned. The berries are likewise eaten when they are ripe, and taste well.

Oct. 6th. The chenopodium enthelminticum is very plentiful on the road, and on the banks of the river, but chiefly in dry places, in a loofe fandy foil. The English, who are fettled here, call it worm-feed, and Jerusalem oak. It has a disagreeable fcent. In Pensylvania and New Jersey its feeds are given to children, against the worms, and for that purpose they are excellent. The plant itself is spontaneous in

both provinces.

The environs of Chichester contain many gardens, which are full of apple-trees, sinking under the weight of innumerable apples. Most of them are winter fruit, and therefore were yet quite sour. Each farm has a garden, and so has each house of the better fort. The extent of these gardens is likewise not inconsiderable, and therefore affords the possession, all the year long, great supplies in his housekeeping, both for eating and drinking. I frequently was surprized at the prudence of the inhabitants of this country. As soon as one has bought a piece of ground, which is neither built upon nor sown, his first care is to get young apple-trees, and to make a garden. He next proceeds to build his house, and lastly prepares the uncultivated ground to receive corn. For it is well known that the trees require many years before they arrive to perfection, and this makes it necessary to plant them first. I now perceived, near the farms, mills, wheels, and other instruments, which are made use of in crushing the apples, in order to prepare cycler from them afterwards.

From Chichester I went on towards Philadelphia. The oaks were the most plentiful trees in the wood. But there were several species of them, all different from the European ones. The swine now went about in great herds in the oak woods, where they sed upon the acorns, which sell in great abundance from the trees. Each hog had a wooden triangular yoke about its neck, by which it was hindered from penetrating through the holes in the enclosures; and, for this reason, the enclosures are made very slender, and easy to put up, and do not require much wood. No other enclosures are in use, but those which are so like sheep-hurdles. A number of squirels were in the oak woods, partly running on the ground, and partly leaping from

one branch to another; and at this time they chiefly fed upon acorns.

I feldom faw beech-trees; but I found them quite the fame with the European ones.

Their wood is reckoned very good for making joiner's planes of.

I do not remember feeing any other than the black ants, or formica nigra, in Penfylvania. They are as black as a coal, and of two forts; fome very little, like the least of our ants, and others of the fize of our common reddish ants. I have not yet observed any hills of theirs, but only seen some running about singly. In other parts of America I have likewise found other species of ants, as I intend to remark in

the fequel.

The common privet, or ligustrum vulgare, is made use of in many places, as a hedge round corn-fields and gardens; and on my whole voyage, I did not see that any other trees were made use of for this purpose, though the Englishmen here well know that the hawthorn makes a much better hedge. The privet hedges grow very thick and close, but, having no spines, the hogs, and even other animals, break easily through them; and when they have once made a hole, it requires a long while before it grows up again. But when the hedges consist of spinose bushes, the cattle will hardly attempt to get through them.

About noon I came through Chefter, a little market-town, which lies on the Delaware. A rivulet, coming down out of the country, passes through this place, and discharges itself into the Delaware. There is a bridge over it. The houses stand dispersed. Most of them are built of stone, and two or three stories high; some are

however made of wood. In the town is a church and a market-place.

Wheat was now fown every where. In some places it was already green, having been sown four weeks before. The wheat fields were made in the English manner, having no ditches in them, but numerous furrows for draining the water, at the distance of sour or six seet from one another. Great stumps of the trees which had

been

been cut down, are every where feen on the fields; and this shews that the country has

been but lately cultivated.

The roots of the trees do not go deep into the ground, but fpread horizontally. I had opportunities of observing this in feveral places where the trees were dug up, for I feldom faw one whose root went above a foot deep into the ground, though it was a loose foil.

About two English miles behind Chester, I passed by an iron forge, which was to the right hand by the road side. It belonged to two brothers, as I was told. The ore however is not dug here, but thirty or forty miles from hence, where it is first melted in the oven, and then carried to this place. The bellows were made of leather, and both they and the hammers, and even the hearth, but small in proportion to ours. All the machines were worked by water. The iron was wrought into bars.

To-day I remarked, as I have fince frequently feen on my travels in this country, that horfes are very greedy of apples. When they are let into an orchard to feed upon the grafs, if there are any apples on the ground, they frequently leave the fresh green grafs and eat the apples, which, however, are not reckoned a good food for

them; and, besides that, it is too expensive.

The red maple, or acer rubrum, is plentiful in thefe places. Its proper fituations are chiefly fwampy, wet places, in which the alder commonly is its companion. Out of its wood they make plates, fpinning-wheels, rolls, feet for chairs and beds, and all forts of work. With the bark they die both worsted and linen, giving it a dark blue colour. For that purpose it is first boiled in water, and some copperas, such as the hat-makers and shoe-makers commonly make use of, is added, before the stuff (which is to be dyed) is put into the boiler. This bark lifewife affords a good black ink. When the tree is felled early in fpring, a fweet juice runs out of it, like that which runs out of our birches. This juice they do not make any use of here; but, in Canada, they make both treacle and fugar of it. Here is a variety of this tree, which they call the curled maple, the wood being as it were marbled within; it is much used in all kinds of joiner's work, and the utenfils made of this wood are preferable to those made of any other fort of wood in the country, and are much dearer than those made of the wood of the wild cherry-trees (prunus virginiani) or of black walnut-trees. But the most valuable utensils were those made of curled black walnut, for that is an excessive scarce kind of wood. The curled maple was likewise very uncommon, and you frequently find trees, whose outsides are marbled but their infide not. The tree is therefore cut very deep before it is felled, to fee whether it has veins in every part.

In the evening I reached Philadelphia.

Oct. 7th. In the morning we croffed the Dilaware in a boat to the other fide, which belongs to New Jerfey, each person paying fourpence for his passage. The country here is very different from that in Pensylvania; for here the ground is almost mere sand; but in the other province it is mixed with a good deal of clay, and this makes the ground pretty rich. The discoveries which I made to-day of insects and plants I intend to mention in another work.

A foil like this in New Jerfey, one might be led to think, could produce nothing, because it is so dry and poor. Yet the maize, which is planted on it, grows extremely well, and we saw many fields filled with it. The earth is of that kind in which tobacco commonly succeeds, but it is not near so rich. The stalks of maize are commonly eight feet high, more or less, and are full of leaves. The maize is planted, as usual, in rows, in little squares, so that there is a space of sive feet and six

inches

inches between each square, both in length and breadth; on each of these little hills three or four stalks come up, which were not yet cut for the cattle; each stalk again has from one to four ears, which are large and full of corn. A fandy ground could never have been better employed. In some places the ground between the maize is ploughed, and rye sown in it, so that when the maize is cut, the rye remains upon the field.

We frequently faw asparagus growing near the enclosures, in a loofe foil, on uncultivated fandy fields. It is likewise plentiful between the maize, and was at present full of berries, but I cannot tell whether the feeds are carried by the wind to the places where I saw them; it is however certain, that I have likewise seen it growing wild in

other parts of America.

The worm-feed is likewife plentiful on the road, in a fandy ground, fuch as that near the ferry, opposite to Philadelphia. I have already mentioned that it is given to children, as a remedy to carry off the worms. It is then put into brandy, and when it has been in it for one hour, it is taken out again, dried, and given to the children, either in beer, fweetened with treacle, or in any other liquor. Its effects are talked of differently. Some people fay it kills the worms; others again pretend that it forwards their increase. But I know, by my own experience, that this worm-feed has had very good effects upon children.

The pursain, which we cultivate in our gardens, grows wild in great abundance in the loose soil, amongst the maize. It was there creeping on the ground, and its stalks were pretty thick and succulent; which circumstances very justly gave reason to wonder from whence it could get juice sufficient to supply it in such a dry ground. It is to be

found plentiful in fuch foil, in other places of this country.

The bidens bipinnata is here called Spanish needles. It grows fingle about farm-houses, near roads, pales, and along the hedges. It was yet partly in flower; but for the greatest part it was already out of blossom. When the feeds are ripe it is very disagreeable walking where it grows, for they stick to the clothes and make them black; and it is difficult to discharge the black spots which they occasion. Each feed has three spines at its extremity; and each of these again is full of numerous little hooks, by which the feed fastens itself to the clothes.

In the woods and along the hedges in this neighbourhood, fome fingle red ants (formica rubra) crept about, and their antennæ or feel-horns, were as long as their bodies.

Towards night we returned to Philadelphia.

Oct. 8th. The shore of Pensylvania has a great quantity of the finest oysters. About this time the people began to bring them to Philadelphia for sale. They come from that part of the shore which is near the mouth of the river Delaware. They are reckoned as good as the New York oysters, of which I shall make more particular mention afterwards. However, I thought that this latter fort of oysters was generally larger, fatter, and more palatable. It is remarkable that they commonly became palatable at the time when the agues had left off their sury. Some men went with whole carts full of oysters, crying them about the streets; this is unusual here when any thing else is to be fold, but in London it is very common. The oyster shells are thrown away, though formerly a lime was burnt from them, which has been found unnecessary, there being stones for burning of lime in this neighbourhood, and the lime of oyster shells not being as good as this other lime. The people shewed me some houses in this town which are built of stone, and to the mason work of which the lime of oyster shells had been employed. The walls of these houses were always so wet

two or three days before a rain, that great drops of water could plainly be perceived, on them; and thus they were as good as hygrometers *. Several people who had

lived in this kind of houses complained of these inconveniences.

Oct. 9. Peafe are not much cultivated in Penfylvania at prefent, though formerly, according to the accounts of fome old Swedes, every farmer had a little field with peafe. In New Jerfey, and the fouthern parts of New York, peafe are likewife not fo much cultivated as they used to be. But in the northern parts of New York, or about Albany, and in all the parts of Canada, which are inhabited by the French, the people fow great quantities, and have a plentiful crop. In the former colonies, a little despicable insect has obliged the people to give up so useful a part of agriculture. This little infect was formerly little known, but a few years ago it multiplied excessively. It couples in fummer, about the time when the peafe are in bloffom, and then depofits an egg into almost every one of the little pease. When the pease are ripe, their outward appearance does not discover the worm, which, however, is found within when it is cut. This worm lies in the pea, if it is not stirred, during all the winter, and part of the fpring, and in that space of time consumes the greatest part of the inside of the pea: in fpring, therefore, little more than the mere thin outward skin is left. This worm at last changes into an insect of the coleoptera class, and in that state creeps through a hole of its own making in the hufk, and flies off, in order to look for new fields of peafe, in which it may couple with its cogeneric infects, and provide food fufficient for its posterity.

This noxious infect has fpread from Penfylvania to the north. For the country of New York, where it is common at prefent, has not been plagued with it above twelve or fifteen years ago; and before that time the people fowed peafe every year, without any inconvenience, and had excellent crops. But by degrees these little enemies came in such numbers that the inhabitants were forced to leave off sowing of pease. The people complained of this in several places. The country people about Albany have yet the pleasure to see their fields of pease not insected by these bectles, but are always as a fraid of their approach; as it has been observed they come every year nearer

to that province.

I know not whether this infect would live in Europe, and I should think our Swedish winters must kill the worm, even if it be ever so deeply inclosed in the pea; notwithstanding it is often as cold in New York (where this infect is so abundant) as in our country, yet it continues to multiply here every year, and proceeds always farther to the north. I was very near bringing some of these vermin into Europe without knowing of it. At my departure from America I took some sweet pease with me in a paper, and they were at that time quite fresh and green; but on opening the paper, after my arrival at Stockholm, on August the 1st, 1751, I sound all the pease hollow, and the head of an infect peeping out of each. Some of these infects even crept out, in order to try the weather of this new climate; but I made haste to shut the paper again, in order to prevent the spreading of this noxious insect. I own, that when I sirst per-

† Though Mr. Kalm has so carefully avoided peopling Europe with this infect, yet Dr. Linnæus affures us, in his Systema Naturæ, that the southern countries of Europe are already infested with it; Scopoli mentions it among his infecta carniolica, p. 63. and Geossroy, among his Parisian infects, vol. i. p. 267. t. 4.

f. 9. has given a fine figure of it. F.

^{*} As the shells of oysters are a marine animal production, and their cavities are full of particles of seawater, the moisture of it slies off, leaving behind its salt; when the shells are burnt, and the lime is slacked, the salt mixes with the lime: and though the mortar of such a lime grows ever so dry, the particles of salt immediately attract the moisture of the air, and cause that dampness complained of here. F.

ceived them, I was more frightened than I should have been at the fight of a viper. For I at once had a full view of the whole damage, which my dear country would have fuffered, if only two or three of these noxious insects had escaped me. The posterity of many families, and even the inhabitants of whole provinces, would have had sufficient reason to detest me, as the cause of so great a calamity. I afterwards sent some of them, though well secured, to Count Tessin, and to Dr. Linnæus, together with an account of their destructive qualities. Dr. Linnæus has already inserted a description of them in an academical dissertation, which has been drawn up under his presidency, and treats of the damages made by insects*. He there calls this insect the Bruchus of North America†. It was very peculiar that every pea in the paper was eaten without exception.

When the inhabitants of Penfylvania fow peafe procured from abroad, they are not commonly attacked by these insects for the first year; but in the next they take possession of the pea. It is greatly to be wished that none of the ships which annually depart from New York or Pensylvania, may bring them into the European countries. From hence the power of a single despicable insect will plainly appear; as also, that the study of the economy and of the qualities of insects is not to be looked upon as a mere

pastime and useless employment t.

The rhus radicans is a fhrub or tree which grows abundantly in this country, and has in common with the ivy, called hedera arborea, the quality of not growing without the fupport either of a tree, a wall, or a hedge. I have feen it climbing to the very top of high trees in the woods, and its branches shoot out every where little roots, which fasten upon the tree, and as it were enter into it. When the stem is cut, it emits a pale brown sap of a disagreeable scent. This sap is so sharp that the letters and characters made upon linen with it cannot be got out again, but grow blacker the more the cloth is washed. Boys commonly marked their names on their linen with this juice. If you write with it on paper the letters never go out, but grow blacker from time to time.

This species of sumach has the same noxious qualities as the poisonous sumach, or poison-tree, which I have above described, being poisonous to some people, though not to every one. Therefore all that has been said of the poison-tree is likewise applicable to this; excepting that the former has the stronger poison. However, I have seen people who have been as much swelled from the noxious exhalations of the latter, as they could have been from those of the former. I likewise know, that of two sisters, the one could manage the tree without being affected by its venom, though the other immediately selt it as soon as the exhalations of the tree came near her, or whenever she came a yard too near the tree, and even when she stood in the way of the wind, which blew directly from this shrub. But upon me this species of sumach has never exerted its power; though I made above a hundred experiments upon myself with the greatest stems, and the juice once squirted into my eye, without doing me any harm. On another person's hand, which I had covered very thick with it, the skin, a few hours after, became as hard as a piece of tanned leather, and peeled off in the following days, as if little scales fell from it.

* Diff. de Noxa Insectorum, Amon. Acad. vol. 3. p. 347.

If the peafe were steeped, before they are fown, in a lye of lime water and fome diffolved arfenic, the

pupa or aurelia of the infect would be killed. F.

[†] In his Systema Naturæ, he calls it bruchus piss, or the pease beetle; and says, that the gracula quiscula, or purple daw of Catesby, is the greatest destroyer of them, and though this bird has been proscribed by the legislature of Pensylvania, New Jersey, and New England, as a maize-thief, they seel however the imprudence of extirpating this bird: for a quantity of worms, which formerly were eaten by these birds, destroy their meadows at present. F.

Oct. 10th. In the morning I accompanied Mr. Cock to his country feat.

Though the woods of Penfylvania afford many oaks, and more species of them than are found further north, yet they do not build fo many ships in this province as they do in the northern ones, and especially in New England. But experience has taught the people that the fame kind of trees is more durable the further it grows to the north, and that this advantage decreases the more it grows in warm climates. It is likewife plain that the trees in the fouth grow more every year, and form thicker ringlets, than those in the north. The former have likewise much greater tubes for the circulation of the fap than the latter. And for this reason they do not build so many ships in Penfylvania, as they do in New England, though more than in Virginia and Maryland; but Carolina builds very few, and its merchants get all their ships from New England. Those which are here made of the best oak hardly are serviceable above ten or at most twelve years; for then they are so rotten that nobody ventures to go to sea in them. Many captains of ships come over from England to North America, in order to get ships built. But most of them choose New England, that being the most northerly province; and if they even come over in ships which are bound for Philadelphia, they frequently, on their arrival, fet out from Penfylvania for New England. The Spaniards in the West Indies are said to build their ships of a peculiar fort of cedar, which holds out against putrefaction and wet; but it is not to be met with on the continent in the English provinces. Here are above nine different forts of oak, but not one of them is comparable to the fingle species we have in Sweden, with regard to its goodness. And therefore a ship of European oak costs a great deal more than one made of American

Many people who chiefly employed themselves in gardening, had found, in a fuccesfion of years, that the red beet, which grew out of the feed which was got from New York, became very fweet, and had a very fine taste; but that it every year lost part of its goodness, if it was cultivated from seeds which were got here. The people were therefore obliged to get as many feeds of red beet every year from New York, as were wanted in their gardens. It has likewife been generally observed, that the plants which are produced from English feeds are always much better and more agreeable than those which come from feeds of this country.

In the garden of Mr. Cock was a radish, which was in the loose foil grown so big as to be feven inches in diameter. Every body that faw it, owned it was uncommon to fee

them of fuch a fize.

That species of convolvulus which is commonly called batatas, has here the name of Bermudian potatoes. The common people, and the gentry without diffinction, planted them in their gardens. This is done in the fame manner as with the common potatoes. Some people made little hillocks, into which they put these potatoes; but others only planted them in flat beds. The foil must be a mixture of fand and earth, and neither too rich nor too poor. When they are going to plant them, they cut them as the common potatoes, taking care however that a bud or two be left on each piece which is intended to be planted. Their colour is commonly red without and yellow within. They are bigger than the common fort, and have a fweet and very agreeable taste which I cannot find in the other potatoes, in artichokes, or in any other root; and they almost melt in the mouth. It is not long fince they have been planted here. They are dreffed in the fame manner as common potatoes, and eaten either along with them, or by themselves. They grow very fast and very well here; but the greatest difficulty confists in keeping them over winter, for they will bear neither cold nor a great heat, nor wet. They must therefore be kept, during winter, in a box

with fand, in a warm room. In Penfylvania, where they have no valves in their chimnies, they are put in fuch a box with fand, at fome diftance from the fire, and there they are fecured both against frost and against over great heat. It will not answer the purpose to put them into dry sand in a cellar, as is commonly done with the common fort of potatoes; for the moisture which is always in cellars, penetrates the sand, and makes them putrify. It would probably be very easy to keep them in Sweden in warm rooms, during the cold season. But the difficulty lies wholly in bringing them over to Sweden. I carried a considerable number of them with me on leaving America, and took all possible care in preserving them, but we had a very violent storm at sea, by which the ship was so greatly damaged that the water got in every where, and wetted our cloaths, beds, and other moveables so much, that we could wring the water out of them. It is therefore no wonder that my Bermuda potatoes were rotten; but as they are now cultivated in Portugal and Spain, nay even in England, it will be easy to bring them into Sweden. The drink which the Spaniards prepare from these potatoes, in their American possessions, is not usual in Pensylvania.*

Mr. Cock had a paper mill, on a little brook, and all the coarser forts of paper are manufactured in it. It is now annually rented for fifty pounds Pensylvania

currency.

Oct. 11th. I have already mentioned that every countryman has a greater or leffer number of apple-trees planted round his farm-house, from whence he gets great quantities of fruit, part of which he sells, part he makes cyder of, and part he uses in his own family for pies, tarts, and the like. However, he cannot expect an equal quantity of fruit every year; and I was told, that this year had not by far afforded such a great quantity of apples as the preceding; the cause of which they told me, was the continual and great drought in the month of May, which had hurt all the blotsoms of the apple trees, and made them wither. The heat had been so great as to dry up all the plants, and the grass in the fields.

The polytrichum commune, a species of moss, grew plentifully on wet and low meadows between the woods, and in several places quite covered them, as our mosses

cover the meadows in Sweden. It was likewife very plentiful on hills.

Agriculture was in a very bad state hereabouts. When a person had bought a piece of land, which perhaps had never been ploughed since the creation, he cut down part of the wood, tore up the roots, ploughed the ground, sowed corn on it, and the first time got a plentiful crop. But the same land being tilled for several years successively without being manured, it at last must of course lose its fertility. Its possessor therefore leaves it fallow, and proceeds to another part of this ground, which he treats in the same manner. Thus he goes on till he has changed a great part of his possessions into corn-fields, and by that means deprives the ground of its fertility. He then returns to the first field, which now is pretty well recovered; this he again tills as long as it will afford him a good crop, but when its fertility is exhausted, he leaves it fallow again, and proceeds to the rest as before.

It being customary here to let the cattle go about the fields and in the woods both day and night, the people cannot collect much dung for manure, but by leaving the land fallow for feveral years together, a great quantity of weeds spring up in it, and get such strength, that it requires a considerable time to extirpate them. From hence it likewise comes, that the corn is always so much mixed with weeds. The great richness of the

^{*} Mr. Miller describes this liquor in his Gardener's Dictionary, under the article of Convolvulus, species the 17th and 18th. F. 8

foil, which the first European colonists sound here, and which had never been ploughed before, has given rise to this neglect of agriculture, which is still observed by many of the inhabitants. But they do not consider, that when the earth is quite exhausted, a great space of time, and an infinite deal of labour is necessary to bring it again into good order; especially in these countries which are almost every summer so scorched up by the excessive heat and drought. The soil of the corn fields consisted of a thin mould, greatly mixed with a brick coloured clay, and a quantity of small particles of glimmer. This latter came from the stones which are here almost every where to be met with at the depth of a foot or thereabouts. These little pieces of glimmer made the

ground fparkle when the fun shone upon it.

Almost all the houses hereabouts were built either of stone or bricks; but those of ftone were more numerous. Germantown, which is about two English miles long, had no other houses, and the country houses thereabouts were all built of stone. But there are feveral varieties of that stone which is commonly made use of in building. Sometimes it confifted of a black or grey glimmer, running in undulated veins, the spaces between their bendings being filled up with a grey, loofe, fmall-grained limestone, which was cafily friable. Some transparent particles of quartz were scattered in the mass, of which the glimmer made the greatest part. It was very easy to be cut, and with proper tools could readily be shaped into any form. Sometimes however the pieces confifted of a black, finall-grained glimmer, a white finall-grained fandstone, and fome particles of quartz, and the feveral conflituent parts were well mixed together; and fometimes the ftone had broad stripes of the white limestone without any addition of glimmer, but most commonly they were much blended together, and of a grey colour. Sometimes this stone was found to consist of quite fine and black pieces of glimmer, and a grey, loofe, and very fmall-grained limeftone. This was likewife very eafy to be cut, being loofe.

These varieties of the stone are commonly found close together. They were every where to be met with, at a little depth, but not in equal quantity and goodness; and not always easy to be broken. When therefore a person intended to build a house, he enquired where the best stone could be met with. It is to be found on corn fields and meadows, at a depth which varies from two to six seet. The pieces were different as to size. Some were eight or ten seet long, two broad, and one thick. Sometimes they were still bigger, but frequently much less. Hereabouts they lay in strata one above another, the thickness of each stratum being about one foot. The length and breadth were different, but commonly such as I have before mentioned. They must commonly dig three or four feet before they reach the first stratum. The loose ground above that stratum is full of little pieces of this stone. This ground is the common brick-coloured soil, which is universal here, and consists of sand and clay, though the former is more plentiful. The loose pieces of glimmer which shine so much in it, seem

to have been broken off from the great strata of stone.

It must be observed that when the people build with this stone, they take care to turn the flat side of it outwards. But as that cannot always be done, the stone being frequently rough on all sides, it is easily cut smooth with tools, since it is soft, and not very difficult to be broken. The stones however are unequal in thickness, and therefore by putting them together they cannot be kept in such straight lines as bricks. It sometimes likewise happens that pieces break off when they are cut, and leave holes on the outside of the wall. But in order to fill up these holes, the little pieces of stone which cannot be made use of are pounded, mixed with mortar, and put into the holes; the places thus filled up, are afterwards smoothed, and when they are dry, they are

hardly

hardly distinguishable from the rest, at some distance. At last they draw, on the outfide of the wall, strokes of mortar, which cross each other perpendicularly, so that it looks as if the wall consisted wholly of equal square stones, and as if the white strokes were the places where they were joined with mortar. The inside of the wall is made smooth, covered with mortar, and white-washed. It has not been observed that this kind of stone attracts the moisture in a rainy or wet season. In Philadelphia and its environs, you find several houses built of this kind of stone.

The houses here are commonly built in the English manner.

One of Mr. Cock's negroes shewed me the skin of a badger (ursus meles) which he had killed a few days ago, and which convinced me that the American badger is the same with the Swedish one: it was here called ground-hog.

Towards night I returned to Philadelphia.

Oct. 12th. In the morning we went to the river Skulkill, partly to gather feeds, partly to collect plants for the herbal, and to make all forts of observations. The Skulkill is a narrow river, which falls into the Delaware, about four miles from Philadelphia to the fouth; but narrow as it is, it rises on the west side of those high mountains commonly called the Blue Mountains, and runs two hundred English miles, and perhaps more. It is a great disadvantage to this country, that there are several cataracts in this river as low as Philadelphia, for which reason there can be no navigation on it. To-day I made some descriptions and remarks on such plants as the cattle liked, or such as they never touched.

I observed several little subterraneous walks in the fields, running under ground in various directions, the opening of which was big enough for a mole: the earth, which formed as it were a vault above it, and lay elevated like a little bank, was near two inches high, full as broad as a man's hand, and about two inches thick. In uncultivated fields I frequently saw these subterraneous walks, which discovered themselves by the ground thrown up above them, which when trod upon gave way, and made it in-

convenient to walk in the field.

These walks are inhabited by a kind of mole *, which I intend to describe more accurately in another work. Their food is commonly roots: I have observed the following qualities in one which was caught. It had greater stiffness and strength in its legs than I ever observed in other animals, in proportion to their fize. Whenever it intended to dig, it held its legs obliquely like oars. I laid my handkerchief before it, and it began to stir in it with the snout, and taking away the handkerchief to see what it had done to it, I found that in the space of a minute it had made it full of holes, and it looked as if it had been pierced very much by an awl. I was obliged to put some books on the cover of the box in which I kept this animal, or else it was slung off immediately. It was very irascible, and would bite great holes into any thing that was put in its way; I held a steel pen-case to it, it at first bit at it with great violence, but having selt its hardness, it would not venture again to bite at any thing. These moles do not make such hills as the European ones, but only such walks as I have already described.

Oct. 13th. There is a plant here, from the berries of which they make a kind of wax or tallow, and for that reason the Swedes call it the tallow-shrub. The English call the same tree the candleberry-tree, or bayberry-bush; and Dr. Linnæus gives it the name of myrica cerifera; it grows abundantly on a wet soil, and seems to thrive

^{*} This animal is probably the forex cristatus of Dr. Linnæus, who says it is like the mole, and lives in Penfylvania. F.

particularly well in the neighbourhood of the fea, nor have I ever found it high up in the country far from the fea. The berries grow abundantly on the female fhrub, and look as if flour had been strewed upon them. They are gathered late in autumn, being ripe about that time, and are then thrown into a kettle or pot full of boiling water; by this means their fat melts out, floats at the top of the water, and may be skimmed off into a vessel; with the skimming, they go on till there is no tallow left. The tallow, as foon as it is congealed, looks like common tallow or wax, but has a dirty green colour; it is for that reason melted over again and refined; by which means it acquires a fine and transparent green colour; this tallow is dearer than common tallow, but cheaper than wax. In Philadelphia they pay a shilling Pensylvania currency, for a pound of this tallow; but a pound of common tallow only came to half that money, and wax costs as much again. From this tallow they make candles in many parts of this province, but they usually mix some common tallow with it. Candles of this kind do not eafily bend, nor melt in fummer as common candles do; they burn better and flower, nor do they cause any smoke, but rather yield an agreeable fmell, when they are extinguished. An old Swede, of ninety-one years of age, told me, that this fort of candles had formerly been much in use with his countryman. prefent they do not make fo many candles of this kind, if they can get the tallow of animals; it being too troublefome to gather the berries. However, these candles are made use of by poor people, who live in the neighbourhood of a place where the bushes grow, and have not cattle enough to kill, in order to supply them with a sufficient quantity of tallow. From the wax of the candleberry-tree they likewise make a soap here, which has an agreeable fcent, and is the best for shaving. This wax is likewise used by doctors and surgeons, who reckon it exceedingly good for plasters upon wounds. A merchant of this town once fent a quantity of these candles to those American provinces which had Roman Catholic inhabitants, thinking he would be well paid, fince wax candles are made use of in the Roman Catholic churches; but the clergy would not take them. An old Swede mentioned that the root of the candleberry-tree was formerly made use of by the Indians, as a remedy against the tooth-ach, and that he himself having had the tooth-ach very violently, had cut the root in pieces and applied it round his tooth; and that the pain had been leffened by it. Another Swede affured me, that he had been cured of the tooth-ach, by applying the peel of the root to it. In Carolina they not only make candles out of the wax of the berries, but likewise fealing-wax.

Oct. 14th. Penny-royal is a plant which has a peculiar ftrong fcent, and grows abundantly on dry places in the country; botanists call it cunila pulegioides. It is reckoned very wholesome to drink as a tea, when a person has got cold, as it promotes perspiration. I was likewise told, that on feeling a pain in any limb, this plant, if ap-

plied to it, would give immediate relief.

The goods which are shipped to London from New England are the following: all forts of fish caught near Newfoundland and elsewhere; train-oil of several forts; whalebone, tar, pitch, masts, new ships, of which a great number is annually built, a few hides, and sometimes some forts of wood. The English islands in America, as Jamaica and Barbadoes, get from New England, sish, slesh, butter, cheese, tallow, horses, cattle; all forts of lumber, such as pails, buckets, and hogsheads; and have returns made in rum, sugar, molasses, and other produces of the country, or in cash, the greatest part of all which they send to London (the money especially) in payment of the goods received from thence; and yet all this is insufficient to pay off the debt.

Oct.

Oct. 15th. The alders grew here in confiderable abundance on wet and low places, and even fometimes on pretty high ones, but never reached the height of the European alders, and commonly flood like a bufh, about a fathom or two high. Mr. Bartram and other gentlemen who had frequently travelled in these provinces, told me, that the more you go to the fouth, the less are the alders; but that they are higher and taller, the more you advance to the north. I found afterwards myself, that the alders, in some places of Canada, are little inferior to the Swedish ones. Their bark is employed here in dying red and brown. A Swedish inhabitant of America told me, that he had cut his leg to the very bone, and that some coagulated blood had already been settled within; that he had been advised to boil the alder bark, and to wash the wound often with the water: that he followed this advice, and soon got his leg

healed, though it had been very dangerous at first.

The phytolacca decandra was called poke by the English. The Swedes had no particular name for it, but made use of the English, with some little variation into paok. When the juice of its berries is put upon paper or the like, it strikes it with a high purple colour, which is a fine as any in the world: and it is pity that no method is as yet found out of making this colour last on woollen and linen cloth, for it fades very foon. Mr. Bartram mentioned, that having hit his foot against a stone, he had got a violent pain in it; he then bethought himself to put a leaf of the phytolacca on his foot, by which he lost the pain in a short time. The berries are eaten by the birds about this time. The English and feveral Swedes make use of the leaves in spring, when they are just come out, and are yet tender and foft, and eat them partly as green cale, and partly in the manner we eat fpinnage. Sometimes they likewife prepare them in the first of these ways, when the stalks are already grown a little longer, breaking off none but the upper fprouts, which are yet tender, and not woody; but in this latter case, great care is to be taken, for if you eat the plant when it is already grown up, and its leaves are no longer foft, you may expect death as a confequence, which feldom fails to follow; for the plant has then got a power of purging the body to excess. I have known people, who, by eating great full-grown leaves of this plant, have got fuch a firong dyfentery, that they were near dying with it; its berries however are eaten in autumn by children, without any ill confequence.

Woollen and linen cloth is died yellow with the bark of hiccory. This likewise is done with the bark of the black oak, or Linnæus's quercus nigra, and that variety of it which Catesby in his Natural History of Carolina, vol. i. tab. 19, calls quercus marilandica. The flowers and leaves of the impatiens noli tangere, or balsamine, likewise

dyed all woollen stuffs with a fine yellow colour.

The collinsonia canadensis was frequently found in little woods and bushes, in a good rich soil. Mr. Bartram, who knew the country perfectly well, was sure that Pensylvania, and all the parts of America in the same climate, were the true and original places where this plant grows; for further to the south, neither he nor Messrs. Clayton and Mitchel ever found it, though the latter gentlemen have made accurate observations in Virginia and part of Maryland; and from his own experience he knew that it did not grow in the northerly parts. I have never found it more than sifteen minutes north of forty three degrees. The time of the year when it comes up in Pensylvania is so late, that its feed has but just time sufficient to ripen in, and it therefore seems unlikely that it can succeed farther north. Mr. Bartram was the first who discovered it, and sent it over into Europe. Mr. Jussieu, during his stay at London, and Dr. Linnæus afterwards, called collinsonia, from the celebrated Mr. Peter Collinson, a merchant in London.

London, and fellow of the English and Swedish Royal Societies. He well deserved the honour of having a plant called after his name, for there are few people that have promoted natural history and all useful sciences with a zeal like his; or that have done as much as he towards collecting, cultivating, and making known all forts of plants. The collinsonia has a peculiar scent, which is agreeable, but very strong. It always gave me a pretty violent head-ach whenever I passed by a place where it stood in plenty, and especially when it was in flower. Mr. Bartram was acquainted with a better quality of this plant, which was that of being an excellent remedy against all forts of pain in the limbs, and against a cold, when the parts affected are rubbed with it; and Mr. Conrad Weisler, interpreter of the language of the Indians in Pensylvania, had told him of a more wonderful cure with this plant. He was once among a company of Indians, one of which had been stung by a rattle-snake; the savages gave him over; but he boiled the collinsonia, and made the poor wretch drink the water, from which he happily recovered. Somewhat more to the north, and in New York, they call this plant horse-weed, because the horses eat it in spring, before any other plant comes up.

Oct. 16th. I asked Mr. Franklin, and other gentlemen who were well acquainted with this country, whether they had met with any signs, from whence they could have concluded, that any place which was now a part of the continent, had formerly been

covered with water? and I got the following account in answer:

First, on travelling from hence to the south you meet with a place where the high road is very low in the ground between two mountains. On both sides you see nothing but oyster-shells and muscle-shells in immense quantities above each other; however

the place is many miles off the fea.

Second, whenever they dig wells, or build houses in town, they find the earth lying in several strata above each other. At a depth of sourteen feet or more, they find globular stones, which are as smooth on the outside as those which lie on the sea-shore, and are made round and smooth by the rolling of the waves; and after having dug through the sand, and reached a depth of eighteen feet or more, they discover in some places a slime like that which the sea throws up on the shore, and which commonly lies at its bottom and in rivers: this slime is quite sull of trees, leaves, branches, reed, charcoal, &c.

Third, it has fometimes happened that new houses have sunk on one side in a short time, and have obliged the people to pull them down again. On digging deeper, for a very hard ground to build upon, they have sound a quantity of the above slime,

wood, roots, &c.

Are not these reasons sufficient to make one suppose that those places in Philadelphia, which are at present fourteen seet and more under ground, formerly were the bottom of the sea, and that, by several accidents, sand, earth, and other things, were carried upon it? or, that the Delaware formerly was broader than it is at present? or, that it has changed its course? This last still often happens at present; the river breaking off the bank on one side, and forming one on the other. Both the Swedes and English often

fliewed me fuch places.

Oct. 18th. At prefent I did not find above ten different kinds of plants in bloffom: they were, a gentiana, two species of after, the common golden rod, or folidago virga aurea, a species of hieracium, the yellow wood-forrel, or oxalis corniculata, the fox-gloves, or digitalis purpurea, the hamamelis virginiana, or witch hazel, our common millefoil, or achillœa millefolium, and our dandelion, or leontodon taraxacum. All other plants had for this year laid afide their gay colours. Several trees, especially those which were to flower early in spring, had already formed such large buds, that on

VOL. XIII. grant opening

opening them all the parts of fructification, fuch as calyx, corolla, stamina, and piftillum, were plainly diftinguishable. It was therefore easy to determine the genus to which fuch trees belonged. Such were the red maple, or acer rubrum, and the laurus æftivalis, a species of bay. Thus nature prepared to bring forth flowers, with the first mild weather in the next year. The buds were at present quite hard, and all their parts preffed close together, that the cold might by all means be excluded.

The black walnut-trees had for the greatest part dropt their leaves, and many of them were entirely without them. The walnuts themselves were already fallen off. The green peel which enclosed them, if frequently handled, would yield a black colour, which could not be got off the fingers in two or three weeks time, though the

hands were washed ever so much.

The cornus florida was called dog-wood by the English, and grew abundantly in the woods. It looks beautiful when it is adorned with its numerous great white flowers in fpring. The wood is very hard, and is therefore made use of for weavers spools, joiners planes, wedges, &c. When the cattle fall down in spring for want of strength,

the people tie a branch of this tree on their neck, thinking it will help them.

Oct. 19th. The tulip-tree grows every where in the woods of this country. The botanists call it liriodendron tulipifera, because its flowers, both in respect to their fize, and in respect to their exterior form, and even in some measure with regard to their colour, refemble tulips. The Swedes call it canoe-tree, for both the Indians and the Europeans often make their canoes of the stem of this tree. The Englishmen in Penfylvania give it the name of poplar. It is reckoned a tree which grows to the greatest height and thickness of any in North America, and which vies in that point with our greatest European trees. The white oak and the fir in North America, however, are little inferior to it. It cannot therefore but be very agreeable to fee in fpring, at the end of May (when it is in bloffom), one of the greatest trees covered for a fortnight together with flowers, which, with regard to their shape, fize, and partly colour, are like tulips; the leaves have likewife fomething peculiar; the English, therefore, in fome places, call the tree the old woman's fmock, because their imagination finds fomething like it below the leaves.

Its wood is here made use of for canoes, boards, planks, bowls, dishes, spoons, door-posts, and all forts of joiners work. I have seen a barn of a considerable size, whose walls and roof were made of a fingle tree of this kind, split into boards. Some joiners reckoned this wood better than oak, because this latter frequently is warped, which the other never does, but works very eafy; others again valued it very little. It is certain, that it contracts fo much in hot weather, as to occasion great cracks in the boards, and in wet weather it fwells fo as to be near burfting, and the people hardly know of a wood in these parts which varies so much in contracting and expanding itself. The joiners, however, make much use of it in their work; they fay there are two species of it; but they are merely two varieties, one of which, in time, turns yellow within; the other is white; the former is faid to have a loofer texture. The bark (like Russian glass) is divisible into very thin leaves, which are very tough like baft, though I have never feen it employed as fuch. The leaves, when crushed and applied to the forehead, are faid to be a remedy against the head-ach. When horses are plagued with worms, the bark is pounded, and given them quite dry. Many people believe its roots to be as efficacious against the fever as the Jefuits bark. The trees grow in all forts of dry foil, both on high and low grounds, but too wet a foil will not agree with them.

Oct. 20th. The beaver-tree is to be met with in feveral parts of Penfylvania and New Jersey, in a poor swampy foil, or on wet meadows. Dr. Linnæus calls it magnolia glauca; both the Swedes and English call it beaver-tree, because the root of this tree is the dainty of beavers, which are caught by its means; however, the Swedes fometimes gave it a different name, and the English as improperly called it fwamp fassafras, and white laurel. The trees of this kind dropt their leaves early in autumn, though foine of the young trees kept them all the winter. I have feldom found the beaver-tree to the north of Penfylvania, where it begins to flower about the end of May. The scent of its blossoms is excellent; for by it you can discover, within three quarters of an English mile, whether these little trees stand in the neighbourhood, provided the wind be not against it. For the whole air is filled with this fweet and pleafant fcent. It is beyond description agreeable to travel in the woods about that time, especially towards night. They retain their flowers for three weeks, and even longer, according to the quality of the foil on which the trees stand; and, during the whole time of their being in bloffom, they fpread their odoriferous exhalations. The berries likewise look very fine when they are ripe, for they have a rich red colour, and hang in bunches on flender flalks. The cough, and other pectoral difeases, are cured by putting the berries into rum or brandy, of which a draught every morning may be taken; the virtues of this remedy were univerfally extolled, and even praifed for their falutary effects in confumptions. The bark being put into brandy, or boiled in any other liquor, is faid not only to eafe pectoral diseases, but likewife to be of some service against all internal pains and heat; and it was thought that a decoction of it could frop the dyfentery. Perfons who had caught cold, boiled the branches of the beaver-tree in water, and drank it to their great relief. A Swede, called Lars Lack, gave the following account of a cure effected by this tree: one of his relations, an old man, had an open fore in his leg, which would not heal up again, though he had had much advice, and used many remedies. An Indian at last effected the cure in the following manner: he burnt some of this wood to charcoal, which he reduced to powder, mixed with the fresh fat of pork, and rubbed the open places feveral times. This dried up the holes, which before were continually open, and the legs of the old man were quite found to his death. The wood is likewise made use of for joiners planes.

Oct. 22d. Upon trial it has been found that the following animals and birds, which are wild in the woods of North America, can be made nearly as tractable as domestic

animals.

The wild cows and oxen, of which feveral people of distinction have got young calves from these wild cows, which are to be met with in Carolina, and other provinces to the south of Pensylvania, and brought them up among the tame cattle; when grown up, they were persectly tame, but, at the same time, very unruly, so that there was no enclosure strong enough to resist them, if they had a mind to break through it; for as they posses a great strength in their neck, it was easy for them to overthrow the pales with their horns, and to get into the corn-fields; and as soon as they had made a road, all the tame cattle followed them; they likewise copulated with the latter, and by that means generated as it were a new breed. This American species of oxen is Linnæus's bos bison, β .

American deer can likewise be tamed; and I have seen them tame myself in different places. A farmer in New Jersey had one in his possession, which he had caught when it was very young; and at present it was so tame, that in the day-time it run into the wood for its food, and towards night it returned home, and frequently brought a

3 L 2

wild

wild deer out of the wood, giving its master an opportunity to shoot it. Several people have therefore tamed young deer, and make use of them for hunting wild

deer, or for decoying them home, especially in the time of their ruiting.

Beavers have been fo tamed, that they have gone on filling, and brought home what they had caught to their mafters. This often is the cafe with otters, of which I have feen fome, which were as tame as dogs, and followed their mafters wherever they went; if he went out in a boat, the otter went with him, jumped into the water, and after a while came up with a fish. The oposition can likewise be tamed, so as to follow people like a dog.

The raccoon, which we (Swedes) call fiupp, can in time be made fo tame as to run about the streets like a domestic animal; but it is impossible to make it leave off its habit of stealing. In the dark it creeps to the poultry, and kills in one night a whole stock. Sugar and other sweet things must be carefully hidden from it; for if the chests and boxes are not always locked up, it gets into them, eats the sugar, and licks up the treacle with its paws: the ladies therefore have every day some complaint against it, and for this reason many people rather forbear the diversion which this apelike animal affords.

The grey and flying fquirrels are fo tamed by the boys, that they fit on their

shoulders, and follow them every where.

The turkey cocks and hens run about in the woods of this country, and differ in nothing from our tame ones, except in their fuperior fize, and redder though more palatable flesh. When their eggs are found in the wood, and put under tame turkey hens, the young ones become tame; however, when they grow up, it fometimes happens that they fly away; their wings are therefore commonly clipped, especially when young; but the tamed turkeys are commonly much more irascible than those which are naturally tame. The Indians likewise employ themselves in taming them

and keeping them near their huts.

Wild geefe have likewife been tamed in the following manner: when the wild geefe first come hither in spring, and stop a little while (for they do not breed in Pensylvania) the people try to shoot them in the wing, which, however, is generally mere chance. They then row to the place where the wild-goose fell, catch it, and keep it for some time at home; by this means many of them have been made so tame, that when they were let out in the morning they returned in the evening; but, to be more sure of them, their wings are commonly clipped. I have seen wild-geese of this kind, which the owner assured me that he had kept for more than twelve years; but though he kept eight of them, yet he never had the pleasure to see them copulate with the tame ones, or lay eggs.

Partridges, which are here in abundance, may likewife be fo far tamed, as to run about all day with the poultry, and to come along with them to be fed when they are called. In the fame manner I have feen wild pigeons, which were made fo tame as to fly out and return again. In fome winters there are immense quantities of wild

pigeons in Penfylvania.

Oct. 24th. Of all the rare birds of North America, the humming-bird is the most admirable, or at least most worthy of peculiar attention. Several reasons induce me to believe that few parts of the world can produce its equal. Dr. Linnæus calls it trochilus colubris. The Swedes, and some Englishmen, call it the king's bird; but the name of humming-bird is more common. Catesby, in his Natural History of Carolina, vol. i. page 65. tab. 65. has drawn it, in its natural fize, with its proper

5

colours.

colours, and added a defeription of it *. In fize it is not much bigger than a large humble-bee, and is therefore the least of all birdst, or it is much if there is a leffer species in the world. Its plumage is most beautifully coloured, most of its feathers being green, some grey, and others forming a shining red ring round its neck; the tail glows with fine feathers, changing from green into a brafs colour. These birds come here in fpring, about the time when it begins to grow very warm, and make their nests in fummer; but, towards autumn, they retreat again into the more fouthern countries of America. They fubfift barely upon the nectar, or fweet juice of flowers, contained in that part which botanists call the nectarium, and which they fuck up with their long bills. Of all the flowers, they like those most, which have a long tube; and I have observed that they have fluttered chiefly about the impatiens noli tangere, and the monarda with crimfon flowers. An inhabitant of the country is fure to have a number of these beautiful and agreeable little birds before his windows all the fummer long, if he takes care to plant a bed with all forts of fine flowers under them. It is indeed a diverting spectacle to see these little active creatures slying about the flowers like bees, and fucking their juices with their long and narrow bills. The flowers of the above-mentioned monarda grow verticillated, that is, at different distances they furround the stalk, as the flowers of our mint (mentha), bastard hemp (galeopfis), mother-wort (leonurus), and dead nettle (lamium). It is therefore diverting to fee them putting their bills into every flower in the circle. As foon as they have fucked the juice of one flower, they flutter to the next. One that has not feen them would hardly believe in how fhort a space of time they have had their tongues in all the flowers of a plant, which when large, and with a long tube, the little bird, by putting its head into them, looks as if it crept with half its body into them.

During their fucking the juice out of the flowers they never fettle on it, but flutter continually like bees, bend their feet backwards, and move their wings fo quick that they are hardly visible. During this sluttering they make a humming like bees, or like that which is occasioned by the turning of a little wheel. After they have thus, without resting, fluttered for a while, they fly to a neighbouring tree or post, and refume their vigour again. They then return to their humming and fucking. They are not very fly; and I, in company with feveral other people, have not been full two yards from the place where they fluttered about and fucked the flowers; and though we fpoke and moved, yet they were no ways diffurbed; but, on going towards them, they would fly off with the swiftness of an arrow. When several of them were on the fame bed there was always a violent combat between them, in meeting each other at the fame flower (for envy was likewife predominant amongst these little creatures), and they attacked with fuch impetuofity that it would feem as if the strongest would pierce its antagonist through and through with its long bill. During the fight, they feem to fland in the air, keeping themselves up by the incredibly swift motion of their wings. When the windows towards the garden are open, they purfue each other into the rooms, fight a little, and flutter away again. Sometimes they come to a flower which is withering, and has no more juice in it; they then, in a fit of anger, pluck it off, and throw it on the ground, that it may not mislead them for the future. If a garden contains a great number of these little birds, they are seen to pluck

^{*} The same is to be met with in Edwards's Natural History of Birds, p. 28. tah. 38. F.

[†] There is a much lesser species of humming-bird, by Linnæus called trochilus minimus, being the least bird known; Sir Hans Sloane's living one weighted only twenty grains, and Mr. Edwards's dry one forty-five. It is drawn in Edwards's birds, 1.150, in its natural fize, together with its egg. F.

off the flowers in fuch quantities that the ground is quite covered with them, and

it feems as if this proceeded from a motion of envy.

Commonly you hear no other found than their humming; but when they fly against each other in the air, they make a chirping noise like a sparrow or chicken. I have sometimes walked with several other people in small gardens, and these birds have on all sides fluttered about us without appearing very shy. They are so small that one would easily mistake them for great humming-bees or butterslies, and their slight resembles that of the former, and is incredibly swift. They have never been observed to seed on insects or fruit; the nectar of slowers seems therefore to be their only food. Several people have caught some humming-birds, on account of their singular beauty, and have put them into cages, where they died for want of a proper food. However, Mr. Bartram has kept a couple of them for several weeks together, by feeding them with water in which sugar had been dissolved; and I am of opinion, that it would not be difficult to keep them all winter in a hot-house.

The humming-bird always builds its neft in the middle of a branch of a tree, and it is fo fmall that it cannot be feen from the ground, but he who intends to fee it must get up to the branch. For this reason it is looked upon as a great rarity if a nest is accidentally found, especially as the trees in summer have so thick a foliage. The nest is likewise the least of all; that which is in my possession is quite round, and consists in the inside of a brownish and quite soft down, which seems to have been collected from the leaves of the great mullein or verbascum thapsus, which are often found covered with a soft wool of this colour, and the plant is plentiful here. The outside of the nest has a coating of green moss, such as is common on old pales, or enclosures, and on trees; the inner diameter of the nest is hardly a geometrical inch at the top, and its depth half an inch. It is however known, that the humming-birds make their nests likewise of flax, hemp, moss, hair, and other such soft materials; they are faid to lay two eggs, each of the fize of a pea.

Oct. 25th. I employed this day and the next in packing up all the feeds gathered this autumn, for I had an opportunity of fending them to England by the ships which

failed about this time. From England they were forwarded to Sweden.

Oct. 27th. In the morning I fet out on a little journey to New York, in company with Mr. Cock, with a view to fee the country, and to enquire into the fafest road, which I could take in going to Canada, through the defart or uninhabited country be-

tween it and the English provinces.

That part where we travelled at present was pretty well inhabited on both sides of the road, by Englishmen, Germans, and other Europeans. Plains and hills of different dimensions were seen alternately: mountains and stones I never saw, excepting a few pebbles. Near almost every farm was a great orchard with peach and apple-trees,

fome of which were yet loaded with fruit.

The enclosures were in some parts low enough for the cattle to leap over them with ease; to prevent this the hogs had a triangular wooden yoke; and to the horse's neck was fastened a piece of wood, which at the lower end had a tooth or hook, fastening in the enclosure, and stopping the horse, just when it listed its forc feet to leap over; but I know not whether this be a good invention with regard to horses. They were likewise kept in bounds by a piece of wood, one end of which was fastened to one of the fore feet, and the other to one of the hind feet, and it forced them to walk pretty slowly, as at the same time it made it impossible for them to leap over the enclosures. To me it appeared that the horses were subject to all forts of dangerous accidents from this piece of wood.

Near

Near New Frankfurt we rode over a little stone bridge, and somewhat further, eight or nine English miles from Philadelphia, we passed over another, which was likewise of stone. There are not yet any milestones put up in the country, and the inhabitants only compute the distances by guess. We were afterwards brought over a giver in a

ferry, where we paid threepence a person for ourselves and our horses.

At one of the places where we stopt to have our horses fed, the people had a mockingbird in a cage; and it is here reckoned the best finging bird, though its plumage be very fimple, and not showy at all. At this time of the year it does not fing. Linnæus calls ittiurdus polyglottos; and Catesby, in his Natural History of Carolina, vol. 1. p. 27. tab. 27, has likewife described and drawn this bird. The people faid that it built its nests in the bushes and trees, but is so shy, that if any body come and look at its eggs, it leaves the neft, never to come to it again. Its young ones require great care in being bred up. If they are taken from their mother and put into a cage fhe feeds them for three or four days but feeing no hopes of fetting them at liberty, she flies away; it then often happens, that the young ones die foon after, doubtless because they cannot accustom themselves to eat what the people give them. These birds stay all summer in the colonies, but retire in autumn to the fouth, and stay away all winter. They have got the name of mocking-birds on account of their skill in imitating the note of almost every bird they hear. The fong peculiar to them is excellent, and varied by an infinite change of notes and melody; feveral people are therefore of opinion that they are the best finging birds in the world. So much is certain, that few birds come up to them: this is what makes them precious.

About noon we came to New Bristol, a small town in Penfylvania, on the banks of the Delaware, about fifteen English miles from Philadelphia. Most of the houses are built of stone, and stand as funder. The inhabitants carry on a small trade, though most of them get their goods from Philadelphia. On the other side of the river, almost directly opposite to New Bristol, lies the town of Burlington, in which the governor of

New Jerfey refides.

Country feats appeared on both fides of the roads. But foon we came into a lane enclosed with pales on both fides, including pretty great corn-fields. Next followed a wood, and we perceived, for the space of four English miles, nothing but woods, and a very poor foil, on which the lupinus perennis grew plentifully and succeeded well. I was overjoyed to see a plant come on so well in these poor dry places, and even began to meditate how to improve this discovery in a soil like that which it inhabited. But I afterwards had the mortification to find that the horses and cows eat almost all the other plants, but left the lupine, which was however very green, looked very fresh, and was extremely soft to the touch. Perhaps means may be found out of making this plant palatable to the cattle. In the evening we arrived at Trenton, after having previously passed the Delaware in a ferry.

Oct. 28th. Trenton is a long narrow town, fituate at fome distance from the river Delaware, on a fandy plain; it belongs to New Jersey, and they reckon it thirty miles from Philadelphia. It has two small churches, one for the people belonging to the church of England, the other for the Presbyterians. The houses are partly built of stone, though most of them are made of wood or planks, commonly two stories high, together with a cellar below the building, and a kitchen under ground, close to the cellar. The houses stand at a moderate distance from one another. They are commonly built so that the street passes along one side of the houses, while ga dens of different dimensions bound the other side; in each garden is a draw-well; the place is reckoned very healthy. Our landlord told us, that twenty-two years ago, when he

first settled here, there was hardly more than one house; but from that time Trenton has encreased so much that there are at present near a hundred houses. The houses were within divided into several rooms by their partitions of boards. The inhabitants of the place carried on a small trade with the goods which they got from Philadelphia, but their chief gain consisted in the arrival of the numerous travellers between that city and New York; for they are commonly brought by the Trenton yatchs from Philadelphia to Trenton, or from thence to Philadelphia. But from Trenton further to New Brunswick, the travellers go in the waggons which set out every day for that place. Several of the inhabitants, however, likewise subsists on the carriage for all forts of goods, which are every day sent in great quantities either from Philadelphia to New York or from thence to the former places; for between Philadelphia and Trenton all goods go by water, but between Trenton and New Brunswick they are all carried by land, and both these conveniences belong to people of this town.

For the yatchts which go between this place and the capital of Penfylvania, they usually pay a shilling and fixpence of Penfylvania currency per person, and every one pays besides for his baggage. Every passenger must provide meat and drink for himself, or pay some settled fare: between Trenton and New Brunswick a person pays

two shillings and fixpence, and the baggage is likewise paid for separately.

We continued our journey in the morning; the country through which we paffed was for the greatest part level, though sometimes there were some long hills; some parts were covered with trees, but far the greater part of the country was without woods; on the other hand, I never faw any place in America, the towns excepted, fo well peopled. An old man, who lived in this neighbourhood, and accompanied us for fome part of the road, however affured me, that he could well remember the time when between Trenton and New Brunswick there were not above three farms, and he reckoned it was about fifty and fome odd years ago. During the greater part of the day we had very extensive corn-fields on both fides of the road; and commonly towards the fouth the country had a great declivity. Near almost every farm was a fpacious orchard full of peaches and apple-trees, and in fome of them the fruit was fallen from the trees in fuch quantities as to cover nearly the whole furface. Part of it they left to rot, fince they could not take it all in and confume it. Wherever we passed by, we were always welcome to go into the fine orchards, and gather our pockets full of the choicest fruit, without the possessor's so much as looking after it. Cherry-trees were planted near the farms, on the roads, &c.

The barns* had a peculiar kind of construction hereabouts, which I will give a concise description of. The whole building was very great, so as almost to equal a small church; the roof was pretty high, covered with wooden shingles, declining on both sides, but not steep: the walls which support it were not much higher than a full-grown man; but, on the other hand, the breadth of the building was the more considerable: in the middle was the threshing-sloor, and above it, or in the lost or garret, they put the corn which was not yet threshed, the straw, or any thing else, according to the season: on one side were stables for the horses, and on the other for the cows. And the small cattle had likewise their particular stables or styes; on both ends of the buildings were great gates, so that one could come in with a cart and horses through one of them, and go out at the other: here was therefore under one roof the threshing-sloor, the barn, the stables, the hay-lost, the coach-house, &c. This kind of buildings is chiefly made use of by the Dutch and Germans; for it is to be observed, that the

^{*} The author feems to comprehend more by this word than what it commonly includes, for he describes it as a building which contains both a barn and stables. F.

country between Trenton and New York is inhabited by few Englishmen, but, instead of

them, by Germans or Dutch *, the latter of which especially are numerous.

Before I proceed I find it necessary to remark one thing with regard to the Indians, or old Americans. For this account may perhaps meet with readers, who, like many people of my acquaintance, may be of opinion that all North America was almost wholly inhabited by favage or heathen nations, and they may be aftonished that I do not mention them more frequently in my account. Others may perhaps imagine, that when I mention in my journal that the country is much cultivated, that in feveral places houses of stone or wood are built, round which are corn-fields, gardens, and orchards, that I am fpeaking of the property of the Indians; to undeceive them, I here give the following explication. The country, especially all along the coasts, in the English colonies, is inhabited by Europeans, who in some places are already so numerous that few parts of Europe are more populous. The Indians have fold the country to the Europeans, and have retired further up: in most parts you may travel twenty Swedish miles, or about a hundred and twenty English miles from the sea-shore before you reach the first habitations of the Indians: and it is very possible for a person to have been at Philadelphia and other towns on the fea-shore for half a year together without fo much as feeing an Indian. I intend in the fequel to give a more circumftantial account of them, their religion, manners, occonomy, and other particulars relating to them: at prefent I return to the feguel of my journal.

About nine English miles from Trenton, the ground began to change its colour; hitherto it confided of a confiderable quantity of hazel-coloured clay, but at prefent the earth was a reddish brown, so that it sometimes had a purple colour, and sometimes looked like logwood. This colour came from a red limestone, which approached very near to that which is on the mountain Kinnekulle in West Gothland, and makes a particular stratum in the rock. The American red limestone therefore seems to be merely a variety of that I faw in Sweden, it lay in strata of two or three fingers thickness; but was divisible into many thinner plates or shivers, whose surface was feldom flat and finooth, but commonly rough: the strata themselves were frequently cut off by horizontal cracks. When these stones were exposed to the air they, by degrees, shivered and withered into pieces, and at last turned into dust. The people of this neighbourhood did not know how to make any use of it; the soil above is fometimes rich and fometimes poor: in fuch places where the people had lately dug new wells, I perceived that most of the rubbish which was thrown up consisted of such a species of stone. This reddish brown earth we always faw till near New Brunswick, where it is particularly plentiful. The banks of the river shewed, in many places, nothing but strata of limestone, which did not run horizontally but dipped very much.

About ten o'clock in the morning we came to Prince-town, which is fituated in a plain. Most of the houses are built of wood, and are not contiguous, so that there are gardens and pastures between them. As these parts were sooner inhabited by Europeans than Penfylvania, the woods were likewife more cut away, and the country more cultivated, fo that one might have imagined him elf to be in Europe.

We now thought of continuing our journey, but as it began to rain very heavily, and continued fo during the whole day and part of the night, we were forced to stay

till next morning.

^{*} This kind of building is frequent in the north of Germany, Holland, and Prussia, and therefore it is no wonder that it is employed by people who were used to them in their own country. F. oa. VOL. XIII.

Oct. 29th. This morning we proceeded on our journey. The country was pretty well peopled; however there were yet great woods in many places: they all confifted of deciduous trees; and I did not perceive a fingle tree of the fir kind till I came to New Brunswick. The ground was level, and did not seem to be every where of the richest kind. In some places it had hillocks, losing themselves almost imperceptibly in the plains, which were commonly crossed by a rivulet. Almost near every farmhouse were great orchards. The houses were commonly built of timber, and at some distance by themselves stood the ovens for baking, consisting commonly of clay.

On a hill covered with trees, and called Rock-hill, I faw feveral pieces of stone or rock, so big that they would have required three men to roll them down. But besides these there were few great stones in the country; for most of those which we saw could easily be lifted up by a single man. In another place we perceived a number of little round pebbles, but we did not meet with either mountains

or rocks.

About noon we arrived at New Brunswick, a pretty little town in the province of New Jerfey, in a valley on the west side of the river Rareton; on account of its low fituation it cannot be feen (coming from Penfylvania) before you get to the top of the hill, which is quite close up to it: the town extends north and fouth along the river. The German inhabitants have two churches, one of stone and the other of wood; the English church is of the latter kind, but the presbyterians were building one of ftone: the town-house makes likewise a pretty good appearance. Some of the other houses are built of bricks, but most of them are made either wholly of wood, or of bricks and wood; the wooden houses are not made of strong timber but merely of boards or planks, which are within joined by laths: fuch houses as confist of both wood and bricks have only the wall towards the street of bricks, all the other sides being merely of planks. This peculiar kind of oftentation would eafily lead a traveller who passes through the town in haste, to believe that most of the houses are built of bricks. The houses were covered with shingles; before each door there was an elevation, to which you afcend by fome fteps from the ftreet; it refembled a small balcony, and had fome benches on both fides, on which the people fat in the evening, in order to enjoy the fresh air, and to have the pleasure of viewing those who passed by. The town has only one ffreet lengthways, and at its northern extremity there is a street across; both of these are of a considerable length.

The river Rareton passes hard by the town, and is deep enough for great yachts to come up; its breadth near the town is within the reach of a common gun-shot; the tide comes up several miles beyond the town, the yachts were placed lengthways along the bridge; the river has very high and pretty steep banks on both sides, but near the town there are no such banks, it being situated in a low valley. One of the streets is almost entirely inhabited by Dutchmen, who came hither from Albany, and for that reason they call it Albany-street. These Dutch only keep company among themselves, and seldom or ever go amongst the other inhabitants, living as it were quite separate from them. New Brunswick belongs to New Jersey; however the greatest part, or rather all its trade is to New York, which is about forty English miles distant; to that place they send corn, flour in great quantities, bread, several other necessaries, a great quantity of linseed, boards, timber, wooden vessels, and all forts of carpenter's work. Several small yachts are every day going backwards and forwards between these two towns. The inhabitants likewise get a considerable profit from the travellers

who every hour pass through on the high road.

The

The fleep banks confift of the red limestone, which I have before described. It is here plainly visible that the strata are not horizontal, but considerably dipping, especially towards the south. The weather and the air has in a great measure dissolved the stone here: I enquired whether it could not be made use of; but was assured, that in building houses it was entirely useless; for, though it is hard and permanent under ground, yet, on being dug out, and exposed for some time to the air, it first crumbles into greater, then into lesser pieces, and at last is converted into dust. An inhabitant of this town, however, tried to build a house with this fort of stone, but its outsides being exposed to the air, soon began to change so much, that the owner was obliged to put boards all over the wall to preserve it from falling to pieces. The people however pretend that this stone is a very good manure, if it is scattered upon the cornfields in its rubbish state, for it is said to stifle the weeds: it is therefore made use of both on the fields and in gardens *.

Towards the evening we continued our journey, and were ferried over the river Rareton, together with our horfes. In a very dry fummer, and when the tide has ebbed, it is by no means dangerous to ride through this river. On the opposite shore the red juniper tree was pretty abundant. The country through which we now passed

was pretty well inhabited, but in most places full of small pebbles.

We faw guinea-hens in many places where we passed by. They sometimes run about

the fields, at a good distance from the farm houses.

About eight English miles from New Brunswick the road divided. We took that on the left, for that on the right leads to Amboy, the chief sea-town in New Jersey. The country now made a charming appearance; some parts being high, others forming vallies, and all of them well cultivated. From the hills you had a prospect of houses, farms, gardens, corn-fields, forests, lakes, islands, roads, and pastures.

In most of the places where we travelled this day the colour of the ground was reddish. I make no doubt but there were strata of the before mentioned red limestone under it.

Sometimes the ground looked very like a cinnabar ore.

Wood-bridge is a small village in a plain, consisting of a few houses: we stopped here to rest our horses a little. The houses were most of them built of boards; the walls had a covering of shingles on the outside; these shingles were round at one end, and all of a length in each row: some of the houses had an Italian roof, but the greatest part had roofs with pediments; most of them were covered with shingles. In most

places we met with wells, and buckets to draw up the water.

Elizabeth-town is a finall town, about twenty English miles distant from New Brunswick: we arrived there immediately after fun-setting. Its houses are mostly scattered, but well built, and generally of boards, with a roof of shingles, and walls covered with the same. There were likewise some stone buildings. A little rivulet passes through the town from west to east; it is almost reduced to nothing when the water ebbs away, but with the full tide they can bring up small yachts. Here were two sine churches, each of which made a much better appearance than any one in Philadelphia. That belonging to the people of the church of England was built of bricks, had a steeple with bells, and a balustrade round it, from which there was a prospect of the country. The meeting-house of the presbyterians was built of wood, but had both a steeple and bells, and was, like the other houses, covered with shingles. The town-house made likewise a good appearance, and had a spire with a bell. The banks of the river were red, from the reddish lime-

3 M 2

[•] Probably it is a stone marle; a blue and reddish species of this kind is used with good success in the county of Bamff in Scotland.

ftone; both in about the town were many gardens and orchards; and it might truly be faid, that Elizabeth-town was fituated in a garden, the ground hereabouts being even and well cultivated.

At night we took up our lodgings at Elizabeth-town Point, an inn, about two English miles distant from the town, and the last house on this road belonging to New Jersey. The man who had taken the lease of it, together with that of the ferry near it, told us

that he paid a hundred and ten pounds of Penfylvania currency to the owner.

Oct. 30th. We were ready to proceed on our journey at fun-rifing. Near the inn where we had passed the night, we were to cross a river, and we were brought over, together with our horses, in a wretched half-rotten ferry. This river came a considerable way out of the country, and small vessels could easily fail up it. This was a great advantage to the inhabitants of the neighbouring country, giving them an opportunity of sending their goods to New York with great ease; and they even made use of it for trading to the West Indies. The country was low on both sides of the river, and conssisted of meadows. But there was no other hay to be got than such as commonly grows in swampy grounds; for as the tide comes up in this river, these low plains were sometimes overslowed when the water was high. The people hereabouts are said to be troubled in summer with immense swamps of gnats or musquitos, which sting them and their cattle. This was ascribed to the low swampy meadows, on which these infects deposit their eggs, which are afterwards hatched by the heat.

As foon as we had got over the river, we were upon Staten Island, which is quite furrounded with falt water. This is the beginning of the province of New York. Most of the people settled here were Dutchmen, or such as came hither whilst the Dutch were yet in possession of this place. But at present they were scattered among the English and other European inhabitants, and spoke English for the greatest part. The prospect of the country here is extremely pleasing, as it is not so much intercepted by woods, but offers more cultivated fields to view. Hills and vallies still continued, as

ufual, to change alternately.

The farms were near each other. Most of the houses were wooden; however some were built of stone. Near every farm house was an orchard with apple-trees. Here, and on the whole journey before, I observed a press for cyder at every farm-house, made in different manners, by which the people had already pressed the juice out of the apples, or were just bushed with that work. Some people made use of a wheel made of thick oak planks, which turned upon a wooden axis, by means of a horse drawing it, much in the same manner as the people do with woad; * except that here the wheel runs upon planks. Cherry-trees stood along the enclosures round corn-fields.

The corn-fields were excellently fituated, and either fown with wheat or rye. They had no ditches on their fides, but (as is usual in England) only furrows, drawn at greater

or leffer diftances from each other.

In one place we observed a water-mill, so fituated that when the tide flowed the water ran into a pond; but when it ebbed, the floodgate was drawn up, and the mill driven by

the water flowing out of the pond.

About eight o'clock in the morning we arrived at the place where we were to cross the water, in order to come to the town of New York. We left our horses here, and went on board the yacht: we were to go eight English miles by sea; however, we landed about eleven o'clock in the morning at New York. We saw a kind of wild

^{*} Dr. Linnæus, in his Travels through Westrogothia, has given a drawing of the machine by which woad prepared, on the 128th page.

ducks in immense quantities upon the water: the people called them blue bills, and they feemed to be the same with our pintail ducks, or Linnæus's anas acuta: but they were very shy. On the shore of the continent we saw some very sine sloping corn-fields, which at present looked quite green, the corn being already come up. We saw many boats, in which the sishermen were busy catching oysters: to this purpose they make use of a kind of rakes with long iron teeth bent inwards; these they used either single, or two tied together, in such a manner that the teeth were turned towards each other.

Oct. 31st. About New York they find innumerable quantities of excellent oysters, and there are few places which have oysters of such an exquisite taste, and of so great a fize: they are pickled and sent to the West Indies and other places; which is done in the following manner. As soon as the oysters are caught, their shells are opened, and the fish washed clean; some water is then poured into a pot, the oysters are put into it, and they must boil for a while; the pot is then taken off from the fire again, the oysters taken out and put upon a dish, till they are somewhat dry: then you take some mace, allspice, black pepper, and as much vinegar as you think is sufficient to give a sourish taste. All this is mixed with half the liquor in which the oysters were boiled, and put over the fire again. While you boil it, great care is to be taken in seumming off the thick seum; at last the whole pickle is poured into a glass or earthen vessel, the oysters are put to it, and the vessel is well stopped to keep out the air. In this manner oysters will keep for years together, and may be sent to the most distant parts of the world.

The merchants here buy up great quantities of oysters about this time, pickle them in the above-mentioned manner, and fend them to the West Indies: by which they frequently make a considerable profit: for the oysters which cost them five shillings of their currency, they commonly sell for a pistole, or about fix times as much as they gave for them; and sometimes they get even more: the oysters which are thus pickled have a very fine slavour. The following is another way of preserving oysters: they are taken out of the shells, fried with butter, put into a glass or earthen vessel with the melted butter over them, so that they are quite covered with it, and no air can get to them. Oysters prepared in this manner have likewise an agreeable taste, and are exported to the West Indies, and other parts.

Oysters are here reckoned very wholesome, some people assured us, that they had not felt the least inconvenience after eating a considerable quantity of them. It is likewise a common rule here, that oysters are best in those months, which have an r in their name, such as September, October, &c.; but that they are not so good in other months; however there are poor people who live all the year long upon nothing but

oysters with bread.

The fea near New York, affords annually the greatest quantity of oysters. They are found chiefly in a muddy ground, where they lie in the slime, and are not so frequent in a fandy bottom: a rocky and a stony bottom is seldom found here. The oyster shells are gathered in great heaps, and burnt into a lime, which by some people is made use of in building houses, but is not reckoned so good as that made of limestone. On our journey to New York, we saw high heaps of oyster shells near the farm-houses, upon the sea shore; and about New York, we observed the people had carried them upon the fields, which were sown with wheat. However they were entire, and not crushed.

The Indians, who inhabited the coast before the arrival of the Europeans, have made oysters and other shell-sish their chief food; and at present, whenever they

come to a falt water, where oysters are to be got, they are very active in catching them, and fell them in great quantities to other Indians, who live higher up the country: for this reason you see immense numbers of oyster and muscle shells piled up near such places, where you are certain that the Indians formerly built their huts. This circumstance ought to make us cautious in maintaining, that in all places on the sea-shore, or higher up in the country, where such heaps of shells are to be met with, the latter have

lain there ever fince the time that those places were overflowed by the fea.

Lobsters are likewise plentifully caught hereabouts, pickled much in the same way as oysters, and sent to several places. I was told of a very remarkable circumstance about these lobsters, and I have afterwards frequently heard it mentioned. The coast of New York had already European inhabitants for a considerable time, yet no lobsters were to be met with on that coast; and though the people sished ever so often, they could never find any signs of lobsters being in this part of the sea: they were therefore continually brought in great well-boats from New England, where they are plentiful; but it happened that one of these well-boats broke in pieces near Hellgate, about ten English miles from New York, and all the lobsters in it got off. Since that time they have so multiplied in this part of the sea that they are now caught in the greatest abundance.

Nov. 1st. A kind of cold fever, which the English in this country call fever and ague, is very common in feveral parts of the English colonies. There are, however, other parts where the people have never felt it. I will in the fequel describe the fymptoms of this difease at large. Several of the most considerable inhabitants of this town affured me, that this difease was not near so common in New York as it is in Penfylvania, where ten were feized by it to one in the former province; therefore they were of opinion, that this difease was occasioned by the vapours arising from stagnant fresh water, from marshes, and from rivers; for which reason those provinces, fituated on the fea fhore, could not be fo much affected by it. However the carelefsnefs with which people eat quantities of melons, water melons, peaches, and other juicy fruit, in fummer, was reckoned to contribute much towards the progress of this fever; and repeated examples confirmed the truth of this opinion. The Jefuit's bark was reckoned a good remedy against it. It has, however, often been found to have operated contrary to expectation, though I am ignorant whether it was adulterated, or whether fome miftake had been committed in the manner of taking it. Mr. Davis van Horne, a merchant, told me, that he cured himself, and several other people, of this fever, by the leaves of the common garden fage, or falvia officinalis of Linnæus. The leaves are crushed or pounded in a mortar, and the juice is pressed out of them; this is continued till they get a spoonful of the liquid, which is mixed with lemon juice. This draught is taken about the time that the cold fit comes on; and after taking it three or four times the fever does not come again.

The bark of the white oak was reckoned the best remedy which had as yet been found against the dysentery. It is reduced to a powder, and then taken: some people assured me, that in cases where nothing would help, this remedy had given a certain and speedy relief. The people in this place likewise make use of this bark (as is usually done in the English colonies) to dye wool a brown colour, which looks like that of bohea tea, and does not sade by being exposed to the sun. Among the numerous shells which are found on the sea-shore, there are some, which by the English here are called clams, and which bear some resemblance to the human ear. They have a considerable thickness, and are chiesly white, excepting the pointed end, which both without and within has a blue colour, between purple and violet. They are met with in vast

numbers on the fea-shore of New York, Long Island, and other places. The shells contain a large animal, which is eaten both by the Indians and Europeans settled here.

A confiderable commerce is carried on in this article with fuch Indians as live further up the country. When these people inhabited the coast they were able to catch their own clams, which at that time made a great part of their food; but at present this is the business of the Dutch and English, who live in Long Island and other maritime provinces. As soon as the shells are caught, the fish is taken out of them, drawn upon a wire, and hung up in the open air, in order to dry by the heat of the sun. When this is done, the sless has put into proper vessels, and carried to Albany upon the river Hudson; there the Indians buy them, and reckon them one of their best dishes. Besides the Europeans, many of the native Indians come annually down to the sca-shore, in order to eatch clams, proceeding with them afterwards in the manner I have just described.

The shells of these clams are used by the Indians as money, and make what they call their wampum; they likewise serve their women for an ornament, when they intend to appear in full dress. These wampums are properly made of the purple parts of the shells, which the Indians value more than the white parts. A traveller, who goes to trade with the Indians, and is well stocked with them, may become a considerable gainer; but if he take gold coin, or bullion, he will undoubtedly be a loser; for the Indians, who live farther up the country, put little or no value upon these metals which we reckon so precious, as I have frequently observed in the course of my travels. The Indians formerly made their own wampums, though not without a deal of trouble; but at present the Europeans employ themselves that way, especially the inhabitants of Albany, who get a considerable profit by it. In the sequel I intend to relate the manner of making the wampum.

Nov. 2d. Besides the different sects of Christians there are many Jews settled in New York, who possess great privileges. They have a synagogue and houses, and great country seats of their own property, and are allowed to keep shops in town. They have likewise several ships, which they freight, and send out with their own goods; in sine, they enjoy all the privileges common to the other inhabitants of this town and

province.

During my refidence at New York this time, and in the two next years, I was frequently in company with Jews. I was informed, among other things, that these people never boiled any meat for themselves on Saturday, but that they always did it the day before; and that in winter they kept a fire during the whole Saturday. They commonly eat no pork; yet I have been told by feveral men of credit, that many of them (especially among the young Jews) when travelling, did not make the least difficulty about eating this or any other meat that was put before them; even though they were in company with Christians. I was in their fynagogue last evening for the first time, and this day at noon I vifited it again, and each time I was put into a particular feat, which was fet apart for strangers or Christians. A young rabbi read the divine fervice, which was partly in Hebrew, and partly in the rabbinical dialect. Both men and women were dreffed entirely in the English fashion; the former had all of them their hats on, and did not once take them off during fervice. The galleries, I observed, were appropriated to the ladies, while the men fat below. During prayers the men spread a white cloth over their heads; which perhaps is to reprefent fackcloth; but I observed that the wealthier fort of people had a much richer cloth than the poorer ones. Many of the men had Hebrew books, in which they fang and read alternately. The rabbi flood

flood in the middle of the fynagogue, and read with his face turned towards the eaft: he spoke, however, so fast, as to make it almost impossible for any one to understand what he faid *.

New York, the capital of a province of the fame name, is fituated under forty degrees and forty minutes north latitude, and feventy-four degrees and four minutes of weltern longitude from London; and is about ninety-feventy English miles distant from Philadelphia. The fituation of it is extremely advantageous for trade; for the town stands upon a point which is formed by two bays, into one of which the river. Hudson discharges itself, not far from the town; New York is therefore on three fides furrounded with water: the ground it is built on is level in fome parts, and hilly in others: the place is generally reckoned very wholesome.

The town was first founded by the Dutch: this, it is faid, was done in the year 1623, when they were yet mafters of the country; they called it New Amfterdam, and the country itself New Holland. The English, towards the end of the year 1664, taking possession of it under the conduct of Des Cartes, and keeping it by the virtue of the next treaty of peace, gave the name of New York to both the town and the province belonging to it; in fize it comes neareft to Boston and Philadelphia. But with regard to its fine buildings, its opulence, and extensive commerce, it disputes the preference with them: at prefent it is about half as big again as Gothenburg in Sweden.

The streets do not run so straight as those of Philadelphia, and have sometimes confiderable bendings: however they are very spacious and well-built, and most of them are paved, except in high places, where it has been found useless. In the chief streets there are trees planted, which in fummer gave them a fine appearance, and during the excessive heat at that time, afford a cooling shade: I found it extremely pleasant to walk in the town, for it feemed quite like a garden; the trees which are planted for this purpose are chiefly of two kinds: the water-beech, or Linnæus's platanus occidentalis, are the most numerous, and give an agreeable shade in summer, by their great and numerous leaves. The locust-tree, or Linnæus's robinia pseud-acacia, is likewise frequent: its fine leaves, and the odoriferous scent which exhales from its flowers, make it very proper for being planted in the streets near the houses, and in gardens. There are likewife lime-trees and elms in these walks, but they are not by far fo frequent as the others: one feldom met with trees of the fame fort next to each other, they being in general planted alternately.

Befides numbers of birds of all kinds which make thefe trees their abode, there are likewise a kind of frogs which frequent them in great numbers in summer; they are Dr. Linnæus's rana arborea, and especially the American variety of this animal. They are very clamorous in the evening and in the nights (efpecially when the days had been hot, and a rain was expected) and in a manner drown the finging of the birds. They frequently make such a noise that it is difficult for a person to make himself

heard.

Most of the houses are built of bricks, and are generally strong and neat, and several florics high. Some had, according to old architecture, turned the gable-end towards the ftrcets; but the new houses were altered in this respect. Many of the houses had a balcony on the roof, on which the people used to fit in the evenings in the summer feafon; and from thence they had a pleafant view of a great part of the town, and likewise of part of the adjacent water, and of the opposite shore. The roofs are com-

monly

^{*} As there are no Jews in Sweden, Prof. Kalm was an utter stranger to their manners and religious customs, and therefore relates them as a kind of novelty. F.

monly covered with tiles or shingles; the latter of which are made of the white fir-tree, or pinus strobus (Linn. sp. plant.) which grows higher up in the country. The inhabitants are of opinion, that a roof made of these shingles is as durable as one made in Pensylvania of the white cedar, or cupressus thyoides (Linn. spec. plant.) The walls were white-washed within; and I did not any where see hangings, with which the people in this country seem in general to be but little acquainted. The walls were quite covered with all forts of drawings and pictures in small frames. On each side of the chimnies they had usually a fort of alcove; and the wall under the windows was wain-scotted, and had benches placed near it. The alcoves and all the wood work were

painted with a bluish grey colour.

There are feveral churches in the town, which deferve fome attention. 1. The English church, built in the year 1695, at the west end of the town, consisting of stone, and has a steeple with a bell. 2. The new Dutch church, which is likewise built of stone, is pretty large, and is provided with a steeple; it also has a clock, which is the only one in the town. This church stands almost due from north to fouth. No particular point of the compass has here been in general attended to in erecting facred buildings. Some churches stand as is usual from east to west, others from south to north, and others in different positions. In this Dutch church there is neither altar, vestry, choir, fconces, nor paintings. Some trees are planted round it, which make it look as if it was built in a wood. 3. The old Dutch church, which is also built of stone; it is not fo large as the new one. It was painted in the infide, though without any images, and adorned with a small organ, of which Governor Burnet made them a present. The men, for the most part, fit in the gallery, and the women below. 4. The Profbyterian church, which is pretty large, and was built but lately; it is of stone, and has a steeple and a bell in it. 5. The German Lutheran church. 6. The German Reformed church. 7. The French church, for Protestant refugees. 8. The Quaker's meeting-house. 9. To these may be added the Jewish synagogue, which I mentioned before.

Towards the fea, on the extremity of the promontory, is a pretty good fortrefs, called Fort George, which entirely commands the port, and can defend the town, at least from a fudden attack on the fea-fide. Besides that, it is likewise secured on the north, or towards the shore, by a pallisade, which, however, (as for a considerable time the people have had nothing to fear from an enemy) is in many places in a very bad state of defence.

There is no good water to be met with in the town itself, but at a little distance there is a large spring of good water, which the inhabitants take for their tea, and for the uses of the kitchen. Those, however, who are less delicate in this point, make use of the water from the wells in town, though it be very bad. This want of good water lies heavy upon the horses of the strangers that come to this place; for they do not like to drink the water from the wells in the town.

The port is a good one; ships of the greatest burthen can lie in it, quite close up to the bridge; but its water is very falt, as the sea continually comes in upon it, and therefore is never frozen, except in extraordinary cold weather. This is of great advantage to the city and its commerce; for many ships either come in or go out of the port at any time of the year, unless the winds be contrary; a convenience which, as I have before observed, is wanting at Philadelphia. It is secured from all violent hurricanes from the south-east by Long Island, which is situated just before the town; therefore only the storms from the south-west are dangerous to the ships which ride at anchor here, because the port is open only on that side. The entrance however has its faults; one

vol. XIII. 3 N

of them is, that no men of war can pass through it; for though the water is pretty deep, yet it is not sufficiently so for great ships. Sometimes even merchant ships of a large fize have, by the rolling of the waves and by sinking down between them, slightly touched the bottom, though without any bad consequences. Besides this, the canal is narrow; and for this reason many ships have been lost here, because they may be easily cast upon a sand, if the ship is not well piloted. Some old people, who had constantly been upon this canal, assured me, that it was neither deeper nor shallower at present than in their youth.

The common difference between high and low water at New York amounts to about fix feet, English measure. But at a certain time in every month, when the tide flows more than commonly, the difference in the height of the water is feven feet.

New York probably carries on a more extensive commerce than any town in the English North American provinces; at least it may be said to equal them: Boston and Philadelphia however come very near up to it. The trade of New York extends to many places; and it is faid they fend more ships from thence to London than they do from Philadelphia. They export to that capital all the various forts of fkins which they buy of the Indians, fugar, logwood, and other dying woods, rum, mahogany, and many other goods which are the produce of the West Indies; together with all the specie which they get in the course of trade. Every year they build several ships here, which are fent to London, and there fold; and of late years they have shipped a quantity of iron to England. In return for these, they import from London stuffs, and every other article of English growth or manufacture, together with all forts of foreign goods. England, and especially London, profits immensely by its trade with the American colonies; for not only New York, but likewife all the other English towns on the continent, import fo many articles from England, that all their specie, together with the goods which they get in other countries, must altogether go to Old England, in order to pay the amount, to which they are however infufficient. From hence it appears how much a well-regulated colony contributes to the increase and welfare of its mother country.

New York fends many ships to the West Indies, with flour, corn, biscuit, timber, tuns, boards, flesh, fish, butter, and other provisions; together with some of the few fruits that grow here. Many ships go to Beston in New England, with corn and flour; and take in exchange, flesh, butter, timber, different forts of fish, and other articles, which they carry further to the West Indies. They now and then take rum from thence, which is diffilled there in great quantities, and fell it here with a confiderable advantage. Sometimes they fend yachts with goods from New York to Philadelphia, and at other times yachts are fent from Philadelphia to New York, which is only done, as appears from the gazettes, because certain articles are cheaper at one place than at the other. They fend ships to Ireland every year, laden with all kinds of West India goods, but especially with linfeed, which is reaped in this province. I have been affured, that in some years no less than ten ships have been fent to Ireland, laden with nothing but linfeed, because it is faid the flax in Ireland does not afford good feed; but probably the true reason is this; the people of Ireland, in order to have the better flax, make use of the plant before the feed is ripe, and therefore are obliged to fend for foreign feed; and hence it becomes one of the chief articles in trade.

A set is it as a find of lineard in full for eight faillings of Mary Varl

At this time a bushel of linfeed is fold for eight shillings of New York currency, or exactly a piece of eight.

The goods which are shipped to the West Indies are sometimes paid for with ready money, and sometimes with West India goods, which are either first brought to New York,

York, or immediately fent to England or Holland. If a ship does not chuse to take in West India goods in its return to New York, or if nobody will freight it, it often goes to Newcastle in England, to take in coals for ballast, which when brought home fell for a pretty good price. In many parts of the town coals are made use of, both for kitchen fires, and in rooms, because they are reckoned cheaper than wood, which at present costs thirty shillings of New York currency per fathom; of which measure I have before made mention. New York has likewise some intercourse with South Carolina; to which it sends corn, flour, sugar, rum, and other goods, and takes rice in return,

which is almost the only commodity exported from South Carolina.

The goods with which the province of New York trades are not very numerous. They chiefly export the skins of animals, which are bought of the Indians about Ofwego; great quantities of boards, coming for the most part from Albany; timber and ready-made lumber, from that part of the country which lies about the river Hudson; and lastly, wheat, flour, barley, oats, and other kinds of corn, which are brought from New Jersey and the cultivated parts of this province. I have seen yachts from New Brunswick, laden with wheat which lay loose on board, and with flour packed up in tuns; and also with great quantities of linseed. New York likewise exports some flesh and other provisions out of its own province, but they are very few; nor is the quantity of pease, which the people about Albany bring, much greater. Iron however may be had more plentifully, as it is found in several parts of this province, and is of a considerable goodness; but all the other products of this country are of little account.

Most of the wine, which is drank here and in the other colonies, is brought from

the ifle of Madeira, and is very ftrong and fiery.

No manufactures of note have as yet been established here; at present they get all manufactured goods, such as woollen and linen cloth, &c. from England, and espe-

cially from London.

The river Hudfon is very convenient for the commerce of this city; as it is navigable for near an hundred and fifty English miles up the country, and falls into the bay not far from the town, on its western side. During eight months of the year this river is full of yachts, and other greater and lesser vessels, either going to New York or returning from thence, laden either with inland or foreign goods.

I cannot make a just estimate of the ships that annually come to this town or fail from it. But I have found, by the Pensylvania gazettes, that from the first of December in 1729, to the fifth of December in the next year, two hundred and eleven ships entered the port of New York, and two hundred and twenty-two cleared it; and

fince that time there has been a great increase of trade here.

The country people come to market in New York twice a week, much in the fame manner as they do at Philadelphia, with this difference, that the markets are here kept

in feveral places.

The governor of the province of New York refides here, and has a palace in the fort. Among those who have been entrusted with this post, William Burnet deserves to be had in perpetual remembrance. He was one of the sons of Dr. Thomas Burnet (so celebrated on account of his learning) and seemed to have inherited the knowledge of his father. But his great assiduity in promoting the welfare of this province, is what makes the principal merit of his character. The people of New York therefore still reckon him the best governor they ever had, and think that they cannot praise his services too much. The many astronomical observations which he made in these parts are inserted in several English works. In the year 1727, at the accession of King

George II. to the throne of Great Britain, he was appointed governor of New England. In consequence of this he left New York, and went to Boston, where he died

univerfally lamented, on the 7th of September 1729.

An affembly of deputies, from all the particular districts of the province of New York, is held at New York once or twice every year. It may be looked upon as a parliament or diet in miniature. Every thing relating to the good of the province is here debated. The governor calls the affembly, and diffolves it at pleafure: this is a power which he ought only to make use of, either when no farther debates are necesfary, or when the members are not fo unanimous in the fervice of their king and country as is their duty: it frequently however happens, that, led afide by caprice or by interested views, he exerts it to the prejudice of the province. The colony has sometimes had a governor whose quarrels with the inhabitants have induced their reprefentatives, or the members of the affembly, through a spirit of revenge, to oppose indifferently every thing he proposed, whether it was beneficial to the country or not. In fuch cases the governor has made use of his power; dissolving the assembly, and calling another foon after, which however he again diffolved upon the least mark of their ill humour. By this means he fo much tired them, by the many expences which they were forced to bear in fo fhort a time, that they were at last glad to unite with him in his endeavours for the good of the province. But there have likewise been governors who have called affemblies and diffolved them foon after, merely because the representatives did not act according to their whims, or would not give their affent to propofals which were perhaps dangerous or hurtful to the common welfare.

The king appoints the governor according to his royal pleasure, but the inhabitants of the province make up his excellency's falary. Therefore a man entrusted with this place has greater or leffer revenues, according as he knows how to gain the confidence of the inhabitants. There are examples of governors, in this and other provinces of North America, who, by their diffensions with the inhabitants of their respective governments, have loft their whole falary, his Majesty having no power to make them pay it. If a governor had no other resource in these circumstances, he would be obliged either to refign his office, or be content with an income too fmall for his dignity; or elfe to conform himself in every thing to the inclinations of the inhabitants; but there are feveral flated profits, which in some measure make up for this. I. No one is allowed to keep a public house without the governor's leave, which is only to be obtained by the payment of a certain fee, according to the circumstances of the person. Some governors therefore, when the inhabitants refused to pay them a falary, have hit upon the expedient of doubling the number of inns in their province. 2. Few people who intend to be married, unless they be very poor, will have their banns published from the pulpit; but inflead of this they get licenses from the governor, which empower any minister to marry them. Now for such a licence the governor receives about half a guinea, and this, collected throughout the whole province, amounts to a confiderable fum. 3. The governor figns all paffports, and especially of such as go to sea; and this gives him another means of fupplying his expences. There are feveral other advantages allowed to him, but as they are very trifling I shall omit them.

At the above affembly the old laws are reviewed and amended, and new ones are made; and the regulation and circulation of coin, together with all other affairs of that kind, are there determined. For it is to be observed, that each English colony in North America is independent of the other, and that each has its proper laws and coin, and may be looked upon in several lights as a state by itself. From hence it happens, that in time of war, things go on very slowly and-irregularly here: for not only the

ienie

fense of one province is sometimes directly opposite to that of another, but frequently the views of the governor, and those of the assembly, of the same province, are quite different: so that it is easy to see that while the people are quarrelling about the best and cheapest manner of carrying on the war, an enemy has it in his power to take one place after another. It has commonly happened that whilst some provinces have been suffering from their enemies, the neighbouring ones were quiet and inactive, and as if it did not in the least concern them. They have frequently taken up two or three years in considering whether they should give affistance to an oppressed fister colony, and sometimes they have expressly declared themselves against it. There are instances of provinces who were not only neuter in these circumstances, but who even carried on a great trade with the power which at that very time was attacking and laying waste some other provinces.

The French in Canada, who are but an inconfiderable body, in comparison with the English in America, have, by this position of affairs, been able to obtain great advantages in times of war; for if we judge from the number and power of the English, it would feem very easy for them to get the better of the French in America*.

It is however of great advantage to the crown of England that the North American colonies are near a country under the government of the French, like Canada. There is reason to believe that the King never was earnest in his attempts to expel the French from their possessions there; though it might have been done with little difficulty: for the English colonies in this part of the world have increased so much in their number of inhabitants, and in their riches, that they almost vie with Old Eng-Now in order to keep up the authority and trade of their mother country, and to answer several other purposes, they are forbid to establish new manufactures, which would turn to the disadvantage of the British commerce: they are not allowed to dig for any gold or filver, unless they fend them to England immediately: they have not the liberty of trading to any parts that do not belong to the British dominions, excepting fome fettled places; and foreign traders are not allowed to fend their fhips to them. These and some other restrictions, occasion the inhabitants of the English colonies to grow less tender for their mother country. This coldness is kept up by the many foreigners, fuch as Germans, Dutch, and French, fettled here, and living among the English, who commonly have no particular attachment to Old England; add to this likewife, that many people can never be contented with their poffessions, though they be ever fo great, and will always be defirous of getting more, and of enjoying the pleafure which arifes from changing; and their over great liberty, and their luxury, often lead them to licentiousness.

I have been told by Englishmen, and not only by such as were born in America, but even by such as came from Europe, that the English colonies in North America, in the space of thirty or sifty years, would be able to form a state by themselves, entirely independent on Old England: but as the whole country which lies along the seasone is unguarded, and on the land side is harrassed by the French in times of war, these dangerous neighbours are sufficient to prevent the connection of the colonies with their mother country from being quite broken off. The English government has therefore sufficient reason to consider the French in North America as the best means of keeping the colonies in their due submission. But I am almost gone too far from my purpose; I will therefore sinish my observations on New York.

^{*} This has really happened by a greater union and exertion of power from the colonies and the mother country; fo that Canada has been conquered, and its possession has been confirmed to Great Britain in the last peace. F.

The declination of the magnetic needle in this town was observed by Philip Wells, the chief engineer of the province of New York, in the year 1686, to be eight degrees and forty-five minutes to the westward; but, in 1723, it was only seven degrees and

twenty minutes, according to the observations of Governor Burnet.

From hence we may conclude, that in thirty-eight years the magnet approaches about one degree and twenty-five minutes nearer to the true north, or, which is the fame thing, about two minutes annually. Mr. Alexander, a man of great knowledge in aftronomy and in mathematics, affured me, from feveral observations, that, in the year 1750, on the eighteenth of September, the deviation was to be reckoned fix degrees and twenty-two minutes.

There are two printers in the town, and every week fome English gazettes are pub-

lished, which contain news from all parts of the world.

The winter is much more fevere here than in Penfylvania, it being nearly as cold as in some of the provinces of Sweden: its continuance, however, is much shorter than with us: their spring is very early, and their autumn very late, and the heat in summer is excessive. For this reason, the melons sown in the fields are ripe at the beginning of August; whereas we can hardly bring them so soon to maturity under glasses and on hot-beds. The cold of the winter I cannot justly determine, as the meteorological observations which were communicated to me were all calculated after thermometers which were so placed in the houses that the air could not freely come at them. The snow lies for some months together upon the ground, and sledges are made use of here as in Sweden, but they are rather too bulky. The river Hudson is about an English mile and a half broad at its mouth: the difference between the highest flood and the lowest ebb is between six and seven feet, and the water is very brackish: yet the ice stands in it not only one, but even feveral months; it has sometimes a thickness of more than two feet.

The inhabitants are fometimes greatly troubled with musquitoes. They either follow the hay, which is made near the town, in the low meadows which are quite penetrated with falt water, or they accompany the cattle at night when it is brought home. I have myself experienced, and have observed in others, how much these little animalcules can disfigure a person's face during a single night; for the skin is sometimes so covered over with little blisters from their stings, that people are assumed to appear in public. The water melons, which are cultivated near the town, grow very large: they are extremely delicious, and are better than in other parts of North America, though they are planted in the open fields, and never in a hot-bed. I saw a water melon at Governor Clinton's in September 1750, which weighed forty-seven English pounds, and at a merchant's in town another of forty-two pounds weight; however, they

were reckoned the biggest ever seen in this country.

In the year 1710, five kings, or fachens, of the Iroquois, went from hence to England, in order to engage Queen Anne to make an alliance with them against the French. Their names, dress, reception at court, speeches to the Queen, opinion of England, and of the European manners, and several other particulars about them, are sufficiently known from other writings; it would therefore be here unnecessary to enlarge about them. The kings or sachems of the Indians, have commonly no greater authority over their subjects than constables in a meeting of the inhabitants of a parish, and hardly so much. On my travels through the country of these Indians, I had never any occasion to go and wait upon the sachems, for they always came into my habitation without being asked: these visits they commonly paid in order to get a glass or

two

two of brandy, which they value above any thing they know. One of the five fa-

chems, mentioned above, died in England; the others returned fafe.

The first colonists in New York were Dutchmen: when the town and its territories were taken by the English, and left them by the next peace in exchange for Surinam, the old inhabitants were allowed either to remain at New York, and to enjoy all the privileges and immunities which they were possessed of before, or to leave the place with all their goods: most of them chose the former; and therefore the inhabitants, both of the town and of the province belonging to it, are yet for the greatest part Dutchmen, who still, especially the old people, speak their mother tongue.

They begin, however, by degrees, to change their manners and opinions; chiefly indeed in the town and in its neighbourhood, for most of the young people now speak principally English, and go only to the English church; and would even take it amiss

if they were called Dutchmen and not Englishmen.

Though the province of New York has been inhabited by Europeans much longer than Penfylvania, yet it is not by far fo populous as that colony. This cannot be afcribed to any particular discouragement arising from the nature of the foil, for that is pretty good; but I was told of a very different reason, which I will mention here. In the reign of Queen Anne, about the year 1709, many Germans came hither, who got a tract of land from the government, on which they might fettle. After they had lived there for fome time, and had built houfes and churches, and made corn-fields and meadows, their liberties and privileges were infringed, and, under feveral pretences they were repeatedly deprived of parts of their land. This at last roused the Germans; they returned violence for violence, and beat those who thus robbed them of their possessions. But these proceedings were looked upon in a very bad light by the government; the most active people among the Germans being taken up, they were very roughly treated, and punished with the utmost rigour of the law. This, however, so far exasperated the rest that the greater part of them left their houses and fields, and went to esttle in Penfylvania; there they were exceedingly well received, got a confiderable tract of land, and were indulged in great privileges, which were given them for ever. The Germans, not fatisfied with being themselves removed from New York, wrote to their relations and friends, and advised them, if ever they intended to come to America, not to go to New York, where the government had shewn itself so unequitable. This advice had fuch influence that the Germans, who afterwards went in great numbers to North America, constantly avoided New York, and always went to Penfylvania. It fometimes happened that they were forced to go on board fuch ships as were bound to New York; but they were scarce got on shore, when they hastened on to Pensylvania, in fight of all the inhabitants of New York.

But the want of people in this province may likewife be accounted for in a different manner. As the Dutch, who first cultivated this country, obtained the liberty of staying here by the treaty with England, and of enjoying all their privileges and advantages without the least limitation, each of them took a very large piece of ground for himself; and many of the more powerful heads of families made themselves the possession and masters of a country of as great an extent as would be sufficient to form a middling and even a great parish. Most of them being very rich, their envy of the English led them not to fell them any land but at an excessive rate; a practice which is still punctually observed among their descendants. The English, therefore, as well as people of different nations, have little encouragement to settle here. On the other hand, they have sufficient opportunity in the other provinces to purchase land at a more moderate price, and with more security to themselves. It is not then to be

wondered

wondered that so many parts of New York are still uncultivated, and have entirely the appearance of deferts. This instance may teach us how much a small mistake in a government will injure population.

Nov. 3d. About noon we fet out from New York on our return; and, continuing

our journey, we arrived at Philadelphia on the fifth of November.

In the neighbourhood of this capital (of Penfylvania) the people had a month ago made their cyder, which they were obliged to do, because their apples were so ripe as to drop from the trees. But on our journey through New York we observed the people still employed in pressing out the cyder. This is a plain proof, that in Penfylvania the apples are sooner ripe than in New York; but whether this be owing to the nature of the soil, or a greater heat of the summer in Philadelphia, or to some other cause, I know not. However, there is not the least advantage in making cyder so early; for long experience had taught the husbandmen that it is worse for being made early in the year; the great heat in the beginning of autumn being said to hinder

the fermentation of the juice.

There is a certain quadruped which is pretty common not only in Penfylvania but likewise in other provinces both of South and North America, and goes by the name of polecat among the English. In New York they generally call it skunk. The Swedes here, by way of nickname, called it fiskatta, on account of the horrid stench it fometimes causes, as I shall presently show. The French in Canada, for the same reason, call it bête puante, or stinking animal, and enfant du diable, or child of the devil. Some of them likewife call it pekan: Catefby, in his Natural History of Carolina, has described it in Vol. ii. p. 62. by the name of putorius Americanus striatus, and drawn in plate 62. Dr. Linnæus calls it viverra putorius. This animal which is very fimilar to the marten, is of about the fame fize, and commonly black; on the back it has a longitudinal white stripe, and two others on each fide, parallel to the former. Sometimes, but very feldom, some are seen which are quite white. our return to Philadelphia, we faw one of these animals not far from town, near a farmer's house, killed by dogs; and afterwards I had, during my stay in these parts, feveral opportunities of feeing it, and of hearing its qualities. It keeps its young ones in holes in the ground, and in hollow trees; for it does not confine itself to the ground, but climbs up trees with the greatest agility: it is a great enemy to birds, for it breaks their eggs, and devours their young ones; and if it can get into a hen-rooft, it foon destroys all its inhabitants.

This animal has a particular quality by which it is principally known: when it is pursued by men or dogs, it runs at first as fast as it can, or climbs upon a tree; but if it is so beset by its pursuers as to have no other way of making its escape, it squirts its urine upon them. This, according to some, it does by wetting its tail with the urine, whence, by a sudden motion, it scatters it abroad; but others believe, that it could send its urine equally far without the help of its tail: I find the former of these accounts to be themost likely. For some credible people assured me, that they have had their faces wetted with it all over, though they stood above eighteen feet off from the animal. The urine has so horrid a stench that nothing can equal it: it is something like that of the cranesbill, or Linnæus's geranium robertianum, but infinitely stronger. If you come near a polecat when it spreads its stench you cannot breathe for a while, and it seems as if you were stifled; and in case the urine comes into the eyes, a person is likely to be blinded. Many dogs that in a chace pursue the polecat very eagerly, run away as sast as they can when they are wetted; however, if they be of the true breed, they will not give over the pursuit till they have caught and killed the polecat;

but

but they are obliged now and then to rub their nofes in the ground in order to relieve themselves.

Clothes which have been wetted by this animal retain the finell for more than a month, unlefs they be covered with fresh foil, and suffered to remain under it for twenty-four hours together, when it will, in a great measure, be removed. Those likewise who have got any of this urine upon their face and hands, rub them with loose earth; and some even hold their hands in the ground for an hour, as washing will not help them fo foon. A certain man of rank, who had by accident been wetted by the polecat, flunk fo ill, that on going into a house, the people either ran away, or, on his opening the door, rudely denied him entrance. Dogs that have hunted a polecat are fo offensive, for some days afterwards, that they cannot be borne in the house. At Philadelphia I once faw a great number of people on a market-day, throwing at a dog that was fo unfortunate as to have been engaged with a polecat just before, and to carry about him the tokens of its displeasure. Persons when travelling through a forest, are often troubled with the slink which this creature makes; and sometimes the air is so much infected that it is necessary to hold one's nofe. If the wind blows from the place where the polecat has been, or if it be quite calm, as at night, the finell is more strong and disagreeable.

In the winter of 1749, a polecat, tempted by a dead lamb, came one night near the farm-house where I then slept. Being immediately pursued by some dogs, it had recourse to its usual expedient in order to get rid of them. The attempt succeeded, the dogs not choofing to continue the purfuit: the stink was fo extremely great, that, though I was at some distance, it affected me in the same manner as if I had been flifled; and it was fo difagreeable to the cattle, that it made them roar very loudly: however, by degrees it vanished. Towards the end of the same year one of these animals got into our cellar, but no stench was observed, for it only vents that when it is purfued. The cook, however, found for feveral days together that fome of the meat which was kept there was eaten; and fuspecting that it was done by the cat, she shut up all avenues, in order to prevent their getting at it. But the next night, being awoke by a noise in the cellar, she went down, and, though it was quite dark, faw an animal with two shining eyes, which seemed to be all on fire; she however resolutely killed it, but not before the polecat had filled the cellar with a most dreadful stench. The maid was fick of it for feveral days; and all the bread, flesh, and other provisions kept in the cellar, were so penetrated with it, that we could not make the least use of them, and were forced to throw them all away.

From an accident that happened at New York to one of my acquaintances, I conclude that the polecat either is not always very fly, or that it fleeps very hard at night. This man coming home out of a wood in a fummer evening, thought that he faw a plant flanding before him; flooping to pluck it, he was to his cost convinced of his mistake, by being all on a sudden covered with the urine of a polecat, whose tail, as it flood upright, the good man had taken for a plant: the creature had taken its revenge

fo effectually that he was much at a loss how to get rid of the stench.

However, though these animals play such disagreeable tricks, yet the English, the Swedes, the French, and the Indians, in these parts, tame them. They follow their masters like domestic animals; and never make use of their urine except they be very much beaten or terrified. When the Indians kill such a polecat, they always eat its sliesh; but when they pull off its skin, they take care to cut away the bladder, that the slesh may not get a taste from it. I have spoken with both Englishmen and Frenchmen, who assured me that they had eaten of it, and found it very good meat, and

not much unlike the flesh of a pig. The skin, which is pretty coarse, and has long hair, is not made use of by the Europeans; but the Indians prepare it with the hair on, and make tobacco pouches of it, which they carry before them.

November 6th. In the evening I made a vifit to Mr. Bartram, and found him in conversation with a gentleman of Carolina, from whom I obtained several particulars:

a few of which I will here mention.

Tar, pitch, and rice are the chief products of Carolina. The foil is very fandy, and therefore many pines and furs grow in it, from which they make tar: the firs which are taken for this purpose are commonly such as are dried up of themselves; the people here in general not knowing how to prepare the firs by taking the bark off on one, or on feveral fides, as they do in Oftrobothnia. In fome parts of Carolina they likewise make use of the branches. The manner of burning or boiling, as the man describes it to me, is entirely the same as in Finland. The pitch is thus made: they dig a hole into the ground, and fmear the infide well with clay, into which they pour the tar, and make a fire round it, which is kept up till the tar has got the confiftence of pitch. They make two kinds of tar in the North American colonies: one is the common tar, which I have above described, and which is made of the stems. branches, and roots, of fuch firs, as were already confiderably dried out before; which is the most common way in this country. The other way is peeling the bark from the firs on one fide, and afterwards letting them stand another year; during which the refin comes out between the cracks of the stem. The tree is then felled and burnt for tar; and the tar thus made is called green tar, not that there is that difference of colour in it, for in this respect they are both pretty much alike; but the latter is called fo from being made of green and fresh trees; whereas common tar is made of dead trees: the burning is done in the fame manner as in Finland. They use only black firs; for the white firs will not ferve this purpose, though they are excellent for boards, masts, &c. Green tar is dearer than common tar. It is already a pretty general complaint, that the fir woods are almost wholly destroyed by this practice.

Rice is planted in great quantity in Carolina; it fucceeds best in marshy and swampy grounds, which may be laid under water, and likewise ripens there the soonest. Where these cannot be had, they must choose a dry soil; but the rice produced here, will be much inferior to the other; the land on which it is cultivated must never be manured. In Carolina they sow it in the middle of April, and it is ripe in September: it is planted in rows like pease, and commonly fifteen inches space is lest between the rows; as soon as the plants are come up, the field is laid under water. This not only greatly forwards the growth of the rice, but likewise kills all weeds, so as to render weeding unnecessary. The straw of rice is said to be excellent food for cattle, who eat it very greedily. Rice requires a hot climate, and therefore it will not succeed well in Virginia, the summer there being too short, and the winter too cold; and much less will it grow in Pensylvania. They are as yet ignorant in Carolina of the art of making arrack from rice: it is chiefly South Carolina that produces the greatest quantity of rice; and on the other hand they make the most tar in North

Carolina.

Nov. 7th. The stranger from Carolina, whom I have mentioned before, had met with many oyster shells at the bottom of a well, seventy English miles distant from the sea, and four from a river: they lay in a depth of sourteen English feet from the surface of the earth: the water in the well was brackish; but that in the river was fresh. The same man, had at the building of a saw-mill, a mile and a half from a river,

found,

467

found, first sand and then clay filled with oyster shells. Under these he found several bills of fea-birds as he called them, which were already quite petrified: they were

probably gloffopetræ.

There are two species of foxes in the English colonies, the one grey and the other red: but in the fequel I shall shew that there are others which sometimes appear in Canada. The grey foxes are here constantly, and are very common in Pensylvania and in the fouthern provinces: in the northern ones they are pretty fcarce, and the French in Canada call them Virginian foxes on that account: in fize they do not quite come up to our foxes. They do no harm to lambs: but they prey upon all forts of poultry, whenever they can come at them. They do not however feem to be looked upon as animals that cause a great deal of damage; for there is no reward given for killing them: their skin is greatly fought for by hatters, who employ the hair in their work. People have their clothes lined with it fometimes: the greafe is used against all forts of rheumatic pains. These foxes are faid to be less nimble than the red ones: they are fometimes tamed; though they be not fuffered to run about, but are tied up. Mr. Catefby has drawn and described this fort of foxes in his Natural History of Carolina, by the name of the grey American fox, vol.2. p. 78. tab. 78. A skin of it was fold in

Philadelphia for two shillings and fixpence in Pensylvanian currency.

The red foxes are very scarce here: they are entirely the same with the European fort. Mr. Bartram and feveral others affured me, that, according to the unanimous testimony of the Indians, this kind of foxes never was in the country before the Europeans fettled in it. But of the manner of their coming over I have two different accounts: Mr. Bartram and feveral other people were told by the Indians, that thefe foxes came into America foon after the arrival of the Europeans, after an extraordinary cold winter, when all the fea to the northward was frozen: from whence they would infer, that they could perhaps get over to America upon the ice, from Greenland or the northern parts of Europe and Asia. But Mr. Evans, and some others, assured me, that the following account was still known by the people. A gentleman of fortune in New England, who had a great inclination for hunting, brought over a great number of foxes from Europe, and let them loofe in his territories, that he might be able to indulge his passion for hunting*. This is faid to have happened almost at the very beginning of New England's being peopled with European inhabitants. These foxes were believed to have fo multiplied, that all the red foxes in the country were their offspring. At prefent they are reckoned among the noxious creatures in these parts; for they are not contented, as the grey foxes, with killing fowl; but they likewife devour the lambs. In Penfylvania therefore there is a reward of two shillings for killing an old fox, and of one shilling for killing a young one. And in all other provinces there are likewise rewards offered for killing them. Their skin is in great request, and is fold as dear as that of the grey foxes, that is, two shillings and fix-pence in Pensylvanian currency.

^{*} Neither of these accounts appear to be satisfactory; and therefore I am inclined to believe that these red foxes originally came over from Asia, (most probably from Kamtchatka, where this species is common. See Miller's account of the navigations of the Russians, &c.) though in remote times, and thus spread over North America. It is perhaps true that the Indians never took notice of them till the Europeans were fettled among them; this, however, was because they never had occasion to use their skins: but when there was a demand for these they began to hunt them, and, as they had not been much accustomed to them was a demand for these they began to bunt them, and, as they had not been much accultomed to them before, they escended them as a novelty. What gives additional confirmation to this is, that when the Russians, under Commodore Bering, landed on the western coast of America, they saw five red foxes which were quite tame, and seemed not to be in the least asraid of men: now this might very well have been the case, if we suppose them to have been for many generations in a place where nobody disturbed them; but we cannot account for it, if we imagine that they had been used to a country where there were many inhabitants, or where they had been much hunted. F.

They have two forts of wolves here, which however feem to be of the fame species. For fome of them are yellowish, or almost pale grey, and others are black or dark All the old Swedes related, that during their childhood, and still more at the arrival of their fathers, there were excessive numbers of wolves in the country, and that their howling and yelping might be heard all night. They likewise frequently tore in pieces, theep, hogs, and other young and finall cattle. About that time or foon after, when the Swedes and the English were quite settled here, the Indians were attacked by the fmall-pox: this discase they got from the Europeans, for they knew nothing of it before: it killed many hundreds of them, and most of the Indians, of the country, then called New Sweden, died of it. The woives then came, attracted by the stench of so many corpfes, in fuch great numbers that they devoured them all, and even attacked the poor fick Indians in their huts, fo that the few healthy ones had enough to do to drive them away; but fince that time they have disappeared, so that they are now seldom feen, and it is very rarely that they commit any diforders. This is attributed to the greater cultivation of the country, and to their being killed in great numbers. But further up the country, where it is not yet so much inhabited, they are still very abundant. On the coasts of Pensylvania and New Jersey, the sheep stay all night in the fields, without the people's fearing the wolves: however, to prevent their multiplying too much, there is a reward of twenty shillings in Pensylvania, and of thirty in New Jersey, for delivering in a dead wolf, and the person that brings it may keep the skin. But for a young wolf the reward is only ten shillings of the Pensylvanian currency. examples of these wolves being made as tame as dogs.

The wild oxen have their abode principally in the woods of Carolina, which are far up in the country. The inhabitants frequently bunt them, and falt their flesh like common beef, which is eaten by servants and the lower class of people. But the hide is of little use, having too large pores to be made use of for shoes. However the poorer

people in Carolina spread these hides on the ground instead of beds.

The viscum filamentosum, or fibrous misletoe, is found in abundance in Carolina; the inhabitants make use of it as straw in their beds, and to adorn their houses; the cattle are very fond of it: it is likewise employed in packing goods.

The fpartium fcoparium grew in Mr. Bartram's garden from English feeds; he faid that he had several bushes of it, but that the frost in the cold winters here had killed

most of them: they however grow spontaneously in Sweden.

Mr. Bartram had fome truffles, or Linnæus's lycoperdon tuber, which he had got out of a fandy foil in New Jerfey, where they are abundant. These he shewed to his friend from Carolina, and asked him whether they were the tuckahoo of the Indians. But the stranger denied it, and added, that though these truffles were likewise very common in Carolina, yet he had never seen them used any other way but in milk, against the dysentery; and he gave us the following description of the tuckahoo. It grows in several swamps and marshes, and is commonly plentiful. The hogs greedily dig up its roots with their noses in such places; and the Indians in Carolina likewise gather them in their rambles in the woods, dry them in the sun-shine, grind them, and bake bread of them. Whilst the root is fresh it is harsh and acrid, but being dried it loses the greatest part of its acrimony. To judge by these qualities the tuckahoo may very likely be the arum virginianum. Compare with this account, what shall be related in the sequel of the tahim and tuckah.

After dinner I again returned to town.

Nov. 8th. Several English and Swedish œconomists kept bee-hives, which afforded their possessions profit: for bees succeed very well here: the wax was for the most part fold

fold to tradefinen: but the honey they made use of in their own families, in different ways. The people were unanimous, that the common bees were not in North America before the arrival of the Europeans; but that they were first brought over by the English who settled here. The Indians likewise generally declare, that their fathers had never feen any bees either in the woods or any where elfe, before the Europeans had been feveral years fettled here. This is further confirmed by the name which the Indians give them: for having no particular name for them in their language, they call them English flies, because the English first brought them over; but at present they fly plentifully about the woods of North America. However it has been observed, that the bees always, when they fwarm, fpread to the fouthward, and never to the northward. It feems as if they do not find the latter countries fo good for their conftitution: therefore they cannot stay in Canada, and all that have been carried over thither, died in winter. It feemed to me as if the bees in America were fomewhat fmaller than ours in Sweden. They have not yet been found in the woods on the other fide of the Blue Mountains, which confirms the opinion of their being brought to America of late. A man told Mr. Bartram, that on his travels in the woods of North America, he had found another fort of bees, which, instead of separating their wax and honey, mixed it both together in a great bag. But this account wants both clearing up and confirming.

Nov. 9th. All the old Swedes and Englishmen, born in America, whom I ever questioned, afferted that there were not near so many birds fit for eating at present, as there used to be when they were children, and that their decrease was visible. They even said, that they had heard their fathers complain of this, in whose childhood the bays, rivers, and brooks were quite covered with all forts of water sowl, such as wild geese, ducks, and the like. But at present there is sometimes not a single bird upon them; about sixty or seventy years ago, a single person could kill eighty ducks in a morning; but at present you frequently wait in vain for a single one. A Swede above ninety years old assured me, that he had in his youth killed twenty-three ducks at a

This good luck nobody is likely to have at prefent, as you are forced to ramble about for a whole day without getting a fight of more than three or four. Cranes * at that time came hither by hundreds in the fpring: at prefent there are but very few. The wild turkeys and the birds, which the Swedes in this country call partridges and hazel-hens, were in whole flocks in the woods. But at this time a person is tired with walking before he can start a single bird.

The cause of this diminution is not difficult to find. Before the arrival of the Europeans, the country was uncultivated, and full of great forests. The few Indians that lived here seldom disturbed the birds; they carried on no trade among themselves, iron and gunpowder were unknown to them. One hundredth part of the fowl which at that time were so plentiful here, would have sufficed to feed the few inhabitants; and considering that they cultivated their small maize fields, caught fish, hunted stags, beavers, bears, wild cattle, and other animals whose stellar was delicious to them, it will soon appear how little they disturbed the birds. But since the arrival of great crouds of Europeans, things are greatly changed; the country is well peopled, and the woods are cut down; the people increasing in this country, they have by hunting and shooting

^{*} When Captain Amadas, the first Englishman that ever landed in North America, set soot on shore (to use his own words) such a slock of cranes (the most part white) arose under us with such a cry, redoubled by many echoes, as if an army of men had shouted altogether.

in part extirpated the birds, in part scared them away: in spring the people still take both eggs, mothers, and young indifferently, because no regulations are made to the contrary; and if any had been made, the spirit of freedom which prevails in the country would not fuffer them to be obeyed. But though the eatable birds have been diminished greatly, yet there are others, which have rather increased than decreased in number fince the arrival of the Europeans: this can most properly be said of a species of daws, which the English call blackbirds *, and the Swedes, maize thieves; Dr. Linnæus calls them gracula quiscula; and together with them, the several forts of fquirrels among the quadrupeds have spread; for these and the former live chiefly upon maize, or at least they are most greedy of it. But as population increases, the cultivation of maize increases, and of course the food of the above mentioned animals is more plentiful: to this it is to be added, that these latter are rarely eaten, and therefore they are more at liberty to multiply their kind. There are likewife other birds which are not eaten, of which at prefent there are nearly as many as there were before the arrival of the Europeans. On the other hand, I heard great complaints of the great decrease of eatable fowl, not only in this province, but in all the parts of North America, where I have been.

Aged people had experienced that with the fish, which I have just mentioned of the birds: in their youth, the bays, rivers, and brooks, had fuch quantities of fish, that at one draught in the morning they caught as many as a horse was able to carry home. But at prefent things are greatly altered; and they often work in vain all the night long with all their fishing tackle. The causes of this decrease of fish are partly the fame with those of the diminution of the number of birds; being of late caught by a greater variety of contrivances, and in different manners than before. The numerous mills on the rivers and brooks likewife contribute to it in part; for it has been observed here, that the fish go up the river in order to spawn in a shallow water; but when they meet with works that prevent their proceeding, they turn back and never come again. Of this I was affured by a man of fortune at Boston: his father was used to catch a number of herrings throughout the winter, and almost always in summer, in a river, upon his country feat: but he having built a mill with a dyke in this water, they were loft. In this manner they complained here and every where of the decrease of fish. Old people afferted the fame in regard to oyfters at New York; for though they are ftill taken in confiderable quantity, and are as big and as delicious as can be wished, yet all the oyster-catchers own, that the number diminishes greatly every year; the most natural cause of it is probably the immoderate catching of them at all times of the year.

Mr. Franklin told me, that in that part of New England where his father lived, two rivers fell into the fea, in one of which they caught great numbers of herrings, and in the other not one. Yet the places where these rivers discharged themselves into the fea were not far asunder. They had observed that when the herrings came in spring to deposit their spawn, they always swam up the river, where they used to catch them, but never came into the other. This circumstance led Mr. Franklin's father, who was settled between the two rivers, to try whether it was not possible to make the herrings likewise live in the other river. For that purpose he put out his nets, as they were coming up for spawning, and he caught some. He took the spawn out of them, and carefully carried it across the land into the other river. It was hatched, and the consequence was, that every year afterwards they caught more herrings in that river; and

this is still the case. This leads one to believe that the fish always like to spawn in the same place where they were hatched, and from whence they first put out to sea; being as it were accustomed to it.

The following is another peculiar observation. It has never formerly been known that codfish were to be caught at Cape Hinlopen: they were always caught at the mouth of the Delaware; but at present they are numerous in the former place. From hence it may be concluded, that fish likewise change their places of abode of their own accord.

A captain of a ship who had been in Greenland, asserted from his own experience, that on passing the seventieth degree of north latitude, the summer heat was there much greater than it is below that degree. From hence he concluded, that the summer heat at the pole itself must be still more excessive, since the sun shines there for such a long space of time without ever setting. The same account, with similar consequences drawn from thence, Mr. Franklin had heard of the ship-captains in Boston, who had sailed to the most northern parts of this hemisphere. But still more astonishing is the account he got from Captain Henry Atkins, who still lives at Boston. He had for some time been upon the sishery along the coasts of New England. But not catching as much as he wished, he sailed north, as far as Greenland. At last he went so far, that he discovered people, who had never seen Europeans before (and what is more astonishing) who had no idea of the use of fire, which they had never employed; and if they had known it, they could have made no use of their knowledge, as there were no trees in the country. But they eat the birds and sish which they caught quite raw. Captain Atkins got some very scarce skins in exchange for some trisses.

It is already known from feveral accounts of voyages, that to the northward neither trees nor bushes, nor any ligneous plants, are to be met with, fit for burning. But is it not probable that the inhabitants of so desolate a country, like other northern nations which we know, burn the train-oil of fishes, and the fat of animals in lamps, in order to boil their meat, to warm their subterraneous caves in winter, and to light them in

the darkest season of the year? else their darkness would be insupportable.

Nov. 11th. In feveral writings we read of a large animal, which is to be met with in New England, and other parts of North America. They fometimes dig very long and branched horns out of the ground in Ireland, and nobody in that country, or any where elfe in the world, knows an animal that has fuch horns. This has induced many people to believe that it is the moofe-deer, fo famous in North America, and that the horns found were of animals of this kind, which had formerly lived in that island, but were gradually destroyed. It has even been concluded, that Ireland, in diftant ages, either was connected with North America, or that a number of little islands, which are lost at present, made a chain between them. This led me to enquire, whether an animal with fuch excessive great horns, as are described to the moofe-deer, had ever been feen in any part of this country. Mr. Bartram told me, that, notwithstanding he had carefully enquired to that purpose, yet there was no person who could give him any information which could be relied upon; and therefore, he was entirely of opinion, that there was no fuch an animal in North America. Mr. Franklin related, that he had, when a boy, feen two of the animals which they call moofe-deer, but he well remembered that they were not near of fuch a fize as they must have been, if the horns found in Ireland were to fit them: the two animals which he faw, were brought to Boston, in order to be fent to England to Queen Anne. The height of the animal up to the back was that of a pretty tall horse, but the head and its horns were still higher: Mr. Dudley has given a description of the moofe-deer which is found in North America. On my travels in Canada, I often enquired of the Frenchmen, whether there had ever been feen fo large an animal in this country, as fome people fay there is in North America, and with fuch great horns as are fometimes dug out in Ireland. But I was always told, that they had never heard of it, and much lefs feen it: fome added, that if there was fuch an animal, they certainly must have met with it in some of their excursions in the woods. There are elks here, which are either of the same fort with the Swedish ones, or a variety of them; of these they often catch some which are larger than common, whence perhaps the report of the very large animal with excessive horns in North America first had its rife. These elks are called originals by the French in Canada, which name they have borrowed from the Indians: perhaps Dudley, in describing the moose-deer, meant no other animals than these large elks.*

Mr. Franklin gave me a piece of a stone, which, on account of its indestructibility in the fire, is made use of in New England for making melting furnaces and forges.

It confifts of a mixture of lapis ollaris, or ferpentine stone, and of asbest. The greatest part of it is a grey serpentine stone, which is fat and smooth to the touch, and is easily cut and worked. Here and there are some glittering speckles of that fort of asbest, whose sibres come from a center like rays, or star asbest. This stone is not sound in strata or solid rocks, but here and there scattered on the fields.

Another stone is called soapstone by many of the Swedes, being as smooth as soap on the outside. They make use of it for rubbing spots out of their cloaths. It might be called saxum talcosum particulis spataceis granatisque immixtis, or a talc with mixed particles of spar and garnets. A more exact description I reserve for another work. At present I only add, that the ground-colour is pale green, with some dark spots, and sometimes a few of a greenish hue. It is very smooth to the touch, and runs always waved. It is likewise easily sawed and cut, though it is not very smooth. I have seen large stones of it which were a fathom and more long, proportionably broad, and commonly six inches or a foot deep. But I cannot determine any thing of their original size, as I have not been at the place where they are dug, and have only seen the stones at Philadelphia, which are brought there ready cut. The particles of talc in this slone are about thirty times as many as those of spar and garnet. It is found in many parts of the country, for example, in the neighbourhood of Chester in Pensylvania. The English likewise call it foapstone †, and it is likely that the Swedes have borrowed that name from them.

This stone was chiefly employed in the following manner. First, the people took spots out of their cloaths with it. But, for this purpose, the whole stone is not equally useful, for it includes in its clear particles some dark ones which consist wholly of serpentine stone, and may easily be cut with a knife; some of the loose stone is scraped off like a powder, and strewed upon a greasy spot, in silk or any other stuff; this imbibes the grease, and after rubbing off the powder the spot disappears: and as this stone is likewise very durable in the fire, the country people make their hearths with it, especially the place where the fire lies, and where the heat is the greatest, for the stone stands

† It feems to be either the substance commonly called French chalk, or perhaps the soap rock, which is common in Cornwall, near the Lizard point, and which confists, besides of some particles of tale, chiefly of an earth like magnesia; which latter, with acid of vitriol, yields an earthy vitriolic salt, or Epsom salt. F.

What gives still more weight to Mr. Kalm's opinion of the elk being the moofe-deer, is, the name musu, which the Algonkins give to the elk, as Mr. Kalm himself observes in the sequel of his work; and this circumstance is the more remarkable, as the Algonkins, before the Irokeese, or Five Nations, got so great a power in America, were the most powerful nation in the northern part of this continent; insomuch that, though they be now reduced to an inconsiderable number, their language is however a kind of universal language in North America; so that there is no doubt that the elk is the samous moofe-deer. F.

the strongest fire. If the people can get a sufficient quantity of this stone, they lay the steps before the houses with it, instead of bricks, which are generally used for that

purpofe.

The walls round the court-yards, gardens, burying-places, and those for the sloping cellar-doors towards the street, which are all commonly built of brick, are covered with a coping of this stone; for it holds excellently against all the effects of the sun, air, rain, and storm, and does not decay, but secures the bricks. On account of this quality, people commonly get the door-posts, in which their hinges are fastened, made of this stone; and in several public buildings, such as the house of affembly for the province, the whole lower wall is built of it, and in other houses the corners are laid out with it.

The falt which is used in the English North American colonies, is brought from the West Indies. The Indians have in some places falt springs, from which they get falt by boiling. I shall in the sequel have occasion to describe some of them. Mr. Franklin was of opinion, that the people in Pensylvania could easier make good falt of sea water, than in New England, where sometimes falt is made of the sea water on their coast; though their situation is more northerly. Lead-ore has been discovered in Pensylvania, but as it is not to be met with in quantity, nobody ever attempted to use it. Loadstones of considerable goodness have likewise been found; and I myself

possess feveral pretty pieces of them.

Iron is dug in such great quantities in Pensylvania, and in the other American provinces of the English, that they could provide with that commodity not only England, but almost all Europe, and perhaps the greater part of the globe. The ore is here commonly infinitely easier got in the mines than our Swedish ore. For in many places, with a pick-axe, a crow-foot, and a wooden club, it is got with the same ease with which a hole can be made in a hard foil: in many places the people know nothing of boring, blassing, and firing; and the ore is likewise very susple. Of this iron they get such quantities, that not only the numerous inhabitants of the colonies themselves have enough of it, but great quantities are sent to the West Indies, and they have lately began even to trade to Europe with it. This iron is reckoned better for ship-building than our Swedish iron, or any other, because falt water does not corrode it so much. Some people believed, that, without reckoning the freight, they could fell their iron in England at a lower rate than any other nation; especially when the country becomes better peopled, and labour cheaper.

The mountain flax *, or that kind of stone, which Bishop Browallius calls amiantus sibris separabilibus molliusculis, in his lectures on mineralogy, which were published in 1739, or the amiant with soft fibres, which can easily be separated, is sound abundantly in Pensylvania. Some pieces are very soft, others pretty tough: Mr. Franklin told me, that, twenty and some odd years ago, when he made a voyage to England, he had a little purse with him, made of the mountain flax of this country, which he presented to Sir Hans Sloane. I have likewise seen paper made of this stone; and I have likewise received some small pieces of it, which I keep in my cabinet. Mr. Franklin had been told by others, that, on exposing this mountain flax to the open air in winter, and leaving it in the cold and wet, it would grow together, and more fit for spinning. But he did not venture to determine how far this opinion was grounded.

^{*} Amiantus (Asbestus) fibrosus, fibris separabilibus sexilibus tenacibus, Linn. Syst. Nat. p. 55. Amiantus sibris mollibus parallelis sacile separabilibus, Wall. Min. 140 Mountain slax, linum montanum, Forster's Mineralogy, p. 17. F.

On this occasion he related a very pleasant accident which happened to him with this mountain flax: he had, feveral years ago, got a piece of it, which he gave to one of his journeymen printers, in order to get it made into a fleet at the paper mill. As foon as the fellow brought the paper, Mr. Franklin rolled it up, and threw it into the fire, telling the journeyman he would fee a miracle, a sheet of paper which did not burn: the ignorant fellow afferted the contrary, but was greatly aftonished upon seeing himfelf convinced. Mr. Franklin then explained to him, though not very clearly, the peculiar qualities of the paper. As foon as he was gone, fome of his acquaintance came in, who immediately knew the paper. The journeyman thought he would fhew them a great curiofity and aftonish them. He accordingly told them, that he had curiously made a sheet of paper which would not burn, though it was thrown into the fire. They pretended to think it impossible, and he as strenuously maintained his affertion. At last they laid a wager about it; but whilst he was busy with stirring up the fire, the others flily befmeared the paper with fat: the journeyman, who was not aware of it, threw it into the fire, and that moment it was all in flames: this aftonished him fo much, that he was almost speechless; upon which they could not help laughing, and fo discovered the whole artifice.

In feveral houses of the town, a number of little ants run about, living under ground, and in holes in the wall. The length of their bodies is one geometrical line. Their colour is either black or dark red: they have the custom of carrying off fweet things, if they can come at them, in common with the ants of other countries. Mr. Franklin was much inclined to believe that these little insects could by some means communicate their thoughts or defires to each other, and he confirmed his opinion by fome examples. When an ant finds fome fugar, it runs immediately under ground to its hole, where, having flayed a little while, a whole army comes out, unites and marches to the place where the fugar is, and carries it off by pieces; or if an ant meets with a dead fly, which it cannot carry alone, it immediately haftens home, and foon after fome more come out, creep to the fly, and carry it away. Some time ago Mr. Franklin put a little earthen pot with treacle into a closet. A number of ants got into the pot, and devoured the treacle very quickly. But as he observed it, he shook them out, and tied the pot with a thin string to a nail which he had fastened in 'the ceiling; fo that the pot hung down by the string. A fingle ant by chance remained in the pot: this ant eat till it was fatisfied; but when it wanted to get off, it was under great concern to find its way out: it ran about the bottom of the pot, but in vain: at last it found, after many attempts, the way to get to the ceiling by the string. After it was come there, it ran to the wall, and from thence to the ground. It had hardly been away for half an hour, when a great fwarm of ants came out, got up to the ceiling, and crept along the ftring into the pot, and began to eat again: this they continued till the treacle was all eaten: in the mean time, one fwarm running down the flring, and the other up.

Nov. 12th. A man of fortune, who has long been in this province, afferted, that, by twenty years experience, he had found a confirmation of what other people have observed with regard to the weather, viz. that the weather in winter was commonly foretold by that on the first of November, old stile, or twelve new stile; if that whole day be fair, the next winter will bring but little rain and snow along with it; but if the first half of the day be clear, and the other cloudy, the beginning of winter would accordingly be fair, but its end, and spring, would turn out rigorous and disagreeable: of the same kind were the other presages. I have likewise in other places heard of similar signs of the weather; but as a mature judgment greatly lessens

ŏ

the confidence in them, fo the meteorological observations have sufficiently shewn, how

infinitely often these prophecies have failed.

Penfylvania abounds in fprings, and you commonly meet with a fpring of clear water on one or the other, and fometimes on feveral fides of a mountain. The people near fuch fprings use them for every purpose of a fine spring water. They also conduct the water into a little stone building near the house, where they can confine it, and bring fresh supplies at pleasure. In summer they place their milk, bottles of wine, and other liquors, in this building, where they keep cool and fresh. In many country houses, the kitchen or buttery was so situated, that a rivulet ran under it, and had the water near at hand.

Not only people of fortune, but even others that had some possessions, commonly had sish-ponds in the country near their houses. They always took care that fresh water might run into their ponds, which is very salutary for the sish: for that purpose the

ponds were placed near a fpring on a hill.

Nov. 13th. I faw, in feveral parts of this province, a ready method of getting plenty of grass to grow in the meadows. Here must be remembered what I have before mentioned about the fprings, which are fometimes found on the fides of hills, and fometimes in vallies. The meadows lie commonly in the vallies between the hills: if they are too swampy and wet, the water is carried off by feveral ditches. But the fummer in Penfylvania is very hot; and the fun often burns the grass so much, that it dries up entirely. The husbandmen therefore have been very attentive to prevent this in their meadows: to that purpose they look for all the springs in the neighbourhood of a meadow; and as the rivulets flowed before by the shortest way into the vallies, they raife the water as much as possible and necessary, to the higher part of meadow, and make feveral narrow channels from the brook, down into the plain, fo that it is entirely watered by it. When there are some deeper places, they frequently lay wooden gutters across them, through which the water flows to the other side; and from thence it is again, by very narrow channels, carried to all the places where it feems necessary. To raise the water the higher, and in order to spread it more, there are high dykes built near the fprings, between which the water rifes till it is fo high as to run down where the people want it. Industry and ingenuity went further: when a brook runs in a wood, with a direction not towards the meadow, and it has been found, by levelling, and taking an exact furvey of the land between the meadow and the rivulet, that the latter can be conducted towards the former; a dyke is made, which hems the course of the brook, and the water is led round the meadow, over many hills, fometimes for the space of an English mile and further, partly across vallies in wooden pipes, till at last it is brought where it is wanted, and where it can be spread as above mentioned. One that has not seen it himself, cannot believe how great a quantity of grafs there is in fuch meadows, especially near the little channels; whilft others, which have not been thus managed, look wretchedly. The meadows commonly lie in the vallies, and one or more of their fides have a declivity. The water can therefore eafily be brought to run down in them. These meadows, which are fo carefully watered, are commonly moved three times every fummer. But it is likewife to be observed, that fummer continues seven months here. The inhabitants feldom fail to employ a brook or fpring in this manner, if it is not too far from the meadows to be led to them.

The leaves were at present fallen from all the trees; both from oaks, and from all those which have deciduous leaves, and they covered the ground in the wood fix inches deep. The great quantity of leaves which drop annually would necessarily feem to

3 P 2 encrease

encrease the upper black mould greatly. However, it is not above three or four inches thick in the woods, and under it lays a brick-coloured clay, mixed with a fand of the fame colour. It is remarkable, that a foil which, in all probability, has not been stirred, should be covered with so little black mould: but I shall speak of this is the sequal.

Nov. 14th. The fquirrels, which run about plentifully in the woods, are of different species; I here intend to describe the most common forts more accurately.

The grey fquirrels are very plentiful in Penfylvania, and in the other provinces of North America. Their shape corresponds with that of our Swedish squirrel; but they differ from them by keeping their grey colour all the year long, and in fize being fomething bigger. The woods in all these provinces, and chiefly in Penfylvania, confift of trees with deciduous leaves, and in fuch thefe fquirrels like to live. Ray, in his Synopsis Quadrupedum, p. 215, and Catesby, in his Natural History of Carolina, Vol. 2, p. 74, tab. 74, call it the Virginian greater grey fquirrel; and the latter has added a figure after life. The Swedes call it grao ickorn, which is the same as the English grey fquirrel. Their nests are commonly in hollow trees, and are made of moss, straw, and other foft things: their food is chiefly nuts; as hazel nuts, chinquapins, chesnuts, walnuts, hiccory nuts, and the acorns of the different forts of oak which grow here; but maize is what they are most greedy of. The ground in the woods is in autumn covered with acorns, and all kinds of nuts which drop from the numerous trees; of these the squirrels gather great stores for winter, which they lay up in holes dug by them for that purpose: they likewise carry a great quantity of them into their nefts.

As foon as winter comes, the fnow and cold confines them to their holes for feveral days, especially when the weather is very rough. During this time they confume the little store which they have brought to their nests: as foon therefore as the weather grows milder, they creep out, and dig out part of the store which they have laid up in the ground: of this they eat some on the spot, and carry the rest into their nests on the trees. We frequently observed, that, in winter, at the eve of a great frost, when there had been some temperate weather, the squirrels, a day or two before the frost, ran about the woods in greater numbers than common, partly in order to eat their fill, and partly to store their nests with a new provision for the ensuing great cold, during which they did not venture to come out, but lay snug in their nests: therefore, seeing them run in the woods in greater numbers than ordinary, was a safe prognostic of an ensuing cold.

The hogs which are here driven into the woods, whilft there is yet no fnow in them, often do confiderable damage to the poor fquirrels, by rooting up their ftore-holes, and robbing their winter provisions. Both the Indians, and the European Americans, take great pains to find out these store-holes, whether in trees or in the ground, as all the nuts they contain are choice, and not only quite ripe, but likewise not pierced by worms. The nuts and acorns which the dormice, or mus cricetus, Linn. store up in autumn, are all in the same condition. The Swedes relate, that, in the long winter, which happened here in the year 1741, there fell such a quantity of snow, that the squirrels could not get to their store, and many of them were starved to death.

The damage which these animals do in the maize fields I have already described: they do the more harm, as they do not eat all the corn, but only the inner and sweet part, and as it were take off the huses. In spring, towards the end of April, when the oaks were in full flower, I once observed a number of squirrels on them, sometimes sive, six, or more in a tree, who bit off the slower-stalks a little below the slowers.

and dropt them on the ground; whether they eat any thing off them, or made use of them for some other purpose, I know not; but the ground was quite covered with oak flowers, to which part of the stalk adhered. For this reason the oaks do not bear so much fruit by far to feed hogs and other animals as they would otherwise do.

Of all the wild animals in this country the fquirrels are some of the easiest to tame, especially when they are taken young for that purpose. I have seen them tamed so far that they would follow the boys into the woods, and run about every where, and when tired would fit on their shoulders. Sometimes they only ran a little way into the wood, and then returned home again to the little hole that had been sitted up for them. When they eat, they sit almost upright, hold their food between their fore seet, and their tail bent upwards. When the tame ones got more than they could eat at a time, they carried the remainder to their habitations, and hid it amongst the wool which they lay upon. Such tame squirrels shewed no fear of strangers, and would suffer themselves to be touched by every body, without offering to bite. They sometimes would leap upon strangers' cloaths, and lie still on them, in order to sleep. In the farm-houses, where they were kept, they played with cats and dogs: they likewise eat bread.

The wild grey fquirrels likewife hold up their tails when fitting. As foon as they perceive a man, they continually wag their tails and begin to gnash with their teeth, and make a great noise, which they do not readily give over. Those who go a shooting birds and other animals are therefore very angry at them, as this noise discovers them, and alarms the game. Though a grey fquirrel does not feem to be very shy, yet it is very difficult to kill, for when it perceives a man, it climbs upon a tree, and commonly chuses the highest about it. It then tries to hide itself behind the trunk, so that the shooter may not see it, and though he goes ever so fast round the tree, yet the fquirrel changes its place as quickly, if not quicker; if two boughs bend towards each other, the squirrel lies in the middle of them, and presses itself so close, that it is hardly visible. You may then shake the tree, throw sticks and stones to the place where it lies, or shoot at it, yet it will never stir. If three branches join, it takes refuge between them, and lies as close to them as possible, and then it is fusficiently fafe. Sometimes it escapes on a tree where there are old nests of squirrels, or of large birds; it flips into fuch, and cannot be got out, either by fhooting, throwing, or any thing elfe; for the grey fquirrels feldom leap from one tree to another, except extreme danger compels them. They commonly run directly up the trees, and down the same way, with their head straight forward. Several of them which I shot in the woods had great numbers of fleas.

I have already mentioned, that these squirrels are among the animals which at present are more plentiful than they formerly were, and that the infinitely greater cultivation of maize, which is their favourite sood, is the cause of their multiplication. However, it is peculiar, that in some years a greater number of squirrels come down from the higher countries into Pensylvania, and other English colonies. They commonly come in autumn, and are then very busy in the woods gathering nuts and acorns, which they carry into hollow trees or their store-holes, in order to be sufficiently provided with food for winter. They are so diligent in storing up of provisions, that though the nuts have been extremely plentiful this year, yet it is difficult to get a considerable quantity of them. The people here pretended, from their own experience, to know, that when the squirrels came down in such numbers from the higher parts of the country, the winter ensuing was uncommonly rigorous and cold, and for that reason they always look upon their coming down as a sure sign of such a winter. Yet

this does not always prove true, as I experienced in the autumn of the year 1749: at that time a great number of fquirrels came down into the colonies, yet the winter was very mild, and no colder than common. But it appeared that their migration was occasioned by the fcarcity of nuts and acorns, which happened that year in the higher parts of the country, and obliged them to come hither for their food. Therefore they generally return the next year to the place from which they came.

Some people reckon fquirrel flesh a great dainty, but the generality make no account of it. The skin is good for little, yet small straps are sometimes made of it, as it is very tough: others use it as a fur lining, for want of a better. Ladies shoes are like-

wife fometimes made of it.

The rattle-fnake often devours the fquirrels, notwithstanding all their agility. This unwieldy creature is faid to catch fo agile an one merely by fascination. I have never had an opportunity of feeing how it is done; but fo many credible people affured me of the truth of the fact, and afferted that they were present, and paid peculiar attention to it, that I am almost forced to believe their unanimous accounts. The fascination is effected in the following manner: the fnake lies at the bottom of the tree upon which the squirrel fits; its eyes are fixed upon the little animal, and from that moment it cannot escape; it begins a doleful outcry, which is so well known, that a person passing by, on hearing it, immediately knows that it is charmed by a snake. The fquirrel runs up the tree a little way, comes downwards again, then goes up, and now comes lower again. On that occasion it has been observed, that the fquirrel always goes down more than it goes up. The fnake still continues at the root of the tree, with its eyes fixed on the fquirrel, with which its attention is fo entirely taken up, that a person accidentally approaching may make a considerable noise, without the snake's fo much as turning about. The fquirrel, as before-mentioned, comes always lower, and at last leaps down to the snake, whose mouth is already wide open for its reception. The poor little animal then with a piteous cry runs into the fnake's jaws, and is swallowed at once, if it be not too big; but if its fize will not allow it to be fwallowed at once, the fnake licks it feveral times with its tongue, and by that means makes it fit for fwallowing. Every thing elfe remarkable at this enchantment I have described in a treatise inserted in the Memoirs of the Royal Swedish Academy of Sciences, in the volume for the year 1753. I therefore am not fo circumstantial here. The fame power of enchanting is afcribed to that kind of fnake, which is commonly called the black fnake in America, and it is faid to catch and devour fquirrels in the fame manner as the former*.

But these little animals do considerable damage to the maize, not only whilst it is upon the stalk, as I have before observed, but even when it is brought home into the barns; for if they can come at it without any obstacle, they can in a sew nights bring a whole bushel away into their lurking holes. The government, in most of the North American colonies, has therefore been obliged to offer a certain premium to be paid out of the common treasury, for the head of a squirrel. It seems inconceivable what a sum of money has been paid for grey and black squirrels heads, in the province of Pensylvania only, from the first of January 1749 to the first of January

It has been observed, that only such squirrels and birds as have their nests near the place where such snakes come to, make this pitiful noise, and are so busy in running up and down the tree and the neighbouring branches, in order to draw off the attention of the snake from their broad, and often they come so very near in order to fly away again, that being within reach of the snakes, they are at last bit, poisoned, and devoured; and this will, I believe, perfectly account for the powers of sascinating birds and small creatures in the snakes. F.

1750; for when the deputies from the feveral districts of the province met, in order to deliberate upon the affairs of the province, each of them complained that their treasures were exhausted by paying so much for squirrels; for at that time the law had appointed a reward of threepence for each squirrel's head. So far extended the vengeance taken upon these little creatures, i. e. upon the grey and black squirrels. It was found, by casting up accounts, that in that one year eight thousand pounds of Pensylvania currency had been expended in paying these rewards: this I was assured of by a man who had looked over the accounts himself.

Many people, especially young men, lest all other employment, and went into the woods to shoot squirrels; but the government, having experienced how much three-pence per head took out of the treasury, settled half that sum upon each squirrel's

head.

Flying squirrels are a peculiar kind, which seem to be the same with those which inhabit Finland, and which Dr. Linnæus, in his Fauna Svecica, No. 38, calls fciurus volans. The American flying-fquirrel at the utmost is only a variety of that which we have in Finland. Catefby, in his Natural History of Carolina, vol. 2, p. 76, 77, has described it, and tab. 76, 77, drawn it after life. He likewise calls it sciurus volans. Edwards, in his Natural History of Birds, represents it, t. 191. They are met with in the woods, but not very frequently. They are scarce ever seen in the day-time, unless they are forced out by men who have discovered their nests; for they fleep in the day-time, but as foon as it grows dark, they come out, and run about almost all night. They live in hollow trees, and by cutting one down, seven or more flying-squirrels are frequently found in it. By the additional skin with which Providence has provided them on both fides, they can fly from one tree to another. They expand their fkins like wings, and contract them again as foon as they can get hold of the opposite tree. Some people say that they sly in a horizontal line; but others afferted that they first went a little downwards, and then rose up again, when they approached the tree to which they would fly: they cannot fly further than four or five fathoms. Among all the fquirrels in this country, these are the most easily tamed. The boys carry them to school, or wherever they go, without their ever attempting to escape; if even they put their squirrel aside, it leaps upon them again immediately, creeps either into their bosom, or their sleeve, or any fold of the clothes, and lies down to fleep: its food is the same with that of the grey squirrel.

There is a small species of squirrels abounding in the woods, which the English call ground squirrels. Catesby has described and drawn them from life, in the 2d vol. of his Natural History of Carolina, p. 75, tab. 75, and Edwards in his Natural History of Birds, t. 181.* He and Dr. Linnæus call it sciurus striatus, or the streaked squirrel. These do not properly live in trees, as others of this genus, but dig holes in the ground (much in the same manner as rabbets) in which they live, and whither they take resuge when they perceive any danger. Their holes go deep, and commonly further inwards divide into many branches. They are also cunning enough to make sometimes an opening or hole to the surface of the ground from one of these branches. The advantage they have from hence, is, that when they stroll about for food, and the hole is stopt up through which they went out, they may not expose themselves to be caught,

^{*} It is not yet made out with certainty whether the American flying fquirrel, and that found in Finland, and in the north of Europe and Asia, be the same animal. The American kind has a flat pennated tail, but the European kind a round one, which affords a very distinguishing character. F.

but prefently find the other hole, into which they may retreat: but in autumn, when the leaves fall from the trees, or fome time after, it is diversion to see the consternation they are fometimes in when purfued; for their holes being eafily covered with the great fall of leaves, or by the wind, they have a great deal to do, to find them on a fudden: they then run backwards and forwards as if they had loft their way: they feem to know the places where they have made their fubterraneous walks, but cannot conceive where he entrances are. If they be then purfued, and ore claps his hands, they know no other refuge than that of climbing upon a tree; for it is to be observed that these fquirrels always live under ground, and never climb upon trees unless purfued, and unable in the hurry to find their holes. This kind of fquirrels is much more numerous in Penfylvania than in any other province of North America through which I have travelled. Its length is commonly fix inches, without the curved tail; and it is very narrow. The skin is ferruginous, or of a reddish brown, and marked with five black streaks, one of which runs along the back, and two on each fide. Their food confifts of all forts of corn, as rye, barley, wheat, maize, and of acorns, nuts, &c. They gather their winter provisions in autumn, like the common grey fquirrels, and keep them in their holes under ground. If they get into a granary, they do as much mischief as mice and rats. It has often been observed that if, after eating rye, they come to some wheat, they throw up the former, which they do not like fo well as the wheat, in order to fill their belly with the latter. When the maize is reaped in the fields, they are very bufy in biting off the ears, and filling the pouches in their mouth with corn, fo that their cheeks are quite blown up. With this booty they haften into the holes which they have made in the ground.

As a Swede was making a mill-dyke, pretty late in autumn, he employed for that purpose the soil of a neighbouring hill, and met with a hole on a subterraneous walk belonging to these squirrels: he sollowed it for some time, and discovered a walk on one side like a branch, parting from the chief stem: it was near two seet long, and at its end was a quantity of choice acorns of the white oak, which the little careful animal had stored up for winter. Soon after he sound another walk on the side like the former, but containing a fine store of maize: the next had hiccory nuts, and the last and most hidden one contained some excellent chesnuts, which might have silled

two hats.

In winter these squirrels are seldom seen, for during that season they live in their subterraneous holes, upon the provisions which they have stored up there. However on a very fine and clear day they sometimes come out. They frequently dig through the ground, into cellars in which the country people lay up their apples, which they partly eat, and partly spoil, so that the master has little or nothing left. They handle the maize stores full as roughly as the apples. But the cats are their great enemies, who devour them and bring them home to their young ones: their sless is not eaten by men, and their skin is not made use of.

Of all the fquirrels in the country, these are the most difficult to be tamed; for, though they be caught very young, yet it is dangerous to touch them with naked hands, as they bite very sharp when one is not aware of them. Many boys, who had lost a deal of time in trying to tame these squirrels, owned that they knew of no art to make them quite tame; at least they are never so far tamed as the other species. In order to do any thing towards taming them, they must be caught when they are very small. Some

people kept them in that state in a cage, because they looked very pretty.

I shall take another opportunity of speaking of the black and ferruginous squirrels, which likewise inhabit this country.

Nov.

Nov. 15th. In the morning I returned to Philadelphia. Mr. Cock told me to-day, and on fome other occasions afterwards, an accident which happened to him, and which feemed greatly to confirm a peculiar fign of an imminent hurricane. He failed to the West Indies in a small yacht, and had an old man on board, who had for a considerable time failed in this fea. The old man founding the depth, called to the mate to tell Mr. Cock to launch the boats immediately, and to put a fufficient number of men into them, in order to tow the yacht during the calm, that they might reach the island before them, as foon as possible, as within twenty-four hours there would be a strong hurricane. Mr. Cock asked him what reasons he had to think so; the old man replied, that on founding, he faw the lead in the water at a diffance of many fathoms more than he had feen it before; and that therefore the water was become clear all of a fudden, which he looked upon as a certain fign of an impending hurricane in the fea. Mr. Cock likewife faw the excessive clearness of the water. He therefore gave immediate orders for launching the boat, and towing the yacht, fo that they arrived before night in a fafe harbour. But before they had quite reached it the waves began to rife more and more, and the water was as it were boiling, though no wind was perceptible. In the enfuing night the hurricane came on, and raged with fuch violence, that not only many thips were loft, and the roofs were torn off from the houses, but even Mr. Cock's yacht and other ships, though they were in fafe harbours, were by the wind, and the violence of the fea, washed so far on shore, that several weeks elapsed before they could be

An old Dutch skipper said, that he had once caught a dogsish in the bay of New

York, which being cut open, had a quantity of eels in his stomach.

Nov. 18th. Mr. Bartram shewed me an earthen pot, which had been found in a place where the Indians formerly lived. He, who first dug it out, kept grease and fat in it to finear his shoes, boots, and all forts of leather with: Mr. Bartram bought the pot of that man; it was yet entire and not damaged: I could perceive no glaze or colour upon it, but on the outfide it was very much ornamented, and upon the whole well made. Mr. Bartram shewed me several pieces of broken earthen vessels which the Indians formerly made use of. It plainly appeared in all these that they were not made of mere clay; but that different materials had been mixed with it, according to the nature of the places where they were made. Those Indians, for example, who lived near the fea-shore, pounded the shells of snails and muscles, and mixed them with the clay. Others who lived further up in the country, where mountain crystals could be found, pounded them and mixed them with their clay; but how they proceeded in making the veffels, is entirely unknown: it was plain that they did not burn them much, for they were fo foft that they might be cut in pieces with a knife: the workmanship however feems to have been very good; for at prefent they find whole veffels or pieces in the ground, which are not damaged at all, though they have lain in the ground above a century. Before the Europeans fettled in North America, the Indians had no other veffels to boil their meat in, than these earthen pots of their own making: but fince their arrival, they have always bought pots, kettles, and other necessary vessels, of the Europeans, and take no longer the pains of making some, by which means this art is entirely lost among them. Such vessels of their own construction are therefore a great rarity even among the Indians. I have feen fuch old pots and pieces of them, confisting of a kind of serpentine stone, or Linnaus's talcum, Syst. Nat. 3. p. 52.

Mr. Bartram likewise shewed me little pieces of a black state, which is plentifully found in some parts of the river Skullkill. There are pieces to be found which are four feet and above square: the colour and configuration is the same as in the table vol. XIII.

flate (schistus tabularis Linn.) Syst. Nat. 3. p. 37., except that this is a little thicker. The inhabitants of the country thereabouts (in the neighbourhood of the Skullkill) cover their roofs with it; Mr. Bartram assured me, that he had seen a whole roof composed of four such slates. The rays of the sun, heat, cold, and rain do not assured the sun, heat, cold, and rain do not assured the sun, heat, cold, and rain do not assured the sun, heat, cold, and rain do not assured the sun as such as such as the sun as such as s

upon the stone.

Mr. Bartram further related, that in feveral parts of the country, caves or holes were to be met with, going deep into the mountains: he had been in feveral of them, and had often found a number of stalactites, Linnæus's stalactites stillatitius, Syst. Nat. 3. p. 183., of different dimensions at the top: they differed in colour, but the greatest curiosity was, that in some of the caves Mr. Bartram had sound stalactites, whose outward side was as it were wreathed from top to bottom: he had sent some pieces of it to

London, and had none at prefent.

Nov. 20th. This morning I fet out in company of a friend, on a journey to Raccoon in New Jerfey, where many Swedes live, who have their own church. We had three miles to go before we came to the ferry which was to bring us over the Delaware. The country here was very low in fome places: the plains on the banks of the river were overflowed at every high water or flowing of the tide, and at the ebbing they were left dry again. However the inhabitants of the country hereabouts made use of this plain: for that purpose they had in several places thrown up walls or dykes of earth towards the river, to prevent its overflowing the plains, which they made use of as On them the water-beeches (platanus occidentalis Linn.) were planted in great numbers on both fides the road, quite close together: these in summer afford a pleafant shade, on account of the abundance and fize of their leaves, and make the road extremely delightful, as it resembles a fine shady walk. The Delaware has nearly the fame breadth here which it has near Philadelphia. Near the place where the ferry is to be met with, feveral pretty houses were built on both fides, where travellers might get all kinds of refreshment. On our journey from Pensylvania to New Jersey, we were brought over the Delaware in a ferry belonging to the Penfylvania-men; but on our return we were obliged to take the ferry belonging to the New Jersey side. As foon as we had croffed the river, we were in a different province; for the Delaware makes the divifion between Penfylvania and New Jerfey, fo that every thing to the west of it belongs to the former, and all to the east, to the latter province. Both these provinces have in most things different laws, and their peculiar coin.

We now purfued our journey further, and foon observed that the country on this fide appeared very different from that on the other; for in Penfylvania the ground confifts of more clay and black mould, and is very fertile; but in New Jersey it is more fandy and very poor, fo that the horses went very deep in fand in several parts of the road. Near the place where we were brought over, and a little way along the fhore, was a thick fir wood: the trees were not very high, but in their greatest vigour: between them appeared now and then a low bush of oak. But after travelling about three English miles, the fir wood ended, and we faw no more trees of this kind till we came to the church in Raccoon. In all the parts of Penfylvania where I have been, I have found few fir woods; on the other hand, they are abundant in New Jerfey, and especially in the lower part of that province. We afterwards found all the day long no other trees than fuch as have deciduous leaves; most of these were oaks of different forts, and of confiderable height, but they flood every where far enough afunder to admit a chaife to pass through the wood without any inconvenience, there being feldom any shrubs or underwood between the trees, to obstruct the way. In feveral places flowed a finall rivulet. The country was commonly plain, but formetimes formed

a few hills with an eafy declivity, though no high mountains appeared, and in a few places we found fome finall flones not bigger than a fift. Single farm-houses were feattered in the country, and in one place only was a small village: the country was yet more covered with forests than cultivated, and we were for the greatest part always in a wood.

This day and the next we passed several kills, or small rivulets, which slowed out of the country into the Delaware with no great descent nor rapidity. When the tide came up in the Delaware, it likewise rose in some of these rivulets a good way; formerly they must have spread to a considerable breadth by the slowing of the tide, but at present there were meadows on their banks, formed by throwing up strong dykes as close as possible to the water, to keep it from overslowing. Such dykes were made along all rivers here to consine their water; therefore when the tide was highest, the water in the rivers was much higher than the meadows: in the dykes were gates through which the water can be drawn from, or led into the meadows; they were sometimes placed on the outward side of the wall, so that the water in the meadows forced it open, but the river water shut it.

In the evening we came into the house of a Swede, called Peter Rambo, and we

staid the night at his house.

The pines which we had feen to-day, and which I have mentioned before, were of that kind which has double leaves and oblong cones, covered with aculeated scales. The English to distinguish it call it the Jersey pine: commonly there were only two spines or leaves in one fascicle, as in our common Swedish pines, but sometimes three; the cones had long spines fo that they were difficult to be touched. These pines look at a distance wholly like the Swedish ones, so that if the cones were not regarded, they might eafily be taken for the fame species. Of these pines they make a great quantity of tar, of which I shall speak in the sequel; but as most them are but small, they are good for nothing elfe; for if they be employed as posts, or poles in the ground, they are in a fhort time rendered useless by rotting: as soon as they are cut down the worms are very greedy of them; they foon eat through the wood, and only a few weeks after it is cut down; however it is made use of as fuel, where no other wood is to be got, in feveral places they make charcoal of it, as I intend to mention in the fequel. There is another thing which deferves notice, in regard to these trees, and which several people besides myself have experienced. In the great heat of the summer, the cattle like to stand in the shade of these trees, preferably to that of the oak, hiccory, walnut, water-beech, and other trees of this kind, whose foliage is very thick; and when the cattle find the latter with the former, they always choose to stand under the firs and pines, though the other trees with annual deciduous leaves could afford a better shade; and if there be but a single pine in the wood, as many cattle from the herd as can stand under it throng to it. Some people would infer from hence, that the refinous exhalations of thefe trees were beneficial to the cattle, and which made them more inclined to be near firs and pines than any other trees.

The spoon-tree, which never grows to a great height, we saw this day in several places. The Swedes here have called it thus because the Indians, who formerly lived in these provinces, used to make their spoons and trowels of the wood of this tree. In my cabinet of natural curiosities I have a spoon made of this wood by an Indian, who has killed many stags and other animals on the very spot where Philadelphia afterwards was built; for in his time that spot was yet covered with trees and shrubs. The English call this tree a laurel, because its leaves resemble those of the laurocerasus. Dr. Linnæus, conformable to the peculiar friendship and goodness which he has

always honoured me with, has been pleafed to call this tree kalmia foliis ovatis, corymbis terminalibus, or kalmia latifolia. It fucceeds best on the fide of hills, especially on the north fide, where a brook passes by; therefore on meeting with some steep places (on hills) towards a brook, or with a fteep fide of a hill towards a marsh, you are sure to find the kalmia. But it frequently flands mixed among beech-trees. The higher the kalmias stand on the north side of a mountain the less they grow: I have seen them not only in Penfylvania and New Jerfey, but even in New York, but there they are more scarce: I never found them beyond the forty-second degree of north latitude, though I took ever so great care to look for them: they have the quality of preferving their fine green leaves throughout winter, fo that when all other trees have loft their ornaments, and fland quite naked, these chear the woods with their green foliage. About the month of May they begin to flower in these parts, and then their beauty rivals that of most of the known trees in nature; the flowers are innumerable, and fit in great bunches. Before they open they have a fine red colour, but as they are expanded the fun bleaches them, fo that fome are quite white; many preferve the colour of roses. Their shape is singular, for they resemble a crater of the ancients: their fcent however is none of the most agreeable. In some places it was customary to adorn the churches on Christmas-day or Newyear's-day with the fine branches of this tree, which are then thick covered with leaves.

But these trees are known for another remarkable quality: their leaves are poison to fome animals, and food for others: experience has taught the people that when sheep eat of these leaves, they either die immediately, or fall very sick, and recover with great difficulty. The young and more tender sheep are killed by a small portion, but the elder ones can bear a ftronger dose. Yet this food will likewise prove mortal to them, if they take too much of it: the fame noxious effect it shews in regard to calves which eat too much of the leaves; they either die, or do not recover eafily. I can remember, that in the autumn of the year 1748, some calves eat of the leaves, but fell very fick, fwelled, foamed at the mouth, and could hardly fland; however they were cured by giving them gunpowder and other medicines: the fheep are most exposed to be tempted by these leaves in winter; for, after having been kept in stables for some months, they are greedy of all greens, especially if the snow still lies upon the fields, and therefore the green but poisonous leaves of the kalmia are to them very tempting. Horses, oxen, and cows, which have eaten them, have likewise been very ill after the meal, and though none of them ever died of eating these leaves, yet most people believed, that if they took too great a portion of them, death would certainly be the refult; for it has been observed that when these animals only eat small quantities, yet they fuffer great pains. On the other hand, the leaves of the kalinia are the food of stags, when the fnow covers the ground, and hides all other provisions from them. Therefore, if they be shot in winter, their bowels are found filled with these leaves; and it is very extraordinary, that if those bowels are given to dogs, they become quite stupid, and as it were drunk, and often fall so sick that they seem to be at the point of death; but the people who have eaten the venison have not felt the least indisposition. The leaves of the kalmia are likewise the winter food of those, birds, which the Swedes in North America call hazel-hens, and which flay here all winter, for when they are killed, their crop is found quite filled with them.

The wood of the kalmia is very hard, and some people on that account make the axis of their pullies of it. Weavers' shuttles are chiefly made of it, and the weavers are of opinion, that no wood in this country is better for this purpose; for it is compact, may be made very smooth, and does not easily crack or burst. The joiners and turners

here

here employ it in making all kinds of work which requires the best wood; they chiesly use the root because it is quite yellow: the wood has a very suitable hardness and fineness, and from the centre spreads, as it were, small rays, which are at some distance from each other. When the leaves of the kalmia are thrown into the sire, they make a crackling like salt. The chimney-sweepers make brooms in winter of the branches with the leaves on them, since they cannot get others in that season. In the summer of the year 1750, a certain kind of worms devoured the leaves of almost all the trees in Pensylvania; yet they did not venture to attack the leaves of the kalmia. Some people afferted, that when a sire happened in the woods it never went further as soon as it came to the kalmias or spoon-trees.

Nov. 2 tft. The Swedes and all the other inhabitants of the country plant great quantities of maize, both for themselves and for their cattle. It was afferted that it is the best food for hogs, because it makes them very fat, and gives their flesh an agreeable flavour, preserable to all other other meat. I have given in two differtations upon this kind of corn to the Swedish Royal Academy of Sciences, which stand in their Memoirs

for 1751 and 1752.

The wheels of the carts which are here made use of, are composed of two different kinds of wood. The stellies were made of what is called the Spanish oak, and the

fpokes of the white oak.

The fassafras-tree grows every where in this place. I have already observed several particulars in regard to it, and intend to add a few more here. On throwing some of the wood into the fire it causes a crackling as falt does. The wood is made use of for posts belonging to the inclosures, for it is said to last a long time in the ground: but it is likewise said, that there is hardly any kind of wood which is more attacked by worms than this when it is exposed to the air without cover; and that in a short time it is quite worm-eaten through and through. The Swedes related, that the Indians, who formerly inhabited these parts, made bowls of it. On cutting some part of the sassafras-tree, or its shoots, and holding it to the nose, it has a strong but pleasant smell. Some people peel the root, and boil the peel with the beer which they are brewing, because they believe it wholesome; for the same reason, the peel is put into brandy, either whilst it is distilling, or after it is made.

An old Swede remembered that his mother cured many people of the dropfy by a a decoction of the root of fassafras in water, drank every morning; but she used, at the same time, to cup the patient on the seet. The old man assured me, he had often seen people cured by this means, who had been brought to his mother wrapped up in

sheets.

When a part of a wood is destined for cultivation the fassafras-trees are commonly left upon it, because they have a very thick foliage, and afford a cool shade to the cattle during the great heats. Several of the Swedes wash and scour the vessels in which they intend to keep cyder, beer, or brandy, with water in which the fassafras root or its peel has been boiled; which they think renders all those liquors more wholesome. Some people get their bed-posts made of sassafras wood, in order to expel the bugs; for its strong scent, it is said, prevents those vermin from settling in them. For two or three years together this has the desired effect, or about as long as the wood keeps its strong aromatic smell; but after that time it has been observed to lose its effect. A joiner shewed me a bed which he had made for himself, the posts of which were of sassafras wood, but as it was ten or twelve years old, there were so many bugs in it that it seemed likely they would not let him sleep peaceably. Some Englishmen related, that some years ago it had been customary in London to drink a

kind

kind of tea of the flowers of faffafras, because it was looked upon as very falutary; but upon recollecting that the same potion was much used against the venereal disease it was soon left off, lest those that used it should be looked upon as infected with that disease. In Pensylvania some people put chips of fassafras into their chests, where they keep all forts of woollen stuffs, in order to expel the moths (or larvæ, or caterpillars of moths or tinies) which commonly settle in them in summer. The root keeps its smell for a long while: I have seen one which had lain sive or six years in the drawer of a table, and still preserved the strength of its scent.

A Swede, named Rambo, related that the Indians formerly dyed all forts of leather

red with the bark of the chefnut oak.

Nov. 22d. Aoke Helm was one of the most considerable Swedes in this place, and his father came over into this country along with the Swedish governor Prince; he was upwards of feventy years of age. This old man told us, that in his youth there was grass in the woods, which grew very close, and was every where two feet high; but that it was fo much leffened at prefent that the cattle hardly find food enough, and that therefore four cows now give no more milk than one at that time; but the causes of this alteration are easy to find. In the younger years of old Helm, the country was little inhabited, and hardly the tenth part of the cattle kept which is at prefent; a cow had therefore as much food at that time as ten now have. Further, most kinds of grafs here are annual, and do not for feveral years together shoot up from the same root, as our Swedish grasses: they must fow themselves every year, because the last year's plant dies away every autumn. The great numbers of cattle hinder this fowing, as the grass is eaten before it can produce flowers and fruit. We need not therefore wonder that the grass is so thin on fields, hills, and pastures in these provinces. is likewife the reason why travellers in New Jersey, Pensylvania, and Maryland, find many difficulties, especially in winter, to get forwards with their own horses, for the grass in these provinces is not very abundant, because the cattle eat it before it can bring feeds: but more to the north, as in Canada, are a fufficient quantity of perennial graffes; fo wifely has the Creator regulated every thing. The cold parts of the earth naturally bring forth a more durable grafs, because the inhabitants want more hav to feed their cattle with, on account of the length of the winter. The fouthern provinces again have less perennial grafs, as the cattle may be in the fields all the winter. However careful economists have got feeds of perennial graffes from England, and other European states, and fowed it in their meadows, where they feem to thrive exceedingly well.

The perfimon (diofpyros Virginiana) was pretty common here: I have already mentioned it before, but I intend now to add fome more particulars. Some of its fruits began to ripen and to become fit for eating about this time, for they always ripen very late in autumn, and then the people eat them like other fruit: they are very fweet and glutinous, yet have a little aftringency: I frequently used to eat a great quantity of them, without feeling the least inconvenience. From the persimon several Englishmen and Swedes brew a very palatable liquor in the following manner. As soon as the fruit is ripe, a sufficient quantity is gathered, which is very easy, as each tree is well stocked with them. These persimon apples are put into a dough of wheat or other shour, formed into cakes, and put into an oven, in which they continue till they are quite baked, and sufficiently dry, when they are taken out again: then, in order to brew the liquor, a pot sull of water is put on the fire, and some of the cakes are put in: these become soft by degrees as the water grows warm, and crumble in pieces at last; the pot is then taken from the fire, and the water in it well stirred about, that

the

the cakes may mix with it: this is then poured into another veffel, and they continue to fleep and break as many cakes as are necessary for a brewing: the malt is then infused, and they proceed as usual with the brewing. Beer thus prepared is reckoned much preferable to other beer. They likewife make brandy of this fruit in the following manner; having collected a fufficient quantity of perfunons in autumn, they are all together put into a veffel, where they lie for a week till they are quite foft: then they pour water on them, and in that state they are left to ferment of themselves, without promoting the fermentation by any addition. The brandy is then made in the common way, and is faid to be very good, especially if grapes (in particular of the fweet fort) which are wild in the woods, be mixed with the perfimon fruit. Some perfimons are ripe at the end of September, but most of them later, and some not before November and December, when the cold first overcomes their acrimony. The wood of this tree is very good for joiners' inftruments, fuch as planes, handles to chiffels, &c., but if after being cut down, it lies exposed to funshine and rain, it is the first wood which rots, and in a year's time there is nothing left but what is ufelefs. When the perfimon trees get once into a field they are not eafily got out of it again as they fpread fo much. I was told, that if you cut off a branch, and put it into the ground, it strikes root; but in very strong winters these trees often die by frost, and they, together with the peachtrees, bear cold the least of any.

Nov. 23d. Several kinds of gourds and melons are cultivated here: they have partly been originally cultivated by the Indians, and partly brought over by Europeans. Of the gourds there was a kind which were crooked at the end, and oblong in general, and therefore they were called crooked necks (crocknacks); they keep almost all winter. There is yet another species of gourds which have the same quality: others again are cut in pieces or slips, drawn upon thread, and dried; they keep all the year long, and are then boiled or stewed. All forts of gourds are prepared for eating in different manners, as is likewise customary in Sweden. Many farmers have a whole

field of gourds.

Squashes are a kind of gourds, which the Europeans got from the Indians, and I have already mentioned them before. They are eaten boiled, either with flesh or by themselves. In the first case, they are put on the edge of the dish round the meat, they require little care, for into whatever ground they are sown, they grow in it and succeed well. If the seed is put into the fields in autumn it brings squashes next spring,

though during winter it has fuffered from frost, snow, and wet.

The calibashes are likewise gourds, which are planted in quantities by the Swedes and other inhabitants, but they are not fit for eating, and are made use of for making all sorts of vessels; they are more tender than the squashes, for they do not always ripen here, and only when the weather is very warm. In order to make vessels of them, they are first dried well; the seeds, together with the pulpy and spungy matter in which they lie, are afterwards taken out and thrown away; the shells are scraped very clean within, and then great spoons or ladles, sunnels, bowls, dishes, and the like, may be made of them: they are particularly sit for keeping seeds of plants in, which are to be sent over sea, for they keep their power of vegetating much longer, if they be put in calibashes, than by any other means. Some people scrape the outside of the calibashes before they are opened, dry them afterwards, and then clean them within; this makes them as hard as bones: they are sometimes washed, so that they always keep their white colour.

Most of the farmers in this country fow buck-wheat in the middle of July: it must not be fown later, for in that case the frost ruins it; but if it be sown before July, it

Howers

flowers all the fummer long, but the flowers drop, and no feed is generated. Some people plough the ground twice where they intend to fow buck-wheat; others plough it only once, about two weeks before they fow it. As foon as it is fown the field is harrowed. It has been found by experience, that in a wet year buck-wheat has been most likely to succeed: it stands on the fields till the frost comes on. When the crop is favourable, they get twenty, thirty, and even forty bushels from one. The Swedish churchwarden Ragnillon, in whose house we were at this time, had got such a crop: they make buck-wheat cakes and pudding. The cakes are commonly made in the morning, and are baked in a frying-pan, or on a fione: are buttered and then eaten with tea or coffee, instead of toasted bread with butter, or toast, which the English commonly eat at breakfast. The buck-wheat cakes are very good, and are likewise ufual at Philadelphia and in other English colonies, especially in winter. Buck-wheat is an excellent food for fowls; they eat it greedily, and lay more eggs than they do with other food; hogs are likewise fattened with it. Buck-wheat straw is of no use; it is therefore left upon the field, in the places where it has been thrashed, or it is feattered in the orchards, in order to ferve as a manure by putrifying. Neither cattle nor any other animal will eat of it, except in the greatest necessity, when the fnow covers the ground, and nothing else is to be met with. But though buckwheat is fo common in the English colonies, yet the French had no right notion of it in Canada, and it was never cultivated among them.

Towards night we found fome glow-worms in the wood: their body was linear, confisting of eleven articulations, a little pointed before and behind; the length from head to tail was five and a half geometrical lines; the colour was brown, and the articulations joined in the fame manner as in the onifci or woodlice. The antennæ, or feel-horns, were short and filiform, or thread-shaped; and the feet were fastened to the foremost articulations of the body: when the insect creeps, its hindmost articulations are dragged on the ground, and help its motion. The extremity of the tail contains a matter which shines in the dark, with a green light: the insect could draw it in, so that it was not visible. It had rained considerably all day, yet they crept in great numbers among the bushes, so that the ground seemed as it were sown with stars. I shall in the sequel have occasion to mention another kind of insects or

flies which shine in the dark, when flying in the air.

Nov. 24th. Holly, or ilex aquifolium, grows in wet places, fcattered in the forest, and belongs to the rare trees: its leaves are green both in summer and in winter. The Swedes dry its leaves, bruise them in a mortar, boil them in small beer, and take

them against the pleurify.

Red is dyed with Brazil wood, and likewife with a kind of mofs, which grows on the trees here; blue is dyed with indigo; but to get a black colour, the leaves of the common field forrel (rumex acetofella) are boiled with the stuff to be dyed, which is then dried, and boiled again with logwood and copperas: the black colour thus produced is said to be very durable. The people spin and weave a great part of their every day's apparel, and dye them in their houses. Flax is cultivated by many people, and succeeds very well, but the use of hemp is not very common.

Rye, wheat, and buck-wheat are cut with the fickle, but outs are mown with a fcythe. The fickles which are here made use of are long and narrow, and their sharp edges have close teeth on the inner side. The field lies fallow during a year, and in

that time the cattle may graze on it.

All the inhabitants of this place, from the highest to the lowest, have each their orchard, which is greater or less according to their wealth. The trees in it are chiefly peach

peach trees, apple trees, and cherry trees: compare with this what I have already faid

upon this fubject before.

A little before noon we left this place, and continued our journey, past the Swedish church in Raccoon, to Peils groves. The country on the sides of this road is very fandy in many places, and pretty near level. Here and there appear single farms, yet they are very scarce; and large extensive pieces of ground are still covered with forests, which chiefly consist of several species of oak and hiccory. However, we could go with ease through these woods, as there are few bushes (or under-wood) and stones to be met with. It was not only easy to ride in every part of the wood on horseback, but even in most places there was sufficient room for a small coach or a cart.

Nov. 25th. During my flay at Raccoon, at this time and all the enfuing winter, I endeavoured to get the most information from the old Swedes relating to the increase of land, and the decrease of water in these parts; I shall therefore insert the answers here, which I have received to my questions. They are as I got them; and I shall only throw in a sew remarks which may serve to explain things: the reader therefore

is left at liberty to draw his own inferences and conclusions.

One of the Swedes called King, who was above fifty years of age, was convinced that about this time the little lakes, brooks, fprings, and rivers, had much lefs water than they had when he was a boy. He could mention feveral lakes on which the people went in large boats in his youth, and had fufficient water even in the hottest fummers; but now they were either entirely dried up, or for the greatest part; and in the latter case, all the water was lost in summer. He had himself seen the fish dying in them; and he was apt to believe that at this time it did not rain so much in summer as it did when he was young. One of his relations, who lived about eight miles from the river Delaware, on a hill near a rivulet, had got a well dug in his court yard: at the depth of forty feet they found a quantity of shells of oysters and muscles, and likewise a great quantity of reed and pieces of broken branches. I asked to what causes they ascribed what they had discovered, and I was answered, that some people believed these things had lain there ever fince the deluge, and others, that the ground increased.

Peter Rambo, a man who was near fixty years of age, affured me, that in feveral places at Raccoon, where wells had been dug, or any other work carried deep into the ground, he had feen great quantities of muscle shells and other marine animals. On digging wells, the people have sometimes met with logs of wood at the depth of twenty feet, some of which were petrified, and others as it were burnt. They once found a great spoon in the ground at this depth. Query, Is it not probable that the burnt wood which has been thus dug up was only blackened by a subterraneous mineral vapour? People however have concluded from this, that America has had inhabitants before the deluge. This man (Peter Rambo) further told me, that bricks had been found deep in the ground; but may not the brick-coloured clay (of which the ground here chiefly consists, and which is a mixture of clay and fand) in a hard state have had the appearance of bricks? I have seen such hardened clay, which at first sight is easily mistaken for brick. He likewise afferted, that the water in rivers was still as high as it used to be, as far back as memory could reach; but little lakes, ponds, and waters in

marshes are visibly decreased, and many of them dried up.

Maons Keen, a Swede, above feventy years old, afferted, that, on digging a well, he had feen, at the depth of forty feet, a great piece of chefnut wood, together with roots and stalks of reed, and a clayey earth like that which commonly covers the

VOL. XIII. 3 R

fhores of falt-water bays and coves. This clay had a fimilar fmell and a faline tafte. Maons Keen, and feveral other people, inferred from hence, that the whole country, where Raccoon and Penn's neck are fituated, was anciently quite overflowed by the fea. They likewife knew, that, at a great depth in the ground, fuch a trowel as the Indians make use of, had been found.

Sven Lock, and William Cobb, both above fifty years of age, agreed, that in many places hereabouts, where wells had been dug, they had feen a great quantity of reed,

mostly rotten, at the depth of twenty or thirty feet and upwards.

As Cobb made a well for himfelf, the workmen, after digging twenty feet deep, came upon fo thick a branch that they could not get forwards till it was cut in two places; the wood was ftill very hard. It is very common to find, near the furface of the earth, quantities of all forts of leaves not quite putrified. On making a dyke fome years ago, along the river on which the church at Raccoon flands; and for that purpose cutting through a bank, it was found quite full of oyster shells, though this place is above a hundred and twenty English miles from the nearest sea shore. These men, and all the inhabitants of Raccoon, concluded from this circumstance (of their own accord, and without being led to the thought) that this tract of land was a part of the sea many centuries ago. They likewise afferted, that many little lakes, which in their youth were full of water, even in the hottest season, now hardly formed a narrow brook in summer, except after heavy rains; but it did not appear to them that the rivers had lost any water.

Aoke Helm found (on digging a well) first fand and little stones, to the depth of eight feet; next a pale-coloured clay, and then a black one. At the depth of sisteen feet he found a piece of hard wood, and several pieces of mundick or pyrites. He told me, that he knew several places in the Delaware, where the people went in boats when he was young, but which at present were changed into little islands, some of which were near an English mile in length. These islands derive their origin from a sand or bank in the river; on this the water washes some clay, in which rushes come

up, and thus the rest is generated by degrees.

On a meeting of the oldest Swedes in the parish of Raccoon, I obtained the following answers to the questions which I asked them on this account. Whenever they dig a well in this neighbourhood, they always find, at the depth of twenty or thirty feet, great numbers of oyster shells and clams: the latter are, as was above-mentioned, a kind of large shells, which are found in bays, and of which the Indians make their money. In many places, on digging wells, a quantity of rushes and reeds have been found almost wholly undamaged; and once on such an occasion a whole bundle of flax was brought up, found between twenty and thirty feet under ground: it feemed as little damaged as if it had been lately put under ground: all looked at it with aftonishment, as it was beyond conception how it could get there; but I believe the good people faw fome American plants, fuch as the wild Virginian flax, or linum Virginianum, and the antirrhinum Canadenfe, which look very like common flax; yet it is remarkable that the bundle was really tied together. The Europeans, on their arrival in America, found our common flax neither growing wild nor cultivated by the Indians, how then could this bundle get into the ground? Can it be fupposed, that past ages have seen a nation here, so early acquainted with the use of flax? I would rather abide by the opinion, that the above American plants, or other fimilar ones, have been taken for flax. Charcoal and fire-brands have often been found under ground. The Swedish church-warden, Eric Ragnilson, told me that he had feen a quantity of them, which had been brought up at the digging of a well: on fuch occasions people have often found (at the depth of between twenty and sifty feet) great branches and blocks. There were some spots where, twenty feet under the surface of the earth, the people had found such trowels as the Indians use: from these observations they all concluded, that this tract of land had formerly been the bottom of the sea. It is to be observed, that most of the wells which have hitherto been made, have been dug in new settlements, where the wood was yet standing, and had probably stood for centuries together. From the observations which have hitherto been mentioned, and to which I shall add similar ones in the sequel, we may, with a considerable degree of certainty, conclude that a great part of the province of New Jersey, in ages unknown to posterity, was part of the bottom of the sea, and was afterwards formed by the slime and mud, and the many other things which the river Delaware carries down along with it, from the upper parts of the country: however, Cape May seems to give some occasion for doubts, of which I shall speak in the sequel.

Nov. 27th. The American ever-greens are,

1. Ilex aquifolium, holly.

2. Kalmia latifolia, the spoon tree.

3. Kalmia angustitolia, another species of it.

4. Magnolia glauca, the beaver tree. The young trees of this kind only keep

their leaves, the others drop them.

5. Viscum album, or misletoe: this commonly grows upon the nyssa aquatica, or tupelo tree, upon the liquidambar styracissua, or sweet gum tree, the oak and lime tree, so that their whole summits were frequently quite green in winter.

6. Myrica cerifera, or the candleberry tree: of this however only some of the

youngest shrubs preserve some leaves, but most of them had already lost them.

7. Pinus abies, the pine. 8. Pinus fylvestris, the fir.

9. Cupressus thyoides, the white cedar.
10. Juniperus Virginiana, the red cedar.

Several oaks and other trees dropt their leaves here in winter, which however keep

them ever-green, a little more to the fouth, and in Carolina.

Nov. 30th. It has been observed, that the Europeans in North America, whether they were born in Sweden, England, Germany, or Holland; or in North America, of European parents, always lost their teeth much sooner than common: the women especially were subject to this disagreeable circumstance: the men did not suffer so much from it. Girls, not above twenty years old, frequently had loft half of their teeth, without any hopes of getting new ones. I have attempted to penetrate into the causes of this early shedding of the teeth, but I know not whether I have hit upon a true one. Many people were of opinion that the air of this country hurt the teeth: fo much is certain, that the weather can no where be subject to more frequent and fudden changes; for the end of a hot day often turns out piercing cold, and vice versa. Yet this change of weather cannot be looked upon as having any effect upon the shedding of the teeth, for the Indians prove the contrary: they live in the fame air, and always keep fine, entire white teeth: this I have feen myfelf, and have been affured of by every body: others ascribe it to the great quantities of fruit and fweetineats which are here eaten. But I have known many people who never eat any fruit, and nevertheless had hardly a tooth left.

I then

I then began to suspect the tea, which is drank here in the morning and afternoon, especially by women, and is so common at present, that there is hardly a farmer's wise, or a poor woman, who does not drink tea in the morning: I was confirmed in this opinion, when I took a journey through some parts of the country which were still inhabited by Indians. For Major General Johnson told me at that time, that several of the Indians, who lived close to the European settlements, had learnt to drink tea. And it has been observed, that such of the Indian women, as used themselves too much to this liquor, had, in the same manner as the European women, lost their teeth prematurely, though they had formerly been quite sound. Those again, who had not used tea,

preferved their teeth strong and found to a great age.

I afterwards found, that the use of tea could not entirely cause this accident. Several young women, who lived in this country, but were born in Europe, complained that they lost most of their teeth after they came to America: I asked, whether they did not think that it arose from the frequent use of tea, as it was known that strong tea, as it were, enters into and corrodes the teeth; but they answered, that they had loft their teeth before they had began to drink tea; but, continuing my enquiries, I found at last a fufficient cause to account for the loss of their teeth: each of these women owned, that they were accustomed to eat every thing hot, and nothing was good, in their opinion, unless they could eat it as fast as it came from the fire. This is likewise the case with the women in the country, who lose their teeth much sooner and more abundantly than the men. They drink tea in greater quantity, and much oftener, in the morning, and even at noon, when the employment of the men will not allow them to fit at the tea-table. Befides that, the Englishmen care very little for tea, and a bowl of punch is much more agreeable to them. When the English women drink tea, they never pour it out of the cup into the faucer, but drink it hot as it is out of the former. The Indian women, in imitation of them, fwallow the tea in the fame manner. On the contrary, those Indians, whose teeth are found, never eat any thing hot, but take their meat either quite cold, or only just milk warm.

I asked the Swedish church-warden in Philadelphia, Mr. Bengtson, and a number of old Swedes, whether their parents and countrymen had likewise lost their teeth as soon as the American colonists; but they told me that they had preserved them to a very great age. Bengtson assured me, that his father, at the age of seventy, cracked peach stones and the black walnuts with his teeth, notwithstanding their great hardness, which at this time no body dares to venture at that age. This confirms what I have before

faid, for at that time the use of tea was not yet known in North America.

No difease is more common here, than that which the English call sever and ague, which is sometimes quotidian, tertian, or quartan. But it often happens, that a person who has had a tertian ague, after losing it for a week or two, gets a quotidian ague in its stead, which after a while again changes into a tertian. The sever commonly attacks the people at the end of August, or beginning of September, and commonly continues during autumn and winter, till towards spring, when it ceases entirely.

Strangers who arrive here commonly are attacked by this fickness the first or second year after their arrival; and it is more violent upon them than upon the natives, so that they sometimes die of it; but if they escape the first time, they have the advantage of not being visited again the next year, or perhaps never any more. It is commonly said here, that strangers get the sever to accustom them to the climate. The natives of European offspring have annual sits of this ague in some parts of the country: some, however, are soon delivered from it; with others, on the contrary, it continues for six months together, and others are afflicted with it till they die. The Indians also suffer

it, but not fo violently as the Europeans. No age is fecured against it: in those places where it rages annually, you fee old men and women attacked with it; and even children in the cradle fometimes not above three weeks old: it is likewife quotidian, tertian, or quartan, with them. This autumn the ague was more violent here than it commonly used to be. People who are afflicted with it look as pale as death, and are greatly weakened, but in general are not prevented from doing their work in the intervals. It is remarkable, that every year there are great parts of the country where this fever rages, and others where fcarce a fingle perfon has been taken ill. It likewife is worth notice, that there are places where the people cannot remember that it formerly prevailed in their country, though at prefent it begins to grow more common: yet there was no other visible difference between the feveral places. All the old Swedes, Englishmen, Germans, &c. unanimously afferted, that the fever had never been so violent, and of fuch continuance, when they were boys, as it is at prefent. They were likewife generally of opinion, that about the year 1680, there were not fo many people afflicted with it as about this time. However, others equally old were of opinion, that the fever was proportionably as common formerly as it is at prefent; but that it could not at that time be fo fensibly perceived, on account of the fearcity of inhabitants, and the great distance of their fettlements from each other; it is therefore probable that the effects of the fever have at all times been equal.

It would be difficult to determine the true causes of this disease: they seem to be numerous, and not always alke: sometimes, and I believe commonly, several of them unite. I have taken all possible care to sound the opinions of the physicians here on

that head, and I here offer them to the reader.

Some of them think that the peculiar qualities of the air of this country cause this fever; but most of them affert, that it is generated by the standing and purid water, which it feems is confirmed by experience. For it has been observed in this country, that fuch people as live in the neighbourhood of moraffes or fwamps, or in places where a stagnant, stinking water is to be met with, are commonly infested with the fever and ague every year, and get it more readily than others. And this chiefly happens at a time of the year when those stagnant waters are most evaporated by the exceffive heat of the fun, and the air is filled with the most noxious vapours. The fever likewife is very violent in all places which have a very low fituation, and where falt water comes up with the tide twice in twenty-four hours, and unites with the flagmant fresh water in the country. Therefore on travelling in summer over such low places where fresh and salt water unite, the nauseous stench arising from thence often forces the traveller to ftop his nofe. On that account most of the inhabitants of Penn's Neck, and Salem in New Jersey, where the ground has the above-mentioned quality, are annually infested with the fever to a much greater degree than the inhabitants of the higher country. If an inhabitant of the higher part of the country, where the people are free from the fever, removes into the lower parts, he may be well affured that the fever will attack him at the usual time, and that he will get it again every year, as long as he continues in that country. People of the livelieft complexion, on coming into the low parts of the country, and continuing there for fome time, have entirely loft their colour and become quite pale. However, this cannot be the fole cause of the sever, as I have been in feveral parts of the country which had a low fituation, and had flagnant waters near them, where the people declared they feldom fuffered from this fickness; but these places were about two or three degrees more northerly.

Others were of opinion that diet did very much contribute towards it, and chiefly laid the blame upon the inconfiderate and intemperate confumption of fruit. This is

particularly

particularly the case with the Europeans who come into America, and are not used to its climate and its fruit; for those who are born here can bear more, yet are not entirely free from the bad effects of eating too much. I have heard many Englishmen, Germans, and others, speak from their own experience on this account; they owned, that they had often tried, and were certain that after eating a water melon once or twice before they had breakfasted they would have the fever and ague in a few days after. Yet it is remarkable that the French in Canada told me that fevers were lefs common in that country, though they confumed as many water melons as the English colonies, and that it had never been observed that they occasioned a fever; but that on coming in the hot feafon to the Illinois, an Indian nation which is nearly in the fame latitude with Penfylvania and New Jerfey, they could not eat a water melon without feeling the shaking fits of an ague, and that the Indians therefore warned them not to eat of fo dangerous a fruit. Query, Does not this lead us to think that the greater heat in Penfylvania, and the country of the Illinois, which are both five or fix degrees more foutherly than Canada, makes fruit in fome measure more dangerous? In the English North American colonies, every countryman plants a number of water melons, which are eaten whilft the people make hay, or during the harvest, when they have nothing upon their stomachs, in order to cool them during the great heat, as that juicy fruit feems very proper to give refreshment. In the same manner melons, cucumbers, gourds, squashes, mulberries, apples, peaches, cherries, and fuch like fruit are caten here in fummer, and

all together contribute to the attacks of the ague.

But that the manner of living contributes greatly towards it, may be concluded from the unanimous accounts of old people concerning the times of their childhood; according to which the inhabitants of these parts were at that time not subject to so many difeases as they are at present, and people were seldom sick. All the old Swedes likewife agreed, that their countrymen, who first came into North America, attained to a great age, and their children nearly to the fame; but that their grand children, and great grand children did not reach the age of their ancestors, and their health was not near fo vigorous and durable. But the Swedes who first settled in America lived very frugally; they were poor, and could not buy rum, brandy, or other strong liquors, which they feldom diftilled themselves, as few of them had a distilling vessel. However they fometimes had a good strong beer. They did not understand the art of making cyder, which is now so common in the country: tea, coffee, chocolate, which are at prefent even the country people's daily breakfast, were wholly unknown to them: most of them had never tafted fugar or punch. The tea which is now drank is either very old or mixed with all forts of herbs, fo that it no longer deferves the name of tea: therefore it cannot have any good effect upon those who use it plentifully; besides, it cannot fail of relaxing the bowels, as it is drank both in the morning and in the afternoon quite boiling hot. The Indians, the offspring of the first inhabitants of this country, are a proof of what I have faid. It is well known that their ancestors, at the time of the first arrival of the Europeans, lived to a very great age. According to the common accounts, it was then not uncommon to find people among the Indians, who were above a hundred years old: they lived frugally, and drank pure water: brandy, rum, wine, and all the other strong liquors, were utterly unknown to them; but fince the Christians have taught them to drink these liquors, and the Indians have found them too palatable, those who cannot resist their appetites hardly reach half the age of their parents.

Lastly, some people pretended that the loss of many odoriferous plants, with which the woods were filled at the arrival of the Europeans, but which the cattle have now extirpated, might be looked upon as a cause of the greater progress of the sever at present.

The number of those strong plants occasioned a pleasant scent to rise in the woods every morning and evening. It is therefore not unreasonable to think that the noxiousness of the effluvia from putrifying substances was then prevented, so that they were not so

dangerous to the inhabitants.

Several remedies are employed against this disease: the jesuit's bark was formerly a certain one, but at prefent it has not always this effect, though they fell it genuine, and for the very best. Many people accused it of leaving something noxious in the body. Yet it was commonly observed, that when the bark was good, and it was taken as foon as the fever made its appearance, and before the body was weakened, it was almost fure to conquer the fever, so that the cold fits never returned, and no pain or stiffness remained in the limbs; but when the disease is rooted in, and has confiderably weakened the patients, or they are naturally very weak, the fever leaves them after using the jesuit's bark, but returns again in a fortnight's time, and obliges them to take the bark again; but the confequence frequently is a pain and a stiffness in their limbs, and fometimes in their bowels, which almost hinders them from walking: this pain continues for feveral years together, and even accompanies fome to the grave. This bad effect is partly attributed to the bark, which can feldom be got genuine here, and partly to the little care which the patients take in using the bark. man of my acquaintance was particularly dexterous in expelling the ague by the use of the jefuit's bark. His manner of proceeding was as follows: when it was possible, the patient must use the remedy as soon as the fever begun, and before it was settled in his body; but before he took the medicine he was to take a diaphoretic remedy, as that had been found very falutary; and as the fever is frequently of fuch a nature here as not to make the patient sweat, even when the hot fit is upon him, a perfpiration was to be brought about by fome other means. To that purpose the patient took his dose on the day when he had his cold fit, and was not allowed to eat any thing at night. The next morning he continued in a warm bed, drank a quantity of tea, and was well covered, that he might perspire plentifully. He continued fo till the perspiration ceased, and then left the bed in a hot room, and washed his body with milk-warm water, in order to cleanfe it from the impurities that fettled on it from the perspiration, and to prevent their stopping up of the pores. The patient was then dried again, and at last he took the bark feveral times in one day. This was repeated twice or thrice on the days after he had the ague, and it commonly left him without returning, and most people recover so well that they do not look pale after their fickness.

The bark of the root of the tulip tree, or liriodendron tulipifera, taken in the fame

manner as the jefuit's bark, fometimes had a fimilar effect.

Several people peeled the roots of the cornus florida, or dog-wood, and gave this peel to patients; and even some people, who could not be cured by the jesuit's bark, have recovered by the help of this. I have likewise seen people cured of the sever by taking brimstone reduced to powder, and mixed with sugar, every night before they went to bed, and every morning before they got up: they took it three or four times in the intervals, and at each time drank some warm liquor, to wash the powder down. However, others that tried the same remedy did not find much relief from it.

Some people collected the yellow bark of the peach tree, especially that which is on the root, and boiled it in water, till half of it was evaporated by boiling. Of this decoction the patient took every morning about a wine glass full before he had eaten any thing. This liquor has a disagreeable taste, and contracts the mouth and tongue like

like alum; yet feveral perfons at Raccoon, who had tried many remedies in vain,

were cured by this.

Others boiled the leaves of the potentilla reptans, or of the potentilla canadensis, in water, and made the patients drink it before the ague sit came on, and it is well

known that feveral persons have recovered by this means.

The people who are fettled upon the river Mohawk in New York, both Indians and Europeans, collect the root of the geum rivale, and pound it. This powder fome of them boil in water till it is a pretty ftrong decoction: others only infuse cold water on it and leave it so for a day; others mix it with brandy. Of this medicine the patient is to take a wine glass full on the morning of the day when the fever does not come, before he has eaten any thing. I was affured that this was one of the furest remedies, and more certain than the jesuit's bark.

The people who live near the iron mines declared that they were feldom or never visited by the fever and ague; but when they have the fever they drink the water of such fountains as arise from the iron mines, and have a strong chalybeat taste; and they assured me that this remedy was infallible. Other people therefore who did not live very far from such springs, went to them for a few days, when they had

the fever, in order to drink the water, which commonly cured them.

I have already shewn above, that sage mixed with lemon juice has been found very

falutary against the ague.

It was however univerfally remarkable, that that which cures one perfon of it has

no effect upon another.

The pleurify is likewise a disease which the people of this country are much subject to. The Swedes in this province call it stitches and burning, and they always mean the pleurify whenever they mention those words. Many of the old Swedes told me that they had heard very little of it when they were young, and that their parents had known still less of it in their childhood; but that it was so common now that many people died every year of it: yet it has been observed, that in some years this disease has been very moderate, and taken sew people away with it, whilst in other years it makes great havock: it likewise is more violent in some places than in others.

In the autumn of the year 1728, it swept away many at Penn's Neck, a place below Raccoon, and nearer to the Delaware, where a number of Swedes are fettled. Almost all the Swedes there died of it, though they were very numerous. hence it happened that their children who were left in a very tender age, and grew up among the English children, forgot their mother tongue, so that few of them understand it at present. Since that time, though the pleurify has every year killed a few people at Penn's Neck, yet it has not carried off any confiderable numbers. It rested as it were till the autumn of the year 1748, but then it began to make dreadful havock, and every week fix or ten of the old people died. The difease was fo violent, that when it attacked a person, he seldom lived above two or three days; and of those who were taken ill with it very few recovered. When the pleurify was got into a house it killed most of the old people in it: it was a true pleurify, but it had a peculiarity with it, for it commonly began with a great fwelling under the throat and in the neck, and with a difficulty of fwallowing. Some people looked upon it as contagious, and others feriously declared, that when it came into a family, not only those who lived in the same house suffered from it, but even such relations as lived far off. There have been feveral people at Penn's Neck, who, without vifiting their fick friends, have got the pleurify and died of it. I do not dispute the truth of this,

though

though I do not agree to the conclusion. The pleurify was the most violent in November; yet some old people died of it even in the next winter; but children were pretty free from it. The physicians did not know what to make of it, nor how to re-

medy it.

It is difficult to determine the causes of such violent diseases. An old English furgeon who lived here gave the following reason. The inhabitants of this country drink great quantities of punch and other strong liquors in summer, when it is very hot; by that means the veins in the diaphragm contract, and the blood grows thick. Towards the end of October and the beginning of November, the weather is apt to alter very fuddenly, fo that heat and cold change feveral times a day. When the people during this changeable weather are in the open air, they commonly get this disease. It is likewise certain that the air is more unwholesome one year than another, which depends upon the heat and other circumstances: this peculiar quality of the air must of course produce a pleurify. It is remarkable, that both in the year 1728, and in the prefent, when so many people died at Penn's Neck, few died at Raccoon, though the two places are near each other, and feem to have the fame foil and climate. But there is this difference, that Penn's Neck lies remarkably low, and Raccoon pretty high. The people in the former place have fettled between marshes and swamps, in which the water stagnates and putrifies; and most of these places are covered with trees, by which means the wet is shut up still more, and near such marshes are the houses. Lastly, the water at Penn's Neck is not reckoned so good as that in Raccoon. It likewife becomes brackish in several little rivers, when the Delaware, during the tide, rifes very high, and runs up into them. On the banks of these rivulets live many of the Swedes, and take water for common use from them.

December the 3d. This morning I fet out for Philadelphia, where I arrived in the

evening.

Wild grapes are very abundant in the woods, and of various kinds; a species of them, which are remarkable for their fize, grow in the marshes, and are greedily eaten by the racoon: they are therefore called marsh grapes, but the English call them fox grape: they have not an agreeable flavour, and are seldom eaten by the inhabitants of this country, who make use of a small kind of wild grapes, which grow on a dry soil: pretty late in autumn, when they are quite ripe, they have a very good flavour, being a mixture of sweet and acid. Some people dry these grapes when gathered, and bake them in tarts, &c.: they likewise make use of them as dried sweetmeats. The Swedes formerly made a pretty good wine from them, but have now left it off. However, some of the English still press an agreeable liquor from these grapes, which they assured me was as good as the best claret, and that it would keep for several years.

The manner of preparing this fort of wine has been described at large in an almanack of this country, for the year 1743, and is as sollows: the grapes are collected from the twenty-first of September to about the eleventh of November, that is as they grow ripe: they must be gathered in dry weather, and after the dew is gone off: the grapes are cleared of the cobwebs, dry leaves, and other things adhering to them. Next a great hogshead is prepared which has either had treacle or brandy in it; it is washed very clean, one of the bottoms beat out, and the other placed on a stand for the purpose, or on pieces of wood in the cellar, or else in a warm room, about two feet above the ground: the grapes are put into this hogshead, and as they sink lower in three or four days time, more are added. A man with naked feet

gets into the hogshead and treads the grapes, and in about half an hour's time the juice is forced out; the man then turns the lowest grapes uppermost, and treads them for about a quarter of an hour: this is sufficient to squeeze the good juice out of them, for an additional preffure would even crush the unripe grapes, and give the whole a difagreeable flavour. The hogshead is then covered with a thick blanket; but if there is no cellar, or it is very cold, two are spread over it. Under this covering the juice is left to ferment for the first time, and in the next four or five days it ferments and works very ftrongly. As foon as the fermentation ceases, a hole is made about fix inches from the bottom, and fome of the juice is tapped off about twice in a day. As foon as this is clear and fettled, it is poured into an anker of a middling fize; for from twenty bushels of grapes, they get about as many gallons of juice: the anker remains untouched; and the must in it ferments a fecond time: at this time it is necessary that the anker be quite full; the feum which fettles at the bung-hole must be taken off, and the anker always filled up with more must, which is kept ready for that purpose; this is continued till Christmas, when the anker may be stopped up; at last the wine is ready in February and bottled. It is likewife usual here to put some of the ripe grapes into a vessel, in order to make a vinegar; and that which is got by this means is very good. Several people made brandy from these grapes, which has a very pleasant taste, but is fill more pleafant if the fruits of the perfimon are mixed with it. The wood of these vines is of no use, it is so brittle that it cannot be used for sticks: on cutting into the ftem, a white, infipid refin comes out a few hours after the wound is made. In many gardens vines are planted for the purpose of making arbours, for which they are indeed excellent; as their large and plentiful leaves form a very close cover against the fcorching heat of the fun. When the vines flower here in May and June, the flowers exhale a strong, but exceeding pleasant and refreshing finell, which is perceptible even at a great distance. Therefore on coming into the woods about that time, you may judge from the sweet persume in the air, arising from the slowers of the vines, that you are near them, though you do not fee them. Though the winters be ever so severe, yet they do not affect the vines. Each grape is about the fize of a pea, but further fouthward they are faid to be of the fize of common raifins, and of a fine flavour. Further up in the country, during a part of autumn, they are the chief food of bears, who climb up the trees in order to pluck them. People are of opinion, that if the wild vines were cultivated with more care, the grapes would grow larger, and more palatable.

December the 5th. I shall here mention two prognostics of the weather, which were greatly valued here. Some people pretended to foretel that the ensuing winter would not be a severe one: this they conjectured from having seen wild geese and other migratory birds go to the south in October, but return a sew days ago in great numbers, and even pass on further to the north. Indeed, the ensuing winter was one

of the most temperate ones.

Several persons likewise assured us that we should have rain before to-morrow night. The reason they gave for this conjecture was, that this morning at sun-rising, from their windows they had seen every thing very plainly on the other side of the river, so that it appeared much nearer than usual, and that this commonly foreboded rain. This presage was likewise pretty exactly sulfilled.

The Indians, before the arrival of the Europeans, had no notion of the use of iron, though that metal was abundant in their country. However, they knew in some measure how to make use of copper. Some Dutchmen who lived here, still preserved

the old account among them, that their ancestors, on their first fettling in New York, had met with many of the Indians, who had tobacco pipes of copper, and who made them understand by figns, that they got them in the neighbourhood: afterwards the fine copper mine was difcovered, upon the fecond river between Elizabeth-town and New York. On digging in this mine, the people met with holes worked in the mountain, out of which fome copper had been taken, and they found even fome tools, which the Indians probably made use of, when they endeavoured to get the metal for their pipes. Such holes in the mountains have likewife been found in fome parts of Penfylvania, viz. below Newcastle towards the sea side, and always some marks of a copper ore along with them. Some people have conjectured, that the Spaniards, after discovering Mexico, failed along the coasts of North America, and landed now and then, in order to enquire whether any gold or filver was to be met with, and that they perhaps made these holes in the mountains; but supposing them to have made fuch a voyage along the coasts, they could not immediately have found out the copper mines; and they probably did not stop to blast this ore, as they were bent only upon gold and filver; it is therefore almost undoubted that the Indians dug these holes: or may we be allowed to fuspect that our old Normans, long before the difcoveries of Columbus, came into these parts, and met with such veins of copper, when they failed to what they called the excellent Wineland*, of which our ancient traditional records called Sagor speak, and which undoubtedly was North America? But in regard to this, I shall have occasion in the sequel better to explain my sentiments. It was remarkable, that in all those places where fuch holes have lately been found in the mountains, which manifestly seem to have been dug by men, they were always covered with a great quantity of earth, as if they were intended to remain hidden from strangers.

Dec. 6th. On long voyages the failors fometimes catch fuch fish as are known to none of the ship's company; but as they are very greedy after fresh provisions, they feldom abstain from eating them; however it proves often venturing too much, experience having shown, that their want of caution has often cost them their lives. for sometimes poisonous fish are caught. But there is a method of finding them out, as I have heard from feveral captains of ships; it is usual when such unknown fish are boiled, to put a filver button, or any piece of filver, into the kettle, which, if the fish be poisonous, will turn quite black, but if it be not, it will not change: some

of the feamen referred to their own repeated experience †.

Mr. Franklin and feveral other gentlemen frequently told me, that a powerful Indian, who possessed Rhode Island, had fold it to the English for a pair of spectacles: it is large enough for a prince's domain, and makes a peculiar government at prefent. This Indian knew to fet a true value upon a pair of spectacles: for undoubtedly if those glasses were not fo plentiful, and only a few of them could be found, they would, on account of their great use, bear the same price with diamonds.

The fervants which are made use of in the English American colonies are either free

persons, or slaves, and the former are again of two different forts.

* See for this opinion the scarce and curious work intituled, "Torfxi historia Vinlandix antiqux feu

partis Americæ septentrionalis." Hasniæ, 1715, 410. F.

† This experiment with the silver supposes, that the broth of the sish would be so strong as to act as a folvent upon the filver; but there may be poifons, which would not affect the filver, and however prove fatal to men; the furest way therefore would be to suppress that appetite, which may become fatal not only to a few men of the crew, but also endanger the whole ship, by the loss of necessary hands. F.

First, Those who are quite free serve by the year; they are not only allowed to leave their service at the expiration of their year, but may leave it at any time when they do not agree with their masters. However, in that case they are in danger of losing their wages, which are very considerable. A man-servant who has some abilities, gets between sixteen and twenty pounds in Pensylvania currency, but those in the country do not get so much. A servant-maid gets eight or ten pounds a year: these servants have their food besides their wages, but must buy their own clothes, and what they get

of these, they must thank their master's goodness for.

Second, The fecond kind of free fervants confift of fuch persons as annually come from Germany, England, and other countries, in order to fettle here. These new comers are very numerous every year: there are old and young ones, and of both fexes; fome of them have fled from oppression, under which they supposed themselves to have laboured. Others have been driven from their country by perfecution on account of religion; but most of them are poor, and have not money enough to pay their paffage, which is between fix and eight pounds sterling for each person; therefore they agree with the captain that they will fuffer themselves to be sold for a few years, on their arrival. In that case the person who buys them, pays the freight for them; but frequently very old people come over, who cannot pay their paffage, they therefore fell their children, fo that they ferve both for themselves and for their parents: there are likewife fome who pay part of their passage, and they are fold only for a short time. From these circumstances it appears, that the price of the poor foreigners who come over to North America is not equal, and that some of them serve longer than others: when their time is expired, they get a new fuit of clothes from their mafter, and fome other things: he is likewife obliged to feed and elothe them during the years of their fervitude. Many of the Germans who come hither, bring money enough with them to pay their passage, but rather suffer themselves to be sold, with a view, that during their fervitude they may get fome knowledge of the language and quality of the country, and the like, that they may the better be able to confider what they shall do when they have got their liberty. Such fervants are taken preferable to all others, because they are not so dear; for to buy a negroe or black flave requires too much money at once; and men or maids who get yearly wages, are likewife too dear; but this kind of fervants may be got for half the money, and even for lefs; for they commonly pay fourteen pounds, Penfylvania currency, for a perfon who is to ferve four years, and so on in proportion. Their wages therefore are not above three pounds Pensylvania currency per annunr. This kind of fervants, the English call fervings. When a person has bought such a servant for a certain number of years, and has an intention to fell him again, he is at liberty to do fo; but he is obliged, at the expiration of the term of the fervitude, to provide the usual suit of cloaths for the servant, unless he has made that part of the bargain with the purchaser. The English and Irifh commonly fell themselves for four years, but the Germans frequently agree with the captain before they fet out, to pay him a certain fum of money, for a certain number of perfons; as foon as they arrive in America, they go about and try to get a man who will pay the passage for them: in return they give according to the circumstances, one or feveral of their children, to ferve a certain number of years: at last they make their bargain with the highest bidder.

Third, The negroes or blacks make the third kind. They are in a manner flaves; for when a negro is once bought, he is the purchaser's servant as long as he lives, unless he gives him to another, or makes him free. However, it is not in the power of the master to kill his negro for a fault, but he must leave it to the magistrates to pro-

ceed according to the laws. Formerly the negroes were brought over from Africa, and bought by almost every one who could afford it. The quakers alone scrupled to have slaves; but they are no longer so nice, and they have as many negroes as other people. However, many people cannot conquer the idea of its being contrary to the laws of Christianity to keep slaves. There are likewise several free negroes in town, who have been lucky enough to get a very zealous quaker for their master, who gave

them their liberty, after they had faithfully ferved him for fome time.

At prefent they feldom bring over any negroes to the English colonies, for those which were formerly brought thither, have multiplied considerably. In regard to their marriage, they proceed as follows: In case you have not only male but likewise female negroes, they must intermarry, and then the children are all your slaves; but if you posses a male negro only, and he has an inclination to marry a female belonging to a different master, you do not hinder your negro in so delicate a point; but it is no advantage to you, for the children belong to the master of the semale; it is therefore advantageous to have negro-women. A man who kills his negro must suffer death for it; there is not however an example here of a white man's having been executed on this account. A few years ago it happened that a master killed his slave; his friends and even the magistrates secretly advised him to leave the country, as otherwise they could not avoid taking him prisoner, and then he would be condemned to die according to the laws of the country, without any hopes of saving him. This lenity was employed towards him, that the negroes might not have the satisfaction of seeing a master executed for killing his slave; for this would lead them to ail forts of dangerous.

defigns against their masters, and to value themselves too much.

The negroes were formerly brought from Africa, as I mentioned before; but now this feldom happens, for they are bought in the West Indies, or American Islands. whither they were originally brought from their own country: for it has been found that on transporting the negroes from Africa, immediately into these northern countries, they have not fuch a good state of health, as when they gradually change places, and are first carried from Africa to the West Indies, and from thence to North America. It has frequently been found, that the negroes cannot stand the cold here fo well as the Europeans or whites; for whilft the latter are not in the leaft affected by the cold, the toes and fingers of the former are frequently frozen. There is likewife a material difference among them in this point; for those who come immediately from Africa, cannot bear the cold fo well as those who are either born in this country, or have been here for a confiderable time; for the frost easily hurts the hands or feet of the negroes which come from Africa, or occasions violent pains in their whole body, or in some parts of it, though it does not at all affect those who have been here for There are frequent examples that the negroes on their passage from. Africa, if it happens in winter, have fome of their limbs destroyed by frost, on board the ship, when the cold is but very inconsiderable, and the sailors are scarce obliged to cover their hands. I was even affured, that some negroes have been seen here, who have had an excessive pain in their legs, which afterwards broke in the middle, and dropped entirely from the body, together with the flesh on them. Thus it is the same case with men here, as with plants which are brought from the fouthern countries, and cannot accustom themselves to a colder climate.

The price of negroes differs according to their age, health, and abilities. A full-grown negro costs from forty pounds and upwards to a hundred, of Pensylvania currency. A negro boy or girl, of two or three years old, can hardly be got for less than

eight.

eight or fourteen pounds in Penfylvania currency. Not only the quakers, but likewife feveral christians of other denominations, sometimes set their negroes at liberty. This is done in the following manner: When a gentleman has a faithful negro, who has done him great fervices, he fometimes declares him independent at his death. This is however very expensive; for they are obliged to make a provision for the negro thus fet at liberty, to afford him fubfiftence when he is grown old, that he may not be driven by necessity to wicked actions, or that he may be at any body's charge, for these free negroes become very lazy and indolent afterwards. But the children which the free negro has begot during his fervitude, are all flaves, though their father be free. On the other hand, those negro children are free whose parents are at liberty. negroes in the North American colonies are treated more mildly, and fed better than those in the West Indies. They have as good food as the rest of the servants, and they possess equal advantages in all things, except their being obliged to serve their whole life-time, and get no other wages than what their mafter's goodness allows them: they are likewife clad at their mafter's expence. On the contrary, in the West Indies, and especially in the Spanish islands, they are treated very cruelly; therefore no threats make more impression upon a negro here, than that of sending him over to the West Indies, in cale he would not reform. It has likewife been frequently found by experience, that when you flow too much remissions to these negroes, they grow so obstinate, that they will no longer do any thing but of their own accord: therefore a ftrict difcipline is very necessary, if their master expects to be satisfied with their services.

In the year 1620, some negroes were brought to North America in a Dutch ship, and in Virginia they bought twenty of them. These are said to have been the first that came hither. When the Indians, who were then more numerous in the country than at present, saw these black people for the first time, they thought they were a true breed of devils, and therefore they called them Manitto for a great while: this word in their language signifies not only God, but likewise the devil. Some time before that, when they saw the first European ship on their coasts, they were perfectly persuaded that God himself was in the ship. This account I got from some Indians, who preserved it among them as a tradition which they had received from their ancestors: therefore the arrival of the negroes seemed to them to have confused every thing; but since that time, they have entertained less disagreeable notions of the negroes, for at present many live

among them, and they even fometimes intermarry, as I myfelf have feen.

The negroes have therefore been upwards of a hundred and thirty years in this country: but the winters here, especially in New England and New York, are as severe as our Swedish winters. I therefore very carefully enquired, whether the cold had not been observed to assect the colour of the negroes, and to change it, so that the third or fourth generation from the first that came hither, were not so black as their ancestors. But I was generally answered, that there was not the least difference of colour to be perceived; and that a negro born here, of parents which were likewise born in this country, and whose ancestors both men and women had all been blacks born in this country, up to the third or fourth generation, was not at all different in colour from those negroes who are brought directly over from Africa. From hence many people conclude, that a negro or his posserity do not change colour, though they continue ever so long in a cold climate; but the mixing of a white man with a negro woman, or of a negro with a white woman, has a different essect therefore to prevent any disagreeable mixtures of the white people and negroes, and that the negroes may not form too great an opinion of themselves, to the disadvantage of their matters, I am told there is

a law made, prohibiting the whites of both fexes to marry negroes, under pain of death, and deprivation of the clergyman who marries them; but that the whites and blacks fometimes mix, appears from children of a mixed complexion, which are fometimes born.

It is likewise greatly to be pitied, that the masters of these negroes in most of the English colonies take little care of their spiritual welfare, and let them live on in their Pagan darkness. There are even some, who would be very ill pleased at, and would by all means hinder their negroes from being instructed in the doctrines of Christianity; to this they are partly led by the conceit of its being shameful, to have a spiritual brother or sister among so despicable a people; partly by thinking that they should not be able to keep their negroes so meanly afterwards; and partly through fear of the negroes growing too proud, on seeing themselves upon a level with their

masters in religious matters.

Several writings are well known, which mention, that the negroes in South America have a kind of poison with which they kill each other, though the effect is not sudden, but happens a long time after the person has taken it: the same dangerous art of poisoning is known by the negroes of North America, as has frequently been experienced. However only a few of them know the fecret, and they likewife know the remedy against it, therefore when a negro feels himself poisoned, and can recollect the enemy who might possibly have given him the poison, he goes to him, and endeavours by money and entreaties to move him to deliver him from the poison; but if the negro is malicious, he does not only deny that he ever poisoned him, but likewise that he knows a remedy against it: this poison does not kill immediately, for fometimes the fick person dies some years after. But from the moment he has the poison, he falls into a consumption, and enjoys few days of good health: such a poor wretch often knows that he is poisoned, the moment he gets the poison. The negroes commonly employ it on fuch of their brethren as behave well, are beloved by their mafters, and feparate as it were from their countrymen, or do not like to converfe with them. They have likewife often other reasons for their enmity; but there are few examples of their having poiloned their mafters. Perhaps the mild treatment they receive. keeps them from doing it, or perhaps they fear that they may be discovered, and that. in fuch a case, the severest punishments would be inslicted on them.

They never discover what the poison confists of, and keep it secret beyond conception. It is probable that it is a very common thing, which may be got all the world over, for wherever they are they can always eafily procure it. Therefore it cannot be a plant, as feveral learned men have thought; for that is not to be met with every. where. I have heard many accounts here of negroes who have been killed by this poifon. I shall only mention one incident, which happened during my stay in this country. A man here had a negro who was exceedingly faithful to him, and behaved fo well, that he would not have given him for twenty other negroes. His mafter likewise shewed him a peculiar kindness, and the slave's conduct equalled that of the best Christian servant; he likewise conversed as little as possible with the other negroes; on that account they hated him to excefs; but as he was fcarce ever in company with them, they had no opportunity of conveying the poison to him, which they had often tried. However, on coming to town during the fair (for he lived in the country), fome other negroes invited him to drink with them. At first he would not, but they preffed him till he was obliged to comply. As foon as he came into the room, the others took a pot from the wall and pledged him, defiring him to drink likewife: he

drank, but when he took the pot from his mouth, he faid, what beer is this? It is full of ******. I purposely omit what he mentioned, for it seems undoubtedly to have been the name of the poison with which malicious negroes do so much harm, and which is to be met with almost every where. It might be too much employed to wicked purposes, and it is therefore better that it remains unknown. The other negroes and negro-women fell a laughing at the complaints of their hated countryman, and danced and sung as if they had done an excellent action, and had at last obtained the point so much wished-for. The innocent negro went away immediately, and, when he got home, said, that the other negroes had certainly poisoned him: he then fell into a consumption, and no remedy could prevent his death.

Dec. 7th. In the morning I undertook again a little journey to Raccoon, in New

Jerfey.

It does not feem difficult to find out the reasons why the people multiply more here than in Europe. As soon as a person is old enough, he may marry in these provinces, without any fear of poverty; for there is such a tract of good ground yet uncultivated, that a new-married man can, without difficulty, get a spot of ground, where he may sufficiently substitute with his wife and children. The taxes are very low, and he need not be under any concern on their account. The liberties he enjoys are so great, that he considers himself as a prince in his possessions. I shall here demonstrate, by some plain examples, what effect such a constitution is capable of.

Maons Keen, one of the Swedes in Raccoon, was now near feventy years old: he had many children, grandchildren, and great-grand-children; fo that, of those who were yet alive, he could muster up forty-five persons. Besides them, several of his children and grand-children died young, and some in a mature age. He was, therefore uncommonly blessed. Yet his happiness is not comparable to that which is to be seen in the following examples, and which I have extracted from the Phila-

delphia gazette.

In the year 1732, died at Ipswich, in New England, Mrs. Sarah Tuthil, a widow, aged eighty-fix years. She had brought fixteen children into the world; and from feven of them only, she had seen one hundred and seventy-seven grand-children and great-

grand-children.

In 1739, May 30th, the children, grand, and great-grand-children, of Mr. Richard Buttington, in the parish of Chester, in Pensylvania, were assembled in his house; and they made together one hundred and sisteen persons. The parent of these children, Richard Buttington, who was born in England, was then entering into his eighty-fifth year; and was at that time quite fresh, active, and sensible. His eldest son, then sixty years old, was the first Englishman born in Pensylvania.

In 1742, 8th of Jan., died at Trenton, in New Jersey, Mrs. Sarah Furman, a widow, aged ninety-seven years. She was born in New England, and left five children, fixty-one grand-children, one hundred and eighty-two great-grand-children, and twelve

great-great-grand-children, who were all alive when she died.

In 1739, 28th of Jan., died at South Kingston, in New England, Mrs. Maria Hazard, a widow, in the hundredth year of her age. She was born in Rhode Island, and was a grandmother of the then vice-governor of that island, Mr. George Hazard. She could count altogether five hundred children, grand-children, great-grand-children, and great-great-grand-children. When she died, two hundred and sive persons of them were alive; a grand-daughter of hers had already been grandmother near sisteen years.

In

In this manner, the usual wish of bleffing in our liturgy, that the new-married couple may see their grand children, till the third and fourth generation, has been literally sulfilled in regard to some of these persons*.

Dec. oth. In every country we commonly meet with a number of infects; of which many, though they be ever fo small and contemptible, can do considerable damage to the inhabitants. Of these dangerous infects there are likewise some in North America: some are peculiar to that country, others are common to Europe likewise.

I have already mentioned the mosquitoes as a kind of disagreeable gnats; and another noxious infect, the bruchus pisi, which destroys whole fields with pease. I shall here add some more

There are a kind of locusts, which about every seventeenth year, come hither in incredible numbers. They come out of the ground in the middle of May, and make, for fix weeks together, such a noise in the trees and woods, that two persons who meet in such places, cannot understand each other, unless they speak louder than the locusts can chirp. During that time, they make with the sting in their tail, holes into the soft bark of the little branches on the trees, by which means these branches are ruined. They do no other harm to the trees or other plants. In the interval, between the years when they are so numerous, they are only seen or heard single in the woods.

There is likewise a kind of caterpillars in these provinces, which eat the leaves from the trees. They are also innumerable in some years. In the intervals there are but few of them: but when they come, they strip the tree so entirely of their leaves, that the woods in the middle of summer are as naked as in winter. They eat all kinds of leaves, and very sew trees are lest untouched by them: as, about that time of the year, the heat is most excessive, the stripping the trees of their leaves has this satal consequence, that they cannot withstand the heat, but dry up entirely. In this manner, great forests are sometimes entirely ruined. The Swedes, who live here, shewed me, here and there, great tracts in the woods, where young trees were now growing, instead of the old ones, which some years ago had been destroyed by the caterpillars. These caterpillars afterwards change into moths, or phalænæ, which shall be described in the sequel, in their proper places.

In other years the grass-worms do a great deal of damage in several places, both in the meadows and corn-fields. For the fields are at certain times over-run with great armies of these worms, as with the other insects; yet it is very happy that these many plagues do not come all together. For in those years, when the locusts are numerous, the caterpillars and grass-worms are not very considerable, and it happens so with the latter kinds, so that only one of the three kinds comes at a time. Then there are several years when they are very scarce. The grass-worms have been observed to settle chiefly in a fat foil; but as soon as careful husbandmen discover them, they draw narrow channels with almost perpendicular sides quite round the field in which the worms are settled; then, by creeping further, they all fall into the ditch, and cannot get out again. I was assured, by many persons, that these three sorts of insects followed each other pretty closely; and that the locusts came in the first year, the caterpillars in the second, and the grass-worms in the last: I have likewise found, by my own experience, that this is partly true.

Moths, or tineæ, which eat the clothes, are likewife abundant here. I have feen cloth, worsted gloves, and other woollen stuffs, which had hung all the summer locked

[&]quot; Mr. Kalm speaks here of the Swedish liturgy.

up in a shrine, and had not been taken care of, quite cut through by these worms, so that whole pieces fell out. Furs, which had been kept in the garret, were frequently so ruined by worms, that the hair went off by handfuls. I am, however, not certain whether these worms were originally in the country, or whether they were brought

over from Europe.

Fleas are likewise to be sound in this part of the world. Many thousands were undoubtedly brought over from other countries; yet immense numbers of them have certainly been here since time immemorial. I have seen them on the grey squirrels, and on the hares which have been killed in such defart parts of this country, where no human creature ever lived. As I afterwards came further up into the country, and was obliged to lie at night in the huts and beds of the Indians, I was so plagued by immense quantities of sleas that I imagined I was put to the torture. They drove me from the bed, and I was very glad to sleep on the benches below the roof of the huts. But it is easy to conceive that the many dogs which the Indians keep, breed sleas without end. Dogs and men lie promiscuously in the huts; and a stranger can hardly lie down and shut his eyes, but he is in danger of being either squeezed to death, or stifled by a dozen or more dogs, which lie round him and upon him, in order to have a good resting place. For I imagine they do not expect that strangers will venture to beat them, or throw them off as their masters and mistresses commonly do.

The noify crickets (gryllus domefticus) which are fometimes to be met with in the houses in Sweden, I have not perceived in any part of Pensylvania or New Jersey; and other people whom I have asked, could not say that they had ever seen any. In summer there are a kind of black crickets * in the fields, which make exactly the same chirping noise as our house crickets. But they keep only to the fields, and were silent as soon as winter or the cold weather came on. They say it sometimes happens that these field crickets take refuge in houses, and chirp continually there, whilst it is warm weather, or whilst the rooms are warm; but as soon as it grows cold they are silent. In some parts of the province of New York, and in Canada, every farm-house, and most of the houses in the towns, swarm with so many, that no farm-house in our country can be better stocked with them. They continue their music there throughout the

whole winter.

Bugs (cimex lectularius) are very plentiful here. I have been sufficiently tormented by them in many places in Canada; but I do not remember having seen any with the Indians, during my stay at Fort Frederick. The commander there, Mr. de Lousignan, told me, that none of the Illinois and other Indians of the western parts of North America knew any thing of these vermin; and he added, that he could with certainty say this from his own experience, having been among them for a great while. Yet I cannot determine whether bugs were first brought over by the Europeans, or whether they have originally been in the country. Many people looked upon them as natives of this country, and as a proof of it said, that under the wings of bats the people had often sound bugs, which had eaten very deep into the sless. It was therefore believed that the bats had got them in some hollow tree, and had afterwards brought them into the houses, as they commonly six themselves close to the walls, and creep into the little chinks which they meet with; but as I have never seen any bugs upon bats, I cannot say any thing upon that subject. Perhaps a louse or a tick (acarus) has been taken

for

^{*} Perhaps it is the gryllus campestris, or common black field cricket of Europe, of which Rocfel, in his work on infects, vol. 2, Gryll. f. 13. has giving a fine drawing. F.

for a bug; or, if a real bug has been found upon a bat's wing, it is very easy to conceive that it fixed on the bat, whilst the latter was sitting in the chinks of a house stocked

with European bugs.

As the people here could not bear the inconvenience of these vermin, any more than we can in Sweden, they endeavoured to expel them by different means. I have already remarked, that the beds to that purpose were made of sassaffars wood, but that they were only temporary remedies. Some persons assured me that they had found, from their own experience, and by repeated trials, that no remedy was more effectual towards the expulsion of bugs than the injecting of boiling water into all the cracks where they are settled, and washing all the wood of the beds with it; this being twice or thrice repeated, the bugs are wholly destroyed. But if there are bugs in neighbouring houses, they will fasten to one's clothes, and thus be brought over into other houses.

I cannot fay whether these remedies are good or no, as I have not tried them; but by repeated trials I have been convinced that sulphur, if it be properly employed, entirely destroys bugs and their eggs in beds and walls, though they were ten times

more numerous than the ants in an ant-hill*.

The mill-beetles, or cock-roaches, are likewise a plague of North America, and are settled in many of its provinces. The learned Dr. Colden was of opinion that these insects were properly natives of the West Indies, and that those that were found in North America were brought over from those islands. To confirm his opinion, he said, that it was yet daily seen how the ships coming with goods from the West Indies to North America, brought mill-beetles with them in great numbers. But from the observations which I have made in this country, I have reason to believe that these insects have been on the continent of North America time immemorial. Yet notwithstanding this I do not deny their being brought over from the West Indies. They are in almost every house in the city of New York; and those undoubtedly came over in ships. But how can that be said of those mill-beetles which are found in the midst of the woods and deserts?

The English likewife call the mill-beetles cock-roaches, and the Dutch give them the name of cackerlack. The Swedes in this country call them brodoetare, or breadeaters, on account of the damage they do to the bread, which I am going to describe. Dr. Linnæus calls them blatta orientalis. Many of the Swedes call them likewife kackerlack. They are not only observed in the houses, but in the summer they appear often in the woods, and run about the trees which are cut down. On bringing in all forts of old rotten blocks of wood for fuel, in February, I discovered several cockroaches fettled in them; they were at first quite torpid, or as it were dead; but after lying in the room for a while, they recovered, became very lively, and began to run about. I afterwards found very often, that when old rotten wood was brought home in winter, and cut in pieces for fuel, the cock-roaches were got into it in numbers, and lay in it in a torpid state. In the same winter, a fellow cut down a great dry tree, and was about to split it. I then observed in a crack, some fathoms above the ground, feveral cock-roaches together with the common ants. They were, it feems, crept up a great way, in order to find a fecure place of abode against winter. On travelling, in the middle of October 1749, through the uninhabited country between the English and French colonies, and making a fire at night near a thick half-rotten tree, on the

[•] A still more infallible remedy is to wash all the furniture infected with that vermin, with a solution of arsenic. F.

shore of Lake Champlain, numbers of cock-roaches came out of the wood, being wakened by the smoke and the fire, which had driven them out of their holes. The Frenchmen, who were then in my company, did not not know them, and could not give them any name. In Canada the French did not remember seeing any in the houses. In Pensylvania, I am told, they run in immense numbers about the sheaves of corn, during the harvest. At other times they live commonly in the houses in the English settlements, and lie in the crevices, especially in the cracks of those beams which

support the ceiling, and are nearest to the chimney.

They do a deal of damage by eating the foft parts of the bread. If they have once made a hole into a loaf, they will in a little time eat all the foft part in it, fo that on cutting the loaf, nothing but the crust is left. I am told they likewise eat other victuals. Sometimes they bite people's noses or feet, whilst they are assepp. An old Swede, called Suen Laock, a grandson of the Rev. Mr. Laockenius, one of the first Swedish clergymen that came to Pensylvania, told me, that he had in his younger years been once very much frightened on account of a cock-roach, which crept into his ear whilst he was assepp. He waked suddenly, jumped out of bed, and felt that the insect, probably out of fear, was endeavouring with all its strength to get deeper. These attempts of the cock-roach were so painful to him, that he imagined his head was bursting, and he was almost senseless; however he hastened to the well, and bringing up a bucket sull of water, threw some into his ear. As soon as the cock-roach found itself in danger of being drowned, it endeavoured to save itself, and pushed backwards out of the ear, with its hind feet, and thus happily delivered the poor man from his fears.

The wood-lice are difagreeable infects, which in a manner are worse than the preceding; but as I have already described them in a peculiar memoir, which is printed among the memoirs of the Royal Academy of Sciences for the year 1754, I refer my

readers to that account.

Dec. 11th. This morning I made a little excursion to Penn's Neck, and further over the Delaware to Wilmington. The country round Penn's Neck has the same qualities as that about other places in this part of New Jersey. For the ground confists chiefly of sand, with a thin stratum of black soil. It is not very hilly, but chiefly flat, and in most places covered with open woods of such trees as have annual leaves, especially oak. Now and then you see a single farm, and a little corn-field round it. Between them are here and there little marshes or swamps, and sometimes a brook

with water, which has a very flow motion.

The woods of these parts consist of all forts of trees, but chiefly of oak and hiccory. These woods have certainly never been cut down, and have always grown without hindrance. It might therefore be expected that there are trees of an uncommon great age to be found in them; but it happens otherwise, and there are very sew trees three hundred years old. Most of them are only two hundred years old; and this convinced me that trees have the same quality as animals, and die after they are arrived at a certain age. Thus we find great woods here, but when the trees in them have stood an hundred and fifty or an hundred and eighty years, they are either rotting within, or losing their crown, or their wood becomes quite soft, or their roots are no longer able to draw in sufficient nourishment, or they die from some other cause. Therefore when stooms blow, which sometimes happens here, the trees are broke off either just above the root, or in the middle, or at the summit. Several trees are likewise torn out with their roots by the power of the winds. The storms thus cause great devastations in these forests. Everywhere you see trees thrown down by the winds, after they are too

much weakened by one or the other of the above-mentioned causes to be able to refist their fury. Fire likewise breaks out often in the woods, and burns the trees half way

from the root, fo that a violent gust of wind easily throws them down.

On travelling through these woods, I purposely tried to find out, by the position of the trees which were fallen down, which winds are the strongest hereabouts. But Icould not conclude any thing with certainty, for the trees fell on all fides, and lay towards all the points of the compass. I therefore judged, that any wind which blows from that fide where the roots of the tree are weakest and shortest, and where it can make the least refistance, must root it up and throw it down. In this manner the old trees die away continually, and are fucceeded by a young generation. Those which are thrown down lie on the ground and putrify, fooner or later, and by that means increase the black soil, into which the leaves are likewise finally changed, which drop abundantly in autumn, are blown about by the winds for some time, but are heaped up, and lie on both fides of the trees, which are fallen down. It requires feveral years before a tree is entirely reduced to dust. When the winds tear up a tree with the roots, a quantity of loofe foil commonly comes out with, and sticks to them for some time, but at last it drops off, and forms a little hillock, which is afterwards augmented by the leaves, which commonly gather about the roots. Thus feveral inequalities are formed in the woods, fuch as little holes and hills; and by this means the upper foil must likewise be heaped up in such places.

Some trees are more inclined to putrify than others. The tupelo-tree (nyffa), the tulip-tree (liriodendron), and the fweet gum-tree (liquidambar), became rotten in a fhort time. The hiccory did not take much time, and the black oak fell fooner to pieces than the white oak; but this was owing to circumftances. If the bark remained on the wood, it was for the greatest part rotten, and entirely eaten by worms within, in the space of fix, eight, or ten years, so that nothing was to be found but a reddish brown dust. But if the bark was taken off, they would often lie twenty years before they were entirely rotten. The suddenness of a tree's growth, the bigness of its pores, and the frequent changes of heat and wet in summer, cause it to rot sooner. To this it must be added, that all forts of insects make holes into the stems of the fallen trees, and by that means the moisture and the air get into the tree, which must of course forward putrefaction. Most of the trees here have deciduous or annual leaves. Many of them begin to rot whilst they are yet standing and blooming. This forms the hollow

trees, in which many animals make their nefts and places of refuge.

The breadth of the Delaware directly opposite Wilmington, is reckoned an English mile and a half; yet to look at it, it did not feem to be so great. The depth of the

river, in the middle, is faid to be from four to fix fathoms here.

Dec. 12th. The joiners fay, that among the trees of this country they chiefly use the black walnut-trees, the wild cherry-trees, and the curled maple. Of the black walnut-trees (juglans nigra) there is yet a sufficient quantity. However careless people take pains enough to destroy them, and some peasants even use them as suel. The wood of the wild cherry-trees (prunus Virginiana) is very good, and looks exceedingly well; it has a yellow colour, and the older the surniture is, which is made of it, the better it looks. But it is already difficult to get at it, for they cut it everywhere, and plant it nowhere. The curled maple (acer rubrum) is a species of the common red maple, but likewise very difficult to be got. You may cut down many trees without finding the wood which you want. The wood of the sweet gum-tree (liquidambar) is merely employed in joiner's work, such as tables and other furniture. But it must not

be brought near the fire, because it warps. The firs and the white cedars (cupressus

thyoides) are likewise made use of by the joiners for different sorts of work.

The millers who attended the mill which stood here, said, that the axletrees of the wheels of the mill were made of white oak, and that they continued good three or four years, but that the fir-wood does not keep so well. The cogs of the mill-wheel and the pullies are made of the wood of the white walnut-tree, because it is the hardest which can be got here. The wood of mulberry-trees is of all others reckoned the most excellent for pegs and plugs in ships and boats.

At night I went over the river Delaware, from Wilmington to the ferrying-place, on

the New Jerfey fide.

Dec. 13th. In the morning I returned to Raccoon.

On many trees in the woods of this country, either on one of the fides, or in the middle of a branch, or round a branch, are greater or leffer knobs or excrefcences. Sometimes there is only a fingle one in a tree. In the fize there is a confiderable difference, for some of these knobs are as big and bigger than a man's head, others are only fmall. They project above the furface of the tree, like a tumor. Sometimes a tree was quite covered with them. They do not lie on one fide only, but often form a circle round a branch, and even round the ftem itself. The trees which have these knobs are not always great ones, but fome not above a fathom high. The knobs commonly confift of the fame parts as the wood itself, and look within like curled wood. Some of them are hollow. When a knob on a little tree is cut open, we commonly find a number of little worms in it, which are fometimes also common in the greater knobs. This shews the origin of the knobs in general. The tree is stung by insects, which lay their eggs under the bark, and from the eggs worms are afterwards hatched. They occasion an extravalation of the fap, which gradually condenses into a knob. Only the trees with annual deciduous leaves have these knobs, and among them chiefly the oak, of which again the black and Spanish oak have the greatest abundance of knobs. The ash trees, (fraxinus excelsior) and the red maple (acer rubrum) likewise have enough of them. Formerly the Swedes, and more especially the Finlanders, who are fettled here, made dishes, bowls, &c. of the knobs which were on the ash-trees. These vessels, I am told, were very pretty, and looked as if they were made of curled wood. The oak-knobs cannot be employed in this manner as they are commonly worm-eaten and rotten within. At prefent the Swedes no longer make use of such bowls and diffies, but make use of earthenware, or vessels made of other wood. knobs are of an uncommon fize, and make a tree have a monstrous appearance. with knobs are very common in the woods of this country*.

The roads are good or bad according to the difference of the ground. In a fandy foil the roads are dry and good; but in a clayey one they are bad. The people here are likewife very careless in mending them. If a rivulet be not very great, they do not make a bridge over it; and travellers may do as well as they can to get over: Therefore many people are in danger of being drowned in such places, where the water is

rifen

In Siberia, and in the province of Wiatka, in the government of Cazan, in Russia, the inhabitants make use of the knobs, which are pretty frequently found in birches, to make bowls and other domestic utensils thereof. They are turned, made pretty thin, and covered with a kind of varnish, which gives them a pretty appearance; for the utensil looks yellow, and is marbled quite in a picturesque manner, with brown veins. The best kind of these vessels are made so thin that they are semidiaphanous, and when put into hot water they grow quite pliant, and may be formed by main force, quite flat, but when again left to themselves, and grown cold, they return to their original shape. This kind of wood is called, in Russia, kap, and the vessels made of it, kappowie tchashkt, and are pretty high in price, when they are of the best kind, and well varnished. F.

rifen by a heavy rain. When a tree falls acrofs the road, it is feldom cut off, to keep the road clear, but the people go round it. This they can eafily do, fince the ground is very even, and without stones; has no underwood or shrubs, and the trees on it stand

much afunder. Hence the roads here have fo many bendings.

The farms are most of them single, and you seldom meet with even two together, except in towns, or places which are intended for towns; therefore there are but few villages. Each farm has its corn-fields, its woods, its pastures and meadows. This may perhaps have contributed something towards the extirpation of wolves, that they everywhere met with houses, and people who fired at them. Two or three farmhouses have generally a pasture or a wood in common, and there are feldom more to-

gether; but most of them have their own grounds divided from the others.

Dec. 18th. All perfons who intend to be married, must either have their banns published three times from the pulpit, or get a licence from the governor. The banns of the poorer fort of people only are published, and all those who are a little above them get a licence from the governor. In that licence he declares that he has examined the affair, and found no obstacles to hinder the marriage, and therefore he allows it. The licence is figned by the governor; but, before he delivers it, the bridegroom must come to him in company with two creditable and well-known men, who answer for him, that there really is no lawful obstacle to his marriage. These men must subscribe a certificate, in which they make themselves answerable for, and engage to bear all the damages of, any complaints made by the relations of the persons who intend to be married, by their guardians, their mafters, or by those to whom they may have been promifed before. For all these circumstances the governor cannot possibly know. They further certify that nothing hinders the intended marriage, and that nothing is to be feared on that account. For a licence they pay five and twenty shillings in Penfylvanian money, at Philadelphia. The governor keeps twenty shillings, or one pound, and the remaining five shillings belong to his secretary. The licence is directed only to protestant clergymen. The quakers have a peculiar licence to their marriages. But as it would be very troublesome, especially for those who live far from the governor's refidence, to come up to town for every licence, and to bring the men with them who are to answer for them, the clergymen in the country commonly take a sufficient number of licences and certificates, which are ready printed, with blanks left for the names; they give them occasionally, and get the common money, one pound five shillings, for each of them, besides something for their trouble. The money that they have collected, they deliver to the governor as foon as they come to town, together with the certificates, which are figned by two men, as above-mentioned; they then take again as many licences as they think sufficient: from hence we may conceive that the governors in the English North American colonies, besides their falaries, have very confiderable revenues *.

There is a great mixture of people of all forts in these colonies, partly of such as are lately come over from Europe, and partly of such as have not yet any settled place of abode. Hence it frequently happens that when a clergyman has married such a couple, the bridegroom says he has no money at present, but would pay the see at the first opportunity: however he goes off with his wise, and the clergyman never gets his due.

^{*} Though it is very defirable that the members of the church of England may enjoy the fame religious liberty in America as the reft of their fellow-subjects, and have every part of their religious establishment among themselves, and that therefore bishops might be introduced in America, it is however to be feared this will prove one of the obstacles to the introducing of English bishops in that part of the world.

This

This proceeding has given occasion to a custom which is now common in Maryland. When the clergyman marries a very poor couple, he breaks off in the middle of the liturgy, and cries out, Where is my fee? The man must then give the money, and the clergyman proceeds; but if the bridegroom has no money, the clergyman defers the marriage till another time, when the man is better provided. People of fortune, of whom the clergyman is fure to get his due, need not fear this disagreeable question,

when they are married.

However, though the parfon has got licences to marry a couple, yet if he be not very careful, he may get into very difagreeable circumstances; for in many parts of the country there is a law made, which, notwithstanding the governor's licence, greatly limits a clergyman in some cases. He is not allowed to marry a couple who are not yet of age, unless he be certain of the consent of their parents. He cannot marry such strangers as have bound themselves to serve a certain number of years, in order to pay off their passage from Europe, without the consent of their masters; if he acts without their consent, or in opposition to it, he must pay a penalty of sifty pounds, Pensylvania currency, though he has the licence, and the certificate of the two men who are to answer for any objection. But parents or masters give themselves no concern about these men, but take hold of the clergyman, who is at liberty to prosecute those who gave him the certificate, and to get his damages repaid. With the consent of the parents and masters, he may marry people without danger to himself. No clergyman is allowed to marry a negro with one of European extraction, or he must pay a penalty

of one hundred pounds, according to the laws of Penfylvania. There is a very peculiar diverting cultom here, in regard to marrying. When a man dies, and leaves his widow in great poverty, or fo that she cannot pay all the debts with what little fhe has left; and that, notwithstanding all that, there is a person who will marry her, she must be married in no other habit than her shift. By that means, fhe leaves to the creditors of her deceased husband her cloaths, and every thing which they find in the house. But she is not obliged to pay them any thing more, because she has left them all she was worth, even her cloaths, keeping only a shift to cover her. which the laws of the country cannot refuse her. As soon as she is married, and no longer belongs to the deceased husband, she puts on the cloaths which the second has given her. The Swedish clergymen here have often been obliged to marry a woman in a drefs which is so little expensive, and so light. This appears from the registers kept in the churches, and from the accounts given by the clergymen themselves. I have likewife often feen accounts of fuch marriages in the English gazettes, which are printed in these colonies; and I particularly remember the following relation: A woman went, with no other dress than her shift, out of the house of her deceased husband to that of her bridegroom, who met her half way with fine new cloaths, and faid, before all who were prefent, that he lent them his bride; and put them on her with his own hands. It feems he faid that he lent the cloaths, left, if he had faid he gave them, the creditors of the first husband should come and take them from her; pretending, that she was looked upon as the relict of her first husband, before she was married to the second.

Dec. 21st. It feems very probable, from the following observations, that long before the arrival of the Swedes, there have been Europeans in this province; and, in the fequel, we shall give more confirmations of this opinion. The same old Maons Keen, whom I have already mentioned before, told me repeatedly, that, on the arrival of the Swedes in the last century, and on their making a settlement, called Helsingburg, on the banks of the Delaware, somewhat below the place where Salem is now situated; they found, at the depth of twenty feet, some wells, inclosed with walls. This could

not be a work of the native. Americans, or Indians, as bricks were entirely unknown to them when the Europeans first settled here, at the end of the fisteenth century; and they still less knew how to make use of them. The wells were at that time on the land; but in such a place, on the banks of the Delaware, as is sometimes under water, and sometimes dry. But since the ground has been so washed away, that the wells are entirely covered by the river, and the water is seldom low enough to shew the wells. As the Swedes afterwards made new wells for themselves, at some distance from the former, they discovered in the ground, some broken earthen vessels, and some entire

good bricks; and they have often got them out of the ground by ploughing. From these marks, it seems we may conclude, that, in times of yore, either Europeans, or other people of the then civilized parts of the world, have been carried hither by storms, or other accidents, fettled here, on the banks of the river, burnt bricks, and made a colony here; but that they afterwards mixed with the Indians, or were killed by them. They may gradually, by converfing with the Indians, have learnt their manners, and turn of thinking. The Swedes themselves are accused, that they were already half Indians, when the English arrived in the year 1682. And we still see, that the French, English, Germans, Dutch, and other Europeans, who have lived for several years together in diffant provinces, near and among the Indians, grow fo like them, in their behaviour and thoughts, that they can only be diffinguished by the difference of their colour. But history, together with the tradition among the Indians, assures us, that the above-mentioned wells and bricks cannot have been made at the time of Columbus's expedition, nor foon after; as the traditions of the Indians fay, that those wells were made long before that epocha. This account of the wells, which had been inclosed with bricks, and of such bricks as have been found in feveral places in the ground, I have afterwards heard repeated by many other old Swedes.

Dec. 22d. An old farmer foretold a change of the weather, because the air was very warm this day at noon, though the morning had been very cold. This he likewise concluded, from having observed the clouds gathering about the sun. The meteorological observations annexed to this work, will prove that his observation

was just.

Dec. 31st. The remedies against the tooth-ach are almost as numerous as days in a year. There is hardly an old woman but can tell you three or four score of them, of which she is perfectly certain that they are as infallible and speedy in giving relief, as a month's fasting, by bread and water, is to a burthensome paunch. Yet it happens often, nay, too frequently, that this painful disease eludes all this formidable army of remedies. However, I cannot forbear observing the following remedies, which have sometimes, in this country, been found effectual against the tooth-ach.

When the pains come from the hollowness of the teeth, the following remedy is said to have had a good effect: A little cotton is put at the bottom of a tobacco-pipe; the tobacco is put in upon it, and lighted; and you smoke till it is almost burnt up. By smoking, the oil of the tobacco gets into the cotton, which is then taken out, and applied

to the tooth as hot as it can be fuffered.

The chief remedy of the Iroquois, or Iroquese, against the tooth-ach, occasioned by hollow teeth, I heard of Captain Lindsey's lady, at Oswego; and she assured me, that the knew, from her own experience, that the remedy was effectual. They take the seed capsules of the Virginian Anemone, as soon as the seed is ripe, and rub them in pieces. It will then be rough, and look like cotton. This cotton-like substance is dipped into strong brandy, and then put into the hollow tooth, which commonly ceases to ache soon after. The brandy is biting or sharp, and the seeds of the anemone, as most seeds of

the polyandria polygynia class of plants (or such as have many stamina, or male flowers, and many pistilla, or female flowers) have likewise an acrimony. They therefore, both together, help to assuage the pain; and this remedy is much of the same kind with the former. Besides that, we have many seeds which have the same qualities with the American anemone.

The following remedy was much in vogue against the tooth-ach which is attended with a swelling: They boil gruel of flour of maize, and milk; to this they add, whilst it is yet over the fire, some of the fat of hogs or other suet, and stir it well, that every thing may mix equally. A handkerchief is then spread over the gruel, and applied as hot as possible to the swelled cheek, where it is kept till it is gone cool again. I have found, that this remedy has been very efficacious against a swelling; as it lesses the pain, abates the swelling, opens a gathering if there be any, and procures a good discharge of the pus.

I have feen the Iroquese boil the inner bark of the sambucus Canadensis, or Canada elder, and put it on that part of the cheek in which the pain was most violent. This,

I am told, often diminishes the pain.

Among the Iroquese, or Five Nations, upon the river Mohawk, I saw a young Indian woman, who, by frequent drinking of tea, had got a violent tooch-ach. To cure it, she boiled the myrica asplenii solia, and tied it, as hot as she could bear it, on the whole

cheek. She faid, that remedy had often cured the tooth-ach before.

Jan. 2d, 1749. Before the Europeans, under the direction of columbus, came to the West Indies, the favages or Indians (who lived there fince times immemorial) were entirely unacquainted with iron, which appears very strange to us, as North America, almost in every part of it, contains a number of iron mines. They were therefore obliged to fupply this want with sharp stones, shells, claws of birds and wild beasts, pieces of bones, and other things of that kind, whenever they intended to make hatchets, knives, and fuch like inftruments. From hence it appears, that they must have led a very wretched life. The old Swedes, who lived here, and had had an intercourfe with the Indians when they were young, and at a time when they were yet very numerous in these parts, could tell a great many things concerning their manner of living. At this time the people find accidentally, by ploughing and digging in the ground, feveral of the instruments which the Indians employed, before the Swedes and other Europeans had provided them with iron tools. For it is observable that the Indians at prefent make use of no other tools, than such as are made of iron and other metals, and which they always get from the Europeans. Of this I shall be more particular, in its proper place. But having had an opportunity of feeing and partly collecting a great many of the ancient Indian tools, I shall here describe them.

Their hatchets were made of stone. Their shape is similar to that of the wedges with which we cleave our wood, about half a foot long, and broad in proportion; they are made like a wedge, sharp at one end, but rather blunter than our wedges. As this hatchet must be fixed on a handle, there was a notch made all round the thick end. To fasten it, they split a stick at one end, and put the stone between it, so that the two halves of the stick come into the notches of the stone; then they tied the two split ends together with a rope, or something like it, almost in the same way as smiths fasten the instrument with which they cut off iron, to a split stick. Some of these stone-hatchets were not notched or surrowed at the upper end, and it seems they only held those in their hands in order to hew or strike with them, and did not make handles to them. Most of the hatchets which I have seen, consisted of a hard rock-stone; but some were made of a sine, hard, black, apyrous stone. When the

4

Indians intended to fell a thick strong tree, they could not make use of their hatchets, but, for want of proper instruments, employed fire. They set fire to a great quantity of wood at the roots of the tree, and made it fall by that means. But that the fire might not reach higher than they would have it, they fastened some rags to a pole, dipped them into water, and kept continually washing the tree, a little above the fire. Whenever they intended to hollow out a thick tree for a canoe, they laid dry branches all along the stem of the tree, as far as it must be hollowed out. They then put fire to those dry branches, and as foon as they were burnt, they were replaced by others. Whilst these branches were burning, the Indians were very busy with wet rags, and pouring water upon the tree, to prevent the fire from spreading too far on the fides, and at the ends. The tree being burnt hollow as far as they found it fufficient, or as far as it could, without damaging the canoe, they took the above described stonehatchets, or fliarp flints, and quartzes, or fliarp shells, and scraped off the burnt part of the wood, and fmoothened the boats within. By this means they likewise gave it what shape they pleased. Instead of cutting with a hatchet such a piece of wood as was necessary for making a canoe, they likewife employed fire. A canoe was commonly between thirty and forty feet long. The chief use of their hatchets was, according to the unanimous accounts of all the Swedes, to make good fields for maize-plantations; for if the ground where they intended to make a maize-field was covered with trees, they cut off the bark all round the trees with their hatchets, especially at the time when they lose their sap. By that means the tree became dry and could not take any more nourishment, and the leaves could no longer obstruct the rays of the fun from passing. The smaller trees were then pulled out by main force, and the ground was a little turned up with crooked or sharp branches.

Instead of knives they were satisfied with little sharp pieces of slint or quartz, or else some other hard kind of a stone, or with a sharp shell, or with a piece of a bone

which they had sharpened.

At the end of their arrows they fastened narrow angulated pieces of stone; they made use of them, having no iron to make them sharp again, or a wood of sufficient hardness: these points were commonly slints or quartzes, but sometimes likewise another kind of a stone. Some employed the bones of animals, or the claws of birds and beasts. Some of these ancient harpoons are very blunt, and it seems that the Indians might kill birds and small quadrupeds with them; but whether they could enter deep into the body of a great beast or of a man, by the velocity which they get from the bow, I cannot ascertain; yet some have been found very sharp and well made.

They had stone pestles, about a foot long, and as thick as a man's arm. They consist chiefly of a black fort of a stone, and were formerly employed by the Indians, for pounding maize, which has, since times immemorial, been their chief and almost their only corn. They had neither wind-mills, water-mills, nor hand-mills, to grind it, and did not so much as know a mill before the Europeans came into the country. I have spoken with old Frenchmen in Canada, who told me that the Indians had been associated beyond expression when the French set up the sirst wind-mill. They came in numbers, even from the most distant parts, to view this wonder, and were not tired with sitting near it for several days together, in order to observe it; they were long of opinion that it was not driven by the wind, but by the spirits who lived within it. They were partly under the same associatement when the first water-mill was built. They formerly pounded all their corn or maize in hollow trees, with the above-mentioned pestles, made of stone. Many Indians had only wooden pestles.

pestles. The blackish stone, of which the hatchets and pestles are sometimes made, is very good for a grindstone, and therefore both the English and the Swedes employ the hatchets and peftles chiefly as grindstones, at prefent, when they can get

The old boilers or kettles of the Indians, were either made of clay, or of different kinds of potstone, (lapis ollaris). The former consisted of a dark clay, mixt with grains of white fand or quartz, and burnt in the fire. Many of these kettles have two holes in the upper margin, on each fide one, through which the Indians put a flick, and held the kettle over the fire, as long as it was to boil. Most of the kettles have no feet. It is remarkable that no pots of this kind have been found glazed, either on the outfide or the infide. A few of the oldest Swedes could yet remember feeing the Indians boil their meat in these pots. They are very thin, and of different fizes; they are made fometimes of a greenish, and sometimes of a grey potstone, and some are made of another species of apyrous stone; the bottom and the margin are frequently above an inch thick. The Indians, notwithstanding their being unacquainted with iron, steel, and other metals, have learnt to hollow out very in-

geniously these pots or kettles of pot-stone.

The old tobacco-pipes of the Indians are likewife made of clay, or pot-stone, or ferpentine-stone. The first fort are shaped like our tobacco-pipes, though much coarfer and not fo well made. The tube is thick and fhort, hardly an inch long, but sometimes as long as a finger; their colour comes nearest to that of our tobaccopipes which have been long used. Their tobacco-pipes of pot-stone are made of the fame stone as their kettles. Some of them are pretty well made, though they had neither iron nor fteel. But befides these kinds of tobacco-pipes, we find another fort of pipes, which are made with great ingenuity, of a very fine red pot-stone, or a kind of ferpentine marble. They are very fcarce, and feldom made use of by any other than the Indian fachems, or elders. The fine red stone, of which these pipes are made, is likewife very scarce, and is found only in the country of those Indians who are called Ingouez, and who, according to father Charlevoix, live on the other fide of the river Missisppi*. The Indians themselves commonly value a pipe of this kind as much as a piece of filver of the same fize, and sometimes they make it still dearer. Of the faine kind of stone commonly consists their pipe of peace, which the French call calumet de paix, and which they make use of in their treaties of peace and alliances. Most authors who have wrote of these nations mention this instrument, and I intend to speak of it when an opportunity offers.

The Indians employ hooks made of bone, or bird's claws, inflead of fifthing-hooks. Some of the oldest Swedes here told me, that when they were young, a great number of Indians had been in this part of the country, which was then called New Sweden,

and had caught fishes in the river Delaware with these hooks.

They made fire by rubbing one end of a hard piece of wood continually against

another dry one, till the wood began to fmoke, and afterwards to burn.

Such were the tools of the ancient Indians, and the use which they made of them, before the Europeans invaded this country, and before they (the Indians) were acquainted with the advantages of iron. North America abounds in iron-mines, and the Indians lived all about the country before the arrival of the Europeans, fo that feveral places can be shewn in this country where at present there are iron-mines, and where not a hundred years ago, stood great towns or villages of the Indians. It is

therefore

^{*} See his Journal historique d'un voyage de l'Amerique. Tome v. p. m. 311. and the 13th letter.

therefore very remarkable, that the Indians did not know how to make use of a metal or ore which was always under their eyes, and on which they could not avoid treading every day. They even lived upon the very spots where iron ores were afterwards found, and yet they often went many miles in order to get a wretched hatchet, knife, or the like, as above described. They were forced to employ several days in order to sharpen their tools, by rubbing them against a rock, or other stones, though the advantage was far from being equal to the labour. For they could never cut down a thick tree with their hatchets, and with difficulty they felled a small one. They could not hollow out a tree with their hatchets, or do a hundredth part of the work which we can perform with ease, by the help of our iron hatchets. Thus we see how disadvantageous the ignorance and inconsiderate contempt of useful arts is. Happy is the country which knows their full value!

January the 5th. Christmas-day was celebrated this day by the Swedes and English,

for they kept them to the old stile.

January the 6th. There are a great number of hares in this country, but they differ from our Swedish ones in their fize, which is very small, and but little bigger than that of a rabbit; they keep almost the same grey colour both in summer and winter, which our northern hares have in fummer only; the tip of their ears is always grey, and not black; the tail is likewife grey on the upper fide, at all feafons; they breed feveral times a year: in fpring they lodge their young ones in hollow trees, and in fummer, in the months of June and July, they breed in the grafs. When they are furprifed they commonly take refuge in hollow trees, out of which they are taken by means of a crooked stick, or by cutting a hole into the tree, opposite to the place where they lie; or by fmoke, which is occasioned by making a fire on the outfide of the tree. On all these occasions the greyhounds must be at hand. These hares never bite, and can be touched without any danger. In day-time they usually lie in hollow trees, and hardly ever stir from thence, unless they be disturbed by men or dogs; but in the night they come out, and feek their food. In bad weather, or when it fnows, they lie close for a day or two, and do not venture to leave their retreats. They do a great deal of mischief in the cabbage-fields; but apple-trees fuffer infinitely more from them, for they peel off all the bark next to the ground. The people here agreed that the hares are fatter in a cold and fevere winter, than in a mild and wet one, of which they could give me feveral reasons, from their own conjectures. The skin is useless, because it is so loose that it can be drawn off; for when you would separate it from the slesh, you need only pull at the fur, and the skin sollows: these hares cannot be tamed. They were at all times, even in the midst of winter, plagued with a number of common fleas*.

Jan. 16th. The common mice were in great abundance in the towns and in the country; they do as much mischief as in the old countries. Oldmixon in his book, the British Empire in America, vol. i. p. 444, writes, that North America had neither rats nor mice before European ships brought them over. How far this is true I know not. It is undoubted, that in several defart places, where no man ever lived, I have seen and killed the common mice in crevices of stones or mountains; and is it probable that all such mice as are spread in this manner, throughout the inland

^{*} This account sufficiently proves, that these hares are a species distinct from our European reddish grey kind, and also of that species or variety only, which in the northern parts of Europe and Asia is white in winter, with black tipped ears, and has a grey coat in summer. Upon a closer examination naturalists will perhaps find more characters to distinguish them more accurately. F.

parts of the country, derive their origin from those which were brought over from

Europe?

Rats likewife may be ranked among those animals which do great damage in this country. They live both in the cities and in the country, and destroy their provisions. Their fize is the fame with that of our rats, but their colour differs; for they are grey, or blue-grey. I enquired of the Swedes, whether these rats had been here prior to the arrival of the Europeans, or whether they came over in the ships? But I could not get an answer which I might depend upon. All agreed, that a number of these dangerous and mischievous animals were every year brought to America, by ships from Europe and other countries. But Mr. Bartram maintained, that before the Europeans fettled here, rats had been in the country; for he faw a great number of them on the high mountains which are commonly called the blue mountains, where they lived among ftones, and in the fubterraneous grottoes which are in those mountains. They always lie very close in the day-time, and you hardly ever fee one out; but at night they come out, and make a terrible noife. When the cold was very violent, they feemed quite torpid; for during the continuance of the cold weather, one could not hear the least noise or shricking, occasioned by them. It is to be observed, that neither the Swedes nor the English have any dark windows in their houses here. There is hardly a dormer-window in the garret; but only loofe boards. The walls in the wooden houses are frequently not closed, even with moss; so that the rooms, though they have fires in them, are no warmer than the outfide apartment, or hall. The rooms where the fervants fleep have never any fire in them, though the winter is pretty fevere fometimes. The rats have therefore, little or no warmth in winter; but as foon as a milder feafon makes its appearance, they come out again. We observed several times this winter, that the rats were very active, and made an unufual noise all night, just before a fevere cold. It feems, they had fome fenfation of cold weather being at hand; and that they therefore eat fufficiently, or stored up provisions. In mild weather, they were used to carry away apples, and other provisions: therefore, we could always conclude with certainty, when the rats made an uncommon noise at night or were extremely greedy, that a fevere cold would enfue. I have already observed, that the grey fquirrels in this country have the fame quality. When thefe, and the common mice eat maize, they do not confume the whole grains, but only the loofe, fweet, and fost kernel, and leave the rest.

Jan 21st. The cold now equalled that of Sweden, though this country is fo much more foutherly. The Celfian or Swedish thermometer was twenty two degrees below the freezing point in the morning. As the rooms are without any flutters here, the cracks in the walls not closed with mofs, and fometimes no fire-place or chimney in the room, the winters here must be very disagreeable to one who is used to our Swedish warm winter-rooms. But the greatest comfort here is, that the cold is of a very short duration. Some days of this month, the room which I lodged in was fuch, that I could not write two lines before the ink would freeze in my pen. When I did not write, I could not leave the ink-stand on the table; but was forced to put it upon the hearth, or into my pocket. Yet, notwithstanding it was so cold, as appears from the meteorological observations annexed to this work; and though it snowed sometimes for feveral days and nights together, and the fnow lay near fix inches high upon the ground; yet all the cattle are obliged to flay, day and night, in the fields during the whole winter. For neither the English nor the Swedes had any stables; but the Germans and Dutch had preferved the custom of their country, and generally kept their cattle in stables during winter. Almost all the old Swedes fay, that on their

first

first arrival in this country, they made stables for their cattle, as is usual in Sweden; but as the English came and settled among them, and left their cattle in the sields all winter, as is customary in England, they left off their former custom and adopted the English one. They owned, however, that the cattle suffered greatly in winter when it was very cold, especially when it froze after a rain; and that some cattle were killed by it in several places, in the long winter of the year 1741. About noon, the cattle went out into the woods, where there were yet some leaves on the young oak; but they did not eat the leaves, and only bit off the extremities of the branches and the tops of the youngest oaks. The horses went into the maize fields, and eat the dry leaves on the few stalks which remained. The sheep ran about the woods and on the corn-fields. The chickens perched on the trees of the gardens at night; for they had no particular habitations. The hogs were likewise exposed to the roughness of the weather, within a small inclosure.

A fmall kind of birds, which the Swedes call fnow-bird, and the English chuck-bird, came into the houses about this time. At other times, they sought their food along the roads. They are seldom seen but when it snows. Catesby, in his Natural History of Carolina, calls it passer nivalis; and Dr. Linnæus, in his Systema Naturæ, calls it

emberiza hyemalis.

The river Delaware was now covered with ice opposite Philadelphia, and even fomewhat lower, and the people could walk over it; but nobody ventured to ride over

on horfeback.

Jan. 22d. There are partridges in this country; but they are not of the fame kind with ours. The Swedes called them fometimes rapphons (partridges), and fometimes aekkerhoens (quails). Some of the English likewise called them partridges, others quails. Their fhape is almost the fame with that of the European partridges, and their nature and qualities the fame: I mean, they run and hide themselves, when pursued. But they are fmaller, and entirely different in colour. In this work I cannot infert at large, the descriptions which I have made of birds, insects, quadrupeds, and plants; because it would swell my volume too much. I only observe, that the feet are naked and not hairy; the back is spotted with brown, black, and white; the breast is dark yellow; and the belly whitish, with black edges on the tips of the feathers. The fize is nearly that of a hazel-hen, or tetrao bonafia. Above each eye is a narrow stroke of whitish yellow. These birds are numerous in this part of the country. On going but a little way, you meet with great coveys of them. However, they keep at a great distance from towns; being either extirpated or frightened there by the frequent shooting. They are always in lesser or greater coveys, do not sly very much, but run in the fields, and keep under the bushes and near the inclosures, where they feek their food. They are reckoned very delicious food; and the people here prepare them in different ways. For that purpose they are caught, and shot in great numbers. They are caught by putting up a fieve, or a fquare open box, made of boards, in the places they frequent. The people strew some oats under the sieve, and lift it up on one fide by a little flick, and as foon as the partridges are got under the fieve, in order to pick up the oats, it falls, and they are caught alive. Sometimes they get feveral partridges at once. When they run in the bushes, you can come very near them, without flarting them. When they fleep at night, they come t ether in an heap. They fcratch in the bushes and upon the field, like common chickens. In spring they make their nefts, either under a bush or in the maize fields, or on the hills in the open air: they fcratch fome hay together, into which they lay about thirteen white eggs. They eat feveral forts of corn, and feeds of grass. They have likewise been feen eating

the berries of fumach, or rhus glabra. Some people have taken them young, and kept them in a cage till they were tame: then they let them go; and they followed the

chickens, and never left the court-yards.

The inclosures made use of in Pensylvania and New Jersey, but especially in New York, are those, which on account of their serpentine form resembling worms, are called worm-fences in English. The poles which compose this fence are taken from different trees; but they are not all of equal duration: the red cedar is reckoned the most durable of any, for it holds out above thirty years: but it is very scarce, and grows only in a fingle place hereabouts, fo that no fences can be made of it. It is true, the fences about Philadelphia (which however are different from the worm-fences) are all made of red cedar; but it has been brought by water from Egg-harbour, where it grows in abundance. The supports on which the poles lie are made of the white cedar, or cupreffus thyoides, and the poles which are laid between them of the red cedar or juniperus Virginiana. Next to the cedar-wood, oak and chefnut are reckoned best. Chefnut is commonly preferred, but it is not every where fo plentiful as to be made into fences; in its flead they make use of several forts of oak. In order to make inclofures, the people do not cut down the young trees, as is common with us, but they fell here and there thick trees, cut them in feveral places, leaving the pieces as long as it is necessary, and split them into poles of the usual thickness; a single tree affords a multitude of poles. Several old men in this country told me, that the Swedes, on their arrival here, made fuch inclofures as are usual in Sweden, but they were forced to leave off in a few years time, because they could not get posts enough; for they had found by experience, that a post being put into the ground would not last above four or fix years before the part under ground was entirely rotten; but the chief thing was, that they could not get any fwitches for to tie them together; they made fome of hiccory, which is one of the toughest trees in this country, and of the white oak; but in the space of a year or two the switches were rotten, and the sence fell in pieces of itself, therefore they were forced to give over making such inclosures. Several of the new comers again attempted, but with the fame bad fuccefs, to make fences with posts and switches. The Swedish way of inclosing therefore will not succeed here. Thus the worm-fences are one of the most useful forts of inclosures, especially as they cannot get any post, made of the woods of this country, to stay above six or eight years in the ground without rotting. The poles in this country are very heavy, and the posts cannot bear them well, especially when it blows a storm; but the wormfences are eafily put up again when they are thrown down. Experience has shewn that an inclosure made of chefnut or white oak feldom holds out above ten or twelve years, before the poles and posts are thoroughly rotten: when the poles are made of other wood, the fences hardly stand fix or eight years. Confidering how much more wood the worm-fences require, (fince they run in bendings) than other inclosures which go in ftraight lines, and that they are fo foon ufelefs, one may imagine how the forests will be consumed, and what fort of an appearance the country will have forty or fifty years hence, in case no alteration is made; especially as woods is really squandered away in immense quantities, day and night all the winter, or nearly one half of the year, for fuel.

Feb. 8th. The musk-rats, so called by the English in this country, on account of their scent, are pretty common in North America; they always live near the water, especially on the banks of lakes, rivers, and brooks. On travelling to places where they are, you see the holes which they have dug in the ground just at the water's edge, or a little above its surface. In these holes they have their ness, and there they con-

tinue whenever they are not in the water in pursuit of food. The Swedes call them definans rattor *, and the French, rats musqués. Linnœus calls this animal castor zibethicus. Their food is chiefly the muscles which lie at the bottom of lakes and rivers; you fee a number of fuch shells near the entrance of their holes. I am told they likewife eat feveral kinds of roots and plants. They differ from the European musk-rat, or Linnaus's easter moschatus. The teeth are the same in both; the tail of the American is compressed on the fides so, that one sharp edge goes upwards and the other downwards: the hind feet are not palmated, or joined by a moveable tkin, but are peculiar for having on both fides of the feet, long, white, close, pectinated, offflanding hair, befides the fhort hair with which the feet are quite covered. Such hairs are on both fides of the toes, and do the fame fervice in swimming as a web. Their fize is that of a little cat, or to be more accurate, the length of the body is about ten inches, and the tail of the same length: the colour of the head, neek, back, sides, and of the outfide of the thighs, is blackish brown; the hairs are foft and shining; under the neck, on the breafts, and on the infide of the thighs, they are grey. They make their nests in the dykes that are erected along the banks of rivers to keep off the water from the adjoining meadows; but they often do a great deal of damage, by spoiling the dykes with digging, and opening passages for the water to come into the meadows; whereas beavers stop up all the holes in a dyke or bank. They make their nests of twigs and fuch like things externally, and carry foft stuff into them for their young ones to lie upon. The Swedes afferted that they could never observe a diminution in their number, but believed that they were as numerous at prefent as formerly. As they damage the banks fo confiderably the people are endeavouring to extirpate them when they can find out their nests; the skin is paid for, and this is an encouragement towards catching the animal. A skin of a musk-rat formerly cost but threepence, but at present they gave from fixpence to ninepence. The skins are chiefly employed by hatters, who make hats of the hair, which are faid to be nearly as good as beaver hats. The musk-rats are commonly caught in traps, with apples as baits. In the country of the Iroquefe, I faw those Indians following the holes of the musk-rats, by digging till they came to their nests, where they killed them all. Nobody here eats their flesh; I do not know whether the Indians eat it, for they are commonly not over nice in the choice of meat. The musk-bag is put between the cloaths, in order to preserve them against worms. It is very difficult to extirpate these rats when they are once settled in a bank. A Swede, however, told me, that he had freed his bank, or piece of dyke along the river, from them in the following manner: he fought for all their holes, stopped them all up with earth, excepting one, on that fide from whence the wind came. He put a quantity of fulphur into the open entrance, fet fire to it, and then closed the hole, leaving but a small one for the wind to pass through. The smoke of the fulphur then entered their most remote nests, and stifled all the animals. As soon as the fulphur was burnt, he was obliged to dig up part of the ground in the bank, where they had their nests; and he found them lie dead by heaps. He fold the skins, and they paid his trouble, not to mention the advantage he got by clearing his bank of the musk-rats.

Beavers were formerly abundant in New Sweden, as all the old Swedes here toldme. At that time they faw one bank after another raifed in the rivers by beavers.

^{*} Defin fignifies musk in the Swedish, and in some provincial dialects of the German language; consequently, desiman rat is nothing but musk-rat; and from hence M. de Busson has formed his desiman or Russian musk-rat. F.

But after the Europeans came over in great numbers, and cultivated the country better, the beavers have been partly killed, and partly extirpated, and partly are removed higher into the country, where the people are not fo numerous. Therefore there is but a fingle place in Penfylvania where beavers are to be met with; their chief food is the bark of the beaver-tree, or magnolia glauca, which they prefer to any other. The Swedes therefore put branches of this tree near the beaver-dykes, into traps, which they laid for the beavers, whilft they were yet plentiful; and they could almost be certain of good success. Some persons in Philadelphia have tamed beavers, fo that they go a fishing with them, and they always come back to their masters. Major Roderfert, in New York, related that he had a tame beaver above half a year in his house, where he went about quite loose, like a dog. The Major gave him bread, and fometimes fish, which he was very greedy of: he got as much water in a bowl as he wanted. All the rags and foft things he could meet with he dragged into a corner, where he was used to sleep, and made a bed of them. The cat in the house having kittens, took poffession of his bed, and he did not hinder her. When the cat went out, the beaver often took the kitten between his fore-paws, and held it to his breaft to warm it, and doated upon it; as foon as the cat returned he gave her the kitten again.

Sometimes he grumbled, but never did any hurt, or attempted to bite.

The English and the Swedes gave the name of mink to an animal of this country, which likewife lives either in the water, or very near it. I have never had an opportunity to fee any more than the skin of this animal; but the shape of the skin, and the unanimous accounts I have heard of it make me conclude, with much certainty, that it belonged to the genus of weafels or mustelæ. The greatest skin I ever faw, was one foot eight inches long, a leffer one was about ten inches long, and about three inches onethird broad, before it was cut; the colour was dark brown, and fometimes almost black; the tail was bufly, as that of a marten; the hair was very close, and the ears short, with short hair. The length of the feet belonging to the lesser skin was about two inches long. I am told this animal is fo fimilar to the American polecat, or viverra putorius, that they are hardly diftinguishable *. I have had the following accounts given me of its way of living: it feldom appears in day time, but at night it comes out of the hollow trees, on the banks of rivers. Sometimes it lives in the docks and bridges, at Philadelphia, where it is a cruel enemy to the rats. Sometimes it gets into the court-yards at night, and creeps into the chicken-house, through a small hole, where it kills all the poultry, and fucks their blood, but feldom eats one. If it meets with geefe, fowls, ducks, or other birds on the road, it kills and devours them. It lives upon fifth and birds. When a brook is near the houses, it is not easy to keep ducks and geefe, for the mink, which lives near rivers, kills the young ones. It first kills as many as it can come at, and then it carries them off, and feafts upon them. In banks and dykes near the water, it likewife does mifchief with digging. To catch it the people put up traps, into which they put heads of birds, fifnes, or other meat. The skin is fold in the towns, and at Philadelphia; they give twenty-pence and even two fhillings a-piece for them, according to their fize. Some of the ladies get muffs made of their fkins; but for the greatest part they are fent over to England, from whence they are distributed to other countries. The old Swedes told me that the Indians formerly used to eat all kinds of flesh, except that of the mink.

I have already mentioned fomething of the raccoon; I shall here add more of the

^{*} The mink, or minx, is a kind of small otter, which is called by Dr. Linnæus, mustela latreola, in his system, i. p. 66. F.

nature of this animal, in a place which is properly its native country *. The English call it everywhere by the name of raccoon, which name they have undoubtedly taken from one of the Indian nations; the Dutch call it hefpan; the Swedes, efpan; and the Iroquefe, attigbro. It commonly lodges in hollow trees, lies close in the day-time, never going out but on a dark cloudy day; but at night it rambles and feeks its food. I have been told by feveral people, that in bad weather, especially when it snows and blows a ftorm, the raccoon lies in its hole for a week together, without coming out once; during that time it lives by fucking and licking its paws. Its food are feveral forts of fruit, fuch as maize, whilst the ears are soft. In gardens it often does a great deal of damage among the apples, chefinuts, plumbs, and wild grapes, which are what it likes best; among the poultry it is very cruel. When it finds the hens on their eggs, it first kills them, and then eats the eggs. It is caught by dogs, which trace it back to its neft, in hollow trees, or by fnares and traps, in which a chicken, foine other bird, or a fish, is put as a bait. Some people eat its flesh. It leaps with all its feet at once; on account of this and of feveral other qualities, many people here reckoned it to the genus of bears. The fkin fold for eighteen-pence at Philadelphia. I was told that the raccoons were not near fo numerous as they were formerly; yet in the more inland parts they were abundant. I have mentioned the use which the hatters make of their furs; as likewise that they are easily tamed, that they are very greedy of fweet-meats, &c. in the preceding pages. Of all the North American wild quadrupeds none can be tamed to fuch a degree as this.

February 10th. In the morning I went to Philadelphia, where I arrived towards night. On my arrival at the ferry upon the river Delaware, I found the river quite covered with drifts of ice, which at first prevented our crossing the water. After waiting about an hour, and making an opening near the ferry, I, together with many more passengers, got over before any more shoals came on. As it began to freeze very hard soon after the twelfth of January (or new year, according to the old style) the river Delaware was covered with ice, which by the intenseness of the frost grew so strong, that the people crossed the river with horses at Philadelphia. The ice continued till the eighth of February, when it began to get loose, and the violent hurricane, which happened that night, broke it, and it was driven down so fast, that on the twelsth of February not a single shoal came down, excepting a piece or two near the shore.

Crows flew in great numbers together to-day, and fettled on the tops of trees. During the whole winter we hardly observed one, though they are faid to winter there. During all this fpring they commonly used to fit at the tops of trees in the morning; yet not all together, but in feveral trees. They belong to the noxious birds in this part of the world, for they chiefly live upon corn. After the maize is planted or fown, they for for the grains out of the ground and cat them. When the maize begins to ripen, they peck a hole into the involucrum which furrounds the ear, by which means the maize is spoiled, as the rain passes through the hole which they have made, and occasions the putrefaction of the corn. Befides eating corn, they likewife steal chickens. They are very fond of dead carcasses. Some years ago the government of Pensylvania had given threepence, and that of New Jersey fourpence premium for every head of a crow, but this law has now been repealed, as the expences are too great. I have feen the young crows of this kind in feveral places playing with tame ones whose wings were cut. The latter hopped about the fields, near the farm-houses where they belonged to, but always returned again, without endeavouring to escape on any occasion. These American crows are only a variety of the Royston crow, or Linnæus's corvus cornix.

Feb. 12th. In the afternoon I returned to Raccoon from Philadelphia.

^{*} The village of Raccoon.

On my journey to Raccoon, I attentively observed the trees which had yet any leaves left. The leaves were pale and dried up, but not all dropt from the following trees:

The beech-tree, (fagus fylvatica) whether great or fmall; it always kept a confiderable part of its leaves during the whole winter, even till fpring. The greater

trees kept the lowermost leaves.

The white oak (quercus alba). Most of the young trees, which were not above a quarter of a yard in diameter, had the greatest part of their leaves still on them, but the old trees had lost most of theirs, except in some places where they have got new shoots. The colour of the dry leaves was much paler in the white oak than in the black one.

The black oak (as it is commonly called here). Dr. Linnæus calls it the red oak, quercus rubra. Most of the young trees still preserved their dried leaves. Their colour was reddish brown, and darker than that of the white oak.

The Spanish oak, which is a mere variety of the black oak. The young trees of

this kind likewife keep their leaves.

A fearce species of oak which is known by its leaves having a triangular apex or top, whose angles terminate in a short bristle; the leaves are smooth below, but woolly above*. The young oaks of this species had still their leaves.

When I came into any wood where the above kinds of oaks were only twenty years,

and even not fo old, I always found the leaves on them.

It feems that Providence has, befides other views, aimed to protect feveral forts of birds, it being very cold and flormy about this time, by preferving even the dry leaves on these trees. I have this winter at several times seen birds hiding in the trees covered with old leaves, during a severe cold or storm.

Feb. 13th. As I began to dig a hole to-day, I found feveral infects which were crept deep into the ground in order to pass the winter. As soon as they came to the air, they moved their limbs a little, but had not strength sufficient for creeping, except

the black ants, which crept a little, though flowly.

Formica nigra, or the black ant, were pretty numerous, and somewhat lively. They

lay about ten inches below the furface.

Carabus latus. Some of these lay at the same depth with the ants. This is a very

common infect in all North America.

Scarabæus; chefnut-coloured, with a hairy thorax; the elytræ shorter than the abdomen, with several longitudinal lines, beset with hair. It is something similar to the cock-chaffer, but differs in many respects. I sound it very abundant in the

ground.

Gryllus campeftris, or the field-cricket. They lay ten inches deep; they were quite torpid, but as foon as they came into a warm place, they revived and were quite lively. In fummer I have found these crickets in great plenty in all parts of North America where I have been. They leaped about on the fields, and made a noise like that of our common house crickets, so that it would be difficult to distinguish them by their chirping. They sometimes make so great a noise that it causes pain in the ears, and even two people cannot understand each other. In such places where the rattle-snakes live, the field-crickets are very disagreeable, and in a manner dangerous, for their violent chirping prevents the warning which that horrid snake gives with its cattle from reaching the ear, and thus deprives one of the means of avoiding it. I

^{*} This feems to be nothing but a variety of the quercus rubra, Linn. F.

have already mentioned that they likewife winter fometimes in chimnies. Here they lie all winter in the ground, but at the beginning of March, as the air was grown warm, they came out of their holes, and began their mufic, though at first it was but very faint and rarely heard. When we were forced on our travels to sleep in uninhabited places, the crickets had got into the folds of our clothes, fo that we were obliged to stop an hour every morning in examining our clothes, before we could get rid of them.

The red ants (formica rufa) which in Sweden make the great ant-hills, I likewife found to-day and the following day; they were not in the ground, for when my fervant Yungstroem cut down old dry trees, he met with a number of them in the cracks of the tree. These cracks were at the height of many yards in the tree, and the ants were crept so high, in order to find their winter habitation. As soon as they came

into a warm place, they began to ftir about very brifkly.

Feb. 14th. The Swedes and the English gave the name of blue bird to a very pretty little bird, which was of a sine blue colour. Linnæus calls it motacilla sialis. Catesby has drawn it in his Natural History of Carolina, vol. 1. pl. 47, and described it by the name of rubecula Americana cærulea; and Edwards has represented it in his Natural History of Birds, plate and page 24. In my own journal I called it motacilla cærulea nitida, pectore ruso, ventre albo. In Catesby's plate I must observe, that the colour of the breast ought to be dirty red or ferruginous; the tibiæ and feet black as jet; the bill too should be quite black; the blue colour in general ought to be much deeper, more lively and shining; no bird in Sweden has so shining and deep a blue colour as this. The jay has perhaps a plumage like it. The food of the blue bird is not merely infects, he likewise feeds upon plants; therefore in winter, when no infects are to be met with, they come to the farm-houses in order to subsist on the seeds

of hay and other fmall grains.

Red-bird is another species of small bird. Catesby has likewise sigured it*. Dr. Linnæus calls it loxia cardinalis. It belongs to that class of birds which are enemies to bees, lying in wait for them and eating them. I fed a cock for five months together in a cage; it eat both maize and buck-wheat, for I gave it nothing elfe. By its fong it attracted others of its species to the court-yard; and after we had put some maize on the ground under the window where I had it, the others came there every day to get their food; it was then easy to catch them by means of traps. Some of them, especially old ones, both cocks and hens, would die with grief on being put into cages. Those on the other hand which were grown tame, began to fing exceedingly fweet. Their note very nearly refembles that of our European nightingale, and on account of their agreeable fong, they are fent to London in cages. They have fuch ftrength in their bill that when you hold your hand to them they pinch it fo hard as to cause the blood to iffue forth. In spring they fit warbling on the tops of the highest trees in the woods in the morning. But in cages they fit quite still for an hour; the next hour they hop up and down, finging; and fo they go on alternately all day.

Feb. 17th. Cranes (ardea Canadensis) were sometimes seen slying in the day-time to the northward. They commonly slop here early in spring, for a short time, but they do not make their nests here, for they proceed on more to the north. Certain old Swedes told me that in their younger years, as the country was not yet much cultivated, an incredible number of cranes were here every spring; but at present they

^{*} See Catesby's Natural History, vol. 1. pl. 38. Coccothraustes rubra.

are not fo numerous. Several people who have fettled here eat their flesh, when they can shoot them. They are said to do no harm to corn or the like.

Feb. 23d. This morning I went down to Penn's Neck, and returned in the

evening.

Snow lay yet in feveral parts of the woods, especially where trees the stood very thick, and the sun could not make its way; however, it was not above four inches deep. All along the roads was ice, especially in the woods, and therefore it was very difficult to ride horses which were not sharp-shoed. The people who are settled here know little of sledges, but ride on horseback to church in winter, though the snow is sometimes near a foot deep. It lays seldom above a week before it melts, and then some fresh snow falls.

A fpecies of birds, called by the Swedes maize-thieves, do the greatest mischief in this country. They have given them that name because they eat maize both publicly and fecretly, just after it is fown and covered with the ground, and when it is ripe. The English call them black-birds. There are two species of them, both described and drawn by Catefby*. Though they are very different in species, yet there is so great a friendship between them, that they frequently accompany each other in mixed flocks. However, in Penfylvania, the first fort are more obvious, and often sly together, without any of the red-winged stares. The first fort, or the purple daws, bear, in many points, fo great a likeness to the daw, the stare, and the thrush, that it is difficult to determine to which genus they are to be reckoned, but feem to come nearest to the flare; for the bill is exactly the fame with that of the thrush, but the tongue, the flight, their fitting on the trees, their fong, and shape, make it entirely a stare; at a distance they look almost black, but close by they have a very blue or purple cast, but not so much as Catefby's print: their fize is that of a stare; the bill is conic, almost subulated, ftrait, convex, naked at the base, black, with almost equal mandibles, the upper being only a very little longer than the lower; the noftrils are oblong, yet a little angulated, fo as to form almost squares: they are placed obliquely at the base of the bill, and have no hair; there is a little horny knob, or a finall prominence, on the upper fide of them: the tongue is sharp and bifid at the point: the iris of the eyes is pale: the forehead, the crown, the nucha, the upper part, and the fides of the neck, are of an obscure blue and green shining colour: the sides of the head under the eyes are obscurely blue; all the back and coverts of the wings are purple; the upper coverts of the tail are not of fo conspicuous a purple colour, but as it were blackened with foot: the nine primary quill-feathers are black: the other fecondary ones are likewife black, but their outward margin is purple; the twelve tail feathers have a blackish purple colour, and their tips are round; those on the outside are the shortest, and the middle extremely long. When the tail is spread, it looks round towards the extremity. The throat is blueish green, and shining; the breast is likewise black or fhining green, according as you turn it to the light; the belly is blackifh, and the vent feathers are obscurely purple-coloured; the parts of the breast and belly which are covered by the wings, are purple-coloured; the wings are black below, or rather footy; and the thighs have blackish feathers; the legs (tibiæ), and the toes are of a thining black. It has four toes, as most birds have. The claws are black, and that on the back toe is longer than the reft. Dr. Linnæus calls this bird gracula quifcula.

^{*} See Catefby's Natural History of Carolina, vol. i. table 12, the purple daw; and table 13, the redvinged starling.

16

A few

A few of these birds are faid to winter in swamps, which are quite overgrown with thick woods; and they only appear in mild weather. But the greatest number go to the fouth at the approach of winter. To-day I faw them, for the first time this year. They slew in great flocks already. Their chief and most agreeable food is maize. They come in great fwarms in fpring, foon after the maize is put under ground. They fcratch up the grains of maize, and eat them. As foon as the leaf comes out, they take hold of it with their bills, and pluck it up, together with the corn or grain; and thus they give a great deal of trouble to the country people, even fo early in fpring. To lessen their greediness of maize, some people dip the grains of that plant in a decoction of the root of the veratrum album, or white hellebore, (of which I shall speak in the fequel) and plant them afterwards. When the maize-thief eats a grain or two, which are fo prepared, his head is difordered, and he falls down: this frightens his companions, and they dare not venture to the place again. But they repay themselves amply towards autumn, when the maize grows ripe; for at that time, they are continually feafting. They affemble by thousands in the maize-fields, and live at discretion. They are very bold; for when they are diffurbed, they only go and fettle in another part of the field. In that manner they always go from one end of the field to the other, and do not leave it till they are quite fatisfied. They fly in incredible fwarms in autumn; and it can hardly be conceived whence fuch immense numbers of them should come. When they rife in the air they darken the sky, and make it look quite black. They are then in fuch great numbers, and fo close together, that it is furprifing how they find room to move their wings. I have known a person shoot a great number of them on one fide of a maize-field, which was far from frightening the rest; for they only just took flight and dropped at about the distance of a musket-shot in another part of the field, and always changed their place when their enemy approached. They tired the sportsman before he could drive them from off the maize, though he killed a great many of them at every fhot. They likewife eat the feeds of the aquatic tare-grafs (zizania aquatica) commonly late in autumn, after the maize is got in. I am told, they likewife eat buck-wheat and oats. Some people fay, that they even eat wheat, barley, and rye, when preffed by hunger; yet, from the best information I could obtain, they have not been found to do any damage to these species of corn. In spring, they sit in numbers on the trees, near the farms; and their note is pretty agreeable. As they are fo destructive to maize, the odium of the inhabitants against them is carried fo far, that the laws of Penfylvania and New Jerfey have fettled a premium of threepence a dozen for dead maize-thieves. In New England, the people are still greater enemies to them; for Dr. Franklin told me, in the spring of the year 1750, that, by means of the premiums which have been fettled for killing them in New England, they have been fo extirpated, that they are very rarely feen, and in a few places only. But as, in the fummer of the year 1749, an immense quantity of worms appeared on the meadows, which devoured the grafs, and did great damage, the people have abated their enmity against the maize-thieves; for they thought they had observed, that those birds lived chiefly on these worms before the maize is ripe, and consequently extirpated them, or at least prevented their spreading too much. They seem therefore to be entitled, as it were, to a reward for their trouble. But after these enemies and destroyers of the worms (the maize-thieves) were extirpated, the worms were more at liberty to multiply; and therefore they grew fo numerous that they did more mischief now than the birds did before. In the fummer 1749, the worms left fo little hay in New England that the inhabitants were forced to get hay from Penfylvania and even from Old England. The maizethieves have enemies besides the human species. A species of little hawks live upon

them, and upon other little birds. I faw fome of these hawks driving up the maize-thieves, which were in the greatest security, and catching them in the air. Nobody eato the sless of the purple maize-thieves or daws (gracula quiscula); but that of the redwinged maize-thieves, or stares (oriolus phæniceus) is sometimes eaten. Some old people have told me, that this part of America, formerly called New Sweden, still contained as many maize-thieves as it did formerly. The cause of this they derive from the maize, which is now sown in much greater quantity than formerly; and they think

that the birds can get their food with more eafe at prefent.

The American whortleberry, or the vaccinium hispidulum, is extremely abundant over all North America, and grows in such places where we commonly find our whortle-berries in Sweden. The American ones are bigger, but in most things so like the Swedish ones, that many people would take them to be mere varieties. The English call them cranberries, the Swedes tranbær, and the French in Canada atopa, which is a name they have borrowed from the Indians. They are brought to market every Wednesday and Saturday at Philadelphia, late in autumn. They are boiled and prepared in the same manner as we do our red whortle-berries, or vaccinium vitis idæa; and they are made use of during winter, and part of summer, in tarts and other kinds of pastry. But as they are very sour, they require a deal of sugar; but that is not very dear in a country where the sugar-plantations are not far off. Quantities of these berries are fent over, preserved, to Europe and to the West Indies.

Mar. 2d. Mytilus anatinus, a kind of muscle-shells, was found abundantly in little furrows, which crossed the meadows. The shells were frequently covered on the outside with a thin crust of particles of iron, when the water in the surrows came from an iron mine. The Englishmen and Swedes settled here, seldom made any use of these shells; but the Indians who formerly lived here, broiled them and eat the sless. Some

of the Europeans eat them fometimes.

Mar. 3d. The Swedes call a fpecies of little birds, fnofogel, and the English call it fnow-bird. This is Dr. Linnæus's emberiza hyemalis. The reason why it is called fnow-bird is because it never appears in summer, but only in winter, when the fields are covered with snow. In some winters they come in as great numbers as the maize-thieves, sly about the houses and barns, into the gardens, and eat the corn, and the feeds of grass, which they find scattered on the hills.

At eight o'clock at night we observed a meteor, commonly ealled a snow-

fire*.

Wild pigeons, (columba migratoria), flew in the woods in numbers beyond conception; and I was affured that they were more plentiful than they had been for feveral years past. They came this week, and continued here for about a fortnight, after which they all disappeared, or advanced further into the country, from whence they

came. I shall speak of them more particularly in another place.

Mar. 7th. Several people told me, that it was a certain fign of bad weather here when a thunder-storm arose in the south or south-west, if it spread to the east and afterwards to the north: but that on the contrary, when it did not spread at all, or when it spread both east and west, though it should rise in south or south-west, yet it would prognosticate fair weather. To-day it was heard in south-west, but it did not spread at all.

Till now the frost had continued in the ground, so that if any one had a mind to dig a hole, he was forced to cut it through with a pick-axe. However it had not penetrated

above four inches deep. But to-day it was quite gone out. This made the foil fo foft,

that on riding, even in the woods, the horse sunk in very deep.

I often enquired among the old Englishmen and Swedes, whether they had found that any trees were killed in very fevere winters, or had received much hurt. I was answered, that young hiccory-trees are commonly killed in very cold weather; and the young black oaks likewife fuffer in the fame manner. Nay, fometimes black oaks. five inches in diameter, were killed by the frost in a severe winter, and sometimes, though very feldom, a fingle mulberry-tree was killed. Peach-trees very frequently die in a cold winter, and often all the peach-trees in a whole diffrict are killed by a fevere frost. It has been found repeatedly, with regard to these trees, that they can stand the frost much better on hills than in vallies; infomuch, that when the trees in a valley were killed by frost, those on a hill were not hurt at all. They assured me that they had never observed that the black walnut-tree, the sassafras, and other trees, had been hurt in winter. In regard to a frost in spring, they had observed, at different times, that a cold night or two happened often after the trees were furnished with pretty large leaves, and that by this most of the leaves were killed. But the leaves thus killed have always been supplied by fresh ones. It is remarkable that in such cold nights the frost acts chiefly upon the more delicate trees, and in such a manner that all the leaves, to the height of feven, and even of ten feet from the ground, were killed by the frost, and all the top remained unhurt. Several old men assured me they had made this observation, and the attentive engineer, Mr. Lewis Evans, has shewn it me among his notes. Such a cold night happened here, in the year 1746, in the night between the 14th and 15th of June, new style, attended with the same effect, as appears from Mr. Evans's observations. The trees which were then in blossom had lost both their leaves and their flowers in these parts which were nearest the ground; some time after they got fresh leaves, but no new flowers. Further it is observable, that the cold nights which happen in spring and summer never do any hurt to high grounds, damaging only the low and moift ones. They are likewife very perceptible in fuch places where limestone is to be met with; and though all the other parts of the country be not visited by fuch cold nights in a fummer, yet those where limestone lies have commonly one or two every fummer. Frequently the places where the limestone lies are fituated on a high ground; but they fuffer notwithstanding their situation; whilst a little way off in a lower ground, where no limestone is to be found, the effects of the cold nights are not felt. Mr. Evans was the first who made this observation, and I have had occasion at different times to fee the truth of it on my travels, as I shall mention in the sequel. The young hiccory-trees have their leaves killed fooner than other trees in fuch a cold night, and the young oaks next; this has been observed by other people, and I have found it to be true in the years 1749 and 1750.

Mar. 11th. Of the genus of wood peckers, we find here all those which Catesby, in his first volume of the Natural History of Carolina, has drawn and described. I shall only enumerate them, and add one or two of their qualities; but their description

at large I defer for another occasion.

Picus principalis, the king of the wood-peckers, is found here, though very feldom, and only at a certain feafon.

Picus pileatus, the crefted wood-pecker. This I have already mentioned.

Picus auratus, the gold-winged wood-pecker. This fpecies is plentiful here, and the Swedes call it hittock, and piut; both these names have a relation to its note; it is almost continually on the ground, and is not observed to pick in the trees; it lives chiefly on insects, but sometimes becomes the prey of hawks; it is commonly very fat, and you. XIII.

its flesh is very palatable. As it stays all the year, and cannot easily get insects in winter, it must doubtless eat some kinds of grass or plants in the fields. Its form, and some of its qualities, make it resemble a cuckow.

· Picus Carolinus, the Carolina wood-pecker. It lives here likewife, and the colour of its head is of a deeper and more shining red than Catesby has represented

it, vol. i. p. 19. t. 19.

Picus villosus, the spotted, hairy, middle-sized wood-pecker is abundant here; it

destroys the apple-trees by pecking holes into them.

Picus erythrocephalus, the red-headed wood-pecker. This bird was frequent in the country, and the Swedes called it merely hackspick, or wood-pecker. They give the same name to all the birds which I now enumerate, the gold-winged wood-pecker excepted. This species is destructive to maize fields and orchards, for it pecks through the ears of maize, and eats apples. In some years they are very numerous, especially where sweet apples grow, which they eat so far that nothing but the mere peels remain. Some years ago there was a premium of twopence per head paid from the public funds, in order to extirpate this pernicious bird, but this law has been repealed. They are likewise very fond of acorns. At the approach of winter they travel to the southward. But when they stay in numbers in the woods, at the beginnining of winter, the people look upon it as a sign of a pretty mild winter.

Picus varius, the lesser, spotted, yellow-bellied wood-pecker. These birds are much more numerous than many people wished; for this, as well as the preceding and suc-

ceeding species, are very hurtful to apple-trees.

Picus pubefcens, or the least spotted wood-pecker. This species abounds here. Of all the wood-peckers it is the most dangerous to orchards, because it is the most daring. As soon as it has pecked a hole into the tree, it makes another close to the first, in a horizontal direction, proceeding till it has pecked a circle of holes round the tree. Therefore the apple-trees in the orchards here have several rings round their stems, which lie very close above each other, frequently only an inch distant from each other. Sometimes these wood-peckers peck the holes so close that the tree dries up. This bird, as Catesby remarks, is so like the lesser spotted wood-pecker, in regard to its colour and other qualities, that they would be taken for the same bird were not the former (the picus pubescens) a great deal less. They agree in the bad quality, which

they both poffels, of pecking holes into the apple-trees.

Rana ocellata are a kind of frogs here, which the Swedes call fill-hoppetoffer, i. e. herring-hoppers, and which now began to quack in the evening, and at night, in fwamps, pools, and ponds. The name which the Swedes give them is derived from their beginning to make their noise in spring, at the same time when the people here go catching what are called herrings, which however differ greatly from the true European herrings. These frogs have a peculiar note, which is not like that of our European frogs, but rather corresponds with the chirping of some large birds, and can nearly be expressed by picet. With this noise they continued throughout a great part of fpring, beginning their noise foon after fun-fetting, and finishing it just before fun-rifing. The found was sharp, but yet so loud that it could be heard at a great distance. When they expected rain they cried much worse than commonly, and began in the middle of the day, or when it grew cloudy, and the rain came usually fix hours after. As it fnowed on the 16th of the next month, and blew very violently all day, there was not the least fign of them at night; and during the whole time that it was cold, and whilft the fnow lay on the fields, the frost had so filenced them, that we could not hear one: but as foon as the mild weather returned, they began their noise again.

were

were very timorous, and it was difficult to catch them; for as foon as a perfon approached the place where they lived, they are quite filent, and none of them appeared. It feems that they hide themselves entirely under water, except the tip of the snout, when they cry. For when I stepped to the pond where they were in, I could not observe a single one hopping into the water. I could not see any of them before I had emptied a whole pool, where they lodged in. Their colour is a dirty green, variegated with spots of brown. When they are touched they make a noise and moan; they then sometimes assume a form as if they had blown up the hind part of the back, so that it makes a high elevation; and then they do not stir, though touched. When they are put alive into spirits of wine, they die within a minute.

Mar. 12th. The bird which the English and Swedes in this country call robin-redbreast, is found here all the year round. It is a very different bird from that which in England bears the same name. It is Linnæus's turdus migratorius. It sings very melodiously, is not very shy, but hops on the ground, quite close to the

houses.

The hazels (corylus avellana) were now opening their bloffoms. They fucceeded best in a rich mould, and the Swedes reckoned it a fign of a good foil where they found them growing.

Mar. 13th. The alder (betula alnus) was just blossoming.

The dracontium feetidum grew plentifully in the marshes, and began to flower. Among the stinking plants, this is the most feetid; its nauseous scent was so strong that I could hardly examine the flower; and when I smelled a little too long at it my head ached. The Swedes call it byorn-blad (bear's-leaf) or byorn-retter (bear's-root.) The English call it polecat-root, because its essuais are as nauseous and sectid as those of the polecat, which I have mentioned before. The flowers are purple-coloured; when they are in full flower the leaves begin to come out of the ground; in summer the cattle do not touch it. Dr. Colden told me, that he had employed the root in all cases where the root of the arum is made use of, especially against the scurvy, &c. The Swedish name it got, because the bears, when they leave their winter habitations, are fond of it in spring. It is a common plant in all North America.

The draba verna was abundant here, and now appeared in flower.

The veratrum album was very common in the marshes, and in low places, over all North America. The Swedes here call it dack, dackor, or dackretter, that is puppetroot, because the children make puppets of its stalks and leaves. The English call it itch-reed or ellebore. It is a poisonous plant, and therefore the cattle never touch it; however it fometimes happens that the cattle are deceived in the beginning of fpring, when the paltures are bare, and eat of the fine broad green leaves of this plant, which come up very early; but fuch a meal frequently proves fatal to them. Sheep and geefe have likewife often been killed with it. By means of its root the maize is preferved from the greedincss of voracious birds in the following manner: The roots are boiled in water, into which the maize is put as foon as the water is quite cool; the maize must lie all night in it, and is then planted as usual. When the maize-thieves, crows, or other birds, pick up or pluck out the grains of maize their heads grow delirious, and they fall, which fo frightens the rest, that they never venture on the field again: when those which have tasted the grains recover, they leave the field, and are no more tempted to vifit it again. By thus preparing maize one must be very careful that no other creatures touch it; for when ducks or fowls eat a grain or two of the maize which is thus fleeped they become very fick; but if they fwallow a confiderable quantity they die. When the root is thrown away raw no animal cats it;

bu

but when it is put out boiled, its fweet tafte tempts the beafts to eat it. Dogs have been feen to eat a little of it, and have been very fick after it; however they have recovered after a vomit, for when animals cannot free themselves of it by this means, they often die. Some people boil the root, and wash the scorbutic parts with the water or decoction. This is said to cause some pain, and even a plentiful discharge of urine, but it re-establishes the patient. When the children here are plagued with vermin, the women boil this root, put the comb into the decoction, and comb the head with it, and

this kills them most effectually.

Mar. 17th. At the first arrival of the Swedes in this country, and long after that time, it was filled with Indians. But as the Europeans proceeded to cultivate the land, the Indians fold their land, and went further into the country. But in reality few of the Indians really left the country in this manner; most of them ended their days before, either by wars among themselves, or by the small pox, a disease which the Indians were unacquainted with before their commerce with the Europeans, and which fince that time has killed incredible numbers of them. For though they can heal wounds and other external hurts, yet they know not how to proceed with fevers, or in general with internal difeases. One can imagine how ill they would succeed with the cure of the fmall-pox, when, as foon as the pultules appeared, they leaped, naked, into the cold water of the rivers, lakes, or fountains, and either dived over head into it, or poured it over their body in great abundance, in order to cool the heat of the fever. In the fame manner they carry their children, when they have the small-pox, into the water and duck them *. But brandy has killed most of the Indians. This liquor was likewife entirely unknown to them before the Europeans came hither; but after they had tasted it they could never get enough of it. A man can hardly have a greater desire of a thing than the Indians have of brandy. I have heard them say, that to die by drinking brandy was a defirable and an honorable death; and indeed it is no very uncommon thing to kill themselves by drinking this liquor to excefs.

The food of these Indians was very different from that of the inhabitants of the other parts of the world. Wheat, rye, barley, oats, and rice-groats, were quite unknown in America. In the same manner it is with regard to the fruits and herbs which are caten in the old countries. The maize, some kinds of beans, and melons, made almost the whole of the Indian agriculture and gardening; and dogs were the only domestic animals in North America. But as their agriculture and their gardening were very trisling, and they could hardly live two months in a year upon their produce, they were forced to apply to hunting and fishing, which at that time, and even at present, are their chief subsistence, and to seek some of the wild plants and trees here. Some of the

[•] Professor Kalm wrote this when the truly laudable method of treating the small-pox with a cold regimen was not yet adopted; and he thought therefore the way in which the Americans treated this disease was the cause of its being so deleterious. But when the Kalmucks, in the Russian dominions, get the small-pox, it has been observed that very sew escape. Of this I believe no other reason can be alledged than that the small-pox is always dangerous, either when the open pores of the human skin are too numerous, which is caused by opening them in a warm-water bath, or when they are too much closed, which is the case with all the nations that are dirty and greasy. All the American Indians rub their body with oils, the Kalmucks never wash themselves, and rub their bodies and their fur coats with grease; the Hottentots are. I believe, known to be patterns of silthiness, their bodies being richly anointed with their ornamental greasy sheep guts; this shuts up all the pores, hinders perspiration entirely, and makes the small-pox always lethal among these nations; to which we may yet add the too frequent use of spirituous instammatory liquors, fince their acquaintance with the Europeans. F.

old Swedes were yet alive, who in their younger years had an intercourse with the Indians, and had seen the minutiæ of their oconomy. I was therefore desirous of knowing which of the spontaneous herbs they made use of for food at that time; and all the old men agreed that the following plants were what they chiefly consumed.

Hopnifs or hapnifs was the Indian name of a wild plant which they are at that time. The Swedes still call it by that name, and it grows in the meadows in a good soil. The roots resemble potatoes, and were boiled by the Indians, who cat them instead of bread. Some of the Swedes at that time likewise ate this root for want of bread. Some of the English still eat them instead of potatoes. Mr. Bartram told me, that the Indians who live farther in the country do dot only eat these roots, which are equal in goodness to potatoes, but likewise take the pease which lie in the pods of this plant, and prepare them like common pease. Dr. Linnæus calls the plant

glycine apios.

Katnifs is another Indian name of a plant, the root of which they were likewife accustomed to eat, when they lived here. The Swedes still preserve this name. It grows in low, muddy, and very wet ground. The root is oblong, commonly an inch and an half long, and one inch and a quarter broad in the middle; but some of the roots have been as big as a man's fifts. The Indians either boiled this root or roafted it in hot aftes. Some of the Swedes likewife eat them with much appetite, at the time when the Indians were fo near the coast; but at present none of them make any use of the roots. A man of ninety-one years of age, called Nils Gustafson, told me, that he had often eaten these roots when he was a boy, and that he liked them very well at that time. He added, that the Indians, especially their women, travelled to the islands, dug out the roots, and brought them home; and whilst they had them, they defired no other food. They faid that the hogs, which are amazingly greedy of them, have made them very fcarce. The cattle are very fond of its leaves. I afterwards got fome of these roots roasted, and in my opinion they tasted well, though they were rather dry: the taste was nearly the same with that of the potatoes. When the Indians come down to the coast and fee the turnips of the Europeans, they likewise give them the name of katnifs. Their katnifs is in an arrow-head or fagittaria, and is only a variety of the Swedish arrow-head or fagittaria fagittifolia, for the plant above the ground is entirely the fame, but the root under ground is much greater in the American than in the European. Mr. Ofbeck in his voyage to China, mentions that the Chinese plant a fagittaria, and eat its roots. This feems undoubtedly to be a variety of this kitnass. Further in the north of this part of America, I met with the other species of fagittaria which we have in Sweden.

Taw-ho and taw-him was the Indian name of another plant, the root of which they eat. Some of them likewife call it tuckah; but most of the Swedes still knew it by the name of taw-ho. It grows in moist ground and swamps. Hogs are very greedy of the roots, and grow very sat by feeding on them. Therefore, they often visit the places where these roots grow; and they are frequently seen rooting up the mud, and falling with their whole body into the water, so that only a little of the back part was out of the water. It is therefore very plain that these roots must have been extirpated in places which are frequented by hogs. The roots often grow to the thickness of a man's thigh. When they are fresh they have a pungent taste, and are reckoned a poison in that fresh state. Nor did the Indians ever venture to eat them raw, but prepared them in the following manner: They gathered a great heap of these roots, dug

a great

a great long hole, fometimes two or three fathoms and upwards in length, into which they put the roots, and covered them with the earth that had been taken out of the hole; they made a great fire above it, which burnt till they thought proper to remove it; and then they dug up the roots, and confumed them with great avidity. These roots, when prepared in this manner, I am told, tafte like potatoes. The Indians never dry and preferve them; but always take them fresh out of the marshes, when they want them. This taw-ho is the arum Virginicum, or Virginian wake-robin. is remarkable, that the arums, with the plants next akin to them, are eaten by men in different parts of the world, though their roots, when raw, have a fiery pungent tafte, and are almost poisonous in that state. How can men have learnt that plants fo extremely opposite to our nature were eatable; and that their poison, which burns on the tongue, can be conquered by fire? Thus the root of the cala paluftris, which grows in the north of Europe, is sometimes used instead of bread on an exigency. The North American Indians confume this species of arum. Those of South America, and of the West Indies, eat other species of arums. The Hottentots, at the Cape of Good Hope, in Africa, prepare bread from a species of arum or wake-robin, which is as burning and poisonous as the other species of this plant. In the same manner, they employ the roots of some kinds of arum as a food, in Egypt and Asia. Probably, that fevere but fometimes ufeful mistress, necessity, has first taught men to find out a food which the first taste would have rejected as useless. This taw-ho seems to be the fame with what the Indians in Carolina call tuckahoo.

Taw-kee is another plant, fo called by the Indians, who eat it. Some of them call it taw-kim, and others tackvim. The Swedes call it always by the name of taw-kee. The plant grows in marshes, near moist and low grounds, and is very plentiful in North America. The cattle, hogs, and stags, are very fond of the leaves in spring; for they are some of the carliest. The leaves are broad, like those of the convallaria, or lilly of the valley, green on the upper side, and covered with very minute hair, so that they looked like a sine velvet. The Indians pluck the feeds, and keep them for cating. They cannot be eaten fresh or raw, but must be dried. The Indians were forced to boil them repeatedly in water, before they were sit for use; and then they ate them like pease. When the Swedes gave them butter or milk, they boiled or broiled the feeds in it. Sometimes they employ these feeds instead of bread; and they taste like pease. Some of the Swedes likewise ate them, and the old men among them told me, they liked this food better than any of the other plants which the Indians

formerly made use of. This taw-kee was the orontium aquaticum.

Bilberries were likewise a very common dish among the Indians. They are called huckle-berries by the English here, and belong to several species of vaccinium, which are all of them different from our Swedish bilberry-bush, though their berries, in regard to colour, shape, and taste, are so similar to the Swedish bilberry that they are dislingushed from each other with difficulty. The American ones grow on shrubs, which are from two to four seet high; and there are some species which are above seven feet in height. The Indians formerly plucked them in abundance every year, dried them either in the sun-shine or by the sire-side, and afterwards prepared them for eating in different manners. These huckle-berries are still a dainty dish among the Indians. On my travels through the country of the Iroquese, they offered me, whenever they designed to treat me well, fresh maize-bread, baked in an oblong shape, mixed with dried huckle-berries, which lay as close in it as the raisins in a plumb-pudding, of which more in the sequel. The Europeans are likewise used to collect a

quantity of these berries, to dry them in ovens, to bake them in tarts, and to employ them in several other ways. Some preserve them with treacle. They are likewise eaten raw, either quite alone or with fresh milk.

I shall, on the 27th of March, find occasion to mention another dish, which the

Indians ate formerly, and still eat, on formal ceremonies.

Mar. 18th. Almost during the whole of this spring, the weather and the winds were always calm in the morning at sun rising. At eight o'clock the wind began to blow pretty hard, and continued so all day, till sun-setting; when it ceased, and all the night was calm. This was the regular course of the weather; but sometimes the winds raged without intermission for two or three days together. At noon it was commonly most violent. But in the ordinary way the wind decreased and increased as follows: At six in the morning, a calm; at seven, a very gentle western breeze, which grew stronger at eight; at eleven it was much stronger; but at four in the afternoon, it is no stronger than it was at eight o'clock in the morning; and thus it goes on decreasing till it is quite a calm, just before sun-set. The winds this spring blew generally west, as appears from the observations at the end of this work.

I was told, that it was a very certain prognostic of bad weather, that when you see clouds in the horizon in the fouth-west, about fun-setting, and when those clouds fink below the horizon, in an hour's time, it will rain the next day, though all the forenoon be fair and clear. But if some clouds be seen in the south-west, in the horizon at sun-set, and they rise some time after, you may expect fair weather the

next day.

Mar. 20th. An old Swede prognosticated a change in the weather, because it was calm to-day; for when there has been wind for some days together, and a calm follows, they say, rain or snow, or some other change in the weather will happen. I was likewise told, that some people here were of that salse opinion, that the weather commonly alters on Friday; so that, in case it had rained or blown hard all the week, and a change was to happen, it would commonly sall on Friday. How far the former prognostic has been true, appears from my own observations of the weather, to which I refer.

Mar. 21st. The red maple (acer rubrum) and the American elm (ulmus Americana) began to flower at present; and some of the latter kind were already in full blossom.

Mar. 24th. I walked pretty far to-day, in order to fee whether I could find any plants in flower. But the cloudy weather, and the great rains which had lately fallen, had allowed little or nothing to grow up. The leaves now began to grow pretty green. The plants which I have just before mentioned were now in full blossom.

The noble liverwort, or anemone hepatica, was now everywhere in flower. It was abundant; and the Swedes call it blablomster, or blue-flower. They did not

know any use of it.

Near all the corn fields on which I walked to-day, I did not fee a fingle ditch, though many of them wanted it. But the people generally followed the English way of making no ditches along the fields, without confidering whether the corn-fields wanted them or not. The confequence was, that the late rain had in many places washed away great pieces of the grounds, fown with wheat and rye. There were no ridges left between the fields, except a very narrow one near the fence, which was entirely overgrown with the fumach, or rhus glabra, and with black-berry bushes, fo

that there the cattle could find very little or no food. The corn-fields were broad-caft, or divided into pieces, which were near feventeen feet broad, and feparated from each other only by means of furrows. These pieces were uniform, and not elevated in the middle.

Meloe majalis, a species of oil-beetle, crept about on the hills.

Papilio antiopa, or willow butterfly, flew in the woods to-day, and was the first

butterfly which I faw this year.

Papilio euphrofyne, or the April butterfly, was one of the fcarce species. -The other American infects, which I described this day and the following days, I shall mention on some other occasion. In the sequel I shall only mention those which were re-

markable for fome peculiar qualities.

The hay-stacks were commonly made here after the the Swedish manner, that is, in the shape of a thick and short cone, without any cover over it. When the people wanted any hay, they cut some of it loose, by a peculiar fort of a knife. However, many people, especially in the environs of Philadelphia, had hay-stacks with roofs which could be moved up and down. Near the surface of the ground were some poles laid, on which the hay was put, that the air may pass freely through it. I have mentioned before, that the cattle have no stables in winter or summer, but must go in the open air, during the whole year. However, in Philadelphia, and in a few other places, I have seen that those people who made use of the latter kind of hay-stacks, viz. that with moveable roofs, commonly had built them so that the hay was put a fathom or two above the ground, on a floor of boards, under which the cattle could stand in winter, when the weather was very bad. Under this sloor of boards were partitions of boards on all the sides, which

however stood far enough from each other to afford the air a free passage.

Mar. 27th. In the morning I went in order to fpeak with the old Swede, Nils Guftalson, who was ninety-one years of age. I intended to get an account of the former ftate of New Sweden. The country which I now paffed through was the fame with that which I had found in those parts of North America I had hitherto seen. It was diversified with a variety of little hills and vallies: the former confifted of a very pale brickcoloured earth, composed, for the greatest part, of a fine fand mixed with some mould. I faw no mountains, and no stones, except some little stones, not above the size of a pigeon's or hen's egg, lying on the hills, and commonly confifting of white quartz, which was generally finooth and polifhed on the outfide. At the bottom, along the vallies, ran fometimes rivulets of chrystalline water, the bottom of which was covered with fuch white pebbles as I have just described. Now and then I met with a swamp in the vallies. Sometimes there appeared, though at confiderable distances from each other, fome farms frequently furrounded on all fides by corn-fields. Almost on every cornfield there yet remained the stumps of trees, which had been cut down; a proof that this country has not been long cultivated, being overgrown with trees forty or fifty years ago. The farms did not lie together in villages, or fo that feveral of them were near each other, in one place; but they were all feparated from one another. Each countryman lived by himself, had his own ground about his house, separated from the property of his neighbour. The greatest part of the land, between these farms so distant from each other, was overgrown with woods, confilting of tall trees. Here and there appeared fome fallen trees, thrown down by the wind; fome were torn up by the roots; others broken quite acrofs the stem. In some parts of the country the trees were thick and tall, but in others I found large tracts covered with young trees, only twenty, thirty, or forty years old: thefe tracts, I am told, the Indians formerly had their little plantations in. I did not yet fee any marks of the leaves coming out, and I did

I did not meet with a flower in the woods; for the cold winds, which had blown for feveral days together fuccessively, had hindered this. The woods confisted chiefly of feveral species of oak, and of hiccory. The swamps were filled with red maple, which

was all now in flower, and made these places look quite red at a distance.

The old Swede, whom I came to vifit, feemed to be still pretty hearty and fresh, and could walk by the help of a stick; but he complained of having felt, in these latter years, some pains in his back and limbs, that he could keep his feet warm in winter only by sitting near the fire. He said he could very well remember the state of this country, at the time when the Dutch possessed it, and in what circumstances it was in before the arrival of the English. He added, that he had brought a great deal of timber to Philadelphia, at the time that it was built. He still remembered to have seen a great forest on the spot where Philadelphia now stands. The father of this old man had been one of the Swedes who were sent over from Sweden, in order to cultivate and inhabit this country. He returned me the following answers to the questions I asked him.

Ouere, Whence did the Swedes, who first came hither, get their cattle? The old man answered, that when he was a boy, his father and other people had told him, that the Swedes brought their horfes, cows, and oxen, sheep, hogs, geefe, and ducks, over with them. There were but few of a kind at first, but they multiplied greatly here afterwards. He said, that Maryland, New York, New England, and Virginia, had been fooner inhabited by Europeans than this part of the country; but he did not know whether the Swedes ever got cattle of any kind from any of these provinces, except from New York. Whilft he was yet very young, the Swedes, as well as he could remember, had already a fufficient flock of all these animals. The hogs had propagated fo much at that time, there being fo great a plenty of food for them, that they ran about wild in the woods, and that the people were obliged to shoot them, when they intended to make use of them. The old man likewise recollected, that horses ran wild in the woods, in some places; but he could not tell whether any other kind of cattle turned wild. He thought that the cattle grow as big at prefent as they did when he was a boy, supposing they get as much food as they want; for in his younger years, food for all kinds of cattle was fo plentiful, and even fo superfluous, that the cattle were extremely well fed by it. A cow at that time gave more milk than three or four do at present; but she got more and better food at that time, than three or four get now.

Quere, Whence did the English in Pensylvania and New Jersey get their cattle? They bought them chiefly from the Swedes and Dutch, who lived here; and a small number were brought over from Old England. The form of the cattle, and the

unanimous accounts of the English here, confirmed what the old man had faid.

YOL. XIII.

Quere, Whence did the Swedes here fettled get their feveral forts of corn, and likewife their fruit-trees and kitchen-herbs? The old man told me that he had frequently heard, when he was young, that the Swedes had brought all kinds of corn, and fruits, and herbs, or feeds of them, with them. For, as far as he could recollect, the Swedes here were plentifully provided with wheat, ryc, barley, and oats. The Swedes, at that time, brewed all their beer of malt made of barley, and likewife made good strong beer. They had already got distilling vessels, and made good brandy. Every one among them had not a distilling vessel, but when they intended to distil, they lent their apparatus to one another. At first they were forced to buy maize of the Indians, both for sowing and eating. But after continuing for some years in this country, they extended their maize plantations so much that the Indians were obliged, some time after, to buy maize of the Swedes. The old man likewise assured me, that the Indians formerly, and about the time of the first settling of the Swedes, were more industrious and laborious

3 Z

in every branch of business than they are now. Whilst he was young, the Swedes had a great quantity of very good white cabbage. Winter cabbage, or cale, which was left on the ground during winter, was likewife abundant. They were likewife well provided with turnips: in winter they kept them in holes under ground; but the old man did not like that method; for when they had lain too long in these holes, in winter they became fpungy. He preferred that method of keeping them which is now commonly adopted, and which confifts in the following particulars. After the turnips have been taken out of the ground in autumn, and exposed to the air for a while, they are put in a heap upon the field, covered with straw at the top, and on the sides, and with earth over the straw. By this means they stand the winter very well here, and do not become fpungy. The Indians are very fond of turnips, and called them fometimes hopnifs, fometimes katnifs. The Swedes likewife cultivated carrots, in the old man's younger years. Among the fruit-trees were apple-trees: they were not numerous, and only fome of the Swedes had little orchards of them, whilst others had not a fingle tree. None of the Swedes made cyder, for it is come into use but lately. The Swedes brewed strong beer and small beer, and it was their common liquor; but at present there are very few who brew beer, for they commonly prepare cyder. Cherrytrees were abundant when Nils Gustafson was yet a boy. Peach-trees were at that time more numerous than at present, and the Swedes brewed beer of the fruit. The old man could not tell from whence the Swedes first of all got the peach-trees.

During the younger years of this old man, the Indians were every where fpread in the country; they lived among the Swedes, and were fcattered every where. The old man mentioned Swedes who had been killed by the Indians; and he mentioned two of his countrymen who had been fcalped by them. They stole children from the Swedes, and carried them off, and they were never heard of again. Once they came and killed some Swedes, and took the upper part of their sculls with them; on that occasion they scalped a little girl, and would have killed her, if they had not perceived a boat full of Swedes, making towards them, which obliged them to fly; the girl was afterwards healed, but never got any hair on her head again: she was married, had many children, and lived to a considerable age. At another time the Indians attempted to kill the mother of this old man, but she vigorously resisted them, and in the mean while a number of Swedes came up, who frightened the Indians, and made them run away. Nobody could ever find out to what nation of Indians these owe their origin; for in

general they lived very peaceably with the Swedes.

The Indians had their little plantations of maize in many places; before the Swedes came into this country, the Indians had no other than their hatchets made of stone. In order to make maize plantations they cut out the trees, and prepared the ground in the mainer I have before mentioned. They planted but little maize, for they lived chiefly upon hunting; and throughout the greatest part of summer, their hopnis, or the roots of the glycine apios, their katnis, or the roots of the fagittaria fagittisolia, their tawho or the roots of the arum virginicum, their taw-kee or orontium aquaticum, and whortle-berries, were their chief food. They had no horses or other cattle which could be subservient to them in their agriculture, and therefore did all the work with their own hands. After they had reaped the maize, they kept it in holes under ground, during winter; they dug these holes seldom deeper than a fathom, and often not so deep; at the bottom and on the sides they put broad pieces of bark. The andropogon bicorne, a grass which grows in great plenty here, and which the English call Indian grass, and the Swedes wilskt grass *, supplies the want of bark; the ears of maize are then thrown into the hole, and covered to a considerable thickness with the same grass, and the

whole is again covered by a fufficient quantity of earth: the maize kept extremely well in those holes, and each Indian had several such subterraneous stores, where his corn lay fafe, though he travelled far from it. After the Swedes had fettled here, and planted apple-trees and peach-trees, the Indians, and especially their women, sometimes stole the fruit in great quantity; but when the Swedes caught them, they gave them a fevere drubbing, took the fruit from them, and often their clothes too. In the fame manner it happened fometimes, that as the Swedes had a great increase of hogs, and they ran about in the woods, the Indians killed some of them privately and feasted upon them; but there were likewise some Indians who bought hogs of the Swedes and fed them; they taught them to run after them like dogs, and whenever they removed from one place to another, their hogs always followed them. Some of those Indians got fuch numbers of these animals, that they afterwards gave them to the Swedes for a mere trifle. When the Swedes arrived in America the Indians had no domestic animals, except a fpecies of little dogs. The Indians were extremely fond of milk, and ate it with pleasure when the Swedes gave it them. They likewise prepared a kind of liquor like milk in the following manner: they gathered a great number of hiccory nuts, and walnuts from the black walnut-trees, dried and crushed them; then they took out the kernels, pounded them fo fine as flour, and mixed this flour with water, which took a milky hue from them, and was as fweet as milk. They had tobaccopipes of clay, manufactured by themselves, at the time that the Swedes arrived here; they did not always smoke true tobacco, but made use of another plant instead of it, which was unknown to the old Swedes, but of which he affured me that it was not the common mullein, or verbafcum thapfus, which is generally called Indian tobacco

As to their religion, the old man thought it very trifling, and even believed that they had none at all; when they heard loud claps of thunder, they faid that the evil spirit was angry; some of them said that they believed in a God, who lives in heaven. The old Swede once walked with an Indian, and they met with a red-spotted snake on the road: the old man therefore went to feek a flick in order to kill the fnake; but the Indian begged he would not touch it, because he adored it: perhaps the Swede would not have killed it, but on hearing that it was the Indian's deity, he took a stick and killed it, in the presence of the Indian, faying: because thou believest in it, I think myself obliged to kill it. Sometimes the Indians came into the Swedish churches, looked at them, heard them, and went away again, after a while. One day as this old Swede was at church, and did not fing, because he had no psalm-book by him, one of the Indians, who was well acquainted with him, tapped him on the shoulder, and faid: Why dost thou not sing with the others, Tantanta! Tantanta! Tantanta? On another occasion, as a sermon was preached in the Swedish church at Raccoon, an Indian came in, looked about him, and, after hearkening a while to the preacher, he faid: Here is a great deal of prattle and nonfense, but neither brandy nor cyder; and went out again. For it is to be observed, that when an Indian makes a speech to his companions, in order to encourage them to war, or to any thing elfe, they all drink immoderately on those occasions.

At the time when the Swedes arrived, they bought land at a very inconfiderable price. For a piece of baize, or a pot full of brandy, or the like, they could get a piece of ground, which at present would be worth more than four hundred pounds, Pensylvania currency. When they fold a piece of land, they commonly figned an agreement; and though they could neither read nor write, yet they scribbled their marks, or fignatures, at the bottom of it. The father of old Nils Gustasson bought a

piece of ground from the Indians in New Jersey. As soon as the agreement was drawn up, and the Indians should sign it, one of them, whose name signified a beaver, drew a beaver; another of them drew a bow and arrow; and a third a mountain, instead of their names. Their canoes they made of thick trees, which they hollowed out by fire, and made them smooth again with their hatchets, as has been before mentioned.

The following account the old man gave me, in answer to my questions with regard to the weather and its changes: it was his opinion, that the weather had always been pretty uniform ever fince his childhood: that there happen as great florms at present as formerly: that the fummers now are fometimes hotter, fometimes colder, than they were at that time; that the winters were often as cold and as long as formerly; and that still there often falls as great a quantity of snow as in former times. However, he thought that no cold winter came up to that which happened in the year 1697; and which is often mentioned in the almanacks of this country; and I have mentioned it in the beginning of this volume. For in that winter the river Delaware was fo strongly covered with ice, that the old man brought many waggons full of hay over it, near Christina; and that it was passable in sledges even lower. No cattle, as far as he could recollect, were starved to death in cold winters; except, in later years, such cattle as were lean, and had no stables to retire into. It commonly does not rain, neither more nor less, in summer than it did formerly; excepting that, during the last years, the fummers have been more dry. Nor could the old Swede find a diminution of water in brooks, rivers, and fwamps. He allowed, as a very common and certain fact, that wherever you dig wells you meet with oyster-shells in the ground.

The old Gustasson was of opinion that intermitting fevers were as frequent and violent formerly as they are now; but that they seemed more uncommon, because there were fewer people at that time here. When he got this sever he was not yet full grown. He got it in summer, and had it till the ensuing spring, which is almost a year; but it did not hinder him from doing his work, either within or out of doors. Pleurify likewise attacked one or two of the Swedes formerly; but it was not near so common

as it is now. The people in general were very healthy at that time.

Some years ago, the old Swede's eyes were fo much weakened, that he was forced to make use of a pair of spectacles. He then got a fever; which was so violent that it was feared he would not recover. However, he became quite well again, and at the same time got new strength in his eyes, so that he has been able to read without spectacles since that time.

The houses which the Swedes built when they first settled here, were very bad. The whole house confisted of one little room, the door of which was so low, that one was obliged to stoop in order to get in. As they had brought no glass with them, they were obliged to be content with little holes, before which a moveable board was fastened. They found no moss, or at least none which could have been serviceable in stopping up holes or cracks in the walls. They were therefore forced to close them, both without and within, with clay. The chimneys were made in a corner, either of grey sand, a stone, or (in places where no stone was to be got) of mere clay, which they laid very thick in one corner of the house. The ovens for baking were likewise in the rooms.

Before the English came to settle here, the Swedes could not get as many cloaths as they wanted, and were therefore obliged to make shift as well as they could. The men wore waistcoats and breeches of skins. Hats were not in fashion; and they made little caps, provided with slaps before. They had worsted stockings. Their shoes were of their own making. Some of them had learnt to prepare leather, and to make com-

mon shoes, with heels; but those who were not shocmakers by profession, took the length of their feet, and sewed the leather together accordingly; taking a piece for the sole, one for the hind-quarters, and one more for the upper-leather. At that time they likewise sowed flax here, and wove linen cloth. Hemp was not to be got; and they made use of slaxen ropes and sishing tackle. The women were dressed in jackets and petticoats of skins. Their beds, excepting the sheets, were skins of several animals; such as bears, wolves, &c.

Tea, coffee, and chocolate, which are at prefent univerfally in use here, were then * wholly unknown. Bread and butter, and other substantial food, was what they breakfasted upon; and the above-mentioned superfluities have only been lately introduced, according to the account of the old Swede. Sugar and treacle they had in abundance, as far as he could remember; and rum formerly bore a more moderate

price.

From the accounts of this old Swede I concluded, that before the English settled here they followed wholly the customs of Old Sweden; but after the English had been in the country for fome time, the Swedes began gradually to follow their customs. When this Swede was but a boy there were two Swedish smiths here, who made hatchets, knives, and feythes, exactly like the Swedish ones, and made them sharper than they can be got now. The hatchets now in use are in the English way, with a broad edge; and their handles are very narrow. Almost all the Swedes made use of baths; and they commonly bathed every Saturday. They celebrated Christinas with several forts of games, and with feveral peculiar diffies, as is usual in Sweden; all which is now, for the greatest part, left off. In the younger years of this Swede they made a peculiar kind of carts here. They fawed thick pieces of liquidamber trees, and made use of two of them for the foremost wheels, and of two more for the hindmost. With those carts they brought home their wood. Their sledges were at that time made almost in the fame manner as they are now, or about as broad again as the true Swedish ones. Timber and great beams of wood were carried upon a dray. They baked great loaves, fuch as they do now. They had never any bifcuit, though the clergymen, who came from Sweden, commonly got fome baked.

The English on their arrival here bought large tracts of land of the Swedes, at a very inconsiderable price. The father of the old Swede sold an estate to the English, which at this time would be reckoned worth three hundred pounds, for which he got

a cow, a fow, and a hundred gourds.

With regard to the decrease of birds, the number of them and fish, he was wholly of that opinion which I have already mentioned. This was the account which the old man gave me of the former state of the Swedes in this country. I shall speak more

particularly of it in the fequel.

Hurricanes are fometimes very violent here, and often tear up great trees. They fometimes proceed as it were in peculiar tracts, or lines. In fome places, especially in the hurricane's tract, all the trees are struck down, and it looks as if the woods were cut down designedly; but close to the tract the trees receive no hurt. Such is the place which was shewn to me to-day. It is dangerous to go into the woods where the hurricanes blow; for no one can guard sufficiently against the sudden fall of trees.

The Penfylvania asp was now in full blossom. But neither this tree, nor those near

a-kin to it, shewed their leaves.

An old countryman afferted, that he commonly fowed a bushel of rye on an acre of ground, and got twenty bushels in return; but from a bushel of barley he got thirty bushels. However, in that case the ground must be well prepared. Wheat returns about as much as rye. The soil was a clay mixed with sand and mould.

In the evening I returned*.

March 28th. I found a black beetle † (fcarabæus) with a pentagonal oval clypeus or shield, on the head a short blunt horn, and a gibbous or hump-backed thorax, or corfelet. This beetle is one of the bigger fort here. I found here and there holes on the hills, which were so wide that I could put my singer into them. On digging them up I always found these beetles lying at the bottom, about sive inches under ground. Sometimes there were short whitish worms, about as thick as one's singer, which lay with the beetles; and perhaps they were related to them. There were likewise other insects in such holes, as a black cricket (gryllus campestris), spiders, earth-beetles (carabi), and others. This beetle had a scent exactly like the trisolium melilotus cærulea, or the blue melilot. It was entirely covered with oblong pale ticks (acari). Its feet were as strong as those of the common dung chaffer (scarabæus stercorarius).

April 4th. A cicindela, or shining beetle, with a gold-green head, thorax, and feet, and a blue-green abdomen or belly, slew every where about the fields, and was hunting other infects. It is very common in North America, and seems to be a mere

variety of the cicindela campestris.

Cimex lacustris, a kind of water-bugs, hopped in numbers on the surface of waters which had a flow course.

Dytifcus piceus, or, the great water-beetle, swam sometimes in the water.

About fixty years ago, the greatest part of this country was covered with tall and thick trees, and the swamps were full of water. But it has undergone so great a change, as sew other places have undergone in so short a time. At present the forests are cut down in most places, the swamps drained by ditches, the country cultivated, and changed into corn-fields, meadows, and pastures. Therefore, it seems very reasonable to suppose, that so sudden a change has likewise had some effect upon the weather. I was therefore desirous of hearing from the old Swedes, who have lived the longest in this country, and have been inhabitants of this place during the whole time of the change mentioned, whether the present state of the weather was in some particulars remarkably different from that which they selt in their younger years? The following is an account which they all unanimously gave me in answer to this question.

The winter came fooner formerly than it does now. Mr. Isaac Norris, a wealthy merchant, who has a confiderable share in the government of Pensylvania, confirmed this by a particular account. His father, one of the first English merchants in this country, observed, that in his younger years the river Delaware was commonly covered with ice, about the middle of November, old style, fo that the merchants were obliged to bring down their ships in great haste before that time, for fear of their being obliged to lie all winter. On the contrary, this river seldom freezes over at present,

before the middle of December, old style.

* From Nils Gustafson, the old Swede.

[†] The beetle here described seems to be the scarabæus Carolinus, Linn. Syst. Nat. p. 545, and of Drury Istustrations of Nat. Hist. tab. 35. s. 2. It is common in New York, New Jersey, Pensylvania, Maryland, and Carolina. F.

It snowed much more in winter, formerly, than it does now; but the weather in general was likewise more constant and uniform; and when the cold set in, it continued to the end of February, or till March, old style, when it commonly began to grow warm. At present, it is warm, even the very next day after a severe cold; and some-

times the weather changes feveral times a day.

Most of the old people here were of opinion, that spring came much later at present, than formerly, and that it was now much colder in the latter end of February, and the whole month of May, than when they were young. Formerly the fields were as green, and the air as warm, towards the end of February, as it is now in March, or in the beginning of April, old style. The Swedes at that time made use of this phrase: pask bitida, pask sent, altid gras, that is, we have always grass at Easter, whether it be soon or late in the year. But perhaps we can account as follows, for the opinion which the people here have, that vegetation appeared formerly more forward than it does now. Formerly the cattle were not so numerous as now; however, the woods were full of grass and herbs, which, according to the testimony of all the old people here, grew to the height of a man. At present a great part of the annual grasses and plants have been entirely extirpated by the continual grazing of numbers of cattle. These annual grasses were probably green very early in spring, and (being extirpated) might lead the people to believe, that every thing came on sooner formerly than it does at present.

It used to rain more abundantly than it does now; during the harvest especially, the rains fell in such plenty, that it was very difficult to bring home the hay and corn. Some of the last years had been extremely dry. However, a few people were of

opinion that it rained as plentifully at prefent, as formerly.

All the people agreed, that the weather was not by far fo inconftant, when they were young, as it is now. For at prefent it happens at all times of the year, that when a day has been warm, the next is very cold, and vice verfa. It frequently happens that the weather alters feveral times in one day; fo that when it has been a pretty warm morning, the wind blows from north west about ten o'clock, and brings a cold air with it; yet a little after noon it may be warm again. My meteorological obfervations sufficiently confirm the reality of these sudden changes of weather, which are said to cause, in a great measure, the people to be more unhealthy at present, than they were formerly.

I likewise found every body agree in afferting, that the winter, betwixt the autumn of the year 1697, and the spring of the year 1698, was the coldest and the severest

which they had ever felt.

April 6th. Sanguinaria Canadensis, which is here called blood-root, because the root is great and red, and, when cut, looks like the root of red beet, and the epigæa repens, which some call the creeping ground-laurel, were both beginning to flower. The former grew in a rich mould, the other in a poorer soil.

The Laurus æstivalis, which some people call spice-wood, likewise began to blosfom about this time; its leaves were not yet broke out; it liked a moist soil in

the woods.

April 9th. Apocynum Cannabinum was by the Swedes called hemp of the Indians*; and grew plentifully in old corn-grounds, in woods, on hills, and in high glades. The Swedes have given it the name of Indian hemp, because the Indians formerly, and even now, apply it to the same purposes as the Europeans do hemp; for the stalk may

be divided into filaments, and is eafily prepared. When the Indians were yet fettled among the Swedes, in Penfylvania and New Jersey, they made ropes of this apocynum, which the Swedes bought, and employed them as bridles, and for nets. These ropes were stronger, and kept longer in water, than such as were made of common hemp. The Swedes commonly got fourteen yards of these ropes for one piece of bread. Many of the Europeans still buy such ropes, because they last so well. The Indians likewise make several other stuffs of their hemp. On my journey through the country of the Iroquese, I saw the women employed in manufacturing this hemp. They made use neither of spinning-wheels nor distass, but rolled the filaments upon their bare thighs, and made thread and strings of them, which they dyed red, yellow, black, &c. and afterwards worked them into stuffs, with a great deal of ingenuity. The plant is perennial, which renders the annual planting of it altogether unnecessary. Out of the root and stalk of this plant, when it is fresh, comes a white milky juice, which is somewhat poisonous. Sometimes the fishing tackle of the Indians consists entirely of this hemp. The Europeans make no use of it, that I know of.

Flax and cat-tail, were names given to a plant which grows in bays, rivers, and in deep whirlpools, and which is known to botanifts by the name of Typha latifolia. Its leaves are here twifted together, and formed into great oblong rings, which are put upon the horse's neck, between the mane and the collar, in order to prevent the horse's neck from being hurt by the collar. The bottoms of chairs were frequently made of these leaves, twisted together. Formerly the Swedes employed the wool or cotton which surrounds its feeds, and put it into their beds instead of feathers; but as it coalesces into lumps after the beds have been used for some time, they have left off making use of them. I omit the use of this plant in physic, it being the peculiar province of

the physicians.

A species of leek*, very like that which appears only in woods on hills in Sweden, grows at present on almost all corn-fields mixed with fand. The English here called it garlick. On some fields it grew in great abundance. When the cattle grazed on such fields, and ate the garlick, their milk, and the butter which was made of it, tasted so strongly of it, that they were scarce eatable. Sometimes they sold butter in the Philadelphia markets, which tasted to strongly of garlick that it was entirely useless. On this account, they do not suffer milking cows to graze on fields where garlick abounds: this they reserve for other species of cattle. When the cattle eat much of this garlick in summer, their sless has likewise such a strong slavour, that it is unsit for eating. This kind of garlick appears early in spring; and the horses always passed by it without ever touching it.

[•] Allium arvense; odore gravi, capitulis bulbosis rubentibus. See Gronov. Flora Virginica, 37. This leek seems to be Dr. Linnæus's Allium Canadense, scapo nudo tereti, foliis linearibus, capitulo bulbisero. Spec. plant. I. p. 431. F.

PETER KALM'S TRAVELS.

VOLUME THE SECOND.

PREFACE OF THE EDITOR TO THE SECOND VOLUME.

T COULD have left this volume without preface, was it not for some circumstances

which I am going to mention.

The author of this account of North America is a Swede, and therefore feems always to flew a peculiar way of thinking in regard to the English in general, and in regard to the first proprietors and inhabitants of Philadelphia in particular. The French, the natural enemies of the English, have, for upwards of a century, been the allies of the Swedes, who therefore are in general more fond of them than of the English. The external politeness of the French in Canada fully captivated our authorprejudiced him in their favour, and alienated his mind, though unjustly, from the English. I have therefore now and then, in remarks, been obliged to do the English justice, especially when I saw the author carried away either by prejudice or misinformation. He paffed almost all the winter, between 1748 and 1749, at Raccoon, and converfed there with his countrymen; when he came to Philadelphia he likewise was in the company of the Swedes fettled there; these, no doubt, furnished him with many partial and difingenuous accounts of the English, and gave his mind that unfavourable bias which he fo often displays in prejudice of a nation, now at the head of the enlightened world, in regard to every religious, moral, and focial virtue. The author frequently feems to throw an illiberal reflection on the first proprietors of Penfylvania, and the Quakers; though they got that province not by force, but by a charter from the English government, to whom the Swedes gave it up by virtue of a public treaty. Prompted by fuch false infinuations of his countrymen, he likewise enters very minutely into the circumstances of the Swedes, and often omits more important points relative to the legislator and father of Pensylvania, William Penn, who gave that province existence, laws, and reputation.

The author, however, often does justice to the excellent constitution of Pensylvania, as may be seen in vol. 1. But when he speaks of stones attracting the moisture of the air, see vol. 1. this is somewhat unphilosophically expressed. No stone attracts the moisture of the air unless impregnated with faline particles; however, when the stones are colder than the atmosphere, they then condense the moisture of the air on their surface: the porous stones absorb it immediately, but those of a more solid texture, as

marbles, &c. keep it on their furface till it evaporates.

I here take the opportunity of returning my humble thanks to my friends, who have generously promoted this publication; as without this public manner of acknowledging their favours, I would think myself guilty of ingratitude, which, in my opinion, is one of the most detestable vices.

London, Feb. the 15th, 1771.

PETER KALM'S TRAVELS. - VOLUME THE SECOND.

PRIL the 12th, 1749. This morning I went to Philadelphia and the places adjacent, in order to know whether there were more plants lately fprung up than at Raccoon, and in New Jersey in general. The wet weather which had happened

the preceding days had made the roads very bad in low and clayey places.

The leaves which dropt last autumn had covered the ground in depth three or four inches. As this feems to hinder the growth of the grafs, it was customary to burn it in March, or at the end of that month, (according to the old stile) in order to give the grafs the liberty of growing up. I found feveral fpots burnt in this manner to-day; but if it be useful one way, it does a great deal of damage in another; all the young shoots of several trees were burnt with the dead leaves, which diminishes the woods confiderably; and in fuch places where the dead leaves had been burnt for feveral years together, the old trees were only left, which being cut down, there remains nothing but a great field, without any wood. At the fame time, all forts of trees and plants are confumed by the fire, or at least deprived of their power of budding; a great number of plants, and most of the grasses here, are annual; their seeds fall between the leaves, and by that means are burnt: this is another cause of universal complaint, that grafs is much fcarcer at prefent in the woods than it was formerly; a great number of dry and hollow trees are burnt at the fame time, though they could ferve as fuel in the houses, and by that means spare part of the forests. The upper mould likewise burns away in part by that means, not to mention feveral other inconveniencies with which this burning of the dead leaves is attended. To this purpose, the government of Penfylvania have lately published an edict, which prohibits this burning; nevertheless every one did as he pleafed, and this prohibition met with a general centure.

There were vast numbers of woodlice in the woods about this time; they are a very disagreeable insect; for as soon as a person sits down on an old stump of a tree, or on a tree which is cut down, or on the ground itself, a whole army of woodlice creep upon

his clothes, and infenfibly come upon the naked body.

I had a piece of petrified wood given me to-day, which was found deep in the ground at Raccoon. In this wood the fibres and inward rings appeared very plainly; it feemed to be a piece of hiccory, for it was as like it, in every respect, as if it had but just

been cut from a hiccory tree.

I likewise got some shells to-day, which the English commonly call clams, and whereof the Indians make their ornaments and money, which I shall take an opportunity of speaking of in the sequel. These clams were not fresh, but such as are every where found in New Jersey, on digging deep into the ground; the live shells of this kind are only found in salt water, and on the sea coasts. But these clams were found at Raccoon, about eight or nine English miles from the river Delaware, and near a hundred from the nearest sea-shore.

At night I went to Mr. Bartram's feat.

April 13th. I employed this day in feveral observations relative to botany.

Two nefts of wasps hung in a high maple-tree, over a brook. Their form was wholly the same with that of our wasp nests, but they exceeded them in size. Each

neft was ten inches in diameter; in each neft were three cakes, above one another, of which the lowermost was the biggest, and the two uppermost decreased in proportion: there were some eggs of wasps in them. The diameter of the lowest cake was about six inches and one quarter, and that of the uppermost, three inches and three quarters. The cells in which the eggs, or the young ones were deposited, were hexagonal, and the colour of the nest grey. I was told that the wasps make this kind of nests out of the grey splints, which stick to old pales and walls. A dark brown bee, with black antennæ, and two black rings on the belly, and purple wings, slew about the trees,

and might perhaps be an inhabitant of these nests.

Another kind of wasps, which are larger than these, make their nests quite open. It confifts merely of one cake, which has no covering, and is made of the boughs of trees. The cells are horizontal, and when the eggs or young larvæ lie in them they have lids or coverings, that the rain may not come into them. But whither the old wasps retreat during storms, is a mystery to me, except they creep into the crevices of rocks. That fide of the cake which is uppermost is covered with some oily particles, fo that the rain cannot penetrate. The cells are hexagonal, from five to feven lines deep, and two lines in diameter. Mr. Bartram observed, that these nests are built of two forts of materials, viz. the fplints which are found upon old pales, or fences, and which the wind separates from them; for the wasps have often been observed to sit on fuch old wood, and to gnaw away these splints; the sides, and the lid or cover of the cells are made of an animal fubstance, or glutinous matter, thrown up by the wasps, or prepared in their mouths; for when this substance is thrown into the fire, it does not burn, but is only finged, like hair or horn. But the bottom of the nest being put into the fire, burns like linen or half-rotten wood, and leaves a fmell of burnt wood. The wasps, whose nests I have now described, have three elevated black shining points on the forehead*, and a pentagonal black spot on the thorax. Towards the end of autumn these wasps creep into the cavities of mountains, where they lie torpid during winter. In fpring, when the fun begins to operate, they come out during day-time, but return towards night, when it grows cold. I faw them early in fpring during funshine, in and about some cavities in the mountains. I was told of another species of wafps, which make their nefts under ground.

Gyrinus natator (Americanus), or the whirl-beetles. These were found dancing in

great numbers on the furface of the waters.

April 14th. This morning I went down to Chefter: in feveral places on the road are faw-mills; but those which I faw to-day had no more than one faw. I likewise perceived that the woods and forests of these parts had been very roughly treated. It is customary here, when they erect faw-mills, wind-mills, or iron-works, to lead the water a good way lower, in case the ground near a fall in the river is not convenient for building upon.

April 16th. This morning I returned to Raccoon. This country has feveral kinds of swallows, viz. such as live in barns, in chimneys, and under ground; there are

likewise martens.

The barn swallows, or house swallows, are those with a furcated tail. They are Linnæus's hirundo rustica. I found them in all the parts of North America which I travelled over. They correspond very nearly to the European house-swallow. In regard to

^{*} These three points are common to most insects, and ought therefore not to be made characteristics of any particular species. They are called stemmata, and are a kind of eyes which serve the insects for looking at distant objects, as the compound eyes do for objects near at hand. F.

their colour, however, there feems to be a small difference in the note. I took no notice this year when they arrived: but the following year, 1750, I observed them for the first time, on the 10th of April (new style); the next day in the morning, I saw great numbers of them sitting on posts and planks, and they were as wet as if they had been just come out of the sea*. They build their nests in houses, and under the roofs

OI

· It has been a fubject of contest among naturalists, to determine the winter retreat of swallows. Some think, they go to warmer climates when they disappear in the northern countries: others say, they creep into hollow trees, and holes in clefts of rocks, and lie there all the winter in a torpid flate: and others affirm, that they take their retreat into water, and revive again in fpring. The two first opinions have been proved, and it feems have found credit; the last have been treated as ridiculous, and almost as an old woman's tale. Natural history, as all the other histories, depends not always upon the intrinsic degree of probability, but upon facts founded on the testimony of people of noted veracity. - Swallows are feldom feen finking down into the water; fwallows have not fuch organs as frogs or lizards, which are torpid during winter, ergo, fwallows live not, and cannot live under water. - This way of arguing, I believe, would carry us, in a great many cases, too far; for though it is not clear to every one, it may however be true; and lizards and frogs are animals of a class widely different from that of birds, and must therefore of course have a different structure; hence it is they are classed separately. The bear and the marmot are in winter in a torpid state, and have however not fuch organs as lizards and frogs; and nobody doubts of their being, during fome time, in the most rigid climates, in a torpid state; for the Alpine nations hunt the marmots frequently, by digging their holes up, and find them so torpid, that they cut their throats, without their reviving or giving the least fign of life during the operation; but when the torpid marmot is brought into a warm room and placed before the fire, it revives from its lethargy. The queftion must therefore be decided by facts; nor are they wanting here; Dr. Wallerius, the celebrated Swedish chemist, wrote in 1748, September the 6th, O. S. to the late Mr. Klein, secretary to the city of Dantzick: "That he has feen, more than once, fwallows affembling on a reed, till they were all immerfed and went to the bottom; this being preceded by a dirge of a quarter of an hour's length. He attests likewife, that he had feen a fwallow caught during winter out of a lake with a nct, drawn, as is common in northern countries, under the ice: this bird was brought into a warm room, revived, fluttered about,

and foon after died."

Mr. Klein applied to many fermiers generaux of the King of Pruffia's domains, who had great lakes in their districts, the fishery in them being a part of the revenue; in winter the fishery thereon is the most confiderable under the ice, with nets spreading more than two hundred or three hundred fathoms, and they are often wound by fcrews and engines, on account of their weight. All the people questioned made affidavits upon oath before the magilitrates. First, The mother of the Countess Lehndorf said, that she had feen a bundle of swallows brought from the Frish-haff (a lake communicating with the Baltic at Pillau) which when brought into a moderately warm room, revived and fluttered about. Secondly, Count Schlieben gave an instrument on stamped paper, importing, that by fishing on the lake belonging to his estate of Gerdauen, in winter, he faw feveral Iwallows caught in the net, one of which he took up with his hand, brought it into a warm room, where it lay about an hour, when it began to stir, and half an hour after it flew about in the room. Thirdly, fermier general (Amtman) Witkowski made affidavit, that in the year 1740, three swallows were brought up with the net in the great pond at Didlacken; in the year 1741 lie got two swallows from anuther part of the pond, and took them home, (they all being caught in his presence); after an hour's space they revived all in a warm room, fluttered about, and died three hours after. Fourthly, Amtmam Bonke fays, that having had the estate Kleskow in farm, he had feen nine fwallows brought up in the net from under the ice, all which he took into a warm room, where he diftinctly observed how they gradually revived; but a few hours after they all died. Another time his people got likewise some swallows in a net, but he ordered them again to be thrown into the water. Fifthly, Andrew Rutta, a master fisherman, at Oletsko, made affidavit, 1747, that twenty-two years ago, two swallows were taken up by him, in a net, under the ice, and being brought into a warm room, they flew about. Sixthly, Jacob Kosiulo, a master sisherman, at Stradauen, made assidavit, that in 1736, he brought up in winter, in a net, from under the ice of the lake at Raski, a seemingly dead swallow, which revived in half an hour's time, in a warm room, and he saw, a quarter of an hour after, the bird grow weaker, and soon after dying. Seventhly, I can reckon myfelf among the eye-witneffes of this paradoxon of natural hiftory. In the year 1735, being a little boy, I faw several swallows brought in winter by fishermen, from the river Vistula, to my father's house, where two of them were brought into a warm room, revived, and slew I faw them several times settling on the warm stove, (which the northern nations have in their rooms) and I recollect well that the fame forenoon they died, and I had them, when dead, in my hand.

on theoutfide; I likewise found their nests built on mountains and rocks whose top projected beyond the bottom; they build too under the corners of perpendicular rocks; and this shews where the swallows made their nests, before the Europeans settled and built houses here; for it is well known that the huts of the Indians could not serve the purpose of the swallows. A very creditable lady and her children told me the following story, assuring me that they were eye-witnesses to it: a couple of swallows built their nest in the stable belonging to the lady; the semale swallow sat upon the nest, laid eggs in it, and was about to brood them; some days after, the people saw the semale still sitting on the eggs; but the male slying about the nest, and sometimes settling on a nail, was heard to utter a very plaintive note, which betrayed his uneasiness: on a nearer examination the cause appeared, for the semale was found dead in the nest. The male then went to sit upon the eggs, but after being about two hours on them, and thinking the business too troublesome for him, he went out, and returned in the afternoon with another semale, which sat upon the eggs, and afterwards fed the young ones

In the year 1754, after the death of my uncle Godefroy Wolf, captain in the Polish regiment of foot-guards; being myself one of his heirs, I administered for my co-heirs several estates called the Starosty of Dirschau, in Polish Prussia, which my late uncle farmed under the King. In January the lake of Lybshau, belonging to these estates being covered with ice, I ordered the sistement to fish therein, and in my presence several swallows were taken, which the fishermen threw in again; but one I took up myself, brought it home, which was shown as from thence, and it revived, but died about an hour after its reviving. These are facts attested by people of the highest quality, by some in public offices, and by others, who, though of a low rank, however made these affidavits upon oath. It is impossible to suppose indifcriminately that they were prompted by views of interest, to affert as a fact, a thing which had no truth in it. It is therefore highly probable, or rather incontestably true, that swallows retire in the Northern countries during winter into the water, and stay there in a torpid state, till the return or warmth revives them again in spring. The question therefore I believe ought for the future to be thus stated: The swallows in Spain, Italy, France, and perhaps some from England, remove to warmer climates; some English ones, and some in Germany and other mild countries, retire into clefts and holes in rocks, and remain there in a torpid state. In the colder northern countries the swallows immerse in the sea, in lakes and rivers, and remain in a torpid slate under ice during winter. There are still some objections to this latter affertion, which we must remove. It is said, why do not rapacious sish, and aquatic quadrupeds and birds, devour thefe fwallows? The answer is obvious. Swallows chuse only such places in the water for their winter retreat, as are near reeds and rushes, fo that finking down there between them and their roots, they are by them fecured against the rapaciousness of their enemies. But others object, why are not these birds caught in such waters as are continually harrassed by nets? I believe the same answer which has been made to the first objection, will serve for this likewise. Fishermen take care to keep off with their nets from places filled with reeds and rushes, for fear of entangling and tearing their nets; and thus the fituation of fwallows under water, is the reason that they are seldom diffurbed in their filent winter retreats. What confirms this opinion still more is, that swallows were never caught in Prussia, according to the above-mentioned affidavits, but with those parts of the net which passed near to the reeds and rushes; and fometimes the swallows were yet fastened with their feet to a reed when they were drawn up by the net. As to the argument taken from their being fo long under water without corruption, I believe there is a real difference between animals fuffocated in water, and animals being torpid therein. We have examples of things being a long time under water, to which we may add the intense cold of these northern regions which preferves them. Who would have thought it, that fnails and polypes may be diffected, and could reproduce the parts fevered from their body, if it was not a fact? Natural history ought to be studied as a collection of facts, not as the history of our guesses or opinions. Nature varies in an infinite manner; and Providence has divertified the inftinet of animals, and their economy, and adapted it to the various feafons and climates. This long digrefion I thought necessary and excufable; and the more so, as the ingenious great friends to the cause of Natural History, the late Mr. Collinson and Mr. Pennant, have both afferted the impossibility and improbability of this immersion. I revere the memory and the ashes of the one, and think the friendship of the other an honour to me; but am assured, that both prefer truth to their private opinion, and can bear a modest opposition, when it is proposed with candour, with a view to promote truth, and with fentiments of respect and gratitude, as it is done by me in the present case. F. till

till they were able to provide for themselves. The people differed here in their opinions about the abode of swallows in winter: most of the Swedes thought that they lay at the bottom of the sea; some, with the English and the French in Canada, thought that they migrate to the southward in Autumn, and return in spring. I have likewise been credibly informed in Albany, that they have been sound sleeping in deep holes and

clefts of rocks, during winter.

The chimney swallows are the second species, and they derive their name from building their nefts in chimneys, which are not made use of in summer: sometimes when the fire is not very great, they do not mind the fmoke, and remain in the chimney. I did not see them this year till late in May, but in the ensuing year, 1750, they arrived on the 3d of May, for they appear much later than the other swallows. It is remarkable that each feather in their tail ends in a stiff sharp point, like the end of an awl; they apply the tail to the fide of the wall in the chimneys, hold themselves with their feet, and the stiff tail ferves to keep them up: they make a great thundering noise all the day long, by flying up and down in the chimneys; and as they build their nefts in chimneys only, and it is well known that the Indians have not fo much as a hearth made of maloury, much lefs a chimney, but make their fires on the ground in their huts, it is an obvious question, Where did these swallows build their nests before the Furopeans came, and made houses with chimneys? It is probable that they formerly made them in great hollow trees. This opinion was adopted by Mr. Bartram, and many others here. Catesby has described the chimney swallow and figured it *, and Dr. Linnæus calls it hirundo pelafgia.

The ground swallows or fand martins, (Linnæus's hirundo riparia) are to be met with every where in America; they make their nests in the ground on the steep shores of

rivers and lakes.

The purple martins have likewise been described and drawn in their natural colours by Catesby†. Dr. Linnæus likewise calls them hirundo purpurea. They are less common here than the former species; I have seen in several places little houses made of boards, and fixed on the outside of the walls, on purpose that these martins may make their nests in them; for the people are very desirous of having them near their houses, because they both drive away hawks and crows as soon as they see them, and alarm the poultry, by their anxious note, of the approach of their enemies. The chickens are likewise used to run under shelter, as soon as they are warned by the martins.

April 17th. The direa palustris, or mouse-wood, is a little shrub which grows on the rising ground adjoining to the swamps and marshes, and was now in full blossom. The English in Albany, call it leather-wood, because its bark is as tough as leather. The French in Canada, call it bois de plomb, or leaden-wood, because the wood itself is as soft and as tough as lead. The bark of this shrub was made use of for ropes, baskets, &c. by the Indians, whilst they lived among the Swedes; and it is really very fit for that purpose, on account of its remarkable strength and toughness, which is equal to that of the lime-tree bark. The English and the Dutch in many parts of North America, and the French in Canada, employ this bark in all cases where we make use of lime-tree bark in Europe. The tree itself is very tough, and you cannot easily separate its branches without the help of a knife: some people employ the twigs for rods.

^{*} Hirundo, caudâ aculeatà, Americana. Catesb. Carol. vol. iii. t. 8.

April 20th. This day I found the strawberries in flower, for the first time this year: the fruit is commonly larger than that in Sweden; but it seems to be less sweet

and agreeable.

The annual harvest, I am told, is always of fuch a nature, that it affords plenty of bread for the inhabitants, though it turns out to greater advantage in some years than it does in others. A venerable feptuagenary Swede, called Aoke Helm, affured me, that in his time no absolutely barren crop had been met with, but that the people had always had pretty plentiful crops. It is likewife to be observed, that the people eat their bread of maize, rye, or wheat, quite pure and free from the inferior kinds of corn, and clear of hufks, stalks, or other impurities. Many aged Swedes and Englishmen confirmed this account, and faid, that they could not remember any crop fo bad as to make the people fuffer in the leaft, much less that any body was starved to death, whilst they were in America. Sometimes the price of corn role higher in one year than in another, on account of a great drought or bad weather, but still there was always corn fufficient for the confumption of the inhabitants. Nor is it likely that any great famine can happen in this country, unless it please God to afflict it with extraordinary punishments. The weather is well known, from more than fixty years experience. Here are no cold nights which hurt the germ; the wet is of short continuance, and the drought is feldom or never of long duration; but the chief thing is the great variety of corn. The people fow the different kinds at different times and feafons, and though one crop turn out bad, yet another fucceeds. The fummer is fo long, that of fome species of corn they may get three crops. There is hardly a month from May to October or November inclusive, in which the people do not reap some kind of corn, or gather fome fort of fruit. It would indeed be a very great misfortune if a bad crop should happen; for here, as in many other places, they lay up no stores, and are contented that there is plenty of food for the prefent exigencies.

The peach-trees were now every where in bloffon; their leaves were not yet comeout of the buds, and therefore the flowers flewed to greater advantage; their beautiful pale red colour had a very fine effect; and they fat so close that the branches were entirely clad with them. The other fruit trees were not yet in flower; however, the

apple bloffoms began to appear.

The English and the Swedes of America, give the name of currants * to a shrub-which grows in wet ground, and near swamps, and which was now in blossom; its flowers are white, have a very agreeable fragancy, and grow in oblong bunches; the fruit is very good eating, when it is ripe; the style (stylus) is thread-shaped (fili-formis), and shorter than the stamina; it is divided in the middle, into sive parts, or stigmata. Dr. Linnæus calls it cratægus †, and Dr. Gronovius calls it a mespilus †.

April 22d. The Swedes give the name of whipperiwill, and the English that of whippeor-will, to a kind of nocturnal bird, whose voice is heard in North America, almost throughout the whole night. Catesby and Edwards both have described and figured it §. Dr. Linnæus calls it a variety of the caprimulgus Europæus, or goat-sucker: its shape, colour, fize, and other qualities make it dissipute to distinguish them from each other; but the peculiar note of the American one distinguishes it from the European

^{*} It must be carefully diffinguished from what is called currants in England, which is the ribes rubrum. F.

[†] Cratægus tomentofa, Linn. Spcc. pl. p. 682.

[†] Mespilus inermis, soliis ovato-oblongis, serratis, subtus tomentosis. Gronov. Fl. Virgin. 55. & Caprimulgus minor Americanus. Catesb. Nat. Hist. of Carolina, vol. iii. t. 16. Edwards's Nat. Hist. of Birds, t. 63.

one, and from all other birds: it is not found here during winter, but returns with the beginning of fummer. I heard it to-day, for the first time, and many other people said, that they had not heard it before this fummer; its English and Swedish name is taken from its note; but, accurately speaking, it does not call whipperiwill, nor whip-poorwill, but rather whipperiwip, fo that the first and last fyllables are accented, and the intermediate ones but flightly pronounced. The English change the call of this bird into whip-poor-will, that it may have fome kind of fignification: it is neither heard nor feen in day-time; but foon after fun-fet it begins to call, and continues for a good while, as the cuckoo does in Europe. After it has continued calling in a place for fome time, it removes to another, and begins again: it usually comes several times in a night, and fettles close to the houses; I have feen it coming late in the evening, and fettling on the steps of the house in order to sing its song; it is very shy, and when a perfon flood still, it would fettle close by him, and begin to call. It came to the houses in order to get its food, which confifts of infects; and those always abound near the houses at night; when it sat and called its whipperiwhip, and saw an insect passing, it flew up and caught it, and fettled again. Sometimes you hear four or five, or more, near each other, calling as it were for a wager, and raifing a great noise in the woods. They were feldom heard in towns, being either extirpated there, or frightened away, by frequent flooting. They do not like to fit on trees, but are commonly on the ground, or very low in bushes, or on the lower poles of the enclosures; they always fly near the ground; they continue their calling at night till it grows quite dark; they are filent till the dawn of day comes on, and then they call till the fun rifes. The fun feems to stop their mouths, or dazzle their eyes, so as to make them sit still. I have never heard them call in the midft of night, though I have hearkened very attentively on purpose to hear it, and many others have done the same. I am told they make no nest, but lay two eggs in the open fields. My servant shot at one which sat on a bush near the house, and though he did not hit it, yet it fell down through fear, and lay for Some time as if dead, but recovered afterwards. It never attempted to bite when it was held in the hands, only endeavouring to get loofe by stirring itself about. Above, and close under the eyes, were feveral black, long, and stiff bristles, as in other nocturnal birds. The Europeans eat it. Mr. Catesby fays, the Indians affirm, that they never faw these birds, or heard of them, before a certain great battle, in which the Europeans killed a great number of Indians. Therefore, they suppose that these birds, which are reftlefs, and utter their plaintive note at night, are the fouls of their ancestors who died in battle.

April 24th. To-day the cherry-trees began to flow their bloffoms; they had already pretty large leaves.

The apple-trees likewife began to bloffom; however, the cherry-trees were more

forward: they likewife got a greenish hue from their leaves.

The mulberry-trees * were yet quite naked; and I was forry to find that this tree is

one of the latest in getting leaves, and one of the first which gets fruit.

April 26th. This morning I travelled to Penn's Neck. The tulip-trees, especially the tall ones, looked quite green, being covered with their leaves; this tree is therefore one of the earliest which get leaves.

To-day I faw the flowers of the faffafras-tree, (laurus faffafras.) The leaves were

not yet come out. The flowers have a fine fmell.

The lupinus perennis is abundant in the woods, and grows equally in good foil and

in poor. I often found it thriving on very poor fandy fields, and on heaths, where on other plants will grow. Its flowers, which commonly appear in the middle of May, make a fine shew by their purple hue. I was told, that the cattle eat these slowers very greedily; but I was forry to find very often that they were not fo fond of it as it is represented, especially when they had any thing else to eat; and they seldom touched it, notwithstanding its fine green colour, and its softness: the horses eat the slowers, but leave the stalks and leaves. If the cattle eat this plant in spring, necessity and hunger give it a relish. This country does not afford any green pastures like the Swedish ones; the woods are the places where the cattle must collect their food. The ground in the woods is chiefly flat, or with very little rifings. The trees fland far afunder; but the ground between them is not covered with green fods; for there are but few kinds of graffes in the woods, and they stand single and scattered. The soil is very loofe, partly owing to the dead leaves which cover the ground during a great part of the year. Thus the cattle find very little grafs in the woods, and are forced to be fatiffied with all kinds of plants which come in their way, whether they be good or bad food. I faw for some time this spring, that the cattle bit off the tops and shoots of young trees, and fed upon them; for no plants were yet come up, and they stand in general but very thin, and scattered here and there, as I have just mentioned. Hence you may eafily imagine that hunger compels the cattle to eat plants, which they would not touch were they better provided for. However, I am of opinion, that it would be worth while to make use of this lupine to mend dry fandy heaths, and, I believe, it would not be absolutely impossible to find out the means of making it agreeable to the cattle.

The oaks here have fimilar qualities with the European ones. They keep their dead leaves almost during the whole winter, and are very backward in getting fresh ones; they had no leaves as yet, and were but just beginning to shew a few.

The humming-bird, which the Swedes call king's-bird*, and which I have mentioned

in a former volume, appeared hereabouts to-day, for the first time this spring.

Numbers of oil beetles, (Meloë Profcarabœus) fat on the leaves of white hellebore (Veratrum album) and feasted on them. I considered them a great while, and they devoured a leaf in a few minutes. Some of them had already eaten so much that they could hardly creep. Thus this plant, which is almost certain death to other animals, is their dainty food.

The fire-flies appeared at night, for the first time this year, and flew about between the trees, in the woods. It seemed, in the dark, as if sparks of fire flew up and down.

I will give a more particular account of them in another place.

Towards night I went to Raccoon.

May 1st. The last night was so cold, that the ground at sun-rising was as white as snow, from the hoary-frost. The Swedish thermometer was a degree and a half below the freezing point. We observed no ice in the rivers or waters of any depth; but upon such only as were about three inches deep, the ice lay to the thickness of one third part of a line f. The evening before, the wind was south, but the night was calm. The apple-trees and cherry-trees were in full blossom. The peach-trees were almost out of flower. Most of the forest-trees had already got new and tender leaves, and most of them were in flower, as almost all kinds of oaks, the dog-wood, (Cornus Florida), hiccory, wild prunes, fassafras, horn-beam, beeches, &c.

The plants which were found damaged by the frost, were the following. 1. The hiccory. Most of the young trees of this kind had their leaves killed by the frost, so

that they looked quite black in the afternoon; the leaves were confumed by frost every where in the fields, near the marshes, and in the woods. 2. The black oak. Several of these trees had their leaves damaged by the frost. 3. The white oak. Some very young trees of this kind had lost their leaves by the frost. 4. The blossoms of the cherry trees were hurt in several places. 5. The slowers of the English walnut-tree were entirely spoiled by the frost. 6. The rhus glabra. Some of these trees had already got leaves, and they were killed by the cold. 7. The rhus radicans; the tender young trees of this kind suffered from the frost, and had their leaves partly killed. 8. The thalistra, or meadow rues, had both their flowers and leaves hurt by the frost. 9. The podophyllum peltatum. Of this plant there was not above one in five hundred hurt by the frost. 10. The ferns. A number of them, which were lately come up, were destroyed. I must add several plants which were likewise hurt, but which I could not distinguish, on account of their smallness.

I went to feveral places this day.

The bartfia coccinea grew in great abundance on feveral low meadows. Its flower-buds were already tinged with their precious fearlet, and adorned the meadows. It is

not yet applied to any use, but that of delighting the fight.

One of the Swedes here had planted an English walnut-tree (Juglans regia) in his garden, and it was now about three yards high; it was in full blossom, and had already great leaves, whereas the black walnut-trees, which grow spontaneously in every part of this country, had not yet any leaves, or flowers. The last night's frost had killed all the leaves of the European kind. Dr. Franklin told me afterwards, that there had been some English walnut-trees in Philadelphia, which came on very well; but that they were killed by the frost.

I locked about me for the trees which had not yet got fresh leaves, and I found the

following ones:

Juglans nigra, or the black walnut-tree.

Fraxinus excelsior, or the ash.

Acer Negundo, called the white ash here.

Nyssa aquatica, the tupelo-tree.

Diofpyros Virginiana, or the perfimon. Vitis labrufca, or the fox-grapes; and

Rhus glabra, or the fumach.

The trees whose leaves were coming out, were the following:

Morus rubra, the mulberry-tree. Fagus Castanea, the chesnut-tree.

Platanus occidentalis, or the water-beech.

Laurus fassafras, the fassafras-tree.

Juglans alba, the hiccory. Some trees of this kind had already large leaves, but others had none at all; the fame difference, I believe, exists likewise among the other species of hiccory.

The Virginian cherry-tree grows here and there, in the woods and glades: its leaves

were already pretty large; but the flowers were not yet entirely open.

The faffafras-tree was now every where in flower; but its leaves were not yet quite difclosed.

The Liquidambar ftyraciflua or fweet gum-tree, grows in the woods, especially in wet soil, in and near purling rivulets: its leaves were now already sprouting out at its summit. This tree grows to a great thickness, and its height rivals that of the tallest firs and oaks; as it grows higher, the lower branches die and drop, and leave the stem.

at last quite smooth and strait, with a great crown at the very summit; the seeds are contained in round, dentated cones, which drop in autumn; and as the tree is very tall, so the high winds carry the seeds away to a great distance. I have already given an account of the use of this tree in the first volume, to which I must add the following account.

The wood can be made very fmooth, because its veins are extremely sine: but it is not hard; you can carve letters on it with a knife, which will seem to be engraved. Mr. Lewis Evans told me, from his own experience, that no wood in this country was more fit for making moulds for casting brass in, than this. I enquired of Mr. Bartram, "Whether he had found the rosin on this tree, which is so much praised in physic?" He told me, "That a very odoriferous rosin always flows out of any cut or wound, which is made in the tree; but that the quantity here was too inconsiderable to recompense the labour of collecting it." This odoriferous rosin or gum first gave rise to the English name. The further you go to the south, the greater quantity of gum does the tree yield, so that it is easy to collect it. Mr. Bartram was of opinion, that this tree was properly calculated for the climate of Carolina, and that it was brought by several ways so far north as New York. In the southern countries the heat of the sun fills the tree with gum, but in the northern ones it does not.

May 2nd. This morning I travelled down to Salem, in order to fee the

country.

The faffafras-tree stood single in the woods, and along the fences, round the fields: it was now distinguishable at a distance for its fine slowers, which being now quite open,

made it look quite yellow. The leaves were not yet come out.

In fome meadows the grafs was already grown up pretty high: but it is to be obferved, that these meadows were marshy, and that no cattle had been on them this year. These meadows are mown twice a year, viz. in May, and the end of August, or beginning of September, old style. I saw some meadows of this kind to day, in which I saw grafs which was now almost sit to be mown; and many meadows in Sweden have not such grafs at the proper time of mowing, as these had now; these meadows lay in marshes and vallies, where the sun had very great power: the grafs consisted merely of cyprus-grafs or carex. The wild prune-trees were now every where in flower; they grow here and there in the woods, but commonly near marshes and in wet ground: they are distinguishable by their white flowers: the fruit when ripe is eatable.

The cornus florida, or dogwood, grows in the forests, on hills, on plains, in vallies, in marshes, and near rivulets. I cannot therefore say which is its native soil; however, it seems that in a low but not a wet soil it succeeds best; it was now adorned with its great snowy involucra, which render it conspicuous even at a distance. At this time it is a pleasure to travel through the woods, so much are they beautisted by the blossoms of this tree. The flowers which are within the involucra began to open to-day. The tree does not grow to any considerable height or thickness, but is about the size of our mountain ash (Sorbus aucuparia). There are three species of this tree in the woods; one with great white involucra, another with small white ones, and a third with reddish

ones.

The woods were now full of birds: I faw the leffer species every where hopping on the ground, or creeping in bushes, without any great degree of shines; it is therefore very easy for all kind of snakes to approach and bite them. I believe that the rattle-snake has nothing to do but to lie still, and without waiting long, some little bird or other will pass by or run directly upon her, giving her an opportunity of catching it, without any enchantment.

Salem

Salem is a little trading town, fituated at fome diftance from the river Delaware. The houses do not stand far asunder, and are partly stone, and partly wood. A rivulet passes by the town, and falls into the Delaware. The inhabitants live by their several trades as well as they can. In the neighbourhood of Salem are some very low and swampy meadows; and therefore it is reckoned a very unwholesome place. Experience has shewn, that those who came hither from other places to settle, got a very pale and fickly look, though they arrived in perfect health, and with a very lively colour. The town is very easily distinguished about this time, by the disagreeable stenent which arises from the swamps. The vapours of the putrid water are carried to those inhabitants which live next to the marshes; and enter the body along with the air, and through the pores, and thus are hurtful to health. At the end of every summer, the intermitting severs are very frequent. I knew a young couple, who came along with me from England to America: soon after their arrival at Philadelphia, they went to Salem, in perfect health; but a few weeks after they fell sick, and before the winter was half over they were both dead.

Many of the inhabitants plant faffron; but it is not fo good and fo strong as the English and French fassron. Perhaps it grows better by being laid up for some years,

as tobacco does.

The goffypium herbaceum, or cotton plant, is an annual plant; and feveral of the inhabitants of Salem had began to fow it. Some had the feeds from Carolina, where they have great plantations of cotton; but others got it out of fome cotton which they had bought. They faid, it was difficult at first to get ripe feeds from the plants which were fown here; for the summer in Carolina, from whence their first feed came, is both longer and hotter than it is here. But after the plants have been more used to the climate, and hastened more than they were formerly, the feeds are ripe in due time.

At night I returned to Raccoon.

May 4th. Crab trees are a fpecies of wild apple trees, which grow in the woods and glades, but especially on little hillocks near rivers *. In New Jersey the tree is rather scarce; but in Pensylvania is plentiful. Some people had planted a single tree of this kind near their farms, on account of the fine smells which its flowers afford. It had begun to open some of its flowers about a day or two ago; however, most of them were not yet open. They are exactly like the blossoms of the common apple trees, except that the colour is a little more reddish in the crab trees; though some kinds of the cultivated trees have flowers which are very near as red: but the smell distinguishes them plainly; for the wild trees have a very pleasant smell, somewhat like the rasp-berry. The apples, or crabs, are small, sour, and unsit for any thing but to make vinegar of. They lie under the trees all the winter, and acquire a yellow colour. They seldom begin to rot before spring comes on.

I cannot omit an observation here. The crab-trees opened their flowers only yesterday and to-day; whereas the cultivated apple-trees, which were brought from Europe, had already lost their flowers. The wild cherry-trees did not flower before the 12th of May: on the other hand, the cultivated or European ones, had already opened their blossoms on the 24th of April. The black walnut-trees of this country had neither leaves nor flowers, when the European kind has large leaves and blossoms. From hence it appears that trees brought over from Europe, of the same kind with the wild trees of America, flower much sooner than the latter. I cannot say what is the reason

^{*} Pyrus coronaria. Linn. Sp. Plant. Malus sylvestris, floribus odoratis. Gronov. Fl. Virginica. p. 55.

of this forwardness of the European trees in this country, unless they bring forth their blossoms as soon as they get a certain degree of warmth, which they have in their native country. It seems the European trees do not expect, after a considerable degree of warmth, any such cold nights as will kill their flowers; for, in the cold countries, there seldom happen any hot days succeeded by such cold nights as will hurt the flowers considerably. On the contrary, the wild trees in this country are directed by experience, (if I may so speak) not to trust to the first warmth; but they wait for a greater heat, when they are already safe from cold nights. Therefore, it happens often that the flowers of the European trees are killed by the frosts here; but the native trees are seldom hurt, though they be of the same kind with the European ones. This is a manifest proof of the wisdom of the Creator.

May 5th. Early this morning I went to Rapaapo, which is a great village, whose farms lay all scattered. It was inhabited merely by Swedes, and not a single Englishman, or people of any other nation lived in it: therefore they have preserved their native Swedish tongue, and mixed but few English words with it. The intention of my journey was partly to see the place, and to collect plants and other natural curiosities there; and partly to find the places where the white cedar, or cupressus thyoides,

grows.

The May flowers, as the Swedes call them, were plentiful in the woods wherever I went to-day; especially on a dry soil, or one that is somewhat moist. The Swedes have given them this name because they are in full blossom in May. Some of the Swedes and the Dutch call them pinxter-bloem, (Whitsunday flowers), as they really are in bloffom about Whitfuntide. The English call them wild honeysuckles; and at a distance they have some similarity to the honeysuckle or lonicera. Dr. Linnæus, and other botanists, call it an azalea *. Its flowers were now open, and added a new ornament to the woods, being little inferior to the flowers of the honeyfuckle and hedyfarum. They fit in a circle round the ftem's extremity, and have either a dark red or a lively red colour; but, by standing for some time, the sun bleaches them, and at last they get a whitish hue. I know not why Colden calls them yellow t. The height of the bush is not always alike. Some were as tall as a full grown man, and taller; others were but low, and some were not above a palm from the ground; yet they were all full of flowers. The people have not yet found that this plant may be applied to any use; they only gather the flowers, and put them in pots, because, they are very flewy. They have some smell; but I cannot say it is very pleasant. However, the beauty of the colour entitles them to a place in every flower-garden.

To-day I faw the first ear of this year's rye. In Sweden, rye begins to shew its ears about Ericmas, that is about the 18th of May, old stile ‡. But in New Sweden, the people said, they always saw the ears of rye in April, old stile; whether the spring begins late or early. However, in some years the ears come early, and in others late in April.

This fpring was reckoned one of the late ones.

Bullfrogs || are a large species of frogs which I had an opportunity of hearing and feeing to-day. As I was riding out, I heard a roaring before me; and I thought it was a bull in the bushes, on the other side of the dyke, though the sound was rather more hoarse than that of a bull. I was, however, asraid that a bad goring bull might

† Azalea erecta, foliis ovatis, integris, alternis, flore luteo, piloso, præcoci. Cold. Ebor. 25. ‡ Accordingly about the 29th of May, new stile.

be near me, though I did not fee him, and I continued to think fo till fome hours after, when I talked with some Swedes about the bullfrogs, and, by their account, I immediately found that I had heard their voice; for the Swedes told me, that there were numbers of them in the dyke. I afterwards hunted for them. Of all the frogs in this country, this is doubtless the greatest. I am told that towards autumn, as soon as the air begins to grow a little cool, they hide themselves under the mud, which lies at the bottom of ponds and stagnant waters, and lie there torpid during winter. As foon as the weather grows mild, towards fummer, they begin to get out of their holes and croak. If the fpring, that is, if the mild weather begins early, they appear about the end of March, old stile; but if it happens late, they tarry under water till late in April. Their places of abode are ponds and bogs with stagnant water; they are never in any flowing water. When many of them croak together, they make an enormous noise. Their croak exactly refembles the roaring of an ox or bull which is fomewhat hoarfe. They croak fo loud, that two people talking by the fide of a pond cannot understand each other. They croak all together; then stop a little, and begin again. It feems as if they had a captain among them: for when he begins to croak, all the others follow; and when he stops, the others are all filent. When this captain gives the fignal for stopping, you hear a note like poop coming from him. In day time they feldom make any great noise, unless the sky is covered. But the night is their croaking time; and, when all is calm, you may hear them, though you are near a mile and a half off. When they croak, they commonly are near the surface of the water, under the bushes, and have their heads out of the water. Therefore, by going flowly, one may get close up to them before they go away. As foon as they are quite under water, they think themselves safe, though the water be very shallow.

Sometimes they fit at a good diftance from the pond, but as foon as they fufpect any danger, they hasten with great leaps into the water. They are very expert at hopping. A full-grown bullfrog takes near three yards at one hop. I have often been told the following story by the old Swedes, which happened here, at the time when the Indians lived with the Swedes. It is well known, that the Indians are excellent runners; I have feen them at Governor Johnson's, equal the best horse in its swiftest courfe, and almost pass by it. Therefore, in order to try how well the bull-frogs could leap, some of the Swedes laid a wager with a young Indian, that he could not overtake the frog, provided it had two leaps before hand. They carried a bullfrog, which they had caught in a pond, upon a field, and burnt his back-fide; the fire, and the Indian, who endeavoured to be closely up with the frog, had fuch an effect upon the animal, that it made its long hops acrofs the field as fast as it could. The Indian began to purfue the frog with all his might at the proper time: the noise he made in running frightened the poor frog; probably it was afraid of being tortured with fire again, and therefore it redoubled its leaps, and by that means it reached the

pond before the Indian could overtake it.

In fome years they are more numerous than in others: nobody could tell whether the fnakes had ever ventured to eat them, though they eat all the leffer kinds of frogs. The women are no friends to these frogs, because they kill and eat young ducklings and goflings: fometimes they carry off chickens that come too near the ponds. have not observed that they bite when they are held in the hands, though they have little teeth; when they are beaten, they cry out almost like children. was told that fome eat the thighs of the hind legs, and that they are very palatable.

A tree which grows in the fwamps here, and in other parts of America, goes by the name of white juniper tree. Its stem indeed looks like one of our old tall and strait juniperjuniper-trees in Sweden: but the leaves are different, and the wood is white. The English call it white cedar, because the boards which are made of the wood are like those made of cedar. But neither of these names are just, for the tree is of the cypress kind*. It always grows in wet ground or swamps: it is therefore difficult to come to them, because the ground between the little hillocks is full of water. The trees stand both on the hillocks and in the water: they grow very close together, and have strait, thick, and tall stems; but they were greatly reduced in number to what they have been before. In such places where they are left to grow up, they grow as tall and as thick as the tallest fir trees; they preserve their green leaves both in winter and summer;

the tall ones have no branches on the lower part of the stem.

The marshes where these trees grow are called cedar swamps. The cedar swamps are numerous in New Jerfey, and likewife in fome parts of Penfylvania and New The most northerly place, where it has been hitherto found, is near Goshen in New York, under forty-one degrees and twenty-five minutes of north latitude, as I am informed by Dr. Colden. For to the north of Goshen, it has not been found in the woods. The white cedar is one of the trees which refift the most to putrefaction; and when it is put above ground, it will last longer than under ground: therefore it is employed for many purposes; it makes good fences, and posts which are to be put into the ground; but in this point, the red cedar is still preferable to the white; it likewife makes good canoes. The young trees are employed for hoops round barrels, tuns, &c., because they are thin and pliable; the thick and tall trees afford timber and wood for cooper's work. The houses which are built of it surpass, in duration, those which are built of American oak. Many of the houses in Rapaapo were made of this white cedar wood; but the chief thing which the white cedar affords is the best kind of shingles. The white cedar shingles are preferred to all others for several reasons; first, they are more durable than any others made of American wood, the red cedar shingles excepted; fecondly, they are very light, fo that no strong beams are requisite to support the roof. For the fame reason it is unnecessary to build thick walls, because they are not pressed by heavy roofs. When fires break out, it is less dangerous to go under or along the roofs, because the shingles being very light can do little hurt by falling; they fuck the water, being fomewhat spongy, so that the roofs can easily be wetted in case of a fire: however, their fatness occasions that the water does not hurt them, but evaporates eafily. When they burn and are carried about by the wind, they have commonly what is called a dead coal, which does not eafily fet fire where it alights. The roofs made of these shingles can easily be cut through, if required, because they are thin, and not very hard; for these qualities the people in the country, and in the towns, are very defirous of having their houses covered with white cedar fhingles, if the wood can be got. Therefore all churches, and the houses of the more substantial inhabitants of the towns, have shingle roofs. In many parts of New York province, where the white cedar does not grow, the people, however, have their houses roofed with cedar shingles, which they get from other parts. To that purpose great quantities of shingles are annually exported from Eggharbour and other parts of New Jersey, to the town of New York, from whence they are distributed throughout the province. A quantity of white cedar wood is likewife exported every year to the West Indies, for shingles, pipe-staves, &c. Thus the inhabitants are very busy here, not only to lessen the number of these trees, but even to extirpate them entirely.

^{*} Cupressus thyoides. Linn. Spec. Pl. p. 1422. Cypressus Americana, fructu minimo. Miller's Gard. Dictionary..

They are here (and in many other places) in regard to wood, bent only upon their own prefent advantage, utterly regardless of posterity. By this means many cedar fwamps are already quite deftitute of cedars, having only young fhoots left; and I plainly observed, by counting the circles round the stem, that they do not grow up very quickly, but require a great deal of time before they can be cut for timber. It is well known that a tree gets only one circle every year; a stem, eighteen inches in diameter, had one hundred and eight circles round the thicker end: another, feventeen inches in diameter, had a hundred and fixteen; and another, two feet in diameter, had one hundred and forty-two circles upon it. Thus near eighty years growth is required, before a white cedar raifed from feed can be used for timber. Among the advantages which the white cedar flyingles have over others, the people reckon their lightness. But this good and useful quality may in future times turn out very disadvantageous to Philadelphia, and other places where the houses are roofed with cedar shingles: for as the roofs made of these shingles are very light, and bear but a trifling weight on the walls, fo the people have made the walls but very thin. I measured the thickness of the walls of several houses here, of three stories high (cellar and garret not not included), and found most of them nine inches and a half, and some ten inches thick; therefore it is by no means furprifing, that violent hurricanes fometimes make the brick gable-ends to vibrate apparently, especially on such houses as have a very open fituation. And fince the cedar trees will foon be wanting in this country, and the prefent roofs when rotten must be supplied with heavier ones of tiles, or of other wood, it is more than probable, that the thin walls will not be able to bear fuch an additional weight, and will either break or require to be supported by props: or else the whole house must be pulled down and rebuilt with thicker walls. This observation has already been made by others. Some of the people here make use of the chips of white cedar inflead of tea, affuring me that they preferred it in regard to its wholesomeness to all foreign tea. All the inhabitants here were of opinion, that the water in the cedar fwamps is wholefomer than any other drink; it creates a great appetite, which they endeavoured to prove by feveral examples. They ascribed this quality to the water itself, which is filled with the rosin of the trees, and to the exhalations which came from the trees, and can eafily be fmelled. The people likewise thought that the vellowish colour of the water, which stands between the cedar trees, was owing to the rosin, which comes out of the roots of these trees. They likewise all agreed, that this water is always very cold in the hottest feason, which may be partly owing to the continual fhade it is in. I knew feveral people who were refolved to go to these cedar fwamps, and use the waters for the recovery of their appetite. Mr. Bartram planted a white cedar in a dry foil, but it could not fucceed there: he then put it into a fwampy ground, where it got as it were new life, and came on very well; and though it was not taller than a man, yet it was full of cones. Another thing is very remarkable, with regard to the propagation of this tree: Mr. Bartram cut its branches in spring two years fuccessively, and put them into the swampy foil, where they struck roots, and fucceeded very well. I have feen them myfelf.

The red juniper-tree is another tree which I have mentioned very frequently in the course of my account. The Swedes have given it the name of red juniper, because the wood is very red and fine within. The English call it red cedar, and the French cedre rouge. However, the Swedish name is the most proper, as the tree belongs to the junipers *. At its first growth it has a deal of similarity to the Swedish juniper †,

^{*} Juniperus Virginiana. Lin. Spec. pl. p. 114. † Juniperus communis. Linn. Spec. pl. p. 1470.

but after it is grown up it gets quite different leaves. The berry exactly refembles that of the Swedish juniper, in regard to its colour and shape; however, they are not fo big, though the red cedar grows very tall. At Raccoon these trees stood single, and were not very tall. But at other places I have feen them standing together in clusters; they like the fame ground as the common Swedish juniper, especially on the rifing banks of rivers, and on other rifing grounds, in a dry, and frequently in a poor foil. I have feen them growing in abundance, as thick and tall as the tallest fir-trees, on poor dry and fandy heaths. Towards Canada, or in the most northerly places, where I have feen them, they commonly choose the steep sides of the mountains, and there they grow promiscuously with the common juniper. The most northerly places where I have found them wild in the woods, is in Canada, eighteen French miles to the fouthward of the Fort Saint Jean, or St. John, in about 44° 35' north latitude. I have likewife feen it growing very well in a garden, on the island of Magdalene*, belonging to the then governor of Montreal, Monsieur le Baron de Longueil. But it had been got at more foutherly places, and was transplanted here. Of all the woods in this country, this is without exception the most durable, and withstands putrefaction longer than any other; it is therefore employed in all fuch cases where it is most liable to rot, especially for all kinds of posts which are to be put into the ground. Some people fay, that if an iron be put into the ground along with a pole of cedar, the iron would be half corroded by rust in the same time that the wood would be rotten. In many places both the fences, and the posts belonging to them, are made of red cedar. The best canoes, confisting of a single piece of wood, are made of red cedar; for they last longer than any others, and are very light. In New York I have feen pretty large yachts built of red cedar. Several yachts which go from New York to Albany, up the river Hudson, are built in a different manner, as I have mentioned in the first volume †. In Philadelphia they cannot make any yachts or other boats of red cedar, because the quantity and the fize of the trees will not allow of it. For the fame reason they do not roof their houses with red cedar shingles; but in such places where it is plentiful, it makes excellent good roofs. The heart of this cedar is of a fine red colour, and whatever is made of it looks very fine, and has a very agreeable and wholesome smell. But the colour fades by degrees, or elfe the wood would be exceedingly proper for cabinet work. I faw a parlour in the country feat of Mr. Norris, one of the members of the Penfylvanian house of affembly, wainfcotted many years ago with boards of red cedar. Mr. Norris affured me that the cedar looked exceedingly well in the beginning, but it was quite faded when I faw it, and the boards looked very shabby, especially the boards near the window had entirely loft their colour; fo that Mr. Norris had been obliged to put mahogany in their flead: however, I was told, that the wood will keep its colour if a thin varnish is put upon it whilst it is fresh, and just after it has been planed, and if care is taken that the wood is not afterwards rubbed or hurt. At least it makes the wood keep its colour much longer than commonly. Since it has a very pleafant fmell when fresh, some people put the shavings and chips of it among their linen to secure it against being worm-eaten. Some likewise get bureaus, &c. made of red cedar, with the same view. But it is only useful for this purpose as long as it is fresh, for it loses its fmell after fome time, and is then no longer good for keeping off infects. It is fometimes fent to England, as timber, and fells very well. In many places round Philadelphia,

^{*} An island in the river St. Lawrence, close by the town of Montreal in Canada.

[†] The lower part of the yachts, which is continually under water, is made of black oak; the upper part is built of red cedar, because it is sometimes above and sometimes in the water.

in the feats of the gentry, there was commonly an avenue, with a row of thefe trees planted on both fides, leading from the high road to the house. The lower branches were cut, and only a fine crown left. In winter, when most other trees have lost their leaves, this looks very fine. This tree has likewise a very flow growth; for a stem, thirteen inches and a quarter in diameter, had one hundred and eighty-eight rings, or annual circles; and another, eighteen inches in diameter, had at least two hundred and fifty, for a great number of the rings were so fine that they could not be counted. This tree is propagated in the same manner as the common juniper-tree is in Sweden, viz. chiefly by birds, which eat the berries and emit the seeds entire.

In the evening I returned to Raccoon.

May 6th. The mulberry-trees (morus rubra) about this time began to bloffom, but their leaves were yet very small. The people divided them into male and semale trees or flowers; and said that those which never bore any fruit were males, and those

which did, females.

Smilax laurifolia was superabundant in all the swamps near this place. leaves were now beginning to come out, for it sheds them all every winter; it climbs up along trees and fhrubs, and runs acrofs from one tree or bush to another: by this means it shuts up the passage between the trees, fastening itself every where with its cirrhi or tendrils, and even on people, so it is with the utmost difficulty one must force a passage in the swamps and woods, where it is plentiful; the stalk towards the bottom is full of long spines, which are as strong as the spines of a rose-bush, and catch hold of the clothes, and tear them: this troublefome plant may fometimes bring you into imminent danger, when botanizing or going into the woods, for, not to mention that the cloaths must be absolutely ruined by its numberless spines, it occasions a deep shade in the woods, by croffing from tree to tree so often; this forces you to stoop, and even to creep on all fours through the little paffages which are left close to the ground, and then you cannot be careful enough to prevent a fnake (of which there are numbers here) from darting into your face. The stalk of the plant has the same colour as the young rofe-bushes. It is quite green and smooth between the spines; so that a stranger would take it to be a kind of thorn-bush, in winter, when it is destitute of leaves.

May 8th. The trees hereabouts were now stocked with innumerable caterpillars; one kind especially was observable, which is worse than all the others. They immediately formed great white webs, between the branches of the trees, fo that they were perceptible, even at a distance; in each of these webs were thousands of caterpillars, which crept out of them afterwards, and spread chiefly upon the apple-trees. They confumed the leaves, and often left not one on a whole branch. I was told, that fome years ago they did fo much damage, that the apple-trees and peach-trees hardly bore any fruit at all; because they had confumed all the leaves, and exposed the naked trees to the intense heat of the fun, by which means several of the trees died. Thepeople took the following method of killing these caterpillars: They fixed some straw or flax on a pole, fet it on fire, and held it under the web or nests; by which a part was burnt, and a part fell to the ground. However, numbers of the caterpillars crept up the trees again, which could have been prevented, if they had been trod upon, or killed any other way. I called chickens to fuch places where they crept on the ground in numbers; but they would not eat them. Nor did the wild birds like them; for the trees were full of thefe webs, though whole flights of little birds had their nefts in the gardens and orchards.

May 18th. Though it was already pretty late in May, yet the nights were very dark here. About an hour after fun-fet, it was fo dark, that it was impossible to read in a book,

book, though the type was ever fo large. About ten o'clock, on a clear night, the dark was fo much increased, that it looked like one of the darkest star-light nights in autumn, in Sweden. It likewise seemed to me, that though the nights were clear, yet the stars did not give so great a light as they do in Sweden. And as, about this time, the nights are commonly dark, and the sky covered with clouds; I could compare them only to dark and cloudy Swedish winter nights. It was therefore, at this time of the year, very difficult to travel in such cloudy nights; for neither man nor horse could find their way. The nights, in general, seem very disagreeable to me, in comparison to the light and glorious summer nights of Sweden. Ignorance sometimes makes us think slightly of our country. If other countries have their advantages, Sweden is not destitute of matter to boast of on this head: it likewise has its peculiar advantages; and upon weighing the advantages and inconveniencies of different places, Sweden will be found to be not inferior to any of them.

I will briefly mention in what points I think Sweden is preferable to this part of

America; and why I prefer Old Sweden to New Sweden.

The nights are very dark here all the fummer; and in winter, they are quite as dark, if not darker, than the winter nights in Sweden; for here is no kind of aurora borealis, and the stars give a very faint light. It is very remarkable if an aurora borealis appears once or twice a year. The winters here bring no fnow, to make the nights clear, and to make travelling more fafe and eafy. The cold is, however, frequently as intense as in Old Sweden. The snow which falls lies only a few days, and always goes off with a great deal of wet. The rattle-fnakes, horned-fnakes, red-bellied, green, and other poisonous fnakes, against whose bite there is frequently no remedy, are in great plenty here. To these I must add the wood-lice, with which the forests are fo peftered, that it is impossible to pass through a bush without having a whole army of them on your cloaths, or to fit down, though the place be ever fo pleafant. The weather is fo inconstant here, that when a day is most excessively hot, the next is often fenfibly cold. This fudden change often happens in one day; and few people can fuffer these changes, without impairing their health. The heat in summer is exceflive, and the cold in winter often very piercing, but may be guarded against. But when the great heat endures long, there is hardly any remedy for it. It has frequently happened, that people who walked into the fields, dropped down dead, on account of the violence of the heat. Several diffempers prevail here; and they increase every year. Nobody is left unattacked by the intermitting fever; and many people are forced to fuffer it every year, together with other diseases. Pease cannot be fown, on account of the infects which confume them*. There are worms in the grains of rye, and numbers of them are in the cherry-trees. The caterpillars often eat all the leaves from the trees, fo that they cannot bear fruit in that year; and numbers die every year, both of fruit-trees and forest-trees. The grass in the meadows is likewise consumed by a kind of worms, and other species cause the plumbs to drop before they are half ripe. The oak here affords not near fo good timber as the European oak. The houses are of no long duration. The meadows are poor, and what grafs they have is bad. The pafture for cattle in the forests consists of such plants as they do not like, and which they are compelled to cat by necessity; for it is difficult to find a fingle grass in great forests, where the trees stand far asunder, notwithstanding the foil is excellent. For this reason, the cattle are forced, during almost the whole winter and part of the summer, to live upon the young shoots and branches of trees, which sometimes have no leaves: therefore, the cows give very little milk, and decrease in fize every generation. The houses

are extremely unfit for winter habitations. Hurricanes are frequent, which overthrow trees, carry away roofs, and fometimes houses, and do a great deal of damage. Some of these inconveniences might be remedied by art; but others will either admit of no alteration, or they will at least cost vast trouble. Thus every country has its advantages, and

its defects: happy is he who can content himfelf with his own.

The rye grows very ill in most of the fields, which is chiefly owing to the carelessines in agriculture, and to the poorness of the fields, which are seldom or never manured. After the inhabitants have converted a tract of land into fields, which had been a forest for many centuries together, and which confequently had a very fine foil, they use it as fuch, as long as it will bear any corn; and when it ceases to bear any, they turn it into pastures for the cattle, and take new corn-fields in another place, where a fine foil can be met with, and where it has never been made use of for this purpose. This kind of agriculture will do for fome time; but it will afterwards have bad confequences, as every one may clearly fee. A few of the inhabitants, however, treated their fields a little better: the English in general have carried agriculture to a higher degree of perfection than any other nation. But the depth and riches of the foil, which those found here who came over from England, (as they were preparing land for ploughing which had been covered with woods from times immemorial) misled them, and made them careless husbandmen. It is well known, that the Indians lived in this country for feveral centuries before the Europeans came into it; but it is likewife known, that they lived chiefly by hunting and fishing, and had hardly any fields. They planted maize, and foine species of beans and gourds; and at the same time it is certain, that a plantation of fuch vegetables as ferve an Indian family during one year, take up no more ground than a farmer in our country takes to plant cabbage for his family upon; at leaft, a farmer's cabbage and turnip ground, taken together, is always as extensive, if not more fo, than the corn-fields and kitchen-gardens of an Indian family. Therefore, the Indians could hardly fubfift for one month upon the produce of their gardens and fields. Commonly, the little villages of Indians are about twelve or eighteen miles diftant from each other. From hence one may judge how little ground was formerly employed for corn-fields; and the rest was overgrown with thick and tall trees. And though they cleared (as is yet usual) new ground, as foon as the old had quite lost its fertility, yet fuch little pieces as they made use of were very inconsiderable when compared to the vast forests which remained. Thus the upper fertile foil increased confiderably for centuries together; and the Europeans coming to America found a rich and fine foil before them, lying as loofe between the trees as the best bed in a garden. They had nothing to do but to cut down the wood, put it up in heaps, and to clear the dead leaves away. They could then immediately proceed to ploughing, which in fuch loofe ground is very eafy; and having fown their corn, they got a most plentiful harvest. This easy method of getting a rich crop has spoiled the English and other European inhabitants, and induced them to adopt the fame method of agriculture which the Indians make ufe of; that is, to fow uncultivated grounds, as long as they will produce a crop without manuring, but to turn them into pastures as foon as they can bear no more, and to take in hand new fpots of ground, covered fince time immemorial with woods, which have been fpared by the fire or the hatchet ever fince the creation. This is likewife the reason why agriculture, and the knowledge of this useful branch, is fo imperfect here, that one can learn nothing in a great tract of land, neither of the English, nor of the Swedes, Germans, Dutch, and French; except that, from their groß miltakes and careleffness for futurity, one finds opportunities every day of making all forts of observations, and of growing wife at the expence of other people.

In a word, the corn-fields, the meadows, the forests, the cattle, &c. are treated with great carelessness by the inhabitants. We can hardly be more lavish of our woods in Sweden and Finland than they are here: their eyes are fixed upon the prefent gain, and they are blind to futurity. Every day their cattle are harraffed by labour, and each generation decreases in goodness and fize, by being kept short of food, as I have before mentioned. On my travels in this country I observed several plants which the horses and cows preferred to all others. They were wild in this country, and likewife grew well on the drieft and poorest ground, where no other plants would succeed. But the inhabitants did not know how to turn this to their advantage, owing to the little account made of Natural History, that science being here (as in other parts of the world) looked upon as a mere trifle, and the pastime of fools. I am certain, and my certainty is founded upon experience, that by mean of these plants, in the space of a few years, I have been able to turn the poorest ground, which would hardly afford food for a cow, into the richeft and most fertile meadow, where great flocks of cattle have found superfluous food, and are grown fat upon. I own, that these useful plants were not to be found on the grounds of every planter; but with a fmall share of natural knowledge, a man would eafily collect them in the places where they were to be got. I was aftonished, when I heard the country people complaining of the badness of the pastures; but I likewise perceived their negligence, and often faw excellent plants growing on their own grounds, which only required a little more attention and affiftance from their unexperienced owners. I found every where the wifdom and goodness of the Creator; but too feldom saw any acknowledgment, or adequate estimation of it, among men.

> O fortunatos nimium sua si bona norint Agricolas! VIRG. Georgic.

I have been led to these reslections, which may perhaps seem foreign to my purpose, by the bad and neglected state of agriculture in every part of this continent. I likewise intended to shew the reason why this journal is so thinly stocked with economical advantages in the several branches of husbandry. I do not however deny that I have sometimes found one or two skilful economists, but they were very scarce.

Birds of prey which pursue the poultry are found in abundance here, and if possible more plentiful than in Sweden. They enjoy great liberty here, as there are still great forests in many places, from whence they can come unawares upon chickens and ducks. To the birds of prey it is quite indifferent whether the woods consist of good or bad trees, provided they are in shade. At night the owls, which are very numerous, endanger the safety of the tame sowls. They live chicsly in marshes, give a disagreeable shriek at night, and attack the chickens, which commonly rooft at night in the apple-trees, peach-trees, and cherry-trees, in the garden. But since they are very busy in clearing this country of woods, as we are in Sweden and Finland, it may be of use for exposing the birds of prey, more than they are now, and for depriving them of the opportunities of doing mischief with so much ease.

The thick forests of America contain numbers of stags; they do not seem to be a different species from the European stags. An Englishman was possessed of a tame hind. It is observable that though these creatures are very shy when wild in the woods and codar swamps, which are very much frequented by them, yet they can be tamed to such a degree, if taken young, that they will come of their own accord to seek for food. This hind was caught when it was but very little; the colour of the whole body was a dirty reddish brown, the belly and the under side of the tail excepted, which were white; the ears were grey; the head, towards the snout, was very narrow; but

upon the whole the creature looked very fine. The hair lay close together, and was quite short; the tail reached almost to the bend of the knee, near which, on the inside of each hind-foot, was a knob or callus. The possessor of the hind faid that he had tamed feveral stags, by catching them whilft they were very young. It was now big with young ones. It had a little bell hung about its neck, that by walking in the woods, the people might know it to be tame, and take care not to fhoot it. It was at liberty to go where it pleafed, and to keep it confined would have been a pretty hard task, as it could leap over the highest enclosures. Sometimes it went far into the woods, and frequently staid away a night or two, but afterwards returned home like other cattle. When it went into the woods, it was often accompanied by wild stags, and decoyed them even into the very houses, especially in rutting time, giving its master numerous opportunities of shooting the wild stags, almost at his door. Its scent was excellent, and when it was turned towards the wind, I often faw it rifing and looking towards that part, though I did not fee any people on the road, but they commonly appeared about an hour after. As foon as the wild stags have the scent of a man, they make off. In winter the man fed the hind with corn and hay; but in fummer it went out into the woods and meadows, feeking its own food, eating both grafs and other plants: it was now kept in a meadow; it did chiefly eat clover, the leaves of hiccory, of the andromeda paniculata, and the geranium maculatum. It was likewife contented with the leaves of the common plantane, or plantago, graffes, and feveral other plants. The possession of this hind fold stags to people in Philadelphia, who sent them as curiofities to other places. He got twenty-five, thirty, and forty shillings a-piece for them. In the long and fevere winter, which commenced here upon the tenth of December 1740, and continued to the thirteenth of March, old style, during the course of which there fell a great quantity of fnow, the stags were found dead in the fnow, but chiefly higher up the country, where the fnow was deeper. Nobody could determine whether their death was the confequence of the great quantity and depth of fnow, which hindered their getting out, or whether the frost had been too fevere, and of too long duration, or whether they were short of food. The old people likewise relate that vast numbers of stags came down in the year 1705, when there was a heavy fall of fnow, near a yard deep, and that they were afterwards found dead in the woods, in great numbers, because the snow was deeper than they could pass through. Numbers of birds were likewife found dead at that time. In that fame winter a ftag came to Matfong into the ftables, and eat hay together with the cattle. It was so pinched by hunger that it grew tame immediately, and did not run away from people. It afterwards continued in the house, as another tame creature. All aged persons afferted, that formerly this country abounded more with stags than it does at present. It was formerly not uncommon to see thirty or forty of them in a slock together. The reason of their decrease is chiefly owing to the increase of population, the destruction of the woods, and the number of people who kill and frighten the stags at present. However, high up in the country, in great forests and desarts, there are yet great numbers of them. Among their enemies is the lynx of this country, which is the same with the Swedish one*. They climb up the trees, and when the stags pass by, they dart down upon him, get fast hold, bite, and suck the blood, and never give over till they have killed it.

I faw

^{*} Warglo; felis lynx Linn. The Swedes mention two kinds of lynx; the one is called the warglo, or wolf-lynx, and the other the kattlo, or cat-lynx. The Germans make the fame diffinction, and call the former wolf-luchs, and the latter katz-luchs: the former is the biggeft, of a brownish red, mixed with grey and white on its back, and white towards the belly, with brownish spots; the latter is smaller, and has a coat which is more white, and with more spots. F.

I faw feveral holes in the ground, both on hills and on fields, and fallow grounds; they were round, and commonly about an inch wide; they went almost perpendicularly into the earth, and were made by dung-beetles, or by great worms, which are made use of for angling. The dung-beetles had dug very deep into the ground, through horse-dung, though it lay on the hardest road, so that a great heap of earth lay near it. These holes were afterwards occupied by other insects, especially grashoppers, (grylli) and cicadæ; for by digging these holes up, I commonly sound one or more young ones of

these insects, which had not yet got their perfect size.

May 19th. This morning I left Raccoon, a parish in the country called New Sweden, and which is yet chiesly inhabited by Swedes, in order to proceed in my travels to the North. I first intended to set out with the beginning of April, but for several reasons this was not advisable. No leaves were come out at that time, and hardly any flowers appeared. I did not know what slowers grew here in spring; for the autumnal plants are different from the vernal ones. The Swedes had this winter told me the economical and medical uses of many plants, to which they gave names unknown to me: they could not then shew me those plants on account of the season, and by their deficient and erroneous descriptions, I was not able to guess what plants they meant. By going away so early as the beginning of April I would have remained in uncertainty in regard to these things. It was therefore fit that I should spend a part of the spring at Raccoon, especially as I had still time enough left for my tour to the North.

On the road we faw a black fnake, which we killed, and found just five feet long. Catesby has described it and its qualities, and also drawn it*. The full-grown black snakes are commonly about five feet long, but very slender; the thickest I ever saw was in the broadest part hardly three inches thick; the back is black, shining, and smooth; the chin white and smooth; the belly whitish turning into blue, shining, and very smooth; I believe there are some varieties of this snake. One, which was nineteen inches long, had a hundred and eighty-fix scales on the belly, (scuta abdominalia) and ninety-two half scales on the tail (squamæ subcaudales), which I sound to be true, by a repeated counting of the scales. Another, which was seventeen inches and a half in length, had a hundred and eighty-four scales on the belly, and only sixty-four half scales on the tail; this I likewise assured myself of, by counting the scales over again. It is possible that the end of this last snake's tail was cut off, and the wound healed up again †.

The country abounds with black fnakes. They are among the first that come out in spring, and often appear very early if warm weather happens; but if it grows cold again after that, they are quite frozen, and lie stiff and torpid on the ground or on the ice; when taken in this state and put before a fire, they revive in less than an hour's time. It has sometimes happened, when the beginning of January is very warm, that

^{*} Anguis niger. See Catesby's Nat. Hist. of Carol. ii. t. 48.

[†] It has been found by repeated experience, that the specific character employed by Dr. Linnzus, for the distinction of the species of snakes, taken from their scuta abdominalia and caudalia, or their squame subcaudales, varies greatly in snakes of the same species, so that often the difference amounts to ten or more: the whole number of the scuta sometimes helps to find out the species; care ought however to be taken that the snake may not by any accident have lost its tail, and that it be growing again; in which case it is impossible to make use of this character. The character is not quite so good and decisive as may be wished, but neither are the marks taken from colours, spots, stripes, &c. quite constant; and so it is better to make use of an impersect character than none at all. Time, and greater acquaintance with this class of animals may perhaps clear up their natural characters. F.

they come out of their winter habitations. They commonly appear about the end of

March, old style.

This is the fwiftest of all the snakes which are to be found here, for it moves so quick that a dog can hardly catch it. It is therefore almost impossible for a man to escape it if pursued; but happily its bite is neither poisonous nor any way dangerous; many people have been bit by it in the woods, and have fcarce felt any more inconvenience than if they had been wounded by a knife; the wounded place only remains painful for some time. The black snakes seldom do any harm, except in spring, when they copulate; at which time, if disturbed, they will attack the person that disturbs them. I am acquainted with feveral people, who have on fuch an occasion run so hard as to be quite out of breath, in endeavouring to escape the snake, which moved with the swiftness of an arrow after them. If a person thus pursued can muster up courage enough to oppose the snake with a stick or any thing else, when it is either passed by him, or when he steps aside to avoid it, it will turn back again, and seek a refuge in its swiftness. I have been affured by several, that when it overtakes a person who has tried to escape it, and who has not courage enough to oppose it, it winds round his feet, so as to make him fall down; it then bites him several times in the leg, or whatever part it can get hold of, and goes off again. I shall mention two circumstances. which confirm what I have faid. During my stay in New York, Doctor Colden told me, that in the fpring 1748, he had feveral workmen at his country feat, and among them one lately arrived from Europe, who of course knew very little of the qualities of the black fnake. The other workmen feeing a great black fnake copulating with its female, engaged the new comer to go and kill it, which he intended to do with a little stick. But on approaching the place where the fnakes lie, they perceived him, and the male in great wrath leaves his pleasure to pursue the fellow with amazing swiftness; he little expected fuch courage in the fnake, and flinging away his flick, began to run as fast as he was able. The fnake purfued him, overtook him, and twisting feveral times round his feet, threw him down, and frightened him almost out of his senses; he could not get rid of the fnake, till he took a knife and cut it through in two or three places. The other workmen were rejoiced at this fight, and laughed at it, without offering to help their companion. Many people at Albany told me of an accident which happened to a young lady, who went out of town in fummer, together with many other girls, attended by her negro. She fat down in the wood, in a place where the others were running about, and before she was aware, a black snake being disturbed in its amours, ran under her petticoats, and twifted round her waift, so that she fell backwards in a fwoon, occasioned by her fright or by the compression which the snake caused. The negro came up to her, and suspecting that a black snake might have hurt her, on making use of a remedy to bring his lady to herself again, he lifted up her cloaths, and really found the fnake wound about her body as close as possible; the negro was not able to tear it away, and therefore cut it, and the girl came to herself again; but she conceived so great an aversion to the negro, that she could not bear the fight of him afterwards, and died of a confumption. At other times of the year this fnake is more apt to run away than to attack people. However, I have heard it afferted frequently, that even in fummer when its time of copulation is past, it pursues people, especially children, if it finds that they are afraid and run from it. Several people likewife affured me from their own experience, that it may be provoked to purfue people, if they throw at it, and then run away. I cannot well doubt of this, as I have heard it faid by numbers of creditable people; but though I wanted to try the experiment I could never fucceed in provoking them. Most

Most of the people in this country ascribed to this snake a power of fascinating birds and fquirrels, as I have described in several parts of my journal. When the snake lies under a tree, and has fixed his eyes on a bird or fquirrel above; it obliges them to come down, and to go directly into its mouth. I cannot account for this, for I never faw it done. However, I have a lift of more than twenty perfons, among which are fome of the most creditable people, who have all unanimously, though living far distant from each other, afferted the fame thing; they affured me, upon their honour, that they have feen (at feveral times) these black snakes fascinating squirrels and birds which fat on the tops of trees, the fnake lying at the foot of the tree, with its eyes fixed upon the bird or fquirrel, which fits above it, and utters a doleful note; from which it is eafy to conclude with certainty that it is about to be fascinated, though you cannot see it. The bird or fquirrel runs up and down along the tree continuing its plaintive fong, and always comes nearer the fnake, whose eyes are unalterably fixed upon it. It should frem as if these poor creatures endeavoured to escape the snake, by hopping or running up the tree; but there appears to be a power which withholds them: they are forced downwards, and each time that they turn back they approach nearer their enemy, till they are at last forced to leap into its mouth, which stands wide open for that purpose. Numbers of squirrels and birds are continually running and hopping fearless in the woods on the ground, where the snakes lie in wait for them, and can eafily give these poor creatures a mortal bite. Therefore it seems that this sascination might be thus interpreted, that the creature has first got a mortal wound from the make, which is fure of her bite, and lies quiet, being affured that the wounded creature has been poisoned with the bite, or at least feels pain from the violence of the bite, and that it will at last be obliged to come down into its mouth. The plaintive note is perhaps occasioned by the acuteness of the pain which the wound gives the creature. But to this it may be objected, that the bite of the black fnake is not poisonous; it may further be objected, that if the fnake could come near enough to a bird or fquirrel to give it a mortal bite, it might as eafily keep hold of it, or, as it fometimes does with poultry, twist round and strangle or stifle it. But the chief objection which lies against this interpretation is the following account, which I received from the most creditable people, who have affured me of it. The fquirrel being upon the point of running into the fnake's mouth, the fpectators have not been able to let it come to that pitch, but killed the fnake, and as foon as it had got a mortal blow the fquirrel or bird deftined for destruction flew away, and left off their mounful note, as if they had broke loose from a net. Some fay, that if they only touched the fnake, fo as to draw off its attention from the fquirrel, it went off quickly, not stopping till it had got to a great diffance. Why do the fquirrels or birds go away fo fuddenly, and why no fooner? If they had been poisoned or bitten by the snake before, so as not to be able to get from the tree, and to be forced to approach the fnake always more and more, they could however not get new strength by the snake being either killed or diverted. Therefore, it feems that they are only enchanted, whilft the fnake has its eyes fixed on them. However, this looks odd and unaccountable, though many of the worthiest and most reputable people have related it, and though it is fo univerfally believed here, that to doubt it would be to expose oneself to general laughter.

The black fnakes kill the fmaller species of frogs, and cat them. If they get at eggs of poultry, or of other birds, they make holes in them, and suck the contents. When the hens are sitting on the eggs they creep into the nest, wind round the birds, stiffle them, and suck the eggs. Mr. Bartram asserted, that he had often seen this snake creep up into the tallest trees, after birds' eggs, or young birds, always with the

head foremost, when descending. A Swede told me, that a black snake had once got the head of one of his hens in its mouth, and was wound several times round the body,

when he came and killed the fnake. The hen was afterwards as well as ever.

This fnake is very greedy of milk, and it is difficult to keep it out when it is once used to go into a cellar where milk is kept. It has been seen eating milk out of the same dish with children, without biting them, though they often gave it blows with the spoon upon the head, when it was over greedy. I never heard it hissing. It can raise more than one half of its body from the ground, in order to look about her. It skins every year; and its skin is said to be a remedy against the cramp, if continually worn about the body.

The rye was now beginning to flower.

I have often observed with astonishment, on my travels, the great difference between the plants and the soil, on the two opposite banks of brooks. Sometimes a brook, which one can stride over, has plants on one bank widely different from those on the opposite bank. Therefore, whenever I came to a great brook or a river, I expected to find plants which I had not met with before. Their feeds are carried down with the stream from distant parts. The soil is likewise very often different on the different sides of a rivulet, being rich and fertile on the one, and dry, barren, and sandy on the other. But a great river can make still greater differences. Thus we see the great disparity between the province of Pensylvania and New Jersey, which are only divided by the river Delaware. In Pensylvania the soil consists of a mould mixed with sand and clay, and is very rich and fertile; and in the woods which are high in the country, the ground is mountainous and stony. On the other hand, in the province of New Jersey, the soil is poor and dry, and not very fertile, some parts excepted. You can hardly find a stone in New Jersey, and much less mountains. In Pensylvania you scarce ever see a fir-tree, and in New Jersey are whole woods of it.

This evening I arrived at Philadelphia.

May 22d. The locusts began to creep out of their holes in the ground last night, and continued to do so to-day. As soon as their wings were dry, they began their song, which is almost sufficient to make one deaf, when travelling through the woods. This year there was an immense number of them.

May 25th. The tulip-tree (liriodendron tulipifera) was now in full bloffom. The flowers have a refemblance to tulips, and look very fine, and though they have not a very agreeable finell, yet the eye is pleafed to fee trees as tall as full-grown oaks,

covered with tulip-like flowers.

On the flowers of the tulip-tree was an olive-coloured chafer (fcarabæus), without horns (muticus), the future and borders of his wing-shells (elytræ) were black, and his thighs brown. I cannot with certainty say whether they collected the pollen of the flower, or whether they coupled. Later in summer, I saw the same kind of beetles make deep holes into the ripe mulberries, either to eat them, or to lay their eggs in them. I likewise found them abundant in the leaves of the magnolia glauca, or beavertree.

The strawberries were now ripe on the hills.

The country people already brought ripe cherries up to town; but they were only

a few to fatisfy curiofity, yet we may form a judgment of the climate from hence.

May 26th. A peculiar kind of from called a travat, or travado, happened to-day. In the evening about ten o'clock, when the fky was quite clear, a thick black cloud came rufhing from the fouth-west, with a wind. The air was quite calm, and we could not feel any breeze; but the approach of this cloud was perceived from the strong

rushing noise in the woods to the south-west, and which increased in proportion as the cloud came nearer. As soon as it was come up to us, it was attended by a violent gust of wind, which in its course threw down the weaker enclosures, carried them a good way along with it, and broke down several trees. It was then followed by a hard shower of rain, which put an end to the storm, and every thing was calm as before. These travadoes are frequent in summer, and have the quality of cooling the air. However, they often do a great deal of damage; they are commonly attended by thunder and lightning; as soon as they are passed over the sky is as clear as it was before.

May 28th. The magnolia glauca was now in full bloom. Its flowers have a very pleafant fragrancy, which refreshes the travellers in the woods, especially towards the evening. The flowers of the wild vine afterwards supplied the place of those of the magnolia. Several other flowers contribute likewise towards perfuming the ambient air.

The kalmia angustifolia was now every where in flower: it grows chiesly on fandy heaths or on dry poor grounds, which sew other plants will agree with; it is common in Pensylvania, but particularly in New Jersey and the province of New York; it is scarce in Canada; its leaves stay the winter; the flowers are a real ornament to the woods; they grow in bunches like crowns, and are of a fine lively purple colour; at the bottom is a circle of deep purple, and within it a greyish or whitish colour. The flowers grow as aforesaid, in bunches, round the extremity of the stalk, and make it look like a decorated pyramid. The English at New York, call this plant the dwarf laurel. Its qualities are the same with those of the kalmia latisolia, viz. that it kills sheep and other smaller animals, when they cat plentifully of it. I do not know whether it is noxious to the greater cattle. It is not of any known use, and only serves to attract the eye whilst in slower.

The kalmia latifolia was likewife in full bloffom at prefent: it rivals the preceding one in the beauty of its colour; yet though they are confpicuous in regard to the colours and shape of their flowers, they are no ways remarkable for smell, such as the magnolia is; for they have little or no smell at all. So equally and justly does nature distribute her gifts; no part of the creation has them all, each has its own, and none is

absolutely without a share of them.

May 30th. The Moravian brethren, who arrived in great numbers from Europe at New York, in May, brought two converted Greenlanders with them. The Moravians who were already fettled in America, immediately fent fome of their brethren from Philadelphia to the new comers, in order to welcome them. Among these deputies were two North American Indians, who had been converted to their doctrine, and likewise two South American Indians, from Surinam. These three kinds of converted Indians accordingly met at New York. I had no opportunity of seeing them; but all those who had seen them, and whom I conversed with, thought that they had plainly perceived a similarity in their features and shape, the Greenlanders being only somewhat smaller. They concluded from hence that all these three kinds of Americans were the posterity of one and the same descendant of Noah, or that they were perhaps yet more nearly related. How far their guesses are to be relied upon I cannot determine.

Ripe cherries were now already pretty common, and confequently cheap.

Yams are a species of roots which are cultivated in the hottest parts of America, for eating as we do potatoes. It has not yet been attempted to plant them here, and they are brought from the West Indies in ships; therefore they are reckoned a rarity here,

and as fuch I ate them at Dr. Franklin's to-day. They are white, and tafte like common potatoes, but not quite so agreeable; and I think it would not be worth while to plant them in Sweden, though they might bear the climate. The plant these roots

belong to is the diofcorea alata.

The inhabitants make plenty of cheefe: they are not reckoned fo good as English cheefe: however, some take them to be full as good when old; and so they seemed to me. A man from Boston, in New England, told me, that they made very good cheefe there: but they take care to keep the cattle from falt water, especially those who live near the sea coasts; for it has been found that the cheese will not become so good when the cows graze near falt water as it will when they have fresh water. This, however, wants nearer examination, in my opinion.

May 31st. About noon I left Philadelphia, and went on board a small yacht, which sails continually up and down upon the river Delaware, between Trenton and Philadelphia. We sailed up the river with sair wind and weather. Sturgeons leaped often a fathom into the air. We saw them continuing this exercise all day, till we came to Trenton. The banks on the Pensylvanian side were low; and those on the New Jersey side steep and sandy, but not very high. On both sides were perceived forests of

tall trees, with deciduous leaves.

During the course of this month the forenoon was always calm; but immediately after noon it began to blow gently, and sometimes pretty strongly. This morning was likewise fair, and in the afternoon it was cloudy, but did not rain.

We faw fome finall houses near the shore, in the woods; and now and then a good house built of stone. The river now decreased visibly in breadth. About three

o'clock this afternoon we paffed Burlington.

Burlington, the chief town in the province of New Jerfey, and the refidence of the governor, is but a finall town, about twenty miles from Philadelphia, on the eaftern fide of the Delaware. The houses were chiefly built of stone, though they stood far distant from each other. The town has a good situation, since ships of considerable burthen can fail close up to it: but Philadelphia prevents its carrying on an extensive trade; for the proprietors of that place * have granted it great immunities, by which it is increased so as to swallow all the trade of the adjacent towns. The house of the governor at Burlington is but a small one: it is built of stone, close by the river side, and is the first building in the town as you come from Philadelphia. It is observed, that about the full moons, when the tides are highest, and the high water at Cape Hinlopen comes at nine o'clock in the morning, it will be at Chester, on the river Delaware, about ten minutes after one o'clock; at Philadelphia, about ten minutes after two o'clock; and at Burlington, about ten minutes after three o'clock; for the tide in the river Delaware comes quite up to Trenton.

The banks of the river were now chiefly high and steep on the side of New Jersey, consisting of a pale brick-coloured soil. On the Pensylvanian side they were gently sloping, and consisted of a blackish rich mould, mixed with particles of glimmer (mica). On the New Jersey side appeared some sirs; but seldom on the other, except in a few

places where they were accidentally brought over from New Jerfey.

Towards night, after the tide had begun to ebb, and the wind was quite fubfided, we could not proceed, but dropped our anchor about feven miles from Trenton, and paffed the night there. The woods were full of fireflies, (lampyris) which flew like sparks of fire between the trees, and fometimes across the river. In the marshes, the

bullfrogs now and then began their hideous roaring; and more than a hundred of them roared together. The whip-poor-will, or goat-fucker, was likewife heard every where.

June 1st. We continued our voyage this morning after the rain was over. The river Delaware was very narrow here, and the banks the same as we found them yesterday, after we had passed Burlington. About eight o'clock in the morning we arrived at Trenton.

June 2nd. This morning we left Trenton, and proceeded towards New York. The country I have described before. The fields were fown with wheat, rye, maize, oats, hemp, and flax. In several places we saw very large pieces of ground with hemp.

We faw abundance of chefnut-trees in the woods. They often stood in excessive

poor ground, which was neither too dry nor too wet.

Tulip-trees did not appear on the road; but the people faid there were some in the

The beaver-tree (magnolia glauca) grows in the fwamps. It was now in flower, and the fragrancy of its bloffoms had fo perfumed the air that one could enjoy it before one approached the fwamps; and this fine fmell likewife shewed that a beaver-tree was

near us, though we often happened not to fee it.

The phlox glaberrima grows abundantly in the woods, and cuts a fine figure with its red flowers. It grows in fuch foil here as in Europe is occupied by the lychnis vifcaria and lychnis dioica, or read catchfly and campion. The phlox maculata grows abundantly in wet ground, and has fine red and odoriferous flowers. It grows on low meadows, where in Europe the meadow-pinks, or lychnis flos cuculi, would be met with. By adding to these flowers the bartsia coccinea, the lobelia cardinalis, and the monarda didyma, which grow wild in this country, they are undoubtedly altogether adorned with the finest red imaginable.

The faffafras-tree was abundant in the woods and near the inclosures.

The houses which we passed by were most of them wooden. In one place, I saw the people building a house with walls of mere clay, which is likewise employed in making ovens for baking.

Buckwheat was already coming up in feveral places. We faw fingle plants of it all day in the woods and in the fields, but always by the fide of the road; from whence

it may be concluded that they fpring up from loft and scattered seeds.

Late this evening we arrived at New Brunfwick.

June the 3rd. At noon we went on board a yacht bound for New York, and failed down the river which had at first pretty high and steep banks of red fand-stone on each side, which I have mentioned before. Now and then there was a farm-house on the high shore. As we came lower down, we saw on both sides great fields and meadows close up to the water. We could not sail at random with the yacht; for the river was often shallow in some places and sometimes in the very middle. For that purpose, the course which we were to take was marked out by branches with leaves on them. At last we got into the sea, which bounded our prospect on the south; but on the other side, we were continually in sight of land at some distance. On coming to the mouth of the river, we had a choice of two roads to New York, viz. either within the Staten Island, or without it. The inhabitants are determined in their choice by the weather; for when it is stormy and cloudy, or dark, they do not venture to sail without, where the sea itself communicates. We took that course now, it being very pleasant weather; and though we struck on the sands once or twice, yet we got loose again, and arrived at New York about nine o'clock.

June

June 4th. I found vines in feveral gardens, got from the old countries. They bear annually a quantity of excellent grapes. When the winters are very fevere they are killed by the frost, and die quite to the ground; but the next spring new shoots spring up from the root.

Strawberries were now fold in abundance about the town every day. An Englishman from Jamaica afferted, that in that island there were no strawberries. The snakes are very fond of strawberries. Those which they had here were as good as the Swedish

and Finland ones.

Red clover was fown in feveral places on the hills without the town. The country people were now employed in mowing the meadows. Some were already mown; and the dry clover was put under cover, in order to be carried away the first opportunity.

Cherry-trees were planted in great quantities before the farm houses, and along the high-roads, from Philadelphia to New Brunswick; but behind that place they became more scarce. On coming to Staten Island, in the province of New York, I sound them very common again, near the gardens. Here are not so many varieties of cherries as there are in Pensylvania. I feldom saw any of the black sweet cherries * at New York; but commonly the sour red ones. All travellers are allowed to pluck ripe fruit as they pass by. Between New Brunswick and Staten Island, are a few cherry-gardens; but proportionarly more orchards, with apple-trees.

June 6th. Several gentlemen and merchants, between fifty and fixty years of age, afferted, that during their life they had plainly found feveral kinds of fish decrease in number every year; and that they could not get near so many fish now as they

could formerly.

Rum, a brandy prepared from the fugar-canes, and in great use with all the English North American colonies, is reckoned much wholesomer than brandy, made from wine or corn †. In confirmation of this opinion, they say, that if you put a piece of fresh meat into rum, and another into brandy, and leave them there for some months, that in the rum will keep as it was, but that in the brandy will be quite eaten, and full of holes. But this experiment does not seem a very accurate one to me. Major Roderfort told me, that being upon the Canada expedition, he had observed, that such of his men as drank brandy for some time died of it; but those who drank rum were not

hurt, though they got drunk with it every day, and oftener than the others.

Long Island is the name of an island opposite the town of New York, in the sea. The northern part of the island is much more fertile than the southern. Formerly there lived a number of Indians on this island; and there are yet some, which however decrease in number every year, because they leave the island. The soil of the southern part of the island is very poor; but this deficiency is made up by a vast quantity of oysters, lobsters, crabs, several kinds of sish, and numbers of water-sowl, all which are there far more abundant than on the northern shores of the island. Therefore the Indians formerly chose the southern part to live in, because they subsisted on oysters, and other productions of the sea. When the tide is out it is very easy to fill a whole cart with oysters, which have been driven on shore by one slood. The island is strewed

* Commonly called black-heart cherries.

[†] That rum is among the spirituous liquors less noxious than any one of the rest, is chiesly owing to the balfamic quality it gets from the sugar, which corrects the styptic quality all kinds of brandy and spirituous liquors have. The older the rum is, and the longer it has been kept in a great case, the more is its stypticity corrected. All which has been lately proved by the clearest experiments, explained and deducted from the most indisputable principles of chemistry, in a pamphlet written by that able chemist Mr. Dossie. F.

with oyster-shells and other shells, which the Indians left there; these shells serve now for good manure for the fields. The southern part of the island is turned into meadows, and the northern part into fields. The winter is more constant on the northern part, and the snow in spring lies longer there than on the southern part. The people are

very fertile here, and commonly tall and ftrong.

June 10th. At noon we left New York, and failed up the river Hudson, in a yacht bound for Albany. All this afternoon we faw a whole fleet of little boats returning from New York, whither they had brought provisions and other goods for fale, which on account of the extensive commerce of this town, and the great number of its inhabitants, go off very well. The river Hudfon runs from north to fouth here, except fome high pieces of land which fometimes project far into it, and alter its direction; its breadth at the mouth is reckoned about a mile and a quarter. Some porpoifes played and tumbled in the river. The eaftern shore, or the New York side, was at first very steep and high; but the western was very sloping and covered with woods. There appeared farm-houses on both fides, furrounded with corn-fields. The ground of which the fleep flores confifted was of a pale brick colour, and fome little rocks of a grey fand-stone were seen here and there. About ten or twelve miles from New York, the western shore appears quite different from what it was before; it consists of steep mountains with perpendicular fides towards the river, and they are exactly like the fleep fides of the mountains of Hall and Hunnebarg in West Gothland. Sometimes a rock projects like the falliant angle of a baltion: the tops of these mountains are covered with oaks, and other wood; a number of stones of all fizes lay along the shore, having rolled down from the mountains.

These high and steep mountains continue for some English miles on the western fhore; but on the eaftern fide the land is high, and fometimes diverfified with hills and vallies, which are commonly covered with deciduous trees, amongst which there appears a farm now and then in a glade. The hills are covered with stones in some places. About twelve miles from New York we faw flurgeons * (acipenfer flurio), leaping up out of the water, and on the whole passage we met with porpoises in the river. As we proceeded we found the eastern banks of the river very much cultivated; and a number of pretty farms, furrounded with orchards and fine corn-fields, prefented themselves to our view. About twenty-two miles from New York the high mountains which I have before mentioned left us, and made as it were a high ridge here from east to west quite across the country. This altered the face of the country on the western shore of the river: from mountainous, it became interspersed with little vallies and round hillocks, which were fcarce inhabited at all; but the eastern shore continued to afford us a delightful prospect. After failing a little while in the night, we cast our anchor and lay here till the morning, especially as the tide was ebbing with great force.

June 11th. This morning we continued our voyage up the river, with the tide and a faint breeze. We now passed the Highland mountains, which were to the east of us; they consist of a grey fand-stone, are very high and pretty steep, and covered with deciduous trees, and likewise with firs and red cedars. The western shore was full of rocks, which however did not come up to the height of the mountains on the opposite shore; the tops of these eastern mountains were cut off from our sight by a thick fog which surrounded them. The country was unsit for cultivation, being so full of rocks,

[•] The New York flurgeons which I faw this year brought over, had fhort blunt nofes, in which particular they are different from the English ones, which have long nofes. F.

and accordingly we faw no farms. The diffance from these mountains to New York

is computed at thirty-fix English miles.

A thick fog now rose up from the high mountains. For the space of some English miles we had hills and rocks on the western banks of the river; and a change of lesser and greater mountains and vallies covered with young firs, red cedars, and oaks, on the eaftern fide. The hills close to the river fide are commonly low, but their height increases as they are further from the river. Afterwards we saw, for some inites together, nothing but high round mountains and vallies, both covered with woods; the vallies are in reality nothing but low rocks, and fland perpendicular towards the river in many places. The breadth of the river is fometimes two or three musket-thot, but commonly not above one; every now and then we faw feveral kinds of fifh leaping out of the water. The wind vanished away about ten o'clock in the morning, and

forced us to get forwards with our oars, the tide being almost spent.

The water in the river has here no more a brackish taste; yet I was told that the tide, especially when the wind is south, sometimes carries the falt water up higher with it. The colour of the water was likewise altered, for it appeared darker here than before. To account for the first origin of rivers is very difficult, if not wholly impossible; some rivers may have come from a great refervoir of water, which being confiderably encreased by heavy falls of rain or other circumstances, passed its old bounds and flowed to the lower countries, through the places where it met with the least opposition. This is perhaps the reason why some rivers run in so many bendings equally through fields of foft earth, as likewife there, where mountains, rocks, and stones, divert their paffage. However, it feems that fome rivers derive their first origin from the creation itself, and that Providence then pointed out their course; for their existence can, in all probability, not be owing to the accidental eruption of water alone. Among these rivers we may rank the river Hudson: I was surprised on seeing its course, and the variety of its fhores. It takes its rife a good way above Albany, and descends to New York, in a direct line from north to fouth, which is a distance of about a hundred and fixty English miles, and perhaps more; for the little bendings which it makes are of no fignification. In many places between New York and Albany are ridges of high mountains running west and east. But it is remarkable that they go on undisturbed till they come to the river Hudson, which cuts directly across them, and frequently their fides fland perpendicular towards the river. There is an opening left in the chain of mountains, as broad as the river commonly is, for it to pass through, and the mountains go on as before, on the other fide, in the fame direction. It is likewife remarkable that the river in fuch places where it paffes through the mountains is as deep, and often deeper than in the other places. The perpendicular rocks on the fides of the river are furprifing, and it appears that if no passages had been opened by Providence, for the river to pass through, the mountains in the upper part of the country would have been inundated, fince these mountains, like so many dykes, would have hindered the water from going on. Quere, Why does this river go on in a direct line for so considerable a distance? Why do the many passages, through which the river flows acrofs the mountains, lie under the fame meridian? Why are water-falls near fome of these passages, or at least shallow water with a rocky ground?

We now perceived excessive high and steep mountains on both sides of the river, which echoed back each found we uttered. Yet notwithstanding they were so high

and steep, they were covered with small trees.

The Blue Mountains, which reared their towering tops above all theother mountains, were now feen before us, towards north, but at a great distance.

The

The country began here to look more cultivated, and less mountainous.

The last of the high western mountains is called Butterhill, after which the country between the mountains grows more spacious. The farms became very numerous, and we had a prospect of many corn-fields, between the hills: before we passed these hills we had the wind in our face, and we could only get forward by tacking, which went very slow, as the river was hardly a musket-shot in breadth. Afterwards we cast anchor, because we had both wind and tide against us.

Whilst we waited for the return of tide, and the change of wind, we went on

fhore.

The fassafras-tree (laurus fassafras) and the chesnut-tree grows here in great abundance. I found the tulip-tree (liriodendron tulipisera) in some parts of the wood, as likewise the kalmia latifolia, which was now in full blossom, though the slowers were

already withering.

Some time after noon the wind arofe from fouth-west, which being a fair wind, we weighed anchor, and continued our voyage. The place where we lay at anchor was just the end of those steep and amazing high mountains: their height is very amazing; they confift of grey rock-stone, and close to them on the shores lay a vast number of little stones. As soon as we had passed these mountains, the country became clearer of mountains, and higher. The river likewife increased in breadth, so as to be near an English mile broad. After failing for some time, we found no more mountains along the river; but on the eastern fide goes a high chain of mountains to the northeast, whose sides are covered with woods up to one-half of their height. The summits however are quite barren, for I suppose that nothing would grow there, on account of the great degree of heat*, drynefs, and the violence of the wind, to which that part is exposed. The eastern fide of the river is much more cultivated than the western, where we feldom faw a house, the land being covered with woods, though it is in general very level. About fifty-fix English miles from New York the country is not very high; yet it is every where covered with woods, except some new farms which were fcattered here and there. The high mountains which we left in the afternoon, now appeared above the woods and the country. These mountains which were called the Highlands, did not project more north than the other, in the place where we anchored. Their fides (not those towards the river) were feldom perpendicular, but floping, fo that one could clime up to the top, though not without difficulty.

On feveral high grounds near the river, the people burnt lime. The mafter of the yacht told me, that they break a fine blueish grey lime-stone in the high grounds along both sides of the river, for the space of some English miles, and burn lime of it. But at some miles distance there is no more lime-stone, and they find also none on the banks

till they come to Albany.

We passed by a little neck of land, which projected on the western side of the river, and was called Dance. The name of this place is said to derive its origin from a sessival which the Dutch celebrated here in former times, and at which they danced and diverted themselves; but once there came a number of Indians, who killed them all.

We cast anchor late at night, because the wind ceased and the tide was ebbing. The depth of the river is twelve fathoms here.

^{*} Mr. Kalm was certainly mistaken by thinking the fummits of these mountains without wood, on account of the great degree of heat: for it is a general notion founded on experience, that the sun operates not so much on the tops of mountains, as in plains or vallies, and the cold often hinders the increase of wood on the summits of high mountains. F.

The fire-flies passed the river in numbers at night, and sometimes settled upon the

rigging.

June 12th. This morning we proceeded with the tide, but againft the wind. The river was here a musket-shot broad. The country in general is low on both sides, confifting of low rocks and ftony fields, which are however covered with woods. It is fo rocky, stony, and poor, that nobody can settle in it or inhabit it, there being no fpot of ground fit for a corn-field. The country continued to have the fame appearance for the space of some miles, and we never perceived one settlement. At eleven o'clock this morning we came to a little island, which lies in the middle of the river, and is faid to be half-way between New York and Albany. The shores are still low, ftony, and rocky, as before. But at a greater distance we saw high mountains, covered with woods, chiefly on the western shore, raising their tops above the rest of the country: and still further off, the blue mountains rose up above them. Towards noon it was quite calm, and we went on very flow. Here the land is well cultivated, especially on the eastern shore, and full of great corn-fields; yet the soil seemed fandy. Several villages lay on the eastern fide, and one of them called Strasburg, was inhabited by a number of Germans. To the west we saw several cultivated places. The blue mountains are very plainly to be feen here. They appear through the clouds, and tower above all other mountains. The river is full an English mile broad opposite Strasburg.

They make use of a yellow agaricus, or mushroom, which grows on maple-trees, for tinder; that which is found on the red-flowering maple (acer rubrum) is reckoned the best, and next in goodness is that of the sugar-maple (acer saccarinum), which is

fometimes reckoned as good as the former.

Rhinbeck is a place at some distance from Strasburg, further off from the river. It

is inhabited by many Germans, who have a church there.

At two in the afternoon it began again to blow from the fouth, which enabled us to proceed. The country on the eaftern fide is high, and confifts of a well cultivated foil. We had fine corn-fields, pretty farms, and good orchards in view. The western shore is likewise somewhat high, but still covered with woods, and we now and then, though feldom, saw one or two little settlements. The river is above an English mile broad in most places, and comes in a strait line from the north, so that we could not sometimes

follow it with our eye.

June 13th. The wind favoured our voyage during the whole night, fo that I had no opportunity of observing the nature of the country. This morning at five o'clock we were but nine English miles from Albany. The country on both fides the river is low, and covered with woods, excepting a few little scattered settlements. Under the higher shores of the river are wet meadows, covered with sword-grass (carex), and they formed several little islands. We saw no mountains; and hastened towards Albany. The land on both sides of the river is chiefly low, and more carefully cultivated as we came nearer to Albany.

As to the houses which we saw, some were of wood, others of stone. The river is feldom above a musket-shot broad, and in several parts of it are sands, which require great experience for governing the yachts. At eight o'clock in the morning we arrived

at Albany.

All the yachts which ply between Albany and New York, belong to Albany. They go up and down the river Hudson, as long as it is open and free from ice. They bring from Albany boards or planks, and all forts of timber, flour, pease, and furs, which they get from the Indians, or which are smuggled from the French. They come home almost

almost empty, and only bring a few merchandizes with them, among which rum is the chief. This last is absolutely necessary to the inhabitants of Albany; they cheat the Indians in the fur trade with it; for when the Indians are drunk, they will leave it to the Albanians to fix the price of the furs. The yachts are pretty large, and have a good cabin, in which the passengers can be very commodiously lodged. They are commonly built of red cedar, or of white oak. Frequently, the bottom consists of white oak, and the sides of red cedar, because the latter withstands putrefaction much longer than the former. The red cedar is likewise apt to split when it is struck against any thing, and the river Hudson is in many parts full of sands and rocks, against which the keel of the yacht sometimes hits; therefore they choose white oak for the bottom, as being the softer wood, and not splitting so easily: and the bottom being continually under water, is not so much exposed to putrefaction, and holds out longer.

The canoes which the yachts have along with them are made of a fingle piece of wood, hollowed out; they are sharp on both ends, frequently three or four fathoms long, and as broad as the thickness of the wood will allow. The people in it do not row sitting, but commonly a fellow stands at each end, with a short oar in his hand with which he governs and brings the canoe forwards. Those which are made here at Albany, are commonly of the white pine; they can do service for eight or twelve years, especially if they be tarred and painted. At Albany they make them of the white pine, since there is no other wood sit for them; at New York they are made of the tulip-tree, and in other parts they are made of red or white cedars: but both these trees are so small, in the neighbourhood of Albany, that they are unsit for canoes; there are no seats in the canoes, for if they had any, they would be more liable to be

overfet, as one could not keep the equilibrium fo well.

Battoes* are another kind of boats, which are much in use in Albany: they are made of boards of white pine; the bottom is flat that they may row the better in shallow water; they are sharp at both ends, and somewhat higher towards the end than in the middle. They have seats in them, and are rowed as common boats. They are long, yet not all alike, commonly three, and sometimes four fathoms long. The height from the bottom to the top of the board (for the sides stand almost perpendicular) is from twenty inches to two feet, and the breadth in the middle about a yard and six inches. They are chiefly made use of for carrying goods, by means of the rivers, to the Indians; that is, when those rivers are open enough for the battoes to pass through, and when they need not be carried by land a great way. The boats made of the bark of trees, break easily by knocking against a stone, and the canoes cannot carry a great cargo, and are easily overset; the battoes are therefore preferable to them both. I saw no boats here like those in Sweden, and other parts of Europe.

The frost does frequently a great deal of damage at Albany. There is hardly a month in fummer during which a frost does not happen. The spring comes very late, and in April and May are numerous cold nights, which frequently kill the flowers of trees and kitchen herbs. It was feared that the blossoms of the apple-trees had been so feverely damaged by the frost last May, that next autumn there would be but very few apples. The oak blossoms are very often killed by the frost in the woods. The autumn here is of long continuance, with warm days and nights. However, the cold

nights commonly commence towards the end of September, and are frequent in October. The people are forced to keep their cattle in stables from the middle of

November till March or April, and must find them hay during that time *.

During summer the wind blows commonly from the fouth, and brings a great drought along with it. Sometimes it rains a little, and as soon as it has rained the wind veers to north-west, blowing for several days from that point, and then returning to the south. I have had frequent opportunities of seeing this change of wind happen very exactly, both this year and the following.

June 15th. The enciosures were made of boards of fir-wood, of which there is

abundance in the extensive woods, and many faw-mills to cut it into boards.

The feveral forts of apple-trees grow very well here, and bear as fine fruit as in any other part of North America. Each farm has a large orchard. They have fome apples here, which are very large, and very palatable; they are fent to New York, and other places as a rarity. They make excellent cyder in autumn, in the country round Albany.

All the kinds of cherry-trees, which have been planted here, fucceed very well.

Pear-trees do not fucceed here. This was complained of in many other parts of North America. But I fear that they do not take fufficient care in the management and planting of them; for I had feen fine pears in feveral parts of North America.

Peach-trees have often been planted here, and never would fucceed well. This was attributed to a worm which lives in the ground, and eats through the root, fo that the

tree dies. Perhaps the feverity of the winter contributes much to it.

They plant no other fruit-trees at Albany befides these I have mentioned. They sow as much hemp and flax here as they want for home consumption.

They fow maize in great abundance: a loofe foil is reckoned the best for this purpose; for it will not grow in clay: from half a bushel they reap a hundred bushels. They reckon maize a very good kind of corn, because the shoots recovers after being hurt by the frost. They have had examples here of the shoots dying twice in spring, to the very ground, and yet they shot up again afterwards, and afforded an excellent crop. Maize has likewise the advantage of standing much longer against a drought than wheat. The larger fort of maize which is commonly sown here, ripens in

September.

They fow wheat in the neighbourhood of Albany, with great advantage. From one bushel they get twelve sometimes; if the soil be good, they get twenty bushels. If their crop amounts only to ten bushels from one, they think it very trisling. The inhabitants of the country round Albany are Dutch and Germans. The Germans live in several great villages, and sow great quantities of wheat, which is brought to Albany; and from thence they sent many yachts laden with sour to New York. The wheat flour from Albany is reckoned the best in all North America, except that from Sopus or King's Town, a place between Albany and New York. All the bread in Albany is made of wheat. At New York they pay the Albany flour with several shillings more per hundred weight than that from other places.

Rye is likewife fown here, but not fo generally as wheat.

They do not fow much barley here, because they do not reekon the profits very great. Wheat is so plentiful that they make malt of it. In the neighbourhood of New York I saw great fields sown with barley.

^{*} The reader mult reckon all this according to the old stile.

They do not fow more oats than are necessary for their horses.

The Dutch and Germans who live hereabouts, fow peafe in great abundance; they fucceed very well, and are annually carried to New York, in great quantities. They have been free from infects for a confiderable time; but of late years the fame beetles which destroy the peafe in Penfylvania, New Jerfey, and the lower parts of the province of New York, have likewife appeared abundant among the peafe here. It is a real loss to this town, and to the other parts of North America, which used to get peafe from hence for their own confumption, and that of their failors. It had been found that if they procured good peafe from Albany, and sowed them near King's Town, or the lower part of the province of New York, they succeeded very well the first year, but were so full of worms the second, and following years, that nobody could or would eat them. Some people put ashes into the pot, among the peafe, when they will not boil, or soften well; but whether this is wholesome and agreeable to the palate, I do not know.

Potatoes are generally planted. Some people preferred ashes to fand for keeping

them in during winter.

The Bermuda potatoes (convolvulus batatas) have likewife been planted here, and fucceed pretty well. The greatest difficulty is to keep them during winter; for they generally rot in that season.

The humming-bird (trochilus colubris) comes to this place fometimes; but it is

rather a scarce bird.

The shingles with which the houses are covered are made of the white pine, which is reckoned as good and as durable, and sometimes better, than the white cedar (cupressus thyoides). The white pine is found abundant here, in such places where common pines grow in Europe. I have never seen them in the lower parts of the province of New York, nor in New Jersey and Pensylvania. They saw a vast quantity of deal from the white pine on this side of Albany, which are brought down to New York, and from thence exported.

The woods abound with vines, which likewise grow on the steep banks of the river in surprising quantities. They climbed to the tops of trees on the bank, and bent them by their weight; but where they found no trees, they hung down along the steep shores, and covered them entirely. The grapes are eaten after the frost has attacked them; for they are too sour before. They are not much used any other way.

The vast woods and uninhabited grounds between Albany and Canada contain immense fwarms of gnats, which annoy the travellers. To be in some measure secured against these infects, some besimear their face with butter or grease; for the gnats do not like to settle on greasy places. The great heat makes boots very uneasy; but to prevent the gnats from stinging the legs, they wrap some paper round them, under the stockings. Some travellers wear caps which cover the whole sace, and have some gauze before their eyes. At night they lie in tents, if they can carry any with them; and make a great fire at the entrance, by the smoke of which the gnats are driven away.

The porpoifes feldom go higher up the river Hudson than the falt water goes; after that, the sturgeons fill their place. It has however sometimes happened, that porpoises

have gone quite up to Albany.

The fire-flies (lampyris) which are the fame that are fo common in Penfylvania during fummer, are here feen in abundance every night. They fly up and down in the ftreets of this town. They come into the houses, if the doors and windows are open.

feveral

Several of the Penfylvanian trees are not to be met with in these woods, viz.

Magnolia glauca, the beaver-tree. Nyssa aquatica, the tupelo-tree.

Liquidambar styracissua, the sweet-gum tree.

Diofpyros Virginiana, the perfimon. Liriodendron tulipifera, the tulip-tree.

Juglans nigra, the black walnut-tree.

Quercus—, the fwamp oak. Cercis Canadenfis, the fallad-tree. Robinia pfeudacacia, the locust-tree.

Gleditfia triacanthos, the honey-locust-tree.

Annona muricata, the papaw-tree.

Celtis occidentalis, the nettle-tree; and a number of shrubs, which are never found here.

The more northerly fituation of the place, the height of the blue mountains, and the course of the rivers, which slow here southward into the sea, and accordingly carry the seeds of plants from north to south, and not the contrary way, are chiefly the causes

that feveral plants which grow in Penfylvania cannot be found here.

This afternoon I went to fee an ifland which lies in the middle of the river, about a mile below the town. This island is an English mile long, and not above a quarter of a mile broad. It is almost entirely turned into corn-fields; and is inhabited by a fingle planter, who, befides poffeffing this ifland, is the owner of two more. Here we faw no woods, except a few trees which were left round the island on the shore, and formed as it were a tall and great hedge. The red maple (acer rubrum) grows in abundance in feveral places. Its leaves are white or filvery on the under fides, and when agitated by the wind, they make the tree appear as if it was full of white flowers. The water-beech (platanus occidentalis) grows to a great height, and is one of the most shady trees here. The water-poplar * is the most common tree hereabouts, grows exceedingly well on the shores of the river, and is as tall as the tallest of our asps. In summer it affords the best shade for men and cattle against the scorching heat. On the banks of rivers and lakes it is one of the most useful trees, because it holds the soil by its extensive branched roots, and prevents the water from washing it away. The water-beech and the elm-tree (ulmus) ferve the fame purpofe. The wild prune-trees were plentiful here, and were full of unripe fruit: its wood is not made use of; but its fruit is eaten. Sumach (rhus glabra) is plentiful here; as also the wild vines, which climb up the trees, and creep along the high shores of the river. I was told that the grapes ripen very late, though they were already pretty large.

The American elm-tree (ulmus Americana) formed feveral high hedges. The foil of this island is a rich mould, mixed with fand, which is chiefly employed in maize plantations. There were likewise large fields of potatoes. The whole island was leased for one hundred pounds of New York currency. The person who had taken the lease again let some greater and some smaller lots of ground to the inhabitants of Albany, for making kitchen gardens of, and by that means reimbursed himself. Portulack (portulaca oleracea) grows spontaneously here in great abundance, and looks very

well.

[•] Populus glandulis variis basi foliorum adnexis, foliis cordato-deltoidibus, acuminatis, serrato-angulosis, attrinque glabris. — An populus heterophylla Linnzi?

June 20th. The tide in the river Hudson goes about eight or ten English miles above Albany, and consequently runs one hundred and fifty-fix English miles from the sea. In spring, when the snow melts, there is hardly any flowing near this town; for the great quantity of water which comes from the mountains during that season occa-

fions a continual ebbing. This likewise happens after heavy rains.

The cold is generally reckoned very fevere here. The ice in the river Hudson is commonly three or four feet thick. On the 3d of April some of the inhabitants crossed the river with fix pair of horses. The ice commonly dissolves about the end of March or beginning of April. Great pieces of ice come down about that time, which sometimes carry with them the houses that stand close to the shore. The water is very high at that time in the river, because the ice stops sometimes, and sticks in places where the river is narrow. The water has been often observed to rise three fathoms higher than it commonly is in summer. The ground is frozen here in winter to the depth of three, four, or sive feet. On the 16th of November the yachts are put up,

and about the beginning or middle of April they are in motion again.

The water of feveral wells in this town was very cool about this time; but had a kind of acid tafte, which was not very agreeable. On a nearer examination, I found an abundance of little infects in it, which were probably monoculi. Their length was different; fome were a geometrical line and an half, others two, and others four lines long: they were very narrow, and of a pale colour. The head was blacker and thicker than the other parts of the body, and about the fize of a pin's head. The tail was divided into two branches, and each branch terminated in a little black globule. When these insects swim, they proceed in crooked or undulated lines, almost like tadpoles. I poured some of this water into a bowl, and put near a fourth part of rum to it. The monoculi, instead of being affected with it, swam about as briskly as they had done in the water. This shews, that if one makes punch with this water, it must be very strong to kill the monoculi. I think this water is not very wholesome for people who are not used to it, though the inhabitants of Albany, who drink it every day, fay, they do not feel the least inconvenience from it. I have been several times obliged to drink water here, in which I have plainly feen monoculi fwimming; but I generally felt the next day fomewhat like a pea in my throat, or as if I had a fwelling there; and this continued for above a week. I felt fuch swellings this year, both at Albany and in other parts. My fervant, Yungstroem, likewise got a great pain in his breast, and a fensation as from a swelling, after drinking water with monoculi in it; but whether these insects occasioned it, or whether it came from some other cause, I cannot ascertain. However, I have always endeavoured as much as possible to do without such water as had monoculi in it. I have found monoculi in very cold water taken from the deepest wells, in different parts of this country. Perhaps many of our diseases arise from waters of this kind, which we do not fufficiently examine. I have frequently observed abundance of minute infects in water, which has been remarkable for its clearnefs. Almost each house in Albany has its well, the water of which is applied to common use; but for tea, brewing, and washing, they commonly take the water of the river Hudson, which flows close by the town. This water is generally quite muddy, and very warm in fummer; and, on that account, it is kept in cellars, in order that the flime may fubfide, and that the water may cool a little.

We lodged with a gunfnith, who told us, that the best charcoals for the forge were made of the black pine. The next in goodness, in his opinion, were charcoals.

made of the beech-tree.

The best and dearest stocks for his muskets were made of the wood of the wild cherry-tree; and next to these he valued those of the red maple most. They scarce make use of any other wood for this purpose. The black walnut-tree affords excel-

lent wood for stocks; but it does not grow in the neighbourhood of Albany.

June 21st. Next to the town of New York, Albany is the principal town, or at least, the most wealthy, in the province of New York. It is situated on the declivity of a hill, close to the western shore of the river Hudson, about one hundred and forty-fix English miles from New York. The town extends along the river, which flows here from N.N.E. to S.S.W. The high mountains in the west, above the town, bound the prospect on that side. There are two churches in Albany, an English one and a Dutch one. The Dutch church stands at some distance from the river, on the east side of the market. It is built of stone; and in the middle it has a small steeple, with a bell. It has but one minister, who preaches twice every Sunday. The English church is fituated on the hill, at the west end of the market, directly under the fort. It is likewise built of stone, but has no steeple. There was no service at this church at this time, because they had no minister; and all the people understood Dutch, the garrison excepted. The minister of this church has a settled income of one hundred pounds fterling, which he gets from England. The town-hall lies to the fouthward of the Dutch church, close by the river fide. It is a fine building of stone, three stories high. It has a small tower or steeple, with a bell, and a gilt ball and vane at

the top of it.

The houses in this town are very neat, and partly built with stones covered with shingles of the white pine. Some are flated with tiles from Holland, because the clay of this neighbourhood is not reckoned fit for tiles. Most of the houses are built in the old way, with the gable-end towards the street; a few excepted, which were lately built in the manner now used. A great number of houses were built like those of New Brunswick, which I have described; the gable-end being built, towards the street, of bricks, and all the other walls of planks. The outside of the houses is never covered with lime or mortar, nor have I feen it practifed in any North American towns which I have vifited; and the walls do not feem to be damaged by the air. The gutters on the roofs reach almost to the middle of the street. This preserves the walls from being damaged by the rain, but is extremely difagreeable in rainy weather for the people in the streets, there being hardly any means of avoiding the water from the gutters. The street-doors are generally in the middle of the houses; and on both fides are feats, on which, during fair weather, the people fpend almost the whole day, especially on those which are in the shadow of the houses. In the evening these seats are covered with people of both fexes; but this is rather troublesome, as those who pass by are obliged to greet every body, unless they will shock the politeness of the inhabitants of this town. The streets are broad, and some of them are paved; in fome parts they are lined with trees; the long ftreets are almost parallel to the river, and the others interfect them at right angles. The street which goes between the two churches is five times broader than the others, and ferves as a market-place. The ftreets upon the whole are very dirty, because the people leave their cattle in them during the fummer nights. There are two market-places in the town, to which the country people refort twice a week.

The fort lies higher than any other building, on a high steep hill on the west side of the town. It is a great building of stone, surrounded with high and thick walls; its situation is very bad, as it can only serve to keep off plundering parties, without being

able to fustain a siege. There are numerous high hills to the west of the fort, which command it, and from whence one may see all that is done within it. There is commonly an officer and a number of foldiers quartered in it. They say the fort contains a

fpring of water.

The fituation of Albany is very advantageous in regard to trade. The river Hudson, which flows close by it, is from twelve to twenty feet deep. There is not yet any gray made for the better lading of the yachts, because the people feared it would suffer greatly, or be entirely carried away in spring by the ice, which then comes down the river; the veffels which are in use here may come pretty near the shore in order to be laden, and heavy goods are brought to them upon canoes tied together. Albany carries on a confiderable commerce with New York, chiefly in furs, boards, wheat, flour, peafe, feveral kinds of timber, &c. There is not a place in all the Britth colonies, the Hudfon's Bay fettlements excepted, where fuch quantities of furs and skins are bought of the Indians as at Albany. Most of the merchants in this town fend a clerk or agent to Ofwego, an English trading town upon the lake Ontario, to which the Indians refort with their furs. I intend to give a more minute account of this place in my journal for the year 1750. The merchants from Albany spend the whole fummer at Ofwego, and trade with many tribes of Indians who come to them with their goods. Many people have affured me, that the Indians are frequently cheated in disposing of their goods, especially when they are in liquor, and that sometimes they do not get one half of the value of their goods. I have been a witness to feveral transactions of this kind. The merchants of Albany glory in these tricks, and are highly pleased when they have given a poor Indian a greater portion of brandy than he can bear, and when they can after that get all his goods for mere trifles. The Indians often find, when they are fober again, that they have been cheated, they grumble formewhat, but are foon fatisfied when they reflect that they have for once drank as much as they are able, of a liquor which they value beyond any thing elfe in the whole world, and they are quite infensible to their loss if they again get a draught of this nectar. Besides this trade at Oswego, a number of Indians come to Albany from feveral parts, especially from Canada; but from this latter place, they hardly bring any thing but beaver-fkins. There is a great penalty in Canada for carrying furs to the English, that trade belonging to the French West India Company; notwithflanding which the French merchants in Canada carry on a confiderable fmuggling trade. They fend their furs, by means of the Indians, to their correspondents at Albany, who purchase it at the price which they have fixed upon with the French merchants. The Indians take in return feveral kinds of cloth, and other goods, which may be got here at a lower rate than those which are fent to Canada from France.

The greater part of the merchants at Albany have extensive cstates in the country, and a great deal of wood. If their estates have a little brook, they do not fail to erect a faw-mill upon it for fawing boards and planks, with which commodity many yachts go during the whole summer to New York, having scarce any other lading than

boards.

Many people at Albany make the wampum of the Indians, which is their ornament and their money, by grinding some kinds of shells and muscles; this is a considerable profit to the inhabitants. I shall speak of this kind of money in the sequel. The extensive trade which the inhabitants of Albany carry on, and their sparing manner of life, in the Dutch way, contribute to the considerable wealth which many of them acquire.

The inhabitants of Albany and its environs are almost all Dutchmen. They speak Dutch, have Dutch preachers, and divine fervice is performed in that language: their manners are likewise quite Dutch; their dress is however like that of the English. is well known that the first Europeans who settled in the province of New York were Dutchmen. During the time that they were the masters of this province, they possessed themselves of New Sweden*, of which they were jealous. However, the pleasure of possessing this conquered land and their own, was but of short duration; for towards the end of 1664, Sir Robert Carre, by order of King Charles the Second, went to New York, then New Amsterdam, and took it. Soon after Colonel Nichols went to Albany, which then bore the name of Fort Orange, and upon taking it, named it Albany, from the Duke of York's Scotch title. The Dutch inhabitants were allowed either to continue where they were, and, under the protection of the English, to enjoy all their former privileges, or to leave the country. The greater part of them chose to stay, and from them the Dutchmen are descended, who now live in the province of New York, and who possess the greatest and best estates in that province.

The avarice and felfishness of the inhabitants of Albany are very well known throughout all North America, by the English, by the French, and even by the Dutch, in the lower part of New York province. If a Jew, who understands the art of getting forward perfectly well, should fettle amongst them, they would not fail to ruin him. For this reason nobody comes to this place without the most pressing necesfity; and therefore I was asked in several places, what induced me to go to it, two years one after another. I likewife found that the judgment, which people formed of them, was not without foundation. For though they feldom fee any strangers, (except those who go from the British colonies to Canada and back again) and one might therefore expect to find victuals and accommodation for travellers cheaper than in places where travellers always refort to, yet I experienced the contrary. I was here obliged to pay for every thing twice, thrice, and four times as dear as in any part of North America which I have passed through. If I wanted their assistance, I was obliged to pay them very well for it, and when I wanted to purchase any thing, or to be helped in fome case or other, I could presently see what kind of blood ran into their veins; for they either fixed exorbitant prices for their fervices, or were very backward to affift Such was this people in general. However, there were some amongst them who equalled any in North America, or any where elfe, in politeness, equity, goodness, and readiness to serve and to oblige; but their number fell far short of that of the former. If I may be allowed to declare my conjectures, the origin of the inhabitants of Albany and its neighbourhood feems to me to be as follows. Whilft the Dutch poffeffed this country, and intended to people it, the government took up a pack of vagabonds, of which they intended to clear the country, and fent them along with a number of other fettlers to this province. The vagabonds were fent far from the other colonists, upon the borders towards the Indians and other enemics, and a few honest families were perfuaded to go with them, in order to keep them in bounds. I cannot any other way account for the difference between the inhabitants of Albany, and the other descendants of so respectable a nation as the Dutch, who are settled in the lower part of New York province. The latter are civil, obliging, just in the prices, and fincere; and though they are not ceremonious, yet they are well meaning and honest, and their promifes are to be relied on.

^{*} New Jersey and part of Pensylvania were formerly comprised under this name.

The behaviour of the inhabitants of Albany, during the war between England and France, which was ended with the peace of Aix la Chapelle, has, among feveral other causes, contributed to make them the object of hatred in all the British colonies, but more especially in New England. For at the beginning of that war, when the Indians of both parties had received orders to commence hostilities, the French engaged theirs to attack the inhabitants of New England; which they faithfully executed, killing every body they met with, and carrying off whatever they found. During this time the people of Albany remained neutral, and carried on a great trade with the very Indians who murdered the inhabitants of New England. The plate, fuch as filverspoons, bowls, cups, &c. of which the Indians robbed the houses in New England, was carried to Albany, for fale. The people of that town bought up these filver veffels, though the names of the owners were graved on many of them, and encouraged the Indians to get more of them, promifing to pay them well, and whatever they would demand. This was afterwards interpreted by the inhabitants of New England, as if the Albanians encouraged the Indians to kill more of the people, who were in a manner their brothers, and who were fubjects of the fame crown. Upon the first news of this behaviour, which the Indians themselves spread in New England, the inhabitants of the latter province were greatly incenfed, and threatened, that the first step they would take in another war, would be to burn Albany, and the adjacent parts. In the prefent war it would fufficiently appear how backward the other British provinces in America are in affisting Albany, and the neighbouring places, in case of an attack from the French or Indians*. The hatred which the English bear against the people, at Albany, is very great, but that of the Albanians against the English is carried to a ten times higher degree. This hatred has subfished ever fince the time when the English conquered this country, and is not yet extinguished, though they could never have got fuch advantages under the Dutch government, as they have obtained under that of the English. For, in a manner, their privileges are greater than those of Englishmen.

The inhabitants of Albany are much more sparing than the English. The meat which is served up is often insufficient to satisfy the stomach, and the bowl does not circulate so freely as amongst the English. The women are perfectly well acquainted with economy; they rise early, go to sleep very late, and are almost over-nice and cleanly in regard to the floor, which is frequently scoured several times in the week. The servants in the town are chiefly negroes. Some of the inhabitants wear their own hair, but it is very short, without a bag or queue, which are looked upon as the characteristics of Frenchmen; and as I wore my hair in a bag the first day I came here from Canada, I was surrounded with children, who called me Frenchman, and

fome of the boldest offered to pull at my French drefs.

Their meat, and manner of dressing it, is very different from that of the English. Their breakfast is tea, commonly without milk. About thirty or forty years ago, tea was unknown to them, and they breakfasted either upon bread and butter, or bread and milk. They never put sugar into the cup, but take a small bit of it into their mouths whilst they drink. Along with the tea they eat bread and butter, with slices of hung beef. Cossee is not usual here; they breakfast generally about seven. Their dinner is butter-milk and bread, to which they sometimes add sugar, then it is a delicious dish for them; or fresh milk and bread; or boiled or roasted slesh. They sometimes make use of butter-milk instead of fresh milk, to boil a thin kind of porridge

^{*} Mr. Kalm published this third volume just during the time of the last war. F.

with, which tastes very sour, but not disagreeable in hot weather. To each dinner they have a great fallad, prepared with abundance of vinegar, and very little or no oil. They frequently eat butter-milk, bread, and fallad, one mouthful after another. Their supper is generally bread and butter, and milk and bread. They sometimes eat cheese at breakfast and at dinner; it is not in slices, but scraped or rasped, so as to resemble coarse flour, which they pretend adds to the good taste of cheese. They commonly

drink very fmall beer, or pure water.

The governor of New York often confers at Albany with the Indians of the Five Nations, or the Iroquefe, (Mohawks, Senekas, Cayugaws, Onondagoes, and Onidoes) especially when they intend either to make war upon, or to continue a war against the French. Sometimes their deliberations likewife turn upon their conversion to the christian religion, and it appears by the answer of one of the Indian chiefs, or Sachems. to Governor Hunter, at a conference in this town, that the English do not pay so much attention to a work of fo much confequence as the French do, and that they do not fend fuch able men to instruct the Indians as they ought to do *. For after Governor Hunter had prefented these Indians, by order of Queen Anne, with many clothes, and other prefents, of which they were fond, he intended to convince them still more of Her Majesty's good-will, and care for them, by adding, that their good mother, the Queen, had not only generously provided them with fine clothes for their bodies, but likewife intended to adorn their fouls, by the preaching of the gofpel; and that to this purpose some ministers should be sent to them to instruct them. The governor had fcarce ended, when one of the oldest Sachems got up, and answered, that in the name of all the Indians, he thanked their gracious good Queen and mother for the fine clothes fhe had fent them; but that in regard to the ministers, they had already had some among them (whom he likewife named), who instead of preaching the holy gospel to them, had taught them to drink to excefs, to cheat, and to quarrel among themselves. He then entreated the governor to take from them these preachers, and a number of Europeans who refided amongst them; for before they were come among them, the Indians had been an honest, sober, and innocent people, but most of them became rogues now. That they had formerly had the fear of God, but that they hardly believed his existence at prefent. That if he (the governor) would do them any favour, he should fend two or three blackfmiths amongft them, to teach them to forge iron, in which they were unexperienced. The governor could not forbear laughing at this extraordinary speech. I think the words of St. Paul not wholly unapplicable on this occasion: For the name of God is blasphemed amongst the Gentiles, through you *.

June 21st. About five o'clock in the afternoon we left Albany, and proceeded towards Canada. We had two men with us, who were to accompany us to the first

[•] Mr. Kalm is, I believe, not rightly informed. The French ecclesiaftics have allured some few wretched Indians to their religion and interest, and fettled them in small villages; but by the accounts of their behaviour in the several wars of the French and English, they were always guilty of the greatest cruelties and brutalities; and more so than their beathen countrymen; and therefore it seems that they have been rather perverted than converted. On the other hand, the singlish have translated the bible into the language of the Virginian Indians, and converted many of them to the true knowledge of God; and at this present time, the Indian charity schools and missions, conducted by the Rev. Mr Eleazor Wheelock, have brought numbers of the Indians to the knowledge of the true God. The society for propagating the gospel in foreign parts, sends every year many missionaries, at their own expence, among the Indians. And the Moravian brethren are also very active in the conversion of Gentiles; so that if Mr. Kalm had considered all these circumstances, he would have judged otherwise of the zeal of the British nation, in propagating the gospel among the Indians. F. + Romans ii. 24:

French place, which is Fort St. Frederick, or, as the English call it, Crown Point. For this fervice each of them was to receive five pounds of New York currency, befides which I was to provide them with victuals. This is the common price here, and he that does not choose to conform to it, is obliged to travel alone. We were forced to take up with a canoe *, as we could get neither battoes, nor boats of bark; and as there was a good road along the west side of the river Hudson, we left the men to row forwards, in the canoe, and we went along it on the shore, that we might be better able to examine it, and its curiofities, with greater accuracy. It is very incommodious to row in these canoes; for one stands at each end and pushes the boat forwards. They commonly keep close to the shore, that they may be able to reach the ground eafily. Thus the rowers are forced to fland upright, whilft they row in a canoe. We kept along the shore all the evening, towards the river; it consisted of great hills, and next to the water grew the trees, which I have above mentioned, and which likewife are to be met with on the shores of the isle, in the river, situate below Albany. The cafterly shore of the river is uncultivated, woody, and hilly; but the western is flat, cultivated, and chiefly turned into corn-fields, which had no drains, though they wanted them in fome places. It appeared very plainly here, that the river had formerly been broader; for there is a floping bank on the corn-fields, at about thirty yards distance from the river, with which it always runs parallel. From this it sufficiently appears, that the rifing ground formerly was the shore of the river, and the corn-fields its bed. As a further proof, it may be added, that the fame shells which abound on the present shore of the river, and are not applied to any use by the inhabitants, lie plentifully scattered on these fields. I cannot say whether this change was occasioned by the diminishing of the water in the river, or by its washing some earth down the river, and carrying it to its fides, or by the river's cutting deeper in on the fides.

All the grounds were ploughed very even, as is usual in the Swedish province of Upland. Some were sown with yellow, and others with white wheat. Now and then we saw great fields of flax, which was now beginning to flower. In some parts it grows very well, and in others it was but indifferent. The excessive drought which had continued throughout this spring, had parched all the grass and plants on hills and high grounds, leaving no other green plant than the common mullein (Verbascum thapsus Linn.) which I saw in several places, on the driest and highest hills, growing in spite of the parching heat of the sun, and though the pastures and meadows were excessively poor, and afforded scarce any food at all, yet the cattle never touched the mullein. Now and then I sound fields with pease, but the charlock (sinapis arvensis Linn.) kept them quite under. The soil in most of these fields is a sine mould, which

goes pretty deep.

The wild vines cover all the hills along the rivers, on which no other plants grow, and on those which are covered with trees, they climb to the tops of them, and wholly cover them, making them bend down with their weight. They had already large grapes; we saw them abundant all this day, and during all the time that we kept to the river Hudson, on the hills, along the shores, and on some little islands in the river.

The white-backed maize-thieves appeared now and then, flying amongst the bushes: their note is fine, and they are not so large as the black maize-thieves, (oriolus phæniceus). We saw them near New York, for the sirst time.

We found a water-beech tree (platanus occidentalis) cut down near the road, meafuring about five feet in diameter.

This day, and for some days afterwards, we met with islands in the river. The

larger ones were cultivated, and turned into corn-fields and meadows.

We walked about five English miles along the river to-day, and found the ground, during that time, very uniform, and confifting of pure earth. The red maple, the water-beech, the water-asp, the wild prune-tree, the sumach, the elm, the wild vines, and some species of willows, were the trees which we met with on the rising shores of

the river, where fome afparagus (afparagus officinalis) grew wild.

We passed the night about fix miles from Albany, in a countryman's cottage. On the west fide of the river we saw several houses, one after another, inhabited by the defeendants of the first Dutch fettlers, who lived by cultivating their grounds. About half an English mile beyond our lodgings, was the place where the tide stops in the river Hudson, there being only small and shallow streams above it. At that place they catch a good many forts of fish in the river.

The barns were generally built in the Dutch way, as I have before described; for in the middle was the threshing-floor, above it a place for the hay and straw, and on each fide stables for horses, cows, and other animals. The barn itself was very large. Sometimes the buildings in the court-yard confift only of a room, and a garret above

it, together with a barn upon the above plan.

June 22d. This morning I followed one of our guides to the water-fall near Cohoes, in the river Moliawk, before it falls into the river Hudson. This fall is about three English miles from the place where I passed the night. The country till the fall is a plain, and only hilly about the fall itself. The wood is cleared in most places, and the

ground cultivated, and interspersed with farm-houses.

The Cohoes fall is one of the greatest in North America: it is in the river Mohawk, before it unites with the river Hudson. Above and below the fall, the sides and the bottom of the river confift of hard rock. The river is three hundred yards broad here. At the fall there is a rock croffways in the river, running every where equally high, and croffing in a strait line with the side which forms the fall. It represents, as it were, a wall towards the lower fide, which is not quite perpendicular, wanting about four yards. The height of this wall, over which the water rolls, appeared to me about twenty or twenty-four yards. I had marked this height in my pocket-book; and afterwards found it agreed pretty well with the account which that ingenious engineer, Mr. Lewis Evans, communicated to me at Philadelphia. He faid, that he had geometrically ineafured the breadth and height of the fall, and found it nine hundred English feet broad, and feventy-five feet high. The representation of this fall, which is here joined, has been made by Mr. Evans. There was very little water in the river at prefent, and it only ran over the fall in a few places. In fuch places where the water had rolled down before, it had cut deep holes below into the rock, fornetimes to the depth of two or three fathoms. The bed of the river, below the fall, was of rock, and quite dry, there being only a channel in the middle fourteen feet broad, and a fathom or fomewhat more deep, through which the water paffed which came over the fall. We faw a number of holes in the rock, below the fall, which bore a perfect refemblance to those in Sweden which we call giants pots, or mountain kettles. They differed in fize; there being large deep ones, and fmall shallow ones. We had clear uninterrupted fun-shine, not a cloud above horizon, and no wind at all. However, close to this fall, where the water was in fuch a finall quantity, there was a continual drizzling rain, 16

occasioned

occasioned by the vapours which rose from the water during its fall, and were carried about by the wind. Therefore, in coming within a musket-shot of the fall, against the wind, our cloths were wetted at once, as from a rain. The whirl-pools, which were in the water below the fall, contained feveral kinds of fish; and they were caught by fome people, who amused themselves with angling. The rocks hereabouts consist of the fame black stone which forms the hills about Albany. When exposed to the air, it is apt to shiver into horizontal flakes, as flate does.

At noon we continued our journey to Canada in the canoe, which was pretty long, and made out of a white pine. Somewhat beyond the farm where we lay at night, the river became fo shallow that the men could reach the ground every where with their oars; it being in some parts not above two feet and sometimes but one foot deep. The shore and bed of the river consisted of sand and pebbles. The river was very rapid, and against us; fo that our rowers found it very hard work to get forward against the ftream. The hills along the shore confisted merely of foil; and were very high and fteep in fome parts. The breadth of the river was generally near two mufket-shot.

Sturgeons abound in the river Hudson. We faw them for several days together leap high up in the air, especially in the evening; our guides, and the people who lived hereabouts, afferted that they never fee any sturgeons in winter time, because these fish go into the fea late in autumn, but come up again in fpring and ftay in the river all the fummer. They are faid to prefer the shallowest places in the river, which agreed pretty well with our observations; for we never faw them leap out of the water but in fhallows. Their food is faid to be feveral kinds of confervæ, which grow in plenty in fome places at the bottom of the river; for these weeds are found in their bellies when they are opened. The Dutch who are fettled here, and the Indians, fish for sturgeons, and every night of our voyage upon this river, we observed several boats with people who firuck them with harpoons. The torches which they employed were made of that kind of pine, which they call the black pine here. The nights were exceedingly dark, though they were now fliortest, and though we were in a country so much to the south of Sweden. The banks of the river lay covered with dead sturgeons, which had been wounded with the harpoon, but efcaped, and died afterwards; they occasioned an

insupportable stench during the excessive heat of the weather.

As we went further up the river, we saw an Indian woman and her boy fitting in a boat of bark, and an Indian wading through the river, with a great cap of bark on his head. Near them was an island on which there were a number of Indians at present, on account of the sturgeon fishery. We went to their huts to try if we cuold get one of them to accompany us to Fort St. Frederick. On our arrival we found that all the men were gone into the woods a hunting, and we were forced to engage their boys to go and look for them. They demanded bread for payment, and we gave them twenty little round loaves; for as they found that it was of great importance to us to speak with the Indians, they raifed difficulties, and would not go till we gave them what they wanted. The island belonged to the Dutch, who had turned it into corn-fields. But at prefent they had leafed it to the Indians, who planted their maize and feveral kinds of mellons on it. They built their huts or wigwams on this island, on a very simple plan. Four posts were put into the ground perpendicularly, over which they had placed poles, and made a roof of bark upon them. They had either no walls at all, or they confifted of branches with leaves, which were fixed to the poles. Their beds confifted of deer-skins which were spread on the ground. Their utenfils were a couple of fmall kettles, and two ladles, and a bucket or two of bark, made fo close as to keep water. The flurgeons were cut into long flices, and hung up in the fun-shine to dry, and

and to be ready against winter. The Indian women were sitting at their work on the hill, upon deer-skins. They never make use of chairs, but sit on the ground: however they do not sit cross-legged, as the Turks do, but between their feet, which, though they be turned backwards, are not crossed, but bent outwards. The women wear no head-dress, and have black hair. They have a short blue petticoat, which reaches to their knees, and the brim of which is bordered with red or other ribbands. They wear their shifts over their petticoats. They have large ear-rings; and their hair is tied behind, and wrapped in ribbands. Their wampum, or pearls, and their money, which is made of shells, are tied round the neck, and hang down on the breast. This is their whole dress. They were now making several kinds of work of skins, to which they sowed the quills of the American porcupines, having dyed them black or red, or left them in their original colour.

Towards evening, we went from hence to a farm close to the river, where we found only one man, looking after the maize and the fields; the chief of the men not being

then returned from the war.

The little brooks here contain crawfish, which are exactly the same with ours *, with this difference only, that they are somewhat less; however, the Dutch inhabitants will not eat them.

June 23d. We waited a good while for the Indians, who had promifed to come home, in order to fhew us the way to Fort St. Ann, and to affift us in making a boat of bark, to continue our voyage. About eight o'clock three of the men arrived. Their hair was black, and cut fhort; they wore rough pieces of woollen cloth, of a bright green colour, on their fhoulders, a fhirt which covers their thighs, and pieces of cloth, or fkins, which they wrap round the legs and part of the thighs. They had neither hats, caps, nor breeches. Two of them had painted the upper part of their foreheads, and their cheeks, with vermilion. Round their neck was a ribband, from which hung a bag down to the breaft, containing their knives. They promifed to accompany us for thirty shillings; but soon after changed their minds, and went with an Englishman, who gave them more. Thus we were obliged to make this journey without these guides, who were, however, honest enough to return us fifteen shillings, which we had paid them before-hand.

Our last night's lodging was about ten English miles from Albany. During the last war, which was just ended, the inhabitants had retreated from thence to Albany, because the French Indians had taken or killed all the people they met with, set the houses on fire, and cut down the trees. Therefore, when the inhabitants returned, they found no houses, and were forced to lie under a few boards which were huddled

together.

The river was almost a musket-shot broad, and the ground on both sides cultivated.

The hills near the river were steep, and the earth of a pale colour.

The American elder (Sambucus occidentalis†) grows in incredible quantities along those hills, which appear quite white, from the abundance of flowers on the elder.

All this day along, we had one current after another, full of stones, which were great obstacles to our getting forward. The water in the river was very clear, and generally shallow, being only from two to four feet deep, running very violently against us in most places. The shore was covered with pebbles, and a grey fand. The hills consisted of earth, were high, and stood perpendicular towards the river, which was

near two musket-shot broad. Sometimes the land was cultivated, and sometimes it was covered with woods.

The hills near the river abound with red and white clover. We found both these kinds plentiful in the woods. It is therefore difficult to determine whether they were brought over by the Europeans, as some people think, or whether they were originally in America, which the Indians deny.

We found purssane (portulaca oleracea) growing plentifully in a fandy foil. In

gardens it was one of the worst weeds.

We found people returning every where to their habitations, which they had been

forced to leave during the war.

The farms were commonly built close to the river, on the hills. Each house has a little kitchen-garden, and a still lesser orchard. Some farms, however, had large gardens. The kitchen-gardens afford several kinds of gourds, water-melons, and kidney-beans. The orchards are full of apple-trees. This year the trees had few or no apples, on account of the frosty nights which had happened in May, and the drought

which had continued throughout this fummer.

The houses hereabouts are generally built of beams of wood, and of unburnt bricks dried by the sun and the air. The beams are first erected, and upon them a gable with two walls, and the spars. The wall on the gable is made of boards. The roof is covered with shingles of sir. They make the walls of unburnt bricks, between the beams, to keep the rooms warmer; and that they might not easily be destroyed by rain and air, they are covered with boards on the outside. The cellar is below the house.

The farms are either built close to the river-fide, or on the high grounds; and

around them are large fields with maize.

We faw great numbers of musk-rats (castor zibethicus Linn.) on the shores of the river, where they had many holes, some on a level with the surface of the water. These holes were large enough to admit a kitten. Before and in the entrance to the holes lay a quantity of empty shells, the animals of which had been eaten by the musk-rats*. They are caught in traps placed along the water-side, and baited with some maize or apples.

The fassafras-trees abound here, but never grow to any considerable height.

Chefnut-trees appear now and then.

The cockspur hawthorn (cratægus crus galli Linn.) grows in the poorest soil, and has very long spines; which shews, that it may be very advantageously planted in hedges, especially in a poor soil.

This night we lodged with a farmer, who had returned to his farm after the war

was over. All his buildings, except the great barn, were burnt.

June 24th. The farm where we passed the night was the last in the province of New York, towards Canada, which had been left standing, and which was now inhabited. Further on, we met still with inhabitants; but they had no houses, and lived in huts of boards; the houses being burnt during the war.

As we continued our journey, we observed the country on both fides of the river to be generally flat, but sometimes hilly; and large tracts of it are covered with woods of fir-trees. Now and then we found some parts turned into corn-fields and meadows; however, the greater part was covered with woods. Ever since we left Albany, almost

4 G

half-

^{*} This appears to be a new observation, as Linnæus, De Busson, and Sarrasin, pretend they only feed on the acorns, or reeds, and other roots.

half-way to Saratoga, the river runs very rapid; and it cost us a deal of pains to get upwards. But afterwards it becomes very deep, for the space of several miles; and the water moves very slowly. The shores are very steep, though they are not very high. The river is two musket-shot broad. In the afternoon it changed its direction; for hitherto its direction was from north to south, but now it came from N. E. to S.S. W. and sometimes from N. E. to S.W.

Ant-hills are very fearce in America; and I do not remember feeing a fingle one before I came to the Cohoes Fall. We observed a few in the woods to-day. The ants were the same with our common red ones (formica rusa Linn.) The ant-hills consist chiefly of the slate-like mouldered stone which abounds here, there being nothing else

for them.

Chesnut-trees grew scattered in the woods. We are told, that mulberry-trees (morus rubra Linn.) likewise grow wild here, but rather scarce; and this is the most northerly place where they grow in America; at least, they have not been observed further to the north. We met with wild parsnips every day; but commonly in such places where the kind was, or had been, cultivated. Hemp grows spontaneously, and in great abundance, near old plantations.

The woods abound with wood-lice, which were extremely troublesome to us.

The thuya occidentalis Linn, appeared along the shores of the river. I had not seen it there before.

The trees which grow along the fhores, and on the adjacent hills, within our fight to-day, are elms, birches, white firs, alders, dog-trees, lime-trees, red willows, and chefnut trees. The American elder, (fambucus Canadenfis Linn.) and the wild vines, only appear in places where the ground has been fomewhat cultivated, as if they were defirous of being the companions of men. The lime-trees and white walnut-trees are the most numerous. The horn-beams, with inflated cones, (carpinus ostrya Linn.) appeared now and then; but the water-beech and water-poplar never came within fight any more.

We frequently faw ground-fquirrels and black fquirrels in the woods.

At a little distance from Saratoga, we met two Indians in their boats of bark, which could scarce contain more than one person.

Near Saratoga the river becomes shallow and rapid again. The ground is here turned into corn-fields and meadows, but on account of the war it was not made

Saratoga has been a fort built of wood by the English, to stop the attacks of the French Indians upon the English inhabitants in these parts, and to serve as a rampart to Albany. It is situated on a hill, on the east side of the river Hudson, and is built of thick posts driven into the ground, close to each other, in the manner of palisades, forming a square, the length of whose sides was within the reach of a musket-shot. At each corner are the houses of the officers, and within the palisades are the barracks, all of timber. This fort has been kept in order and was garrisoned till the last war, when the English themselves in 1747 set fire to it, not being able to defend themselves in it against the attacks of the French and their Indians; for as soon as a party of them went out of the fort, some of these enemies lay concealed, and either took them all prisoners, or shot them.

I shall only mention one out of many artful tricks which were played here, and which both the English and French who were present here at that time told me repeatedly. A party of French, with their Indians, concealed themselves one night in a thicket near the fort. In the morning some of their Indians, as they had previously

refolved,

refolved, went to have a nearer view of the fort. The English sired upon them, as foon as they saw them at a distance; the Indians pretended to be wounded, fell down, got up again, ran a little way, and dropped again. Above half the garrison rushed out to take them prisoners; but as soon as they were come up with them, the French and the remaining Indians came out of the bushes, betwixt the fortress and the English, surrounded them, and took them prisoners. Those who remained in the fort had hardly time to shut the gates, nor could they sire upon the enemy, because they equally exposed their countrymen to danger, and they were vexed to see their enemies take and carry them off in their sight, and under their cannon. Such French artisices as these made the English weary of their ill-planned fort. We saw some of the palisades still in the ground. There was an island in the river, near Saratoga, much better situated for a fortification. The country is slat on both sides of the river near Saratoga, and its soil good. The wood round about was generally cut down. The shores of the river are high, steep, and consist of earth. We saw some hills in the north, beyond the distant forest. The inhabitants are Dutch, and bear an inveterate hatred to all Englishmen.

We lay over night in a little hut of boards, erected by the people who were come to

live here.

June 25th. Several faw-mills were built here before the war, which were very profitable to the inhabitants, on account of the abundance of wood which grows here.

The boards were eafily brought to Albany, and from thence to New York, in rafts

every fpring with the high water; but all the mills were burnt at prefent.

This morning we proceeded up the river, but after we had advanced about an English mile, we fell in with a water-fall, which cost us a deal of pains before we could get our canoe over it. The water was very deep just below the fall, owing to its hollowing the rock out by the fall. In every place where we met with rocks in the river, we found the water very deep, from two to four fathoms and upwards; because by finding a resistance it had worked a deeper channel into the ground. Above the fall, the river is very deep again, the water slides along silently, and increases suddenly near the shores. On both sides, till you come to Fort Nicholson, the shore is covered with tall trees. After rowing several miles we passed another water-fall which was longer and more dangerous than the preceding one.

Giants-pots*, which I have described in the Memoirs of the Royal Swedish Academy of Sciences, are abundant near the fall of the rock which extends across the river. The rock was almost dry at present, the river containing very little water at this season of the year. Some of the giants-pots were round, but in general they were oblong. At the bottom of most of them lay either stones or grit, in abundance. Some were sisteen inches in diameter, but some were less. Their depth was likewise different, and some that I observed were above two seet deep. It is plain that they owed their origin to the whirling of the water round a pebble, which by that means was put in motion,

together with the fand.

We intended to have gone quite up to Fort Nicholson in the canoe, which would have been a great convenience to us; but we found it impossible to get over the upper fall, the canoe being heavy, and scarce any water in the river, except in one place where it flowed over the rock, and where it was impossible to get up, on account of the steepness and the violence of the fall. We were accordingly obliged to leave

^{*} This is the literal meaning of the Swedish word jatte grytor.

our canoe here, and to carry our baggage through unfrequented woods to Fort Anne, on the river Woodcreek, which is a space from forty-three to fifty English miles, during which we were quite spent through the excess of heat. Sometimes we had no other way of crossing deep rivers, than by cutting down tall trees, which stood on their banks, and throwing them across the water. All the land we passed over this afternoon was almost level, without hills and stones, and entirely covered with a tall and thick forest, in which we continually met with trees which were fallen down, because no one made the least use of the woods. We passed the next night in the midst of the forest, plagued with muskitoes, gnats, and wood-lice, and in fear of all kinds of snakes.

June 26th. Early this morning we continued our journey through the wood, along the river Hudson. There was an old path leading to Fort Nicholson, but it was so overgrown with grafs that we discovered it with great difficulty. In some places we found

plenty of rafpberries.

Fort Nicholfon is the place on the eastern shore of the river Hudson, where a wooden fortification formerly stood. We arrived here some time before noon, and rested a while. Colonel Lydius resided here till the beginning of the last war, chiefly with a view of carrying on a greater trade with the French Indians; but during the war, they burnt his house, and took his son prisoner. The fort was situated on a plain, but at present the place is all overgrown with a thicket. It was built in the year 1709, during the war with Queen Anne carried on against the French, and it was named after the brave English General Nicholson. It was not so much a fort, as a magazine to Fort Anne. In the year 1711, when the English naval attempt upon Canada miscarried, the English themselves set fire to this place. The soil hereabouts seems to be

pretty fertile. The river Hudson passed close by here.

In the afternoon we continued our journey. We had hitherto followed the eastern shore of the river Hudson, and gone almost due north; but now we left it and went N. N. E. or N. E. across the woods, in order to come to the upper end of the river Woodcreak, which flows to Fort St. Frederick, where we might go in a boat from the former place. The ground we passed over this afternoon was generally flat, and fomewhat low. Sometimes we faw a little hill, but neither mountains nor stones, and the country was every where covered with tall and thick forests. The trees stood close, and afforded a fine shade; but the pleasure which we enjoyed from it was leffened by the incredible quantity of gnats which filled the woods. We found feveral plants here, but they were far from each other, (as in our woods where the cattle have destroyed them) though no cattle ever came here. The ground was every where thick covered with leaves of the last autumn. In some places we found the ground overgrown with great quantities of moss. The foil was generally very good, confisting of a deep mould, in which the plants thrive very well. Therefore it feems that it would answer very well if it were cultivated: however, flowing waters were very scarce hereabouts; and if the woods were cleared, how great would be the effects of the parching heat of the fun, which might then act with its full force!

We lodged this night near a brook, in order to be fufficiently fupplied with water, which was not every where at hand during this feafon. The muskitoes, punchins, or gnats, and the wood-lice, were very troublesome. Our fear of snakes, and of the

Indians, rendered this night's rest very precarious and insecure.

Punchins, as the Dutch call them, are the little gnats (culex pulicaris Linn.) which abound here. They are very minute, and their wings grey, with black fpots. They are ten times worfe than the larger ones, (culex pipiens Linn.) or muskitoes; for their

fize renders them next to imperceptible; they are every where careless of their lives, fuck their fill of blood, and cause a burning pain.

We heard feveral great trees fall of themselves in the night, though it was so calm

that not a leaf stirred. They made a dreadful cracking.

June 27th. We continued our journey in the morning. We found the country like that which we passed over yesterday, except meeting with a few hills. Early this morn-

ing we plainly heard a fall in the river Hudson.

In every part of the forest we found trees thrown down either by storms or age; but none were cut down, there being no inhabitants; and though the wood is very fine, yet nobody makes use of it. We found it very difficult to get over such trees, because they had stopped up almost all the passages, and close to them was the chief

refidence of rattle-fnakes, during the intenfeness of the heat.

About two o'clock this afternoon we arrived at Fort Anne. It lies upon the river Woodcreek, which is here at its origin no bigger than a little brook. We ftayed here all this day, and next, in order to make a new boat of bark, because there was no possibility to go down the river to Fort St. Frederick without it. We arrived in time, for one of our guides fell ill this morning, and could not have gone any further with his burthen. If he had been worse, we should have been obliged to stop on his account, which would have put us under great difficulties, as our provisions would soon have been exhausted, and from the desart place where we were, we could not have arrived at any inhabited place in less than three or four days. Happily we reached the wished for place, and the sick man had time to rest and recover.

About Fort Anne were found a number of mice of the common kind. They were probably the offspring of those which were brought to the fort in the foldier's provisions,

at the time when it was kept in a state of defence.

We met with some apple and plumb-trees, which were certainly planted when the

fort was in a good condition.

June 28th. The American elm, (ulmus Americana Linn.) grows in abundance in the forests hereabouts. There are two kinds of it. One was called the white elm, on account of the inside of the tree being white. It was more plentiful than the other species, which was called the red elm, because the colour of the wood was reddish. Of the bark of the former the boats made use of here are commonly made, it being tougher than the bark of any other tree. With the bark of hiccory, which is employed as bast, they sow the elm-bark together, and with the bark of the red elm they join the ends of the boat so close as to keep the water out. They beat the bark between two stones; or for want of them, between two pieces of wood,

The making of the boat took up half yesterday and all this day. To make such a boat they pick out a thick tall elm with a smooth bark, and with as sew branches as possible. This tree is cut down, and great care is taken to prevent the bark from being hurt by falling against other trees, or against the ground. With this view some people do not fell the trees, but climb to the top of them, split the bark, and strip it off, which was the method our carpenter took. The bark is split on one side in a strait line along the tree, as long as the boat is intended to be; at the same time, the bark is carefully cut from the stem a little way on both sides of the slit, that it may more easily separate; the bark is then pealed off very carefully, and particular care is taken not to make any holes into it; this is easy when the sap is in the trees, and at other feasons the tree is heated by the sire for that purpose. The bark thus stript off is spread on the ground in a smooth place, turning the inside downwards, and the rough out-

fide

fide upwards, and to firetch it better, fome logs of wood or fiones are carefully put on it, which prefs it down. Then the fides of the bark are gently bent upwards, in order to form the fides of the boat; fome flieks are then fixed into the ground, at the distance of three or four feet from each other, in the curve line, in which the sides of the boat are intended to be, supporting the bark intended for the sides; the sides of the bark are then bent in the form which the boat is to have, and according to that the flicks are either put nearer or further off. The ribs of the boat are made of thick branches of hiccory, they being tough and pliable. They are cut into feveral flat pieces, about an inch thick, and bent into the form which the ribs require, according to their places in the broader or narrower part of the boat. Being thus bent, they are put across the boat, upon the back, or its bottom, pretty close, about a span or ten inches from each other. The upper edge on each fide of the boat is made of two thin poles, of the length of the boat, which are put close together, on the fide of the boat, being flat, where they are to be joined. The edge of the bark is put between these two poles, and fewed up with threads of baft, of the mouse-wood, or other tough bark, or with roots. But before it is thus fewed up the ends of the ribs are likewise put between the two poles on each fide, taking care to keep them at fome diffance from each other; after that is done, the poles are fewed together, and being bent properly, both their ends join at each end of the boat, where they are tied together with ropes. To prevent the widening of the boat at the top, three or four transverse bands are put acrofs it; from one edge to the other, at the distance of thirty or forty inches from each These bands are commonly made of hiccory, on account of its toughness and flexibility, and have a good length. Their extremities are put through the bark on both fides, just below the poles, which make the edges; they are bent up above those poles, and twifted round the middle part of the bands, where they are carefully tied by ropes. As the bark at the two ends of the boat cannot be put fo close together as to keep the water out, the crevices are stopped up with the crushed or pounded bark of the red elm, which in that state looks like oakum. Some pieces of bark are put upon the ribs in the boat, without which the foot would eafily pierce the thin and weak bark below, which forms the bottom of the boat, for the better fecurity of which, some thin boards are commonly laid at the bottom, which may be trod upon with more fafety. The fide of the bark which has been upon the wood, thus becomes the outfide of the boat, because it is smooth and slippy, and cuts the water with less difficulty than the other. The building of these boats is not always quick, for sometimes it happens that after peeling the bark off an elm, and carefully examining it, it is found pierced with holes and splits, or it is too thin to venture one's life in; in such a case another elm must be looked out; and it fometimes happens that several elms must be stripped of their bark, before one is found fit for a boat. That which we made was big enough to bear four persons, with our baggage, which weighed somewhat more than a man.

All possible precautions must be taken in rowing on the rivers and lakes of these parts with a boat of bark. For as the rivers, and even the lakes, contain numbers of broken trees, which are commonly hidden under the water, the boat may easily run against a sharp branch, which would tear half the boat away, if one rowed on very fast, exposing the people in it to great danger, where the water is very deep, especially if such

a branch held the boat.

To get into fuch a dangerous vessel must be done with great care, and for the greater safety, without shoes. For with the shoes on, and still more with a sudden leap into the boat, the heels may easily pierce through the bottom of the boat, which might fometimes

fometimes be attended with very difagrecable circumstances, especially when the boat is so near a rock, and close to that a sudden depth of water; and such places are common in the lakes and rivers here.

I never faw the muskitoes (culex pipiens) more plentiful in any part of America than they are here. They were so eager for our blood that we could not rest all the

night, though we had furrounded ourselves with fire.

Wood-lice (acarus Americanus Linn.) abound here, and are more plentiful than on any part of the journey. Scarcely any one of us fat down but a whole army of them crept upon his clothes. They caused us as much inconvenience as the gnats, during the last night, and the short time we stayed here. Their bite is very disagreeable, and they would prove very dangerous, if any one of them should creep into a man's ear, from whence it is dissicult to extract them. There are examples of people whose ears were swelled to the size of the sist, on account of one of these insects creeping into them, and biting them.

The whipperiwill, or whip-poor-will, cried all night on every fide. The fire-flies

flew in numbers through the woods at night.

Fort Anne derives its name from Queen Anne; for in her time it served as a fortification against the French. It lies on the western side of the river Woodcreek, which is here as inconfiderable as a brook, of a fathom's breadth, and may be waded through in any part, during this feafon. The fort is built in the fame manner as the forts Saratoga and Nicholfon, that is to fay, of palifades, within which the foldiers were quartered, and at the corners of which were the lodgings of the officers. The whole confifted of wood, because it was erected only with a view to refift irregular troops. It is built on a little rifing ground which runs obliquely to the river Woodcreek. The country round about it is partly fiat, partly hilly, and partly marshy, but it consists merely of earth, and no stones are to be met with, though ever so carefully sought for. General Nicholfon built this fort in the year 1709; but at the conclusion of the war then carrying on against the French, it shared the same sate with Saratoga and Fort Nicholfon, being burnt by the English in 1711. This happened with the following circumstance: In 1711 the English resolved to attack Canada by land and by sea at the fame time. A powerful fleet failed up the river St. Lawrence to befiege Quebec, and General Nicholfon, who was the greatest promoter of this expedition, headed a numerous army to this place by land, to attack Montreal at the fame time from hence; but a great part of the English fleet was shipwrecked in the river St. Lawrence, and obliged to return to New England. The news of this misfortune was immediately communicated to General Nicholfon, who was advifed to retreat. Captain Butler who commanded Fort Mohawk, during my flay in America, told me, that he had been at Fort Anne in 1711, and that General Nicholfon was about to leave it, and to go down the river Woodcreek, in boats ready for that purpose, when he received the accounts of the difafter which befell the fleet. He was fo enraged, that he endeavoured to tear his wig, but it being too strong for him, he flung it to the ground, and trampled on it, crying out, Roguery, treachery! He then fet fire to the fort, and returned. We faw the remains of the burnt palifades in the ground. And I asked my guides, Why the English had been at so great an expence in erecting the fort, and why they afterwards burnt it without any previous confideration? They replied, that it was done to get money from the government once more, for the rebuilding of the fort, which money coming into some people's hands, they would appropriate a great part of it to themfelves, and erect again a wretched, inconfiderable fort. They further told me, that fome

fome of the richest people in Albany had promoted their poor relations to the places for supplying the army with bread, &c. with a view to patch up their broken fortunes; and that they had acquired fuch fortunes as rendered them equal to the richeft inha-

bitants of Albany.

The heat was excessive to-day, especially in the afternoon, when it was quite calm. We were on the very fpot where Fort Anne formerly flood; it was a little place free from trees, but furrounded with them on every fide, where the fun had full liberty to heat the air. Afternoon it grew as warm as in a hot-bath *, and I never felt a greater heat. I found a difficulty of breathing, and it feemed to me as if my lungs could not draw in a fufficient quantity of air. I was more eafed when I went down into the vallies, and especially along the Woodcreek. I tried to fan the air to me with my hat, but it only encreafed the difficulty of breathing, and I received the greatest relief when I went to the water, and in a shady place frequently sprinkled some water in the air. My companions were all very much weakened, but they did not find fuch difficulty in breathing

as I had done; however towards evening the air became fomewhat cooler.

June 29th. Having completed our boat, after a great deal of trouble, we continued our journey this morning. Our provisions, which were much diminished, obliged us to make great hafte; for by being obliged to carry every thing on our backs, through the woods to Fort Anne, we could not take a great quantity of provisions with us, having feveral other very necessary things with us; and we did always eat very heartily. As there was very little water in the river, and feveral trees were fallen across it, which frequently stopped the boat, I left the men in the boat, and went along the shore with Yungstroem. The ground on both fides of the river was fo low, that it must be under water in fpring and autumn. The shores were covered with several forts of trees, which flood at moderate distances from each other, and a great deal of grass grew between them. The trees afforded a fine shade, very necessary and agreeable in this hot season; but the pleasure it gave was confiderably lessened by the numbers of gnats which we met with. The foil was extremely rich.

As we came lower down the river, the dykes, which the beavers had made in it, produced new difficulties. These laborious animals had carried together all forts of boughs and branches, and placed across the river, putting mud and clay in betwixt them, to stop the water. They had bit off the ends of the branches as neatly as if they had been chopped off with a hatchet. The grass about these places was trod down by them, and in the neighbourhood of the dykes we fometimes met with paths in the grafs, where the beavers probably carried trees along. We found a row of dykes before us, which stopped us a considerable while, as we could not get forwards with the boat, till

we had cut through them.

* In Sweden and in Russia it is usual for people of all ranks to bathe every week at least one time; this is done in a flove heated by an oven, to a surprising degree, and which is enough to slifle people who are not used to it: for commonly the heat is increased by the hot steam, caused by throwing red hot stones into water. In these baths, in Russia, the lower forts of people, men and women, bathe promiscuously, as the Romans did, and from whom, as Plutarch observes, in his Life of Cato, the Greeks adopted this indelicate and indecent custom, and which fpread so much, that the Emperor Adrian, and Marcus Antoninus were obliged to make laws against it, but neither were they long observed, for we find soon the Council of Laodicea obliged to prescribe a canon against this brutal custom, and notwithstanding this, we find from the fame baths; and from thence, it is probable, this custom passed among the Russians, when Christianity took place among them. Near the bath, in Russia, is commonly a pond, where the people plunge in, when quite hot, and in winter they welter in the fnow; and Saturdays it is common to fee . before the bath naked men and women, each having a bundle of rods in their hands, with which they gently beat one another, when in the bath. F.

As

As foon as the river was more open, we got into the boat again, and continued our journey in it. The breadth of the river, however, did not exceed eight or nine yards, and frequently it was not above three or four yards broad, and generally fo shallow, that our boat got on with difficulty. Sometimes it acquired fuch a fudden depth, that we could not reach the ground with flicks of feven feet long. The ftream was very rapid in fome places, and very flow in others. The banks were low at first, but afterwards remarkably high and steep, and now and then a rock projected into the water, which always caused a great depth in such places. The rocks consisted here of a grey quartz, mixed with grey lime-stone, lying in strata. The water in the river was very clear and transparent, and we faw feveral little paths leading to it from the woods, faid to be made by beavers, and other animals, which reforted here to drink. After going a little more than three English miles, we came to a place, where a fire was yet burning, and then we little thought that we had narrowly escaped death last night, as we heard this evening. Now and then we met with feveral trees lying across the river, and some

dykes of beavers, which were troublesome to us.

Towards night we met with a French ferjeant and fix French foldiers, who were fent by the commander of Fort St. Frederick to accompany three Englishmen to Saratoga, and to defend them in case of necessity, against fix French Indians, who were gone to be revenged on the English, for killing the brother of one of them in the last war. The peace was already concluded at that time, but as it had not yet been proclaimed in Canada, the Indians thought they could take this step; therefore they filently got away, contrary to the order of the governor of Montreal, and went towards the English plantations. We here had occasion to admire the care of Providence for us, in escaping these barbarians. We found the grass trod down all the day long, but had no thoughts of danger, as we believed every thing was quiet and peaceable. We were afterwards informed, that these Indians had trod the grass down, and passed the last night in the place where we found the burning brands in the morning. The usual road which they were to take, was by Fort Anne, but to shorten their journey they had gone an unfrequented road. If they had gone on towards Fort Anne, they would have met us without doubt, and looking upon us all as Englishmen, for whose blood they were gone out, they could eafily have furprifed and thot us all, and by that means have been rid of the trouble of going any further to fatisfy their cruelty. We were greatly firuck when the Frenchmen told us how near death we had been to-day. We paffed the night here, and though the French repeatedly advifed and defired me not to venture any further with my company, but to follow them to the first English settlement, and then back to Fort St. Frederick, yet I refolved, with the protection of the Almighty, to continue my journey the next day.

We faw immense numbers of those wild pigeons flying in the woods, which sometimes come in incredible flocks to the fouthern English colonies, most of the inhabitants not knowing where they come from. They have their nests in the trees here; and almost all the night make a great noise and cooing in the trees, where they roost. The Frenchmen shot a great number of them, and gave us some, in which we found great quantity of the feeds of the elin, which evidently demonstrated the care of Providence in supplying them with food; for in May the seeds of the red maple, which abounds here, are ripe, and drop from the trees, and are eaten by the pigeons during that time: afterwards, the feeds of the elm ripen, which then become their food, till other feeds ripen for them. Their flesh is the most palatable of any bird's flesh I ever tasted.

Almost every night, we heard some trees crack and fall, whilst we lay here in the woods, though the air was so calm that not a leaf stirred. The reason of this break-4 H

ing I am totally unacquainted with. Perhaps the dew loofens the roots of trees at night; or perhaps there are too many branches on one fide of the tree. It may be, that the above-mentioned wild-pidgeons fettle in fuch quantities on one tree as to weigh it down; or perhaps the tree begins to bend more and more to one fide, from its centre of gravity, making the weight always greater for the roots to support, till it comes to the point, when it can no longer be kept upright, which may as well happen in the midst of a calm night as at any other time. When the wind blows hard, it is reckoned very dangerous to sleep or walk in the woods, on account of the many trees which fall in them; and even when it is very calm, there is some danger in passing under very great and old trees. I was told, in several parts of America, that the storms or hurricanes sometimes only pass over a small part of the woods, and tear down the trees in it; and I have had opportunities of confirming the truth of this observation, by finding places in the forests, where almost all the trees were thrown down, and lay all in one direction.

Tea is differently efteemed by different people; and I think we would be as well, and our purses much better, if we were both without tea and coffee. However, I must be impartial, and mention in praise of tea, that if it be useful, it must certainly be so in summer, on such journies as mine, through a defart country, where one cannot carry wine or other liquors, and where the water is generally unsit for use, as being sull of insects. In such cases, it is very relishing when boiled, and tea is drunk with it; and I cannot sufficiently describe the sine taste it has in such circumstances. It relieves a weary traveller more than can be imagined, as I have myself experienced, together with a great many others who have travelled through the desart forests of America; on such journeys, tea is found to be almost as necessary as victuals *.

June 30th. This morning we left our boat to the Frenchmen, who made use of it to carry their provisions; for we could not make any further use of it, on account of the number of trees which the French had thrown across the river during the last war, to prevent the attacks of the English upon Canada. The Frenchmen gave us leave to make use of one of their boats, which they had left behind them, about six miles from the place where we passed the last night. Thus we continued our journey on foot, along the river; and found the country flat, with some little vales here and there. It was every where covered with tall trees of the deciduous kind; among which the beech, the elm, the American lime-tree, and the sugar-maple, were the most numerous. The trees stand at some distance from each other; and the soil in which they grow is extremely rich.

After we had walked about a Swedish mile, or fix English miles, we came to the place where the fix Frenchmen had left their bark boats, of which we took one, and rowed down the river, which was now between nineteen and twenty yards broad. The ground on both fides was very smooth, and not very high. Sometimes we found a hill consisting of grey quartz, mixed with small sine grains of grey spar. We likewise observed black stripes in it; but they were so small, that I could not determine whether they were of glimmer, or of another kind of stone. The hills were frequently divided into strata, lying one above another, of the thickness of sive inches. The strata went from north to south; and were not quite horizontal, but dipping to the north. As we went further on, we saw high and steep hills on the river-side, partly

^{*} On my travels through the defait plains, beyond the river Volga, I have had several opportunities of making the same observations on tea; and every traveller in the same circumstances, will readily allow them to be very just. F.

covered with trees; but in other parts, the banks confift of a fwampy turf ground, which gave way when it was walked upon, and had fome fimilarity to the fides of our marshes, which my countrymen are now about to drain. In those parts where the ground was low and flat, we did not fee any stones either on the ground or on the foster shore; and both sides of the river, when they were not hilly, were covered with tall elms, American lime-trees, sugar-maples, beeches, hiccory-trees, some water-beeches, and white walnut-trees.

On our left we faw an old fortification of stones laid above one another; but nobody

could tell me whether the Indians or the Europeans had built it.

We had rowed very fast all the afternoon, in order to get forward; and we thought that we were upon the true road, but found ourselves greatly mistaken: for towards night we observed, that the reeds in the river bent towards us, which was a mark that the river likewise flowed towards us; whereas, if we had been on the true river, it should have gone with us. We likewise observed, from the trees which lay across the river, that nobody had lately passed that way, though we should have seen the steps of the Frenchmen in the grass along the shore, when they brought their boat over these trees. At last, we plainly saw that the river slowed against us, by several pieces of wood which floated slowly towards us; and we were convinced, that we had gone twelve English miles and upwards upon a wrong river, which obliged us to return, and to row till very late at night. We sometimes thought, through fear, that the Indians, who were gone to murder some English, would unavoidably meet with us. Though we rowed very fast, yet we were not able to-day to get half-way back to the place where we first left the true river.

The most odoriferous estluvia sometimes came from the banks of the river, towards night, but we could not determine what slowers disfused them. However, we supposed they chiefly arose from the asclepias syriaca, and the apocynum andro-

fæmifolium.

The musk rats could likewise be smelled at night. They had many holes in the shores, even with the surface of the water.

We passed the night in an island, where we could not sleep on account of the gnats. We did not venture to make a fire for fear the Indians should find us out, and kill us. We heard several of their dogs barking in the woods, at a great distance from us, which added to our uneasiness.

July 1st. 1749. At day break we got up, and rowed a good while before we got to the place where we left the true road. The country which we passed was the poorest and most disagreeable imaginable. We saw nothing but a row of amazing high mountains covered with woods, steep and dirty on their sides; so that we found it difficult to get to a dry place, in order to land and boil our dinner. In many places the ground, which was very smooth, was under water, and looked like the sides of our Swedish morasses which are intended to be drained; for this reason the Dutch in Albany call these parts the drowned lands*. Some of the mountains run from S. S. W. to N. N. E. and when they come to the river, they form perpendicular shores, and are full of stones of different magnitudes. The river runs for the distance of some miles together from south to north.

The wind blew north all day, and made it very hard work for us to get forwards, though we all rowed as hard as we could, for all our provisions were eaten to-day at breakfast. The river was frequently an English mile and more broad, then it became

narrow again, and fo on alternately; but upon the whole it kept a good breadth, and was

furrounded on both fides by high mountains.

About fix o'clock in the evening, we arrived at a point of land about twelve English miles from Fort St. Frederick. Behind this point the river is converted into a spacious bay; and as the wind still kept blowing pretty strong from the north, it was impossible for us to get forward, since we were extremely weak. We were therefore obliged to pass the night here, in spite of the remonstrances of our hungry stomachs.

It is to be attributed to the peculiar grace of God towards us, that we met the above mentioned Frenchmen on our journey, and that they gave us leave to take one of their bark boats. It feldom happens once in three years, that the French go this road to Albany; for they commonly pass over the Lake St. Sacrament, or, as the English call it, Lake George, which is the nearer and better road, and every body wondered why they took this troublesome one. If we had not got their large strong boat, and been obliged to keep that which we had made, we would in all probability have been very ill off; for to venture upon the great bay during the least wind with so wretched a vessel, would have been a great piece of temerity, and we should have been in danger of being starved if we had waited for a calm. For being without fire-arms, and these deserts having but sew quadrupeds, we must have subsisted upon frogs and snakes, which, (especially the latter) abound in these parts. I can never think of this journey, without reverently acknowledging the peculiar care and providence of the merciful Creator.

July 2d. Early this morning we fet out on our journey again, it being moon-shine and calm, and we feared lest the wind should change and become unfavourable to us if we stopped any longer. We all rowed as hard as possible, and happily arrived about eight in the morning at Fort St. Frederick, which the English call Crown Point. Monsieur Lusignan, the governor, received us very politely. He was about fifty years old, well acquainted with polite literature, and had made several journies into this country, by which he had acquired an exact knowledge of several things relative to

its state.

I was informed that during the whole of this fummer, a continual drought had been here, and that they had not had any rain fince last spring. The excessive heat had retarded the growth of plants; and on all dry hills the grass, and a vast number of plants, were quite dried up; the small trees which grew near rocks, heated by the sun, had withered leaves, and the corn in the fields bore a very wretched aspect. The wheat had not yet eared, nor were the pease in blossoms. The ground was full of wide and deep cracks, in which the little snakes retired and hid themselves when pursued, as into an impregnable asylum.

The country hereabout, it is faid, contains vast forests of firs of the white, black, and red kind, which had been formerly still more extensive. One of the chief reasons of their decrease are, the numerous fires which happen every year in the woods, through the carelessness of the Indians, who frequently make great fires when they are hunting, which spread over the fir woods when every thing

is dry.

Great efforts are made here for the advancement of natural history, and there are few places in the world where such good regulations are made for this useful purpose, all which is chiefly owing to the care and zeal of a single person. From hence it appears, how well a useful science is received and set off, when the leading men of a country are its patrons. The governor of the fort was pleased to shew me a long paper,

which the then governor general of Canada, the Marquis la Galiffonniere, had fent him. It was the fame marquis, who, fome years after, as a French admiral, engaged the English fleet under Admiral Byng, the confequence of which was the conquest of Minorca. In this writing, a number of trees and plants are mentioned, which grow in North America, and deferve to be collected and cultivated on account of their useful qualities. Some of them are described, among which is the polygala senega, or rattle-fnake-root; and with feveral of them the places where they grow are mentioned. It is further requested that all kinds of feeds and roots be gathered here; and, to affift fuch an undertaking, a method of preferving the gathered feeds and roots is prefcribed, fo that they may grow and be fent to Paris. Specimens of all kinds of minerals are required; and all the places in the French fettlements are mentioned, where any useful or remarkable stone, earth, or ore has been found. There is likewife a manner of making observations and collections of curiofities in the animal kingdom. To these requests it is added, to enquire and get information, in every possible manner, to what purpose, and in what manner the Indians employ certain plants and other productions of nature, as medicines, or in any other case. This useful paper was drawn up by order of the Marquis la Galiffonniere, by M. Gaultier, the royal physician at Quebec, and afterwards corrected and improved by the Marquis's own hand. He had feveral copies made of it, which he fent to all the officers in the forts, and likewise to other learned men who travelled in the country. At the end of the writing is an injunction to the officers, to let the governor-general know which of the common foldiers had used the greatest diligence in the discovery and collection of plants and other natural curiofities, that he might be able to promote them, when an opportunity occurred, to places adapted to their respective capacities, or to reward them in any other manner. I found that the people of diffinction, in general here, had a much greater tafte for natural history and other parts of literature than in the English colonies, where it was every body's fole care and employment to fcrape a fortune together, and where the fciences were held in univerfal contempt *. It was still complained of here, that those who studied natural history, did not sufficiently enquire into the medicinal use of the plants of Canada.

The French, who are born in France, are faid to enjoy a better health in Canada than in their native country, and to attain to a greater age than the French born in Canada. I was likewife affured that the European Frenchmen can do more work, and perform more journies in winter, without prejudice to their health, than those born in this country.

It feems Mr. Kalm has forgotten his own affertions in the former part of this work. Dr. Colden, Dr. Franklin, and Mr. Bartram, have been the great promoters and inveftigators of nature in this country; and how would the inhabitants of Old England have gotten the fine collections of North American trees, fhrubs, and plants, which grow at prefent almost in every garden, and are as if it were naturalized in Old England, had they not been affisted by their friends, and by the curious in North America. One needs only cast an eye on Dr. Linnæus's new edition of his Systema, and the repeated mention of Dr. Garden, in order to be convinced that the English in America have contributed a greater share towards promoting natural history than any nation under heaven, and certainly more than the French, though their learned men are often handsomely pensioned by their great monarch: on the other hand the English study that branch of knowledge, from the sole motive of its utility, and the pleasure it affords to a thinking being, without any of those mercenary views held forth to the learned of other countries. And as to the other parts of literature, the English in America are undoubtedly superior to the French in Canada, witness the many useful institutions, colleges, and schools sounded in the English colonies in North America, and so many very considerable libraries now erecting in this country, which contain such a choice of useful and curious books, as were very little known in Canada before it fell into the hands of the English; not to mention the productions of original genius written by Americans born. F.

The intermitting fever which attacks the Europeans on their arrival in Penfylvania, and which, as it were, makes the climate familiar to them, is not known here, and the people are as well after their arrival as before. The English have frequently observed, that those who are born in America of European parents, can never bear sea-voyages, and go to the different parts of South-America, as well as those born in Europe. The French born in Canada have the same constitutions; and when any of them go to the West-India islands, such as Martinique, Domingo, &c., and make some stay there, they commonly fall sick, and die soon after: those who fall ill there seldom recover, unless they are brought back to Canada. On the contrary, those who go from France to those islands can more easily bear the climate, and attain a great age there, which I

heard confirmed in many parts of Canada.

July 5th. Whilft we were at dinner, we feveral times heard a repeated difagreeable out-cry, at some distance from the fort, in the river Woodcreek. Mr. Lusignan, the governor, told us this cry was no good omen, because he could conclude from it that the Indians, whom we escaped near Fort Anne, had compleated their defign of revenging the death of one of their brethren upon the English, and that their shouts shewed that they had killed an Englishman. As foon as I came to the window, I saw their boat, with a long pole at one end, on the extremity of which they had put a bloody skull. As foon as they were landed, we heard that they, being fix in number, had continued their journey (from the place where we had marks of their passing the night), till they had got within the English boundaries, where they found a man and his fon employed in mowing the corn. They crept on towards this man, and shot him dead upon the fpot. This happened near the very village, where the English, two years before, killed the brother of one of these Indians, who were then gone out to attack them. According to their custom they cut off the skull of the dead man, and took it with them, together with his clothes and his fon, who was about nine years old. As foon as they came within a mile of Fort St. Frederick, they put the skull on a pole, in the fore part of the boat, and shouted as a fign of their success. They were dressed in shirts, as usual, but some of them had put on the dead man's clothes; one his coat, the other his breeches, another his hat, &c. Their faces were painted with vermillion, with which their shirts were marked across the shoulders. Most of them had great rings in their ears, which seemed to be a great inconvenience to them, as they were obliged to hold them when they leaped, or did any thing which required a violent motion. Some of them had girdles of the skins of rattle-fnakes, with the rattles on them; the fon of the murdered man had nothing but his shirt, breeches and cap, and the Indians had marked his shoulders with red. When they got on shore, they took hold of the pole on which the skull was put, and danced and fung at the fame time. Their view in taking the boy, was to carry him to their habitations, to educate him instead of their dead brother, and afterwards to marry him to one of their relations. Notwithstanding they had perpetrated this act of violence in time of peace, contrary to the command of the governor in Montreal, and to the advice of the governor of St. Frederick, yet the latter could not at prefent deny them provisions, and whatever they wanted for their journey, because he did not think it adviseable to exasperate them; but when they came to Montreal, the governor called them to account for this action, and took the boy from them, whom he afterwards fent to his relations. Mr. Lufignan asked them, what they would have done to me and my companions, if they had met us in the defert? They replied, that as it was their chief intention to take their revenge on the Englishmen in the village where their brother was killed, they would have let us alone; but it much depended on the humour

humour they were in, just at the time when we first came to their fight. However, the commander, and all the Frenchmen, said, that what had happened to me was infinitely safer and better.

Some years ago a skeleton of an amazing great animal had been found in that part of Canada where the Illinois live. One of the lieutenants in the fort assured me, that he had seen it. The Indians who were there, had found it in a swamp. They were surprised at the fight of it, and when they were asked, what they thought it was? They answered, that it must be the skeleton of the chief or father of all the beavers. It was of a prodigious bulk, and had thick white teeth, about ten inches long. It was looked upon as the skeleton of an elephant. The lieutenant assured me that the figure of the whole snout was yet to be seen, though it was half mouldered. He added, that he had not observed that any of the bones were taken away, but thought the skeleton lay quite perfect there. I have heard people talk of this monstrous skeleton in feveral other parts of Canada *.

Bears are plentiful hereabouts, and they kept a young one, about three months old, at the fort. He had perfectly the fame shape, and qualities, as our common bears in Europe, except the ears, which seemed to be longer in proportion, and the hairs which were stiffer; his colour was deep brown, almost black. He played and wrestled every day with one of the dogs. A vast number of bear-skins are annually exported to France from Canada. The Indians prepare an oil from bear's grease, with which in summer they daub their face, hands, and all naked parts of their body, to secure them from the bite of the gnats. With this oil they likewise frequently smear the body, when they are excessively cold, tired with labour, hurt, and in other cases. They believe it softens the skin, and makes the body pliant, and is very serviceable to old age.

The common dandelion (Leontodon Taraxacum Linn.) grows in abundance on the pastures and roads between the fields, and was now in flower. In spring, when the young leaves begin to come up, the French dig up the plants, take their roots †, wash them, cut them, and prepare them as a common sallad; but they have a bitter taste.

It is not usual here to make use of the leaves for eating.

July 6th. The foldiers, which had been paid off after the war, had built houses round the fort, on the grounds allotted to them; but most of these habitations were no more than wretched cottages, no better than those in the most wretched places of Sweden; with that difference, however, that their inhabitants here were rarely oppressed by hunger, and could eat good and pure wheat bread. The huts which they had erected consisted of boards, standing perpendicularly close to each other. The roofs were of wood too. The crevices were stopped up with clay, to keep the room warm. The floor was commonly clay, or a black line-stone, which is common here. The hearth was built of the same stone, except the place where the fire was to lie, which was made of grey sand-stones, which for the greatest part consist of particles of quartz. In some hearths, the stones quite close to the fire-place were lime-stones; however, I was assured that there was no danger of fire, especially if the stones, which were most exposed to the heat, were of a large size. They had no glass in their windows.

† In France the young blanched leaves, which fearce peop out of molchills, and have yet a yellow colour, are univerfally eaten as a falled, under the name of Pifenlit. F.

[•] The country of the Illinois is on the river Ohio, near the place where the English have found some bones, supposed to belong to elephants.

July 8th. The galium tinctorium is called tifavojaune rouge by the French throughout all Canada, and abounds in the woods round this place, growing in a moist but fine foil. The roots of this plant are employed by the Indians in dying the quills of the American porcupines red, which they put into several pieces of their work; and air, fun, or water, feldom change this colour. The French women in Canada sometimes dye their clothes red with these roots, which are but small, like those of galium uteum, or yellow bed-straw.

The horses are left out of doors during the winter, and find their food in the woods, living upon nothing but dry plants, which are very abundant; however they do not fall

off by this food, but look very fine and plump in fpring.

July 9th. The skeleton of a whale was found some French miles from Quebec, and one French mile from the river St. Laurence, in a place where no slowing water comes to at present. This skeleton has been of a very considerable size, and the governor of

the fort faid, he had spoke with several people who had seen it.

July 10th. The boats which are here made use of are of three kinds. 1. Barkboats, made of the bark of trees, and of ribs of wood. 2. Canoes, consisting of a single piece of wood, hollowed out, which I have already described before. They are here made of the white fir, and of different fizes. They are not brought forward by rowing, but by paddling; by which method not half the strength can be applied, which is made use of in rowing; and a single man might, I think, row as fast as two of them could paddle. 3. The third kind of boats are bateaux. They are always made very large here, and employed for large cargoes. They are flat-bottomed, and the bottom is made of the red, but more commonly of the white oak, which resists better, when it runs against a stone, than other wood. The sides are made of the white fir, because oak would make the bateau too heavy. They make plenty of tar and pitch here.

The foldiery enjoy fuch advantages here as they are not allowed in every part of the world. Those who formed the garrison of this place had a very plentiful allowance from their government. They get every day a pound and a half of wheat bread. They likewife get peafe, bacon, and falt meat in plenty. Sometimes they kill oxen and other cattle, the flesh of which is distributed among the soldiers. All the officers kept cows, at the expence of the king, and the milk they gave was more than fufficient to fupply them. The foldiers had each a fmall garden without the fort, which they were allowed to attend, and plant in it whatever they liked, and some of them had built fummer-houses in them, and planted all kind of pot-herbs. The governor told me, that it was a general custom to allow the foldiers a spot of ground for kitchen-gardens, at fuch of the French forts hereabouts as were not fituated near great towns, from whence they could be supplied with greens. In time of peace the soldiers have very little trouble with being upon guard at the fort; and as the lake close by is full of fish, and the woods abound with birds and animals, those amongst them who choose to be diligent may live extremely well, and very grand in regard to food. Each foldier got a new coat every two years; but annually, a waistcoat, cap, hat, breeches, cravat, two pair of stockings, two pair of shoes, and as much wood as he had occasion for in winter. They likewife got five fols * a piece every day; which is augmented to thirty fols when they have any particular labour for the king. When this is confidered, it is not furprifing to find the men are very fresh, well fed, strong and lively here. When a foldier falls fick he is brought to the hospital, where the king provides him with a bed,

A fol in France is about the value of one half-penny sterling.

food, medicines, and people to take care of and serve him. When some of them asked leave to be absent for a day or two, to go abroad, it was generally granted them, if circumstances would permit, and they enjoyed as usual their share of provisions and money, but were obliged to get fome of their comrades to mount the guard for them as often as it came to their turns, for which they gave them an equivalent. The governor and officers were duly honoured by the foldiers; however, the foldiers and officers often spoke together as comrades, without any ceremonies, and with a very becoming freedom. The foldiers who are fent hither from France, commonly ferve till they are forty or fifty years old, after which they are dismissed and allowed to settle upon, and cultivate a piece of ground: but if they have agreed on their arrival to ferve no longer than a certain number of years, they are difmiffed at the expiration of their Those who are born here commonly agree to serve the crown during fix, eight, or ten years; after which they are difinified, and fet up for farmers in the country. The King prefents each difmiffed foldier with a piece of land, being commonly fortyarpents * long, and but three broad, if the foil be of equal goodness throughout; but they get fomewhat more, if it be a worfe ground †. As foon as a foldier fettles to cultivate fuch a piece of land, he is at first affisted by the King, who supplies himself, his wife and children, with provisions, during the three or four first years. The King likewife gives him a cow, and the most necessary instruments for agriculture. Some foldiers are fent to affift him in building a house, for which the King pays them. These are great helps to a poor man, who begins to keep house; and it feems that in a country where the troops are fo highly distinguished by the royal favour, the King cannot be at a loss for foldiers. For the better cultivation and population of Canada, a plan has been proposed some years ago, for sending three hundred men over from France every year, by which means the old foldiers may always be difmiffed, marry, and fettle in the country. The land which was allotted to the foldiers about this place was very good, confifting throughout of a deep mould, mixed with clay.

July 11th. The harrows which they make use of here are made entirely of wood, and of a triangular form. The ploughs seemed to be less convenient. The wheels upon which the plough-beam is placed are as thick as the wheels of a cart, and all the wood-work is so clumfily made that it requires a horse to draw the plough along a

fmooth field.

Rock-stones of different forts lay scattered on the fields. Some were from three to five feet high, and about three feet broad. They were pretty much alike in regard to

the kind of the stone; however, I observed three different species in them.

First, Some consisted of a quartz, whose colour resembled sugar-candy, and which was mixed with a black small-grained glimmer, a black horn-stone, and a few minute grains of a brown spar. The quartz was most abundant in the mixture; the glimmer was likewise in great quantity, but the spar was inconsiderable. The several kinds of stones were well mixed, and though the eye could distinguish them, yet no instrument could

* An arpent in France contains 100 French perches, and each of those 22 French seet; then the French foot being to the English as 1440 to 1352; an arpent is about 2346 English seet, and 8 inches long. See Ordonnances de Louis XIV. sur le fait des Eaux and Forêts. Paris, 1687. p. 112. F.

[†] Mr. Kalm says, in his original, that the length of an arpent was so determined, that they reckoned 84 of them in a French lieue or league; but as this does by no means agree with the statute arpent of France, which by order of King Lewis XIV. was fixed at 2200 seet, Paris measure, (see the preceding note) we thought proper to leave it out of the text. F.

feparate them. The stone was very hard and compact, and the grains of quartz looked very fine.

Second, Some pieces confifted of grey particles of quartz, black glimmer, and horn-flone, together with a few particles of spar, which made a very close, hard, and com-

pact mixture, only differing from the former in colour.

Third, A few of the stones consisted of a mixture of white quartz and black glimmer, to which some red grains of quartz were added. The spar (quartz) was most predominant in this mixture, and the glimmer appeared in large slakes. This stone was not so well mixed as the former, and was by far not so hard and so compact, being

eafily pounded.

The mountains on which Fort St. Frederick is built, as likewife those on which the above kinds of stone are found, consisted generally of a deep black lime-stone, lying in lamellæ as slates do, and it might be called a kind of slates, which can be turned into quick-lime by fire *. This lime-stone is quite black in the inside, and, when broken, appears to be of an exceeding fine texture. There are some grains of a dark spar scattered in it, which, together with some other inequalities, form veins in it. The strata which lie uppermost in the mountains consist of a grey lime-stone, which is seemingly no more than a variety of the preceding. The black lime-stone is constantly

found filled with petrifactions of all kinds, and chiefly the following.

Pectinites, or petrified oftreæ pectines. These petrified shells were more abundant than any others that have been found here, and sometimes whole strata are met with, consisting merely of a quantity of shells of this fort, grown together; they are generally small, never exceeding an inch and a half in length. They are found in two different states of petrifaction; one shews always the impressions of the elevated and hollow surfaces of the shells, without any vestige of the shells themselves. In the other appears the real shell slicking in the stone, and by its light colour is easily distinguishable from the stone. Both these kinds are plentiful in the stone; however, the impressions are more in number than the real shells. Some of the shells are very elevated, especially in the middle, where they form as it were a hump; others again are depressed in the middle; but in most of them the outward surface is remarkably elevated. The surrows always run longitudinally, or from the top, diverging to the margin.

Petrified cornua ammonis. These are likewise frequently found, but not equal to the former in number: like the pectinitæ, they are found really petrified, and in impressions; amongst them were some petrified snails. Some of these cornua ammonis were remarkably big, and I do not remember seeing their equals, for they measured

above two feet in diameter.

Different kinds of corals could be plainly feen in, and feparated from, the stone in which they lay. Some were white and ramose, or lithophytes; others were starry

corals, or madrepores; the latter were rather fearce.

I must give the name of stone-balls to a kind of stones foreign to me, which are found in great plenty in some of the rock-stones. They were globular, one half of them projecting generally above the rock, and the other remaining in it. They consist of nearly parallel sibres, which arise from the bottom as from a center, and spread over the surface of the ball, and have a grey colour. The outside of the balls is smooth, but has a number of small pores, which externally appear to be covered with a pale grey crust. They are from an inch to an inch and a half in diameter.

Amongst

^{*} Marmor schistosum, Linn. Syst. III. p. 40. Marmor unicolor nigrum. Wall. Min. pag. 61. n. 2. Line-slates, schistus calcareus. Forst. Introd. to Min. p. 9. F.

Amongst some other kinds of fand, which are found on the shores of lake Champlain, two were very peculiar, and commonly lay in the same place; and one was black, and

the other reddish brown, or granite coloured.

The black fand always lies uppermost, consists of very fine grains, which, when examined by a microfcope, appear to have a dark blue colour, like that of a fmooth iron, not attacked by ruft. Some grains are roundish, but most of them angular, with fhining furfaces; and they fparkle when the fun shines. All the grains of this fand, without exception, are attracted by the magnet. Amongst these black or deep blue grains, they meet with a few grains of a red or garnet-coloured fand, which is the fame with the red fand which lies immediately under it, and which I shall now describe. This red or garnet-coloured fand is very fine, but not fo fine as the black fand. Its grains not only participate of the colour of garnets, but they are really nothing but pounded garnets. Some grains are round, others angulated: all shine and are semipellucid; but the magnet has no effect on them, and they do not sparkle so much in funshine. This red sand is seldom found very pure, it being commonly mixed with a white sand, consisting of particles of quartz. The black and red sand is not found in every part of the shore, but only in a few places, in the order before mentioned. The uppermost or black fand lay about a quarter of an inch deep; when it was carefully taken off, the fand under it became of a deeper red the deeper it lay, and its depth was commonly greater than that of the former. When this was carefully taken away, the white fand of quartz appeared mixed very much at top with the red fand, but growing purer the deeper it lay. This white fand was above four inches deep, had round grains, which made it entirely like a pearl fand. Below this was a pale grey angulated quartz fand. In fome places the garnet-coloured fand lay uppermost, and this grey angulated one immediately under it, without a grain of either the black or the white

I cannot determine the origin of the black or steel-coloured sand, for it was not known here whether there were iron mines in the neighbourhood or not. But I am rather inclined to believe they may be found in these parts, as they are common in different parts of Canada, and as this sand is found on the shores of almost all the lakes and rivers in Canada, though not in equal quantities. The red or garnet-coloured sand has its origin hereabouts; for though the rocks near Fort St. Frederick contained no garnets, yet there are stones of different sizes on the shores, quite different from the stones which form those rocks; these stones are very full of grains of garnets, and when pounded there is no perceptible difference between them and the red sand. In the more northerly parts of Canada, or below Quebec, the mountains themselves contain a great number of garnets. The garnet-coloured sand is very common on the shores of the river St. Laurence. I shall leave out several observations which I made upon the minerals hereabouts, as uninteresting to most of my readers.

The apocynum androsemifolium grows in abundance on hills covered with trees, and is in full flower about this time; the French call it herbe à le puce. When the stalk is cut or tore, a white milky juice comes out. The French attribute the same qualities to this plant, which the poison-tree, or rhus vermix, has in the English colonies; that its poison is noxious to some persons, and harmless to others. The milky juice when spread upon the hands and body, has no bad effect on some persons; whereas others cannot come near it without being blistered. I saw a soldier whose hands were blistered all over, merely by plucking the plant, in order to shew it me; and it is said its exhalations affect some people, when they come within reach of them. It is generally allowed here, that the lactescent juice of this plant, when spread on any part of

the

the human body not only fwells the part, but frequently corrodes the fkin; at least there are few examples of persons on whom it had no effect. As for my part, it has never hurt me, though in presence of several people I touched the plant, and rubbed my hands with the juice till they were white all over, and I have often rubbed the plant in my hands till it was quite crushed, without seeling the least inconvenience, or change on my hand. The cattle never touch this plant.

July 12th. Burdock, or arctium lappa, grows in feveral places about the fort; and the governor told me, that its tender shoots are eaten in spring as raddishes, after the

exterior peel is taken off.

The fifon Canadense abounds in the woods of all North America. The French call it certeuil sauvage, and make use of it in spring, in green soups, like chervil. It is universally praised here as a wholesome antiscorbutic plant, and as one of the best which

can be had here in fpring.

The asclepias syriaca, or, as the French call it, le cotonier, grows abundant in the country, on the fides of hills which lie near rivers and other fituations, as well in a dry and open place in the woods, as in a rich loofe foil. When the ftalk is cut or broken it emits a lactefcent juice, and for this reason the plant is reckoned in some degree poisonous. The French in Canada nevertheless use its tender shoots in spring, preparing them like afparagus; and the use of them is not attended with any bad confequences, as the flender shoots have not yet had time to suck up any thing poisonous. Its flowers are very odoriferous, and when in feafon, they fill the woods with their fragrant exhalations, and make it agreeable to travel in them, especially in the evening. The French in Canada make a fugar of the flowers, which for that purpose are gathered in the morning, when they are covered all over with dew. This dew is expressed, and by boiling yields a very good brown, palatable sugar. The pods of this plant, when ripe, contain a kind of wool, which encloses the feed, and refembles cotton, from whence the plant has got its French name. The poor collect it, and fill their beds, especially their children's, with it, instead of feathers. This plant flowers in Canada at the end of June, and beginning of July, and the feeds are ripe in the middle of September. The horses never eat of this plant.

July 16th. This morning I croffed lake Champlain to the high mountain on its western fide, in order to examine the plants and other curiosities there. From the top of the rocks, at a little distance from Fort St. Frederick, a row of very high mountains appear on the western shore of lake Champlain, extending from south to north; and on the eaftern fide of this lake is another chain of high mountains, running in the fame direction. Those on the eastern fide are not close to the lake, being about ten or twelve miles from it; and the country between it and them is low and flat, and covered with woods, which likewife clothe the mountains, except in fuch places as the fires, which deftroy the forests here, have reached them and burnt them down. These mountains have generally steep sides, but sometimes they are found gradually floping. We crofted the lake in a canoe, which could only contain three perfons. and as foon as we landed we walked from the shore to the top of the mountains. Their fides are very fleep, and covered with a mould, and fome great rock-stones lay on them. All the mountains are covered with trees; but in some places the forests have been destroyed by fire. After a great deal of trouble, we reached the top of one of the mountains, which was covered with a dufty mould. It was none of the highest; and fome of those which were at a greater distance were much higher, but we had no timeto go to them; for the wind encreased, and our boat was but a little one. We found

no curious plants, or any thing remarkable here.

When we returned to the shore we found the wind risen to such a height, that we did not venture to cross the lake in our boat, and for that reason I lest the fellow to bring it back, as soon as the wind subsided, and walked round the bay, which was a walk of about seven English miles. I was followed by my servant, and, for want of a road, we kept close to the shore, where we passed over mountains and sharp stones; through thick forests and deep marshes, all which were known to be inhabited by numberless rattle-snakes, of which we happily saw none at all. The shore is very full of stones in some places, and covered with large angulated rock-stones, which are sometimes roundish, and their edges as it were worn off. Now and then we met with a small sandy spot covered with grey, but chiefly with the sine red sand which I have before-mentioned; and the black iron sand likewise occurred sometimes. We found stones of a red glimmer of a fine texture, on the mountains. Sometimes these mountains with the trees on them stood perpendicular with the water-side, but in some places the shore was marshy.

I faw a number of petrified cornua ammonis in one place, near the shore, among a number of stones and rocks. The rocks consist of a grey lime-stone, which is a variety of the black one, and lies in a strata, as that does. Some of them contain a number of petrifactions with, and without shells; and in one place we found prodigious large cornua ammonis, about twenty inches in breadth. In some places the water had wore off the stone, but could not have the same effect on the petrifactions, which lay elevated

above, and in a manner glued on the stones.

The mountains near the shore are amazingly high and large, consisting of a compact grey rock stone, which does not lie in strata as the lime-stone, and the chief of whose constituent parts are a grey quartz, and a dark glimmer. This rock-stone reached down to the water, in places where the mountains stood close to the shore; but where they were at some distance from it, they were supplied by strata of grey and black lime-stone, which reached to the water-side, and which I never have seen covered with the grey rocks.

The zizania aquatica grows in mud, and in the most rapid parts of brooks, and is

in full bloom about this time.

July 17th. The distempers which rage among the Indians are rheumatisms and pleurisies, which arise from their being obliged frequently to lie in moist parts of the woods at night; from the sudden changes of heat and cold, to which the air is exposed here; and from their being frequently loaded with too great a quantity of strong liquor, in which case they commonly lie down naked in the open air, without any regard to the season, or the weather. These distempers, especially the pleurisies, are likewise very common among the French here; and the governor told me he had once a very violent sit of the latter, and that Dr. Sarrasin had cured him in the following manner, which has been found to succeed best here. He gave him sudorisies, which were to operate between eight and ten hours; he was then bled, and the sudorisies repeated; he was bled again, and that essectually cured him.

Dr. Sarrasin was the royal physician at Quebec, and a correspondent of the Royal Academy of Sciences at Paris. He was possessed of great knowledge in the practice of physic, anatomy, and other sciences, and very agreeable in his behaviour. He died at Quebec of a malignant sever, which had been brought to that place by a ship, and with which he was infected at an hospital, where he visited the sick. He left a son, who likewise studied physic, and went to France to make himself more perfect in the

practical part of it, but he died there.

The intermitting fevers fometimes come amongst the people here, and the venereal disease is common here. The Indians are likewise infected with it; and many of them have had it, and some still have it; but they likewise are perfectly possessed of the art of curing it. There are examples of Frenchmen and Indians, infected all over the body with this disease, who have been radically and perfectly cured by the Indians, within five or six months. The French have not been able to find this remedy out; though they know that the Indians employ no mercury, but that their chief remedies are roots which are unknown to the French. I have afterwards heard what these plants were, and given an account of them at large to the Royal Swedish Academy of Sciences*.

We are very well acquainted in Sweden with the pain caused by the tæniæ, or a kind of worms. They are less abundant in the British North American colonies; but in Canada they are very frequent. Some of these worms, which have been evacuated by a person, have been several yards long. It is not known, whether the Indians are afflicted with them or not. No particular remedies against them are known here, and no one can give an account from whence they come, though the eating of some fruits

contributes, as is conjectured, to create them.

July 19th. Fort St. Frederick is a fortification on the fouthern extremity of lake Champlain, fituated on a neck of land, between that lake and the river, which arifes from the union of the river Woodcreek, and lake St. Sacrement. The breadth of this river is here about a good musket-shot. The English call this fortress Crown Point, but its French name is derived from the French fecretary of state, Frederic Maurepas, in whose hands the direction and management of the French court of admiralty was at the time of the erection of this fort; for it is to be observed, that the government of Canada is fubject to the court of admiralty in France, and the governor-general is always chosen out of that court. As most of the places in Canada bear the names of faints, custom has made it necessary to prefix the word faint to the name of the for-The fort is built on a rock, confisting of black lime-flates, as aforefaid; it is nearly quadrangular, has high and thick walls, made of the same lime-stone, of which there is a quarry about half a mile from the fort. On the eastern part of the fort is a high tower, which is proof against bombshells, provided with very thick and substantial walls, and well stored with cannon from the bottom almost to the very top; and the governor lives in the tower. In the terre-plein of the fort is a well built little church, and houses of stone for the officers and soldiers. There are sharp rocks on all sides towards the land, beyond a cannon-shot from the fort, but among them are some which are as high as the walls of the fort, and very near them.

The foil about fort St. Frederick is faid to be very fertile, on both fides of the river; and before the last war a great many French families, especially old soldiers, have settled there; but the king obliged them to go into Canada, or to settle close to the fort, and to lie in it at night. A great number of them returned at this time, and it was thought that about forty or fifty families would go to settle here this autumn. Within one or two musket-shots to the east of the fort, is a wind-mill built of stone, with very thick walls, and most of the flour which is wanted to supply the fort is ground here. This wind-mill is so contrived as to serve the purpose of a redoubt, and at the top of it are five or fix small pieces of cannon. During the last war there was a number of soldiers quartered in this mill, because they could from thence look a great

^{*} See the Memoirs of that Academy, for the year 1750, page 284. The fillingia fylvatica is probably one of these roots. F.

way up the river, and observe whether the English boats approached; which could not be done from the fort itself, and which was a matter of great consequence, as the English might (if this guard had not been placed here) have gone in their little boats close under the western shore of the river, and then the hills would have prevented their being feen from the fort. Therefore the fort ought to have been built on the spot where the mill stands, and all those who come to see it are immediately struck with the abfurdity of its fituation. If it had been erected in the place of the mill, it would have commanded the river, and prevented the approach of the enemy; and a small ditch cut through the loofe lime-stone, from the river (which comes out of the lake St. Sacrement) to lake Champlain, would have furrounded the fort with flowing water, because it would have been situated on the extremity of the neck of land. In that case the fort would always have been fufficiently fupplied with fresh water, and at a distance from the high rocks which furrounded it in its prefent fituation. We prepared to-day to leave this place, having waited during fome days for the arrival of the yacht, which plies constantly all fummer between the forts St. John and St. Frederick: during our ftay here, we had received many favours. The governor of the fort, Mr. Lufignan, a man of learning and of great politeness, heaped obligations upon us, and treated us with as much civility as if we had been his relations. I had the honour of eating at his table during my ftay here, and my fervant was allowed to eat with his. We had our rooms, &c. to ourselves, and at our departure the governor supplied us with ample provisions for our journey to fort St. John. In short, he did us more favours than we could have expected from our own countrymen, and the officers were likewise par-

ticularly obliging to us.

About eleven o'olock in the morning we fet out, with a fair wind. On both fides of the lake are high chains of mountains; with the difference which I have before observed, that on the eastern shore is a low piece of ground covered with a forest, extending between twelve and eighteen English miles, after which the mountains begin; and the country behind them belongs to New England. This chain confifts of high mountains, which are to be confidered as the boundaries between the French and Englifth possessions in these parts of North America. On the western shore of the lake, the mountains reach quite to the water fide. The lake at first is but a French mile broad, but always encreases afterwards. The country is inhabited within a French mile of the fort, but after that, it is covered with a thick forest. At the distance of about ten French miles from fort St. Frederick, the lake is four fuch miles broad, and we perceive fome islands in it. The captain of the yacht said there were about fixty islands in that lake, of which fome were of a confiderable fize. He affured me that the lake was in most parts so deep, that a line of two hundred yards could not fathom it; and close to the shore, where a chain of mountains generally runs across the country, it frequently has a depth of eighty fathoms. Fourteen French miles from fort St. Frederick we faw four large islands in the lake, which is here about fix French miles broad. This day the fky was cloudy, and the clouds, which were very low, feemed to furround several high mountains, near the lake, with a fog; and from many mountains the fog rose as the smoke of a charcoal-kiln. Now and then we saw a little river which fell into the lake: the country behind the high mountains, on the western side of the lake, is, as I am told, covered for many miles together with a tall forest, intersected by many rivers and brooks, with marshes and sinall lakes, and very fit to be inhabited. The shores are sometimes rocky, and sometimes fandy here. Towards night the mountains decreased gradually; the lake is very clear, and we observed neither rocks nor **fhallows** 3.

shallows in it. Late at night the wind abated, and we anchored close to the shore, and

fpent one night here.

July 20th. This morning we proceeded with a fair wind. The place where we passed the nightwas above half way to Fort St. John; for the distance of that place from Fort St. Frederick, across lake Champlain is computed to be forty-one French miles; that lake is here about fix English miles in breadth. The mountains were now out of fight, and the country low, plain, and covered with trees. The shores were fandy, and the lake appeared now from four to fix miles broad. It was really broader, but the islands made it appear narrower.

We often faw Indians in bark-boats close to the shore, which was however not inhabited; for the Indians came here only to catch sturgeons, wherewith this lake abounds, and which we often saw leaping up in the air. These Indians lead a very singular life: at one time of the year they live upon the small store of maize, beans, and melons, which they have planted; during another period, or about this time, their food is sish, without bread or any other meat; and another season they eat nothing but stags, roes, beavers, &c., which they shoot in the woods, and rivers. They, however, enjoy long life, perfect health, and are more able to undergo hardships than other people. They sing and dance, are joyful, and always content; and would not, for a great deal, exchange their manner of life for that which is preferred in Europe.

When we were yet ten French miles from fort St. John, we faw fome houses on the western side of the lake, in which the French had lived before the last war, and which they then abandoned, as it was by no means safe: they now returned to them again. These were the first houses and settlements which we saw after we had left those about

fort St. Frederick.

There formerly was a wooden fort, or redoubt, on the eastern fide of the lake, near the water-fide; and the place where it stood was shewn me, which at present is quite overgrown with trees. The French built it to prevent the incursions of the Indians over this lake; and I was affured that many Frenchmen had been slain in these places. At the same time they told me, that they reckon four women to one man in Canada, because annually several Frenchmen are killed on their expeditions, which they undertake for the sake of trading with the Indians.

A wind-mill built of stone, stands on the east side of the lake on a projecting piece of ground. Some Frenchmen have lived near it; but they left it when the war broke out, and are not yet come back to it. From this mill to Fort St. John they reckon eight French miles. The English, with their Indians, have burnt the houses here several

times, but the mill remained unhurt.

The yacht which we went into St. John was the first that was built here, and employed on Lake Champlain, for formerly they made use of bateaux to fend provisions over the lake. The captain of the yacht was a Frenchman, born in this country; he had built it, and taken the foundings of the lake, in order to find out the true road between Fort St. John and Fort St. Frederick. Opposite the wind-mill the lake is about three fathoms deep, but it grows more and more shallow the nearer it comes to Fort St. John.

We now perceived houses on the shore again. The captain had otter-skins in the cabin, which were perfectly the same in colour and species with the European ones. Otters are said to be very abundant in Canada.

Seal-skins are here made use of to cover boxes and trunks, and they often made portmantles of them in Canada. The common people had their tobacco pouches made

of

of the same skins. The seals here are entirely the same with the Swedish or European one, which are grey with black spots. They are said to be plentiful in the mouth of the river St. Lawrence, below Quebec, and go up that river as far as its water is salt. They have not been sound in any of the great lakes of Canada. The French call them

loups marins *.

The French in their colonies, fpend much more time in prayer and external worship, than the English and Dutch settlers in the British colonies. The latter have neither morning nor evening prayer in their ships and yachts, and no difference is made between Sunday and other days. They never, or very feldom, fay grace at dinner. On the contrary, the French here have prayers every morning and night on board their fhipping, and on Sundays they pray more than commonly: they regularly fay grace at their meals; and every one of them fays prayers in private as foon as he gets up. At Fort St. Frederick all the foldiers affembled together for morning and evening prayers. The only fault was, that most of the prayers were read in Latin, which a great part of the people do not understand. Below the above mentioned wind-mill, the breadth of the lake is about a musket-shot, and it looks more like a river than a lake. The country on both fides is low and flat, and covered with woods. We faw at first a few scattered cottages along the shore; but a little further the country is inhabited without interruption. The lake is here from fix to ten foot deep, and forms feveral islands. During the whole course of this voyage, the situation of the lake was always directly from S. S. W. to N. N. E.

In some parts of Canada are great tracts of land belonging to single persons; from these lands, pieces of forty arpens long, and sour wide, are allotted to each discharged soldier who intends to settle here; but after his household is established, he is obliged to pay the owner of the lands six French francs annually.

The lake was now fo shallow in feveral places, that we were obliged to trace the way for the yacht, by founding the depth with branches of trees. In other places opposite,

it was fometimes two fathom deep.

In the evening, about fun-set, we arrived at Fort St. Jean, or St. John, having had a

continual change of rain, fun-shine, wind, and calm, all the afternoon.

July 21st. St. John is a wooden fort which the French built in 1748, on the western shore of the mouth of Lake Champlain, close to the water-side. It was intended to cover the country round about it, which they were then going to people, and to ferve as a magazine for provisions and ammunition, which were usually fent from Montreal to Fort St. Frederick; because they may go in yachts from hence to the last mentioned place, which is impossible lower down, as about two gun-shot further, there is a shallow full of stones, and very rapid water in the river, over which they can only pass in bateaux, or flat vessels. Formerly Fort Chamblan, which lies four French miles lower, was the magazine of provisions; but as they were forced first to fend them hither in bateaux, and then from hence on yachts, and the road to Fort Chamblan from Montreal being by land, and much round about, this fort was erected. It has a low fituation, and lies in a fandy foil, and the country about it is likewife low, flat, and covered with woods. The fort is quadrangular, and includes the space of one arpent square. In each of the two corners which look towards the lake is a wooden building, four stories high, the lower part of which is of stone to the height of about a fathom and a half. In these buildings, which are polyangular, are holes for cannon and leffer fire-arms. In each of the two other corners towards the country, is only a little

wooden house, two stories high. These buildings are intended for the habitations of the foldiers, and for the better defence of the place; between these houses there are poles, two fathoms and a half high, sharpened at the top, and driven into the ground close to one another. They are made of the thuya tree, which is here reckoned the best wood for keeping from petrifaction, and is much preferable to fir in that point. Lower down the pallifades were double, one row within the other. For the convenience of the foldiers, a broad elevated pavement of more than two yards in height, is made in the infide of the fort all along the palifades, with a baluftrade. On this pavement the foldiers fland and fire through the holes upon the enemy, without being exposed to their fire. In the last year, 1748, two hundred men were in garrison here; but at this time there were only a governor, a commissary, a baker, and fix foldiers to take care of the fort and buildings, and to superintend the provisions which are carried to this place. The person who now commanded at the fort, was the Chevalier de Ganues, a very agreeable gentleman, and brother-in-law to Mr. Lufignan, the governor of Fort St. Frederick. The ground about the fort, on both fides the water, is rich and has a very good foil; but it is still without inhabitants, though it is talked of, that it would get fome as foon as possible.

The French in all Canada call the gnats marangoins, which name, it is faid, they have borrowed from the Indians. These insects are in such prodigious numbers in the woods round Fort St. John, that it would more properly be called Fort de Marangoins. The marshes and the low situation of the country, together with the extent of the woods, contribute greatly to their multiplying so much; and when the woods are cut down, the water drained, and the country cultivated, they probably will decrease in number, and

vanish at last, as they have done in other places.

The rattle fnake, according to the unanimous accounts of the French, is never feen in this neighbourhood, nor further north near Montreal and Quebec; and the mountains which furround Fort St. Frederick, are the most northerly part on this side, where they have been feen. Of all the snakes which are found in Canada to the north of these mountains, none is poisonous enough to do any great harm to a man; and all without exception run away when they see a man. My remarks on the nature and properties of the rattle-snake, I have communicated to the royal Swedish academy of sciences *, and

thither I refer my readers.

July 22d. This evening fome people arrived with horses from Prairie, in order to fetch us. The governor had sent for them at my desire, because there were not yet any horses near Fort St. John, the place being only a year old, and the people had not had time to fettle near it. Those who led the horses, brought letters to the governor from the governor-general of Canada, the Marquis la Galissoniere, dated at Quebec the sisteenth of this month, and from the vice-governor of Montreal, the Baron de Longueil, dated the twenty-first of the same month. They mentioned that I had been particularly recommended by the French court, and that the governor should supply me with every thing I wanted, and forward my journey; and at the same time the governor received two little casks of wine for me, which they thought would relieve me on my journey. At night we drank the kings of France and Sweden's health, under a falute from the cannon of the fort, and the health of the governor-general and others.

July 23d. This morning we fet out on our journey to Prairie, from whence we intended to proceed to Montreal; the distance of Prairie from Fort St. John, by land,

is reckoned fix French miles, and from thence to Montreal two lieues (leagues) and a half, by the river St. Lawrence, At first we kept along the shore, so that we had on our right the Riviere de St. John (St. John's river.) This is the name of the mouth of the Lake Champlain, which falls into the river St. Lawrence, and is fometimes called Riviere de Champlain (Champlain river.) After we had travelled about a French mile, we turned to the left from the shore. The country was always low, woody, and pretty wet, though it was in the midst of summer; so that we found it difficult to get forward. But it is to be observed that Fort St. John was only built last summer, when this road was first made, and confequently it could not yet have acquired a proper degree of folidity. Two hundred and fixty men were three months at work, in making this road; for which they were fed at the expence of the government, and each received thirty fols every day; and I was told that they would again refume the work next autumn. The country hereabouts is low and woody, and of course the residence of millions of gnats and flies, which were very troublefome to us. After we had gone about three French miles, we came out of the woods, and the ground feemed to have been formerly a marsh, which was now dried up. From hence we had a pretty good prospect on all sides. On our right hand at a great distance we saw two high mountains, rifing remarkably above the rest; and they were not far from Fort Champlain. could likewife from hence fee the high mountain which lies near Montreal; and our road went on nearly in a straight line. Soon after, we got again upon wet and low grounds, and after that into a wood which confifted chiefly of the fir with leaves which have a filvery underfide *. We found the foil which we paffed over to day, very. fine and rich, and when the woods are cleared and the ground cultivated, it will probably prove very fertile. There are no rocks, and hardly any stones near the road.

About four French miles from Fort St. John, the country makes quite another appearance. It is all cultivated, and a continual variety of fields with excellent wheat, peafe, and oats, prefented itself to our view; but we faw no other kinds of corn. The farms stood scattered, and each of them was surrounded by its corn-fields, and meadows; the houses are built of wood and very small. Instead of moss, which cannot be got here, they employ clay for stopping up the crevices in the walls. The roofs are made very much floping, and covered with straw. The foil is good, flat, and divided by feveral rivulets; and only in a few places there are fome little hills. The profpect is very fine from this part of the road, and as far as I could fee the country, it was cultivated; all the fields were covered with corn, and they generally use fummer wheat here. The ground is still very fertile, so that there is no occasion for leaving it to lie as fallow. The forests are pretty much cleared, and it is to be feared that there will be a time, when wood will become very fcarce. Such was the appearance of the country quite up to Prairie, and the river St. Lawrence, which last we had now always in fight; and, in a word, this country was in my opinion the finest of North America, which I had hitherto feen.

About dinner-time we arrived at Prairie, which is fituated on a little rifing ground near the river St. Lawrence. We flaid here this day, because I intended to visit the places in this neighbourhood before I went on.

Prairie de la Magdalene is a finall village on the eastern side of the river St. Lawrence, about two French miles and a half from Montreal, which place lies N. W. from hence, on the other side of the river. All the country round Prairie is quite slat, and

has hardly any rifings. On all fides are large corn-fields, meadows, and paftures. On the western side, the river St. Lawrence passes by, and has here a breadth of a French mile and a half, if not more. Most of the houses in Prairie are built of timber, with floping wooden roofs, and the crevices in the walls are flopped up with clay. There are fome little buildings of flone, chiefly of the black lime-flone, or of pieces of rock-stone, in which latter the enchasement of the doors and windows was made of the black lime-stone. In the midst of the village is a pretty church of stone, with a steeple at the west end of it, furnished with bells. Before the door is a cross, together with ladders, tongs, hammers, nails, &c., which are to reprefent all the instruments made use of at the crucifixion of our Saviour, and perhaps many others besides them. The village is furrounded with palifades, from four yards to five high, put up formerly as a barrier against the incursions of the Indians. Without these palisades are several little kitchen and pleafure gardens, but very few fruit-trees in them. The rifinggrounds along the river are very inconfiderable here. In this place there was a prieft, and a captain, who affumed the name of governor. The corn-fields round the place are extensive, and sown with summer-wheat; but rye, barley and maize are never seen. To the fouth-west of this place is a great fall in the river St. Lawrence, and the noise which it causes, may be plainly heard here. When the water in spring encreases in the river, on account of the ice which then begins to diffolve, it fometimes happens to rife so high as to overflow a great part of the fields, and, instead of fertilizing them as the river Nile fertilizes the Egyptian fields by its inundations, it does them much damage, by carrying a number of graffes and plants on them, the feeds of which spread the worst kind of weeds, and ruin the fields. These inundations oblige the people to take their cattle a great way off, because the water covers a great tract of land; but happily it never stays on it above two or three days. The cause of these inundations is generally owing to the stopping of ice in some part of the river.

The zizania aquatica, or folle avoine grows plentiful in the rivulet, or brook, which

flows fomewhat below Prairie.

July 24th. This morning I went from Prairie in a bateau to Montreal, upon the river St. Lawrence. The river is very rapid, but not very deep near Prairie, fo that the yatcht cannot go higher than Montreal, except in fpring with the high water, when they can come up to Prairie, but no further. The town of Montreal may be feen at Prairie, and all the way down to it. On our arrival there we found a crowd of people at that gate of the town, where we were to pass through. They were very desirous of feeing us, because they were informed that some Swedes were to come to town; people of whom they had heard fomething, but whom they had never feen; and we are affured by every body, that we were the first Swedes that ever came to Montreal. As foon as we were landed, the governor of the town fent a captain to me, who defired I would follow him to the governor's house, where he introduced me to him. The Baron Longueuil was as yet vice-governor, but he daily expected his promotion from France. He received me more civilly and generously than I can well describe, and shewed me letters from the governor-general at Quebec, the Marquis de la Galissoniere, which mentioned that he had received orders from the French court to supply me with whatever I should want, as I was to travel in this country at the expence of His most Christian Majesty. In short Governor Longueuil loaded me with greater favours than I could expect or even imagine, both during my prefent flay and on my return from Quebec.

The difference between the manners and customs of the French in Montreal and Canada, and those of the English in the American colonies, is as great as that between

the manners of those two nations in Europe. The women in general are handsome here; they are well bred, and virtuous, with an innocent and becoming freedom. They drefs out very fine on Sundays; and though on the other days they do not take much pains with other parts of their drefs, yet they are very fond of adorning their heads, the hair of which is always curled and powdered, and ornamented with glittering bodkins and aigrettes. Every day but Sunday, they wear a little neat jacket, and a fhort petticoat which hardly reaches half the leg, and in this particular they feem to imitate the Indian women. The heels of their shoes are high, and very narrow, and it is furprizing how they walk on them. In their knowledge of occonomy, they greatly furpass the English women in the plantations, who indeed have taken the liberty of throwing all the burthen of house-keeping upon their husbands, and fit in their chairs all day with folded arms *. The women in Canada on the contrary do not spare themselves, especially among the common people, where they are always in the fields, meadows, stables, &c. and do not dislike any work whatsoever. However, they feem rather remifs in regard to the cleaning of the utenfils, and apartments; for fometimes the floors, both in the town and country, were hardly cleaned once in fix months, which is a difagreeable fight to one who comes from amongst the Dutch and English, where the constant scouring and scrubbing of the floors is reckoned as important as the exercise of religion itself. To prevent the thick dust, which is thus left on the floor, from being noxious to the health, the women wet it feveral times a day, which renders it more confiftent; repeating the afperfion as often as the dust is dry and rifes again. Upon the whole, however, they are not averfe to the taking a part in all the bufinefs of housekeeping; and I have with pleasure seen the daughters of the better fort of people, and of the governor himself, not too finely dressed, and going into kitchens and: cellars, to look that every thing be done as it ought.

The men are extremely civil, and take their hats off to every person indifferently whom they meet in the streets. It is customary to return a visit the day after you have

received one; though one should have some scores to pay in one day.

I have been told by some among the French, who had gone a beaver-hunting with the Indians to the northern parts of Canada, that the animals whose skins they endeavour to get, and which are there in great plenty, are beavers, wild-cats, or lynxes, and martens. These animals are the more valued, the farther they are caught to the north, for their skins have better hair, and look better than those which are taken more southward, and they became gradually better or worse, the more they are northward or southward.

White partridges† is the name which the French in Canada give to a kind of birds, abounding during winter near Hudfon's Bay, and which are undoubtedly our ptarmigans, or fnow-hens (tetrao lagopus). They are very plentiful at the time of a great frost, and when a considerable quantity of snow happens to fall. They are described to me as having rough white feet, and being white all over, except three or four black feathers in the tail; and they are reckoned very fine eating. From Edward's Natural History of Birds (page 72) it appears, that the ptarmigans are common about Hudfon's Bay †.

^{*} It feems, that for the future, the fair fex in the English colonies in North-America, will no longer deserve the reproaches Mr. Kalm stigmatizes them with repeatedly, since it is generally reported, that the ladies of late have vyed one with another, in providing their families with linen, stockings, and home-spun cloth of their own making, and that a general spirit of industry prevails among them at this present time. F.

⁺ Perdrix blanches.

Hares are likewise said to be plentiful near Hudson's Bay, and they are abundant even in Canada, where I have often seen, and found them perfectly corresponding with our Swedish hares. In summer they have a brownish grey, and in winter a snowy

white colour, as with us *.

Mechanics, fuch as architecture, cabinet-work, turning, and the like, were not yet fo forward here as they ought to be; and the English, in that particular, out-do the French. The chief cause of this is, that scarce any other people than dismissed soldiers come to settle here, who have not had any opportunity of learning a mechanical trade, but have sometimes accidentally, and through necessity, been obliged to it. There are however some who have a good notion of mechanics, and I saw a person here who made

very good clocks and watches, though he had had but very little instruction.

July 27th. The common house-flies have but been observed in this country about one hundred and fifty years ago, as I have been affured by several persons in this town, and in Quebec. All the Indians affert the same thing, and are of opinion that the common flies first came over here with the Europeans and their ships, which were stranded on this coast. I shall not dispute this; however, I know, that whilst I was in the desarts between Saratoga and Crown Point, or Fort St. Frederick, and sat down to rest or to eat, a number of our common flies always came and settled on me. It is therefore dubious, whether they have not been longer in America than the term abovementioned, or whether they have been imported from Europe. On the other hand, it may be urged that the slies were left in those desarts at the time when fort Anne was yet in a good condition, and when the English often travelled there and back again; not to mention that several Europeans, both before and after that time, had travelled through those places, and carried the slies with them, which were attracted by their

provisions.

Wild cattle are abundant in the fouthern parts of Canada, and have been there fince times immemorial. They are plentiful in those parts, particularly where the Illinois Indians live, which are nearly in the same latitude with Philadelphia; but further to the north they are feldom observed. I saw the skin of a wild ox to-day; it was as big as one of the largest ox hides in Europe, but had better hair. The hair is dark brown, like that on a brown bear-skin. That which is close to the skin is as soft as wool. This hide was not very thick; and in general they do not reckon them fo valuable as bearskins in France. In winter they are spread on the floors, to keep the feet warm. Some of these wild cattle, as I am told, have a long and fine wool, as good, if not better, than sheep wool. They make stockings, cloth, gloves, and other pieces of worsted work of it, which look as well as if they were made of the best sheep wool; and the Indians employ it for feveral uses. The flesh equals the best beef in goodness and fatnefs. Sometimes the hides are thick, and may be made use of as cow-hides are in Europe. The wild cattle in general are faid to be stronger and bigger than European cattle, and of a brown red colour. Their horns are but short, though very thick close to the head. Thefe, and feveral other qualities, which they have in common with, and in greater perfection than the tame cattle, have induced fome to endeavour to tame them; by which means they would obtain the advantages arifing from their goodness of hair, and, on account of their great strength, be able to employ them successfully in agriculture. With this view fome have repeatedly got young wild calves, and brought them up in Quebec, and other places, among the tame cattle; but they commonly died in three or four years time; and though they have seen people every day, yet they

^{*} See a figure of this hare in its white state, in the Supol. to Br. Zool, plate xlvii. f. 1. F.

have always retained a natural ferocity. They have constantly been very shy, pricked up their ears at the fight of a man, and trembled, or run about; so that the art of taming them has not hitherto been sound out. Some have been of opinion, that these cattle cannot well bear the cold; as they never go north of the place I mentioned, though the summers be very hot, even in those northern parts. They think that, when the country about the Illinois is better peopled, it will be more easy to tame these cattle, and that afterwards they might more easily be used to the northerly climates*. The Indians and French in Canada make use of the horns of these creatures to put gunpowder in.

The peace which was concluded between France and England was proclaimed this day. The foldiers were under arms; the artillery on the walls was fired off, and fome falutes were given by the fmall fire-arms. All night fome fire-works were exhibited, and the whole town was illuminated. All the streets were crowded with people till late at night. The governor invited me to supper, and to partake of the joy of the inhabitants. There were present a number of officers, and persons of dif-

tinction; and the festival concluded with the greatest joy.

July 28th. This morning I accompanied the governor, Baron Longueuil, and his family, to a little island called Magdalene, which is his own property. It lies in the river St. Lawrence, directly opposite to the town, on the eastern side. The governor had here a very neat house, though it was not very large, a sine extensive garden, and a court-yard. The river passes between the town and this island, and is very rapid. Near the town it is deep enough for yachts; but towards the island it grows more shallow, so that they are obliged to push the boats forwards with poles. There was a mill on the island, turned by the mere force of the stream, without an additional mill-dam.

The fmooth fumach, or rhus glabra, grows in great plenty here. I have no where feen it fo tall as in this place, where it had fometimes the height of eight yards, and a

proportionable thickness.

Saffafras is planted here; for it is never found wild in these parts, Fort Anne being the most northerly place where I have found it wild. Those shrubs which were on the island had been planted many years ago; however, they were but small shrubs, from two to three feet high, and scarce so much. The reason is, because the stem is killed every winter, almost down to the very root, and must produce new shoots every spring, as I have sound from my own observations here; and so it appeared to be near the Forts Anne, Nicholson, and Oswego. It will therefore be in vain to attempt to

plant faffafras in a very cold climate.

The red mulberry-trees (morus rubra, Linn.) are likewise planted here. I saw sour or five of them about five yards high, which the governor told me had been twenty years in this place, and were brought from more southerly parts, since they do not grow wild near Montreal. The most northerly place, where I have sound it growing spontaneously, is about twenty English miles north of Albany, as I have been assured by the country people who live in that place, and who at the same time informed me, that it was very scarce in the woods. When I came to Saratoga, I enquired whether any of these mulberry-trees had been sound in that neighbourhood? but every body told me, that they were never seen in those parts, but that the before-mentioned place,

^{*} But by this means they would lose that superiority which in their wild state they have over the tame cattle; as all the progenies of tamed animals degenerate from the excellence of their wild and free ancestors. F.

twenty miles above Albany, is the most northern one where they grow. Those mulberry-trees, which were planted on this island, succeed very well, though they are placed in a poor soil. Their soliage is large and thick, but they did not bear any fruits this year. However, I was informed that they can bear a considerable degree of cold.

The water-beech was planted here in a flady place, and was grown to a great height. All the French hereabouts call it cotonier*. It is never found wild near the river

St. Lawrence; nor north of Fort St. Frederick, where it is now very fcarce.

The red cedar is called cedre rouge by the French, and it was likewife planted in the governor's garden, whether it had been brought from more fouthern parts, for it is not to be met with in the forests hereabouts. However, it came on very well here.

About half an hour after seven in the evening we left this pleasant island, and an hour after our return the Baron de Longueuil received two agreeable pieces of news at once. The first was, that his son, who had been two years in France, was returned; and the second, that he had brought with him the royal patents for his father, by which he was appointed governor of Montreal, and the country belonging to it.

They make use of fans here, which are made of the tails of the wild turkeys. As soon as the birds are shot, their tails are spread like fans, and dried, by which means they keep their sigure. The ladies and the men of distinction in town wear these fans,

when they walk in the streets, during the intenseness of the heat.

All the grass on the meadows round Montreal consists chiefly of a species of meadow-grass, or the poa capillaris, Linn. †. This is a very slender grass, which grows very close, and succeeds even on the driest hills. It is however not rich in soliage; and the slender stalk is chiefly used for hay. We have numerous kinds of grasses in Sweden, which make infinitely finer meadows than this.

July 30th. The wild plumb-trees grow in great abundance on the hills, along the rivulets about the town. They were so loaded with fruit, that the boughs were quite bent downwards by the weight. The fruit was not yet ripe, but when it comes to that perfection, it has a red colour and a fine taste, and preserves are sometimes made

of it.

Black currants (ribes nigrum, Linn.) are plentiful in the fame places, and its berries were ripe at this time. They are very fmall, and not by far fo agreeable as those in Sweden.

Parsnips grow in great abundance on the rising banks of rivers, along the corn-fields, and in other places. This led me to think, that they were original natives of America, and not first brought over by the Europeans. But on my journey into the country of the Iroquois, where no European ever had a settlement, I never once saw it, though the soil was excellent; and from hence it appears plain enough, that it was transported hither from Europe, and is not originally an American plant; and therefore it is in vain fought for in any part of this continent, except among the European settlements.

August 1st. The governor-general of Canada commonly resides at Quebec; but he frequently goes to Montreal, and generally spends the winter there. In summer they chiefly reside at Quebec, on account of the king's ships, which arrive there during that season, and bring him letters, which he must answer; besides other business which comes in about that time. During his residence in Montreal he lives in

* Cotton-tree. Mr Kalm mentions before, that this name is given to the afelepias fyriaca. F. † Mr. Kalm deferibes it thus: poa culmo fubcompresso panicula tenuissima, spiculis tristoris minimis, sosculus basi pubescentibus.

the

the castle, as it is called, which is a large house of stone, built by Governor-general

Vaudreuil, and still belonging to his family, who hire it to the King.

They have in Canada fcarce any other but paper-currency. I hardly ever faw any coin, except French fols, confifting of brafs, with a very fmall mixture of filver; they were quite thin by constant circulation, and were valued at a fol and a half. The bills are not printed, but written. Their origin is as follows: the French King having found it very dangerous to fend money for the pay of the troops, and other purpofes, over to Canada, on account of privateers, shipwrecks, and other accidents; he ordered that instead of it the intendant, or King's steward, at Quebec, or the commissary at Montreal, should write bills for the value of the sums which are due to the troops, and which they distribute to each foldier. On these bills is inscribed, that they bear the value of fuch or fuch a fum, till next October; and they are figned by the intendant, or the commissary; and in the interval they bear the value of money. In the month of October, at a certain flated time, every one brings the bills in his possession to the intendant at Quebec, or the commissary at Montreal, who exchanges them for bills of exchange upon France, which are paid there in lawful money, at the King's exchequer, as foon as they are prefented. If the money is not yet wanted, the bill may be kept till next October, when it may be exchanged by one of those gentlemen, for a bill upon France. The paper money can only be delivered in October, and exchanged for bills upon France. They are of different values, and fome do not exceed a livre, and perhaps some are still less. Towards autumn, when the merchants' ships come in from France, the merchants endeavour to get as many bills as they can, and change them for bills upon the French treasury. These bills are partly printed, spaces being left for the name, fum, &c.; but the first bill, or paper currency is all wrote, and is therefore fubject to be counterfeited, which has fometimes been done; but the great punishments which have been inflicted upon the authors of these forged bills, and which generally are capital, have deterred people from attempting it again; fo that examples of this kind are very scarce at present. As there is a great want of small coin here, the buyers or fellers were frequently obliged to fuffer a finall lofs, and could pay no intermediate prices between one livre and two *.

They commonly give one hundred and fifty livres a year to a faithful and diligent footman, and to a maid-fervant of the fame character one hundred livres. A journeyman to an artist gets three or four livres a day, and a common labouring man gets thirty or forty sols a day. The scarcity of labouring people occasions the wages to be so high; for almost every body finds it so easy to set up as a farmer in this uncultivated country, where he can live well, and at a small expence, that he does not care to serve

and work for others.

Montreal is the fecond town in Canada, in regard to fize and wealth; but it is the first on account of its sine situation, and mild climate. Somewhat above the town, the river St. Lawrence divides into several branches, and by that means forms several islands, and among which the isle of Montreal is the greatest. It is ten French miles long, and near four broad, in its broadest part. The town of Montreal is built on the eastern side of the island, and close to one of the most considerable branches of the river St. Lawrence; and thus it receives a very pleasant and advantageous situation. The town has a quadrangular form, or rather it is a rectangular parallelogram, the long and

^{*} The fol is the lowest coin in Canada, and is about the value of a penny in the English colonies. A livre, or franc, (for they are both the same) contains twenty fols; and three livres, or francs, make an ecu, or crown.

eastern fide of which extends along the great branch of the river. On the other fide it is furrounded with excellent corn-fields, charming meadows, and delightful woods. It has got the name of Montreal from a great mountain, about half a mile westwards of the town, and lifting its head far above the woods. Monfieur Cartier, one of the first Frenchmen who furveyed Canada more accurately, called this mountain fo, on his arrival in this island, in the year 1535, when he visited the mountain, and the Indian town Hoshelaga near it. The priests who, according to the Roman Catholic way, would call every place in this country after some faint or other, calling Montreal, Ville Marie, but they have not been able to make this name general, for it has always kept its first name. It is pretty well fortified, and furrounded with a high and thick wall. On the cast side it has the river St. Lawrence, and on all the other sides a deep ditch filled with water, which fecures the inhabitants against all danger from the sudden incursions of the enemy's troops. However, it cannot long stand a regular siege, because it requires a great garrison, on account of its extent; and because it consists chiefly of wooden houses. Here are several churches, of which I shall only mention that belonging to the friars of the order of St. Sulpitius, that of the Jesuits, that of the Franciscan friars, that belonging to the nunnery, and that of the hospital; of which the first is however by far the finest, both in regard to its outward and inward ornaments, not only in this place, but in all Canada. The priests of the seminary of St. Sulpitius have a fine large house, where they live together. The college of the Franciscan friars is likewise spacious, and has good walls, but it is not so magnificent as the former. The college of the Jesuits is small, but well built. To each of these three buildings are annexed fine large gardens, for the amufement, health, and ufe of the communities to which they belong. Some of the houses in the town are built of stone, but most of them are of timber, though very neatly built. Each of the better fort of houses has a door towards the street, with a seat on each side of it, for amusement and recreation in the morning and evening. The long streets are broad and strait, and divided at right angles by the short ones: some are paved, but most of them very uneven. The gates of the town are numerous; on the east fide of the town towards the river are five, two great and three leffer ones; and on the other fide are likewife feveral. The governor-general of Canada, when he is at Montreal, refides in the castle, which the government hires for that purpose of the family of Vaudreuil; but the governor of Montreal is obliged to buy or hire a house in town; though I was told, that the government contributed towards paying the rents.

In the town is a nunnery, and without its walls half a one; for though the last was quite ready, however, it had not yet been confirmed by the pope. In the first they do not receive every girl that offers herself; for their parents must pay about five hundred ecus, or crowns, for them. Some indeed are admitted for three hundred ecus, but they are obliged to serve those who pay more than they. No poor girls are taken

in.

The King has erected a hospital for fick foldiers here. The fick person there is provided with every thing he wants, and the King pays twelve sols every day for his stay, attendance, &c. The surgeons are paid by the King. When an officer is brought to this hospital, who is fallen sick in the service of the crown, he receives victuals and attendance gratis: but if he has got a sickness in the execution of his private concerns, and comes to be cured here, he must pay it out of his own purse. When there is room enough in the hospital, they likewise take in some of the sick inhabitants of the town and country. They have the medicines, and the attendance of the surgeons, gratis, but must pay twelve sols per day for meat, &c.

Every Friday is a market-day, when the country people come to the town with provisions, and those who want them must supply themselves on that day, because it is the only market-day in the whole week. On that day likewise a number of Indians

come to town, to fell their goods, and buy others.

The declination of the magnetic needle was here ten degrees and thirty-eight minutes weft. Mr. Gillion, one of the priefts here, who had a particular tafte for mathematics and aftronomy, had drawn a meridian in the garden of the feminary, which he faid he had examined repeatedly by the fun and ftars, and found to be very exact. I compared my compass with it, taking care that no iron was near it, and found its declination just the fame as that which I have before mentioned.

According to Monfieur Gillion's observations, the latitude of Montreal is forty-five

degrees and twenty-feven minutes.

Monfieur Pontarion, another priest, had made thermometrical observations in Montreal, from the beginning of this year 1749. He made use of Reaumur's thermometer, which he placed fometimes in the window half open, and fometimes in one quite open, and accordingly it will feldom mark the greatest degree of cold in the air. However, I shall give a short abstract of his observations for the winter months. In January the greatest cold was on the 18th day of the month, when the Reaumurian thermometer was twenty-three degrees below the freezing point. The least degree of cold was on the 31st of the same month, when it was just at the freezing point, but most of the days of this month it was from twelve to fifteen degrees below the freezing point. In February the greatest cold was on the 19th and 25th, when the thermometer was fourteen degrees below the freezing point; and the least was on the 3d day of that month, when it rofe eight degrees above the freezing point; but it was generally eleven degrees below it. In March the greatest cold was on the 3d, when it was ten degrees below the freezing point, and on the 22d, 23d, and 24th, it was mildest, being fifteen degrees above it: in general it was four degrees below it. In April the greatest degree of cold happened on the 7th, the thermometer being five degrees below the freezing point; the 25th was the mildest day, it being twenty degrees above the freezing point; but in general it was twelve degrees above it. These are the contents chiefly of Monsieur Pontarion's observations during those months; but I found, by the manner he made his observations, that the cold had every day been from four to fix degrees greater than he had marked it. He had likewife marked in his journal, that the ice in the river St. Lawrence broke on the 3d of April at Montreal, and only on the 20th day of that month at Quebec. On the 3d of May some trees began to slower at Montreal, and on the 12th the hoary frost was so great, that the trees were quite covered with it, as with fnow. The ice in the river close to this town is every winter above a French foot thick, and fometimes it is two of fuch feet, as I was informed by all whom I confulted on that head.

Several of the friars here told me, that the fummers were remarkably longer in Canada, fince its cultivation, than they used to be before; it begins earlier, and ends later. The winters, on the other hand, are much shorter; but the friars were of opinion, that they were as hard as formerly, though they were not of the same duration; and likewise, that the summer at present was no hotter than it used to be. The coldest winds at Montreal are those from the north and north-west.

Aug. 2d. Early this morning we left Montreal, and went in a bateau on our journey to Quebec, in company with the fecond major of Montreal, M. de Sermonville. We fell down the river St. Lawrence, which was here pretty broad on our left; on the

the shore. The isle of Montreal was closely inhabited along the river; and it was very plain, and the rising land near the shore consisted of pure mould, and was between three or four yards high. The woods were cut down along the river-side, for the distance of an English mile. The dwelling-houses were built of wood, or stone, indiscriminately, and white-washed on the outside. The other buildings, such as barns, stables, &c. were all of wood. The ground next to the river was turned either into corn-fields or meadows. Now and then we perceived churches on both sides of the river, the steeples of which were generally on that side of the church which looked towards the river, because they are not obliged here to put the steeples on the west end of the churches. Within six French miles of Montreal we saw several islands of different sizes on the river, and most of them were inhabited; and if some of them were without houses on them, they were sometimes turned into corn-fields, but generally into meadows. We saw no mountains, hills, rocks, or stones to-day, the country being stat throughout, and consisting of pure mould.

All the farms in Canada stand separate from each other, so that each farmer has his possessions entirely distinct from those of his neighbour. Each church, it is true, has a little village near it; but that consists chiefly of the parsonage, a school for the boys and girls of the place, and of the houses of tradesmen, but rarely of farm-houses; and if that was the case, yet their fields were separated. The farm-houses hereabouts are generally built all along the rising banks of the river, either close to the water or at some distance from it, and about three or four arpens from each other. To some farms are annexed small orchards: but they are in general without them; however,

almost every farmer has a kitchen-garden.

I have been told by all those who have made journies to the southern parts of Canada, and to the river Mississippi, that the woods there abound with peach-trees, which bear excellent fruit, and that the Indians of those parts say, that those trees have been there

fince time immemorial.

The farm-houses are generally built of stone, but sometimes of timber, and have three or four rooms. The windows are seldom of glass, but most frequently of paper. They have iron stoves in one of the rooms, and chimnies in the rest. The roofs are covered with boards. The crevices and chinks are silled up with clay. The other

buildings are covered with straw.

There are feveral crosses put up by the road side, which is parallel to the shores of the river. These crosses are very common in Canada, and are put up to excite devotion in the traveller. They are made of wood, sive or six yards high, and proportionally broad. In that side which looks towards the road is a square hole, in which they place an image of our Saviour, the cross, or of the holy Virgin, with the child in her arms; and before that they put a piece of glass, to prevent its being spoiled by the weather. Those crosses, which are not far from churches, are very much adorned, and they put up about them all the instruments which they think the Jews employed in crucifying our Saviour, such as a hammer, tongs, nails, a stask of vinegar, and perhaps many more than were really made use of. A figure of the cock, which crowed when St. Peter denied our Lord, is commonly put at the top of the cross.

The country on both fides was very delightful to-day, and the fine state of its cultivation added greatly to the beauty of the scene. It could really be called a village, beginning at Montreal, and ending at Quebec, which is a distance of more than one hundred and eighty miles; for the farm-houses are never above five arpens, and sometimes but three, as funder, a few places excepted. The prospect is exceedingly beautiful, when the river goes on for some miles together in a strait line, because it then

fhortens

shortens the distances between the houses, and makes them form exactly one continued

village.

All the women in the country, without exception, wear caps of fome kind or other. Their jackets are short, and so are their petticoats, which scarce reach down to the middle of their legs; and they have a filver cross hanging down on the breast. In general they are very laborious; however, I saw some, who, like the English women in the colonies, did nothing but prattle all the day. When they have any thing to do within doors, they (especially the girls) commonly sing songs, in which the words Amour and Cœur are very frequent. In the country it is usual, that when the husband receives a visit from persons of rank, and dines with them, his wife stands behind and serves him; but in the towns, the ladies are more distinguished, and would willingly assume an equal, if not a superior, power to their husbands. When they go out of doors they wear long cloaks, which cover all their other clothes, and are either grey, brown, or blue. The men sometimes make use of them, when they are obliged to go in the rain. The women have the advantage of being in a dishabile under these cloaks, without any body's perceiving it.

We fometimes faw wind-mills near the farms. They were generally built of stone, with a roof of boards, which, together with its flyers, could be turned to the wind

occafionally

The breadth of the river was not always equal to-day; in the narrowest place it was about a quarter of an English mile broad; in other parts it was near two English miles.

The shore was fometimes high and steep, and sometimes low, or sloping.

At three o'clock this afternoon we passed by the river, which falls into the river St. Lawrence, and comes from Lake Champlain, in the middle of which latter is a large island. The yachts which go between Montreal and Quebec, go on the south-east side of this island, because it is deeper there; but the boats preser the north-west side, because it is nearer, and yet deep enough for them. Besides this island there are several more hereabouts, which are all inhabited. Somewhat further, the country on both sides the river is uninhabited, till we come to the lac St. Pierre; because it is so low, as to be quite overslowed at certain times of the year. To make up for this desciency, the country, I am told, is as thickly inhabited further from the river, as we found it along the banks of the river.

Lac St. Pierre is a part of the river St. Lawrence, which is so broad that we could hardly see any thing but sky and water before us, and I was every where told, that it is seven French miles long, and three broad. From the middle of this lake as it is called, you see a large high country in the west, which appears above the woods. In the lake are many places covered with a kind of rush, or scirpus palustris, Linn. There are no houses in sight on either side of the lake, because the land is rather too low there; and in spring the water rises so high, that they may go with boats between the trees. However, at some distance from the shores, where the ground is higher, the farms are close together. We saw no islands in the lake this afternoon, but the next day we met

with fome.

Late in the evening we left lake St. Pierre, and rowed up a little river called Riviere de Loup, in order to come to a house where we might pass the night. Having rowed about an English mile, we found the country inhabited on both sides of the river. Its shores are high; but the country in general is slat. We passed the night in a farmhouse. The territory of Montreal extends to this place; but here begins the jurisdiction of the governor of Trois Rivieres, to which place they reckon eight French miles from hence.

Aug. 3d. At five o'clock in the morning we fet out again, and first rowed down the little river till we came into the lake St. Pierre, which we went downwards. After we had gone a good way, we perceived a high chain of mountains in the north-west, which were very much elevated above the low, flat country. The north-west shore of lake St. Pierre was now in general very closely inhabited; but on the south-east side we saw no houses, and only a country covered with woods, which is sometimes said to be under water, but behind which there are, as I am told, a great number of farms. Towards the end of the lake, the river went into its proper bounds again, being not above a mile and a half broad, and afterwards it grows still narrower. From the end of lake St. Pierre to Trois Rivieres, they reckon three French miles, and about eleven o'clock in the morning we arrived at the latter place, where we attended divine service.

Trois Rivieres is a little market town, which had the appearance of a large village; it is however reckoned among the three great towns of Canada, which are Quebec, Montreal, and Trois Rivieres. It is faid to lie in the middle between the two first. and thirty French miles distant from each. The town is built on the north fide of the river St. Lawrence, on a flat, elevated fand, and its fituation is very pleafant. On one fide the river passes by, which is here an English mile and a half broad. On the other fide, are fine corn-fields, though the foil is very much mixed with fand. In the town are two churches of stone, a nunnery, and a house for the friars of the order of St. Francis. This town is likewife the feat of the third governor in Canada, whose house is likewise of stone. Most of the other houses are of timber, a single story high, tolerably well built, and stand very much asunder; and the streets are crooked. shore here consists of fand, and the rising grounds along it are pretty high. When the wind is very violent here, it raises the fand, and blows it about the streets, making it very troublesome to walk in them. The nuns, which are about twenty-two in number, are reckoned very ingenious in all kinds of needle-work. This town formerly flourished more than any other in Canada, for the Indians brought their goods to it from all fides; but fince that time they go to Montreal and Quebec, and to the English, on account of their wars with the Iroquese, or five nations, and for several other reasons, so that this town is at present very much reduced by it. Its present inhabitants live chiefly by agriculture, though the neighbouring iron-works may ferve in some measure to support them. About an English mile below the town, a great river falls into the river St. Lawrence, but first divides into three branches, so that it appears as if three rivers difembogued themselves there. This has given occasion to call the river and this town. Trois Rivieres (the Three Rivers.)

The tide goes about a French mile above Trois Rivieres, though it is so trifling as to be hardly observable. But about the equinoxes, and at the new moons and full moons in spring and autumn, the difference between the highest and lowest water is two feet. Accordingly the tide in this river goes very far up, for from the above-mentioned place

to the fea they reckon about a hundred and fifty French miles.

Whilst my company were resting, I went on horseback to view the iron-work. The country which I passed through was pretty high, fandy, and generally flat. I saw neither

stones nor mountains here.

The iron-work, which is the only one in this country, lies three miles to the west of Trois Rivieres. Here are two great forges, besides two lesser ones to each of the great ones, and under the same roof with them. The bellows were made of wood, and every thing else, as it is in Swedish forges. The melting ovens stand close to the forges, and are the same as ours. The ore is got two French miles and a half from the iron works

works, and is carried thither on fledges. It is a kind of moor ore *, which lies in veins, within fix inches or a foot from the furface of the ground. Each vein is from fix to eighteen inches deep, and below it is a white fand. The veins are furrounded with this fand on both fides, and covered at the top with a thin mould. The ore is pretty rich and lies in loofe lumps in the veins, of the fize of two fifts, though there are a few which are near eighteen inches thick. These lumps are full of holes which are filled with ochre. The ore is fo foft that it may be crushed betwixt the fingers. They make use of a grey lime-stone, which is broke in the neighbourhood, for promoting the fulibility of the ore; to that purpose they likewise employ a clay marle, which is found near this place. Charcoals are to be had in great abundance here, because all the country round this place is covered with woods, which have never been stirred. The charcoals from ever-green trees, that is, from the fir kind, are best for the forge, but those of deciduous trees are best for the smelting oven. The iron which is here made, was to me described as soft, pliable, and tough, and is said to have the quality of not being attacked by rust fo easily as other iron; and in this point there appears a great difference between the Spanish iron and this in ship building. This iron-work was first founded in 1737, by private persons, who afterwards ceded it to the king; they cast cannon and mortars here of different fizes, iron stoves, which are in use all over Canada, kettles, &c., not to mention the bars which are made here. They have likewife tried to make steel here, but cannot bring it to any great perfection, because they are unacquainted with the best manner of preparing it. Here are many officers and overfeers, who have very good houses, built on purpose for them. It is agreed on all hands, that the revenues of the iron-work do not pay the expences which the king must every year be at in maintaining it. They lay the fault on the bad state of population, and fay that the few inhabitants in the country have enough to do with agriculture, and that it therefore costs great trouble and large sums to get a sufficient number of workmen. But however plaufible this may appear, yet it is furprifing that the king should be a loser in carrying on this work; for the ore is easily broken, very near the iron-work, and very fusible. The iron is good, and can be very conveniently dispersed over the country. This is moreover the only iron-work in the country, from which every body must supply himself with iron tools, and what other iron he wants. But the officers and fervants belonging to the iron-work, appear to be in very affluent circumstances. A river runs down from the iron-work into the river St. Lawrence, by which all the iron can be fent in boats throughout the country at a low rate. In the evening I returned again to Trois Rivieres.

Aug. 4th. At the dawn of day we left this place and went on towards Quebec. We found the land on the north fide of the river somewhat elevated, fandy, and closely inhabited along the water-fide. The fouth-east shore, we were told, is equally well inhabited; but the woods along that shore prevented our seeing the houses, which are built further up in the country, the land close to the river being so low as to be subject to annual inundations. Near Trois Rivieres, the river grows somewhat narrow; but it enlarges again, as soon as you come a little below that place, and has the breadth of

above two English miles.

As we went on, we faw feveral churches of stone, and often very well built ones. The shores of the river are closely inhabited for about three quarters of an English mile

^{*} Tophus tubalcaini, Linn. Syst. Nat. III. p. 187. n. 5. Minera ferri subaquosa nigro cærulescens. Wall. Mineral. p. 263. Germ. Ed. p. 340. n. 3. Iron ochres in the shape of crusts, are sometimes cavernous, as the brush ore. Forster's Mineral. p. 48.

up the country; but beyond that, the woods and the wilderness increase. All the rivulets falling into the river St. Lawrence are likewise well inhabited on both sides. I observed throughout Canada, that the cultivated lands lie only along the river St. Lawrence, and the other rivers in the country, the environs of towns excepted, round which the country is all cultivated and inhabited within the distance of twelve or eighteen English miles. The great islands in the river are likewise inhabited.

The shores of the river now became higher, more oblique and steep, however they consisted chiefly of earth. Now and then some rivers, or great brooks, fall into the river St. Lawrence, among which one of the most considerable is the Riviere Puante, which unites to the south-east side with the river St. Lawrence, about two French miles below Trois Rivieres, and has on its banks, a little way from its mouth, a town called Becancourt, which is wholly inhabited by Abenakee Indians, who have been converted to the Roman Catholic religion, and have Jesuits among them. At a great distance, on the north-west side of the river, we saw a chain of very high mountains, running from north to south, elevated above the rest of the country, which is quite slat here without any remarkable hills.

Here were feveral lime kilns along the river; and the lime-stone employed in them is broke in the neighbouring high grounds. It is compact and grey, and the lime it

yields is pretty white.

The fields here are generally fown with wheat, oats, maize, and peafe. Gourds and

water-melons are planted in abundance near the farms.

A humming bird (trochillus colubris) flew among the bushes, in a place where we landed to-day. The French call it oifeau mouche, and fay it is pretty common in Canada;

and I have feen it fince feveral times at Quebec.

About five o'clock in the afternoon we were obliged to take our night's lodgings on shore, the wind blowing very strong against us, and being attended with rain. I found that the nearer we came to Quebec, the more open and free from woods was the country. The place where we passed the night is distant from Quebec twelve French miles.

They have a very peculiar method of catching fish near the shore here. They place hedges along the shore, made of twisted oziers, so close that no fish can get through them, and from one foot to a yard high, according to the different depth of the water. For this purpose they choose such places where the water runs off during the ebb, and leaves the hedges quite dry. Within this inclosure they place feveral wheels, or fifhtraps, in the form of cylinders, but broader below. They are placed upright, and are about a yard high, and two feet and a half wide: on one fide near the bottom is an entrance for the fishes, made of twigs, and sometimes of yarn made into a net. Opposite to this entrance, on the other side of the wheel, looking towards the lower part of the river, is another entrance, like the first, and leading to a box of boards about four feet long, two deep, and two broad. Near each of the wheels is a hedge, leading obliquely to the long hedge, and making an acute angle with it. This latter hedge is made in order to lead the fish into the trap, and it is placed on that end of the long hedge which looks towards the upper part of the river; now when the tide comes up the river, the fifh, and chiefly the eels, go up with it along the river fide; when the water begins to cbb, the fish likewise go down the river, and meeting with the hedges, they fwim along them, till they come through the wheels into the boxes of boards, at the top of which there is a hole with a cover, through which the fifth could be taken out. This apparatus is chiefly made on account of the eels. In some

places hereabouts they place nets instead of the hedges of twigs.

The shores of the river now consisted no more of pure earth; but of a species of state. They are very steep, and nearly perpendicular here, and the states of which they consist are black, with a brown cast; and divisible into thin shivers, no thicker than the back of a knife. These states moulder as soon as they are exposed to the open air, and the shore is covered with grains of small sand, which are nothing but particles of such mouldered states. Some of the strata run horizontal, others obliquely, dipping to the fouth, and rising to the north, and sometimes the contrary way. Sometimes they form bendings like large semicircles: sometimes a perpendicular line cuts off the strata, to the depth of two seet; and the slates on both sides of the line form a perpendicular and smooth wall. In some places hereabouts, they find amongst the slates a stratum about four inches thick of a grey, compact, but pretty soft lime-stone, of which the Indians for many centuries have made, and the French at present still make, tobacco-pipes.*

August 5th. This morning we continued our journey by rowing, the contrary wind hindering us from failing. The appearance of the shores was the same as yesterday; they were high, pretty steep, and quite perpendicular; and consisted of the black state before described. The country at the top was a plain without eminences, and closely inhabited along the river, for about the space of an English mile and a half inland. Here are no islands in this part of the river, but several stony places, perceptible at low water only, which have several times proved fatal to travellers. The breadth of the river varies; in some parts it was a little more than three quarters of a mile, in others half a mile, and in some above two miles. The inhabitants made use of the same method of catching eels along the shores here, as that which I have just before mentioned. In many places they make use of nets made of offers instead of the

hedge.

Bugs (cimex lectularius) abound in Canada; and I met with them in every place where I lodged, both in the towns and country, and the people know of no other remedy for

them than patience.

The crickets (gryllus domesticus) are also abundant in Canada, especially in the country, where these disagreeable guests lodge in the chimnies; nor are they uncommon in the towns. They stay here both summer and winter, and frequently cut cloths in pieces for passime.

The cock-roaches (blatta orientalis) have never been found in the houses here.

The shores of the river grow more sloping as you come nearer to Quebec. To the northward appears a high ridge of mountains. About two French miles and a half from Quebec the river becomes very narrow, the shores being within the reach of a musket-shot from each other. The country on both sides was sloping, hilly, covered with trees, and had many small rocks; the shore was stony. About four o'clock in the afternoon we happily arrived at Quebec. The city does not appear till one is close to it, the prospect being intercepted by a high mountain on the fouth side. However, a part of the fortifications appear at a good distance, being situate on the same mountain. As soon as the soldiers, who were with us, saw Quebec, they called out, that

^{*} This lime-stone seems to be a marle, or rather a kind of slene-marl; for there is a whitish kind of it in the Krim Tartary, and near Stiva or Thebes, in Greece, which is employed by the Turks and Tartars for making heads of pipes, and that from the first place is called Kessekil, and in the latter, Sca-Scum; it may be very easily cut, but grows harder in time. F.

all those who had never been there before should be ducked, if they did not pay something to release themselves. This custom even the governor-general of Canada is obliged to submit to, on his first journey to Montreal. We did not care when we came in fight of this town to be exempted from this old custom, which is very advantageous to the rowers, as it enables them to spend a merry evening on their arrival at Quebec, after their troublesome labour.

Immediately after my arrival, the officer who had accompanied me from Montreal, led me to the palace of the then vice-governor-general of Canada, the Marquis la Galiffonniere, a nobleman of uncommon qualities, who behaved towards me with extraordinary goodness, during the time he staid in this country. He had already ordered some apartments to be got ready for me, and took care to provide me with every thing I wanted; besides honouring me so far to invite me to his table, almost

every day I was in town.

August 6th. Quebec, the chief city in Canada, lies on the western shore of the river St. Lawrence, close to the water's edge, on a neck of land, bounded by that river on the east fide, and by the river St. Charles on the north fide; the mountain. on which the town is built, rifes still higher on the fouth fide, and behind it begin great pastures; and the same mountain likewise extends a good way westward. The city is diftinguished into the lower and the upper *. The lower lies on the river eastward of the upper. The neck of land I mentioned before, was formed by the dirt and filth, which had from time to time been accumulated there, and by a rock which lay that way, not by any gradual diminution of the water. The upper city lies above the other, on a high hill, and takes up five or fix times the space of the lower, though it is not quite fo populous. The mountain, on which the upper city is fituated, reaches above the houses of the lower city. Notwithstanding the latter are three or four stories high, and the view, from the palace of the lower city (part of which is immediately under it) is enough to cause a swimming of the head. There is only one easy way of getting to the upper city, and there part of the mountain has been blown up. This road is very fleep, notwithstanding it is made winding and serpentine. However, they go up and down it in carriages, and with waggons. All the other roads up the mountain are fo fleep, that it is very difficult to clime to the top of them. Most of the merchants live in the lower city, where the houses are built very close together. The streets in it are narrow, very rugged, and almost always wet. There is likewise a church, and a finall market-place. The upper city is inhabited by people of quality, by feveral persons belonging to the different offices, by tradesmen, and others. In this part are the chief buildings of the town, among which the following are worthy particular notice.

I. The palace is fituated on the west or steepest side of the mountain, just above the lower city. It is not properly a palace, but a large building of stone, two stories high, extending north and south. On the west side of it is a court-yard, surrounded partly with a wall, and partly with houses. On the east side, or towards the river, is a gallery as long as the whole building, and about two sathom broad, paved with smooth slags, and included on the outsides by iron rails, from whence the city and the river exhibit a charming prospect. This gallery serves as a very agreeable walk after dinner, and those who come to speak with the governor-general wait here till he is at leisure. The palace is the lodging of the governor-general of Canada, and a number of soldiers mount the guard before it, both at the gate and in the court-yard; and

when the governor, or the bishop, comes in or goes out, they must all appear in arms, and beat the drum. The governor-general has his own chapel where he hears prayers; however he often goes to mass at the church of the Recolets*, which is very near the palace.

II. The churches in this town are feven or eight in number, and all built of stone.

1. The cathedral church is on the right hand, coming from the lower to the upper city, fomewhat beyond the bishop's house. The people were at present employed in ornamenting it. 'On its west fide is a round steeple, with two divisions, in the lower of which are some bells. The pulpit, and some other parts within the church, are gilt. The seats are very sine.

2. The Jesuits church is built in the form of a cross, and has a round steeple. This is the only church that has a clock, and I shall mention it more particularly

below.

3. The Recolets church is opposite the gate of the palace, on the west side, looks well, and has a pretty high pointed steeple, with a division below for the bells.

4. The church of the Ursulines has a round spire.

5. The church of the hospital.

6. The bishop's chapel.

7. The church in the lower city was built in 1690, after the town had been delivered from the English, and is called Notre Dame de la Victoire. It has a small steeple in the middle of the roof, square at the bottom, and round at the top.

8. The little chapel of the governor-general may likewise be ranked amongst these

churches.

III. The bishop's house is the first, on the right hand, coming from the lower to the upper town. It is a fine large building, surrounded by an extensive court-yard and

kitchen garden on one fide, and by a wall on the other.

IV. The college of the Jesuits, which I will describe more particularly. It has a much more noble appearance, in regard to its fize and architecture, than the palace itself, and would be proper for a palace, if it had a more advantageous fituation. It is about four times as large as the palace, and is the finest building in town. It stands on the north side of a market, on the south side of which is the cathedral.

V. The house of the Recolets lies to the west, near the palace and directly over against it, and consists of a spacious building, with a large orchard, and kitchen garden. The house is two stories high; in each story is a narrow gallery with rooms and halls

on one or both fides.

VI. The Hôtel de Dieu, where the fick are taken care of, fhall be defcribed in the

fequel. The nuns that ferve the fick, are of the Augustine order.

VII. The house of the clergy † is a large building, on the north-east fide of the cathedral. Here is on one side a spacious court, and on the other towards the river, a great orchard, and kitchen garden. Of all the buildings in the town none has so fine a prospect as that in the garden belonging to this house, which lies on the high shore, and looks a good way down the river. The Jesuits, on the other hand, have the worst, and hardly any prospect at all from their college, nor have the Recolets any fine views from their house. In this building all the clergy of Quebec lodge with their superior. They have large pieces of land in several parts of Canada, presented to them by the government, from which they derive a very plentiful income.

+ Le Seminaire.

[·] A kind of Franciscan friars, called Ordo Sti. Francisci thrictioris observantia.

VIII. The convent of the Urfuline nuns shall be mentioned in the fequel.

Thefe are all the chief public buildings in the town, but to the north-west, just before

IX. The house of the intendant, a public building, whose fize makes it fit for a palace. It is covered with tin, and flands in a feeond lower town, fituated fouthward upon the river St. Charles. It has a large and fine garden on its north fide. In this house all the deliberations concerning this province are held; and the gentlemen who have the management of the police and the eivil power meet here, and the intendant generally prefides. In affairs of great confequence the governor-general is likewife here. On one fide of this house is the store-house of the crown, and on the other the

Most of the houses in Quebec are built of stone, and in the upper city they are generally but one flory high, the public buildings excepted. I faw a few wooden houses in the town, but they must not be rebuilt when decayed. The houses and churches in the city are not built of bricks, but the black lime-flates of which the mountain confifts, whereon Quebec stands. When these lime-slates are broke at a good depth in the mountain, they look very compact at first, and appear to have no shivers, or lamellæ, at all; but after being exposed awhile to the air, they separate into thin leaves. These flates are fost, and easily out; and the city-walls, together with the garden-walls, confift chiefly of them. The roofs of the public buildings are covered with common

flates, which are brought from France, because there are none in Canada.

The flated roofs have for fome years withflood the changes of air and weather, without fuffering any damage. The private houses have roofs of boards, which are laid parallel to the spars, and sometimes to the eaves, or sometimes obliquely. The corners of houses are made of a grey fmall-grained lime-stone, which has a strong smell, like the flink-flone *, and the windows are generally enchafed with it. This lime-flone is more ufeful in those places than the lime-slates, which always shiver in the air. The outsides of the houses are generally white-washed. The windows are placed on the inner side of the walls; for they have fometimes double windows in winter. The middle roof has two, or at most three spars, covered with boards only. The rooms are warmed in winter by fmall iron floves, which are removed in fummer. The floors are very dirty in every house, and have all the appearance of being cleaned but once every year.

The powder magazine stands on the fummit of the mountain, on which the city is

built, and fouthward of the palace.

The streets in the upper city have a fufficient breadth, but are very rugged, on account of the rock on which it lies; and this renders them very difagreeable and troublefome, both to foot-paffengers and earriages. The black lime-flates baffet out and project every where into sharp angles, which cut the shoes in pieces. The streets cross

other at all angles, and are very crooked.

The many great orchards and kitchen-gardens near the house of the Jesuits, and other public and private buildings, make the town appear very large, though the number of houses it contains is not very confiderable. Its extent from fouth to north is faid to be about fix hundred toifes, and from the shore of the river along the lower town, to the western wall, between three hundred and fifty and four hundred toises. It must be here observed, that this space is not yet wholly inhabited; for on the west and fouth fide, along the town walls, are large pieces of land without any buildings on

^{*} Nitrum fuillum. Lynn. Syst. III. p. 86. Lapis fuillus prismaticus, Waller, Mineral. p. 59. a. 1. Stink-stone, Forster's Introd. to Mineralogy, p. 40.

them, and destined to be built upon in future times, when the number of inhabitants will be increased in Quebec.

The bishop, whose see is in the city, is the only bishop in Canada. His diocese extends to Louisiana, on the Mexican gulf southward, and to the South Seas westward.

No bishop, the Pope excepted, ever had a more extensive diocese. But his spiritual flock is very inconsiderable at some distance from Quebec, and his sheep are often many hundred miles distant from each other.

Quebec is the only fea-port and trading town in all Canada, and from thence all the produce of the country is exported. The port is below the town in the river, which is there about a quarter of a French mile broad, twenty-five fathous deep, and its ground is very good for anchoring. The ships are secured from all storms in this port; however the north-east wind is the worst, because it can act more powerfully. When I arrived here, I reckoned thirteen great and fmall veffels, and they expected more to come in. But it is to be remarked, that no other ships than French ones can come into the port, though they may come from any place in France, and likewife from the French possessions in the West Indies. All the foreign goods, which are found in Montreal, and other parts of Canada, must be taken from hence. The French merchants from Montreal, on their fide, after making a fix months ftay among feveral Indian nations, in order to purchase skins of beasts and furs, return about the end of August, and go down to Quebec in September or October, in order to fell their goods there. The privilege of felling the imported goods, it is faid, has vaftly enriched the merchants of Quebec; but this is contradicted by others, who allow that there a few in affluent circumstances, but that the generality possess no more than is absolutely necessary for their bare fubfiftence, and that feveral are very much in debt, which they fay is owing to their luxury and vanity. The merchants drefs very finely, and are extravagant in their repasts; and their ladies are every day in full drefs, and as much adorned as if they were to go to court.

The town is furrounded on almost all sides by a high wall, and especially towards the land. It was not quite completed when I was there, and they were very busy in simisfying it. It is built of the above-mentioned black lime-slate, and of a dark grey sand-stone. For the corners of the gates they have employed a grey lime-stone. They have not made any walls towards the water-side, but nature seems to have worked for them, by placing a rock there which it is impossible to ascend. All the rising land thereabouts is likewise so well planted with cannon, that it seems impossible for an enemy's ships or boats to come to the town without running into imminent danger of being sunk. On the land side the town is likewise guarded by high mountains; so

that nature and art have combined to fortify it.

Quebec was founded by its former governor, Samuel de Champlain, in the year 1608. We are informed by history, that its rife was very flow. In 1629, towards the end of July, it was taken by two Englishmen, Lewis and Thomas Kerk, by capitulation, and furrendered to them by the above mentioned de Champlain. At that time, Canada and Quebec were wholly destitute of provisions; fo that they looked upon the English more as their deliverers than their enemies. The above-mentioned Kerks were the brothers of the English admiral David Kerk, who lay with his sleet somewhat lower in the river. In the year 1632, the French got the town of Quebec and all Canada returned to them by the peace. It is remarkable, that the French were doubtful whether they should reclaim Canada from the English, or leave it to them. The greater part were of opinion, that to keep it would be of no advantage to France, because the country was cold, and the expences far exceeded its produce; and because France could not people so extensive a country, without weakening herself, as Spain

had done before; that it was better to keep the people in France, and employ them in all forts of manufactures, which would oblige the other European powers who have colonies in America to bring their raw goods to French ports, and take French manufactures in return. Those on the other hand, who had more extensive views, knew that the climate was not fo rough as it had been reprefented. They likewife believed that that which caused the expences was a fault of the company, because they did not manage the country well. They would not have many people fent over at once, but little by little, fo that France might not feel it. They hoped that this colony would in future times make France powerful, for its inhabitants would become more and more acquainted with the herring, whale, and cod fisheries, and likewise with the taking of feals; and that by this means Canada would become a school for training up seamen. They further mentioned the feveral forts of furs, the conversion of the Indians, the ship-building, and the various uses of the extensive woods. And lastly, that it would be a confiderable advantage to France, even though they should reap no other benefit, to hinder by this means the progress of the English in America, and of their encreafing power, which would otherwife become insupportable to France; not to mention feveral other reasons. Time has shewn that these reasons were the result of mature judgment, and that they laid the foundation of the rife of France. It were to be wished that we had been of the same opinion in Sweden, at a time when we were actually in poffession of New Sweden, the finest and best province in all North America, or when we were yet in a condition to get the possession of it. Wisdom and foresight does not only look upon the prefent times, but even extends its views to futurity.

In the year 1663, at the beginning of February, the great earthquake was felt in Quebec and a great part of Canada, and there are still some vestiges of its effects at

that time; however, no lives were loft.

On the 16th of October 1690, Quebec was befieged by the English general, William Phips, who was obliged to retire a few days after, with great loss. The English have tried several times to repair their losses, but the river St. Lawrence has always been a very good defence for this country. An enemy, and one that is not acquainted with this river, cannot go upwards in it, without being ruined; for in the neighbourhood of Quebec, it abounds with hidden rocks, and has strong currents in some places,

which oblige the fhips to make many windings.

The name of Quebec, it is faid, is derived from a Norman word, on account of its fituation on a neck or point of land. For when one comes up in the river by l'Isle d'Orleans, that part of the river St. Lawrence does not come in fight, which lies above the town, and it appears as if the river St. Charles, which lies just before, was a continuation of the St. Lawrence. But on advancing further the true course of the river comes within fight, and has at first a great similarity to the mouth of a river or a great bay. This has given occasion to a failor, who saw it unexpectedly, to cry out in his provincial dialect, Que bec *, that is, what a point of land! and from hence it is thought the city obtained its name. Others derive it from the Algonkin word Quebego or Quebec, fignifying that which grows narrow, because the river becomes narrower as it comes nearer to the town.

The river St. Lawrence is exactly a quarter of a French mile, or three quarters of an English mile broad at Quebec. The falt water never comes up to the town in it, and therefore the inhabitants can make use of the water in the river for their kitchens, &c. All accounts agree, that notwithstanding the breadth of this river, and

the violence of its courfe, especially during ebb, it is covered with ice during the whole winter, which is strong enough for walking, and a carriage may go over it. It is faid to happen frequently that, when the river has been open in May, there are such cold nights in this month, that it freezes again, and will bear walking over. This is a clear proof of the intenfenels of the frost here, especially when one considers that which I shall mention immediately after, about the ebbing and slowing of the tide in this river. The greatest breadth of the river, at its mouth, is computed to be twentyfix French miles, or feventy-eight English miles, though the boundary between the fea and the river cannot well be afcertained, as the latter gradually lofes itself in, and unites with the former. The greatest part of the water contained in the numerous lakes of Canada, four or five of which are like large feas, is forced to difembogue into the fea by means of this river alone. The navigation up this river from the fea is rendered very dangerous by the strength of the current, and by the number of fand-banks, which often arife in places where they never were before. The English have experienced this formation of new fands once or twice, when they attempted to conquer Canada. Hence the French have good reasons to look upon the river as a barrier to Canada*.

The tide goes far beyond Quebec in the river St. Lawrence, as I have mentioned above. The difference between high and low water is generally between fifteen and fixteen feet, French measure; but with the new and full moon, and when the wind is likewise favourable, the difference is seventeen or eighteen feet, which is indeed very considerable.

August 7th. Ginseng is the current French name in Canada, of a plant, the root of which has a very great value in China †. It has been growing fince times immemorial in the Chinese Tartary and in Corea, where it is annually collected and brought to China. Father Du Halde fays, it is the most precious, and the most useful of all the plants in Eastern Tartary; and attracts, every year, a number of people into the deserts of that country. The Mantechoux-Tartars call it orhota, that is the most noble, or the queen of plants. The Tartars and Chinese praise it very much, and ascribe to it the power of curing feveral dangerous difeases, and that of restoring to the body new ftrength, and fupplying the lofs caused by the exertion of the mental, and corporeal faculties. An ounce of ginfeng bears the furprizing price of feven or eight ounces of filver at Peking. When the French botanists in Canada first saw a figure of it, they remembered to have feen a fimilar plant in this country. They were confirmed in their conjecture by confidering that feveral fettlements in Canada lie under the fame latitude with those parts of the Chinese Tartary, and China, where the true ginseng grows wild. They fucceeded in their attempt, and found the fame ginfeng wild and abundant in feveral parts of North America, both in French and English plantations, in plain parts of the woods. It is fond of shade, and of a deep rich mould, and of land which is neither wet nor high. It is not every where very common, for fometimes one may fearch the woods for the space of several miles without finding a fingle plant of it; but

influence they at present enjoy. F.

+ Botanists know this plant by the name of panax quinquesolium, soliis ternatis quinatis. Linn. Mat. Med. § 116. Sp. plant. p. 15. 12. Gronov. Fl. Virg. p. 147. See likewise Catesby's Nat. Hist. of Carolina, vol. iii. p. 16 t. 16. Lassitau Gins. 51, t. 1. Father Charlevoix Hist. de la Nouvelle France, tom iv. p. 208 for viii and tom v. p. 21.

tom, iv. p. 308, fig. xiii, and tom, v. p. 24.

^{*} The river St. Lawrence was no more a barrier to the victorious British sleets in the last war, nor were the fortifications of Quebec capable to withstand the gallant attacks of their land army, which disappointed the good Frenchmen in Canada of their too sanguine expectations; and, at present, they are rather happy at this change of fortune, which has made them subjects of the British sceptre, whose mild influence they at present enjoy. F.

in those spots where it grows it is always found in great abundance. It flowers in May and June, and its berries are ripe at the end of August. It bears transplanting very well, and will foon thrive in its new ground. Some people here, who have gathered the berries, and put them into their kitchen-gardens, told me that they lay one or two years in the ground without coming up. The Iroquefe, or Five (Six) Nations, call the ginfeng roots garangtoging, which it is faid fignifies a child, the roots bearing a faint refemblance to it; but others are of opinion that they mean the thigh and leg by it, and the roots look pretty like it. The French use this root for curing the afthma, as a stomachic, and to promote fertility in women. The trade which is carried on with it here is very britk; for they gather great quantities of it, and fend them to France, from whence they are brought to China, and fold there to great advantage *. It is faid the merchants in France met with amazing fuccess in this trade at the first outset, but by continuing to fend the ginfeng over to China, its price is fallen confiderably there, and confequently in France and Canada; however, they still find their account in it. In the fummer of 1748, a pound of ginfeng was fold for fix francs, or livres, at Quebec; but its common price here is one hundred fols, or five livres. During my flay in Canada, all the merchants at Quebec and Montreal received orders from their correspondents in France to fend over a quantity of ginfeng, there being an uncommon demand for it this fummer. The roots were accordingly collected in Canada with all possible diligence; the Indians especially travelled about the country in order to collect as much as they could together, and to fell it to the merchants at Montreal. The Indians in the neighbourhood of this town were likewife fo much taken up with this business, that the French farmers were not able during that time to hire a single Indian, as they commonly do, to help them in the harvest. Many people feared lest by continuing for feveral fuccessive years to collect these plants, without leaving one or two in each place to propagate their species, there will soon be very few of them left; which I think is very likely to happen, for by all accounts they formerly grew in abundance round Montreal, but at present there is not a fingle plant of it to be found, so effectually have they been rooted out. This obliged the Indians this fummer to go far within the English boundaries to collect these roots. After the Indians have fold the fresh roots to the merchants, the latter must take a great deal of pains with them. They are fpread on the floor to dry, which commonly requires two months and upwards, according as the feafon is wet or dry. During that time they must be turned once or twice every day, left they should putrify or moulder. Ginseng has never been found far north of Montreal. The fuperior of the clergy here, and feveral other people, affured me that the Chinese value the Canada ginseng as much as the Tartarian †; and that no one ever had been entirely acquainted with the Chinese method of preparing it. However it is thought amongst other preparations they dip the roots in a decoction of the leaves of ginfeng. The roots prepared by the Chinese are almost transparent, and look like horn in the infide; and the roots which are fit for use, must be heavy and compact in the infide.

The plant which throughout Canada bears the name of herba capillaris is likewife one of those with which a great trade is carried on in Canada. The English in their plantations call it maiden-hair; it grows in all their North American colonies, which

† This is directly opposite to Mr. Osbeck's affertion. See the preceding note. F.

^{*} Mr. Ofbeck feems to doubt whether the Europeans reap any advantages from the ginfeng trade or not, because the Chinese do not value the Canada roots so much as those of the Chinese Tartary; and therefore the former bear scarce half the price of the latter. See Ofbeck's Voyage to China, vol. 1. p. 223. F.

I travelled through, and likewise in the southern parts of Canada; but I never sound it near Quebec. It grows in the woods in shady places and in a good soil *. Several people in Albany and Canada assured me that its leaves were very much used instead of tea, in consumptions, coughs, and all kinds of pectoral diseases. This they have learnt from the Indians, who have made use of this plant for these purposes since time immemorial. This American maiden-hair is reckoned preserable in surgery to that which we have in Europe †; and therefore they send a great quantity of it to France every year. The price is different, and regulated according to the goodness of the plant, the care in preparing it, and the quantity which is to be got. For if it be brought to Quebec in great abundance, the price falls; and on the contrary, it rises, when the quantity gathered is but small. Commonly the price at Quebec is between five and sifteen sols a pound. The Indians went into the woods about this time, and

travelled far above Montreal in quest of this plant.

The kitchen herbs fucceed very well here. The white cabbage is very fine, but fometimes fuffers greatly from worms. Onions (allium cepa) are very much in use here, together with other species of leeks. They likewife plant several species of gourds, melons, fallads, wild fuccory or wild endive (cichorium intybus), feveral kinds of peafe, beans, French beans, carrots, and eucumbers. They have plenty of red beets, horfe-radiflies and common radiflies, thyme, and marjoram. Turnips are fown in abundance, and used chiefly in winter. Parsnips are sometimes eaten, though not very common. Few people took notice of potatoes; and neither the common (folanum tuberofum) nor the Bermuda ones (convolvulus batatas) were planted in Canada. When the French here are asked why they do not plant potatoes, they answer, that they cannot find any relish in them, and they laugh at the English who are fo fond of them. Throughout all North America the root cabbage † (braffica gongylodes Linn.) is unknown to the Swedes, English, Dutch, Irish, Germans, and French. Those who have been employed in sowing and planting kitchen herbs in Canada, and have had some experience in gardening, told me that they were obliged to fend for fresh feeds from France every year, because they commonly lose their ftrength here in the third generation, and do not produce fuch plants as would equal the original ones in taste and goodness.

The Europeans have never been able to find any characters, much lefs writings, or books, among the Indians, who have inhabited North America fince time immemorial, and feem to be all of one nation, and fpeak the fame language. These Indians have therefore lived in the greatest ignorance and darkness, during some centuries, and are totally unacquainted with the state of their country before the arrival of the Europeans, and all their knowledge of it consists in vague traditions and mere fables. It is not certain whether any other nations possessed America before the present Indian inhabitants came into it, or whether any other nations visited this part of the globe before Columbus discovered it. It was equally unknown whether the Christian religion was ever preached here in former times. I conversed with several Jesuits, who undertook long journies in this extensive country, and asked them, whether they had met with any marks that there had formerly been some Christians among the Indians which lived here?

^{*} It is the adiantum pedatum of Linn. sp. pl. p. 1557. Cornutus, in his Canadens. Plant. Historia. p. 7. calls it adiantum Americanum, and gives together with the description, a figure of it, p. 6.

[†] Adiantum capillus veneris. True maiden-hair.
† This is a kind of cabbage with large round eatable roots; which grow out above the ground, wherein it differs from the turnip-cabbage (braffica napobraffica) whose root grows in the ground. Both are common in Germany, and the former likewise in Italy.

but they all answered, that they had not found any. The Indians have ever been as ignorant of architecture and manual labour as of science and writing. In vain does one feek for well-built towns and houses, artificial fortifications, high towers and pillars, and fuch like, among them, which the old world can shew from the most antient times. Their dwelling-places are wretched huts of bark, exposed on all fides to wind and rain. All their masonry-work confifts in placing a few grey rock-stones on the ground, round their fire-place, to prevent the firebrands from spreading too far in their hut, or rather, to mark out the space intended for the fire-place in it. Travellers do not enjoy a tenth part of the pleafure in traverfing these countries which they must receive on their journies through our old countries, where they, almost every day, meet with some vestige or other of antiquity: now an antient celebrated town presents itself to view; here the remains of an old castle; there a field, where, many centuries ago, the most powerful and the most skilful generals, and the greatest kings, fought a bloody battle, now the native spot and residence of some great or learned man. In fuch places the mind is delighted in various ways, and reprefents all past occurrences in living colours to itself. We can enjoy none of these pleasures in America. history of the country can be traced no further than from the arrival of the Europeans, for every thing that happened before that period is more like a fiction, or a dream, than any thing that really happened. In later times there have, however, been found a few marks of antiquity, from which it may be conjectured, that North America was formerly inhabited by a nation more verfed in science, and more civilized than that which the Europeans found on their arrival here; or that a great military expedition

was undertaken to this continent, from these known parts of the world.

This is confirmed by an account which I received from Mr. de Verandrier, who has commanded the expedition to the fouth-fea in person, of which I shall presently give an account. I have heard it repeated by others, who have been eye-witneffes of every thing that happened on that occasion. Some years before I came into Canada, the then governor-general, Chevalier de Beauharnois, gave Mr. de Verandrier an order to go from Canada, with a number of people, on an expedition across North America to the fouth fea, in order to examine how far those two places are distant from each other, and to find out what advantages might accrue to Canada or Louisiana from a communication with that ocean. They fet out on horfeback from Montreal, and went as much due west as they could, on account of the lakes, rivers, and mountains, which fell in their way. As they came far into the country, beyond many nations, they fometimes met with large tracts of land free from wood, but covered with a kind of very tall grafs, for the space of some days journey. Many of these fields were every where covered with furrows, as if they had been ploughed and fown formerly. It is to be observed, that the nations, which now inhabit North America, could not cultivate the land in this manner, because they never made use of horses, oxen, ploughs, or any instruments of husbandry, nor had they ever seen a plough before the Europeans came to them. In two or three places, at a confiderable diftance from each other, our travellers met with impressions of the feet of grown people and children in a rock; but this feems to have been no more than a lufus naturæ. When they came far to the west, where, to the best of their knowledge, no Frenchmen or European had ever been, they found in one place in the woods, and again on a large plain, great pillars of flone, leaning upon each other. The pillars confifted of one fingle stone each, and the Frenchmen could not but suppose that they had been erected by human hands. Sometimes they have found fuch stones laid upon one another, and, as it were, formed into a wall. In some of those places where they found such stones, they could not find

find any other forts of stone. They have not been able to discover any characters or writing upon any of these stones, though they have made a very careful search after them. At last they met with a large stone, like a pillar, and in it a smaller stone was fixed, which was covered on both fides with unknown characters. This stone, which was about a foot of French meafure in length, and between four or five inches broad, they broke loofe, and carried to Canada with them, from whence it was fent to France, to the fecretary of state, the Count of Maurepas. What became of it afterwards is unknown; to them but they think it is yet preserved in his collection. Several of the Jefuits, who have feen and handled this stone in Canada, unanimously assirm, that the letters on it are the fame with those which in the books, containing accounts of Tataria, are called Tatarian characters*; and that, on comparing both together, they found them perfectly alike. Notwithstanding the questions which the French on the fouthfea expedition asked the people there concerning the time when, and by whom those pillars were crected? what their traditions and fentiments concerning them were? who had wrote the characters? what was meant by them? what kind of letters they were? in what language they were written? and other circumstances; yet they could never get the least explication, the Indians being as ignorant of all those things as the French themselves. All they could say was, that these stones had been in those places time immemorial. The places where the pillars stood were near nine hundred French miles westward of Montreal. The chief intention of this journey, viz. to come to the fouthfea, and to examine its diffance from Canada, was never attained on this occasion. For the people fent out for that purpose were induced to take part in a war between fome of the most distant Indian nations, in which some of the French were taken prisoners, and the rest obliged to return. Among the last and most westerly Indians they were with, they heard that the south-sea was but a few days journey off; that they (the Indians) often traded with the Spaniards on that coast, and sometimes likewise

[·] This account feems to be highly probable, for we find in Marco Paolo that Kublai-Khan, one of the fucceffors of Genghizkhan, after the conquett of the fouthern part of China, fent ships out to conquer the kingdom of Japan, or, as they call it, Nipan-gri; but in a terrible florm the whole fleet was cast away, and nothing was ever heard of the men in that fleet. It feems that fome of these ships were cast to the shores, opposite the great American lakes, between forty and sifty degrees north latitude, and there probably erected these monuments, and were the ancestors of some nations who are called Mozomlecks, and have some degree of civilization. Another part of this fleet, it feems, reached the country opposite Mexico, and there founded the Mexican empire, which, according to their own records as preferved by the Spaniards, and in their painted annals in Purchas's Pilgrimage, are very recent; fo that they can fearcely remember any more than feven princes before Motezuma II. who was reigning when the Spaniards arrived there 1519, under Fernando Cortez; consequently the first of these princes, supposing each had a reign of thirty-three years and four months, and adding to it the fixteen years of Montezuma, began to reign in the year 1270, when Kublai-Khan, the conqueror of all China and of Japan, was on the throne, and in whose time happened, I believe, the first abortive expedition to Japan, which I mentioned above, and probably furnished North America with civilized inhabitants. There is, if I am not mistaken, a great similarity between the signres of the Mexican idols, and those which are usual among the Tartars, who embrace the doctrines and religion of the Dalai-Lama, whose religion Kublai-Khan first introduced among the Monguls, or Moguls. The favage Indians of North America, it feems, have another origin, and are probably descended from the Yukaghiri, and Tchucktchai, inhabitants of the most easterly and northerly part of Asia, where, according to the accounts of the Russians, there is but a small traject to America. The serocity of these nations, similar to that of the Americans, their way of painting, their fondness of inebriating liquors, (which the Yukaghiri prepare from poisonous and inebriating mushrooms, bought of the Russians) and many other things, show them plainly to be of the same origin. The Eskimaux seems to be the same nation with the inhabitants of Greenland, the Samoyedes, and Lapponians. South America, and especially Peru, is probably peopled from the great unknown south continent, which is very near America, civilized, and full of inhabitants of various colours; who therefore might very eafily be call on the American continent, in boats, or proas. F.

they went to Hudson's Bay, to trade with the English. Some of these Indians had houses, which were made of earth. Many nations had never seen any Frenchmen;

they were commonly clad in skins, but many were quite naked.

All those who had made long journies in Canada to the fouth, but chiefly westward, agreed that there were many great plains destitute of trees, where the land was furrowed, as if it had been ploughed. In what manner this happened no one knows; for the corn-fields of a great village, or town, of the Indians, are scarce above four or fix of our acres in extent; whereas those furrowed plains sometimes continue for several days journey, except now and then a small smooth spot, and here and there some rising grounds.

I could not hear of any more veftiges of antiquity in Canada, notwithstanding my careful enquiries after them. In the continuation of my journey for the year 1750 *, I shall find an opportunity of speaking of two other remarkable curiosities. Our Swedish Mr. George Westman, A. M. has clearly and circumstantially shewn that our Scandinavians, chiefly the northern ones, long before Columbus's time, have undertaken voyages to North America; see his differtation on that subject, which he read at

Abo in 1747, for obtaining his degree.

August 8th. This morning I visited the largest nunnery in Quebec. Men are prohibited from vifiting under very heavy punishments; except in some rooms, divided by iron rails, where the men and women that do not belong to the convent, stand without, and the nuns within the rails, and converse with each other. But to encrease the many favours which the French nation heaped upon me, as a Swede, the governor-general got the bishop's leave for me to enter the convent, and see its construction. The bishop alone has the power of granting this favour, but he does it very sparingly. royal physician, and a surgeon, are however at liberty to go in as often as they think proper. Mr. Gaulthier, a man of great knowledge in physic and botany, was at present the royal physician here, and accompanied me to the convent. We first saw the hospital, which I shall presently describe, and then entered the convent, which forms a part of the hospital. It is a great building of stone, three stories high, divided in the infide into long galleries, on both fides of which are cells, halls, and rooms. The cells of the nuns are in the highest story, on both sides of the gallery; they are but small; net painted in the infide, but hung with paper pictures of faints, and of our Saviour on. the crofs. A bed with curtains, and good bed-clothes, a little narrow desk, and a chair or two, is the whole furniture of a cell. They have no fires in winter, and the nuns are forced to lie in the cold cells. On the gallery is a stove, which is heated in winter, and as all the rooms are left open, some warmth can by this means come into them. In the middle flory are rooms where they pass the day together. One of these is the room where they are at work; this is large, finely painted and adorned, and has an iron flove. Here they were at their needle-work, embroidering, gilding, and making flowers of filk, which bear a great fimilarity to the natural ones. In a word, they were all employed in fuch nice works, as were fuitable to ladies of their rank in life. In another hall they affembled to hold their juntos. Another apartment contains those who are indifpoled; but fuch as are more dangerously ill have rooms to themselves. The novices, and new corners, are taught and instructed in another hall. Another is destined for their refectory, or dining-room, in which are tables on all sides; on one fide of it is a fmall desk, on which is laid a French book, concerning the life of those faints who are mentioned in the New Testament. When they dine, all are filent; one

^{*} This part has not yet been published.

of the eldest gets into the desk, and reads a part of the book before-mentioned; and when they are gone through it, they read fome other religious book. During the meal, they fit on that fide of the table which is turned towards the wall. Almost in every room is a gilt table, on which are placed candles, together with the picture of our Saviour on the cross, and of some faints: before these tables they say their prayers. On one fide is the church, and near it a large gallery, divided from the church by rails, fo that the nuns could only look into it. In this gallery they remain during divine fervice, and the elergyman is in the church, where the nuns reach him his facerdotal clothes through a hole, for they are not allowed to go into the veftry, and to be in the fame room with the prieft. There are still feveral other rooms and halls here, the use of which I do not remember. The lowest story contains a kitchen, bake-house, several butteries, &c. In the garrets they keep their corn, and dry their linen. In the middle flory is a balcony on the outfide, almost round the whole building, where the nuns are allowed to take air. The prospect from the convent is very fine on every fide; the river, the fields, and the meadows out of town, appear there to great advantage. On one fide of the convent is a large garden, in which the nuns are at liberty to walk about; it belongs to the convent, and is furrounded with a high wall. There is a quantity of all forts of fruits in it. This convent, they fay, contains about fifty nuns, most of them advanced in years, scarce any being under forty years of age. At this time there were two young ladies among them who were instructed in those things which belong to the knowledge of nuns. They are not allowed to become nuns immediately after their entrance, but must pass through a noviciate of two or three years, in order to try whether they will be conftant; for, during that time, it is in their power to leave the convent, if a monastic life does not fuit their inclinations. But as foon as they are received among the nuns, and have made their vows, they are obliged to continue their whole life in it: if they appear willing to change their mode of life, they are locked up in a room, from whence they can never get out. The nuns of this convent never go further from it than to the hospital, which lies near it, and even makes a part of it. They go there to attend the fick, and to take care of them. I was told by feveral people here, fome of which were ladies, that none of the nuns went into a convent till she had attained to an age in which she had small hopes of ever getting a husband. The nuns of all the three convents in Quebec looked very old, by which it feems that there is fome foundation for this account.

The hospital, as I have before-mentioned, makes a part of the convent. It consists of two large halls and some rooms near the apothecary's shop. In the halls are two rows of beds on each side, within each other. The beds next to the wall are furnished with curtains, the outward ones are without them. In each bed are sine bed-clothes, with clean double sheets. As soon as a sick person has left his bed, it is made again, in order to keep the hospital in cleanliness and order. The beds are two or three yards distant, and near each is a small table. There are good iron stoves, and sine windows, in this hall. The nuns attend the sick people, and bring them meat and other neceffaries; besides them there are some men who attend, and a surgeon. The royal physician is likewise obliged to come hither once or twice every day, to look after every thing, and give prescriptions. They commonly receive sick soldiers into this hospital, who are very numerous in July and August, when the king's ships arrive, and in time of war; but at other times, when no great number of soldiers are sick, other people can take their places, as far as the number of empty beds will reach. The king finds every thing here that is requisite for the sick persons, viz. provisions, medicines,

fuel, &c. Those who are very ill are put into separate rooms, in order that the

noise in the great hall may not be troublesome to them.

The civility of the inhabitants here is more refined than that of the Dutch and English in the settlements belonging to Great Britain; but the latter, on the other hand, do not idle their time away in dressing, as the French do here. The ladies, especially, dress and powder their hair every day, and put their locks in papers every night; which idle custom was not introduced in the English settlements. The gentlemen wear generally their own hair; but some have wigs. People of rank are used to wear laced cloaths, and all the crown-officers wear swords. All the gentlemen, even those of rank, the governor-general excepted, when they go into town on a day that looks like rain, carry their cloaks on their left arm. Acquaintances of either fex, who have not seen each other for some time, on meeting again salute with mutual kisses.

Concerning the Canada plants, I can here add, that the further you go northward the more you find the plants are the fame with the Swedish ones: thus, on the north fide of Quebec, a fourth part of the plants, if not more, are the same with the spontaneous plants in Sweden. A few plants and trees, which have a particular quality, or are applied to some particular use, shall however, be mentioned in a few words, in

the fequel.

The rein-deer mofs (lichen rangiferinus) grows plentiful in the woods round Quebec. Mr. Gaulthier, and feveral other gentlemen, told me, that the French, on their long journies through the woods, on account of their fur trade with the Indians, fometimes boil this mofs, and drink the decoction for want of better food, when their provisions are at an end; and they fay it is very nutritive. Several Frenchmen, who have been in the Terra Labrador, where there are many rein-deer (which the French and Indians here call cariboux) related, that all the land there is in most places covered with this

rein-deer mofs, fo that the ground looks as white as fnow.

August 10th. This day I dined with the Jesuits. A few days before I paid my visit to them; and the next day their prefident, and another, father Jesuit called on me, to invite me to dine with them to-day. I attended divine fervice in their church, which is a part of their house. It is very fine within, though it has no feats; for every one is obliged to kneel down during the fervice. Above the church is a fmall steeple, with a clock. The building the Jefuits live in is magnificently built, and looks exceeding fine both without and within, which gives it a fimilarity to a fine palace. It confifts of stone, is three stories high, exclusive of the garret, covered with states, and built in a fquare form, like the new palace at Stockholm, including a large court. Its fize is fuch that three hundred families would find room enough in it; though at prefent there were not above twenty Jefuits in it. Sometimes there is a much greater number of them, especially when those return who have been fent as missionaries into the country. There is a long walk along the fides of the fquare, in every flory, on both fides of which are either cells, halls, or other apartments for the friars; and likewife their library, apothecary shop, &c. Every thing is very well regulated, and the Jesuits are very well accommodated here. On the outfide is their college, which is on two fides furrounded with great orchards and kitchen-gardens, in which they have fine walks. A part of the trees here are the remains of the forest which stood here when the French began to build this town. They have besides planted a number of fruittrees; and the garden is stocked with all forts of plants for the use of the kitchen. The Jefuits dine together in a great hall. There are tables placed all round it along the walls, and feats between the tables and the walls, but not on the other fide. Near one wall is a pulpit, upon which one of the fathers gets during the meal, in order to read fome religious book; but this day it was omitted, all the time being employed in converfation. They dine very well, and their dishes are as numerous as at the greatest feasts. In this spacious building you do not see a single woman; all are fathers or brothers; the latter of which are young men brought up to be Jesuits. They prepare the meal, and bring it upon table; for the common servants are not admitted.

Besides the bishop, there are three kinds of clergymen in Canada; viz. Jesuits, priefts, and recolets. The Jesuits are, without doubt, the most considerable; therefore they commonly fay here, by way of proverb, that a hatchet is sufficient to sketch out a recolet; a priest cannot be made without a chissel; but a Jesuit absolutely requires the pencil*; to shew how much one surpasses the others. The Jesuits are commonly very learned, studious, and are very civil and agrecable in company. In their whole deportment there is fomething pleafing; it is no wonder therefore that they captivate the minds of the people. They feldom speak of religious matters; and if it happens, they generally avoid disputes. They are very ready to do any one a fervice; and when they fee that their affiftance is wanted, they hardly give one time to fpeak of it, falling to work immediately, to bring about what is required of them. Their conversation is very entertaining and learned, fo that one cannot be tired of their company. Among all the Jefuits I have converfed with in Canada, I have not found one who was not possessed of these qualities in a very eminent degree. They have large posfessions in this country, which the French king gave them. At Montreal they have likewife a fine church, and a little neat house, with a small but pretty garden within. They do not care to become preachers to a congregation in the town or country; but leave these places, together with the emoluments arising from them, to the priests. All their business here is to convert the heathens; and with that view their mislionaries are fcattered over every part of this country. Near every town and village, peopled by converted Indians, are one or two Jesuits, who take great care that they may not return to Paganism, but live as Christians ought to do. Thus there are Jesuits with the converted Indians in Tadoussae, Lorette, Becancourt, St. Francois, Saut St. Louis, and all over Canada. There are likewife Jefuit miffionaries with those who are not converted; fo that there is commonly a Jefuit in every village belonging to the Indians, whom he endeavours on all occasions to convert. In winter he goes on their great hunts, where he is frequently obliged to fuffer all imaginable inconveniences, fuch as walking in the fnow all day, lying in the open air all winter, being out both in good and bad weather, the Indians not regarding any kind of weather: lying in the Indian huts, which often fwarm with fleas and other vermin, &c. The Jefuits undergo all these hardships for the fake of converting the Indians, and likewise for political reasons. The Jesuits are of great use to their king; for they are frequently able to persuade the Indians to break their treaty with the English, to make war upon them, to bring their firs to the French, and not to permit the English to come amongst them. But there is some danger attending these attempts; for when the Indians are in liquor, they fometimes kill the missionaries who live with them; calling them spies, or excusing themselves by faying that the brandy had killed them. These are accordingly the chief occupations of the Jesuits here. They do not go to visit the sick in the town, they do not hear the confessions, and attend at no funerals. I have never seen them go in

processions

^{*} Pour faire un recolet il faut une hachette, pour un prêtre un ciseau, mais pour un Jesuite il faut un pinceau.

processions in remembrance of the Virgin Mary and other faints. They seldom go into a house in order to get meat; and though they be invited, they do not like to stay, except they be on a journey. Every body fees that they are, as it were, felected from the other people, on account of their superior genius and qualities. They are here reckoned a most cunning set of people, who generally succeed in their undertakings. and furpass all others in acuteness of understanding. I have therefore several times observed that they have enemies in Canada. They never receive any others into their fociety, but perfons of very promifing parts; fo that there are no blockheads among them. On the other hand, the priefts receive the best kind of people among their order they can meet with; and in the choice of monks, they are yet less careful. The Jefuits who live here, are all come from France; and many of them return thither again, after a flay of a few years here. Some (five or fix of which are yet alive) who were born in Canada, went over to France, and were received among the Jesuits there; but none of them ever came back to Canada. I know not what political reason hindered them. During my stay in Quebec, one of the priests, with the bishop's leave, gave up his priefthood and became a Jefuit. The other priefts were very ill pleased with this, because it seemed as if he looked upon their condition as too mean for himself. Those congregations in the country that pay rents to the Jesuits, have, however, divine fervice performed by priefts, who are appointed by the bishop; and the land-rent only belongs to the Jesuits. Neither the priests nor the Jesuits carry on any trade with furs and fkins, leaving that entirely to the merchants.

This afternoon I vifited the building called the feminary, where all the priefts live in common. They have a great house, built of stone, with walks in it, and rooms on each fide. It is several stories high, and close to it is a fine garden, full of all sorts of fruit-trees and pot-herbs, and divided by walks. The prospect from hence is the finest in Quebec. The priests of the seminary are not much inferior to the Jesuits in

civility; and therefore I fpent my time very agreeably in their company.

The priefts are the fecond and most numerous class of the clergy in this country; for most of the churches, both in towns and villages (the Indian converts excepted) are ferved by priefts. A few of them are likewife missionaries. In Canada are two feminaries; one in Quebec, the other in Montreal. The priefts of the feminary of Montreal are of the order of St. Sulpitius, and supply only the congregation on the isle of Montreal, and the town of the same name. At all the other churches in Canada, the priefts belonging to the Quebec feminary officiate. The former, or those of the order of St. Sulpitius, all come from France; and I was affured that they never fuffer a native of Canada to come among them. In the feminary at Quebec, the natives of Canada make the greater part. In order to fit the children of this country for orders, there are schools at Quebec and St. Joachim; where the youths are taught Latin, and instructed in the knowledge of those things and sciences which have a more immediate connexion with the bufiness they are intended for. However, they are not very nice in their choice; and people of a middling capacity are often received among them. They do not feem to have made great progress in Latin; for notwithstanding the fervice is read in that language, and they read their Latin breviary, and other books, every day, yet most of them found it very difficult to speak it. All the priests in the Quebec feminary are confecrated by the bishop. Both the seminaries have got great revenues from the king; that in Quebec has above thirty thousand livres. All the country on the west side of the river St. Lawrence, from the town of Quebec to bay St. Paul, belongs to this feminary, befides their other possessions in the country. They leafe the land to the fettlers for a certain rent, which, if it be annually paid

according to their agreement, the children or heirs of the fettlers may remain in an undiffurbed possession of the lands. A piece of land, three arpents * broad, and thirty, forty, or fifty arpents long, pays annually an ecu †, and a couple of chickens, or fome other additional trifle. In fuch places as have convenient water-falls, they have built water-mills, or faw-mills, from which they annually get confiderable fums. The feminary of Montreal possesses the whole ground on which that town stands, together with the whole ifle of Montreal. I have been affured that the ground-rent of the town and ifle is computed at feventy thousand livres; besides what they get for faving masses, baptizing, holding confessions, attending at marriages and funerals, &c. All the revenues of ground-rent belong to the feminaries alone, and the priefts in the country have no share in them. But as the seminary in Montreal, consisting only of sixteen priests, has greater revenues than it can expend, a large fum of money is annually fent over to France, to the chief feminary there. The land-rents belonging to the Quebec feminary are employed for the use of the priests in it, and for the maintenance of a number of young people, who are brought up to take orders. The priests who live in the country parishes, get the tythe from their congregation, together with the perquisites on vifiting the fick, &c. In fmall congregations, the King gives the priefts an additional fum. When a priest in the country grows old, and has done good services, he is fometimes allowed to come into the feminary in town. The feminaries are allowed to place the priefts on their own estates; but the other places are in the gift of the

The recolets are a third class of clergymen in Canada. They have a fine large dwelling-house here, and a fine church, where they officiate. Near it is a large and fine garden, which they cultivate with great application. In Montreal and Trois Rivieres, they are lodged almost in the same manner as here. They do not endeavour to choose cunning fellows amongst them, but take all they can get. They do not torment their brains with much learning; and I have been affured, that after they have put on their monastic habit, they do not study to increase their knowledge, but forget even what little they knew before. At night they generally lie on mats, or some other hard matraffes; however, I have fometimes feen good beds in the cells of some of them. They have no possessions here, having made vows of poverty, and live chiefly on the alms which people give them. To this purpose, the young monks, or brothers, go into the houses with a bag, and beg what they want. They have no congregations in the country, but fometimes they go among the Indians as missionaries. In each fort, which contains forty men, the King keeps one of these monks instead of a priest, who officiates there. The King gives him lodging, provisions, fervants, and all he wants, befides two hundred livres a year. Half of it he fends to the community he belongs to; the other half he referves for his own use. On board the King's ships are generally no other priefts than these friars, who are therefore looked upon as people belonging to the King. When one of the chief priests t in the country dies, and his place cannot immediately be filled up, they fend one of these friars there, to officiate whilst the place is vacant. Part of these monks come over from France, and part are natives of Canada. There are no other monks in Canada besides these, except now and then one of the order of St. Austin, or some other, who comes with one of the King's flips, but goes off with it again.

^{*} A French acre.

[†] A French coin, value about a crown English.

I Pasteur.

August 11th. This morning I took a walk out of town, with the royal physician Mr. Gaulthier, in order to collect plants, and to fee a nunnery at fome distance from Quebec. This monaftery, which is built very magnificently of stone, lies in a pleafant fpot, furrounded with corn-fields, meadows, and woods, from whence Quebec and the river St. Lawrence may be feen; a hospital for poor old people, cripples, &c. makes part of the monastery, and is divided into two halls, one for men, the other for women. The nuns attend both fexes, with this difference, however, that they only prepare the meal for the men, and bring it in to them, give them physic, and take the cloth away when they have eaten, leaving the rest for male servants. But in the hall where the women are, they do all the work that is to be done. The regulation in the hospital was the same as in that at Quebec. To shew me a particular favour, the bishop, at the desire of the Marquis la Galissonniere, governor-general of Canada, granted me leave to fee this nunnery likewife, where no man is allowed to enter without his leave, which is an honour he feldom confers on any body. The abbefs led us through all the apartments, accompanied by a great number of nuns. Most of the nuns here are of noble families, and one was the daughter of a governor. Many of them are old, but there are likewife fome very young ones among them, who looked very well. They feemed all to be more polite than those in the other nunnery. Their rooms are the fame as in the last place, except some additional furniture in their cells; the beds are hung with blue curtains; there are a couple of fmall bureaux, a table between them, and fome pictures on the walls. There are however no floves in any cell; but those halls and rooms, in which they are affembled together, and in which the fick ones lie, are supplied with an iron stove. The number of nuns is indeterminate here, and I saw a great number of them. Here are likewise some probationers preparing for their reception among the nuns. A number of little girls are fent hither by their parents, to be instructed by the nuns in the principles of the christian religion, and in all forts of ladies work. The convent at a diffance looks like a palace; and, as I am told, was founded by a bishop, who they say is buried in a part of the church.

We botanized till dinner time in the neighbouring meadows, and then returned to the convent to dine with a venerable old father recollet, who officiated here as a prieft. The dishes were all prepared by nuns, and as numerous and various as on the tables of great men. There were likewise several forts of wine, and many preserves. The revenues of this monastery are said to be considerable. At the top of the building is a small steeple with a bell. Considering the large tracts of land which the King has given in Canada to convents, Jesuits, priests, and several families of rank, it seems he

has very little left for himfelf.

Our common rafpberries are fo plentiful here on the hills, near corn-fields, rivers, and brooks, that the branches look quite red on account of the number of berries on them. They are ripe about this time, and eaten as a defert after dinner, both fresh and preserved.

The mountain-ash, or forb-tree * is pretty common in the woods hereabouts.

They reckon the north-east wind the most piercing of all here. Many of the best people here assured me, that this wind, when it is very violent in winter, pierces through walls of a moderate thickness, so that the whole wall on the inside of the house is covered with snow, or a thick hoar frost; and that a candle placed near a thinner wall is almost blown out by the wind which continually comes through. This wind damages

the houses which are built of stone, and forces the owners to repair them very frequently on the north-east side. The north and north-east winds are likewise reckoned

very cold here. In fummer the north wind is generally attended with rain.

The difference of climate between Quebec and Montreal is on all hands allowed to be very great. The wind and weather of Montreal are often entirely different from what they are at Quebec. The winter there is not near fo cold as in the last place. Several forts of fine pears will grow near Montreal, but are far from succeeding at Quebec, where the frost frequently kills them. Quebec has generally more rainy weather, spring begins later, and winter sooner than at Montreal, where all forts of

fruits ripen a week or two earlier than at Quebec.

Aug. 12th. This afternoon I went out of town, to stay in the country for a couple of days, that I might have more leifure to examine the plants which grow in the woods here, and the state of the country. In order to proceed the better, the governorgeneral had fent for an Indian from Lorette, to fhew us the way, and teach us what use they make of the fpontaneous plants hereabouts. This Indian was an Englishman by birth, taken by the Indians thirty years ago, when he was a boy, and adopted by them, according to their custom, instead of a relation of theirs killed by the enemy. Since that time he constantly stayed with them, became a Roman Catholic, and married an Indian woman: he dreffes like an Indian, speaks English and French, and many of the Indian languages. In the wars between the French and English, in this country, the French Indians have made many prisoners of both fexes in the English plantations, adopted them afterwards, and they married with people of the Indian nations. From hence the Indian blood in Canada is very much mixed with European blood, and a great part of the Indians now living owe their origin to Europe. It is likewife remarkable that a great part of the people they had taken during the war and incorporated with their nations, especially the young people, did not choose to return to their native country, though their parents and nearest relations came to them and endeavoured to perfuade them to it, and though it was in their power to do it. The licentious life led by the Indians, pleafed them better than that of their European relations; they dreffed like the Indians, and regulated all their affairs in their way. It is therefore difficult to diffinguish them, except by their colour, which is fomewhat whiter than that There are likewife examples of some Frenchmen going amongst the of the Indians. Indians and following their way of life. There is on the contrary fcarce one instance of an Indian's adopting the European customs; but those who were taken prisoners in the war, have always endeavoured to come to their own people again, even after feveral years of captivity, and though they enjoyed all the privileges that were ever possessed by the Europeans in America.

The lands which we passed over were every where laid out into corn-fields, meadows, or pastures. Almost all round us the prospect presented to our view farms and farmhouses, and excellent fields and meadows. Near the town the land is pretty flat, and intersected now and then by a clear rivulet. The roads are very good, broad, and lined with ditches on each fide, in low grounds. Further from the town, the land rises higher and higher, and consists as it were of terraces, one above another. This rising ground is, however, pretty smooth, chiefly without stones, and covered with rich mould. Under that is the black lime-slate, which is so common hereabouts, and is divided into small shivers, and corroded by the air. Some of the strata were horizontal, others perpendicular; I have likewise found such perpendicular strata of lime-slates in other places in the neighbourhood of Quebec. All the hills are cultivated; and some are adorned with sine churches, houses, and corn-fields. The meadows are commonly in the vallies, though

402

tome

fome were likewife on eminences. Soon after we had a fine profpect from one of these hills. Quebec appeared very plain to the eastward, and the river St. Lawrence could likewise be seen; farther distant, on the south-east side of that river, appears a long chain of high mountains, running generally parallel to it, though many miles distant from it; to the west again, at some distance from the rising lands where we were, the hills changed into a long chain of very high mountains, lying very close to each other, and running parallel likewise to the river, that is, nearly from south to north. These high mountains consist of a grey rock-stone, composed of several kinds of stone, which I shall mention in the sequel. These mountains seem to prove, that the lime-slates are of as ancient a date as the grey rock-stone, and not formed in later times; for the amazing large grey rocks lie on the top of the mountains, which consist of black lime-slates.

The high meadows in Canada are excellent, and by far preferable to the meadows round Philadelphia, and in the other English colonies. The further I advanced northward here, the finer were the meadows, and the turf upon them was better and closer. Almost all the grass here is of two kinds, viz. a species of the narrow leaved meadow-grass*; for its spikes † contain either three or four flowers, which are so exceedingly small, that the plant might easily be taken for a bent grass ‡; and its seeds have several small downy hairs at the bottom. The other plant, which grows in the meadows, is the white clover §. These two plants form the hay in the meadows; they stand close and thick together, and the meadow-grass (poa) is pretty tall, but has very thin stalks. At the root of the meadow-grass the ground was quite covered with clover, so that one cannot wish for siner meadows than are found here. Almost all the meadows have been formerly corn-fields, as appears from the surrows on the ground, which still remained. They can be mown but once every summer, as spring commences very thate.

They were now bussed with making hay, and getting it in; and I was told, they had begun about a week ago. They have hay-stacks near most of their meadows, and on the wet ones they make use of conic hay-stacks. Their meadows are commonly without enclosures, the cattle being in the pastures on the other side of the woods, and having cowherds to take care of them where they are necessary.

The corn-fields are pretty large. I faw no drains any where, though they feemed to be wanting in some places. They are divided into ridges, of the breadth of two or three yards broad, between the furrows. The perpendicular height of the middle of the ridge, from the level to the ground, is near one foot. All their corn is summercorn; for as the cold in winter destroys the corn which lies in the ground, they never sow in autumn. I found white wheat most commonly in the fields. They have likewise large fields with pease, oats, in some places summer-rye, and now and then barley. Near almost every farm I met with cabbages, pumpions, and melons. The fields are not always sown, but lie fallow every two years. The fallow-fields are not ploughed in summer, so the weeds grow without restraint in them, and the cattle are allowed to go on them all summer.

The houses in the country are built promiscuously of stone or wood. To those of stone they do not employ bricks, as there is not yet any considerable quantity of bricks

^{*} Poa angustifolia, Linn. † Spiculæ tri vel quadri sloræ minimæ; semina basi pubescentia. † Agrostris, Linn. † Trisolium repens, Linn. Trisolium pratense album. C. B.

Here follows, in the original, an account of the enclosures made use of near Quebec, which is intended only for the Swedes, but not for a nation that has made such progress in agriculture and husbandry as the English. F.

made here. They therefore take what stones they can find in the neighbourhood. especially the black lime-flates. These are quite compact when broke, but shiver when exposed to the air; however, this is of little consequence, as the stones stick fast in the wall, and do not fall afunder. For want of it, they fometimes make their buildings of lime-stone, or fand-stone, and sometimes of grey rock-stone. The walls of fuch houses are commonly two feet thick, and feldom thinner. The people here can have lime every where in this neighbourhood. The greater part of the houses in the country are built of wood, and fometimes plaistered over on the outfide. The chinks in the walls are filled with clay inftead of mofs. The houses are seldom above one flory high. In every room is either a chimney or flove, or both together. The floves have the form of an oblong fquare; fome are entirely of iron, about two feet and a half long, one foot and a half, or two feet, high, and near a foot and a half broad; these iron stoves are all cast at the iron-works at Trois Rivieres. Some are made of bricks, or stones, not much larger than the iron stoves, but covered at top with an iron plate. The fmoke from the stoves is conveyed up the chimney, by an iron pipe. In fummer the stoves are removed.

This evening we arrived at Lorette, where we lodged with the Jesuits.

August 13th. In the morning we continued our journey through the woods to the high mountains, in order to fee what fcarce plants and curiofities we could get there. The ground was flat at first, and covered with a thick wood all round, except in marshy places. Near half the plants, which are to be met with here, grow in the woods and moraffes of Sweden.

We faw wild cherry-trees here, of two kinds, which are probably mere varieties, though they differ in feveral respects. Both are pretty common in Canada, and both have red berries. One kind, which is called cerifier by the French, tastes like our alpine cherries, and their acid contracts the mouth, and cheeks. The berries of the

other fort have an agreeable fourness, and a pleasant taste *.

The three-leaved hellebore † grows in great plenty in the woods, and in many places it covers the ground by itself. However, it commonly chooses mostly places, that are not very wet; and the wood-forrel t, with the mountain enchanter's night-shade §, are its companions. Its feeds were not yet ripe, and most of the stalks had no feeds at all. This plant is called tiffavoyanne jaune by the French, all over Canada. Its leaves and stalks are used by the Indians for giving a fine yellow colour to several kinds of work, which they make of prepared fkins. The French, who have learned this from them, dye wool and other things yellow with this plant.

We climbed with a great deal of difficulty to the top of one of the highest mountains here, and I was vexed to find nothing at its fummit, but what I had feen in other parts of Canada before. We had not even the pleasure of a prospect, because the trees, with which the mountain is covered, obstructed it. The trees that grow here are a kind of horn-beam, or carpinus oftrya, Linn., the American elm, the red maple, the fugarmaple, that kind of maple which cures scorched wounds (which I have not yet

described), the beech, the common birch-tree, the fugar-birch ||, the forb-tree, the Canada pine, called peruffe, the mealy-tree with dentated leaves ¶, the afh, the cherrytree (certifier) just before described, and the berry-bearing yew.

^{*} The kind called cerifier by the French, I described thus in my journal: cerafus foliis ovatis ferratis, ferraturis profundis fere subulatis, fructu racemoso. The other thus: cerasus soliis lanceolatis, cronatoferratis, acutis, fructu fere folitario.

[‡] Oxalis acetofella, Linn. † Helleborus trifolius.

[§] Circæa alpina, Linn.

li Betula nigra, Linn.

M Viburnum dentatum, Linn.

The gnats in this wood were more numerous than we could have wished. Cold water they reckon the best remedy against the bite, when the wounded places are washed with it immediately after.

At night we returned to Lorette, having accurately examined the plants of note we

met with to-day.

August 14th. Lorette is a village three French miles to the westward of Quebec, inhabited chiefly by Indians of the Huron nation, converted to the Roman Catholic religion. The village lies near a little river, which falls over a rock there, with a great noife, and turns a faw-mill, and a flour-mill. When the Jefuit, who is now with them, arrived among them, they lived in their usual huts, which are made like those of the Laplanders. They have fince laid afide this cuftom, and built all their houses after the French fashion. In each house are two rooms, viz. their bed-room, and the kitchen on the outfide before it. In the room is a final oven of stone, covered at top with an iron plate. Their beds are near the wall, and they put no other clothes on them than those which they are dressed in. Their other furniture and utenfils look equally wretched. Here is a fine little church, with a fleeple and bell. The fleeple is raifed pretty high, and covered with white tin plates. They pretend that there is fome fimilarity between this church in its figure and difposition, and the Santa Casa, at Loretto in Italy, from whence this village has got its name. Close to the church is a house built of stone, for the clergymen, who are two Jesuits, that constantly live here. The divine fervice is as regularly attended here as in any other Roman Catholic church; and I was pleafed with feeing the alacrity of the Indians, especially of the women, and hearing their good voices, when they fing all forts of hymns in their own language. The Indians drefs chiefly like the other adjacent Indian nations; the men, however, like to wear waiftcoats, or jackets, like the French. The women keep exactly to the Indian drefs. It is certain, that thefe Indians and their anceftors, long fince, on being converted to the Christian religion, have made a vow to God, never to drink strong liquors. This vow they have kept pretty inviolable hitherto, fo that one feldom fees one of them drunk, though brandy and other ftrong liquors are goods which other Indians would fooner be killed for than part with them.

These Indians have made the French their patterns in several things, besides the houses. They all plant maize; and some have small fields of wheat and rye. Many of them keep cows. They plant our common fun-slower * in their maize-fields, and mix the sceds of it into their fagamite, or maize-soup. The maize which they plant here is of the small fort, which ripens sooner than the other: its grains are smaller, but give more and better flour in proportion. It commonly ripens here at the middle,

fometimes however at the end, of August.

The Swedish winter-wheat, and winter-rye, has been tried in Canada, to see how well it would succeed; for they employ nothing but summer-corn here, it having been found that the French wheat and rye dies here in winter, if it be sown in autumn. Dr. Sarrazin has therefore (as I was told by the eldest of the two Jesuits here) got a small quantity of wheat and rye, of the winter-corn fort, from Sweden. It was sown in autumn, not hurt by the winter, and bore fine corn. The ears were not so large as those of the Canada corn, but weighed near twice as much, and gave a greater quantity of finer flour than that summer-corn. Nobody could tell me, why the experiments have not been continued. They cannot, I am told, bake such white bread here of the summer-corn, as they can in France of their winter-wheat. Many people

have affured me, that all the summer-corn now employed here came from Sweden, or Norway: for the French, on their arrival, found the winters in Canada too severe for the French winter-corn, and their summer-corn did not always ripen, on account of the shortness of summer. Therefore they began to look upon Canada as little better than an useless country, where nobody could live; till they fell upon the expedient of getting their summer-corn from the most northern parts of Europe, which has succeeded very well.

This day I returned to Quebec, making botanical observations by the way.

August 15th. The new governor-general of all Canada, the Marquis de la Jonquiere, arrived last night in the river before Quebec; but it being late, he reserved his public entrance for to-day. He had lest France on the second of June, but could not reach Quebec before this time, on account of the difficulty which great ships find in passing the sands in the river St. Lawrence. The ships cannot venture to go up without a fair wind, being forced to run in many bendings, and frequently in a very narrow channel. To-day was another great fealt, on account of the Ascension of the Virgin Mary, which is very highly celebrated in Roman Catholic countries. This day was accordingly doubly remarkable, both on account of the holiday, and of the arrival of the new governor-general, who is always received with great pomp, as he represents a

viceroy here.

About eight o'clock the chief people in town affembled at the house of Mr. de Vaudreuil, who had lately been nominated governor of Trois Rivieres, and lived in the lower town, and whose father had likewise been governor-general of Canada. Thither came likewife the Marquis de la Galissonniere, who had till now been governor-general, and was to fail for France with the first opportunity. He was accompanied by the people belonging to the government. I was likewife invited to fee this feftivity. half an hour after eight the new governor-general went from the ship into a barge, covered with red cloth, upon which a fignal with cannons was given from the ramparts, for all the bells in the town to be fet a ringing. All the people of distinction went down to the shore to falute the governor, who, on alighting from the barge, was received by the Marquis la Galiffonniere. After they had faluted each other, the commandant of the town addressed the new governor-general in a very elegant speech, which he answered very concifely; after which all the cannon on the ramparts gave a general falute. The whole street, up to the cathedral, was lined with men in arms, chiefly drawn out from among the burgheffes. The governor-general then walked towards the cathedral, dreffed in a fuit of red, with abundance of gold lace. His fervants went before him in green, carrying fire-arms on their fhoulders. On his arrival at the cathedral he was received by the bishop of Canada, and the whole clergy affembled. The bishop was arrayed in his pontifical robes, and had a long gilt tiara on his head, and a great crozier of maffy filver in his hand. After the bifhop had addreffed a flort speech to the governor-general, a priest brought a filver crucifix on a long stick, (two priests, with lighted tapers in their hands, going on each side of it) to be kiffed by the governor. The bishop and the priests then went through the long walk up to the choir. The fervants of the governor-general followed with their hats on, and arms on their fhoulders. At last came the governor-general and his suite, and after them a crowd of people. At the beginning of the choir the governor-general, and the General de la Galissonniere, stopt before a chair covered with red cloth, and flood there during the whole time of the celebration of the mass, which was celebrated by the bishop himself. From the church he went to the palace, when the gentlemen of note in the town afterwards went to pay their respects to him. The religious

ligious of the different orders, with their respective superiors, likewise came to him, to testify their joy on account of his happy arrival. Among the numbers that came to visit him, none staid to dine but those that were invited before-hand, among which I had the honour to be. The entertainment lasted very long, and was as elegant as the

occasion required.

The governor-general, Marquis de la Jonquiere, was very tall, and, at that time, fomething above fixty years old. He had fought a desperate naval battle with the English in the last war, but had been obliged to surrender, the English being, as it was told, vastly superior in the number of ships and men. On this occasion he was wounded by a ball, which entered one side of his shoulder, and came out at the other. He was very complaisant, but knew how to preserve his dignity, when he distributed favours.

Many of the gentlemen, prefent at this entertainment afferted that the following expedient had been fuccefsfully employed to keep wine, beer, or water, cool during fummer. The wine or other liquor is bottled; the bottles are well corked, hung up in the air, and wrapped in wet clouts. This cools the wine in the bottles, notwithstanding it was quite warm before. After a little while the clouts are again made wet, with the coldest water that is to be had, and this is always continued. The wine or other liquor, in the bottles is then always colder than the water with which the clouts are made wet. And though the bottles should be hung up in the funshine the above way of proceeding will always have the same effect *.

August 16th. The occidental arbor vitæ † is a tree which grows very plentiful in Canada, but not much farther south. The most southerly place I have seen it in, is a place a little on the south side of Saratoga, in the province of New-York, and likewise near Casses, in the same province, which places are in forty-two degrees and ten

minutes north latitude.

Mr. Bartram, however, informed me, that he had found a fingle tree of this kind in Virginia, near the Falls in the river James. Doctor Colden likewife afferted, that he had feen it in many places round his feat at Coldingham, which lies between New-York and Albany, about forty-one degrees thirty minutes north latitude. The French, all over Canada, call it cedre blanc. The English and Dutch in Albany, likewife call it the white cedar. The English in Virginia, have called a thuya, which grows with them, a juniper.

The places and foil where it grows beft, are not always alike, however it generally fucceeds in fuch ground where its roots have fufficient moifture. It feems to prefer fwamps, marshes, and other wet places to all others, and there it grows pretty tall. Stony hills, and places where a number of stones lie together, covered with several kinds of mosses ‡, seemed to be the next in order where it grows. When the sea shores were hilly and covered with mossy stones, the thuya seldom failed to grow on them. It is likewise seen now and then on the hills near rivers, and other high grounds,

^{*} It has been observed by several experiments that any liquor dipt into another siquor, and then exposed to the air for evaporation, will get a remarkable degree of cold; the quicker the evaporation succeeds, after repeated dippings, the greater is the cold. Therefore spirit of wine evaporating quicker than water, cools more than water; and spirit of sal ammoniac, made by quick-lime, being still more volatile than spirit of wine, its cooling quality is still greater. The evaporation succeeds better by moving the vessel containing the liquor, by exposing it to the air, and by blowing upon it, or using a pair of bellows. See de Mairan, Dissertation for le Glace, Prof. Richman in Nov. Comment. Petrop, ad an. 1747 & 1748. and Dr. Cullen in the Edinburgh physical and literary Essays and Observations. Vol. II. p. 145. F.

⁺ Thuja occidentalis, Linn. Lichen, bryum, hypnum.

which are covered with a dust like earth or mould; but it is to be observed that such places commonly carry a fourish water with them, or receive moisture from the upper countries. I have however feen it growing in fome pretty dry places; but there it never comes to any confiderable fize. It is pretty frequent in the clefts of mountains, but cannot grow to any remarkable height or thickness. The tallest trees I have found in the woods in Canada, were about thirty or thirty-fix feet high. A tree of exactly ten inches diameter had ninety-two rings round the stem *; another of one foot and two

inches in diameter had one hundred and forty-two rings †.

The inhabitants of Canada generally make use of this tree in the following cases. It being reckoned the most durable wood in Canada, and which best withstands putrefaction, so as to remain undamaged for above a man's age, enclosures of all kinds are fcarce made of any other than this wood. All the posts which are driven into the ground, are made of the Thuya wood. The palifades round the forts in Canada are likewife made of the same wood. The planks in the houses are made of it; and the thin narrow pieces of wood which form both the ribs and the bottom of the bark boats, commonly made use of here, are taken from this wood, because it is pliant enough for the purpose, especially whilst it is fresh, and likewise because it is very light. Thuya wood is reckoned one of the best for the use of lime kilns. Its branches are used all over Canada for besoms; and the twigs and leaves of it being naturally bent together, feem to be very proper for the purpose. The Indians make such besoms and bring them to the towns for fale, nor do I remember having feen any befoms of any other wood. The fresh branches have a peculiar, agreeable scent, which is pretty ftrongly finelled in houses where they make use of besoms of this kind.

This thuya is made use of for several medicinal purposes. The commandant of Fort St. Frederick, M. de Lufignan, could never fufficiently praife its excellence for rheumatic pains. He told me he had often feen it tried, with remarkable good fuccefs, upon feveral perfons, in the following manner. The fresh leaves are pounded in a mortar, and mixed with hog's greafe, or any other greafe. This is boiled together till it becomes a falve, which is spread on linen, and applied to the part where the pain is. The falve gives certain relief in a short time. Against violent pains, which move up and down in the thighs, and fometimes fpread all over the body, they recommend the following remedy. Take of the leaves of a kind of polypody t four-fiths, and of the cones of the thuya one-fifth, both reduced to a coarse powder by themselves, and mixed together afterwards. Then pour milk-warm water on it, so as to make a poultice, which spread on linen, and wrap it round the body: but as the poultice burns like fire, they commonly lay a cloth between it and the body, otherwise it would burn and scorch the skin. I have heard this remedy praised beyond measure, by people who said they had experienced its good effects. An Iroquese Indian told me, that a decoction of thuya leaves was used as a remedy for the cough. In the neighbourhood of Saratoga,

they use this decoction in the intermitting fevers.

The thuya tree keeps its leaves, and is green all winter. Its feeds are ripe towards the end of September, old style. The fourth of October of this year, 1749, some of the cones, especially those which stood much exposed to the heat of the sun, had already dropt their feeds, and all the other cones were opening in order to fhed them. This tree has, in common with many other American trees, the quality of growing

^{*} Of these rings or circles, it is well known all trees get but one every year, so that they serve to ascertain the age of the tree, and the quickness or slowness of its growth. F.

⁺ The bark is not included, when I speak of the diameters of these trees. ‡ Polypodium fronde pinnata, pinnis alternis ad basin superne appendiculatis.

plentiful in marshes and thick woods, which may be with certainty called its native places. However, there is scare a single thuya tree in those places which bears feeds; if, on the other hand, a tree accidentally stands on the outside of a wood, on the sea shore, or in a field, where the air can freely come at it, it is always full of seeds. I have found this to be the case with the thuya, on innumerable occasions. It is the same likewise with the sugar-maple, the maple which is good for healing scorched wounds, the white fir-tree, the pine called Perusse, the mulberry and several others.

August 17th. This day I went to see the nunnery of the Urfulines, which is disposed nearly in the fame way as the two other numeries. It lies in the town, and has a very fine church. The nuns are renowned for their piety, and they go less abroad than any others. The men are likewise not allowed to go into this monastery, except by the fpecial licence of the bishop. At the defire of the Marquis de la Gallissonniere the bishop granted me leave to vifit this monaftery together with the royal physician M. Gaulthier. On our arrival we were received by the abbefs, who was attended by a great number of nuns, for the most part old ones. We saw the church; and, it being Sunday, we found fome nuns on every fide of it kneeling by themselves, and faying prayers. As foon as we came into the church, the abbefs and the nuns with her dropt on their knees, and fo did M. Gaulthier and myfelf. We then went to an apartment or fmall chapel dedicated to the Virgin Mary, at the entrance of which, they all fell on their knees again. "We aftewards faw the kitchen, the dining hall, and the apartment they work in, which is large and fine. They do all forts of neat work there, gild pictures, make artificial flowers, &c. The dining hall is disposed in the same manner as in the other two monasteries. Under the tables are small drawers for each nun to keep her napkin, knife and fork, and other things in. Their cells are fmall, and each nun has one to herfelf. The walls are not painted; a little bed, a table with a drawer, and a crucifix, and pictures of faints on it, and a chair, conflitute the whole furniture of a cell. We were then led into a room full of young ladies about twelve years old and below that age, fent thither by their parents to be instructed in reading, and in matters of religion. They are allowed to go to vifit their relations once a day, but must not flay away long. When they have learnt reading, and have received infructions in religion, they return to their parents again. Near the monastery is a fine garden, which is furrounded with a high wall. It belongs to this inflitution, and is stocked with all forts of kitchen-herbs and fruit-trees. When the nuns are at work, or during dinner, every thing is filent in the rooms, unless some one of them reads to the others; but after dinner, they have leave to take a walk for an hour or two in the garden, or to divert themselves within-doors. After we had seen every thing remarkable here, we took our leave, and departed.

About a quarter of a Swedish mile to the west of Quebec, is a well of mineral waters, which carries a deal of iron ochre with it, and has a pretty strong taste. M. Gaulthier said, that he had prescribed it with success in costive cases, and the like

difeafes.

I have been affured, that there are no fnakes in the woods and fields round Quebec, whose bite is poisonous; so that one can fasely walk in the grass. I have never found any that endeavoured to bite, and all were very fearful. In the fouth parts of Canada, it is not adviseable to be off one's guard.

A very small species of black ants * live in ant-hills, in high grounds, in woods; they

look exactly like our Swedish ants, but are much less.

August 21st. To-day there were some people of three Indian nations in this country with the governor-general, viz. Hurons, Mickmacks, and Anies*; the last of which are a nation of Iroquese, and allies of the English, and were taken prisoners in the last war.

The Hurons are some of the same Indians with those who live at Lorette, and have received the Christian religion. They are tall, robust people, well shaped, and of a copper-colour. They have fhort black hair, which is shaved on the forehead, from one ear to the other. None of them wear hats or caps. Some have ear-rings, others not. Many of them have the face painted all over with vermillion; others have only strokes of it on the forehead, and near the ears; and some paint their hair with vermillion. Red is the colour they chiefly make use of in painting themselves; but I have likewife feen fome, who had daubed their face with a black colour. Many of them have figures in the face, and on the whole body, which are stained into the skin, so as to be indelible. The manner of making them shall be described in the sequel. figures are commonly black; fome have a fnake painted in each cheek, fome have feveral croffes, fome an arrow, others the fun, or any thing elfe their imagination leads them to. They have fuch figures likewife on the breaft, thighs, and other parts of the body; but fome have no figures at all. They wear a fhirt, which is either white or checked, and a shaggy piece of cloth, which is either blue or white, with a blue or red ftripe below. This they always carry over their fhoulders, or let it hang down, in which case they wrap it round their middle. Round their neck, they have a string of violet wampums, with little white wampums between them. These wampums are small, of the figure of oblong pearls, and made of the shells which the English call clams †. At the end of the wampum strings, many of the Indians wear a large French filver coin, with the king's effigy, on their breafts. Others have a large shell on the breaft, of a fine white colour, which they value very high, and is very dear; others, again, have no ornament at all round the neck. They all have their breafts uncovered. Before them hangs their tobacco-pouch, made of the fkin of an animal, and the hairy fide turned outwards. Their shoes are made of skins, and bear a great resemblance to the shoes without heels, which the women in Finland make use of. Instead of stockings, they wrap the legs in pieces of blue cloth, as I have feen the Rushian boors do.

The Mickmacks are dreffed like the Hurons, but diftinguish themselves by their long strait hair, of a jetty-black colour. Almost all the Indians have black strait hair; however, I have met with a few, whose hair was pretty much curled. But it is to be observed, that it is difficult to judge of the true complexion of the Canada Indians, their blood being mixed with the Europeans, either by the adopted prisoners of both sexes, or by the Frenchmen, who travel in the country, and often contribute their share towards the encrease of the Indian samilies, their women not being very shy. The Mickmacks are commonly not so tall as the Hurons. I have not seen any Indians whose hair was as long and strait as theirs. Their language is different from that of

the Hurons; therefore there is an interpreter here for them on purpofe.

The Anies are the third kind of Indians which came hither. Fifty of them went out in the war, being allies of the English, in order to plunder in the neighbourhood of Montreal. But the French, being informed of their scheme, laid an ambush, and killed with the first discharge of their guns forty-sour of them; so that only the sour who were here to-day saved their lives, and two others, who were ill at this time. They are as tall as the Hurons, whose language they speak. The Hurons seem to have a longer,

^{*} Probably onidoes.

and the Anies a rounder face. The Anies have fomething cruel in their looks; but their drefs is the fame as that of the other Indians. They wear an oblong piece of white tin between the hair which lies on the neck. One of those I saw had taken a flower of the rose mallow, out of a garden, where it was in full blossom at this time, and put it among the hair at the top of his head. Each of the Indians has a tobacco-pipe of grey lime-stone, which is blackened afterwards, and has a long tube of wood. There were no Indian women present at this interview. As soon as the governor-general came in, and was seated in order to speak with them, the Mickmacks sat down on the ground, like Laplanders, but the other Indians took chairs.

There is no printing-press in Canada, though there formerly was one; but all books are brought from France, and all the orders made in the country are written, which extends even to the paper-currency. They pretend that the press is not yet introduced here, lest it should be the means of propagating libels against the government, and religion. But the true reason seems to lie in the poorness of the country, as no printer could put off a sufficient numbers of books for his subsistence; and another reason may be, that France may have the profit arising from the exportation of books hither.

The meals here are in many respects different from those in the English provinces. This perhaps depends upon the difference of cultom, tafte, and religion, between the two nations. They eat three meals a day, viz. breakfast, dinner, and supper. They breakfast commonly between seven and eight. For the French here rise very early, and the governor-general can be fpoke to at feven o'clock, which is the time when he has his levee. Some of the men dip a piece of bread in brandy, and eat it; others take a dram of brandy, and eat a piece of bread after it. Chocolate is likewife very common for breakfast, and many of the ladies drink cossee. Some eat no breakfast at all. I have never feen tea made use of; perhaps because they can get coffee and chocolate from the French provinces in South America; but must get tea from China, for which it is not worth their while to fend the money out of their country. Dinner is pretty exactly at noon. People of quality have a great variety of diffies, and the rest follow their example, when they invite strangers. The loaves are oval, and baked of wheat flour. For each person they put a plate, napkin, spoon, and fork. Sometimes they likewife give knives; but they are generally omitted, all the ladies and gentlemen being provided with their own knives. The fpoons and forks are of filver, and the plates of Delft ware. The meal begins with a foup, with a good deal of bread in it. Then follow fresh meats of various kinds, boiled and roasted, poultry, or game, fricaffees, ragoos, &c. of feveral forts; together with different kinds of fallads. They commonly drink red claret at dinner, mixed with water; and spruce beer is likewise much in use. The ladies drink water and fometimes wine. After dinner the fruit and fweet-meats are ferved up, which are of many different kinds, viz. walnuts from France or Canada, either ripe or pickled; almonds, raifins, hafelnuts, feveral kinds of berries, which are ripe in the fummer feafon, fuch as currents, cran-berries, which are preferved in treacle; many preferves in fugar, as straw-berries, rasp-berries, blackberries, and moss-berries. Cheese is likewise a part of the desert, and so is milk, which they eat last of all with fugar. Friday and Saturday they eat no flesh, according to the Roman Catholic rites; but they well know how to guard against hunger. On those days they boil all forts of kitchen-herbs, and fruit; fishes, eggs, and milk, prepared in various ways. They cut cucumbers into flices, and eat them with cream. which is a very good dish. Sometimes they put whole cucumbers on the table, and every body that likes them takes one, peels, and flices it, and dips the flices into falt, eating them like raddishes. Melons abound here, and are always eaten with fugar. They

They never put any fugar into wine or brandy, and upon the whole, they and the English do not use half so much sugar, as we do in Sweden; though both nations have large sugar plantations in their West Indian possessions. They say no grace before, or after their meals, but only cross themselves, which is likewise omitted by some. Immediately after dinner, they drink a dish of cosse, without cream. Supper is commonly at seven o'clock, or between seven and eight at night, and the dishes the same as at dinner. Pudding and punch is not to met with here, though the latter is well known.

August 23. In many places hereabouts they use their dogs to fetch water out of the river. I faw two great dogs to-day put before a little cart, one before the other. They had neat harness, like horses, and bits in their mouths. In the cart was a barrel. The dogs are directed by a boy, who runs behind the cart, and as foon as they come to the river, they jump in of their own accord. When the barrel is filled, the dogsdraw their burthen up the hill again, to the house they belong to. I have frequently feen dogs employed in this manner, during my stay at Quebec. Sometimes they put but one dog before the water carts, which are made small on purpose. The dogs are not very great, hardly of the fize of our common farmers dogs. The boys that attend them have great whips, with which they make them go on occasionally. I have feen them fetch not only water, but likewife wood, and other things. In winter it is customary in Canada, for travellers to put dogs before little sledges, made on purpose to hold their cloathes, provisions, &c. Poor people commonly employ them on their winter journies, and go on foot themselves. Almost all the wood, which the poorer people in this country fetch out of the woods in winter, is carried by dogs, which have therefore got the name of horses of the poor people. They commonly place a pair of dogs before each load of wood. I have likewise seen some neat little sledges, for ladies to ride in, in winter; they are drawn by a pair of dogs, and go faster on a good road than one would think. A middle-fized dog is fufficient to draw a fingle person, when the roads are good. I have been told by old people, that horses were very scarce here in their youth, and almost all the land-carriage was then effected by dogs. Several Frenchmen, who have been among the Esquimaux on Terra Labrador, have assured me, that they not only make use of dogs for drawing drays, with their provisions, and other necessaries, but are likewise drawn by them themselves, in little sledges.

August 25th. The high hills to the west of the town abound with springs. These hills consist of the black lime-slate, before mentioned, and are pretty steep, so that it is difficult to get to the top. Their perpendicular height is about twenty or four-and-twenty yards. Their summits are destitute of trees, and covered with a thin crust of earth, lying on the lime-slates, and are employed for corn-fields, or pastures. It seems inconceivable, therefore, from whence these naked hills could take so many running springs, which in some places gush out of the hills, like torrents. Have these hills the quality of attracting the water out of the air in the day time, or at night? Or are the

lime-flates more apt to it than others?

All the horses in Canada are strong, well made, swift, as tall as the horses of our cavalry, and of a breed imported from France. The inhabitants have the custom of docking the tails of their horses, which is rather hard upon them here, as they cannot defend themselves against the numerous swarms of gnats, gad-slies, and horse-slies. They put the horses one before the other in their carts, which has probably occa-shoned the docking of their tails, as the horses would hurt the eyes of those behind them, by moving their tails backwards and forwards. The governor-general, and a few of the chief people in town, have coaches, the rest make use of open horse-chairs.

It is a general complaint, that the country people begin to keep too many horfes, by

which means the cows are kept fhort of food in winter.

The cows have likewife been imported from France, and are of the fize of our common Swedish cows. Every body agreed that the cattle, which were born of the original French breed, never grow up to the fame fize. This they afcribe to the cold winters, during which they are obliged to put their cattle into stables, and give them but little food. Almost all the cows have horns, a few, however, I have seen without them. A cow without horns would be reckoned an unheard of curiosity in Pensylvania. The beef and veal at Quebec is reckoned fatter and more palatable than at Montreal. Some look upon the falty passures below Quebec as the cause of this difference. In Canada the oxen draw with the horns, but in the English colonies they draw with their withers, as horses do. The cows vary in colour; however, most of them are either red or black.

Every countryman commonly keeps a few sheep, which supply him with as much wool as he wants to clothe himself with. The better fort of clothes are brought from France. The sheep degenerate here, after they are brought from France, and their progeny still more so. The want of food in winter is said to cause this

degeneration.

I have not feen any goats in Canada, and I have been affured that there are none. I have feen but very few in the English colonies, and only in their towns, where they are kept on account of some fick people, who drink the milk by the advice of their physicians.

The harrows are triangular; two of the fides are fix feet, and the third four feet long. The teeth, and every other part of the harrows are of wood. The teeth are

about five inches long, and about as much distant from each other.

The prospect of the country about a quarter of a mile Swedish, north of Quebec, on the west side of the river St. Lawrence, is very fine. The country is very steep towards the river, and grows higher as you go farther from the water. In many places it is naturally divided into terraces. From the heights, one can look a great way: Quebec appears very plain to the fouth, and the river St. Lawrence to the east, on which were veffels failing up and down. To the west are the high mountains, which the hills of the river end with. All the country is laid out for corn-fields, meadows, and paftures; most of the fields were fown with wheat, many with white oats, and some with peafe. Several fine houses and farms are intersperfed all over the country, and none are ever together. The dwelling house is commonly built of black lime-flates, and generally white-washed on the outside. Many rivulets and brooks roll down the high grounds, above which the great mountains lie, and which confift entirely of the black lime-flates, that shiver in pieces in the open air. On the lime-flates lies a mould of two or three feet in depth. The foil in the corn-fields is always mixed with little pieces of the limeflate. All the rivulets cut their beds deep into the ground; fo that their shores are commonly of lime-flate. A dark grey lime-ftone is fometimes found among the ftrata, which, when broke, fmells like stink-stone.

They were now building feveral ships below Quebec, for the king's account. However, before my departure, an order arrived from France, prohibiting the further building of ships of war, except those which were already on the stocks; because they had found, that the ships built of American oak do not last so long as those of European oak. Near Quebec is found very little oak, and what grows there is not fit for use, being very small; therefore they are obliged to setch their oak timber from those parts of Canada which border upon New England. But all the North American oaks have

the

the quality of lasting longer, and withstanding putrefaction better, the farther north they grow, and vice verfa. The timber from the confines of New England is brought in floats or rafts on the rivers near those parts, and near the lake St. Pierre, which fall into the great river St. Lawrence. Some oak is likewise brought from the country between Montreal and Fort St. Frederick, or Fort Champlain; but it is not reckoned so good as the first, and the place it comes from is further distant.

August 26th. They shewed a green earth, which had been brought to the general, Marquis de la Galissonniere, from the upper parts of Canada. It was a clay, which cohered very fast together, and was of a green colour throughout, like

verdigreafe *.

All the brooks in Canada contain crawfish, of the same kind with ours. The French are fond of eating them, and say they are vastly decreased in number since they have

begun to catch them.

The common people in the country feem to be very poor. They have the necessaries of life, and but little else. They are content with meals of dry bread and water, bringing all other provisions, such as butter, cheefe, sless, poultry, eggs, &c. to town, in order to get money for them, for which they buy clothes and brandy for themselves, and dresses for their women. Notwithstanding their poverty, they are always cheerful, and in high spirits.

August 29th. By the desire of the governor-general, Marquis de la Jonquiere, and of Marquis de la Galissonniere, I set out with some French gentlemen to visit the pretended silver-mine, or the lead-mine, near the bay St. Paul. I was glad to undertake this journey, as it gave me an opportunity of seeing a much greater part of the country than I should otherwise have done. This morning therefore we set out on our

tour in a boat, and went down the river St. Lawrence.

The prospect near Quebec is very lively from the river. The town lies very high, and all the churches and other buildings appear very conspicuous. The ships in the river below ornament the landscape on that side. The powder magazine, which stands at the summit of the mountain on which the town is built, towers above all the other

buildings.

The country we passed by afforded a no less charming sight. The river St. Lawrence flows nearly from south to north here; on both sides of it are cultivated fields, but more on the west side than on the east side. The hills on both shores are steep and high. A number of sine hills separated from each other large fields, which looked quite white from the corn with which they are covered, and excellent woods of deciduous trees, made the country round us look very pleasant. Now and then we saw a church of stone, and in several places brooks fell from the hills into the river. Where the brooks are considerable, there they have made saw-mills and water-mills.

After rowing for the space of a French mile and a half, we came to the isle of Orleans, which is a large island, near seven French miles and a half long, and almost two of those miles broad, in the widest part. It lies in the middle of the river St. Lawrence, is very high, has steep and very woody shores. There are some places without trees, which have farm houses below, quite close to the shore. The isle itself is well cultivated, and nothing but fine houses of stone, large corn-sields, meadows, pastures, woods of deciduous trees, and some churches built of stone, are to be seen on it.

^{*} It was probably impregnated with particles of copper ore.

We went into that branch of the river which flows on the west side of the isle of Orleans, it being the shortest. It is reckoned about a quarter of a French mile broad. but ships cannot take this road, on account of the fand banks which lie here near the projecting points of land, and on account of the shallowness of the water, the rocks and stones at the bottom. The shores on both sides still kept the same appearance as before. On the west side, or on the continent, the hills near the river consist throughout of black lime-flate, and the houses of the pealants are made of this kind of stone, white-washed on the outside. Some few houses are of different kinds of stone. The row of ten mountains, which is on the west side of the river, and runs nearly from fouth to north, gradually comes nearer to the river: for at Quebec they are near two French miles distant from the shore; but nine French miles lower down the river they are almost close to the shore. These mountains are generally covered with woods. but in some places the woods have been destroyed by accidental fires. About eight French miles and a half from Quebec, on the west side of the river, is a church called St. Anne, close to the shore. This church is remarkable, because the ships from France and other parts, as foon as they are got fo far up the river St. Lawrence, as to get fight of it, give a general discharge of their artillery, as a sign of joy, that they have passed all danger in the river, and have escaped all the sands in it.

The water had a pale red colour, and was very dirty in those parts of the river which we saw to-day, though it was every where computed above six fathoms deep. Somewhat below St. Anne, on the west side of the river St. Lawrence, another river, called le Grande Riviere, or the Great River, falls in it. Its water slows with such violence, as to make its way almost into the middle of the branch of the river St. Lawrence, which runs between the continent and the isse of

Orleans.

About two o'clock in the afternoon the tide began to flow up the river, and the wind being likewise against us, we could not proceed any farther, till the tide began to ebb. We therefore took up our night's lodging in a great farm belonging to the priests in Quebec, near which is a fine church called St. Joachim, after a voyage of about eight French miles. We were exceeding well received here. The king has given all the country round about this place to the seminary, or the priests at Quebec, who have leased it to sarmers who have built houses on it. Here are two priests, and a number of young boys, whom they instruct in reading, writing, and Latin. Most of these boys are designed for priests: directly opposite to this farm, to the eastward, is the north-east point, or the extremity of the isse of Orleans.

All the gardens in Canada abound with red currant shrubs, which were at first brought over from Europe. They grow excessively well here, and the shrubs or bushes are quite

red, being covered all over with berries.

The wild vines * grow pretty plentifully in the woods. In all other parts of Canada they plant them in the gardens, near arbours and fummer houses. The summer-houses are made entirely of lashs, over which the vines climb with their tendrils, and cover them entirely with their foliage, so as to shelter them entirely from the heat of the sum. They are very refreshing and cool in summer.

The strong contrary winds obliged us to lie all night at St. Joachim.

August 30th. This morning we continued our journey in spite of the wind, which was very violent against us. The water in the river begins to get a brackish taste, when the tide is highest, somewhat below St. Joachim; and the farther one goes down,

the more the faline taste encreases. At first the western shore of the river has sine, but low corn-fields, but soon after the high mountains run close to the river side. Before they come to the river, the hilly shores consist of black lime-slate; but as soon as the high mountains appear on the river side, the lime-slates disappear. For the stone, of which the high mountains consist, is a chalky rock-stone, mixed with glimmer and quartz. The glimmer is black, the quartz partly violet, and partly grey. All the four constituent parts are so well mixed together, as not to be easily separated by an instrument, though plainly distinguishable with the eye. During our journey to-day, the breadth of the river was generally three French miles. They shewed me the turnings the ships are obliged to sail in, which seem to be very troublesome, as they are obliged to bear away for either shore as occasion requires, or as the rocks and sands in the

river oblige them to do.

For the distance of five French miles we had a very dangerous passage to go through; for the whole western shore, along which we rowed, consists of very high and steep mountains, where we could not have found a fingle place to land with fafety, during the space of five miles, in case a high wind had arisen. There are indeed two or three openings, or holes, in the mountains, into which one could have drawn the boat, in the greatest danger. But they are so narrow, that in case the boat could not find them in the hurry, it would inevitably be dashed against the rocks. These high mountains are either quite bare, or covered with some small firs standing far asunder. In fome places there are great clefts going down the mountains, in which trees grow very close together, and are taller than on the other parts of the mountain; fo that those places look like quick hedges, planted on the folid rock. Soon after we paffed a fmall church, and some farms round it. The place is called Petite Riviere, and they fay its inhabitants are very poor, which feems very probable. They have no more land to cultivate than what lies between the mountains and the river, which in the widest part is not above three musket-shot, and in most parts but one broad. About seventeen French miles from Quebec the water is fo falty in the river that no one can drink it, our rowers therefore provided themselves with a kettle full of fresh water this morning. About five o'clock in the evening we arrived at bay St. Paul, and took our lodgings with the priefts, who have a fine large house here, and entertained us very hospitably.

Bay St. Faul is a small parish, about eighteen French miles below Quebec, lying at some distance from the shore of a bay formed by the river, on a low plain. It is surrounded by high mountains on every side, one large gap excepted, which is over against the river. All the farms are at some distance from each other. The church is reckoned one of the most ancient in Canada; which seems to be confirmed by its bad architecture, and want of ornaments; for the walls are formed of pieces of timber, erected at about two feet distance from each other, supporting the roof. Between these pieces of timber, they have made the walls of the church of lime-slate; the roof is slat; the church has no steeple, but a bell fixed above the roof, in the open air. Almost all the country in this neighbourhood belongs to the priests, who have leased it to the farmers. The inhabitants live chiefly upon agriculture, and making of tar, which last

is fold at Quebec.

This country being low, and fituated upon a bay of the river, it may be conjectured, that this flat ground was formerly part of the bottom of the river, and formed itself either by a decrease of water in the river, or by an encrease of earth, which was carried

Saxum micaceo quarzolo calcarium.

upon it from the continent by the brooks, or thrown on it by florms. A great part of the plants which are to be met with here are likewise marine; such as glass-wort, sea milk-wort, and sea-side pease*. But when I have asked the inhabitants, whether they find shells in the ground by digging for wells, they always answered in the negative. I received the same answer from those who live in the low fields directly north of Quebec, and all agreed, that they never found any thing by digging, but different kinds of earth and sand.

It is remarkable, that there is generally a different wind in the bay from that in the river, which arises from the high mountains, covered with tall woods, with which it is furrounded on every fide but one. For example, when the wind comes from the river, it strikes against one of the mountains at the entrance of the bay, it is reslected,

and confequently takes a direction quite different from what it had before.

I found fand of three kinds upon the shore; one is a clear coarse sand, consisting of angulated grains of quartz, and is very common on the shore; the other is a sine black sand, which I have likewise found in abundance on the shores of Lake Champlain †, and which is common all over Canada. Almost every grain of it is attracted by the magnet. Besides this, there is a garnet-coloured sand ‡, which is likewise very sine. This may owe its origin to the garnet-coloured grains of sands which are to be found in all the strong and mountains here near the shore. The sand may have arisen from the crumbled pieces of some stones, or the stones may have been composed of it. I have sound both this and the black sand on the shores, in several parts of this journey; but the black sand was always the most plentiful.

August 31st. All the high hills in the neighbourhood fent up a smoke this morn-

ing, as from a charcoal-kiln.

Gnats are innumerable here; and as foon as one looks out of doors, they immediately attack him; and they are still worse in the woods. They are exactly the same gnats as our common Swedish ones, being only somewhat less than the North American gnats all are. Near Fort St. Jean, I have likewise feen gnats which were the same with ours, but they were somewhat bigger, almost of the size of our crane-slies §. Those which are here beyond measure blood-thirsty. However, I comforted myself,

because the time of their disappearance was near at hand.

This afternoon we went still lower down the river St. Lawrence, to a place, where, we were told, there were silver or lead mines. Somewhat below bay St. Paul, we passed a neck of land, which consists entirely of a grey, pretty compact lime-stone, lying in dipping, and almost perpendicular strata. It seems to be merely a variety of the black lime-slates. The strata dip to the south-east, and bassed out to the north-west. The thickness of each is from ten to sisteen inches. When the stone is broken, it has a strong smell, like stink-stone. We kept, as before, to the western shore of the river, which consists of nothing but sleep mountains and rocks. The river is not above three French miles broad here. Now and then we could see stripes in the rock, of a sine white, loose, semiopaque spar. In some places of the river are pieces of rock as big as houses, which had rolled from the mountains in spring. The places they formerly occupied are plainly to be seen.

By way of amusement, I wrote down a few Algonkin words, which I learnt from a Jesuit who has been a long time among the Algonkins. They call water, mukuman; the head, ustigon; the heart, uta; the body, veetras; the foot, ukhita; a little boat,

^{*} Salicornia, Glaux, Pisum maritimum.

[‡] Alfo mentioned before.

[†] See a former paffage.

§ Tipula hortorum. L inn.

ush; a ship, nabikoan; fire, skute; hay, maskoesee; the hare, whabus; (they have a verb, which expresses the action of hunting hares, derived from the noun) the marten, whabistanis; the elk, moosu * (but so that the final u is hardly pronounced); the reindeer, atticku; the mouse, mawitulsis. The Jesuit who told me those particulars, likewise informed me, that he had great reason to believe, that, if any Indians here owed their origin to Tataria, he thought the Algonkins certainly did; for their language is universally spoken in that part of North America which lies far to the west of Canada, towards Asia. It is said to be a very copious language; as for example, the verb to go upon the ice, is entirely different in the Algonkin from to go upon dry land, to go upon the mountains, &c.

Late at night we arrived at Terre d'Eboulement, which is twenty-two French miles from Quebec, and the last cultivated place on the western shore of the river St. Lawrence. The country lower down is faid to be so mountainous that no body can live in it, there not being a single spot of ground which could be tilled. A little church,

belonging to this place, stands on the shore, near the water.

No walnut-trees grow near this village, nor are there any kinds of them further north of this place. At bay St. Paul there are two or three walnut-trees of that species which the English call butter-nut-trees; but they are looked upon as great rarities, and there are no others in the neighbourhood.

Oaks of all kinds will not grow near this place, nor lower down, or further north.

Wheat is the kind of corn which is fown in the greatest quantities here. The soil is pretty fertile, and they have sometimes got twenty-four or twenty-six bushels from one, though the harvest is generally ten or twelve sold. The bread here is whiter than any where else in Canada.

They fow plenty of oats, and it fucceeds better than the wheat.

They fow likewife a great quantity of peas, which yield a greater encrease than any

corn; and there are examples of its producing an hundred fold.

Here are but few birds; and those that pass the summer here migrate in autumn; fo that there are no other birds than snow-birds, red partridges, and ravens, in winter. Even crows do not venture to expose themselves to the rigours of winter, but take slight in autumn.

The bull-frogs live in the pools of this neighbourhood. Fire-flies are likewise to be

found here.

Instead of candles, they make use of lamps in country places, in which they burn train-oil of porpesses, which is the common oil here. Where they have none of it,

they supply its place with train-oil of seals.

Sept. 1st. There was a woman with child in this village, who was now in the fifty-ninth year of her age. She had not had the catamenia during eighteen years. In the year 1748, she got the small-pox, and now she was very big. She said she was very well, and could feel the motions of the sœtus. She looked very well, and had her husband alive. This being an uncommon case, she was brought to the royal physician, M. Gaulthier, who accompanied us on this journey.

The famous moofe-deer is accordingly nothing but an clk; for no one can deny the derivation of moofe-deer form moofu. Confidering especially, that before the Iroquese or Five Nations grew to that power, which they at present have all over North America, the Algonkins were then the leading nation among the Indians, and their language was of course then a most universal language over the greater part of North America; and though they have been very nearly destroyed by the Iroquese, their language is still more universal in Canada than any of the rest. F.

At half an hour after feven this morning we went down the river. The country near Terre d'Eboulement is high, and confifts of hills of a loofe mould, which lie in three or four rows above each other, and are all well cultivated, and mostly turned into corn-fields; though there are likewife meadows and pastures.

The great earthquake which happened in Canada, in February 1663, and which is mentioned by Charlevcix*, has done confiderable damage to this place. Many hills tumbled down; and a great part of the corn-fields on the lowest hills were destroyed.

They shewed me several little islands, which arose in the river on this occasion.

There are pieces of black lime-flate feattered on those hills, which confist of mould. For the space of eight French miles along the side of the river there is not a piece of lime-flate to be seen; but instead of it, there are high grey mountains, confisting of a rock-stone, which contains a purple and a chrystaline quartz, mixed with lime-stone, and black glimmer. The roots of these mountains go into the water. We now begin to see the lime-flates again.

Here are a number of terns †, which fly about, and make a noife along the shore.

The river is her computed at about four French miles broad.

On the fides of the river, about two French miles inland, there are fuch terraces of earth as at Terra d'Eboulement; but soon after they are succeeded by high disagreeable mountains.

Several brooks fall into the river here, over the steep shores, with a great noise. The shores are sometimes several yards high, and consists either of earth, or of rock-

stone.

One of these brooks, which slows over a hill of lime-stone, contains a mineral water. It has a strong smell of sulphur, is very clear, and does not change its colour when mixed with gall-apples. If it is poured into a filver cup, it looks as if the cup was gilt; and the water leaves a sediment of a crimson colour at the bottom. The stones and pieces of wood, which lie in the water, are covered with a slime, which is a pale grey at the top, and black at the bottom of the stone. This slime has not much pungency, but tastes like oil of tobacco. My hands had a sulphureous smell all day, because I had handled some of the slimy stones.

The black lime flate now abounds again, near the level of the water. It lies in strata, which are placed almost perpendicularly near each other, inclining a little towards W. S. W. Each stratum is between ten and sifteen inches thick. Most of them are shivered into thin leaves at the top, towards the day; but in the inside, whither neither sun, nor air and water can penetrate, they are close and compact. Some of these stones.

are not quite black, but have a greyish cast.

About noon we arrived at Cape aux Oyes, or Geefe Cape, which has probably got its name from the number of wild geefe which the French found near it, on their first arrival in Canada. At present we saw neither geese, nor any kind of birds here, a single raven excepted. Here we were to examine the renowned metallic veins in the mountain; but found nothing more than small veins of a fine white spar, containing a few specks of lead ore. Cap aux Oyes is computed twenty-two, or twenty-five French miles distant from Quebec. I was most pleased by finding, that most of the plants are the same as grow in Sweden; a proof of which I shall produce in the sequel.

The fand-reed t grows in abundance in the fand, and prevents its being blown

about by the wind.

^{*} See his Histoire de la Nouvelle France, tom. ii. p. m. 125. † Sterna hirundo, Linn. † Arundo arenaria, Linn.

The fea-lime grafs * likewife abounds on the fhores. Both it and the preceding plant are called feigle de mer† by the French. I have been affured that thefe plants grow in great plenty in Newfoundland, and on other North American fhores; the places covered with them looking, at a diffance, like corn-fields; which might explain the paffage in our northern accounts, of the excellent wine-land ‡, which mentions, that they had found whole fields of wheat growing wild.

The fea-fide plantain § is very frequent on the shore. The French boil its leaves in a broth on their fea-voyages, or eat them as a fallad. It may likewise be pickled like

famphire.

The bear-berries || grow in great abundance here. The Indians, French, English, and Dutch, in those parts of North America, which I have seen, call them Sagackhomi, and mix the leaves with tobacco for their use.

Gale, or fweet willow , is likewise abundant here. The French call it laurier, and some poivrier. They put the leaves into their broth, to give it a pleasant taste.

The fea-rocket ** is, likewife, not uncommon. Its root is pounded, mixed with

flour, and eaten here, when there is a fcarcity of bread.

The forb-tree, or mountain-ash, the cranberry-bush, the juniper-tree, the sea-side pease, the Linnæa, and many other Swedish plants, are likewise to be met with here.

We returned to bay St. Paul to-day. A grey feal fwam behind the boat for fome time,

but was not near enough to be shot at.

Sept. 2d. This morning we went to fee the filver or lead veins. They lie a little on the fouth-fide of the mills, belonging to the priefts. The mountain in which the veins lie has the fame constituent parts as the other high grey rocks in this place, viz. a rock-stone composed of a whitish or pale grey lime-stone, a purple or almost garnetcoloured quartz, and a black glimmer. The lime-stone is in greater quantities here than the other parts; and is fo fine as to be hardly visible. It effervesces very strongly with aqua fortis. The purple or garnet-coloured quartz is next in quantity; lies fcattered in exceeding small grains, and strikes size when struck with a steel. The little black particles of glimmer follow next; and last of all, the transparent crystalline speckles of quartz. There are some small grains of spar in the lime-stone. All the different kinds of stone are very well mixed together, except that the glimmer now and then forms little veins and lines. The stone is very hard; but when exposed to sunshine and the open air, it changes so much as to look quite rotten, and becomes friable; and in that case, its constituent particles grow quite undistinguishable. The mountain. is quite full of perpendicular clifts, in which the veins of lead-ore run from E. S. E. to W. N. W. It feems the mountain had formerly got cracks here, which were afterwards filled up with a kind of stone, in which the lead-ore was generated. That stone which contains the lead-ore is a foft, white, often femidiaphanous spar, which works very eafily. In it there are fometimes stripes of a snowy white lime-stone, and almost always veins of a green kind of stone like quartz. This spar has many cracks, and divides into fuch pieces as quartz; but is much fofter, never strikes fire with steel,.

* Elymus arenarius, Linn. + Sea rye.

[†] Vinland det goda, or the good wine-land, is the name which the old Scandinavian navigators gave to America, which they diffeovered long before Columbus. See Torfiei Historia Vinlandiæ antiquæ f partis Americæ septentrionolis. Hasniæ 1715, 4to. and Mr. George Westmann's, A. M. Dissertation on that subject 150. 1747. F.

[§] Plantago maritima, Linn. ¶ Myrica gale, Linn.

Arbutus uva ursi, Linn.

Bunias cakile, Linn.

does not effervesce with acids, and is not smooth to the touch. It seems to be a species of Mr. Professor Wallerius's vitrescent spar *. There are sometimes small pieces of a greyish quartz in this spar, which emit strong sparks of fire, when struck with a steel. In these kinds of stone the lead-ore is lodged. It commonly lies in little lumps of the fize of peas; but fometimes in fpecks of an inch square, or bigger. The ore is very clear, and lies in little cubes †. It is generally very poor, a few places excepted. The veins of foft spar, and other kinds of stone, are very narrow, and commonly from ten to fifteen inches broad. In a few places they are twenty inches broad; and in one fingle place twenty-two and a half. The brook which interfects the mountain towards the mills, runs down so deep into the mountain, that the distance from the summit of the hill, to the bottom of the brook, is near twelve yards. Here I examined the veins, and found that they always keep the same breadth, not encreasing near the bottom of the brook; and likewife, that they are no richer below, than at the top. From hence it may be eafily concluded, that it is not worth while finking mines here. Of these veins there are three or four in this neighbourhood, at fome diffance from each other, but all of the fame quality. The veins are almost perpendicular, sometimes deviating a little. When pieces of the green stone before-mentioned lie in the water, a great deal of the adherent white spar and lime-stone is consumed; but the green stone remains untouched. That part of the veins which is turned towards the air is always very rough, because the fun, air, and rain, have mouldered a great part of the spar and lime-stone; but the green stone has refisted their attacks. They fometimes find deep holes in these veins, filled with mountain crystals. The greatest quantity of lead or filver ore is to be found next to the rock, or even on the fides of vein. There are now and then little grains of pyrites in the spar, which have a fine gold colour. The green stone when pounded, and put on a red-hot shovel, burns with a blue flame. Some fay, they can then observe a fulphureous fmell, which I could never perceive, though my fense of fmelling is very perfect. When this green stone is grown quite red-hot, it looses its green colour, and acquires a whitish one, but will not effervesce with aqua fortis.

The fulphureous fprings (if I may so call them) are at the foot of the mountain, which contains the filver, or lead orc. Several springs join here, and form a little brook. The water in those brooks is covered with a white membrane, and leaves a white, mealy matter on the trees, and other bodies in its way; this matter has a strong sulphureous smell. Trees covered with this mealy matter, when dried and set on fire, burn with a blue slame, and emit a smell of sulphur. The water does not change by being mixed with gall-apples, nor does it change blue paper into a different colour, which is put into it. It makes no good lather with soap. Silver is tarnished, and turns black, if kept in this water for a little while. The blade of a knife was turned quite black, after it had lain about three hours in it. It has a disagreeable smell, which, they say, it spreads still more in rainy weather. A number of grashoppers were fallen into

it at present. The inhabitants used this water, as a remedy against the itch.

In the afternoon we fent to fee another vein, which had been fpoken of as filver-ore. It lies about a quarter of a mile to the north-east of bay St. Paul, near a point of land called Cap au Corbeau, close to the shore of the river St. Lawrence. The mountain in which these veins lie, consist of a pale red vitrescent spar, a black glimmer, a pale limestone, purple or garnet-coloured grains of quartz, and some transparent quartz. Sometimes the reddish vitrescent spar is the most abundant, and lies in long stripes of small hard grains. Sometimes the fine black glimmer abounds more than the remaining

^{*} See Wallerins's Mineralogy, Germ. ed. p. 87. Forst. Introd. to Mineralogy, p. 13. † It is a cubic lead-ore, or lead-glance. Forster's Introd. to Mineralogy, p. 51.

constituent parts; and these two last kinds of stone generally run in alternate stripes. The white lime-stone which consists of almost invisible particles, is mixed in among them. The garnet-coloured quartz grains appear here and there, and sometimes form whole stripes. They are as big as pin's heads, round, shining, and strike fire with steel. All these stones are very hard, and the mountains near the sea consist entirely of them. They sometimes lie in almost perpendicular strata, of ten or sisteen inches thickness. The strata, however, point with their upper ends to the north-west, and go upwards from the river, as if the water, which is close to the south-east side of the mountains, had forced the strata to lean on that side. These mountains contain very narrow veins of a white, and sometimes of a greenish, sine, semidiaphanous, soft spar, which crumbles easily into grains. In this spar they very frequently find specks, which look like a calamine blind *. Now and then, and but very feldom, there is a grain of lead-ore. The mountains near the shore consist sometimes of a black sine-grained horn-stone, and a ferruginous lime-stone. The horn-stone in that case is always in three or four times as great a quantity as the lime-stone.

In this neighbourhood there is likewife a fulphureous fpring, having exactly the fame qualities as that which I have before defcribed. The broad-leaved reed mace † grows in the very fpring, and fucceeds extremely well. A mountain-afh ftood near it, whose berries were of a pale yellow fading colour, whereas on all other mountain-ashes they

have a deep red colour.

They make great quantities of tar at bay St. Paul. We now passed near a place in which they burn tar, during summer. It is exactly the same with ours in East Bothnia, only somewhat less; though I have been told, that there are sometimes very great manufactures of it here. The tar is made folely of the pin rouge ‡, or red pine. All other firs, of which here are several kinds, are not fit for this purpose, because they do not give tar enough to repay the trouble the people are at. They make use of the roots alone, which are quite full of resin, and which they dig out of the ground; and of about two yards of the stem, just above the root, laying aside all the rest. They have not yet learnt the art of drawing the resin to one side of the tree, by peeling off the bark; at least they never take this method. The tar-barrels are about half the size of ours. A ton holds forty-six pots, and sells at present for twenty-sive frances at Quebec. The tar is reckoned pretty good.

The fand on the shore of the river St. Lawrence consists in some places of a kind of pearl-sand. The grains are of quartz, small and semidiaphanous. In some places, it consists of little particles of glimmer; and there are likewise spots, covered with the garnet-coloured sand, which I have before described, and which abounds in Canada.

Sept. 4th. The mountains hereabouts were covered with a very thick fog to-day, refembling the fmoak of a charcoal-kiln. Many of these mountains are very high. During my stay in Canada, I asked many people, who have travelled much in North America, whether they ever met with mountains so high, that the snow never melts on them in winter; to which they always answered in the negative. They say that the snow sometimes stays on the highest, viz. on some of those between Canada and the English colonies, during a great part of the summer; but that it melts as soon as the great heat begins.

^{*} Forster's Introd. to Mineralogy. p. 50. Zincum sterilum, Linn. Syst. Nat. iii. p. 126. ed. xii.

[†] Typha latifolia, Linn.

‡ Pinus foliis geminis longis; ramis triplici fasciculo foliorum terminatis, conis ovatis lævibus. Flor. Canad.

Every countryman fows as much flax as he wants for his own use. They had already taken it up fome time ago, and fpread it on the fields, meadows, and pastures, in

order to bleach it. It was very fhort this year in Canada.

They find iron-ore in feveral places hereabouts. Almost a Swedish mile from bay St. Paul, up in the country, there is a whole mountain full of iron-ore. The country round it is covered with a thick forest, and has many rivulets of different sizes, which feem to make the erection of iron-works very easy here. But the government having as yet suffered very much by the iron-works at Trois Rivieres, nobody ventures to propose any thing further in that way.

Sept. 5th. Early this morning we fet out on our return to Quebec. We continued our journey at noon, notwithstanding the heavy rain and thunder incommoded us. At that time we were just at Petite Riviere, and the tide beginning to ebb, it was impossible for us to come up against it; therefore we lay by here, and went on shore.

Petite Riviere is a little village on the western side of the river St. Lawrence, and lies on a little rivulet, from whence it takes its name. The houses are built of stone, and are dispersed over the country. Here is likewise a fine little church of stone. To the west of the village are some very high mountains, which cause the sun to set three or sour hours sooner here than ordinary. The river St. Lawrence annually cuts off a piece of land, on the east side of the village, so that the inhabitants fear they will in a short time lose all the land they posses here, which at most is but a musket shot broad.

All the houses here are very full of children.

The lime-flates on the hills are of two kinds. One is a black one, which I have often mentioned, and on which the town of Quebec is built. The other is generally black, and fometimes dark grey, and feems to be a fpecies of the former. It is called pierre à chaux here. It is chiefly diftinguished from the former, by being cut very easily, giving a very white lime when burnt, and not easily mouldering into shivers in the air. The walls of the houses here are entirely made of this slate; and likewise the chimnies, those places excepted which are exposed to the greatest fire, where they place pieces of grey rock-stone, mixed with a deal of glimmer. The mountains near Petite Riviere consist merely of a grey rock-stone, which is entirely the same with that which I described near the lead-mines of bay St. Paul. The foot of these mountains consists of one of the lime-slate kinds. A great part of the Canada mountains of grey rock-stone stand on a kind of slate, in the same manner as the grey rocks of West Gothland in Sweden.

Sept. 6th. They catch eels and porpeffes here, at a certain feafon of the year, viz. at the end of September, and during the whole month of October. The eels come up the river at that time, and are caught in the manner I have before described. They are followed by the porpeffes, which feed upon them. The greater the quantity of eels is, the greater is likewife the number of porpeffes, which are caught in the following manner: when the tide ebbs in the river, the porpeffes commonly go down along the fides of the river, catching the cels which they find there. The inhabitants of this place therefore flick little twigs, or branches with leaves, into the river, in a curve line or arch, the ends of which look towards the shore, but stand at some distance from it, leaving a paffage there. The branches stand about two feet distant from each other. When the porpelles come amongst them, and perceive the ruftling the water makes with the leaves, they dare not venture to proceed, fearing left there should be a snare, or trap, and endeavour to go back. Meanwhile the water has receded fo much, that in going back they light upon one of the ends of the arch, whose moving leaves frighten them again. In this confusion they swim backwards and forwards, till the water is entirely

entirely ebbed off, and they lie on the bottom, where the inhabitants kill them. They

give a great quantity of train-oil.

Near the shore, is a grey clay, full of ferruginous cracks, and pierced by worms. The holes are small, perpendicular, and big enough to admit a middling pin. Their sides are likewise ferruginous, and half-petrified; and where the clay has been washed away by the water, the rest looks like ochre-coloured stumps of tobacco-pipe tubes.

At noon we left Petite Riviere, and continued our journey towards St. Joachim.

Between Petite Riviere, which lies in a little bay, and St. Joachim, the western shore of the river St. Lawrence consists of prominent mountains, between which there are several similar to have found, by long experience, that there is always a wind on these mountains, even when it is calm at Petite Riviere. And when the wind is pretty high at the last-mentioned place, it is not adviseable to go to Quebec in a boat, the wind and waves, in that case, being very high near these mountains. We had at present an opportunity of experiencing it. In the creeks between the mountains, the water was almost quite smooth; but on our coming near one of the points formed by the high mountains, the waves encreased, and the wind was so high, that two people were forced to take care of the helm, and the mast broke several times. The waves are likewise greatly encreased by the strong current near those points or capes.

Sept. 7th. A little before noon, we continued our voyage from St. Joachim.

They employ tree-mushrooms very frequently instead of tinder. Those which are taken from the sugar-maple are reckoned the best; those of the red maple are next in goodness; and next to them, those of the sugar-birch. For want of these, they likewise make use of those which grow on the asp-tree or tremble.

There are no other ever-green trees in this part of Canada than the thuya, the yew,

and fome of the fir kind.

The thuya is esteemed for resisting putrefaction much longer than any other wood;

and next in goodness to it is the pine, called perusse here.

They make cheese in several places hereabouts. That of the isle of Orleans is, however, reckoned the best. This kind is small, thin, and round; and four of them weigh about a French pound. Twelve of them sell for thirty sols. A pound of salt butter costs ten sols at Quebec, and of fresh butter sisteen sols. Formerly, they could get a pound of butter for sour sols here.

The corn fields towards the river are floping; they are fuffered to lie fallow and to be fown alternately. The fown ones looked yellow at this diffance, and the fallow ones green. The weeds are left on the latter all fummer, for the cattle to feed upon.

The ash wood furnishes the best hoops for tuns here; and for want of it, they take

the thuya, little birch-trees, wild cherry-trees, and others.

The hills near the river, on the western side, opposite the isle of Orleans, are very high and pretty steep. They consist, in most part, of black lime-state. There are likewise some spots which consist of a rock-stone, which, at first sight, looks like a sand-stone, and is composed of grey quartz, a reddish lime-stone, a little grey lime-stone, and some pale grey grains of sand. These parts of the stone are small and pretty equally mixed with each other. The stone looks red, with a greyish cast, and is very hard. It lies in strata, one above another. The thickness of each stratum is about sive inches. It is remarkable, that there are both elevated and hollow impressions of pectinites on the surface, where one likewise meets with the petrified shells themselves; but on breaking the stone, it does not even contain the least vestige of an impression or

vol. XIII. 4 R petrified

petrified shell. All the impressions are small, about the length and breadth of an inch. The particulars of quartz in the stone strike fire with steel, and the particulars of lime-stone effervesce strongly with aquasortis. The upper and lower surfaces of the strata consist of lime-stone, and the inner parts of quartz. They break great quantities of this stone in order to build houses of it, pave sloors with it, and make stair-cases of it. Great quantities of it are sent to Quebec. It is remarkable, that there are petrifactions in this stone, but never any in the black lime-slates.

The women dye their woollen yarn yellow with feeds of gale *, which is called

poivrier here, and grows abundant in wet places.

This evening, M. Gaulthier and I went to fee the water-fall at Montmorenci. The country near the river is high and level, and laid out into meadows. Above them the high and steep hills begin, which are covered with a crust of mould, and turned into corn-fields. In some very steep places, and near the rivulets, the hills confist of mere-black lime-state, which is often crumbled into small pieces, like earth. All the fields below the hills are full of such pieces of lime-state. In some more elevated places, the

earth confifts of a pale red colour; and the lime-flates are likewife reddifh.

The water-fall near Montmorenci is one of the highest I ever faw. It is in a river whose breadth is not very confiderable, and falls over the steep fide of a hill, confishing entirely of black lime-flate. The fall is now at the bottom of a little creek of the river. Both fides of the creek confift merely of black lime-flate, which is very much cracked and tumbled down. The hill of lime-flate under the water-fall is quite perpendicular, and one cannot look at it without aftonishment. The rain of the preceding days had encreased the water in the river, which gave the fall a grander appearance. breadth of the fall is not above ten or twelve yards. Its perpendicular height Mr. Gaulthier and I gueffed to be between a hundred and ten, and a hundred and twenty feet; and on our return to Quebec, we found our guess confirmed by several gentlemen, who had actually measured the fall, and found it to be nearly as we had conjectured. The people who live in the neighbourhood exaggerate in their accounts of it, absolutely declaring that it is three hundred feet high. Father Charlevoix † is too fparing, in giving it only forty feet in height. At the bottom of the fall there is always a thick fog of vapours spreading about the water, being resolved into them by its violent fall. This fog occasions almost perpetual rain here, which is more or less heavy, in proportion to its distance from the fall. Mr. Gaulthier and myself, together with the man who shewed us the way, were willing to come nearer to the falling water, in order to examine more accurately how it came down from fuch a height, and how the stone behind the water looked. But, being about twelve yards off the fall, a sudden gust of wind blew a thick fog upon us, which, in less than a minute, had wet us as thoroughly as if we had walked for half an hour in a heavy shower. We therefore hurried away as fast as we could. The noise of the fall is sometimes heard at Quebec, which is two French miles off to the fouthward; and this is a fign of a north-east wind. At other times, it can be well heard in the villages, a good way lower to the north; and it is then reckoned an undoubted fign of a fouth-west wind, or of rain. The black lime-flate on the fides of the fall lies in dipping, and almost perpendicular firata. In these lime-state strata are the following kinds of stone to be met with.

Fibrous gypsum 1. This lies in very thin leaves between the cracks of the lime-flate.

^{*} Myrica gale. Linn. + See his Histoire de la Nouv. France, tom. v. p. m. 100. '

Gypsum amiantiforme, Waller. Min. Germ. ed. p.74. Fibrous or radiated gypsum, Forst. Introd. 10 Mineralogy, p. 16.

Its colour is a fnowy white. I have found it in feveral parts of Canada, in the fame black lime-stone.

Pierre à calumet. This is the French name of a stone disposed in strata between the lime-flate, and of which they make almost all the tobacco-pipe heads in the country. The thickness of the strata is different. I have seen pieces near fifteen inches thick: but they are commonly between four and five inches thick. When the stone is long exposed to the open air or heat of the sun, it gets a yellow colour; but in the inside it is grey. It is a lime-stone of such a compactness, that its particles are not distinguishable by the naked eye. It is pretty foft, and will bear cutting with a knife. From this quality, the people likewife judge of the goodness of the stone for tobacco-pipe heads; for the hard pieces of it are not so fit for use as the softer ones. I have seen some of these stones shivering into thin leaves on the outside, where they were exposed to the fun. All the tobacco-pipe heads, which the common people in Canada make use of, are made of this stone, and are ornamented in different ways. A great part of the gentry likewife make use of them, especially when they are on a journey. The Indians have employed this stone for the same purposes for several ages past, and have taught it the Europeans. The heads of the tobacco-pipes are naturally of a pale grey colour; but they are blackened whilst they are quite new, to make them look better. They cover the head all over with greafe, and hold it over a burning candle, or any other fire, by which means it gets a good black colour, which is encreased by frequent use. The tubes of the pipes are always made of wood *.

There are no coals near this fall, or in the steep hills close to it. However, the people in the neighbouring village shewed me a piece of coal, which, they said, they had found on one of the hills about the fall.

We arrived at Quebec very late at night.

Sept. 8. Intermitting fevers of all kinds are very rare at Quebec, as Mr. Gaulthier affirms. On the contrary, they are very common near Fort St. Frederick, and near Fort Detroit, which is a French colony, between Lake Erie and Lake Huron, in forty-

three degrees north latitude.

Some of the people of quality make use of ice-cellars, to keep beer cool in, during fummer, and to keep fresh slesh, which would not keep long in the great heat. These ice-cellars are commonly built of stone, under the house. The walls of it are covered with boards, because the ice is more easily consumed by stones. In winter they sill it with snow, which is beat down with the feet, and covered with water. They then open the cellar holes and the door, to admit the cold. It is customary in summer to put a piece of ice into the water or wine which is to be drank.

All the falt which is made use of here is imported from France. They can make good salt here of the sea water; but France keeping the salt trade entirely to itself, they

do not go on with it here.

The Equimaux are a particular kind of American favages, who live only near the water, and never far in the country, on Terra Labrador, between the most outward point of the mouth of the river St. Lawronce and Hudson's bay. I have never had an opportunity of seeing one of them. I have spoken with many Frenchmen who have seen

^{*} All over Poland, Russia, Turkey, and Tartary, they smoke out of pipes made of a kind of stone-mark, to which they six long wooden tubes; for which latter purpose, they commonly employ the young shoots of the various kinds of spirma, which have a kind of pith easily to be thrust out. The stone-marke is called generally sea-scum, being pretty soft; and by the Tartars, in Crimea, it is called kessekil. And as it cuts so easily, various sigures are curiously carved in it, when it is worked into pipe heads, which often are mounted with silver. F.

them, and had them on board their own veffels. I shall here give a brief history of

them, according to their unanimous accounts.

The Esquimaux are entirely different from the Indians of North America, in regard to their complexion and their language. They are almost as white as Europeans, and have little eyes: the men have likewise beards. The Indians, on the contrary, are copper-coloured, and the men have no beards. The Esquimaux language is faid to contain some European words. Their houses are either caverns or clests in the mountains, or huts of turs above ground. They never sow or plant vegetables, living chiefly on various kinds of whales, on sealst, and walrusset. Sometimes they likewise catch land animals, on which they seed. They eat most of their meat quite raw. Their drink is water; and people have likewise seen them drinking the sea-water, which was like brine.

Their shoes, stockings, breeches, and jackets, are made of seal-skins well prepared, and sewed together with nerves of whales, which may be twisted like threads, and are very tough. Their cloaths, the hairy side of which is turned outwards, are sewed together so well, that they can go up to their shoulders in the water without wetting their under cloaths. Under their upper cloaths, they wear shirts and waistcoats made of seals skins, prepared so well as to be quite soft. I saw one of their women's dresses; a cap, a waistcoat, and coat, made all of one piece of seal's skin well prepared, soft to the touch, and the hair on the outside. There is a long train behind at their coats, which scarce reach them to the middle of the thigh before; under it they wear breeches and boots, all of one piece. The shirt I saw was likewise made of a very soft seal's skin. The Esquimaux women are said to be handsomer than any of the American Indian women, and their husbands are accordingly more jealous in pro-

portion.

I have likewife feen an Esquimaux boat. The outside of it consists entirely of skins, the hair of which has been taken off; and the fides of the skins on which they were inferted are turned outwards, and feel as fmooth as vellum. The boat was near fourteen feet long, but very narrow, and very sharp-pointed at the extremities. In the infide of the boat they place two or three thin boards, which give a kind of form to the boat. It is quite covered with skins at the top, excepting, near one end, a hole big enough for a fingle person to fit and row in, and keep his thighs and legs under the deck. The figure of the hole refembles a femi-circle, the base or diameter of which is turned towards the larger end of the boat. The hole is furrounded with wood, on which a foft folded skin is fastened with straps at its upper end. When the Esquimaux makes use of his boat, he puts his legs and thighs under the deck, fits down at the bottom of the boat, draws the skin before-mentioned round his body, and fastens it well with the straps; the waves may then beat over his boat with considerable violence, and not a fingle drop comes into it; the cloaths of the Efquimaux keep the wet from him. He has an oar in his hand, which has a paddle at each end; it ferves him for rowing with, and keeping the boat in equilibrium during a storm. The paddles of the

^{*} The Moravian brethren in Greenland, coming once over with fome Greenlanders to Terra Labrador, the Efquimaux ran away at their appearance; but they ordered one of their Greenlanders to call them back in his language. The Efquimaux hearing his voice, and understanding the language, immediately stopped, came back, and were glad to find a countryman, and wherever they went among the other Esquimaux, they gave out that one of their brethren was returned. This proves the Esquimaux to be of a tribe different from any European nation, as the Greenland language has no similarity with any language in Europe. F.

⁺ Phoca vitulina. Linn.

oar are very narrow. The boat will contain but a fingle perfon. Equimaux have often been found fafe in their boats many miles from land, in violent ftorms, where fhips found it difficult to fave themfelves. Their boats float on the waves like bladders, and they row them with incredible velocity. I am told they have boats of different fhapes. They have likewife larger boats of wood, covered with leather, in which feveral people may fit, and in which their women commonly go to fea.

Bows and arrows, javelins and harpoons, are their arms. With the last they kill whales, and other large marine animals. The points of their arrows and harpoonsare sometimes made of iron, sometimes of bone, and sometimes of the teeth of the walruss. Their quivers are made of seals skins. The needles with which they sow their cloaths are likewise made of iron, or of bone. All their iron they get, by some means

or other, from the Europeans.

They fometimes go on board the European ships, in order to exchange some of their goods for knives and other iron. But it is not adviseable for Europeans to go on shore, unless they be numerous; for the Esquimaux are false and treacherous, and cannot fuffer strangers amongst them. If they find themselves too weak, they run away at the approach of strangers; but if they think they are an over-match for them, they kill all that come in their way, without leaving a fingle one alive. The Europeans therefore, do not venture to let a greater number of Efquimaux come on board their ships than they can easily master. If they are ship-wrecked on the Esquimaux coasts, they may as well be drowned in the fea as come fafe to the shore: this many Europeans have experienced. The European boats and ships which the Esquimaux get into their power, are immediately cut in pieces, and robbed of all nails and other iron, which they work into knives, needles, arrow-heads, &c. They make use of fire for no other purposes but working of iron, and preparing the skins of animals. Their meat is eaten all raw. When they come on board an European ship, and are offered some of the failors meat, they never will taste of it till they have seen some Europeans eat it. Though nothing pleafed other favage nations fo much as brandy, yet many Frenchmen have affured me, that they never could prevail on the Esquimaux to take a dram of it. Their mistrust of other nations is the cause of it; for they undoubtedly imagine that they are going to poison them, or do them some hurt; and I am not certain whether they do not judge right. They have no ear-rings, and do not paint the face like the American Indians. For many centuries past they have had dogs whose ears are erected, and never hang down. They make use of them for hunting, and instead of horses in winter, for drawing their goods on the ice. They themselves sometimes ride in fledges drawn by dogs. They have no other domestic animal. There are indeed plenty of rein-deer in their country; but it is not known that either the Esquimaux, or any of the Indians in America, have ever tamed them. The French in Canada, who are in a manner the neighbours of the Esquimaux, have taken a deal of pains to carry on fome kind of trade with them, and to endeavour to engage them to a more friendly intercourse with other nations. For that purpose they took some Efquimaux children, taught them to read, and educated them in the best manner possible. The intention of the French was, to fend these children to the Esquimaux again, that they might inform them of the kind treatment the French had given them, and thereby incline them to conceive a better opinion of the French. But unhappily all the children died of the fmall-pox, and the scheme was dropt. Many persons in Canada doubted whether the scheme would have succeeded, though the children had been kept alive. For they fay, there was formerly an Efquimaux taken by the French and brought to Canada, where he staid a good while, and was treated with great

civility. He learnt French pretty well, and feemed to relish the French way of living very well. When he was fent back to his countrymen, he was not able to make the least impression on them, in favour of the French; but was killed by his nearest relations, as half a Frenchman and foreigner. This inhuman proceeding of the Esquimaux against all strangers, is the reason why none of the Indians of North America ever give quarter to the Esquimaux if they meet with them, but kill them on the spot; though they frequently pardon their other enemies, and incorporate the prisoners into their nation.

For the use of those who are fond of comparing the languages of several nations, I liave here inserted a few Esquimaux words, communicated to me by the Jesuit Saint Pie. One, kombuc; two, tigal; three, ké; four, missilagat; water, sillalokto; rain, killaluck; heaven, taktuck, or nabugakshe; the sun, shikonak, or sakaknuk; the moon, takock; an egg, manneguk; the boat, kagack; the oar, pacotick; the knife, shavié; a dog, mekké, or timilok; the bow, petiksick; an arrow, katso; the head, niakock; the ear, tchiu; the eye, killik, or shik; the hair, nutshad; a tooth, ukak; the foot, itikat. Some think that they are nearly the same nation with the Greenlanders, or Skralingers; and pretend that there is a great affinity in the language *.

Plumb-trees of different forts brought over from France, fucceed very well here. The prefent year they did not begin to flower till this month. Some of them looked

very well; and I am told the winter does not hurt them.

Sept. 11th. The Marquis de la Galiffonniere is one of the three noblemen, who, above all others, have gained high efteem with the French admiralty in the last war. They are the Marquisses de la Galissonniere, de la Jonquiere, and de l'Etendue. The first of these was of a low stature, and somewhat hump-backed. He has a surprising knowledge in all branches of science, and especially in natural history; in which he is fo well verfed, that when he began to speak with me about it, I imagined I faw our great Linnaus under a new form. When he spoke of the use of natural history, of the method of learning, and employing it to raife the state of a country, I was astonished to fee him take his reasons from politics, as well as natural philosophy, mathematics, and other sciences. I own, that my conversation with this nobleman was very instructive to me; and I always drew a deal of useful knowledge from it. He told me feveral ways of employing natural history to the purposes of politics, and to make a country powerful, in order to depress its envious neighbours. Never has natural history had a greater promoter in this country; and it is very doubtful whether it will ever have his equal here. As foon as he got the place of governor-general, he began to take those measures for getting information in natural history, which I have mentioned before. When he faw people who had for fome time been in a fettled place of the country, especially in the more remote parts, or had travelled in those parts, he always questioned them about the trees, plants, earths, stones, ores, animals, &c. of the place. He likewife enquired what use the inhabitants made of these things; in what state their husbandry was; what lakes, rivers, and passages there are; and a number of other particulars. Those who seemed to have clearer notions than the rest, were obliged to give him circumstantial descriptions of what they had seen. He

^{*} The above account of the Esquimaux may be compared with Henry Ellis's Account of a Voyage to Hudson's Bay, by the Dobbs Galley and California, &c., and the account of a Voyage for the Discovery of a North-west Passage by Hudson's Streights, by the Clerk of the California. Two Vols. 8vo. And lastly, with Crantz's History of Greenland. Two. Vols. 8vo. F.

himself wrote down all the accounts he had received; and by this great application, fo uncommon among persons of his rank, he soon acquired a knowledge of the most distant parts of America. The priests, commandants of forts, and of several distant places, are often furprifed by his questions, and wonder at his knowledge, when they come to Quebec to pay their vifits to him; for he often tells them, that near fuch a mountain, or on fuch a shore, &c. where they often went a hunting, there are some particular plants, trees, earths, ores, &c. for he had got a knowledge of those things before. From hence it happened, that some of the inhabitants believed he had a preternatural knowledge of things, as he was able to mention all the curiofities of places, fometimes near two hundred Swedish miles from Quebec, though he never was there himself. Never was there a better statesman than he; and nobody can take better measures, and choose more proper means for improving a country, and increasing its welfare. Canada was hardly acquainted with the treasure it possessed in the person of this nobleman, when it lost him again; the king wanted his services at home, and could not leave him fo far off. He was going to France with a collection of natural curiofities; and a quantity of young trees and plants, in boxes full of earth.

The black lime-flate has been repeatedly mentioned during the course of my journey. I will here give a more minute detail of it. The mountain on which Quebec is built, and the hills along the river St. Lawrence, confift of it for fome miles together, on both fides of Quebec. About a yard from the furface, this stone is quite compact, and without any cracks; fo that one cannot perceive that it is a flate, its particles being imperceptible. It lies in strata, which vary from three or four inches, to twenty thick, and upwards. In the mountains on which Quebec is built, the strata do not lie horizontal, but dipping, fo as to be nearly perpendicular; the upper ends pointing northwest, and the lower ones south-east. From hence it is, the corners of these strata always strike out at the surface into the streets, and cut the shoes in pieces. I have likewife feen fome strata, inclining to the northward, but nearly perpendicular as the former. Horizontal firata, or nearly fuch, have occurred to me too. The firata are divided by narrow cracks; which are commonly filled with fibrous white gypfum, which can sometimes be got loose with a knife, if the layer or stratum of slate above it is broken in pieces; and in that case it has the appearance of a thin white leaf. The large cracks are almost filled up with transparent quartz crystals, of different fizes. One part of the mountain contains vast quantities of these crystals, from which the corner of the mountain which lies to the S. S. E. of the palace, has got the name of Pointe de Diamante, or Diamond Point. The fmall cracks which divide the stone, go generally at right angles; the diffances between them are not always equal. The outfide of the stratum, or that which is turned towards the other stratum, is frequently covered with a fine, black, fhining membrane, which looks like a kiud of a pyrous horn-stone. In it there is sometimes a yellow pyrites, always lying in small grains. I never found petrifactions or impreffions, or other kinds of stone in it, besides those I have just mentioned. Almost all the public and private buildings at Quebec consist of this lime-flate; and likewife the walls round the town, and round the monasteries and gardens. It is easily broken, and cut to the fize wanted. But it has the property of fplitting into thin shivers, parallel to the surface of the stratum from whence they are taken, after lying during one or more years in the air, and exposed to the fun. However, this quality does no damage to the walls in which they are placed; for the stones being laid on purpose into such a position that the cracks always run horizontally, the upper stones press so much upon the lower ones, that they can only get cracks outwardly, and shiver only on the outside, without going further inwards. The shivers

always grow thinner, as the houses grow older.

In order to give my readers some idea of the climate of Quebec, and of the different changes of heat and cold, at the several seasons of the year, I will here insert some particulars extracted from the meteorological observations, of the royal physician, Mr. Gaulthier: he gave me a copy of those which he had made from October 1744, to the end of September 1746. The thermometrical observations I will omit, because I do not think them accurate; for as Mr. Gaulthier made use of de la Hire's thermometer, the degrees of cold cannot be exactly determined, the quickfilver being depressed into the globe at the bottom, as soon as the cold begins to be considerable. The observations are made throughout the year, between seven and eight in the morning, and two and three in the afternoon. He has seldom made any observations in the afternoon. His thermometer was likewise inaccurate, by being placed in a bad situation.

The year 1745. Jan. The 29th of this month the river St. Lawrence was covered over with ice, near Quebec. In the observations of other years, it is observed, that the river is sometimes covered with ice in the beginning of January, or the end of

December.

Feb. Nothing remarkable happened during the course of this month.

March. They fay this has been the mildest winter they ever felt; even the eldest persons could not remember one so mild. The snow was only two feet deep, and the ice in the river, opposite Quebec, had the same thickness. On the twenty-first there was a thunder-storm, which fell upon a soldier, and hurt him very much. On the 19th and 20th, they began to make incisions into the sugar-maple, and to prepare

fugar from its juice.

April. During this month they continued to extract the juice of the fugar-maple, for making fugar. On the 7th the gardeners began to make hot-beds. On the 20th the ice in the river broke loofe near Quebec, and went down; which rarely happens fo foon; for the river St. Lawrence is fometimes covered with ice opposite Quebec, on the 10th of May. On the 22d, and 23d, there fell a quantity of snow. On the 25th they began to sow near St. Joachim. The same day they saw some swallows. The 29th they sowed corn all over the country. Ever since the 23d the river had been clear at Quebec.

May. The third of this month the cold was fo great in the morning, that Celfius's or the Swedish thermometer, was four degrees below the freezing point; however, it did not hurt the corn. On the 16th all the summer-corn was fown. On the 5th the sanguinaria, narcissus, and violet, began to blow. The 17th the wild cherry-trees, rasperry-bushes, apple-trees, and lime-trees, began to expand their leaves. The straw-berries were in flower about that time. The 29th the wild cherry-trees were in blossom. On the 26th part of the French apple-trees, cherry-trees, and plum-trees,

opened their flowers.

June. The 5th of this month all the trees had got leaves. The apple-trees were in full flower. Ripe straw-berries were to be had on the 22d. Here it is noted, that the

weather was very fine for the growth of vegetables.

July. The corn began to shoot into ears on the 12th, and had ears every where on the 21st. (It is to be observed, that they sow nothing but summer-corn here) Soon after the corn began to flower. Hay-making began the 22d. All this month the weather was excellent.

Aug. On the 12th there were ripe pears and melons at Montreal. On the 20th the corn was ripe round Montreal, and the harvest was begun there. On the 22d the harvest

harvest began at Quebec. On the 30th and 31st there was a very small hoar-frost on

the ground.

Sept. The harvest of all kinds of corn ended on the 24th and 25th. Melons, water-melons, cucumbers, and fine plums, were very plentiful during the course of this month. Apples and pears were likewise ripe, which is not always the case. On the last days of this month they began to plough the land. The following is one of the observations of this month: "The old people in this country say, that the corn was formerly never ripe till the 15th or 16th of September, and sometimes on the 12th; but no sooner. They likewise affert, that it never was perfectly ripe. But since the woods have been sufficiently cleared, the beams of the sun have had more room to operate, and the corn ripens sooner than before *." It is further remarked, that the hot summers are always very fruitful in Canada, and that most of the corn has hardly ever arrived at perfect maturity.

Oct. During this month the fields were ploughed, and the weather was very fine all the time. There was a little frost for feveral nights, and on the 28th it snowed.

Towards the end of this month the trees began to shed their leaves.

Nov. They continued to plough till the 10th of this month, when the trees had shed all their leaves. Till the 18th the cattle went out of doors, a few days excepted, when bad weather had kept them at home. On the 16th there was some thunder and

lightning. There was not yet any ice in the river St. Lawrence on the 24th.

Dec. During this month it is observed, that the autumn has been much milder than usual. On the 1st a ship could still set fail for France; but on the 1st the river St. Lawrence was covered with ice on the sides, but open in the middle. In the river Charles the ice was thick enough for horses with heavy loads to pass over it. On the 2st the ice in the river St. Lawrence was washed away by a heavy rain; but on the 2st part of that river was again covered with ice.

The next observations shew that the winter has likewise been one of the mildest. I

now refume the account of my own journey.

• It is not only the clearing of woods, but cultivation, and population, that alter the climate of a country, and make it mild. The Romans looked upon the winters of Germany and England as very fevere, but happily hoth countries have at prefent a much more mild climate than formerly, owing to the three above-mentioned reasons. Near Petersburg, under sixty degrees north latitude, the river Neva was covered with ice 1765, in the beginning of December and cleated of it April the 11th 1766. At Tsaritsin, which is under forty-eight degrees forty minutes north latitude, the river Volga was covered with ice the 26th of November 1765, and the ice broke in the river April the 27th 1766, (all old stile). Is it not almost incredible, that in a place very near twelve degrees more to the south, the effects of cold should be felt longer, and more feverely, than in the more northern climate? And though the neighbourhood of Petersburg has a great many woods, the cold was, however, less severe, and latting; Tsarithin, on the contrary, has no woods for many hundred miles in its neighbourhood, if we except some few trees and hushes along the Volga, and its isles, and the low land along it. Wherever the eye looks to the east, there are vast plains without woods, for many hundred miles. The clearing a country of woods, cannot therefore alone contribute so much to make the climate milder. But cultivation does more. On a ploughed field the fnow will always fooner melt, than on a field covered with grafs. The inflammable warm particles brought into the field, by the various kinds of manure, contribute much to fosten the rigours of the climate; but the exhalations of thousands of men and cattle, in a populous country, the burning of so many combustibles, and the dispersion of so many caustic particles, through the whole atmosphere; these are things which contribute so much towards softening the rigours of a climate. In a hundred square miles near Tsaritsin, there is not so much cultivated land as there is within ten near Petersburg; it is in proportion to the number of the inhabitants of both places, and this makes the chief difference of the climate. There is still another confideration, Petersburg lies near the sea, and Tsaritsin in an inland country; and, generally speaking, countries near the fea have been observed to enjoy a milder climate. These few remarks will be, I believe, sufficient to chable every body to judge of the changes of the climate in various countries, which, no doubt, grow warmer and more temperate, as cultivation and population increase. F.

This evening I left Quebec with a fair wind. The governor-general of Canada, the marquis de la Jonquiere, ordered one of the King's boats, and feven men, to bring me to Montreal. The middle of the boat was covered with blue cloth, under which we were fecured from the rain. This journey I made at the expence of the French King. We went three French miles to-day.

Sept. 12. We continued our journey during all this day.

The finall kind of maize, which ripens in three months time, was ripe about this time,

and the people drew it out of the ground, and hung it up to dry.

The weather about this time was like the beginning of our August, old stile. Therefore it seems autumn commences a whole month later in Canada, than in the midst of Sweden.

Near each farm there is a kitchen-garden, in which onions are most abundant; because the French farmers eat their dinners of them with bread, on Fridays and Saturdays, or fasting days. However, I cannot say, the French are strict observers of fasting; for several of my rowers ate steff to-day, though it was Friday. The common people in Canada may be simelled when one passes by them, on account of their frequent use of onions. Pumpions are likewise abundant in the farmers gardens. They dress them in several ways, but the most common is to cut them through the middle, and place the inside of the hearth, towards the fire, till it is quite roasted. The pulp is then cut out of the peel, and eaten; people above the vulgar put sugar to it. Carrots, sallad, French beans, cucumbers, and currant shrubs, are planted in every sarmer's little kitchen-garden.

Every farmer plants a quantity of tobacco near his house, in proportion to the fize of his family. It is likewise very necessary that they should plant tobacco, because it is so universally smoaked by the common people. Boys of ten or twelve years of age run about with the pipe in their mouths, as well as the old people. Persons above the vulgar do not resuse to smoak a pipe now and then. In the northern parts of Canada, they generally smoak tobacco by itself; but surther upwards, and about Montreal, they take the inner bark of the red Cornelian cherry *, crush it, and mix it with the tobacco, to make it weaker. People of both sexes, and of all ranks, use snuff very much. Almost all the tobacco which is consumed here is the produce of the country, and some people prefer it even to Virginian tobacco: but those who pretend to be connoisseurs,

reckon the last kind better than the other.

Though many nations imitate the French customs; yet I observed, on the contrary, that the French in Canada, in many respects, follow the customs of the Indians, with whom they converse every day. They make use of the tobacco-pipes, shoes, garters, and girdles, of the Indians. They follow the Indian way of making war with exactness; they mix the same things with tobacco; they make use of the Indian bark-boats, and row them in the Indian way; they wrap square pieces of cloth round their feet instead of Sockings, and have adopted many other Indian fashions. When one comes into the house of a Canada peasant, or farmer, he gets up, takes his hat off to the stranger, desires him to sit down, puts his hat on, and sits down again. The gentlemen and ladies, as well as the poorest peasants and their wives, are called monsieur and madame. The peasants, and especially their wives, wear shoes, which consist of a piece of wood hollowed out, and are made almost as slippers. Their boys, and the old peasants themselves, wear their hair behind in a cue; and most of them wear red woollen caps at home, and sometimes on their journies.

The farmers prepare most of their dishes of milk. Butter is but feldom seen, and what they have is made of sour cream, and therefore not so good as English butter. Many of the French are very fond of milk, which they eat chiefly on fasting days. However, they have not so many methods of preparing it as we have in Sweden. The common way was to boil it, and put bits of bread, and a good deal of sugar, into it. The French here cat near as much sless the English, on those days when their religion allows it; for excepting the soup, the sallads, and the defert, all their other dishes consist of sless variously prepared.

At night we lay at a farm-house, near a river called Petite Riviere, which falls here into the river St. Lawrence. This place is reckoned sixteen French miles from Quebec, and ten from Trois Rivieres. The tide is still considerable here. Here is the last place where the hills, along the river, consist of black lime-slate; surther on they

are composed merely of earth.

Fire-flies flew about the woods at night, though not in great numbers; the French

call them mouches à feu.

The houses in this neighbourhood are all made of wood; the rooms are pretty large. The inner roof rests on two, three, or four large thick spars, according to the fize of the room. The chinks are filled with clay instead of moss. The windows are made entirely of paper. The chimney is erected in the middle of the room; that part of the room which is opposite the fire, is the kitchen; that which is behind the chimney, serves the people to sleep, and receive strangers in. Sometimes there is an iron stove

behind the chimney.

Sept. 13th. Near Champlain, which is a place about five French miles from Trois Rivieres, the steep hills near the river consist of a yellow, and sometimes ochrecoloured fandy earth, in which a number of small springs arise. The water in them is generally silled with yellow ochre, which is a sign that these dry sandy fields contain a great quantity of the same iron ore which is dug at Trois Rivieres. It is not conceivable from whence that number of small rivulets takes their rise, the ground above being flat, and exceeding dry in summer. The lands near the river are cultivated for about an English mile into the country; but behind them there are thick forests, and low grounds. The woods, which collect a quantity of moisture, and prevent the evaporation of the water, force it to make its way under ground to the river. The shores of the river are here covered with a great deal of black iron-sand.

Towards evening we arrived at Trois Rivieres, where we staid no longer than was necessary to deliver the letters, which we brought with us from Quebec. After that

we went a French mile higher up, before we took our night's lodging.

This afternoon we faw three remarkable old people. One was an old Jesuit, called father Joseph Aubery, who had been a missionary to the converted Indians of St. François. This summer he ended the sistieth year of his mission. He therefore returned to Quebec, to renew his vows there; and he seemed to be healthy, and in good spirits. The other two people were our landlord and his wise; and he was above eighty years of age, and she was not much younger. They had now been sifty-one years married. The year before, at the end of the sistieth year of their marriage, they went to church together, and offered up thanks to God Almighty for the great grace he gave them. They were yet quite well, content, merry, and talkative. The old man said, that he was at Quebec when the English besieged it, in the year 1690, and that the bishop went up and down the streets, dressed in his pontifical robes, and a sword in his hand, in order to recruit the spirits of the soldiers.

This old man faid, that he thought the winters were formerly much colder than they are now. There fell likewife a greater quantity of fnow when he was young. He could remember the time when pumpions, cucumbers, &c. were killed by the frost about midsummer, and he assured me, that the summers were warmer now than they used to be formerly. About thirty and some odd years ago, there was such a severe winter in Canada, that the frost killed many birds; but the old man could not remember the particular year. Every body allowed, that the summers in 1748 and 1749 had been warmer in Canada than they have been many years ago.

The foil is reckoned pretty fertile; and wheat yields nine or ten grains from one. But when this old man was a boy, and the country was new and rich every where, they could get twenty or four-and-twenty grains from one. They fow but little rye here; nor do they fow much barley, except for the use of cattle. They complain, however,

that when they have a bad crop they are obliged to bake bread of barley.

Sept. 14th. This morning we got up early, and pursued our journey. After we had gone about two French miles, we got into lake St. Pierre, which we crossed. Many plants, which are common in our Swedish lakes, swim at the top of this water. This lake is faid to be covered every winter with such strong ice, that a hundred loaded horses could go over it together with fafety.

A craw-fish, or river lobster, somewhat like a erab, but quite minute, about two geometrical lines long, and broad in proportion, was frequently drawn up by us with

the aquatic weeds. Its colour is a pale greenish white.

The cordated pontederia * grows plentiful on the fides of a long and narrow canal of water, in the places frequented by our water-lillies †. A great number of hogs wade far into this kind of strait, and sometimes duck the greatest part of their bodies under water, in order to get at the roots, which they are very fond of.

As foon as we were got through lake St. Pierre, the face of the country was entirely changed, and became as agreeable as could be withed. The isles, and the land on both fides of us, looked like the prettiest pleasure-gardens; and this continued till

near Montreal.

Near every farm on the river-fide there are fome boats, hollowed out of the trunks of fingle trees, but commonly neat and well made, having the proper fhape of boats. In one place I faw a boat made of the bark of trees.

Sept. 15th. We continued our journey early this morning. On account of the strength of the river, which came down against us, we were sometimes obliged to let

the rowers go on shore, and draw the boat.

At four o'clock in the evening we arrived at Montreal; and our voyage was reckoned a happy one, because the violence of the river flowing against us all the way,

and the changeableness of the winds, commonly protract it to fourteen days.

Sept. 19th. Several people here in town have got the French vines, and planted them in their gardens. They have two kinds of grapes, one of a pale green, or almost white; the other, of a reddish brown colour. From the white ones they say white wine is made; and from the red ones, red wine. The cold in winter obliges them to put dung round the roots of the vines, without which they would be killed by the frost. The grapes began to be ripe in these days; the white ones are a little sooner ripe than the red ones. They make no wine of them here, because it is not worth while; but they are served up at desserts. They say these grapes do not grow so big here as in France.

* Pontederia cordata. Linn.

† Nymphææ.

Water-melons * are cultivated in great plenty in the English and French American colonies; and there is hardly a peafant here, who has not a field planted with them. They are chiefly cultivated in the neighbourhood of towns; and they are very rare in the north part of Canada. The Indians plant great quantities of water-inclons at prefent; but whether they have done it of old is not eafily determined; for an old Onidoe Indian (of the fix Iroquese nations) affured me, that the Indians did not know watermelons before the Europeans came into the country, and communicated them to the Indians. The French, on the other hand, have affured me, that the Illinois Indians have had abundance of this fruit, when the French first came to them; and that they declare, they had planted them fince times immemorial. However, I do not remember having read that the Europeans, who first came to North America, mention the water-melons, in fpeaking of the dishes of the Indians at that time. How great the fummer heat is in those parts of America which I have passed through, can easily be conceived, when one confiders, that in all those places, they never fow water-melons in hot-beds, but in the open fields in fpring, without fo much as covering them, and they ripen in time. Here are two species of them, viz. one with a red pulp, and one with a white one. The first is more common to the fouthward, with the Illinois, and in the English colonies; the last is more abundant in Canada. The feeds are fown in spring, after the cold is entirely gone off, in a good rich ground, at some distance from each other; because their stalks spread far, and require much room, if they shall be very fruitful. They were now ripe at Montreal; but in the English colonies they ripen in July and August. They commonly require less time to ripen in than the common melons. Those in the English colonies are commonly sweeter and more agreeable than the Canada ones. Does the greater heat contribute any thing towards making them more palatable? Those in the province of New York are, however, reckoned the best.

The water-melons are very juicy; and the juice is mixed with a cooling pulp, which is very good in the hot fummer-feafon. Nobody in Canada, in Albany, and in other parts of New York, could produce an example that the eating of water-melons in great quantities had hurt any body; and there are examples even of fick persons eating them without any danger. Further to the fouth, the frequent use of them, it is thought, brings on intermitting fevers, and other bad distempers, especially in such people as are less used to them. Many Frenchmen assured me, that when people born in Canada came to the Illinois, and eat feveral times of the water-melons of that part, they immediately got a fever; and therefore the Illinois advise the French not to eat of a fruit fo dangerous to them. They themselves are subject to be attacked by fevers, if they cool their stomachs too often with water-melons. In Canada they keep them in a room, which is a little heated; by which means they will keep fresh two months after they are ripe; but care must be taken, that the frost spoil them not. In the English plantations they likewise keep them fresh in dry cellars, during part of the winter. They affured me that they keep better when they are carefully broke off from the stalk, and afterwards burnt with a red-hot iron, in the place where the stalk was fastened. In this manner they may be eaten at Christmas, and after. In Pensylvania, where they have a dry fandy earth, they make a hole in the ground, put the watermelons carefully into it with their ftalks, by which means they keep very fresh during a great part of the winter. Few people, however, take this trouble with the water-

^{*} Cucurbita citrullus. Linn.

melons, because they being very cooling, and the winter being very cold too, it seems, to be less necessary to keep them for eating in that season, which is already very cold. They are of opinion in these parts, that cucumbers cool more than water-melons. The

latter are very strongly diuretic. The Iroquese call them onoheserakatee.

Gourds of feveral kinds, oblong, round, flat or compressed, crook-necked, small, &c. are planted in all the English and French colonies. In Canada, they fill the chief part of the farmers' kitchen-gardens, though the onions came very near up with them. Each farmer in the English plantations, has a large field planted with gourds, and the Germans, Swedes, Dutch, and other Europeans, fettled in their colonies, plant them. Gourds are a confiderable part of the Indian food; however, they plant more squashes than common gourds. They declare, that they have had gourds long before the Europeans discovered America; which seems to be confirmed by the accounts of the first Europeans that came into these parts, who mentioned gourds as common food among the Indians. The French here call them citrouilles, and the English in the colonies, pumpkins. They are planted in fpring, when they have nothing to fear from the frost, in an enclosed field, and a good rich soil. They are likewise frequently put into old hot-beds. In Canada, they ripen towards the beginning of September, but further fouthward they are ripe at the end of July. As foon as the cold weather commences, they take off all the pumpions that remain on the stalk, whether ripe or not, and spread them on the floor, in a part of the house, where the unripe ones grow perfectly ripe, if they are not laid one upon the other. This is done round Montreal in the middle of September; but in Penfylvania, I have feen fome in the fields on the 19th of October. They keep fresh for several months, and even throughout the winter, if they be well fecured in dry cellars (for in damp ones they rot very foon) where the cold cannot come in, or, which is still better, in dry rooms which are heated now and then,

to prevent the cold from damaging the fruit.

Pumpions are prepared for eating in various ways. The Indians boil them whole, or roast them in ashes, and eat them then, or go to sell them thus prepared in the towns; and they have, indeed, a very fine flavour, when roafted. The French and English slice them, and put the slices before the fire to roast; when they are roasted, they generally put fugar on the pulp. Another way of roafting them, is to cut them through the middle, take out all the feeds, put the halves together again, and roaft them in an oven. When they are quite roasted, some butter is put in, whilst they are warm, which being imbibed into the pulp, renders it very palatable. They often boil pumpions in water, and afterwards eat them, either alone or with flesh. Some make a thin kind of pottage of them, by boiling them in water, and afterwards macerating the pulp. This is again boiled with a little of the water, and a good deal of milk, and stirred about whilst it is boiling. Sometimes the pulp is stamped and kneaded into dough, with maize flour or other flour; of this they make cakes. Some make puddings and tarts of gourds. The Indians, in order to preserve the pumpions for a very long time, cut them in long flices, which they fasten or twist together, and dry them either by the fun, or by the fire in a room. When they are thus dried, they will keep for years together, and when boiled they tafte very well. The Indians prepare them thus at home and on their journies, and from them the Europeans have adopted this method. Sometimes they do not take the time to boil it, but eat it dry with hung-beef, or other flesh; and I own they are eatable in that state, and very welcome to a hungry stomach. They fometimes preferve them in the following manner at Montreal. They cut a pumpion in four pieces, peel them, and take the feeds out of them. The pulp is put

in a pot with boiling water, in which it must boil from four to fix minutes. It is then put into a cullender, and left in it till the next day, that the water may run off. When it is mixed with cloves, cinnamon, and some lemon peel, preserved in fyrup, and there must be an equal quantity of syrup and of the pulp. After which it is boiled together, till the syrup is entirely imbibed, and the white colour of the pulp is quite lost.

Sept. 20th. The corn of this year's harvest in Canada, was reckoned the finest they had ever had. In the province of New York, on the contrary, the crop was

very poor. The autumn was very fine this year in Canada.

Sept. 22d. The French in Canada carry on a great trade with the Indians; and though it was formerly the only trade of this extensive country, yet its inhabitants were considerably enriched by it. At present, they have besides the Indian goods, several other articles which are exported from hence. The Indians in this neighbourhood, who go hunting in winter like the other Indian nations, commonly bring their furs and skins to sale in the neighbouring French towns; however, this is not sufficient. The Indians who live at a greater distance, never come to Canada at all; and, lest they should bring their goods to the English, as the English go to them, the French are obliged to undertake journies, and purchase the Indian goods in the country of the Indians. This trade is chiefly carried on at Montreal, and a great number of young and old men every year undertake long and troublesome voyages for that purpose, carrying with them such goods as they know the Indians like, and are in want of. It is not necessary to take money on such a journey, as the Indians do not value it; and indeed I think the French, who go on these journies, scarce ever take a sol or penny with them.

I will now enumerate the chief goods which the French carry with them for this

trade, and which have a good run among the Indians.

Muskets, powder, shot, and balls. The Europeans have taught the Indians in their neighbourhood the use of fire-arms, and they have laid afide their bows and arrows, which were formerly their only arms, and make use of muskets. If the Europeans should now refuse to supply the Indians with muskets, they would be starved to death; as almost all their food confists of the flesh of the animals, which they hunt; or they would be irritated to fuch a degree as to attack the Europeans. The Indians have hitherto never tried to make muskets or similar fire-arms; and their great indolence does not even allow them to mend those muskets which they have got. They leave this entirely to the Europeans. As the Europeans came into North America, they were very careful not to give the Indians any fire-arms. But in the wars between the French and English, each party gave their Indian allies fire-arms, in order to weaken the force of the enemy. The French lay the blame upon the Dutch fettlers in Albany, faying, that they began, in 1642, to give their Indians fire-arms, and taught them the use of them, in order to weaken the French. The inhabitants of Albany, on the contrary, affert, that the French first introduced this custom, as they would have been too weak to refift the combined force of the Dutch and English in the colonies. Be this as it will, it is certain that the Indians buy muskets from the Europeans, and know at present better how to make use of them, than some of their teachers. It is likewise certain, that the Europeans gain confiderably by their trade in muskets and ammu-

Pieces of white cloth, or of a coarse uncut cloth. The Indians constantly wear such pieces of cloth, wrapping them round their bodies. Sometimes they hang them over their shoulders; in warm weather, they fasten them round the middle; and in

cold weather, they put them over the head. Both their men and women wear these pieces of cloth, which have commonly several blue or red stripes on the edge.

Blue or red cloth. Of this the Indian women make their petticoats, which reach

only to their knees. They generally chuse the blue colour.

Shirts and shifts of linen. As soon as an Indian sellow, or one of their women, have put on a shirt, they never wash it, or strip it off, till it is entirely torn in pieces.

Pieces of cloth. Which they wrap round their legs instead of stockings, like the

Ruffians.

Hatchets, knives, fciffars, needles, and a fteel to ftrike fire with. These inftruments are now common among the Indians. They all take these inftruments from the Europeans, and reckon the hatchets and knives much better than those which they formerly made of stones and bones. The stone hatchets of the ancient Indians are very rare in Canada.

Kettles of copper or brass, sometimes tinned in the inside. In these the Indians now boil all their meat, and they have a very great run with them. They formerly made use of earthen or wooden pots, into which they poured water or whatever else they wanted to boil, and threw in red hot stones to make it boil. They do not want iron beilers, because they cannot be easily carried on their continual journies, and would not bear such falls and knocks as their kettles are subject to.

Ear-rings of different fizes, commonly of brass, and sometimes of tin. They are

worn by both men and women, though the use of them is not general.

Vermillion. With this they paint their face, shirt, and several parts of the body. They formerly made use of a reddish earth, which is to be found in the country; but as the Europeans brought them vermillion, they thought nothing was comparable to it in colour. Many persons have told me, that they had heard their fathers mention, that the first Frenchmen who came over here got a great heap of surs from the Indians, for three times as much cinnabar as would lie on the tip of a knife.

Verdigrease, to paint their faces green. For the black colour, they make use of the

foot at the bottom of their kettles, and daub their whole face with it.

Looking-glaffes. The Indians are very much pleafed with them, and make use of them chiefly when they want to paint themselves. The men constantly carry their looking-glaffes with them on all their journies, but the women do not. The men, upon the whole, are more fond of dressing than the women.

Burning glasses. These are excellent pieces of furniture in the opinion of the Indians; because they serve to light the pipe without any trouble, which an indolent

Indian is very fond of.

Tobacco is bought by the northern Indians, in whose country it will not grow. The fouthern Indians always plant as much of it as they want for their own consumption. Tobacco has a great run amongst the northern Indians, and it has been observed, that the further they live to the northward, the more they smoke of tobacco.

Wampum, or, as they are here called, porcelanes. They are made of a particular kind of fhells, and turned into little fhort cylindrical beads, and ferve the Indians for

money and ornament.

Glass beads, of a small size, and white or other colours. The Indian women know how to sasten them in their ribbands, pouches, and cloths.

Brafs and steel wire, for feveral kinds of work.

Brandy, which the Indians value above all other goods that can be brought them; nor have they any thing, though ever so dear to them, which they would not give away

for

Skins

for this liquor. But, on account of the many irregularities which are caused by the use of brandy, the sale of it has been prohibited under severe penalties; however, they do not always pay an implicit obedience to this order.

These are the chief goods which the French carry to the Indians, and they have a

good run among them.

VOL. XIII.

The goods which they bring back from the Indians, confift entirely in furs. The French get them in exchange for their goods, together with all the necessary provisions they want on the journey. The furs are of two kinds; the best are the northern ones, and the worst fort those from the fouth.

In the northern parts of America there are chiefly the following skins of animals: bears, beavers, elks*, rein-deer †, wolf-lynxes ‡, and martens. They sometimes get martens' skins from the fouth, but they are red, and good for little. Pichou du Nord is perhaps the animal which the English, near Hudson's bay, call the wolverene. To the northern furs belong the bears, which are but few, and foxes, which are not very numerous, and generally black; and several other skins.

The skins of the southern parts are chiefly taken from the following animals: wild cattle, stags, roebucks, otters, Pichoux du Sud, of which P. Charlevoix makes mention §, and are probably a species of cat-lynx, or perhaps a kind of panther; foxes of

various kinds, raccoons, cat-lynxes, and feveral others.

It is inconceivable what hardships the people in Canada must undergo on their journeys. Sometimes they must carry their goods a great way by land; frequently they are abused by the Indians, and sometimes they are killed by them. They often suffer hunger, thirst, heat, and cold, are bit by gnats, and exposed to the bites of poisonous snakes, and other dangerous animals and infects. These destroy a great part of the youth in Canada, and prevent the people from growing old. By this means, however, they become such brave soldiers, and so inured to fatigue, that none of them fear danger or hardships. Many of them settle among the Indians far from Canada, marry Indian women, and never come back again.

The prices of the skins in Canada, in the year 1749, were communicated to me by M. de Couagne, a merchant at Montreal, with whom I lodged. They were as follow:

Great and middle fized bear fkins, cost five livres. Skins of young bears, fifty fols. foxes from the fouthern parts, thirty-five fols.

otters, five livres. ----- raccoons, five livres. ----- martens, forty-five fols. ----- wolf-lynxes ||, four livres. ---- wolves, forty fols. ———— Carcajoux, an animal which I do not know, five livres. — Visions, a kind of martens, which live in the water, twenty-five sols. · Raw skins of elks , ten livres. ----- ftags **. Bad skins of elks and stags ††, three livres. † Cariboux. * Originacs. ‡ Loup cerviers. In his Hist. de la Nouv. France, tom. v. p. 153.

Originacs verts. | Loups cerviers. †† Originaes et cerfs passés.

A T

Skins of roebucks, twenty-five, or thirty fols.

---- red foxes, three livres.
---- beavers, three livres.

I will now infert a lift of all the different kinds of skins, which are to be got in Canada, and which are fent from thence to Europe. I got it from one of the greatest merchants in Montreal. They are as follow:

Prepared roebuck skins, chevrcuils passes.

. Unprepared ditto, chevreuils verts.

Tanned ditto, chevrcuils tanés.

Bears, ours.

Young bears, our fons.

Otters, loutres.

Pecans.

Cats, chats.

Wolves, loup de bois.

Lynxes, loups cerviers.

North Pichoux, pichoux du nord.

South Pichoux, pichoux du sud.

Red foxes, renards rouges.

Cross foxes, renards croises.

Black foxes, renards noirs.

Grey foxes, renards argentés.

Southern, or Virginian foxes, renards du sud où de Virginie.

White foxes, from Tadoussac, renards blanes de Tadoussac.

Martens, martres.

Visons, or foutreaux.

Black squirrels, ecurcuils noirs.

Raw stags skins, cerfs verts.

Prepared ditto, cerfs passés.

Raw elks skins, originacs verts.

Prepared ditto, originax passes.

Rein-deer skins, cariboux.

Raw hind skins, biches verts.

Prepared ditto, biches passes.

Carcajous.

Musk rats, rats musques.

Fat winter beavers, castors gras d'hiver.

Ditto summer beavers, castors gras d été.

Dry winter beavers, castors sees d'hiver.

Ditto summer beavers, castors secs d'été.

Old winter beavers, castors vieux d'hiver.

Ditto summer beavers, eastors vieux d'été.

To-day, I got a piece of native copper from the Upper Lake. They find it there almost quite pure; fo that it does not want melting over again, but is immediately fit for working. Father Charlevoix * speaks of it in his history of New France. One of the Jesuits at Montreal, who had been at the place where this metal is got, told me,

^{*} See his Hist. de. la Nouv. Fr. tom. vi. p. 415.

that it is generally found near the mouths of rivers, and that there are pieces of native copper too heavy for a fingle man to lift up. The Indians there fay, that they formerly found a piece of about feven feet long, and near four feet thick, all of pure copper. As it is always found in the ground near the mouths of rivers, it is probable that the ice or water carried it down from a mountain; but, notwithstanding the careful fearch that has been made, no place has been found where the metal lies in any great

quantity together.

The head or fuperior of the priests of Montreal, gave me a piece of lead-ore to-day. He said it was taken from a place only a few French miles from Montreal, and it confisted of pretty compact, shining cubes of lead-ore. I was told by several persons here, that furthermore southward in the country, there is a place where they find a great quantity of this lead-ore in the ground. The Indians near it, melt it, and make balls and shot of it. I got some pieces of it likewise, consisting of a shining cubic lead-ore, with narrow stripes between it, and of a white hard earth or clay, which effervesces with aqua-fortis.

I likewise received a reddish brown earth to-day, sound near the Lac de Deux Montagnes, or Lake of Two Mountains, a few French miles from Montreal. It may be easily crumbled into dust between the singers. It is very heavy, and more so than the earth of that kind generally is. Outwardly, it has a kind of glossy appearance, and, when it is handled by the singers for some time, they are quite as it were silvered over. It is therefore probable, a kind of lead-earth, or an earth mixed with iron-

glimmer.

The ladies in Canada are generally of two kinds: fome come over from France, and the rest natives. The former possess the politeness peculiar to the French nation; the latter may be divided into those of Quebec and Montreal. The first of these are equal to the French ladies in good breeding, having the advantage of frequently converfing with the French gentlemen and ladies, who come every fummer with the king's ships, and flay feveral weeks at Quebec, but feldom go to Montreal. The ladies of this last place are accused by the French of partaking too much of the pride of the Indians, and of being much wanted in French good breeding. What I have mentioned above of their dreffing their head too affiduoufly, is the cafe with all the ladies throughout Canada. On those days when they pay or receive visits, they dress so gaily, that one is almost induced to think their parents possessed the greatest dignities in the state. The Frenchmen, who confidered things in their true light, complained very much that a great part of the ladies in Canada had got into the pernicious custom of taking too much care of their drefs, and fquandering all their fortunes, and more, upon it, instead of fparing fomething for future times. They are no lefs attentive to have the newest fashions; and they laugh at each other, when they are not dressed to each other's fancy. But what they get as new fashions, are grown old, and laid aside in France; for the ships coming but once every year from thence, the people in Canada consider that as the new fashion for the whole year, which the people on board brought with them, or which they imposed upon them as new. The ladies in Canada, and especially at Montreal, are very ready to laugh at any blunders strangers make in speaking. In Canada nobody ever hears the French language spoken by any but Frenchmen; for ftrangers feldom come thither, and the Indians are naturally too proud to learn French, but oblige the French to learn their language. From hence it naturally follows, that the nice Canada ladies cannot hear any thing uncommon without laughing at it. One of the first questions they propose to a stranger is, whether he is married? The next, how he likes the ladies in the country; and whether he thinks them handsomer than 4 T 2

those of his own country; and the third, whether he will take one home with him? There is some difference between the ladies of Quebec, and those of Montreal; those of the last place seemed to be generally handsomer than those of the former. Their behaviour likewise seemed to me to be somewhat too free at Quebec, and of a more becoming modesty at Montreal. The ladies at Quebec, especially the unmarried ones, are not very industrious. A girl of eighteen is reckoned very poorly off, if she cannot enumerate at least twenty lovers. These young ladies, especially those of a higher rank, get up at feven, and drefs till nine, drinking their coffee at the fame time. When they are dreffed, they place themselves near a window that opens into the street, take up fome needle-work, and few a stitch now and then; but turn their eyes into the ftreet most of the time. When a young fellow comes in, whether they are acquainted with him or not, they immediately lay afide their work, fit down by him, and begin -to chat, laugh, joke, and invent double-entendres; and this is reckoned being very witty *. In this manner they frequently pass the whole day, leaving their mothers to do all the business in the house. In Montreal, the girls are not quite so volatile, but more industrious. They are always at their needle-work, or doing some necessary business in the house. They are likewise cheerful and content; and nobody can say that they want either wit or charms. Their fault is that they think too well of themfelves. However, the daughters of people of all ranks, without exception, go to market, and carry home what they have bought. They rife as foon, and go to bed as late as any of the people in the house. I have been affured, that, in general, their fortunes are not confiderable; which are rendered still more scarce by the number of children, and the fmall revenues in a house. The girls at Montreal are very much displeased that those at Quebec get husbands sooner than they. The reason of this is, that many young gentlemen that come over from France with the ships, are captivated by the ladies at Quebec, and marry them; but as these gentlemen seldom go up to Montreal, the girls there are not often fo happy as those of the former place.

Sept. 23d. This morning I went to Saut au Recollet, a place three French miles northward of Montreal, to describe the plants and minerals there, and chieflyto collect feeds of various plants. Near the town there are farms on both fides of the road; but as one advances farther on, the country grows woody, and varies in regard to height. It is generally very strong; and there are both pieces of rock-stone and a kind of grey lime-stone. The roads are bad and almost impassable for chaises. A little before I arrived at Saut au Recollet, the woods end, and the country is turned into corn-fields,

meadows, and pastures.

About a French mile from the town are two lime-kilns on the road. They are built of a grey lime-stone, burnt hard, and of pieces of rock-stone, towards the fire. The

height of the kiln from top to bottom is feven yards.

The lime-stone which they burn here, is of two kinds. One is quite black, and so-compact, that its constituent particles cannot be distinguished, some dispersed grains of white and pale grey spar excepted. Now and then there are thin cracks in it filled with a white small-grained spar.

I have never feen any petrifactions in this stone, though I looked very carefully for them. This stone is common on the isle of Montreal, about ten or twenty inches below the upper soil. It lies in strata of sive or ten inches thickness. This stone is said to give the best lime; for, though it is not so white as that of the sollowing grey lime-

stone, yet it makes better mortar, and almost turns into stone, growing harder and more compact every day. There are examples, that when they have been about to repair a house made partly of this mortar, the other stones of which the house consists,

fooner broke in pieces than the mortar itself.

The other kind is a grey, and fometimes a dark grey lime-stone, consisting of a cumpact calcareous stone, mixed with grains of spar, of the same colour. It is sull of petrified striated shells or pectinites. The greatest part of these petrifactions are, however, only impressions of the hollow side of the shells. Now and then I found likewise petrified pieces of the shell itself, though I could never find the same shells in their natural state on the shores; and it seems inconceivable how such a quantity of impressions could come together, as I shall presently mention.

I have had great pieces of this lime-stone, confishing of little else than pectinites, lying close to one another. This lime-stone is found on several parts of the isle, where it lies in horizontal strata of the thickness of sive or ten inches. This stone yields a great quantity of white lime, but it is not so good as the former, because it grows damp in

wet weather.

Fir-wood is reckoned the best for the lime-kilns and the thuya wood next to it. The wood of the sugar-maple, and other trees of a similar nature, are not sit for it, because they leave a great quantity of coals.

Grey pieces of rock-stone are to be seen in the woods and fields hereabouts.

The leaves of feveral trees and plants began now to get a pale hue; especially those of the red maple, the smooth sumach *, the polygonum fagittatum, Linn. and several of the ferns.

A great cross is erected on the road, and the boy who shewed me the wood, told me

that a perfon was buried there, who had wrought great miracles.

At noon I arrived at Saut au Recollet, which is a little place fituated on a branch of the river St. Lawrence, which flows with a violent current between the ifles of Montreal and Jefus. It has got its name from an accident which happened to a Recollet friar, called Nicholas Veil, in the year 1625. He went into a boat with a converted Indian, and fome Indians of the nation of Hurons, in order to go to Quebec; but, on going over this place in the river, the boat overfet, and both the friar and his profelyte were drowned. The Indians (who have been suspected of occasioning the overfetting of the boat) swam to the shore, saved what they could of the friar's effects, and kept them.

The country hereabouts is full of stones, and they have but lately began to cultivate it; for all the old people could remember the places covered with tall woods, which are now turned into corn-fields, meadows, and pastures. The priests say, that this place was formerly inhabited by some converted Hurons. These Indians lived on a high mountain, at a little distance from Montreal, when the French first arrived here, and the latter persuaded them to sell that land. They did so, and settled here at Saut au Recollet, and the church which still remains here was built for them, and they have attended divine fervice in it for many years. As the French began to increase on the isle of Montreal, they wished to have it entirely to themselves, and persuaded the Indians again to sell them this spot, and go to another. The French have since prevailed upon the Indians (whom they did not like to have amongst them, because of their drumkenness, and rambling idle life) to leave this place again, and go to settle at the Lake des Deux Montagnes, where they are at present, and have a fine church of stone. Their church at Saut au Recollet is of wood, looks very old and ruinous, though:

its infide is pretty good, and is made use of by the Frenchmen in this place. They have already brought a quantity of stones hither, and intend building a new church

very foon.

Though there had been no rain for some days past, yet the moisture in the air was so great, that as I spread some papers on the ground this afternoon, in a shady place, intending to put the seeds I collected into them, they were so wet in a few minutes time, as to be rendered quite useless. The whole sky was very clear and bright, and the

heat as intolerable as in the middle of July.

One half of the corn-fields are left fallow alternately. The fallow-grounds are never ploughed in fummer; fo the cattle can feed upon the weeds that grow on them. All the corn made use of here is summer corn, as I have before observed. Some plough the fallow grounds late in autumn; others defer that business till spring; but the first way is faid to give a much better crop. Wheat, barley, rye, and oats, are harrowed, but peafe are ploughed under ground. They fow commonly about the 15th of April, and begin with the peafe. Among the many kinds of peafe which are to be got here, they prefer the green ones to all others for fowing. They require a high, dry, poor ground, mixed with coarse fand. The harvest time commences about the end, and fometimes in the middle of August. Wheat returns generally fifteen, and sometimes twenty fold; oats from fifteen to thirty fold. The crop of peafe is fometimes forty fold, but at other times only ten fold; for they are very different. The plough and harrow are the only instruments of husbandry they have, and those none of the best fort neither. The manure is carried upon the fallow grounds in fpring. The foil confifts of a grey stony earth, mixed with clay and fand. They fow no more barley than is necesfary for the cattle; for they make no malt here. They fow a good deal of oats, but merely for the horses, and other cattle. Nobody knows here how to make use of the leaves of deciduous trees as a food for the cattle, though the forests are furnished with no other than trees of that kind, and though the people are commonly forced to feed their cattle at home during five months.

I have already repeatedly mentioned, that almost all the wheat which is sown in Canada is summer wheat, that is such as is sown in spring. Near Quebec it sometimes happens, when the summer is less warm, or the spring later than common, that a great part of the wheat does not ripen perfectly before the cold commences. I have been assured that some people, who live on the Isle de Jesus, sow wheat in autumn, which is better, siner, and gives a more plentiful crop than the summer wheat; but it does

not ripen above a week before the other wheat.

Sept. 25th. In feveral places hereabouts, they enclose the field with a stone fence, instead of wooden pales. The plenty of stones which are to be got here render the

harbour very trifling.

Here are abundance of beech-trees in the woods, and they now had ripe feeds. The people in Canada collect them in autumn, dry them, and keep them till winter, when they eat them inftead of walnuts and hazel-nuts; and I am told they tafte very well.

There is a falt fpring, as the priest of this place informed me, seven French miles from hence, near the river D'Assomption; of which during the war, they have made a

fine white falt. The water is faid to be very briny.

Some kinds of fruit-trees fucceed very well near Montreal, and I had here an opportunity of feeing fome very fine pears and apples of various forts. Near Quebec the pear-trees will not fucceed, because the winter is too severe for them; and sometimes they are killed by the frost in the neighbourhood of Montreal. Plum-trees of several

forts were first brought over from France, succeed very well, and withstand the rigours of winter. Three forts of America walnut-trees grow in the woods; but the walnut-trees brought over from France die almost every year down to the very root, bringing forth new shoots in spring. Peach-trees cannot well agree with this climate; a few bear the cold, but, for greater safety, they are obliged to put straw round them. Chesnut-trees, mulberry-trees, and the like, have never yet been planted in Canada.

The whole cultivated part of Canada has been given away by the King to the clergy, and some noblemen; but all the uncultivated parts belong to him, as likewise the place on which Quebec and Trois Rivieres are built. The ground on which the town of Montreal is built, together with the whole isle of that name, belongs to the priests of the order of St. Sulpicius, who live at Montreal. They have given the land in tenure to farmers and others who were willing to settle on it. The first settlers paid a trifling rent for their land; for frequently the whole lease for a piece of ground, three arpens broad, and thirty long, consist in a couple of chickens; and some pay twenty, thirty, or forty sols, for a piece of land of the same size. But those who came latter, must pay near two ecus (crowns) for such a piece of land, and thus the land-rent is very unequal throughout the country. The revenues of the bishop of Canada do not arise from any landed property. The churches are built at the expence of the congregations. The inhabitants of Canada do not yet pay any taxes to the King; and he has no other revenues from it, than those which arise from the custom-house.

The priefts of Montreal have a mill here, where they take the fourth part of all that is ground. However, the miller receives a third part of this share. In other places he gets the half of it. The priefts sometimes lease the mill for a certain sum. Besides them nobody is allowed to erect a mill on the isle of Montreal, they having reserved that right to themselves. In the agreement drawn up between the priefts and the inhabitants of the isle, the latter are obliged to get all their corn ground in the mills of

the former.

They boil a good deal of fugar in Canada of the juice running out of the incifions in the fugar-maple, the red maple, and the fugar-birch; but that of the first tree is most commonly made use of. The way of preparing it has been more minutely described by me in the Memoirs of the Royal Swedish Academy of Sciences *.

Sept. 26th. Early this morning I returned to Montreal. Every thing began now to look like autumn. The leaves of the trees were pale or reddish, and most of the plants had lost their flowers. Those which still preserved them were the following †.

Several forts of afters, both blue and white.

Golden rods of various kinds.

Common milfoil.
Common felf-heal.
The criliped thiftle.
The biennial oenothera.

The rough-leaved fun-flower, with trifoliated leaves.

The Canada violet, A species of gentian.

Wild vines are abundant in the woods hereabouts, climbing up very high trees.

^{*} See the volume for 1751. † Asteres. Solidagines. Achillea millefolium. Prunella vulgaris. Carduus crispus. Oenothera biennis. Rudbeckia irriloba. Viola Canadensis. Gentiana Saponaria.

I have made enquiry among the French, who travel far into the country, concerning the food of the Indians. Those who live far north, I am told, cannot plant any thing, on account of the great degree of cold. They have, therefore, no bread, and do not live on vegetables; flesh and fish is their only food, and chiefly the flesh of beavers, bears, rein-deer, elks, hares, and feveral kinds of birds. Those Indians who live far fouthward eat the following things. Of vegetables they plant maize, wild kidneybeans * of feveral kinds, pumpions of different forts, squashes, a kind of gourds, watermelons, and melons †. They likewife eat various fruits which grow in their woods. Fish and slesh make a very great part of their food; and they chiefly like the slesh of wild cattle, roe-bucks, ftags, bears, beavers, and fome other quadrupeds. Among their dainty dishes, they reckon the water tare-grass, which the French call Folle Avoine, and which grows in plenty in their lakes, in ftagnant waters, and fometimes in rivers which flow flowly. They gather its feeds in October, and prepare them in different ways, and chiefly as groats, which take almost as well as rice. They make likewise many a delicious meal of the feveral kinds of walnuts, chefnuts, mulberries, acimine §, chinquapins ||, hazel-nuts, peaches, wild prunes, grapes, whortle-berries of feveral forts, various kinds of medlars, black-berries, and other fruit and roots. But the species of corn, fo common in what is called the Old World, were entirely unknown here before the arrival of the Europeans; nor do the Indians at present ever attempt to cultivate them, though they fee the use which the Europeans make of the culture of them, and though they are fond of eating the diffes which are prepared of them.

Sept. 27. Beavers are abundant all over North America, and they are one of the chief articles of the trade in Canada. The Indians live upon their flesh during a great part of the year. It is certain that these animals multiply very fast; but it is no less so, that wast numbers of them are annually killed, and that the Indians are obliged at present to undertake distant journeys, in order to catch or shoot them. Their decreasing in number is very easily accounted for; because the Indians, before the arrival of the Europeans, only caught as many as they found necessary to clothe themselves with, there being then no trade with the skins. At present a number of ships go annually to Europe, laden chiefly with beavers skins; the English and French endeavour to outdo each other, by paying the Indians well for them, and this encourages the latter to extirpate these animals. Many people in Canada told me, that when they were young, all the rivers in the neighbourhood of Montreal, the river St. Lawrence not excepted, were full of beavers and their dykes; but at present they are extirpated in that

duarter.

Beaver-flesh is eaten not only by the Indians, but likewise by the Europeans, and especially the French, on their fasting days; for His Holiness, in his system, has ranged the beaver among the fish. The sless is reckoned best, if the beaver has lived upon vegetables, such as the asp, and the beaver-tree ; but when he has eaten fish, it does not taste well. To-day I tasted this sless hoiled, for the first time; and though every body present, besides myself, thought it a delicious dish, yet I could not agree with them. I think it is eatable, but has nothing delicious. It looks black when boiled, and has a peculiar taste. In order to prepare it well, it must be boiled in several waters from morning till noon, that it may loose the bad taste it has. The tail is likewise caten, after it has been boiled in the same manner, and roasted afterwards; but it consists of fat only, though they would not call it so; and cannot be swallowed by one who is

<sup>Phafeoli.

[†] Cucumis melo. I.inn-|| Fagus pumila. Linn.

[†] Zizania aquatica. Linn. ¶ Magnolia glauca. Linn.

not used to eat it. Sometimes, though but feldom, they eatch beavers with white bair.

Wine is almost the only liquor which people above the vulgar are used to drink. They make a kind of spruce-beer of the top of the white-sir*, which they drink in summer; but the use of it is not general; and it is seldom drank by people of quality. Thus great sums go annually out of the country for wine; as they have no vines here of which they could make a liquor that is sit to be drank. The common people drink water; for it is not yet customary here to brew beer of malt; and there are no orchards large enough to supply the people with apples for making cyder. Some of the people of rank, who possess large orchards, sometimes, out of curiosity, get a small quantity of cyder made. The great people here, who are used from their youth to drink nothing but wine, are greatly at a loss in time of war; when all the ships which brought wine are intercepted by the English privateers. Towards the end of the last war, they gave two hundred and sifty francs, and even one hundred ecus, for a barrique, or hogshead, of wine.

A middling horse now costs forty francs † and upwards; a good horse is valued at an hundred francs, or more. A cow is fold for fifty francs; but people can remember the time when they were fold for ten eeus ‡. A sheep costs five or six livres at present; but last year, when every thing was dear, it cost eight or ten francs. A hog of one year old, and two hundred, or an hundred and fifty pounds weight, is fold at fifteen francs. M. Couâgne, the merchant, told me, that he had feen a hog of four hundred weight among the Indians. A chicken is fold for ten or twelve fols §; and a turkey for twenty fols. A minot of wheat fold for an ecu last year; but at prefent it cost forty fols. Maize is always of the fame price with wheat, because here is but little of it; and it is all made use of by those who go to trade with the Indians. A minot of oats costs sometimes from fifteen to twenty sols; but of late years it has been fold for twenty-fix, or thirty fols. Peafe bear always the fame price with wheat. A pound of butter costs commonly about eight or ten fols; but last year it rose up to fixteen fols. A dozen of eggs used to cost but three sols; however, now are sold for five. They make no cheefe at Montreal; nor is there any to be had, except what is got from abroad. A water-melon generally costs five or fix fols; but, if of a large fize, from fifteen to twenty.

There are as yet no manufactures established in Canada; probably, because France will not lose the advantage of selling off its own goods here. However, both the inhabitants of Canada, and the Indians, are very ill off for want of them, in times of war.

Those persons who want to be married, must have the consent of their parents: however, the judge may give them leave to marry, if the parents oppose their union without any valid reason. Likewise, if the man be thirty years of age, and the woman twenty-six, they may marry, without farther waiting for their parents consent.

Sept. 29th. This afternoon I went out of town, to the fouth-west part of the isse, in order to view the country, and the economy of the people, and to collect several feeds. Just before the town are some sine fields, which were formerly cultivated, but now serve as pastures. To the north-west appears the high mountain which lies west-

^{*} Apinette blanche. The way of brewing this beer is described at large in the Memoirs of the Royal Academy of Sciences, for the year 1751, p. 190.

⁺ Franc is the same as livre; and twenty two livres make a pound sterling.

[†] An ecu is three francs.

¶ Twenty fols make one livre.

¶ A French measure, about the same as two hushels in England.

ward of Montreal, and is very fertile, and covered with fields and gardens from the bottom to the fummit. On the fouth-east side is the river St. Lawrence, which is very broad here; and on its sides are extensive corn-fields and meadows, and fine houses of stone, which look white at a distance. At a great distance south-eastward, appear the two high mountains near Fort Chamblais, and some others near Lake Champlain, raising their tops above the woods. All the fields hereabouts are filled with stones of disferent sizes; and among them there is frequently seen a black lime-stone. About a French mile from the town, the high road goes along the river, which is on the left hand; and on the right hand all the country is cultivated and inhabited. The farm-houses are three, four, or sive arpents distant from each other. The hills near the river are generally high and pretty steep; they consist of earth; and the fields below them are filled with pieces of rock-stone, and of black lime-slate. About two French miles from Montreal, the river runs very rapidly, and is full of stones; in some places there are some waves. However, those who go in boats into the fouthern parts of Canada, are obliged to work through such places.

Wild-geefe and ducks began to migrate in great flocks to the fouthern

countries.

October 2d. The two preceding days, and this, I employed chiefly in collect-

ing feeds.

The last night's frost had caused a great alteration in several trees. Walnut-trees of all forts shed their leaves in plenty now. The flowers of a kind of nettle * were all entirely killed by the frost. The leaves of the American lime-tree were likewise damaged. In the kitchen-gardens the leaves of the melons were all killed by the frost; however, the beech, oak, and birch, did not seem to have suffered at all. The fields were all covered with a hoar-frost. The ice in the pools of water was a geometrical line and a half in thickness.

The biennial oenothera † grows in abundance on open woody hills, and fallow fields. An old Frenchman, who accompanied me as I was collecting its feeds, could not fufficiently praife its property of healing wounds. The leaves of the plant must be

crushed, and then laid on the wound.

Sœurs de Congregation are a kind of religious women, disserent from nuns. They do not live in a convent, but have houses both in the town and country. They go where they please, and are even allowed to marry, if an opportunity offers; but this, I am told, happens very seldom. In many places in the country, there are two or more of them: they have their house commonly near a church, and generally the parsonage-house is on the other side of the church. Their business is to instruct young girls in the Christian religion, to teach them reading, writing, needle-work, and other semale accomplishments. People of fortune board their daughters with them for some time. They have their boarding, lodging, beds, instruction, and whatever else they want, upon very reasonable terms. The house where the whole community of these ladies live, and from whence they are sent out into the country, is at Montreal. A lady that wants to become incorporated among them, must pay a considerable sum of money towards the common stock; and some people reckon it to be four thousand livres. If a person be once received, she is sure of a subsistence during her life-time.

La Chine is a fine village, three French miles to the fouth-east of Montreal, but on the same isle, close to the river St. Lawrence. The farm-houses lie along the river side, about four or sive arpents from each other. Here is a fine church of stone, with a

[&]quot; Urtica divaricata. Linn.

fmall steeple; and the whole place has a very agreeble situation. Its name is said to have had the following origin. As the unfortunate M. Salée was here, who was afterwards murdered by his own countrymen further up in the country, he was very intent upon discovering a shorter road to China, by means of the river St. Lawrence. He talked of nothing at that time but his new short way to China; but as his project of undertaking this journey, in order to make this discovery, was stopped by an accident which happened to him here, and he did not that time come any nearer China, this place got its name, as it were, by way of joke.

This evening I returned to Montreal.

Oct. 5th. The governor-general at Quebec is, as I have already mentioned before, the chief commander in Canada. Next to him is the intendant at Quebec; then follows the governor of Montreal, and after him the governor of Trois Rivieres. The intendant has the greatest power next to the governor-general; he pays all the money of government, and is prefident of the board of finances, and of the court of juffice in this country. He is, however, under the governor-general, for if he refuses to do any thing to which he feems obliged by his office, the governor-general can give him orders to do it, which he must obey. He is allowed, however, to appeal to the government in France. In each of the capital towns, the governor is the highest person, then the lieutenant-general, next to him a major, and after him the captains. The governorgeneral gives the first orders in all matters of consequence. When he comes to Trois Rivieres and Montreal, the power of the governor ceases, because he always commands where he is. The governor-general commonly goes to Montreal once every year, and mostly in winter; and during his absence from Quebec, the lieutenant-general commands there. When the governor-general dies, or go to France, before a new one is come in his flead, the governor of Montreal goes to Quebec, to command in the mean

while, leaving the major to command at Montreal.

One or two of the king's ships are annually sent from France to Canada, carrying recruits to supply the places of those foldiers, who either died in the service, or have got leave to fettle in the country, and turn farmers, or to return to France. Almost every year they fend a hundred, or a hundred and fifty people over in this manner. With these people they likewise send over a great number of persons who have been found guilty of finuggling in France. They were formerly condemned to the gallies, but at present they send them to the colonies, where they are free as soon as they arrive, and can choose what manner of life they please, but are never allowed to go out of the country without the king's special licence. The king's ships likewise bring a great quantity of merchandizes which the king has bought, in order to be distributed among the Indians on certain occasions. The inhabitants of Canada pay very little to the king. In the year 1748, a beginning was however made by laying a duty of three per cent. on all French goods imported by the merchants of Canada. A regulation was likewise made at that time, that all the furs and skins exported to France from hence, should pay a certain duty; but what is carried to the colonies pays nothing. The merchants of all parts of France and its colonies, are allowed to fend ships with goods to this place; and the Quebec merchants are at liberty likewife to fend their goods to any place in France, and its colonies. But the merchants at Quebec have but few ships, because the failors wages are very high. The towns in France which chiefly trade with Canada, are Rochelle and Bourdeaux; next to them are Marfeilles, Nantes, Havre de Grace, St. Malo, and others. The king's ships which bring goods to this country, come either from Brest or from Rochefort. The merchants at Ouebec fend flour, wheat, peafe, wooden utenfils, &c. on their own bottoms, to the 4 U 2

French possessions in the West Indies. The walls round Montreal were built in 1738, at the king's expence, on condition the inhabitants should, little by little, pay off the cost to the king. The town at present pays annually six thousand livres for them to government, of which two thousand are given by the seminary of priests. At Quebec the walls have likewife been built at the king's expence, but he did not re-demand the expense of the inhabitants, because they had already the duty upon goods to pay as above mentioned. The beaver-trade belongs folely to the Indian company in France, and nobody is allowed to carry it on here, besides the people appointed by that company. Every other fur trade is open to every body. There are feveral places among the Indians far in the country, where the French have stores of their goods; and these places they call les postes. The king has no other fortresses in Canada than Quebec, Fort Chamblais, Fort St. Jean, Fort St. Frederick, or Crownpoint, Montreal, Frontenac, and Niagara. All other places belong to private perfons. The king keeps the Niagara trade all to himself. Every one who intends to go to trade with the Indians must have a licence from the governor-general, for which he must pay a fum according as the place he is going to is more or lefs advantageous for trade. A merchant who fends out a boat laden with all forts of goods, and four or five perfons with it, is obliged to give five or fix hundred livres for the permission; and there are places for which they give a thousand livres. Sometimes one cannot buy the licence to go to a certain trading place, because the governor-general has granted, or intends to grant it to fome acquaintance or relation of his. The money arising from the granting of licences belongs to the governor-general.

TRAVELS

THROUGH

THE MIDDLE SETTLEMENTS IN NORTH AMERICA,

In the Tears 1759 and 1760;

WITH OBSERVATIONS UPON THE STATE OF THE COLONIES.

BY THE REV. ANDREW BURNABY, D.D.

Archdeacon of Leicester and Vicar of Greenwich. *

PREFACE TO THE THIRD EDITION.

THE two former Editions of these Travels were published, one immediately after the other, at a moment, when events of the greatest magnitude, and importance to this country, were depending; and when the minds of men were extremely agitated and alarmed for the fate of the British Empire. A rupture between Great Britain and her American Colonies was feriously apprehended: and as men forefaw, or at least fancied they forefaw, very calamitous confequences arifing from fo difastrous an event, it was generally wished that the evil might, if possible, be prevented; and a reconciliation happily effected, before matters were carried to extremity. The author, flattered by his friends, and perhaps a little also by vanity, prefumed to hope, that the publication of his tour through the Middle Settlements in North America might, in some degree, conduce to this defirable end: and as the measures to be adopted by Government were at that time under the deliberation of Parliament, it was thought expedient to fubmit it to the public, before any refolutions were formed that might eventually be decifive of the fate of the British Empire. There was not time, therefore, to publish the work in fo full and correct a manner, as the materials in the author's poffession would otherwise have enabled him to do. He confined himself to general, and what he judged leading, circumstances; and postponed the insertion of others to more favourable and tranquil times. The two former editions, however, being now entirely out of print, he deems it expedient to publish a third edition, revised, corrected, and greatly enlarged by the infertion of new matter; particularly by feveral flatiftical tables referring to the commerce of America; and fome authentic memoirs of Thomas late Lord Fairfax, and of the feveral branches of that noble house now domiciliated in Virginia; both of which have been derived from the best and most unquestionable authority.—The work for these reasons, and from its being almost the only account of the Middle Settlements, during the period of their happiest and most flourishing state, may possibly, notwithstanding the separation that has since taken place, be still interesting; at least to individuals: and the author offers the present edition to the public, with the same affurance as he did the former ones; viz. that he believes the contents to be

ftrictly and literally true. If, however, fome flight errors may accidentally and undefignedly have been committed, and any one will have the goodness to point them out, the author will think himself highly obliged by the information, and will avail himself of the first opportunity to acknowledge and correct them.

The aftonishing events that have taken place fince the publication of the two former editions, will probably expose the author's opinion concerning the termination and final issue of the American contest to animadversion: but in vindication of himself, he must

be permitted to observe,-

That it was not within the sphere of calculation to suppose,

1st. That the British ministry would persist in requiring unconditional submission from the colonies, till it was too late to recede; and the opportunity was lost, and for ever gone by:

adly. That when coercive measures had been resolved upon, they would have been

inforced in fo ruinous and fo ineffectual a manner:

3dly. That, during the war, any member in opposition would have declared publicly, that he corresponded with, and wished success to, the Americans, then in arms against the king:

Still less was it within the sphere of calculation to suppose,

That France, though it might be expected that she would so far interfere in the contest as to endeavour to distress and embarrass this country, would send troops to America, to the irreparable ruin of her own finances, in order to make the Americans free and independent states.

Least of all was it within the sphere of calculation to suppose,

That Spain would join in a plan inevitably leading, though by flow and imperceptible

steps, to the final loss of all her rich possessions in South America.

There were indeed enlightened minds both in France and in Spain, who forefaw what has fince happened, and who deprecated any interference in the dispute, and recommended the observance of a strict neutrality: And the unfortunate Lewis the fixteenth himself is faid to have shewn the greatest repugnance to the treaty with the Americans; and to have declared in the bitterness of sorrow, when he signed it, that he had signed the warrant for his own ruin and destruction.

In August 1792, the author was at Cologne; and there accidentally falling in with the Duke of Bourbon, and several French noblemen of his suite, the conversation naturally turned upon the situation and affairs of France; and the author expressing his surprise at the impolicy of the French ministry in engaging so deeply in the American war, and deducing from thence the present miseries of France, one of the courtiers with great emotion exclaimed,—"Ah monsieur, c'est bien vrai; nous avons mal

calculè!"—But the die is cast, and it is too late to moralize.

The reader will doubtless be surprised, when the author declares, that he has not altered his sentiments since the year 1775, in regard to the American war and its confequences. He still thinks, that the separation might in the first instance, have been prevented: that coercive measures, when resolved upon, might have been inforced, comparatively speaking, without bloodshed; and with great probability of success: that the present union of the American states will not be permanent or last for any considerable length of time: that that extensive country must necessarily be divided into separate states and kingdoms: and that America will never, at least for many ages, become formidable to Europe; or acquire, what has been so frequently predicted, universal empire. The author thinks he could assign plausible reasons at least for these various opinions; but it is better that they should be consigned to oblivion. The wise Disposer of events has decreed, that America shall be independent of Great Britain: that she is

fo, may ultimately perhaps be advantageous to both countries; at least it will be owing to excess of folly if it be highly disadvantageous to either. Let us supplicate Heaven to unite them in permanent friendship and affection; and to preserve inviolate that alliance, that harmony and connexion, which religion, moral habits, language, interest, origin, and innumerable other considerations, can never cease to point out and recommend to them.

INTRODUCTION.

A FEW days before I embarked for America, being in a coffee-house with some friends, and discoursing of things relative to that country, an elderly gentleman advancing towards the box where we were sitting, addressed himself to me in the following manner: "Sir," said he, "you are young, and just entering into the world; I am old, and upon the point of leaving it: allow me therefore to give you one piece of advice, which is the result of experience; and which may possibly, some time or other, be of use to you. You are going to a country where every thing will appear new and wonderful to you; but it will appear so only for a while; for the novelty of it will daily wear off; and in time it will grow quite familiar to you. Let me, therefore, recommend to you to note in your pocket-book every circumstance that may make an impression upon you; for be assured, fir, though it may afterward appear familiar and uninteresting to yourself, it will not appear so to your friends, who have

never vifited that country, for they will be entertained by it."

The following observations were the result of this advice: they were written upon the feveral spots to which they refer; and were intended for no other purpose, than that of ferving as memorandums. They appeared, by the time I returned to Europe, according to the gentleman's prediction, fo very familiar to me, that I fcarcely thought them deferving of the perufal of my friends. Some of thefe, however, were fo obliging as to bestow upon them that trouble; and it is by their advice, and the confideration of the present critical situation of affairs, that I now submit them to the judgment of the public. - Whatever may be their merit, which I fear is but small, I can assure the reader of one thing, I believe they are generally true. They are the fruit of the most impartial inquiries, and best intelligence, that I was able to procure in the different colonies which I visited. If I have been led into any error, or have misrepresented any thing, it has been undefignedly: a spirit of party is universally prevalent in America, and it is not always an eafy matter to arrive at the knowledge of truth: but I believe, in general, I have been pretty fuccefsful. I converfed indifcriminately with perfons of all parties; and endeavoured, by allowing for prejudices and collating their different accounts, to get at the true one. If I have any doubt myfelf about any particular part of the following observations (and it is one in which I wish I may be found to have been misinformed), it is that which relates to the character of the Rhode Islanders. I was exceedingly ill at that place, and had not the fame opportunity of procuring information as elsewhere. I conversed with but few gentlemen, and they were principally of one party; but they were gentlemen of fuch universal good character, that I could not but rely in fome measure on the accounts with which they favoured me. Some allowance, however, I did make for prejudice; and I am defirous that the reader should make a still larger one; indeed, I should be happy to stand corrected in regard to what I have faid of that people, as no one can have less pleasure in speaking unfavourably of mankind than myfelf. I have

I have studiously avoided all technical or scientific terms; such to the informed reader are unnecessary, to the uninformed one they are unintelligible and perplexing: in relations of this kind, they have always an appearance of affectation and pe-

dantry.

For the most valuable part of the following collection, I mean the Diary * of the Weather, I am entirely indebted to my esteemed friend, Francis Fauquier, Esq. son of the late worthy lieutenant-governor of Virginia; who very obligingly transmitted it to me from Williamsburg, while I resided, as chaplain to the British factory, at Leghorn; and has allowed me to make the use of it which I have here done.

The prefent unhappy differences substituting amongst us, with regard to America, will, I am fensible, expose the publication of this account to much censure and criticism; but I can truly aver, that I have been led to it by no party motive whatsoever. My first attachment, as it is natural, is to my native country; my next is to America; and such is my affection for both, that I hope nothing will ever happen to diffolve that union, which is necessary to their common happiness. Let every Englishman and American, but for a moment or two, substitute themselves in each other's place, and, I think, a mode of reconciliation will soon take effect. — Every American will then perceive the reasonableness of acknowledging the supremacy of the British legislature; and every Englishman, perhaps, the hardship of being taxed where there is no representation, or assent.

There is fearcely any fuch thing, I believe, as a perfect government; and folecisms are to be found in all. The present disputes are seemingly the result of one.—Nothing can be more undeniable than the supernacy of parliament over the most distant branches of the British empire: for although the King being esteemed, in the eye of the law, the original proprietor of all the lands in the kingdom; all lands, upon defect of heirs to succeed to an inheritance, escheat to the King; and all new discovered lands vest in him: yet in neither case can be exempt them from the jurisdiction

of the legislature of the kingdom.

He may grant them, under leases or charters, to individuals or companies; with liberty of making rules and regulations for the internal government and improvement of them; but such regulations must ever be consistent with the laws of the kingdom,

and fubject to their controul.

On the other hand, I am extremely dubious, whether it be confiftent with the general principles of liberty (with those of the British constitution I think it is not) to tax where there is no representation: the arguments hitherto adduced from Manchester and Birmingham, and other great towns, not having representatives, are foreign to the subject; at least they are by no means equal to it; — for every inhabitant, possessed of forty shillings freehold, has a vote in the election of members for the county: but it is not the persons, but the property of men that is taxed, and there is not a foot of property in this kingdom, that is not represented.

It appears then, that certain principles exist in the British constitution, which militate with each other; the reason of their doing so is evident; it was never supposed that they would extend beyond the limits of Great Britain, or affect so distant a country as America. It is much to be wished, therefore, that some expedient could be

thought of to reconcile them.

The conduct of the feveral administrations, that have had the direction of the affairs of this kingdom, has been reciprocally arraigned; but, I think, without reason; for,

all things confidered, an impartial and dispassionate mind will find many excuses to alledge in justification of each. — The fewest, I am asraid, are to be pleaded in favour of the Americans; for they settled in America under charters, which expressly referved to the British parliament the authority, whether consistent or not consistent, now afferted. Although, therefore, they had a right to make humble representations to His Majesty in parliament, and to shew the impropriety and inconvenience of enforcing

fuch principles, yet they had certainly no right to oppose them.

Expedients may still be found, it is to be hoped, however, to conciliate the present unhappy differences, and restore harmony again between Great Britain and her colonies; but whatever measures may be adopted by parliament, it is the duty and interest of America to submit. — But it is impertinent to enter any farther into the discussion of a subject, which is at this time under the deliberation of the supreme council of the nation. I will therefore conclude with a fincere prayer, that whatever measures may be adopted, they may be different in their issue from what the sears of men generally lead them to preconceive; and that, if they be coercive ones, they may be enforced, which, I am persuaded, is practicable, without the essusion of blood: if lenient ones, which are preserable, and which I think equally practicable, conceded without any loss or diminution of the dignity or interest of this kingdom.

Greenwich, Jan. 23. 1775.

BURNABY'S TRAVELS.

ON Friday the 27th of April 1759, I embarked, in company with feveral North American gentlemen, on board the Dispatch, Captain Necks, for Virginia; and the next day we set fail from Spithead, under convoy of His Majesty's ship the Lynn, Captain Sterling, commander, with thirty-three sail of trading vessels. We came to an anchor in the evening in Yarmouth Road, and the next day sailed with a fresh easterly wind through the Needles.

April 30. We passed by the Lizard, and in the evening discovered a fail, which proved to be an English sloop laden with corn. She had been taken by a French privateer, and was steering for France: there were three Frenchmen and one Englishman on board. The commodore sent some hands to her, with orders to carry her to

Penzance.

May 1. Thick, hazy weather with a fair wind. A large ship passed through the fleet about four o'clock in the afternoon: and in the evening another vessel bore down upon the sternmost ships, and spoke with them.

May 2. Fair, pleafant weather. The next day we found by our reckoning that we

had made a hundred leagues from the Land's End.

May 4. Strong, violent gales at north-and-by-west. In the evening the Molly, Captain Chew, had her main-top-mast carried away, and hoisted a fignal of distress.

May 5. From this time to the 14th, nothing remarkable happened: the wind was feldom fair; but the weather being moderate, we made frequent vifits, and passed our time very agreeably.

May 14. Captain Necks fell ill of a fever, and continued indisposed several days:

he began to mend about the 17th.

May 19. In the afternoon, a fudden and violent fquall from the north-west obliged us to lye-to under our reefed main-sail: it continued to increase, and blew a storm for

about thirty-fix hours, when it began to moderate.

May 21. We made fail in the afternoon, with four fhips in company; and the next day in the evening were joined by eighteen more. From that time to the 28th, nothing remarkable happened: we had generally pleafant weather, but adverse winds. We frequently visited; and were much entertained with seeing grampuses, turtles, bonetas, porpoises, flying and other fish, common in the Atlantic.

May 28. We discovered a large sail: the directed her course towards the east. We supposed her to be an English man of war going express. She carried three top-

gallant fails.

May 31. We spoke with a sloop bound from Antigua to London. She acquainted the commodore with the agreeable news of His Majesty's forces at Guadaloupe having reduced that whole island under subjection to the British government. The wind still continued unfavourable.

June 5. We fpoke with a fnow from Carolina, which informed the commodore, that a French frigate was cruizing off the Capes of Virginia. From that time to the 11th, we had nothing remarkable. The wind was generally from west to north-west, and there were frequent squalls with lightning. We saw several bonetas, grampuses, albicores, and sish of different kinds.

June 11. The water appeared discoloured; and we concluded that we were upon the Banks of Newsoundland: we cast the lead, but found no ground. The weather was thick and hazy. Nothing remarkable happened from this time to the 3d of July: we had pleasant weather, though now and then squalls with lightning. We fell in with

feveral currents and had variable winds.

July 3. We had fine weather, with a gentle breeze at north-west. We were now, according to the commodore's reckoning, (which we afterward found to be true) about fixty leagues from land. The air was richly scented with the fragrance of the pinetrees.

July 4. We saw a great many sloops, from whence we imagined that we were near

the coast. The wind was at east-by-north.

July 5. About fix in the morning we caught some green fish: upon this we sounded, and sound eighteen fathom water. At ten we discovered land, which proved to be Cape Charles; and about three hours afterward sailed through the capes into Chesapeak Bay. The commodore took his leave to go upon a cruise; and at eight in the evening we came to an anchor in York river, after a tedious and disagreeable voyage of almost ten weeks.

The next morning, having hired a chaife at York, a fmall inconfiderable town, I went to Williamsburg, about twelve miles distant. The road is exceedingly pleasant, through some of the finest tobacco plantations * in North America, with a beautiful

view of the river and woods of great extent.

Williamsburg

^{*} The tobacco growing upon York river, is esteemed superior to any other in North America; particularly that which is raised upon the plantations belonging to Colonel Edward Diggs, which is said to have a shavour excelling all others. Of the growth of one plantation, distinguished from the rest, the tobacco is in such highest imation, that Colonel Diggs puts upon every hogshead in which it is packed, the initials of his name; and it is from thence called the E. D. tobacco, and fells for a proportionably higher price.

Williamsburg is the capital of Virginia: it is situated between two creeks; one falling into James, the other into York river; and is built nearly due east and west. The distance of each landing-place is something more than a mile from the town; which, with the disadvantage of not being able to bring up large vessels, is the reason of its not having increased so fast as might have been expected. It consists of about two hundred houses, does not contain more than one thousand souls, whites and negroes; and is far from being a place of any confequence. It is regularly laid out in parallel streets, intersected by others at right angles; has a handsome square in the center, through which runs the principal street, one of the most spacious in North America, three quarters of a mile in length, and above a hundred feet wide. At the opposite ends of this street are two public buildings, the college and the capitol; and although the houses are of wood, covered with shingles *, and but indifferently built, the whole makes a handsome appearance. There are few public edifices that deserve to be taken notice of; those, which I have mentioned, are the principal; and they are far from being magnificent. The governor's palace is tolerably good, one of the best upon the continent; but the church, the prison, and the other buildings, are all of them extremely indifferent. The streets are not paved, and are consequently very dusty, the soil hereabout consisting chiefly of fand: however, the situation of Williamsburg has one advantage, which few or no places in these lower parts have; that of being free from mufquitoes. Upon the whole, it is an agreeable refidence; there are ten or twelve gentlemen's families constantly residing in it, besides merchants and tradefmen; and at the times of the affemblies, and general courts, it is crowded with the gentry of the country: on those occasions there are balls and other anusements: but as foon as the business is finished, they return to their plantations; and the town is in a manner deferted †.

The fituation of Virginia (according to Evans's map) is between the 36th and 40th degree of north latitude, and about 76 degrees west longitude from London ‡. It is bounded on the north by the river Potowmac, on the east by the Atlantic Ocean, by Carolina on the south, and, to include only what is inhabited, by the great Alleghenny on the west.

Some time ago, Colonel Diggs having a tract of land, feemingly of the fame quality, and under the fame exposure and aspect as the plantation producing the E. D. tobacco, from which it was separated only by a small rill of water, he directed it to be planted; and as the produce was apparently similar in quality, colour, flavour, and every other particular, he thought himself warranted to delineate E. D. upon the hogsheads in which it was packed. Accordingly, it was sent to market with this recommendatory mark or token. But some time after, he received a letter from his factor or merchant in London, informing him that his inspector or agent had been guilty of some great overlight or error, as the tobacco contained in certain casks, which he specified, though marked with E. D., was of a different and very inferior quality to that commodity; and that if the same fault should be again committed, it would ruin the reputation and sale of the E. D. tobacco. It is to be observed, that the foil or mould had been carefully analised and examined previous to its being planted; and that not the smallest difference could be perceived between that of the old and new plantation. The experiment, it will easily be believed, was not repeated.

^{*} These are sormed in the shape of tiles, and are generally made of white cedar or of cypress.

+ Since the revolution, the seat of government has been removed to Richmond, a town situated just

⁺ Since the revolution, the leat of government has been removed to Richmond, a town fituated just below the falls of James river.

[†] Mr. Ebeling, of Hamburgh, in a note to the German translation of this work, fays, "Virginia is fituated between 37 and 40 degrees of north latitude, and extends from 77 to 81 degrees west longitude from London;" but I believe he is mistaken, for the latest and best maps generally agree with Mr. Evans in regard to the situation he has given to this country; at least, they approximate nearer to the account here given than to that of Mr. Ebeling.

The climate is extremely fine, though subject to violent heats in the summer: Farenheit's thermometer being generally for three months from 85 to 95 degrees high. The other feafons, however, make ample amends for this inconvenience: for the autumns and fprings are delightful; and the winters are fo mild and ferene (though there are now and then exceflively cold days) as fearcely to require a fire. The only complaint that a perfon can reasonably make, is, of the very sudden changes to which the weather is liable; for this being entirely regulated by the winds, is exceedingly variable. Southerly winds are productive of heat, northerly of cold, and eafterly of rain; whence it is no uncommon thing for the thermometer to fall many degrees in a very few hours; and, after a warm day, to have fuch fevere cold, as to freeze over a river a mile broad in one night's time *. In fummer there are frequent and violent gufts, with thunder and lightning; but as the country is very thinly inhabited, and most of the gentry have electrical rods to their houses, they are not attended with many fatal accidents. Now and then, indeed, fome of the negroes lofe their lives; and it is not uncommon in the woods, to fee trees torn and riven to pieces by their fury and violence. A remarkable circumstance happened some years ago at York, which is well attested: a person standing at his door during a thunder gust, was unfortunately killed; there was an intermediate tree at some distance, which was struck at the same time; and when they came to examine the body, they found the tree delineated upon it in miniature. Part of the body was livid, but that which was covered by the tree was of its natural colour †.

I believe no country has more certainly proved the efficacy of electrical rods, than this: before the discovery of them, these gusts were frequently productive of melancholy consequences; but now it is rare to hear of such instances. It is observable that no house was ever struck, where they were fixed; and although it has frequently happened that the rods themselves have been melted, or broken to pieces, and the houses scorched or discoloured along the sides of them, which manifested that they had received the stroke, but that the quantity of lightning was too great to be carried off by the conductor, yet never has any misfortune happened; such a direction having been given to the lightning, as to prevent any danger or ill consequence. These circumstances, one would imagine, should induce every person to get over those prejudices which many have entertained; and to consider the neglect, rather than the use, of them as criminal, since they seem to be means put into our hands by Providence, for our safety and protection.

The foil of Virginia is in general good. There are barrens where the lands produce nothing but pine-trees; but taking the whole tract together, it is certainly fertile. The low grounds upon the rivers and creeks are exceedingly rich, being loam intermingled with fand: and the higher you go up into the country, towards the mountains, the value of the land increases; for it grows more strong, and consists of a deeper clay.

Virginia, in its natural flate, produces great quantities of fruits and medicinal plants, with trees and flowers of infinitely various kinds. Tobacco and Indian corn are the original produce of the country; likewife the pigeon-berry, and rattle-fnake-root fo

^{*} On the 19th of December, 1759, being upon a visit to Colonel Washington, at Mount-Vernon, upon the river Potowmae, where the river is two miles broad, I was greatly surprised to find it entirely frozen over in the space of one night, when the preceding day had been mild and temperate.

[†] I have related this circumstance upon the authority of the honourable John Blair, President of the Council of Virginia, who mentioned it as a well known fact; but it appears so improbable and unphilosophical, that I do not pledge myself for the truth of it.

esteemed

esteemed in all ulcerous and pleuritical complaints: grapes, strawberries, hiccory nuts, mulberries, chesnuts, and several other fruits, grow wild and spontaneously.

Befides trees and flowers of an ordinary nature, the woods produce myrtles, cedars, cyprefles, fugar-trees, firs of different forts, and no lefs than feven or eight kinds of oak; they are likewife adorned and beautified with red-flowering maples, faifafrastrees, dog-woods, acacias, red-buds, fcarlet-flowering chefnuts, fringe-trees, flowering poplars, umbrellas, magnolias, yellow jafamines, chamædaphnes, pacoons, atamufco-lilies, May-apples, and innumerable other forts; fo that one may reafonably affert that no country ever appeared with greater elegance or beauty.

Not to notice too the almost numberless creeks and rivulets which every where abound, it is watered by four large rivers of such safe navigation, and such noble and majestic appearance, as cannot be exceeded, perhaps, in the whole known world.

James river, which was formerly called Powhatan, from its having been the feat of that emperor, is feven miles broad at the mouth, navigable to the falls (above 150 miles) for vessels of large burden, and thence to the mountains for small craft and canoes.

The falls are in length about fix or feven miles: they confift of innumerable breaks of water, owing to the obstruction of the current by an infinite number of rocks, which are scattered over the bed of the river; and form a most picturesque and beautiful cascade.

The honourable Colonel Byrd has a fmall place called Belvedere, upon a hill at the lower end of these falls, as romantic and elegant as any thing I have ever seen. It is situated very high, and commands a fine prospect of the river, which is half a mile broad, forming cataracts in the manner above described; there are several little islands scattered carelessly about, very rocky, and covered with trees; and two or three villages * in view at a small distance. Over all these you discover a prodigious extent of wilderness, and the river winding majestically along through the midst of it.

York river, for about forty miles, to a place called West Point, is confined in one channel about two miles broad: it flows in a very direct course, making but one angle, and that an inconsiderable one, during the whole way. At West Point it forks, and divides itself into two branches; the southward called Pamunky; the northward Mattapony: each of these branches, including the windings and meanders of the river, is navigable seventy or eighty miles, and a considerable way of this space for large ships.

The Rappahannoc is navigable to the falls, which are a mile above Fredericfburg, and about 110 from the bay. Veffels of large burden may come up to this place; and fmall craft and canoes may be carried up much higher.

The Potowmac is one of the finest rivers in North America: it is † ten miles broad at the mouth, navigable above 200 miles, to Alexandria, for men of war; and, allowing for a few carrying places, for canoes above 200 farther, to the very branches of the Ohio. Colonel Bouquet, a Swiss gentleman in the Royal Americans, came down this autumn from Fort Cumberland † to Shenando with very little difficulty;

^{*} Amongst the rest, Richmond, the prefent seat of government.

⁺ The Potowmae, according to Mr. Jefferson, is only seven and a half miles broad at its mouth, and perhaps his account may be founded upon better authority than my own. I had no opportunity of afcertaining the fact, and the statement which I have made rests entirely upon the credibility of those Virginian gentlemen, who favoured me with the information, and who, I am persuaded, did not intentionally missed me; though it is possible they might be missaken.

tionally mislead me; though it is possible they might be mistaken.

The distance from Fort Cumberland to Shenando is above 100 miles; from Shenando to the great

feveral other forts.

whence to the great falls, I have been told, a navigation might eafily be effected: so that this river seems to promise to be of as great consequence as any in North America.

In all these rivers the tide flows as far as the falls, and at Alexandria it rises between two and three feet. They discharge themselves into Chesapeak Bay, one of the finest in the world, which runs a great way up the country into Maryland; is from ten to twenty miles broad; navigable near a hundred leagues for vessels of almost any burden;

and receives into its bosom at least twenty great rivers.

These waters are stored with incredible quantities of fish, such as sheeps-heads, rock-fish, drums, white pearch, herrings, oysters, crabs, and several other forts. Sturgeon and shad are in such prodigious numbers, that one day, within the space of two miles only, some gentlemen in canoes, caught above 600 of the former with hooks, which they let down to the bottom, and drew up at a venture when they perceived them to rub against a fish; and of the latter above 5,000 have been caught at one single haul of the seine.

An the mountains there are very rich veins of ore; fome mines having been already opened which turn to great account; particularly Spotfwood's iron mines upon the Rappahannoc, out of which they fmelt annually above fix hundred ton: and one of copper upon the Roanoke, belonging to Colonel Chifwell. This last mentioned gentleman is also going to try for lead upon some hunting grounds belonging to the Indians, towards New River, and the Green Briar; where, it is said, there is fine ore, and in great plenty, lying above ground. Some coal mines have also been opened

upon James river near the falls, which are likely to answer very well.

The forests abound with plenty of game of various kinds; hares, turkies, pheasants, woodcocks, and partridges, are in the greatest abundance. In the marshes are found foruses, a particular species of bird, more exquisitely delicious than the ortolan; snipes also, and ducks of various kinds. The American shell-drake and blue-wing exceed all of the duck kind whatsoever; and these are in prodigious numbers. In the woods there are variety of birds remarkable both for singing and for beauty; of which are the mocking-bird, the red-bird or nightingale, the blue-bird, the yellow-bird, the humming-bird *, the Baltimore bird, the summer-duck, the turtle, and

Infects and reptiles are almost innumerable. The variety of butterslies is not greater than is that of the rich and vivid colours with which each particular species is distinguished and beautified; and such is the number and appearance of the fire-slies, that on a summer's evening the whole air seems to glow and to be enlightened by them. Several snakes of this country are harmless and beautiful; such as the black snake, the wampum-snake, the bead-snake, the garter-snake, and some others; but the rattle-snake and vipers are exceedingly venomous and deadly. There are two curious species of frogs here: one is called the bull-frog, which is prodigiously large, and makes so loud a noise, that it may be heard at a great distance; the other is a small green frog, which sits upon the boughs of trees, and is found in almost every garden.

The humming-bird is the smallest and most beautiful of all the seathered race: its colours are green, crimson, and gold: it lives chiefly by suction upon the sweets and essences of slowers; and nothing can be more curious than to observe numbers of them in gardens, where there are honey-suckles or trumpetslowers, slying from slower to slower, putting their slender bills into every one, and sucking out the sweetest juices. The motion of their wings is incredibly swift, and produces a humming noise, not unlike that of a large humble bec. They are frequently kept in cages, but seldom live longer than two months. The food which is given them, is either honey or sugar, mixed with water. Repeated attempts have been made to send them alive to England, but always without success.

Of quadrupeds there are are various kinds; fquirrels of four or five different species *; opossums, racoons, foxes, beavers, and deer; and in the deserts and uninhabited parts, wolves, bears, panthers, elks or moose deer, buffaloes, mountain-cats, and various other forts. Such are in general the natural productions of this country.

Viewed and considered as a settlement, Virginia is far from being arrived at that persection of which it is capable. Not a tenth of the land is yet cultivated: and that which is cultivated, is far from being so in the most advantageous manner. It produces, however, considerable quantities of grain and cattle, and fruit of many kinds. The Virginian pork is said to be superior in flavour to any in the world; but the sheep and horned cattle being small and lean, the meat of them is inferior to that of Great Britain, or indeed, of most parts of Europe. The horses are sleet and beautiful; and the gentlemen of Virginia, who are exceedingly fond of horse-racing, have spared no expence or trouble to improve the breed of them by importing great numbers from England.

The fruits introduced here from Europe fucceed extremely well; particularly peaches, which have a very fine flavour, and grow in fuch plenty as to ferve to feed the hogs in the autumn of the year. Their blossoms in the spring make a beautiful

appearance throughout the country.

Virginia is divided into fifty-two counties, and feventy-feven parishes, and by act of affembly there ought to be forty-four towns; but one half of these have not more than five houses; and the other half are little better than inconsiderable villages. This is owing to the cheapness of land, and the commodiousness of navigation: for every person may with ease procure a small plantation, can ship his tobacco at his own door, and live independent. When the colony shall come to be more thickly seated, and land grow dear, people will be obliged to follow trades and manusactures, which will necessarily make towns and large cities; but this seems remote, and not likely to happen for some centuries.

The inhabitants are supposed to be in number between two and three hundred thousand. There are a hundred and five thousand tytheables, under which denomination are included all white males from fixteen to fixty; and all negroes whatsoever within the same age. The former are obliged to serve in the militia, and amount

to forty thousand.

The trade of this colony is large and extensive. Tobacco is the principal article of it. Of this they export annually between fifty and fixty thousand hogsheads, each hogshead weighing eight hundred or a thousand weight: some years they export much more ‡. They ship also for the Madeiras, the Streights, and the West-Indies, several articles, such as grain, pork, lumber, and cyder: to Great Britain, bar-iron, indigo, and a small quantity of ginseng, though of an inferior quality; and they clear out one year with another about ton of shipping.

^{*} Of the feveral species of squirrels, the ground and slying-squirrels are much the smallest and most-beautiful. The former are of a dusky orange hue, streaked with black; the latter grey or ash-coloured, and elegantly formed. These have a spreading or san-tail, and two membranes adhering to their sides; which, when they spring or leap from a tree, they expand, and are thereby enabled to sky through a confiderable space. The former are of a very wild nature; but these may be easily, and are frequently tamed—There is a species of pole-cat in this part of America, which is commonly called a skunk. This animal, when pursued, or assalled by its enemy, ejects its urine; which emits such a fetid and insupportables stench, as almost to stifle and suffocate whatever is within the reach of it.

[†] These numbers have been since greatly increased.

In the year 1758, it is faid that feventy thousand hogsheads were exported.

Their manufactures are very inconfiderable. They make a kind of cotton-cloth, with which they clothe themselves in common, and call after the name of their country; and some inconfiderable quantities of linen, hose, and other trisling articles; but

nothing to deferve attention.

The government is a royal one: the legislature confissing of a governor appointed by the king; a council of twelve persons, under the same nomination; and a house of burgesses, or representatives, of a hundred and eight or ten members, elected by the people; two for each county, and one for each of the following places, viz. the College of William and Mary, James-town, Norfolk-borough, and Williamsburg. Each branch has a negative. All laws, in order to be permanent, must have the King's approbation; nor may any be enacted, which are repugnant to the laws of Great Britain.

The courts of judicature are either county, or general courts. The county courts are held monthly in each county, at a place affigued for that purpose, by the justices thereof; four of them making a quorum. They are appointed by the governor, and take cognizance of all causes at common law, or in chancery, within their respective counties, except criminal ones, punishable with loss of life, or member. This power they are not permitted to exercife except over negroes and flaves, and then not without a special commission from the governor for each particular purpose *. The general court is held twice a year at Williamsburg. It consists of the governor and council, any five of which make a court. They hear and determine all causes whatsoever, ecclefiaftical or civil, and fit four-and-twenty days: the first five of these are for hearing and determining fuits in chancery, appeals from the decrees of the county or inferior courts in chancery; and writs of superfedeas to such decrees. The other days are for trying fuits or profecutions in behalf of the King; and all other matters depending in the faid court: appeals are allowed to the King in council, in cases of 500l. sterling value. The governor has a power of pardoning criminals in all cases, except of treason or murder: and then he can only reprieve till he knows the King's pleafure.

The established religion is that of the church of England; and there are very few Dissenters of any denomination in this province. There are at present between fixty and seventy clergymen: men in general of sober and exemplary lives. They have each a glebe of two or three hundred acres of land, a house, and a falary established by law of 16,000 weight of tobacco, with an allowance of 1,700 more for shrinkage. This is delivered to them in hogsheads ready packed for exportation, at the most convenient warehouse. The presentation of livings is in the hands of the vestry; which is a standing body of twelve members, invested with the sole power of raising levies, settling the repairs of the church, and regulating other parochial business. They were originally elected by the people of the several parishes; but now fill up

* How necessary it may be that they should have such a power, even in this case, I will not pretend to say; but the law which transfers it to them seems so inconsistent with the natural rights of mankind,

that I cannot but in pity to humanity recite it.

"Every flave committing any offence, by law punishable by death, or loss of member, shall be committed to the county gaol, and the sheriss of the county shall forthwith certify such commitment, with the cause thereof to the governor, or commandes in chief, who may issue a commission of over and terminer to such persons as he shall think sit, which persons, forthwith after the receipt of such commission shall cause the offender to be publicly arraigned and tried at the court-house of the said county, and take for evidence the confession of the offender, the oath of one or more credible witnesses, or such testimony of negroes, mulattoes, or Indians, bond or free, with pregnant circumstances as to them shall seem convincing, without the solemnity of a jury, and the offender being found guilty, shall pass such judgment upon him or her as the law directs for the like crimes, and on such judgment award execution."

Mercer's Abridgment of the Virginian Laws, p. 3 42.

vacancies themselves. If the vestry does not present to a living in less than twelve months, it lapses to the governor. The diocesan is the bishop of London; who has a power of appointing a commissary to preside over, and convene the clergy on particular occasions; and to censure, or even suspend them, in cases of neglect or immorality. His salary is rool, sterling per annum; and he is generally of the council, which is of

equal emolument to him *.

An unhappy difagreement has lately arisen between the clergy and the laity, which, it is to be feared, may be of serious consequence. The cause of it was this. Tobacco being extremely scarce from a general failure of the crop, the assembly passed an act to oblige the clergy and all public officers to receive their stipends in money instead of tobacco. This the clergy remonstrated against, alledging the hardship of being obliged to take a small price for their tobacco, when it bore an extravagant one; seeing they never had any kind of compensation allowed, when it was so plentiful as to be almost a drug. They sent over an agent to England, and the law was repealed. This greatly exasperated the people; and such a such a such as a such a such as a such as a such a such as a such as

it will not eafily fubfide, or be forgotten.

With regard to the law in question, it was certainly a very hard one; and I doubt whether, upon principles of free government, it can be justified; or whether the affembly can legally interpole any farther, than in cases of necessity, to oblige the clergy to receive their falaries in money instead of tobacco, at the current price of tobacco, They may, I am perfuaded, in cases of exigency, always make, and might then have made, fuch a law, without any confiderable detriment to the colony; for fuppofing the price of tobacco to be what it was at that time, about fifty shillings currency per hundred, what would the whole fum be, were the clergy to be paid ad valorem? Not 20,000l. sterling. There are in Virginia, as I observed before, about fixty-five clergymen: each of these is allowed 16,000 weight of tobacco; which, at the rate of fifty fhillings currency per hundred, amounts to 400l.; 400l. multiplied by 65, is equal to 26,000; which, allowing 40 per cent. discount, the difference of exchange is about 18,571l. sterling. Now what is this fum to such a colony as Virginia? But to this it will be faid, perhaps, why should the clergy be gainers in a time of public distress, when every one elfe is a fufferer? The clergy will doubtlefs reply, and why should the clergy be the only fufferers in plentiful feafons, when all but themselves are gainers? However, as on the one hand I disapprove of the proceedings of the affembly in this affair; fo, on the other, I cannot approve of the steps which were taken by the clergy: that violence of temper; that difrespectful behaviour towards the governor; that unworthy treatment of their commissary; and, to mention nothing else, that confusion of proceeding in the convention, of which some, though not the majority, as has been invidiously represented, were guilty; these things were surely unbecoming the facred character they are invested with; and the moderation of those persons, who ought in all things to imitate the conduct of their divine Master. If, instead of flying out in invectives against the legislature; of accusing the governor of having given up the cause of religion by passing the bill; when, in fact, had he rejected it, he would never have been able to have got any supplies during the course of the war, though ever fo much wanted; if, instead of charging the commissary with want of zeal for having exhorted them to moderate measures, they had followed the prudent counsels

^{*} The commission is commonly president of the college, and has the Parish of Williamsburg, or some other lucrative parish, which render him about 350l. a year: so that his annual income is between 500 and 600l.

of that excellent man, and had acted with more temper and moderation, they might, I am perfuaded, in a very fhort time, have obtained any redrefs they could reafonably have defired. The people in general were extremely well affected towards the clergy, and had expressed their regard for them in several instances; they were sensible, moreover, that their falaries were too feanty to support them with dignity, and there had been fome talk about raifing them: had the clergy therefore, before they applied to England, only offered a memorial to the affembly, fetting forth that they thought the act extremely hard upon them, as their falaries were fmall; and that they hoped the affembly would take their cafe into confideration, and enable them to live with that decency which became their character; I am perfuaded, from the knowledge which I have of the people in general, and from repeated conversations with several members of the affembly, that they might have obtained almost any thing they could have wished; if not, they undoubtedly would have had reason to appeal. But, instead of this, without applying to the affembly for relief, after the act was passed, (for before, indeed, fome of them did apply to the speaker in private) they flew out into the most violent invectives, immediately fent over an agent to England, and appealed to His Majesty in council. The result has been already related.

The progress of arts and sciences in this colony has been very inconsiderable: the college of William and Mary is the only public place of education, and this has by no means answered the design of its institution. It has a foundation for a president and fix professors. The business of the president is to superintend the whole, and to read four theological lectures annually. He has a handsome house to live in, and 2001. Sterling per annum. The professor of the Indian school has 601. Sterling, and a house also; his business is to instruct the Indians in reading, writing, and the principles of the Christian religion: this pious institution was set on foot and promoted by the excellent Mr. Boyle. The professor of humanity has the care of instructing the students in classical learning: he has an usher or affistant under him. The four other professors teach moral philosophy, metaphysics, mathematics, and divinity. Each of the professors has apartments in the college, and a falary of about eighty pounds per

annum *. The prefent chancellor of the college is the bishop of London.

From what has been faid of this colony, it will not be difficult to form an idea of the character † of its inhabitants. The climate and external appearance of the country confpire to make them indolent, eafy, and good-natured; extremely fond of fociety, and much given to convivial pleasures. In consequence of this, they feldom show any spirit of enterprize, or expose themselves willingly to fatigue. Their authority over their slaves renders them vain and imperious, and entire strangers to that elegance of sentiment, which is so peculiarly characteristic of refined and polished nations. Their ignorance of mankind and of learning, exposes them to many errors and prejudices, especially in regard to Indians and negroes, whom they scarcely consider as of the

* They have fince been raised, I believe, to 1col.

⁺ General characters are always liable to many exceptions. In Virginia, I have had the pleafure to know feveral gentlemen adorned with many virtues and accomplishments, to whom the following description is by no means applicable. Amongst others, I cannot resist the inclination of mentioning George Wyth Esquire, who, to a perfect knowledge of the Greek language, which was taught him by his mother in the back woods, and of the ancient, particularly the Platonic philosophy, had joined such a profound reverence for the Supreme Being, such respect for the divine laws, such philanthrophy for mankind, such simplicity of manners, and such inflexible rectitude and integrity of principle, as would have dignified a Roman senator, even in the most virtuous times of the republic.—This gentleman is, I believe, still living.

human fpecies; fo that it is almost impossible, in cases of violence, or even murder, committed upon those unhappy people by any of the planters, to have the delinquents brought to justice: for either the grand jury refuse to find the bill, or the petit jury bring in their verdict, not guilty *.

The display of a character thus constituted, will naturally be in acts of extravagance, oftentation, and a disregard of economy; it is not extraordinary, therefore, that the Virginians out-run their incomes; and that having involved themselves in difficulties, they are frequently tempted to raise money by bills of exchange, which they know will

be returned protested, with ten per cent. interest †.

The public or political character of the Virginians corresponds with their private one: they are haughty and jealous of their liberties, impatient of restraint, and can scarcely bear the thought of being controuled by any superior power. Many of them consider the colonies as independent states, not connected with Great Britain, otherwise than by having the same common King, and being bound to her by natural affection. There are but sew of them that have a turn for business, and even those are by no means expert at it. I have known them, upon a very urgent occasion, vote the relief of a garrison, without once considering whether the thing was practicable, when it was most evidently and demonstrably otherwise. In matters of commerce they are igno-

* There are two laws in this colony, which make it almost impossible to convict a planter or white man of the death of a negroe or Indian. By the first it is enacted, that "if any slave shall die by reason of any stroke or blow, given in correction by his or her owner, or by reason of any accidental blow what-soever, given by such owner; no person concerned in such correction, or accidental homicide, shall undergo any prosecution or punishment for the same; unless, upon examination before the county court, it shall be proved by the oath of one lawful and credible witness, at least, that such slave was killed wilfully, maliciously, and designedly; nor shall any person indicted for the murder of a slave, and upon trial sound guilty only of manslaughter, incur any forseiture or punishment for such offence or missortune." See Mercer's Abridgment, p. 345. By the second, "No negroe, mulatto, or Indian, can be admitted into any court, or before any magistrate, to be sworn as a witness, or give evidence in any cause whatsoever, except upon the trial of a slave for a capital offence." Mercer's Abridgment, p. 419.

† By an act of assembly, if any bill of exchange is drawn for the payment of any sum of money, and such bill is protested for non-acceptance or non-payment, it carries interest from the date thereof, after the

rate of 10 per cent. per annum, until the money be fully fatisfied and paid.

A very curious anecdote relative to this law was mentioned to me at Williamsburg, of which I am persuaded the reader will excuse the relation.—An usurer, not satisfied with 51 per cent. legal interest, resulted to advance a sum of money to a gentleman, unless, by way of security, he would give him a bill of exchange that should be returned protested, by which he would be entitled to 10 per cent. The gentleman, who had immediate occasion for money, drew a bill upon a capital merchant in London, with whom he had never had any transaction, or carried on the least correspondence. The merchant, on the receipt of the bill, observing the name of the drawer, very readily honoured it, knowing the gentleman to be a person of great property, and concluding that he meant to enter into correspondence with him. The usurer upon this became entitled to only 51 per cent. He was exceedingly enraged, therefore, at being, as he supposed, thus tricked: and complained very heavily to the gentleman of his having given him a good bill instead of a bad one.

† The garrison here alluded to, was that of Fort Loudoun, in the Cherokee country, confisting of a lieutenant, and about fifty men. This unfortunate party being besieged by the Cherokee Indians, and reduced to the last extremity, sent off runners to the governors of Virginia and Carolina, imploring immediate succour; adding, that it was impossible for them to hold out above twenty days longer. The assembly of Virginia, commisserating their unhappy situation, very readily voted a considerable sum for their relief. With this, troops were to be levied; were to rendezvous upon the frontiers 200 miles distant from Williamsburg; were afterward to proceed to the fort 200 miles farther through a wilderness, where there was no road, no magazines, no posts, either to shelter the sick, or cover a retreat in case of any disaster; so that the unfortunate garrison might as effectually have been succoured from the moon. The author taking notice of these difficulties to one of the members, he frankly replied, "Faith, it is true: but we have had an opportunity at least of showing our loyalty." In a few days after arrived the melancholy news, that this unfortunate party was entirely cut off.

rant of the necessary principles that must prevail between a colony and the mother country; they think it a hardship not to have an unlimited trade to every part of the world. They consider the duties upon their staple as injurious only to themselves; and it is utterly impossible to persuade them that they affect the consumer also. However, to do them justice, the same spirit of generosity prevails here which does in their private character; they never resuse any necessary supplies for the support of govern-

ment when called upon, and are a generous and loyal people.

The women are, generally fpeaking, handsome, though not to be compared with our fair country-women in England. They have but few advantages, and confequently are feldom accomplished; this makes them referved, and unequal to any interesting or refined conversation. They are immoderately fond of dancing, and indeed it is almost the only amusement they partake of: but even in this they discover want of tafte and elegance, and feldom appear with that gracefulness and ease, which these movements are calculated to display. Towards the close of an evening, when the company are pretty well tired with country dances, it is usual to dance jiggs; a practice, originally borrowed, I am informed, from the negroes *. These dances are without method or regularity: a gentleman and lady fland up, and dance about the room, one of them retiring, the other pursuing, then perhaps meeting, in an irregular fantastical manner. After some time, another lady gets up, and then the first lady must fit down, she being, as they term it, cut out: the second lady acts the same part which the first did, till somebody cuts her out. The gentlemen perform in the same manner. The Virginian ladies, excepting these amusements, and now and then going upon a party of pleasure into the woods to partake of a Barbacue †, chiefly spend their time in fewing and taking care of their families: they feldom read, or endeavour to improve their minds; however, they are in general good housewives; and though they have not, I think, quite fo much tenderness and sensibility as the English ladies, yet they make as good wives, and as good mothers, as any in the world.

It is hard to determine, whether this colony can be called flourishing, or not a because, though it produces great quantities of tobacco and grain, yet there seem to be very sew improvements carrying on in it. Great part of Virginia is a wilderness, and as many of the gentlemen are in possession of immense tracts of land, it is likely to continue so. A spirit of enterprize is by no means the turn of the colony, and therefore sew attempts have been made to force a trade; which I think might easily be done, both to the West Indies and the Ohio. They have every thing necessary for such an undertaking, viz. lumber, provisions, grain, and every other commodity, which the other colonies, that subsist and grow rich by these means, make use of for exports; but, instead of this, they have only a trissing communication with the West Indies; and as to the Ohio, they have suffered themselves, notwithstanding the superior advantages they might enjoy from having a water carriage almost to the Yoghiogheny, to

† Monf. de Willd, in his French translation of these travels, makes the following observation upon the word Barbacue.

"Cet amusement barbare consiste a souetter les porcs jusqu' a la mort, pour en rendre la chair plus delicate. Je ne sache pas que les cannibales même le pratiquent."

In justice to the inhabitants of Virginia, I must beg leave to observe, that such a cruel and inhuman act was never, to my knowledge at least, practifed in that country. A Barbacue is nothing more than a porket, killed in the usual way, stuffed with spices and other rich ingredients, and basted with Madeira vine. It is esteemed a very great delicacy; and is, I believe, a costly dish.

^{*} The author has fince had an opportunity of observing something similar in Italy. The trescone of the Tuscans is very like the jiggs of the Virginians.

neglect this valuable branch of commerce; while the industrious Pensylvanians seize every opportunity, and struggle with innumerable dissiculties, to secure it to themselves. The Virginians are content if they can but live but from day to day; they confine themselves almost entirely to the cultivation of tobacco; and if they have but enough of this to pay their merchants in London, and to provide for their pleasures, they are satisfied, and desire nothing more. Some sew, indeed, have been rather more enterprising, and have endeavoured to improve their estates by raising indigo, and other schemes: but whether it has been owing to the climate, to their inexperience in these matters, or their want of perseverance, I am unable to determine, but their suc-

cels has not answered their expectations.

The taxes of this colony are confiderable, and the public debt amounts to at least 400,000l. currency; this they have been driven into by the war, having seldom had less than a thousand or sisteen hundred provincial troops in pay, exclusive of the expences of some forts. The ways and means employed for raising the money have been generally the same; they have first made an emission of so much paper currency as the exigency required, and then laid a tax for sinking it. This tax has been commonly upon lands and negroes, two shillings for every titheable; and a shilling or eighteen-pence upon every hundred acres of land. This mode of taxation has occasioned some divisions in the house, for the owners of large tracts being unable, perhaps, to cultivate a tenth part of their possessions, and every man's real income arising from the number of his negroes, have thought it very hard to pay a tax for what they pretend is of no value to them; but much better arguments may undoubtedly be urged in support of

the tax than against it.

The taxes for the prefent debt are laid till the year fixty-nine, when the whole, if they add nothing more to it, will be discharged. The use of paper currency in this colony has entirely banished from it gold and filver. Indeed the introduction of it was certain in time to produce this effect; but lest it should not, the Virginians fell into a measure, which completed it at once: for by an act of assembly they fixed the exchange between currency and sterling debts at five and twenty per cent. not considering that the real value of their currency could only be regulated by itself. The consequence was, that when from frequent emissions, the difference of exchange between bills upon merchants in London and currency, was 40 per cent. the difference between currency and specie * was only sive and twenty. So that the monied men collected all the specie they could, sent it to Philadelphia, where it passed for its real value, purchased bills of exchange with it there, and sold them again in Virginia with sisteen per cent. profit: and this they continued to do till there was not a pistole or a dollar remaining.

During my stay in Virginia, I made several excursions into different parts of the country: one in particular to the great Falls of Potowmac; of which, as I expected to

be highly entertained, I kept a journal.

I departed from Williamsburg, Oct. 1. 1759, in company with another gentleman †; and we travelled that day about forty miles, to a plantation ‡ in King William

+ Col. Bernard Moore.

^{*} Fixing the difference between currency and flerling debts, was, in reality, fixing it between currency and fpecie.

[‡] Belonging to Col. Symes. This gentleman's lady, a very beautiful woman, was faid to have just attained her 21st year. She was at that time the mother of seven children, all living. The women in general, in this country, arrive at maturity very early. Some are marriageable at eleven, many at thirteen, and the generality at sources or sistem years of age.

county; beautifully fituated upon a high hill, on the north fide of Pamunky river, A little below this place frands the Pamunky Indian town; where at prefent are the few remains of that large tribe; the rest having dwindled away through intemperance and difeafe. They live in little wigwams or cabins upon the river; and have a very fine tract of land of about 2000 acres, which they are reftrained from alienating by act of affembly. Their employment is chiefly hunting or fishing, for the neighbouring gentry. They commonly drefs like the Virginians, and I have fometimes miftaken them for the lower fort of that people. The night I spent here, they went out into an adjoining marsh to catch Soruses; and one of them, as I was informed in the morning, caught near a hundred dozen. The manner of taking these birds is remarkable. The Sorus is not known to be in Virginia, except for about fix weeks from the latter end of September: at that time they are found in the marshes in prodigious numbers, feeding upon the wild oats. At first they are exceedingly lean, but in a fhort time grow fo fat, as to be unable to fly: in this state they lie upon the reeds, and the Indians go out in canoes and knock them on the head with their paddles. They are rather bigger than a lark, and are delicious eating. During the time of their continuing in feafon, you meet with them at the tables of most of the planters, breakfast, dinner, and supper *.

Oct. 2. We went to another plantation about twenty-four miles diftant, belonging to a private gentleman †, upon Mattapony river. We staid there all that and the next

day on account of rain.

Oct. 4. We travelled twenty-five miles to another gentleman's † house; and from thence, the day following, about twenty-five miles farther, to a town called

Fredericsburg.

Fredericfburg is fituated about a mile below the Falls of Rappahannoc: it is regularly laid out, as most of the towns in Virginia are, in parallel streets. Part of it is built upon an eminence, and commands a delightful prospect; the rest upon the edge of the water for the convenience of warchouses. The town was begun about thirty-two years ago, for the sake of carrying on a trade with the back-settlers; and is at present by far the most flourishing one in these parts.

We left Fredericiburg the 6th inftant, and went to fee the Falls. At this place is a fmall mercantile town called Falmouth, whose inhabitants are endeavouring to rival the Fredericiburghers in their trade. It is built upon the north fide of the river, and confifts

of eighteen or twenty houses.

The Falls of Rappahannoc are fimilar to those of James river, except that they are not upon so large a scale. The whole range scarcely exceeds half a mile, and the breadth not a hundred yards. At the time of our going to see them, there was a fresh in the river, which added very much to their beauty. The centre of view was an island of about an hundred acres covered with trees; this divided the river into two branches, in each of which, at regular distances of sisteen or twenty yards, was a chain of six or seven falls, one above another, the least of them a foot perpendicular. The margin was beautifully variegated with rocks and trees, and the whole formed a pleasing romantic scene.

^{*} In feveral parts of Virginia the antient custom of eating meat at breakfast still continues. At the top of the table, where the lady of the house presides, there is constantly tea and cosses; but the rest of the table is garnished with roasted sowls, ham, venison, game, and other dainties. Even at Williamsburg, it is the custom to have a plate of cold ham upon the table; and there is scarcely a Virginian lady who breakfasts without it.

At this place we met with a person who informed us of his having been a few days before, a spectator of that extraordinary phenomenon in nature, the sascinating power of the rattle snake. He observed one lying coiled near a tree, looking directly at a bird which had settled there. The bird was under great agitation, uttered the most doleful cries, hopped from spray to spray, and at length slew directly down to the snake,

which opened its mouth and fwallowed it.

From hence we ascended up the river, about sifteen miles, to Spotswood's iron-mines; and in our way had a sine view of the Apalachian mountains, or Blue Ridge, at the distance of seventy miles. At this place I was much affected by the following incident:—A gentleman in our company, which was now increased, had a small negro boy with him, about sourteen years of age, that had lived with him in a remote part of the country some time as a servant; an old woman who was working in the mines, and who proved to be the boy's grandmother, accidentally cast her eyes on him; she viewed him with great attention for some time; then screamed out, saying that it was her child, and slung herself down upon the ground. She lay there some seconds; rose up, looked on him again in an extasy of joy, and fell upon his neck and kissed him. After this, she retired a few paces, examined him afresh with fixed attention, and immediately seemed to lose herself in thoughtful and prosound melancholy. The boy all this while stood silent and motionless; reclining his head on one side, pale and affected beyond description: it would not have been in the power of painting to exhibit a siner picture of distress.

We returned from this place the next day to Fredericsburg; and ferrying over the Rappahannoc into the Northern Neck, travelled about seventeen miles to a gentleman's house in Stafford county: in the morning we proceeded through Dumfries, and over

Occoquan river to Colchester, about twenty-one miles.

These are two small towns lately built for the sake of the back trade; the former * on the Quantico, the other upon Occoquan river, both of which fall into the Potowmac. About two miles above Colchester there is an iron furnace, a forge, two sawmills, and a bolting-mill: at our return we had an opportunity of visiting them: they have every convenience of wood and water, that can be wished for. The ore wrought here is brought from Maryland; not that there is any doubt of there being plenty enough in the adjacent hills; but the inhabitants are discouraged from trying for it by the proprietor's (viz. Lord Fairfax) having reserved to himself a third of all ore that may be discovered in the Northern Neck †.

From

* In the preceding editions of this book, Dumfries is mentioned as fituated upon Acquia Creek; but this is certainly erroneous, for all the maps deferibe it as fituated upon the Quantico. The error probably arose from the author's having passed the Acquia, the Quantico and the Occoquan, rivers in the same day; and his want of persect and collect recollection, when he wrote his journal in the

evening.

[†] An occurrence happened to me in the course of this day's travelling, which, though it made a confiderable impression upon me at the time, I should not have thought of sufficient moment to be recorded, had not the intellectual powers of the African Negroes been frequently, of late, made the subject of conversation, both by the friends and the opposers of the emancipation of that unhappy race. In passing either Acquia, Quantico, or Occoquan rivers, I do not recollect which, I was rowed by an old grey-headed Negro; who seemed quite exhausted and worn down by age and infirmity. I inquired into his situation, and received for answer, that he had been a slave from his youth, and had continued to work for his master till age had rendered him unfit for service; that his master had then kindly given him a small piece of ground, and the profits of the ferry, which were indeed very inconsiderable, for his maintenance: and that with these means of subsistence he awaited the hour when it might please God to eall him to another life.

From Colchester we went about twelve miles farther to Mount Vernon. This place is the property of Colonel Washington, and truly deferving of its owner *. The house is most beautifully situated upon a high hill on the banks of the Potowmac; and commands a noble prospect of water, of cliffs, of woods, and plantations. The river is nearly two miles broad, though two hundred from the mouth; and divides the dominions of Virginia from Maryland t. We rested here one day, and proceeded up the river about twenty-fix miles, to take a view of the great falls. These are formed in some respect like those of the Rappahannoc; but are infinitely more noble. The channel of the river is contracted by hills; and is as narrow, I was told, as at Fort Cumberland, which is an hundred and fifty miles higher up. It is clogged moreover with innumerable rocks; fo that the water for a mile or two flows with accelerated velocity. At length coming to a ledge of rocks, which runs diametrically acrofs the river, it divides into two fpouts, each about eight yards wide, and rushes down a precipice with incredible rapidity. The fpout on the Virginian fide makes three falls, one above another; the first about ten feet, the next fifteen, and the last twenty-four or twenty-five feet perpendicular: the water is of a vast bulk, and almost intire. The fpout on the Maryland fide is nearly equal in height and quantity, but a great deal more broken. These two spouts, after running in separate channels for a short space, at length unite in one about thirty yards wide; and as we judged from the fmoothness of the furface and our unfuccefsful endeavours to fathom it, of prodigious depth. The rocks on each fide are at least ninety or a hundred feet high; and yet, in great freshes, the water overflows the tops of them, as appeared by several large and intire trees, which had lodged there.

In the evening we returned down the river about fixteen miles to Alexandria, or Bel-haven, a fmall trading place in one of the finest fituations imaginable. The Potow-

I observed, that he must naturally wish for that hour, as it would release him from his present sufferings. His answer was, no; for he was afraid to die. On my questioning him, why he was afraid to die: whether he had any thing upon his conscience that gave him uneasiness; or whether he had not been honest and faithful to his master? He answered, yes; I have always done my duty to the best of my power: but yet I am afraid to die: and was not our Saviour himself afraid to die? The answer was so unexpected, and so far beyond what I supposed to be the intellectual capacity of the poor Negro, that it sunk deep into my mind, and I was lost for a moment in silence.

* I cannot omit this opportunity of bearing testimony to the gallant and public spirit of this gentleman. Nov. 1, 1753, Licutenant Governor Dinwiddie having informed the assembly of Virginia, that the French had erected a fort upon the Ohio, it was resolved to send somebody to M. St. Pierre, the commander, to claim that country as belonging to His Britannic Majesty, and to order him to withdraw. Mr. Washington, a young gentleman of fortune just arrived at age, offered his service on this important occasion. The distance was more than 400 miles, 200 of which lay through a trackless defart, inhabited by cruel and merciless savages, and the season was uncommonly severe. Notwithstanding these discouraging circumstances, Mr. Washington, attended by one companion only, set out upon this dangerous enterprize; travelled from Winchester on foot, carrying his provisions on his back, executed his commission, and after incredible hardships, and many providential escapes, returned safe to Williamsburg, and gave an account of his negociation to the assembly, the 14th day of February following.

† A very curious fight is frequently exhibited upon this and the other great rivers in Virginia, which for its novelty is exceedingly diverting to strangers. During the spring and summer months the fishing hawk is often seen hovering over the rivers, or resting on the wing without the least visible change of place for some minutes, then suddenly darting down and plunging into the water, from whence it seldom rises again without a rock-sish, or some other considerable sish in its talons. It immediately shakes off the water like a mis, and makes the best of its way towards the woods. The bald-eagle, which is generally upon the watch, instantly pursues, and if it can overtake, endeavours to foar above it. The hawk growing solicitous for its own safety drops the sish, and the bald-eagle immediately stoops, and seldom fails to catch it in its pounces before it reaches the water.

mac aove and below the town, is not more than a mile broad, but it here op es into a

large circular bay, of at least twice that diameter.

The town is built upon an arc of this bay; at one extremity of which is a wharf, at the other a dock for building ships; with water sufficiently deep to launch a vessel of any rate or magnitude.

The next day we returned to Colonel Washington's, and in a few days afterward to

Williamsburg.

The time of my refidence in this colony was ten months, and I received so many instances of friendship and good-nature, that not to acknowledge them would be an act of ingratitude. It would not be easy to mention particular instances, without being guilty of injustice by omitting others: but, in general, I can truly affirm, that I took leave of this hospitable people with regret, and shall ever remember them with gratitude and affection.

May 26, 1760. Having procured three horses, for myself, servant, and baggage, I departed from Williamsburg, and travelled that night to Eltham *; twenty-sive

miles.

May 27. I ferried over Pamunky river at Danfies, and went to Todds ordinary upon Mattopony, or the northern branch of York river; thirty-two miles.

May 28. I went to a plantation in Caroline county †; twenty-feven miles.

May 29. To Fredericiburg; twenty-five miles.

As I was travelling this day, I observed a large black snake, about six feet long, lying cross the stump of a tree by the road side. I touched it with my switch several times before it stirred; at last it darted with incredible swiftness into the woods. On looking into the hole where it had fixed its head, I observed a small bead-snake about two feet long; beautifully variegated with red, black, and orange colour, which the black snake was watching to prey upon. I took and laid it, half stupished, in the sun to revive. After I had proceeded about a quarter of a mile, it occurred to me that it would be a great curiosity if I could carry it to England, I therefore sent my servant back with orders to fetch it; but, at his return, he acquainted me that it was not to be found, and that the black snake was in the same position wherein I had first discovered it. I mention this as an instance of the intrepid nature of the black snake, which though not venomous, will attack and devour the rattlesnake; and, in some cases, it is afferted, even dare to assault a man.

May 30. I left Fredericsburg, and having ferried over the Rappahannoc at the Falls,

travelled that night to Neville's ordinary, about thirty-four miles.

May 31. I passed over the Pignut and Blue Ridges; and, crossing the Shenando,

arrived, after a long day's journey of about fifty miles, at Winchester t.

The Pignut Ridge is a continuation of the fouth-west mountains. It is now here very high; and at the gap where I passed, the ascent is so extremely easy, owing to the

winding of the road between the mountains, that I was fcarcely fenfible of it.

The tract of country lying between this ridge and the coast, is supposed, and with some appearance of probability, to have been gained from the ocean. The situation is extremely low, and the ground every where broken into small hills, nearly of the same elevation, with deep intermediate gullies, as if it were the effect of some sudden

* The plantation of Colonel Eassett.

+ Belonging to Colonel Bailor, mentioned above.

[‡] Greenway Court, the feat of the venerable Lord Fairfax, is fituated a few miles on the left of the road, about half way between the Apalachian mountains and Winchester. His Lordship being absent, I was prevented from paying my respects to him.

retiring of the waters. The foil is principally of fand, and there are few if any pebbles, within a hundred miles of the fhore; for which reason the Virginians in these parts never shoe their horses. Incredible quantities of what are called scallop-shells, are found also near the surface of the ground; and many of the hills are entirely formed of them. These phenomena, with others less obvious to common observation, seem to indicate, that the Atlantic, either gradually or by some sudden revolution in nature, has retired and lost a considerable part of that dominion which formerly belonged to it.

The Blue Ridge is much higher than the Pignut: though even these mountains are not to be compared with the Alleghenny. To the fouthward, I was told, they are more lofty; and but little, if at all, inscrior to them. The Pass, at Ashby's Gap, from the foot of the mountain on the eastern fide to the Shenando, which runs at the foot on the western, is about four miles. The ascent is no where very steep; though the mountains are, upon the whole, I think, higher than any I have ever seen in England. When I got to the top, I was inexpressibly delighted with the scene which opened before me. Immediately under the mountain, which was covered with chamcedaphnes in full bloom, was a most beautiful river: beyond this an extensive plain, diversified with every pleasing object that nature can exhibit; and, at the distance of fifty miles, another ridge of still more lofty mountains, called the Great, or North Ridge *, which inclosed and terminated the whole.

The river Shenando rifes a great way to the fouthward from under this Great North Ridge. It runs through Augusta county, and falls into the Potowmac somewhere in Frederic. At the place where I ferried over, it is only about a hundred yards wide; and indeed it is no where, I believe, very broad. It is exceedingly romantic and beautiful, forming great variety of falls, and is fo transparent, that you may fee the fmallest pebble at the depth of eight or ten feet. There is plenty of trout and other fish in it; but it is not navigable, except for rafts. In sudden freshes it rifes above forty or fifty feet. The low grounds upon the banks of this river are very rich and fertile; they are chiefly fettled by Germans, who gain a comfortable livelihood by raifing flock for the troops, and fending butter down into the lower parts of the country. I could not but reflect with pleasure on the situation of these people; and think if there is fuch a thing as happines in this life, that they enjoy it. Far from the buftle of the world, they live in the most delightful climate, and richest foil imaginable; they are every where furrounded with beautiful prospects and sylvan scenes; losty mountains, transparent streams, falls of water, rich vallies, and majestic woods; the whole interspersed with an infinite variety of flowering shrubs, constitute the landscape furrounding them: they are subject to few diseases; are generally robust; and live in perfect liberty: they are ignorant of want, and acquainted with but few vices. Their inexperience of the elegancies of life precludes any regret that they possess not the means of enjoying them: but they possess what many princes would give half their dominions for, health, content, and tranquillity of mind.

Winchester is a small town of about two hundred houses. It is the place of general rendezvous of the Virginian troops, which is the reason of its late rapid increase, and present flourishing condition. The country about it, before the reduction of Fort du Quesne, was greatly exposed to the ravages of the Indians, who daily committed most horrid cruelties: even the town would have been in danger, had not Colonel Washington, in order to cover and protect it, erected a fort upon an eminence at one end of it, which

[·] All these ridges confist of single mountains joined together, and ron parallel to each other.

proved of the utmost utility; for although the Indians were frequently in fight of the town, they never dared to approach within reach of the fort. It is a regular square fortification, with four bastions, mounting twenty-sour cannon; the length of each curtain, if I am not mistaken, is about eighty yards. Within, there are barracks for 450 men. The materials of which it is constructed, are logs silled up with earth: the soldiers attempted to surround it with a dry ditch; but the rock was so extremely hard and impenetrable that they were obliged to desist. It is still unfinished; and, I fear, going to ruin; for the assembly, who seldom look a great way before them, after having spent about 9000l. currency upon it, cannot be prevailed upon to give another thousand towards sinishing it, because we are in possession of Pitsburg; and, as they suppose, quite secure on this account; yet it is certain, that, in case of another Indian war on this side, which is by no means improbable, considering our general treatment of that people, it would be of the utmost advantage and security.

There is a peculiarity in the water at Winchester, owing, I was told, to the foil's being of a limy quality, which is frequently productive of severe gripings, especially in strangers; but it is generally supposed, on the other hand, to be specific against some

other difeafes *.

During my flay at this place, I was almost induced to make a tour for a fortnight to the fouthward, in Augusta county, for the sake of seeing some natural curiosities; which, the officers assured me, were extremely well worth visiting: but as the Cherokees had been scalping in those parts only a few days before; and as I seared, at the same time, that it would detain me too long, and that I should lose my passage to England, I judged it prudent to decline it.

The curiofities they mentioned to me were chiefly thefe:

1. About forty miles westward of Augusta court-house, a beautiful cascade, bursting out of the side of a rock, and, after running some distance through a meadow, rushing down a precipice 150 feet perpendicular.

2. To the fouthward of this about twenty miles, two curious hot springs, one tasting

like alum, the other like the washings of a gun.

3. A most extraordinary cave.

- 4. A medicinal fpring, specific in venereal cases. A soldier in the Virginian regiment, whose case was thought desperate, by drinking and bathing in these waters, was, after a few days, entirely cured. This sact was afferted very strongly by some officers, who had been posted there: but Colonel Washington, of whom I inquired more particularly concerning it, informed me that he had never heard of it; that he was not indeed at the place where it is said to have happened, but that having had the command of the regiment at that time, he should probably have been informed of it. What credit therefore is to be given to it the reader must judge for himself.
- 5. Sixty miles fouthward of Augusta court-house, a natural arch, or bridge, joining two high mountains, with a considerable river running underneath.

6. A river called Lost river, from its finking under a mountain, and never appearing again.

7. A fpring of a fulphureous nature, an infallible cure for particular cutaneous diforders.

- 8. Sixteen miles north-east of Winchester, a natural cave or well, into which, at times, a person may go down to the depth of 100 or 150 yards; and at other times,
- * Professor Haller, in his notes to the German translation of this book, supposes that the water at Winchester may be impregnated with vitriolic magnesia, sal amarum.

the water rifes up to the top, and overflows plentifully. This is called the ebbing and flowing well, and is fituated in a plain flat country, not contiguous to any mountain or running water.

9. A few miles from hence, fix or feven curious caves communicating with each

other.

A day or two before I left Winchester, I discovered that I had been robbed by my servant: he confessed the fact, and pleaded so little in justification of himself, that I was obliged to dismiss him. This distressed me very much, for it was impossible to hire a servant in these parts, or even any one to go over the mountains with me into the lower settlements. However, by the politeness of the commander of the place, the honourable Colonel Byard, and of another gentleman* of my acquaintance, I got over these difficulties; for the former, while I continued at Winchester, accommodated me with his own apartments in the fort, ordering his servants to attend and wait upon me; and the latter sent a negro boy with me as far as Colonel Washington's, eighty miles distant from this place. On the 4th of June, therefore, I was enabled to leave Winchester, and I travelled that night about eighteen miles, to Sniker's † ferry upon the Shenando.

The next morning I repaffed the Blue Ridge at Williams's Gap, and proceeded on my journey about forty miles. I this day fell into converfation with a planter, who overtook me on the road, concerning the rattlefnake, of which there are infinite numbers in these parts; and he told me, that one day going to a mill at some distance, he provoked one to such a degree as to make it strike a small vine which grew close by, and

that the vine prefently drooped and died †.

My accommodations this evening were extremely bad; I had been wet to the skin in the afternoon; and at the miserable plantation in which I had taken shelter I could get no sire; nothing to eat or drink but pure water; and not even a blanket to cover me. I threw myself down upon my mattrass, but suffered so much from cold, and was so infested with insects and vermin, that I could not close my eyes. I rose early in the morning, therefore, and proceeded upon my journey, being distant from Colonel Washington's not more than thirty miles. It was late, however, before I arrived there, for it rained extremely hard, and a man who undertook to shew me the nearest way, led me among precipices and rocks, and we were lost for above two hours. It was not indeed, without some compensation; for he brought me through as beautiful and picturesque a scene as eye ever beheld. It was a delightful valley, about two miles in length, and a quarter of one in breadth, between high and craggy mountains, covered with chamædaphnes § or wild ivy, in full flower. Through the middle of the valley

* Colonel Churchhill. † Called in Fry and Jefferson's map, Williams's Ferry.

‡ Several persons to whom I have mentioned this fact have seemed to doubt of the probability of it. But were it not true, a question will naturally arise, how an idea of that nature should occur to an ignorant planter, living remote from all cultivated society; and, more particularly, how he should happen to fix upon that tree; which, supposing the thing possible, is the most likely to have been affected in the manner described.

The chamodaphne is the most beautiful of all flowering shrubs: Catesby in his Natural History of Carolina speaks of it in the following manner: "The slowers grow in bunches on the tops of the branches, to sootstake of three inches long; they are white, stained with purplish red; confishing of one leaf in form of a cup, divided at the verge into sive sections. In the middle is a stilus, and ten samina, which, when the flower soft opens, appear lying clote to the sides of the cup, at equal distances; their apices being lodged in ten little hollow cells, which being prominent on the outlide, appear as so many little tubercles—As all plants have their peculiar beauties, it is difficult to assign to any one an elegance excelling all others; yet considering the curious structure of the flower, and beautiful appearance of this whole plant, I know of no shrub that has a better claim to it." Catesby, Vol. II. p. 98.

glided a rivulet about eight yards wide, extremely lucid, and breaking into innumerable cafcades; and in different parts of it stood small clumps of evergreens; such as myrtles, cedars, pines, and various other forts. Upon the whole, not Tempe itself could have displayed greater beauty or a more delightful scene.

At Colonel Washington's I disposed of my horses, and, having borrowed his curricle

and fervant, I took leave of Mount Vernon the 11th of June.

I croffed over the Potowmac into Maryland at Clifton's Ferry, where the river is fomething more than a mile broad; and proceeded on my journey to Marlborough, eighteen miles. I here met with a strolling company of players, under the direction of one Douglas. I went to see their theatre, which was a neat convenient tobacco-house, well fitted up for the purpose. From hence in the afternoon I proceeded to Queen Ann, nine miles; and in the evening nine miles farther, over the Patuxen to Londontown Ferry; I staid here all night, and early in the morning ferrying over South River, three quarters of a mile in breadth, I arrived at Annapolis, four miles distant, about

nine in the morning.

Annapolis is the capital of Maryland; it is a fmall neat town, confifting of about a hundred and fifty houses, fituated on a peninfula upon Severn river. The peninfula is formed by the river, and two fmall creeks; and although the river is not above a mile broad; yet as it falls into Chefapeak bay a little below, there is from this town the finest water-prospect imaginable. The bay is twelve miles over, and beyond it you may difcern the eastern shore; so that the scene is diversified with fields, woods, and water. The tide rifes here about two feet, and the water is falt, though the distance of the capes is more than 200 miles. The town is not laid out regularly, but is tolerably well built, and has feveral good brick houses. None of the streets are paved, and the few public buildings here are not worth mentioning. The church is a very poor one, the stad.-house but indifferent, and the governor's palace is not finished. This last mentioned building was begun a few years ago; it is fituated very finely upon an eminence, and commands a beautiful view of the town and environs. It has four large rooms on the lower floor, besides a magnificent saloon, a stair case, and a vestibule. On each side of the entrance are four windows, and nine upon the first story; the offices are under ground. It was to have had a fine portico the whole range of the building; but unluckily the governor and affembly difagreeing about ways and means, the execution of the defign was fulpended; and only the shell of the house has been finished, which is now going to ruin. The house which the prefent governor inhabits, is hired by the province at 801. currency per annum.

There is very little trade carried on from this place, and the chief of the inhabitants are florekeepers or public officers. They build two or three ships annually, but seldom more. There are no tortifications, except a miserable battery of fifteen fix-pounders.

Maryland is fituated between the 38th and 40th degree of north latitude, and the 75th and 80th of west longitude from London. It is bounded on the east by the Atlantic ocean, and the three lower counties of Delaware; on the south and west by Virginia; and by Pensylvania on the north. The climate, soil, and natural productions of it are nearly the same as those of Virginia. It is watered by many fine rivers, and almost innumerable creeks; but it is far from being well cultivated, and is capable of much improvement. It is divided into fourteen counties, and between forty and sifty parishes; and there are several little towns in it which are neatly built.—The inhabitants, exclusive of slaves, are supposed to be about ninety thousand: of which the militia, including all white males between fixteen and fixty, amounts to eighteen. The slaves are about thirty-two thousand.—The staple of the country is tobacco; and, com-

munibus annis they export near 30,000 hogheads: last year their exports amounted to 50,000.—Their manufactures are very trifling.—The government is a proprietary one; and confists of the proprietor (viz. lord Baltimore); his governor; the council, composed of twelve persons nominated by himself; and a house of representatives, elected by the people; four for each county, and two for Annapolis. The power of the proprietor is next to regal; of the other parts of the legislature, much the same as in Virginia. The lower house has been at variance some years with the council and governor, concerning ways and means; chiefly in regard to taxing the merchants bookdebts: which has been the reason of their having done nothing for the defence of the colonies during the war. The house has constantly voted troops, but as constantly laid the same tax for the maintenance of them: the council therefore has always rejected the bill; alledging the inconvenience of such a tax, as it would necessarily be a restraint upon trade; and ruin many of the merchants credit.—The proprietor has a negative * upon every bill, exclusive of his governor.

There are feveral courts of judicature in this province; but the principal are either those which are held quarterly in each county by the justices thereof, like those in Virginia; or the provincial ones, which are held twice annually at Annapolis by judges appointed for that purpose †. The court of chancery consists of the governor and

council; and the dernier refort is to His Majesty in council at home.

The established religion is that of the church of England: but there are as many Roman Catholics as Protestants. The clergy are liberally provided for; they have not, as in Virginia, a fixed quantity of tobacco; but so much per head, viz. 30 lb. weight for every tytheable in their respective parishes: and some of them make more than 300l. sterling per annum. They are presented to their livings by the governor; and are under the jurisdiction of the Bishop of London; but being at a great distance from England, and having no commissary to superintend their assairs, they lie under many disadvantages. Assessments are made, I was told, by the county-courts; the vestry, which consists of twelve members distinct from the churchwardens, have little or no authority \frac{1}{2}.

In each county throughout this province, there is a public free-school, for reading, writing, and accounts; but no college or academy; and the education of youth is but

little attended to.

The character of the inhabitants is much the fame as that of the Virginians; and the flate of the two colonies nearly alike. Tobacco, to fpeak in general, is the chief thing attended to in both. There have been fome attempts to make wine; and it is certain, that the country is capable of producing almost any fort of grapes. Colonel Tasco, a gentleman of distinction in these parts, attempted to make Burgundy, and succeeded tolerably well for the first trial. I drank some of the wine at the table of Mr. Hamilton, the governor of Pennsylvania, and thought it not bad. But whether, as this gentleman is now deceased, any other person will have spirit to prosecute his plan, I much doubt. The currency here is paper-money, and the difference of exchange about sifty per cent. The duty upon negroes is only forty shillings currency per head at their importation; whereas in Virginia it is ten pounds.

. This power is doubted, though it has never yet been contested.

† Besides these courts, there was formerly a general court of assize held throughout the province, either once or twice a year, but this has been laid aside.

† The whole vesting, as in Virginia, consists of twelve members; but they go off by rotation two every year; and there is annually a fresh election. They have the power of appointing inspectors, &c.

June

June 13. I hired a schooner of about ten ton, and embarked for the head of the bay, distant twenty-three leagues; we made ful with a fresh breeze, and after a pleasant passage of fixteen hours, in one of the most d lightful days imaginable, arrived at Frederick Town upon Saffafras river, about twelve in the evening. I never in my life fpent a day more agreeably, or with higher entertainment. The shores on each side of the bay, and the many little iflands interspersed in it, afford very beautiful prospects; we were entertained at the fame time by innumerable porpoifes playing about the bow of the ship; and naturally fell into a train of the most pleasing reslections, on observing the mouths of the many noble rivers as we passed along. On the western shore, befides those great rivers of Virginia, which I have already described, there are ten or eleven others. large and capacious, fome of them navigable a confiderable way up into the country *. "The Patuxen, which we have left behind us, faid the mafter of the fchooner, as we were failing over this beautiful bay, is navigable near fifty miles for veffels of three hundred ton burthen. Yonder, he added, are South, Severn, and Magotty rivers, navigable about ten miles. A little farther is the Patapfico, a large and noble river; where I have gone up fifteen miles. Back, Middle, Gunpowder, and Bush rivers admit only floops and schooners, and these only for fix or feven miles. The Sufquehannah, though fo majestic, and superior in appearance, has only a short, and that a bad navigation; but it rifes an immenfe way off in unknown and inhospitable regions, is exceedingly large and beautiful, and affords great variety of fish. The next, or North river, is navigable about ten miles. On the eastern shore, he concluded, are Elk, Bahama, Saffafras, Chefter, Wye, Miles, Great Choptank, Little Choptank, Nanticote, Manokin, and Pocomoke rivers, all of them navigable, more or lefs, for feveral miles †."-Such was our conversation and entertainment during this delightful voyage.

Frederic Town is a small village on the western side of Sassafras river, built for the accommodation of strangers and travellers; on the eastern side, exactly opposite to it, is another small village (George Town), erected for the same purpose.—Having hired an Italian chaise, with a servant and horse to attend me as far as Philadelphia, 1 left

Frederic Town the next day, and went to Newcastle, thirty two miles.

Newcastle is situated upon Delaware river, about forty miles above the Bay, and a hundred from the Capes. It is the capital of the three lower counties, but a place of very little consideration; there are scarcely more than a hundred houses in it, and no public buildings that deserve to be taken notice of. The church, presbyterian and quakers meeting-houses, court-house, and market-house, are almost equally bad, and

undeferving of attention.

The province, of which this is the capital, and which is distinguished by the name of the Three Lower Counties of Newcastle, Sussex, and Kent, belonged formerly to the Dutch; but was ratified to the crown of England by the treaty of Breda; it was afterwards sold by the Duke of York to the proprietor of Pensylvania, and has continued a separate government, though nearly under the same regulations with that province, ever since. The same governor presides over both; but the assembly, and courts of judicature are different: different as to their constituent members, for in form they are nearly alike. The assembly consists of eighteen persons, elected annually by the

^{*} By some error or overlight the names of several rivers here mentioned, though particularly specified in the original manuscript, were omitted in the first and second editions of this work. They are now inserted, and the account is correct.

⁺ He said from eighteen to sifty miles.

people; fix for each county: this, with the governor, forms the legislature of the province. There is a militia, in which all perfons, from eighteen to fifty, are obliged to be enrolled; and the county of Newcastle alone furnishes more than seven hundred.

The next day I fet out for Philadelphia, distant about thirty-fix miles, and arrived there in the evening. The country all the way bore a disserent aspect from any thing I had hitherto seen in America. It was much better cultivated, and beautifully laid out into fields of clover, grain, and slax. I passed by a very pretty village called Wilmington, and rode through two others, viz. Chester and Derby. The Delaware river is in fight great part of the way, and is three miles broad; upon the whole nothing could be more pleasing than the ride which I had this day. I ferried over the Schuilkill, about three miles below Philadelphia; from whence to the city the whole

country is covered with villas, gardens, and luxuriant orchards.

Philadelphia, if we confider that not eighty years ago the place where it now flands was a wild and uncultivated defert, inhabited by nothing but ravenous beafts, and a favage people, must certainly be the object of every one's wonder and admiration. It is fituated upon a tongue of land, a few miles above the confluence of the Delaware Schuilkill; and contains about 3000 houses, and 18 or 20,000 inhabitants. It is built north and fouth upon the banks of the Delaware; and is nearly two miles in length, and three quarters of one in breadth. The streets are laid out with great regularity in parallel lines, interfected by others at right angles, and are handfomely built: on each fide there is a pavement of broad stones for foot passengers; and in most of them a caufeway in the middle for carriages. Upon dark nights it is well lighted, and watched by a patrole: there are many fair houses, and public edifices in it. The stadt-house is a large, handsome, though heavy building; in this are held the councils, the affemblics. and supreme courts; there are apartments in it also for the accommodation of Indian chiefs or fachems; likewife two libraries; one belonging to the province, the other to a fociety, which was incorporated about ten years ago, and confifts of fixty members. Each member upon admission, subscribed forty shillings; and afterward annually ten. They can alienate their shares, by will or deed, to any person approved by the society. They have a small collection of medals and medallions, and a few other curiofities. fuch as the skin of a rattlesnake killed at Surinam, twelve feet long; and several northern Indian habits made of furs and fkins. At a fmall distance from the stadt-house, there is another fine library, confifting of a very valuable and chosen collection of books left by a Mr. Logan; they are chiefly in the learned languages. Near this there is also a noble hospital for lunatics and other fick persons. Besides these buildings, there are spacious barracks for 17 or 1800 men; a good assembly-room belonging to the fociety of freemasons; and eight or ten places of religious worship; viz. two churches, three quakers meeting-houses, two presbyterian ditto, one Lutheran church, one Dutch Calvinist ditto, one Swedish ditto, one Romish chapel, one Anabaptist meetinghouse, one Moravian ditto: there is also an academy or college, originally built for a tabernacle for Mr. Whitefield. At the fouth end of the town, upon the river, there is a battery mounting thirty guns, but it is in a flate of decay. It was defigned to be a cheek upon privateers. Thefe, with a few alms-houses, and a school-house belonging to the quakers, are the chief public buildings in Philadelphia. The city is in a very flourishing state, and inhabited by merchants, artists, tradefmen, and persons of all occupations. There is a public market held twice a week, upon Wednefday and Saturday, almost equal to that of Leadenhall, and a tolerable one every day besides.

The streets are crowded with people, and the river with vessels. Houses are so dear, that they will let for 100l. currency per annum; and lots, not above thirty seet in breadth, and a hundred in length, in advantageous situations, will fell for 1000l. sterling. There are several docks upon the river, and about twenty-sive vessels are built there annually. I counted upon the stocks at one time no less than seventeen,

many of them three-masted vessels.

Can the mind have a greater pleasure than in contemplating the rise and progress of cities and kingdoms? Than in perceiving a rich and opulent state arising out of a small settlement or colony? This pleasure every one must feel who considers Pensylvania.— This wonderful province is situated between the 40th and 43d degree of north latitude, and about 76 degrees west longitude from London, in a healthy and delightful climate, amidst all the advantages that nature can bestow. The soil is extremely strong and fertile, and produces spontaneously an infinite variety of trees, slowers, fruits, and plants of different forts. The mountains are enriched with ore, and the rivers with sish: some of these are so stately as not to be beheld without admiration: the Delaware is navigable for large vessels as far as the salls, 180 miles distant from the sea, and 120 from the bay. At the mouth it is more than three miles broad, and above one at Philadelphia. The navigation is obstructed in the winter, for about fix weeks, by the severity of the frost; but, at other times, it is bold and open. The Schuilkill, though not navigable for any great space, is exceedingly romantic, and affords the most delightful retirements.

Cultivation (comparatively speaking) is carried to a high degree of perfection; and Penfylvania produces not only great plenty, but also great variety of grain; it yields

likewife flax-feed, hemp, cattle of different kinds, and various other articles *.

It is divided into eight counties, and contains many large and populous towns: Carlifle, Lancaster, and German-town, consist each of near five hundred houses; there are several others which have from one to two hundred.

The number of inhabitants is supposed to be between four and five hundred thousand †, a fifth of which are Quakers: there are very few negroes or slaves.

The trade of Penfylvania is furprifingly extensive, carried on to Great Britain, the West Indies, every part of North America, the Madeiras, Lisbon, Cadiz, Holland, Africa, the Spanish main, and several other places; exclusive of what is illicitly carried on to Cape François, and Monte Christo. Their exports are provisions of all kinds, lumber, hemp, flax, flax-seed, iron, furs, and deer skins. Their imports, English manufactures, with the superfluities and luxuries of life. By their flag-of-truce trade, they also get sugar, which they refine and fend to Europe.

Their manufactures are very confiderable. The German-town thread stockings are in high estimation; and the year before last, I have been credibly informed, there

† Doubts have fince arisen, whether the number, at the time here mentioned, amounted to more than

350,000.—See Morfe's American geography.

^{*} In the fouthern colonies cultivation is in a very low state. The common process of it is, first to cut off the trees two or three feet above ground, in order to let in the sun and air, leaving the stumps to decay and rot, which they do in a few years. After this they dig and plant, and continue to work the same field, year after year, without ever manuring it, till it is quite spent. They then enter upon a fresh piece of ground, allowing this a respite of about twenty years to recover itself; during which time it becomes beautifully covered with Virginian pines: the feeds of that tree, which are exceedingly small, and, when the cones open, are wasted through the air in great abundance, sowing themselves in every vacant spot of neglected ground.

were manufactured in that town alone above 60,000 dozen pair. Their common

retail price is a dollar per pair.

The Irish settlers make very good linens: some woollens have also been fabricated, but not, I believe, to any amount. There are feveral other manufactures, viz. of beaver hats, which are fuperior in goodness to any in Europe, of cordage, linseed-oil, flarch, myrtle-wax and fpermaceti candles, foap, earthen ware, and other commodities.

The government of this province is a proprietary one. The legislature is lodged in the hands of a governor appointed (with the King's approbation) by the proprietor; and a house of representatives, elected by the people, confisting of thirty-seven members. These are of various religious persuasions, for by the charter of privileges, which Mr. Penn granted to the fettlers in Penfylvania, no perfon who believed in God could be molefted in his calling or profession; and any one who believed in Jesus Christ might enjoy the first post under the government. The crown has referved to itself a power of repealing any law which may interfere with the prerogative, or be contrary

to the laws of Great Britain.

The judicature confifts of different courts. The justices of the peace, who, together with the other judges, are of the governor's appointment, hold quarterly fessions conformable to the laws of England; and, when these are finished, continue to fit in quality of judges of common pleas, by a special commission. The supreme court confifts of a chief justice, and two affistant judges: they have the united authority of the King's Bench, Common Pleas, and Court of Exchequer. They not only receive appeals, but all causes once commenced in the inferior courts, after the first writ, may be moved thither by a habeas corpus, certiorari, writ of error, &c. The judges of the supreme court have also a standing and distinct commission to hold, as shall feem needful, courts of over and terminer, and general gaol-deliveries throughout the province; but this power they feldom, I believe, exercife. The fupreme courts are held twice a year at Philadelphia. There is no Court of Chancery; but the want of it is supplied, in some measure, by the other courts. There is a particular officer called the register-general, appointed by the governor, whose authority extends over the whole province, where he has several deputies. He grants letters of administration, and probates of wills. In cases of dispute, or caveat entered, he may call in, as affiftants, two justices of the peace. The governor can pardon in all cases, except of treason or murder, and then can reprieve till he knows the King's pleasure.

There is here, as in most of the other colonies, a Court of Vice Admiralty, held by commission from the Admiralty in England, for the trial of captures, and of piracies, and other misdemeanors committed upon the high seas, but there lies an appeal from it,

I believe, to the Court of Delegates in England.

As to religion, there is none properly established; but Protestants of all denominations, Papists, Jews, and all other fects whatsoever, are universally tolerated. There are twelve clergymen of the church of England, who are fent by the Society for the Propagation of the Gofpel, and are allowed annually 50l. each, besides what they get from subscriptions and surplice fees. Some few of these are itinerant missionaries, and have no fixed residence, but travel from place to place, as occasion requires, upon the frontiers. They are under the jurisdiction of the Bishop of London.

Arts and sciences are yet in their infancy. There are some few persons who have discovered a taste for music and painting *, and philosophy seems not only to have made

^{*} Mr. Benjamin Well, prefident of the Royal Academy, was, I believe, a native of Penfylvania, if not of Philadelphia.

a confiderable progrefs already, but to be daily gaining ground. The library fociety is an excellent inftitution for propagating a tafte for literature; and the college well calculated to form and cultivate it. This last institution is crected upon an admirable plan, and is by far the best school for learning throughout America. It has been chiefly raised by contributions; and its present sund is about 10,000l. Pensylvanian money. An account of it may be seen in Dr. Smith's (the president's) Discourses. The Quakers also have an academy for instructing their youth in classical learning, and practical mathematics: there are three teachers, and about seventy boys in it. Besides these, there are several schools in the province for the Dutch and other foreign

children; and a confiderable one is going to be erected at German-town.

The Penfylvanians, as to character, are a frugal and industrious people; not remarkably courteous and hospitable to strangers, unless particularly recommended to them; but rather, like the denizens of most commercial cities, the reverse. They are great republicans, and have fallen into the fame errors in their ideas of independency as most of the other colonies have. They are by far the most enterprising people upon the continent. As they confift of feveral nations, and talk feveral languages, they are aliens in some respect to Great Britain; nor can it be expected that they should have the same filial attachment to her which her own immediate offspring have. However, they are quiet, and concern themselves but little, except about getting money. The women are exceedingly handsome and polite: they are naturally sprightly and fond of pleasure; and, upon the whole, are much more agreeable and accomplished than the men. Since their intercourse with the English officers, they are greatly improved; and, without flattery, many of them would not make bad figures even in the first assemblies in Europe. Their amusements are chiefly dancing in the winter, and in the fummer, forming parties of pleasure upon the Schuilkill, and in the country. There is a fociety of fixteen ladies, and as many gentlemen, called the fishing company, who meet once a fortnight upon the Schuilkill. They have a very pleafant room erected in a romantic fituation upon the banks of that river, where they generally dine and drink tea. There are feveral pretty walks about it, and fome wild and rugged rocks, which, together with the water and fine groves that adorn the banks. form a most beautiful and picturesque scene. There are boats and fishing tackle of all forts, and the company divert themselves with walking, fishing, going up the water, dancing, finging, converfing, or just as they please. The ladies wear an uniform, and appear with great ease and advantage from the neatness and simplicity of it. first and most distinguished people of the colony are of this society; and it is very advantageous to a stranger to be introduced to it, as he hereby gets acquainted with the best and most respectable company in Philadelphia. In the winter, when there is fnow upon the ground, it is usual to make what they call fleighing parties, or to go upon it in fledges, but as this is a practice well known in Europe, it is needlefs to describe it.

The present state of Pensylvania is undoubtedly very flourishing. The country is well cultivated, and there are not less than 9000 waggons employed in it, in different services. Till this war they were exempt from taxes, and it was not without difficulty that the Quakers were prevailed upon to grant any supplies for the defence of the frontiers, though exposed to the most horrid cruelties: it was not from principle, say their enemies, that they resuled it, but from interest; for as they were the first settlers, they chiefly occupy the interior and lower parts of the province, and are not exposed to incursions. At length, however, compelled by clamour and public discontent, they

5 A 2

were obliged to pass a supply bill for 100,000l. to raise five-and-twenty hundred men, and these they have kept up ever since: they afterward passed a militia bill, but it was such a one as answered no good purpose. The Quakers have much the greatest influence in the assembly, and are supported there by the Dutch and Germans, who are as adverse to taxes as themselves. Their power, however, at present seems rather on the decline, which is the reason, as the opposite party pretend, that they stir up on all occasions as much consusting as possible, from that trite maxim in politics, divide et impera. They have quarrelled with the proprietors upon several occasions, whether altogether justly or not, I will not pretend to say; it is certain, however, that the determinations at home have been sometimes in their favour. The late subjects of their disputes have been chiefly these:

First, Whether the proprietary lands ought to be taxed? This has been determined

at home in the affirmative.

Secondly, Whether the proprietor ought to have any choice or approbation of the affesfors?

Thirdly, Whether he ought to give his governor instructions? And,

Lastly, Whether the judges of his appointment ought to be during pleasure, or

quamdiu se bene gesserint? These three last are still undecided.

Upon the whole, though this province is exceedingly flourishing, yet there are certainly great abuses in it; and such as, if not speedily rectified, will be productive of bad consequences.

The difference of exchange between bills and the currency of Penfylvania is about

75 per cent.

An occurrence happened to me at Philadelphia, which, though in itself of a trifling nature, I cannot but take notice of, as a fingular inflance of the ftrong possession which an idea will fometimes take of the mind, fo as totally to derange it. A lady from Rhode Island, who lodged in the same house with myself, had an unfortunate brother in the infirmary, a lunatic. He was supposed to be nearly well, and was permitted occasionally to see company. A few days before I was to leave Philadelphia, this lady invited me to accompany her in one of her vifits to him; adding, that on her inadvertently mentioning to him fome circumftances relating to me, he had expressed a most earnest defire to fee me. I ftrongly objected to the proposal, urging the impropriety of introducing a stranger, or, indeed, company of any fort, to a person in that unhappy fituation, as it might possibly agitate his mind, and retard his recovery. I advised her therefore not to take any further notice of it; hoping he might forget, or not mention it any more. The next day fhe renewed her application; adding, that her brother was exceedingly disappointed; and entreated me to attend her, in so pressing a manner, that I could not with civility refuse it. On entering the cell, a beam of fatisfaction feemed to dart from his eye, not eafy to be expressed or conceived. I took him by the hand; and, feating myfelf opposite the bed to which he was chained, immediately took the lead in conversation, talking of indifferent matters, such as I thought could not possibly tend to interest or disturb his mind. I had not proceeded far when he fuddenly interrupted me; and proposed a question, which at once convinced me that he was in a very unfit state to see company. I immediately therefore rose up; and making an excuse that my engagements that day would not admit of my entering into so curious a subject, defired him to reserve it for some future conversation. He feemed greatly difconcerted; but being near the door, which flood open, I took my leave and retired. The next morning I left Philadelphia; nor did I think any more

of this occurrence till I arrived at Rhode Island; where I was informed that the chief, if not fole, instances of infanity shewn by this unhappy young man, were some attempts which he had made to kill a clergyman of the church of England. That he had been educated to be a teacher amongst the congregationalists, but had taken it into his head, that he could never gain heaven, or be happy, but by committing fo heroic and meritorious an action. The very evening of his confinement he was prevented from fulfilling his purpose, in the instant when he was raising up his hand to plunge a knife into the back of a clergyman, who was reading the funeral service, in the presence of a large congregation. What his intentions were in regard to myfelf, I cannot pretend to fay: he offered me no violence; but those at Rhode Island of his acquaintance, to whom I related this transaction, were fully perfuaded that he was far from being cured

of his distemper *.

I left Philadelphia the 6th of July, and travelled in the stage as far as Shemineyferry, about feventeen miles; where I was overtaken by a gentleman and fome ladies of my acquaintance, who were going a few miles farther upon a party of pleasure. They were fo obliging as to make room for me in one of their chaifes, and we proceeded and dined together at Briftol, a fmall town upon the Delaware, opposite Burlington: in the afternoon we went ten miles higher up the river, and ferried over to Trenton, fituated in the Jerseys. This is built on the east side of the Delaware, and contains about a hundred houses. It has nothing remarkable; there is a church, a Quaker's, and Presbyterian meeting-house, and barracks for three hundred men. From hence we went to Sir John Sinclair's, at the falls of Delaware, about a mile above Trenton, a pleafant rural retirement; where we fpent a most agreeable evening. In the morning, the company returned to Philadelphia; and, having hired a chaise, I proceeded to Prince-town, twelve miles distant.

At this place there is a handsome school and college for the education of Dissenters; erected upon the plan of those in Scotland. There are about twenty boys in the grammar-school, and fixty in the college: at present there are only two profesiors, befides the provost; but they intend, as their fund increases, which is yet very small, and does not exceed 2000l. currency, to add to this number. The building is extremely convenient, airy, and fpacious; and has a chapel and other proper offices. Two students are in each set of apartments, which consists of a large bed-room with a fire-place, and two studies. There is a small collection of books, a few instruments,

This flory was related to me in Tufcany, and I had no reason to question the truth of it.

^{*} Since my return to Europe, I have been informed of an instance similar to this, which happened at Florence. A gentleman had taken it into his head that a very large diamond lay buried under a mountain which stood upon his estate, and was near ruining himself and his family by digging for it. His friends, by some contrivance or other, got him away to Florence, and placed him under the care of the late celebrated Dr. Coechi. He there appeared perfectly composed, talked very rationally, and, having been well educated, afforded great entertainment to the doctor and his friends, who converfed with him. One day as they were fitting together, he mentioned to the doctor, that it was very hard he should be deprived of his liberty, when he was perfectly well; and that it was only a scheme of his relations to keep him in confinement, in order that they might enjoy his estate. The doctor, who had perceived no marks of infanity, began to be staggered; and promifed, in case he should see no reason to alter his sentiments, to fign a certificate of his being well on fuch a day, in order to its being fent to England, that he might have his releafe. The day arrived, and the doctor was preparing to perform his promife; but whether by design, on perceiving something particular in the looks of his patient, or by accident, I could not learn, he said to the gentleman; "Now, Sir, I beg from this time that you will think no more of this soolish affair of the mountain and diamond." "Not think of the diamond!" said the madman; "it is for this reason that I want my liberty: I know exactly the spot where it lies; and I will have it in my possession before I am a year older."

and some natural curiosities. The expence to a student for room-rent, commons, and tutorage, amounts to 25l. currency per year. The provost has a salary of 200l. currency, and the professor 50l. each. The name of the college is Nassau-Hall. — From hence, in the afternoon, I proceeded to Brunswick, eighteen miles farther, a small town of about a hundred houses, situated upon Raritan river; where there are also very neat barracks for 300 men, a church, and a Presbyterian meeting-house. It is celebrated for the number of its beauties; and, indeed, at this place and Philadelphia were the handsomest women that I saw in America. At a small distance from the town is a copper-mine belonging to a Mr. French, (I was told) a pretty good one. The next day I rode up the river, about nine miles to the Raritan hills, to see a small cascade, which falls about sifteen or twenty feet, very romanticly, from between two rocks. The country I passed through is exceedingly rich and beautiful; and the banks of the river are covered with gentlemen's houses. At one of these I had an opportunity of seeing some good portraits of Vandyke, and several other small Dutch paintings.

On Monday the 7th, I proceeded to Perth-Amboy, twelve miles, the capital of the East Jerseys, which is pleasantly fituated upon a neck of land, included between the Raritan and Amboy rivers and a large open bay. This is generally the place of the governor's residence; and alternately, here and at Burlington, the capital of the West Jerseys, are held the assemblies, and other public meetings: it contains about a hundred houses, and has a very fine barracks for three hundred men. In the asternoon I travelled sixteen miles farther to Elizabeth-town, leaving Woodbridge, a small village where there is a printing-office, a little on my right hand. Elizabeth-town is built upon a small creek or river that falls into Newark-bay, and contains between two and three hundred houses. It has a court-house, a church, and a meeting-house; and

barracks also like those abovementioned.

The next morning I rode out, in order to vifit Pafaic Falls, distant about twenty-three miles, and had a very agreeable tour. After riding fix miles, I came to a town called Newark, built in an irregular scattered manner, after the fashion of some of our villages in England, near two miles in length. It has a church erected in the Gothic taste with a spire, the first I had seen in America; and some other inconsiderable public buildings. Immediately on my leaving this place, I came upon the banks of Second, or Pasaic river, along which I travelled seventeen or eighteen miles to the Falls, through a rich country, interspersed with fine fields and gentlemen's seats.

The Falls are very extraordinary, different from any I had hitherto met with in America. The river is about forty yards broad, and runs with a very fwift current, till coming to a deep chasm or cleft which crosses the channel, it falls above seventy feet perpendicular in one intire sheet. One end of the cleft is closed up, and the water rushes out at the other with incredible rapidity, in an acute angle to its former direction, and is received into a large bason. Hence it takes a winding course through the rocks, and spreads again into a very considerable channel. The cleft is from sour to twelve feet broad. The spray formed two beautiful (viz. the primary and secondary) rainbows, and helped to make as fine a scene as imagination could conceive. This extraordinary phenomenon is supposed to have been produced by an earthquake. The fate of two Indians is delivered down by tradition, who, venturing too near the Falls in a canoe, were carried down the precipice, and dashed to pieces. Thirty or forty yards above the great Fall, is another, a most beautiful one, gliding over some ledges of rocks, each two or three feet perpendicular, which heightens the scene very much.

From hence I returned, and in my way croffed over the river to Colonel John Schuyler's copper-mines, where there is a very rich vein of ore, and a fire-engine erected

upon common principles.

After this I went down two miles farther to the park and gardens of this gentleman's brother, Colonel Peter Schuyler. In the gardens is a very large collection of citrons, oranges. limes, lemons, balfams of Peru, aloes, pomegranates, and other tropical plants; and in the park I faw feveral American and English deer, and three or four elks or moose-deer. I arrived at Elizabeth-town in the evening, not a little entertained with my expedition, but exceedingly fatigued with the violent heat of the weather, and the many musquitoes that had insested me.

Before I take leave of the Jerseys, it is necessary I should give some account of this province. New Jersey is situated between the 39th and 42d degree of north latitude, and about seventy-sive degrees west longitude: it is bounded on the east by the Atlantic, on the west oy Pensylvania, or to speak more properly the Delaware; on the south by Delaware-bay; and on the north by Hudson's river and the province of New York. The climate is nearly the same as that of Pensylvania; and the soil, which is a kind of red slate, is so exceedingly rich, that in a short time after it has been turned up and

exposed to the air and moisture, it is converted into a species of marle *.

New Jersey has very great natural advantages of hills, valleys, rivers, and large bays. The Delaware is on one side, and Hudson's river on the other; besides which it has the Raritan, Pasaic, and Amboy rivers; and Newark and New York bays. It produces vast quantities of grain, besides hemp, slax, hay, Indian corn, and other articles. It is divided into eleven counties, and has several small towns, though not one of consideration. The number of its inhabitants is supposed to be 70,000: of which, all males between fixteen and fixty, negroes excepted, are obliged to serve in the militia. There is no foreign trade carried on from this province; for the inhabitants sell their produce to the merchants of Philadelphia and New York, and take in return European goods and other necessaries of life. They have some trisling manufactures of their own, but nothing that deserves mentioning.

The government confifts of a governor, twelve counfellors, and a house of representatives of about twenty-fix members, the two former nominated by the King, the latter elected by the the people. Each branch has a negative: they meet at Amboy and at Burlington alternately. The governor's falary, with perquisites, is about 800 or 1000l. sterling a-year: he is not allowed a house to reside in, but is obliged to hire one at his own expence. There are several courts of judicature here, much like those of the other provinces. The justices hold quarterly sessions for petty larcenies, and trisling causes; and the supreme judge, with two assistant justices, holds, once a year, a general assistant throughout the province, of oyer and terminer, and common pleas. He holds also annually four supreme courts, alternately at Amboy and Burlington, of King's bench, common pleas, and exchequer. The offices of chancellor and vice-admiral, are executed by the governor; and the dernier resort is to His Majesty in council.

There is properly no established religion in this province, and the inhabitants are of various persuasions: the society sends six missionaries, who are generally well re-

^{*} Since my return from America, I have met with a gentleman (Edward Wortley Montagu, Esquire) who had visited the Holy Land. He described the soil of that country to be similar in almost every circumstance to this of the Jerseys. He said it appeared to be of a red slaty substance, sterile, and incapable of producing any thing worth the cultivation; but that being broken up and exposed to the air, it became exceedingly mellow, and was fertile in the highest degree.

ceived; and the church gains ground daily. Their falaries are about the fame as in

Penfylvania.

Arts and sciences are here, as in the other parts of America, just dawning. The college will in time, without doubt, be of considerable advantage, but being yet in its infancy, it has not had an opportunity of operating, or effecting any visible im-

provement.

The New Jerfey men, as to character, are like most country gentlemen; good-natured, hospitable, and of a more liberal turn than their neighbours the Pensylvanians. They live altogether upon their estates, and are literally gentlemen farmers. The country in its present state can scarcely be called slourishing; for although it is extremely well cultivated, thickly seated, and the garden of North America, yet, having no foreign trade, it is deprived of those riches and advantages, which it would otherwise soon acquire. There have been some attempts to remedy this defect; but whether from the difficulty of diverting a thing out of a channel in which it has long slowed, or from want of propriety or perseverance in the measures, I am unable to say; but the truth is, they have not succeeded. Upon the whole, however, this province may be called a rich one: during the present war it has raised considerable supplies, having seldom had less than 1000 men in pay, with a leader (Colonel Schuyler) at their head, who has done honour to his country by his patriotic and public spirit. The paper currency of this colony is at about 70 per cent. discount, but in very good repute; and preserved by the Pensylvanians and New Yorkers, to that of their own provinces.

On Wednesday the 9th of July, I crossed over to Staten Island, in the province of New York; and travelled upon it about nine miles to the point which is opposite

New York city.

In my way I had an opportunity of feeing the method of making wampum. This, the reader probably knows is the current money amonst the Indians. It is made of the clam-shell; a shell, consisting within of two colours, purple and white; and in form not unlike a thick oyster-shell. The process of manufacturing it is very simple. It is first clipped to a proper size, which is that of a small oblong parallelopiped, then drilled, and afterward ground to a round smooth surface, and polished. The purple wampum is much more valuable than the white; a very small part of the shell being of that colour.

At the point I embarked for New York; and after a pleafant paffage over the bay, which is three leagues wide, and various delightful prospects of rivers, islands, fields, hills, woods, the Narrows, New York city, vessels failing too and fro, and innumerable porpoises playing upon the surface of the water, in an evening so ferene that the hemisphere was not ruffled by a single cloud, arrived there about the setting of the

fun.

This city is fituated upon the point of a fmall island, lying open to the bay on one fide, and on the others included between the north and east rivers; and commands a fine prospect of water, the Jerseys, Long Island, Staten Island, and several others, which lie scattered in the bay. It contains between two and three thousand houses, and 16 or 17,000 inhabitants, is tolerably well built, and has several good houses. The streets are paved, and very clean, but in general narrow: there are two or three, indeed, which are spacious and airy, particularly the Broad-Way. The houses in this street have most of them a row of trees before them; which form an agreeable shade, and produce a pretty effect. The whole length of the town is something more than a mile; the breadth of it about half an one. The situation is, I believe, esteemed healthy;

Dut

but it is subject to one great inconvenience, which is the want of fresh water; so that the inhabitants are obliged to have it brought from springs at some distance out of town. There are several public buildings, though but sew that deserve attention. The college, when smisshed, will be exceedingly handsome: it is to be built on three sides of a quadrangle, fronting Hudson's or North river, and will be the most beautifully situated of any college, I believe, in the world. At present only one wing is sinished, which is of stone, and consists of twenty-sour sets of apartments; each having a large sitting-room, with a study, and bed-chamber. They are obliged to make use of some of these apartments for a master's lodge, library, chapel, hall, &c. but as soon as the whole shall be completed, there will be proper apartments for each of these offices.

The name of it is King's College.

VOL. XIII.

There are two churches in New York, the old or Trinity Church, and the new one, or St. George's Chapel; both of them large buildings, the former in the Gothic tafte, with a fpire, the other upon the model of fome of the new churches in London. Befides these, there are several other places of religious worship; namely, two Low Dutch Calvinist churches, one High Dutch ditto, one French ditto, one German Lutheran church, one presbyterian meeting-house, one quakers ditto, one anabaptists ditto, one Moravian ditto, and a Jews synagogue. There is also a very handsome charity-school for fixty poor boys and girls, a good work-house, barracks for a regiment of soldiers, and one of the finest prisons I have ever seen. The court or stadt-house makes no great figure, but it is to be repaired and beautissed. There is a quadrangular fort, capable of mounting fixty cannon, though at present there are, I believe, only thirty-two. Within this is the governor's palace, and underneath it a battery capable of mounting ninety-sour guns, and barracks for a company or two of soldiers. Upon one of the islands in the bay is an hospital for sick and wounded seamen; and, upon another, a

pest-house. These are the most noted public buildings in and about the city.

The province of New York is fituated between the 40th and 45th degree of north latitude, and about 75 degrees west longitude. It lies in a fine climate, and enjoys a very wholesome air. The soil of most parts of it is extremely good, particularly of Long Island: and it has the advantages of a fine harbour, and fine rivers. The bay has a communication with Newark bay, the Sound, Amboy river, and feveral others: it receives also Hudson's or North river, one of the largest in North America, it being navigable for floops as far as Albany, above 150 miles: whence, by the Mohock, and other rivers, running through the country of the Six Nations, there is a communication, (excepting a few short carrying places,) with lake Ontario; and another with the river St. Laurence, through the Lakes George, Champlain, and the river Sorel; fo that this river feems to merit the greatest attention. These waters afford various kinds of fish, black-fish, sea-bass, sheeps-heads, rock-fish, lobsters, and several others, all excellent in their kind. The province in its cultivated state affords grain of all forts, cattle, hogs, and great variety of English fruits, particularly the New-town pippin. It is divided into ten counties, and has fome few towns, but none of any fize, except Albany and Schenectady, the former of which is a very confiderable place. The number of inhabitants amounts to nearly 100,000; 15 or 20,000 of which are supposed to be capable of bearing arms, and of ferving in the militia; but I believe this number is exaggerated, as a confiderable part of the 100,000 are negroes, which are imported more frequently into this province than into Penfylvania. The people carry on an extensive trade, and there are said to be cleared out annually from New York, tons of shipping. They export chiefly grain, flour, pork, skins, furs, pig-iron,

lumber, and staves. Their manufactures, indeed, are not extensive, nor by any means to be compared with those of Pensylvania; they make a small quantity of cloth, some linen, hats, shoes, and other articles for wearing apparel. They make glass also, and wampum; refine sugars, which they import from the West Indies; and distil considerable quantities of rum. They also, as well as the Pensylvanians, till both were restrained by act of parliament, had erected several slitting mills, to make nails, &c. But this is now prohibited, and they are exceedingly distaissed at it. They have several other branches of manufactures, but, in general, so inconsiderable, that I shall not take notice of them: one thing it may be necessary to mention, I mean the article of ship-building; about which, in different parts of the province, they employ many hands.

The government of this colony is lodged in the hands of a governor appointed by the crown; a council confifting of twelve members, named by the fame authority; and a house of twenty-seven representatives, elected by the people; four for the city and county of New York; two for the city and county of Albany; two for each of the other eight counties; one for the borough of West Chester; one for the township of Shenectady; and one for each of the three manors of Renslaerwyck, Livingston, and Courtland. The legislative power is entirely lodged in their hands, each branch having a negative; except that, as in the other colonies, all laws must have the King's approbation, and not interfere with, or be repugnant to, the laws of Great Britain.

The courts of judicature are fimilar, I believe, in every respect, to those in the

Jerfeys.

The established religion is that of the church of England, there being six churches in this province with stipends (to the value of about 50l. currency) annexed to each by law. The clergy are twelve in number, who, exclusive of what they acquire by the establishment above-mentioned, or by contributions, receive, as missionaries from the Society for the Propagation of the Gospel, 50l. sterling each. Besides the religion of the church of England, there is a variety of others: diffenters of all denominations, particularly presbyterians, abound in great numbers, and there are some few Roman Catholics.

Arts and sciences have made no greater progress here than in the other colonies; but as a subscription library has been lately opened, and every one seems zealous to promote learning, it may be hoped they will hereafter advance faster than they have done hitherto. The college is established upon the same plan as that in the Jerseys, except that this at New York professes the principles of the church of England. At present the state of it is far from being slourishing, or so good as might be wished. Its fund does not exceed 10,000l. currency, and there is a great scarcity of professors. A commencement was held, nevertheless, this summer, and seven gentlemen took degrees. There are in it at this time about twenty-sive students. The president, Dr. Johnson, is a very worthy and learned man, but rather too far advanced in life to have the direction of so new an institution. The late Dr. Bristow lest to this college a sine library, of which they are in daily expectation.

The inhabitants of New York, in their character, very much refemble the Penfylvanians: more than half of them are Dutch, and almost all traders: they are, therefore, habitually frugal, industrious, and parfimonious. Being, however, of different nations, different languages, and different religions, it is almost impossible to give them any precise or determinate character. The women are handsome and agreeable; though rather more reserved than the Philadelphian ladies. Their amusements are

much

much the fame as in Penfylvania; viz. balls, and fleighing expeditions in the winter; and, in the fummer, going in parties upon the water, and fishing; or making excursions into the country. There are feveral houses pleasantly fituated upon East river, near New York, where it is common to have turtle-feasts: these happen once or twice in a week. Thirty or forty gentlemen and ladies meet and dine together, drink tea in the afternoon, fish and amuse themselves till evening, and then return home in Italian chaises, (the sashionable carriage in this and most parts of America, Virginia excepted, where they chiefly make use of coaches, and these commonly drawn by six horses,) a gentleman and lady in each chaise. In the way there is a bridge, about three miles distant from New York, which you always pass over as you return, called the Kissing-bridge; where it is a part of the etiquette to salute the lady who has put herself under your protection.

The prefent state of this province is flourishing: it has an extensive trade to many parts of the world, particularly to the West Indies; and has acquired great riches by the commerce which it has carried on, under stags of truce, to Cape François, and Monte-Christo. The troops, by having made it the place of their general rendezvous, have also enriched it very much. However, it is burthened with taxes, and the present public debt amounts to more than 300,000l. currency. The taxes are laid upon estates real and personal; and there are duties upon negroes, and other importations. The provincial troops are about 2,600 men. The difference of exchange between currency

and bills, is from 70 to 80 per cent.

Before I left New York, I took a ride upon Long Island, the richest spot, in the opinion of the New Yorkers, of all America; and where they generally have their villas, or country houses. It is undeniably beautiful, and some parts of it are remarkably fertile, but not equal, I think, to the Jerseys. The length of it is something more than 100 miles, and the breadth 25. About 15 or 16 miles from the west end of it, there opens a large plain between 20 and 30 miles long, and sour or sive broad. There is not a tree growing upon it, and it is afferted that there never were any. Strangers are always carried to see this place, as a great curiosity, and the only one of the kind in North America.

Tuesday the 5th of August, being indisposed, and unable to travel any farther by land, I embarked on board a brigantine for Rhode Island. We made sail up the Sound with a sair wind, and after two hours, passed through Hell-gate. It is impossible to go through this place without recalling to mind the description of Scylla and Charybdis. The breadth of the Sound is here half a mile, but the channel is very narrow, not exceeding eighty yards: the water runs with great rapidity, and in different currents, only one of which will carry a vessel through with safety; for, on one side, there is a shoal of rocks just peeping above the water; and, on the other, a dreadful vortex produced by a rock lying about nine feet under the surface: if therefore you get into any but the right current, you are either dashed upon the shoal, or else sucked into the eddy, whirled round with incredible rapidity, and at length swallowed up in the vortex. There are exceeding good pilots to navigate vessels through this place, notwithstanding which, they are frequently lost. The proper time of passing it is at high water. We had pleasant weather during the passage, which is about seventy leagues, with beautiful views of Long Island and Connecticut; and arrived in the harbour at Newport the 7th of August.

This town is fituated upon a fmall island, about twelve miles in length, and five or fix in breadth, called Rhode Island, whence the province takes its name. It is the

capital city, and contains 800, or 1000 houses, chiefly built of wood; and 6 or 7000 inhabitants. There are few buildings in it worth notice. The court-house is indeed handsome, and of brick; and there is a public library, built in the form of a Grecian temple, and by no means inelegant. It is of the Doric order, and has a portico in front with four pillars, supporting a pediment; but the whole is spoilt by two small wings, which are annexed to it. The foundation of a very pretty building is laid for the use of the free-masons, to serve also occasionally for an assembly-room; and there is going to be erected a market-house, upon a very elegant design. The places of public worship, except the Jews fynagogue, are all of wood; and not one of them is worth looking at. They confift chiefly of a church, two prefbyterian meeting-houses, one quakers ditto, three anabaptifts ditto, one Moravian ditto, and the fynagogue abovementioned. This building was defigned, as indeed were feveral of the others, by a Mr. Harrison, an ingenious English gentleman who lives here. It will be extremely clegant within when completed: but the outfide is totally spoilt by a school, which the Jews would have annexed to it for the education of their children. - Upon a small island, before the town, is part of a fine fortification, defigned to confift of a pentagon fort, and an upper and lower battery. Only two of the curtains, and a ravelin, are yet finished; and it is doubted whether the whole will ever be completed. There are now mounted upon it 26 cannon; but the works, when complete, will require above 150.—At the entrance of the harbour there is likewife an exceeding good light-house. —These are the chief public buildings.

Three miles from the town is an indifferent wooden house, built by Dean Berkley, when he was in these parts: the fituation is low, but commands a fine view of the ocean, and of fome wild rugged rocks that are on the left hand of it. They relate here feveral stories of the dean's wild and chimerical notions; which, as they are characteristic of that extraordinary man, deferve to be taken notice of: one in particular I must beg the reader's indulgence to allow me to repeat to him. The dean had formed the plan of building a town upon the rocks which I have just now taken noticeof, and of cutting a road through a fandy beach which lies a little below it, in order that ships might come up and be sheltered in bad weather. He was so full of this project, as one day to fay to one Smibert, a defigner, whom he had brought over with him from Europe, on the latter's asking some ludicrous question concerning the future importance of the place: "Truly, you have very little forefight, for in fifty years time every foot of land in this place will be as valuable as the land in Cheapfide." The dean's house, notwithstanding his prediction, is at present nothing better than a farmhouse, and his library is converted into the dairy: when he left America, he gave it to the college at Newhaven in Connecticut, who have let it to a farmer on a long leafe: his books he divided between this college and that in Maffachufets. The dean

is faid to have written in this place The Minute Philosopher.

The province of Rhode Island is fituated between the 41st and 42d degree of north latitude; and about 72 or 73 degrees west longitude; in the most healthy climate of North America. The winters are severe, though not equally so with those of the other provinces; but the summers are delightful, especially in the island; the violent and excessive heats, to which America is in general subject, being allayed by the cool and temperate breezes that come from the sea. The soil is tolerably good, though rather too stony; its natural produce is maize or Indian corn, with a variety of shrubs and trees. It produces in particular the button-tree; the spruce-pine, of the young twigs of which is made excellent beer; and the pseudo-acacia, or locust-tree; but none of

those fine flowering trees, which are such an ornament to the woods in Carolina and Virginia. It enjoys many advantages, has several large rivers, and one of the finest harbours in the world. Fish are in the greatest plenty and perfection, particularly the tataag or black-sish, lobsters, and sea bass. In its cultivated state, it produces very little, except sheep and horned cattle; the whole province being laid out into pasture or grazing ground. The horses are bony and strong, and the oxen much the largest in America; several of them weighing from 16 to 1800 weight. The butter and cheese are excellent.

The province of Rhode Island is divided into counties and townships; of the former there are four or five, but they are exceedingly finall; of the latter between twenty and thirty; the towns themselves are inconsiderable villages: however, they fend members to the affembly, in the whole about feventy. The number of inhabitants, with Negroes, and Indians, of which in this province there are feveral hundreds, amounts to 35,000. As the province affords but few commodities for exportation; horses, provisions, and an inconfiderable quantity of grain, with spermaceti candles, being the chief articles; they are obliged to Connecticut, and the neighbouring colonies, for most of their traffic; and by their means they carry on an extensive trade. Their mode of commerce is this; they trade to Great Britain, Holland, Africa, the West Indies, and the neighbouring colonies; from each of which places they import the following articles: from Great Britain, dry goods; from Holland, money; from Africa, flaves; from the West Indies, fugars, coffee, and molafles; and from the neighbouring colonies, lumber and provifions: and with what they purchase in one place they make their returns in another. Thus with the money they get in Holland, they pay their merchants in London; the fugars they procure in the West Indies, they carry to Holland; the slaves they fetch from Africa they fend to the West Indies, together with lumber and provisions, which they get from the neighbouring colonies: the rum that they distil they export to Africa; and with the dry goods, which they purchase in London, they traffick in the neighbouring colonies. By this kind of circular commerce they fubfift and grow rich. They have befides thefe fome other inconfiderable branches of trade, but nothing worth mentioning. They have very few manufactures; they diftil rum and make spermaceti candles; but in the article of dry goods, they are far behind the people of New York and Penfylvania.

The government of this province is intirely democratical; every officer, except the collector of the customs, being appointed, I believe, either immediately by the people, or by the general assembly. The people chuse annually a governor, lieutenant-governor, and ten assistants, which constitute an upper-house. The representatives, or lower-house, are elected every half year. These jointly have the appointment of all other public officers, (except the recorder, treasurer, and attorney-general, which are appointed likewise annually by the people) both military and civil; are invested with the powers of legislation, of regulating the militia, and of performing all other acts of government. The governor has no negative, but votes with the assistants, and in case of an equality has a casting voice. The assembly, or two houses united, are obliged to sit immediately after each election; at Newport in the summer, and in the winter alternately at Providence and South Kingston in Narraganset: they adjourn themselves, but may be called together, notwithstanding such adjournment, upon any urgent occasion by the governor. No assistant, or representative, is allowed any salary or pay for his attendance or fervice.

There

There are feveral courts of judicature. The affembly nominates annually fo many justices for each township, as are deemed necessary. These have power to join people in matrimony, and to exercife other acts of authority usually granted to this order of magistrates. Any two of them may hear causes concerning small debts and trespasses: and three may try criminals for thefts, not exceeding ten pounds currency. Appeals in civil causes are allowed to the inferior courts of common pleas; in criminal ones to the fessions of the peace; and in these the determinations are final.—The sessions are held in each county twice every year by five or more juffices; they adjudge all matters relating to the prefervation of the peace, and the punishment of criminals, except in cases of death. Appeals are allowed from this court, in all causes that have originated in it, to the superior one.—The inferior courts of common-pleas fit twice every year in each county, and are held by three or more justices. They take cognizance of all civil causes whatsoever, triable at common law; and if any one thinks himself aggrieved here, he may appeal to the fuperior one; which is held also annually twice in each county, by three judges, and which exercises all the authority of a court of king's bench, commonpleas, and exchequer. The dernier refort is to the King in council, but this only in cases of 300l. value, new tenor. The people have the power of pardoning criminals, except in cases of piracy, murder, or high treason; and then it is doubted whether they can even reprieve.

There is no established form of religion here; but church of England men, independents, quakers, anabaptists, Moravians, Jews, and all other sects whatsoever, have liberty to exercise their several professions. The society for the propagation of the

gospel sends only four missionaries.

Arts and sciences are almost unknown, except to some few individuals; and there are no public seminaries of learning; nor do the Rhode Islanders in general seem to regret the want of them. The institution of a library society, which has lately taken place, may

possibly in time produce a change in these matters.

The character of the Rhode Islanders is by no means engaging, or amiable: a circumstance principally owing to their form of government. Their men in power, from the highest to the lowest, are dependent upon the people, and frequently act without that strict regard to probity and honour, which ought invariably to influence and direct mankind. The private people are cunning, deceitful, and selfish: they live almost entirely by unfair and illicit trading. Their magistrates are partial and corrupt: and it is folly to expect justice in their courts of judicature; for he, who has the greatest influence, is generally found to have the fairest cause*. Were the governor to interpose his authority, were he to resule to grant slags of truce †, or not to wink at abuses;

• The form of their judical oath, or affirmation (fays Douglas, in his fummary), does not invoke the judgments of the omnifeient God, who fees in feeret, but only upon peril of the penalty of perjury.—This does not feem (adds the fame author in a note) to be a faered or folemn oath, and may be illustrated by the story of two profligate thieves; one of them had stolen something, and told his friend of it: well, says his friend, but did any body see you? No: then, says his friend, it is yours as much as if you had bought it with your money. Vol. ii. p. 95.

† It was usual during the late war for several governors in North America, on receiving a pecuniary confideration, to grant to the merchants slags of truce; by which they were licensed to go to the French West Indian islands, in order to exchange prisoners. The real scope and design of the voyage was, to carry on a prohibited trade with the French, and to supply them with stores and provisions. Two or three prisoners were sufficient to cover the design; and in order to have a store in readiness, they seldom carried more. By this abuse both governors and merchants acquired great riches. Very plausible arguments indeed might be adduced against prohibiting, or even restraining a commerce of that nature; but as the wisdom of govern-

abuses; he would at the expiration of the year be excluded from his office, the only thing perhaps which he has to fubfift upon. Were the judges to act with impartiality, and to decide a cause to the prejudice or disadvantage of any great or popular leader, they would probably never be re-elected; indeed, they are incapable in general of determining the merits of a fuit, for they are exceedingly illiterate, and, where they have nothing to make them partial, are managed almost intirely by the lawyers. In short, to give an idea of the wretched state of this colony, it has happened more than once, that a perfon has had fufficient influence to procure a fresh emission of paper-money, solely to defraud his creditors: for having perhaps borrowed a confiderable fum of money, when the difference of exchange has been 1200 per cent. he has afterward, under fanction of the law, repaid only the fame nominal fum in new currency, when the difference has amounted perhaps to 2500 per cent.—Such alas! is the fituation and character of this colony. It is needless, after this, to observe that it is in a very declining state; for it is imposlible that it should prosper under such abuses. Its West Indian trade has diminished; owing indeed, in some measure, to the other colonies having entered more largely into this lucrative branch of commerce: it has loft during the war, by the enemy, above 150 veffels: its own privateers, and it has generally had a great many, have had very ill fuccess: having kept up a regiment of provincial troops, it has also been loaded with taxes, and many of the people have been oppressed by the mode of collecting them: for, the affembly having determined the quota of each township, the inhabitants have been affelfed by the town-council*, confifting of the affiftants refiding there, the justices of the town, and a few freeholders elected annually by the freemen; and thefe have been generally partial in their affefiments, as must necessarily happen under a combination of fuch circumstances.—After having faid so much to the disadvantage of this colony, I should be guilty of injustice and ingratitude, were I not to declare that there are many worthy gentlemen in it, who fee the misfortunes of their country, and lament them; who are fenfible that they arise from the wretched nature of the government, and wish to have it altered; who are courteous and polite; kind and hospitable to strangers; and capable of great acts of generofity and goodness, as I myself experienced during a very fevere fit of fickness which I lay under at this place. — The paper-money here is as bad as it is possible to be; the difference of exchange being at least 2500 per cent.

The 4th of September I took leave of Newport, and having croffed over the river at Briftol-ferry, where it is about a mile broad, and two other inconfiderable ferries, I arrived in the evening at Providence. This is the chief town of what was formerly called Providence Plantation in Narraganfet, and is at prefent the fecond confiderable town in the province of Rhode Ifland. It is fituated upon a pretty large river, and is diftant from Newport about thirty miles. In the morning I fet out for Bofton, and

ment did think fit, and probably with better reason, to forbid it; nothing could excuse the corrupt and mercenary spirit of those governors, who presumed to connive at and encourage it —The honourable Francis Fanquier, lieutenant-governer of Virginia, who, amongst some few others, never could be prevailed upon to countenance it, resusted at one time an offer of near 2001 for the grant of a permit to make a single voyage.

countenance it, refused at one time an offer of near 2001 for the grant of a permit to make a single voyage.

* Each township is managed by a town-council, consisting of the affistants who reside in the town, the justices of the town, and fix freeholders chosen annually by the freemen of the town; the major part of them is a quorum, with full power to manage the affairs and interest of the town to which they respectively belong, to grant licences to public houses: and are a probate office for proving wills, and granting administration, with appeal to governor and council, as supreme ordinary. Douglas's Summary, Vol. ii. p. 85.

arrived there about fun-fet, after a journey of five and forty miles. The country, which I travelled over, is chiefly grazing ground, laid out into neat inclofures, furrounded with ftone walls, and rows of pfeudo acacia or locust-trees, which are said with their leaves to manure and fertilize the land. I passed over a beautiful sall of water in Pantucket river, upon a bridge, which is built directly over it. The sall is about twenty feet high, through several chasms in a rock, which runs diametrically cross it, and serves as a dam to hold up the water. There are two or three mills, which have been erected for the advantage of having the different spouts or streams of water conducted to their respective wheels. These have taken very much from the beauty of the scene; which would otherwise be transcendently elegant; for the sall, though not large or upon a great scale, is by far the most romantic and picturesque of any that I met with in my tour.

During the course of my ride from Newport, I observed prodigious slights of wild pigeons: they directed their course to the southward, and the hemisphere was never intirely free from them. They are birds of passage, of beautiful plumage, and are excellent eating. The accounts given of their numbers are almost incredible; yet they are so well attested, and the opportunities of proving the truth of them are so frequent, as not to admit of their being called in question. Towards evening they generally settle upon trees, and sit one upon another in such crowds, as sometimes to break down the largest branches. The inhabitants, at such times, go out with long poles, and knock numbers of them on the head upon the roost; for they are either so fatigued by their slight, or terrified by the obscurity of the night, that they will not move, or take wing, without some great and uncommon noise to alarm them. I met with scarcely any other food at the ordinaries where I put up: and during their slight, the common people sub-

fift almost whosly upon them.

Boston, the metropolis of Massachusets Bay, in New England, is one of the largest and most flourishing towns in North America. It is situated upon a peninsula, or rather an island joined to the continent by an isthmus or narrow neck of land half a mile in length, at the bottom of a fpacious and noble harbour, defended from the fea by a number of finall islands. The length of it is nearly two miles, and the breadth of it half a one; and it is supposed to contain 3000 houses, and 18 or 20,000 inhabitants. At the entrance of the harbour stands a very good light-house; and upon an island, about a league from the town, a confiderable castle, mounting near 150 cannon: there are several good batteries about it, and one in particular very strong, built by Mr. Shirley. There are also two batteries in the town, for 16 or 20 guns each; but they are not, I believe, of any force. The buildings in Boston are in general good; the streets are open and fpacious, and well paved; and the whole has much the air of fome of our best county towns in England.—The country round about it is exceedingly delightful; and from a hill, which flands close to the town, where there is a beacon to alarm the neighbourhood in case of any surprize, is one of the finest prospects, the most beautifully variegated, and richly grouped, of any without exception that I have ever feen.

The chief public buildings are, three churches; thirteen or fourteen meeting-houses; the governor's palace; the court-house, or exchange; Faneuils-hall; a linen-manufacturing-house; a work-house; a bridewell; a public granary; and a very fine wharf, at least half a mile long, undertaken at the expense of a number of private gentlemen, for the advantage of unloading and loading vessels. Most of these buildings are handsome: the church, called King's Chapel, is exceedingly elegant; and sitted up in the Corinthian taste. There is also an elegant private concert-room, highly finished in the lonic

manner.—I had reason to think the situation of Boston unhealthy, at least in this season

of the year; as there were frequent funerals every night during my flay there.

The fituation of the province of Maffachufets Bay, including the diffrict of Plymouth*, is between the 41st and 43d degree of north latitude, and about 72 degrees west longitude. The climate, foil, natural produce, and improved state of it, are much the same as of Rhode Island. It is divided into counties and townships †; and each township, if it contains forty freeholders t, has a right to fend a member to the affembly §, the prefent number of representatives amounts to between 130 and 140; of which Boston fends four.

The number of fouls in this province is supposed to amount to 200,000; and 40,000 of them to be capable of bearing arms. They carry on a confiderable traffic, chiefly in the manner of the Rhode Islanders; but have some material articles for exportation, which the Rhode Islanders have not, except in a very trisling degree; these are faltfifh and veffels. Of the latter they build annually a great number, and fend them, laden with cargoes of the former, to Great Britain, where they fell them. They clear out from Boston, Salem, Marblehead, and the different ports in this province, yearly, about ton of shipping. Exclusive of these articles, their manufactures are not large; those of spirits, fish-oil, and iron, are, I believe, the most considerable. They fabricate beaver-hats, which they fell for a moidore a-piece; and some years ago they erected a manufactory, with a defign to encourage the Irish fettlers to make linens; but at the breaking out of the war the price of labour was enhanced fo much that it was impossible to carry it on. Like the rest of the colonies they also endeavour to make woollens; but they have not yet been able to bring them to any degree of perfection; indeed, it is an article in which I think they will not eafily fucceed; for the American wool is not only coarse, but in comparison of the English, exceedingly short. Upon the best inquiry I could make, I was not able to discover that any one had ever feen a staple of American wool longer than feven inches; whereas in the counties of Lincoln and Leicester, they are frequently twenty-two | inches long. In the fouthern colonies, at least in those parts where I travelled, there is scarcely any herbage ¶; and whether it is owing to this, or to the excessive heats, I am ignorant, the wool is short and hairy. The northern colonies have indeed greater plenty of herbage, but are for fome months covered with fnow; and without a degree of attention and care in houfing the sheep, and guarding them against accidents, and wild beasts, which would not eafily be compensated, it would be very difficult to increase their numbers to any great amount. The Americans feem very confcious of this fact, and notwithstanding a very

* Sagadahoc and the Main, very large territories, lying north of New Hampshire, belong also to the province of Massachusets Bay; they were annexed to it by the new charter of 1691. The Main forms one county called the county of York, and sends three members to the council; Sagadahoc, which is annexed to it, fends one. .

+ Townships are generally fix miles fquare, and divided into fixty-three equal lots, viz. one lot for the first settled minister as inheritance, one lot for the ministry as glebe-lands, one lot for the benefit of a fchool; the other fixty lots to fixty persons or samilies, who, within five years from the grant, are to erect a dwelling-house, and clear seven acres of land, sit for mowing or ploughing, &c.

† By the charter, every freeholder should possess freehold, or 50l. personal estate; but I believe this article has not been strictly adhered to.

§ Every town, containing forty freeholders, has a "right" to fend a member to the affembly, but is not abfolutely "obliged" to do fo, unless it contains eighty freeholders.

| The common average length, I am told, is about fixteen inches.

¶ I speak of the country in general; in particular spots, as at Greenway Court, the herbage is very fine and luxuriant.

fevere prohibition, contrive to procure from England every year a confiderable number of rams, in order to improve and multiply the breed. What the lands beyond the Alleghenny and upon the banks of the Ohio may be, I do not know; they are faid to be very rich: but the climate, I believe, is not lefs fevere; and I think, upon collating different accounts, that the feverity of heat and cold is not much abated by cultivation. The air becomes drier and more wholefome, in proportion as the woods are cut down, and the ground is cleared and cultivated; but the cold is not lefs piercing, nor the fnow lefs frequent. I think therefore upon the whole, that America, though it may with particular care and attention, produce fmall quantities of tolerably good wool, will yet never be able to produce it in fuch plenty and of fuch a quality as to ferve for the necessary consumption of its inhabitants.

The government of this province is lodged in the hands of a governor or lieutenant-governor, appointed by the king; a counfel of twenty-eight persons chosen annually, with the governor's approbation, by the general assembly *; and a house of representatives † annually elected by the freeholders. The governor commissions all the militia, and other military officers; and, with consent of the council, also nominates and appoints all civil officers, except those that are concerned in the revenue. He calls and adjourns the assembly, and has in every respect a very extensive authority. His falary, with perquisites, amounts to about 1,300l. sterling per year. The governor and council together have the probate of wills, and the power of granting administrations

and divorces.

There are feveral courts of judicature. All actions under twenty shillings sterling are cognizable by a justice of peace, from whose determination there lies an appeal to the inferior county-court of common-pleas; and from hence to the superior provincial court in its circuits, which is also a court of over and terminer in criminal affairs, and is held by a chief justice and some affistant judges. In this court, if the determination is not satisfactory, a rehearing of the cause may be had with a different jury ‡; and even, by petition to the general affembly, a second rehearing: the dernier resort is to His Majesty's council, but this is only in cases of 300l. sterling value; and the appeal

must be made within fourteen days after judgment.

The established religion here, as in all the other provinces of New England, is that of the congregationalists; a religion different in some trisling articles, though none very material, from the Presbyterian. There are, besides these however, great numbers of people of different persuasions, particularly of the religion of the church of England, which seems to gain ground, and to become more fashionable every day. A church has been lately erected at Cambridge, within sight of the college, which has greatly alarmed the congregationalists, who consider it as the most fatal stroke that could possibly have been levelled at their religion. The building is elegant, and the minister of it (the reverend Mr. Apthorpe,) is a young man of shining parts, great learning, and pure and engaging manners ||

* They are chosen by the new representatives, and the last year's counsellors; so that each counsellor has a vote in his own re-election. The governor has a negative to every counsellor's election, without being obliged to assign a reason.

† Each representative must be resident in the township for which he is elected; he must also have a plurality of votes respecting the number of voters, and not in comparison only of the other candidates; he apaid for his attendance and services, and subject to a fine if he neglects them.

I Juries are, I believe, appointed partly by lot, and partly by rotation.

This gentleman, I have heard, afterward met with so much opposition and perfecution from the congregationalists, that he was obliged to resign his cure, to quit the colony, and has since lived in England upon a living, (I believe in Surry,) which was given him by the late Archbishop Secker.

Arts and sciences seem to have made a greater progress here than in any other part of America. Harvard college has been founded above a hundred years; and although it is not upon a perfect plan, yet it has produced a very good effect. The arts are undeniably forwarder in Massachusets Bay, than either in Pensylvania or New York. The public buildings are more elegant; and there is a more general turn for mulic,

painting, and the belles lettres.

The character of the inhabitants of this province is much improved, in comparison of what it was; but puritanism and a spirit of persecution is not yet totally extinguished. The gentry of both sexes are hospitable and good-natured; there is an air of civility in their behaviour, but it is constrained by formality and preciseness. Even the women, though easiness of carriage is peculiarly characteristic of their nature, appear here with more stiffness and reserve than in the other colonics. They are formed with symmetry, are handsome, and have fair and delicate complexions; but are said universally,

and even proverbially, to have very indifferent teeth.

The lower class of the people are more in the extreme of this character; and which is conftantly mentioned as fingularly peculiar to them, are impertinently curious and inquifitive. I was told of a gentleman of Philadelphia, who, in travelling through the provinces of New England, having met with many impertinences from this extraordinary turn of character, at length fell upon an expedient almost as extraordinary, to get rid of them. He had observed, when he went into an ordinary *, that every individual of the family had a question or two to propose to him, relative to his history, and that, till each was fatisfied, and they had conferred and compared together their information, there was no possibility of procuring any refreshment. He therefore the moment he went into any of these places, inquired for the master, the mistress, the fons, the daughters, the men fervants and the maid-fervants; and having affembled them all together, he began in this manner: "Worthy people, I am B. Ft. of Phiadelphia, by trade a ----, and a bachelor; I have fome relations at Boston, to whom I am going to make a vifit; my flay will be short, and I shall then return and follow my bufiness, as a prudent man ought to do. This is all I know of myself, and all I can possibly inform you of; I beg therefore that you will have pity upon me and my horfe, and give us both some refreshment."

Singular fituations and manners will be productive of fingular customs, but frequently such as upon slight examination may appear to be the effects of mere grossness of character, will, upon deeper research, be found to proceed from simplicity and innocence. A very extraordinary method of courtship, which is sometimes practised amongst the lower people of this province, and is called tarrying, has given occasion to this reflection. When a man is enamoured of a young woman, and wishes to marry her, he proposes the affair to her parents, (without whose consent no marriage in this colony can take place); if they have no objection, they allow him to tarry with her one night, in order to make his court to her. At their usual time the old couple retire to bed, leaving the young ones to settle matters as they can; who, after having sate up as long as they think proper, get into bed together also, but without pulling off their under garments, in order to prevent scandal. If the parties agree, it is all very well; the banns are published, and they are married without delay. If not they part, and possibly never see each other again; unless, which is an accident that seldom happens, the forsaken fair one prove pregnant, and then the man is obliged to marry her,

under pain of excommunication 1.

The

^{*} Inns are so called in America. + Benjamin Franklin.

[‡] A gentleman some time ago travelling upon the frontiers of Virginia, where there are sew settlements, was obliged to take up his quarters one evening at a miserable plantation, where, exclusive of a negro or

The province of Massachusets Bay, has been for some years past, I believe, rather on the decline. Its inhabitants have lost several branches of trade, which they are not likely to recover again. They formerly supplied not only Connecticut, but other parts of the continent, with dry goods, and received specie in return; but since the introduction of paper currency they have been deprived of great part of this commerce. Their ship trade is considerably decreased, owing to their not having been so careful in the construction of vessels as formerly; their sisheries too have not been equally successful: they have had also a considerable number of provincial troops † in pay during the course of the present war, and have been burthened with heavy taxes. These have been laid upon estates real and personal. Some merchants in Boston, I have been credibly informed, have paid near 4001. Sterling annually. — Assessment are made by particular officers, who, with the select men, constables, overseers, and several others, are elected annually by the freemen, for the direction and management of each particular township.

There is less paper money in this colony than in any other of America; the current coin is chiefly gold and filver; and Boston is the only place, I believe, where there ever

was a mint to coin money.

I was told of a very impolitic law in force in this province, which forbids any mafter or commander of a veffel, to bring ftrangers into the colony, without giving fecurity that they shall not become chargeable to it.

However, notwithstanding what has been faid, Massachusets Bay is a rich, populous,

and well-cultivated province.

I cannot take leave of it without relating a very extraordinary story, communicated to me by persons of undoubted credit, as it further tends to illustrate the character and manners of its inhabitants.

Some years ago, a commander of one of His Majesty's ships of war being stationed at this place, had orders to cruise from time to time, in order to protect our trade and distress the enemy. It happened unluckily that he returned from one of his cruises on a Sunday; and as he had left his lady at Boston, the moment she heard of the ship's arrival, she hastened down to the water's side, in order to receive him. The captain on landing, embraced her with tenderness and affection; this, as there were several spectators by, gave great offence, and was considered as an act of indecency, and a slagrant profanation of the Sabbath. The next day, therefore, he was summoned before the magistrates, who with many severe rebukes and pious exhortations, ordered him to be publickly whipped. The captain stifled his indignation and resentment as much as possible, and as the punishment, from the frequency of it, was not attended with any great degree of ignominy or disgrace, he mixed with the best company, was well received by them, and they were apparently good friends. At length the time of the station expired, and he was recalled; he went, therefore, with seeming concern

+ Between fix and feven thousand, I believe.

two, the family confisted of a man and his wife, and one daughter about fixteen years of age. Being fitigued, he presently desired them to shew him where he was to sleep; accordingly they pointed to a bed in a corner of the room where they were sitting. The gentleman was a little embarrassed, but being excessively weary, he retired, half undressed himself, and got into bed. After some time the old gentlewoman came to bed to him, after her the old gentleman, and last of all the young lady. This, in a country excluded from all civilized society, could only proceed from simplicity and innocence; and indeed it is a general and true observation that forms and observances become necessary, and are attended to, in proportion as manners become corrupt, and it is found expedient to guard against vice, and that design and duplicity of character, which, from the nature of things, will ever prevail in large and cultivated societies.

to take leave of his worthy friends, and that they might fpend one more happy day together before their final feparation, he invited the principal magistrates and select men to dine with him on board his ship, on the day of his departure. They accepted the invitation, and nothing could be more joyous and convivial than the entertainment which he gave them. At length the fatal moment arrived that was to separate them; the anchor was apeak, the fails were unfurled, and nothing was wanting but the fignal to get under way *. The captain, after taking an affectionate leave of his worthy friends, accompanied them upon deck, where the boatfwain and crew were in readiness to receive them. He there thanked them afresh for the civilities they had flown him, of which he faid, he should retain an eternal remembrance, and to which he wished it had been in his power to have made a more adequate return. One point of civility only remained to be adjusted between them, which, as it was in his power, fo he meant most fully to recompense to them. He then reminded them of what had passed, and ordering the crew to pinion them, had them brought one by one to the gang-way, where the boatfwain stripped off their shirts, and with a cat-of-nine-tails laid on the back of each forty stripes fave one. They were then, amidst the shouts and acclamations of the crew, shoved into their boats; and the captain immediately getting under way, failed for England †.

The 12th of October I embarked on board His Majesty's ship the Winchester, of sifty guns Captain Hale commander, for the river Piscataqua, in New Hampshire;

and we came to an anchor there the next day, after a pleafant paffage.

The capital of this province is Portfmouth, which is fituated upon the river; it is an inconfiderable place, and chiefly built of wood. Very little can be faid of the province of New Hampshire, materially different from what has been faid of Massachusets Bay. — The climate, produce, trade, government, religion, and manners of it are much the same. — There are supposed to be about 40,000 inhabitants, 3,000 militia, and 6 or 700 provincial troops. — There are only two missionaries of the church of England, and one of these has lately applied to be removed to Rhode Island. - The chief articles for exportation are fish, cattle, ships, of which they annually build near 200, and masts for the royal navy. These are made of the white pine, and are, I believe, the finest in the world, many of them being forty yards long, and as many inches in diameter. They never cut them down but in times of deep fnow, as it would be impossible in any other feafon to get them down to the river. When the trees are fallen, they yoke feventy or eighty pair of oxen, and drag them along the fnow. It is exceedingly difficult to put them first into motion, which they call raising them; and when they have once affected this, they never flop upon any account whatfoever till they arrive at the water's fide. Frequently fome of the oxen are taken ill, upon which they immediately cut them out of the gears, and are fometimes obliged, I was told, to destroy five or fix pair of them. — The forests where these masts grow are referved to the crown, which appoints a furveyor of them, who is commonly the governor of this province. This is not the only expedient employed by government for the prefervation of fuch trees as may be of use for the royal navy; for there is an act of parliament, I believe, which prohibits under pain of certain fines and penalties, the

[•] This is usually written " under weigh:" but I am extremely doubtful of the propriety of the phrase.

[†] This flory has lately appeared in one of the English Newspapers, told with much humour, and with some difference respecting the occasion and mode of the captain's punishment. The author cannot take upon himself to say which account may be most exact, but he has chosen to abide by that which he heard at Boston. They either of them serve to characterize the people, and to answer the author's purpose in relating it.

cutting down or destroying of any white pine-tree of specified dimensions, not growing within the boundaries of any township, without His Majesty's licence, in any of the provinces of New England, New York, or New Jerfey; a restriction absolutely necessary, whether considered as securing a provision for the navy, or as a check upon that very destructive practice taken from the Indians, of fire-hunting. It used to be the custom for large companies to go into the woods in the winter, and to fet fire to the brush and underwood in a circle of several miles. This circle gradually contracting itself, the deer, and other wild animals inclosed, naturally retired from the flames, till at length they got herded together in a very fmall compass. Then blinded and suffocated by the smoke, and scorched by the sire, which every moment came nearer to them, they forced their way, under the greatest trepidation and dismay, through the flames; and were no fooner got into the open day-light again, than they were flot by the hunters, who flood without, and were in readiness to fire upon them. — The trees included within the circle, although not abfolutely burnt down, were fo dried and injured, that they never vegetated any more; and as the fire did not only contract itself inwardly, but dilated also outwardly, and fometimes continued burning for feveral weeks, till rain, or fome accidental circumstance put it out; it is incredible what injury and devastation it occasioned in the woods. — I was once a spectator of a similar fire in Virginia, which had happened through accident. Nothing could be more awful and tremendous than the fight. It was of great extent, and burned feveral weeks before the inhabitants could fubdue it. They effected it at last by cutting away the underwood, in wide and long avenues, to leeward of the fire, by which it was deprived of the means of communicating or spreading any farther. — In Virginia (and I believe the other colonies), there is an express act of affembly, passed in the 12th year of his late Majelly, to forbid this practice.

The province of New Hampshire, I was informed at Portsmouth, has grown rich during the war, by the loss of its own vessels, they having been commonly insured

above value.

The currency here is extremely bad, not better than that in Rhode Island.

Having travelled over so large a tract of this vast continent, before I bid a final farewell to it, I must beg the reader's indulgence, while I stop for a moment, and as it were from the top of a high eminence, take one general retrospective look at the whole. An Idea, strange as it is visionary, has entered into the minds of the generality of mankind, that empire is travelling westward; and every one is looking forward with eager and impatient expectation to that destined moment, when America is to give law to the rest of the world. But if ever an idea was illusory and fallacious, I am fully persuaded that this will be so.

America is formed for happiness, but not for empire: in a course of 1,200 miles I did not see a single object that solicited charity, but I saw insuperable causes of weak-

nets, which will necessarily prevent its being a potent state.

Our colonies may be diffinguished into the southern and northern, separated from each other by the Susquehannah and that imaginary line which divides Maryland from

Penfylvania.

The fouthern colonies have fo many inherent causes of weakness that they never can possess any real strength. The climate operates very powerfully upon them, and renders them indolent, inactive, and unenterprising; this is visible in every line of their character. I myself have been a spectator, and it is not an uncommon sight of a man in the vigour of life, lying upon a couch, and a semale slave standing over him, wasting off the sli s, and fanning him, while he took his repose.

The

The fouthern colonies (Maryland, which is the smallest and most inconsiderable, alone excepted) will never be thickly feated: for as they are not confined within determinate limits, but extend to the westward indefinitely; men, sooner than apply to laborious occupations, occupations militating with their dispositions, and generally considered too as the inheritance and badge of slavery, will gradually retire westward, and settle upon fresh lands, which are said also to be more fertile; where, by the servitude of a negro or two, they may enjoy all the satisfaction of an easy and indolent independency: hence the lands upon the coast will of course remain thin of inhabitants.

The mode of cultivation by flavery is another infurmountable cause of weakness. The number of negroes in the southern colonies is upon the whole nearly equal, if not superior, to that of the white men; and they propagate and increase even faster.— Their condition is truly pitiable; their labour excessively hard, their diet poor and scarty, their treatment cruel and oppressive: they cannot therefore but be a subject of terror to those

who fo inhumanly tyrannize over them.

The Indians near the frontiers are a still farther formidable cause of subjection. The fouthern Indians are numerous, and are governed by a founder policy than formerly: experience has taught them wisdom. They never make war with the colonists without carrying terror and devastation along with them. They sometimes break up

intire counties together.—Such is the state of the southern colonies.

The northern colonies are of stronger stamina, but they have other difficulties and difadvantages to flruggle with, not let arduous, or more easy to be furmounted than what have been already mentioned. Their limits being defined, they will undoubtedly become exceedingly populous: for though men will readily retire back towards the frontiers of their own colony, yet they will not fo eafily be induced to fettle beyond them, where different laws and polities prevail; and where, in short, they are a different people: but in proportion to want of territory, if we consider the proposition in a general and abstract light, will be want of power: but the northern colonies have still more positive and real disadvantages to contend with. They are composed of people of disferent nations, different manners, different religions, and different languages. They have a mutual jealoufy of each other, fomented by confiderations of interest, power, and afcendency. Religious zeal too, like a fmothered fire, is fecretly burning in the hearts of the different fectaries that inhabit them, and were it not restrained by laws and superior authority, would foon burst out into a slame of universal perfecution. Even the peaceable quakers flruggle hard for pre-eminence, and evince in a very flriking manner that the passions of mankind are much stronger than any principles of religion.

The colonies, therefore, feparately confidered, are internally weak; but it may be fupposed, that by an union or coalition they would become strong and formidable: but an union feems almost impossible: one sounded in dominion or power is morally so: for, were not England to interfere, the colonies themselves so well understand the policy of preserving a balance, that, I think, they would not be idle spectators, were any one of them to endeavour to subjugate its next neighbour. Indeed, it appears to me a very doubtful point, even supposing all the colonies of America to be united under one head, whether it would be possible to keep in due order and government so wide and extended an empire; the difficulties of communication, of intercourse, of correspondence, and all

other circumstances considered.

A voluntary affociation or coalition, at least a permanent one, is almost as difficult to be supposed: for fire and water are not more heterogeneous than the different colonies

in North America. Nothing can exceed the jealoufy and emulation which they posses in regard to each other. The inhabitants of Penfylvania and New York have an inexhaustible fource of animosity, in their jealoufy for the trade of the Jerseys. Massachusets Bay and Rhode Island are not less interested in that of Connecticut. The West Indies are a common subject of emulation to them all. Even the limits and boundaries of each colony are a constant source of litigation. In short, such is the difference of character, of manners, of religion, of interest, of the different colonies, that I think, if I am not wholly ignorant of the human mind, were they lest to themselves, there would soon be a civil war, from one end of the continent to the other; while the Indians and negroes would, with better reason, impatiently watch the opportunity of exterminating them all together.

After all, however, suppossing what I firmly believe will never take place, a permanent union or alliance of all the colonies, yet it could not be effectual, or productive of the event supposed; for such is the extent of coast settled by the American colonies, that it can never be defended but by a maratime power. America must first be mistress of the sea before she can be independent or mistress of herself. Suppose the colonies ever so populous; suppose them capable of maintaining 100,000 men constantly in arms, (a supposition in the highest degree extravagant), yet half a dozen frigates would, with ease, ravage and lay waste the whole country from end to end, without a possibility of their being able to prevent it; the country is so intersected by rivers, rivers of such magnitude as to render it impossible to build bridges over them, that all communication is in a manner cut off. An army under such circumstances could never act to any pur-

pose or effect; its operations would be totally frustrated.

Further, a great part of the opulence and power of America depends upon her fisheries, and her commerce with the West Indies; she cannot subsist without them; but these would be intirely at the mercy of that power, which might have the sovereignty of the seas. I conclude therefore, that England, so long as she maintains her superiority in that respect, will also posses a superiority in America; but the moment she loses the empire of the one, she will be deprived of the sovereignty of the other: for were that empire to be held by France, Holland, or any other power, America, will, in all probability, be annexed to it.—New establishments formed in the interior parts of America, will not come under this predicament; I should therefore think it the best policy to enlarge the present colonies, but not to establish fresh ones; for to suppose interior colonies to be of use to the mother country, by being a check upon those already settled, is to suppose what is contrary to experience, and the nature of things, viz. that men removed beyond the reach of power will be subordinate to it.

October 20. I embarked again on board the Winchester, for England; and arrived in Plymouth Sound the 21st of November, after a rough and tempestuous

voyage.

TRAVELS TO GUAXACA*,

CAPITAL OF THE PROVINCE OF THE SAME NAME, IN THE KINGDOM OF MEXICO.

BY M. NICOLAS JOSEPH THIERY DE MENONVILLE.

Avocat de Parliament, and Botanist to the King.

FTER communicating to the minister of His Majesty at the head of the naval department the plan I had laid of naturalizing the nopal and cochineal insect in the French colonies, and receiving with his approbation of my design the means requisite for insuring its success, I made all diligence to put this plan in practice.

In this view I embarked for Port-au-Prince, and arrived there after a passage, equally tedious and fatiguing, of fixty-fix days. Tired and disgusted with the sea I determined on enjoying ease for the space of a month or two on shore, a relaxation for which length of time appeared to me necessary towards my becoming acquainted with the mode to be adopted for penetrating into the interior of the Spanish territory bordering on that belonging to France, whence I expected to find a more ready conveyance to Vera Cruz, or to Honduras. Already had I formed schemes for proceeding to Santo Domingo, or, at any rate, for seeking at the Cape an opportunity of reaching Havannah by the vessels of the Assiento company, which pass between that place and the Cape in the traffic for slaves; but I could not disguise from myself that either of these two plans was attended with inconvenience.

In the first place, I might experience a tedious delay by waiting at the Cape till a vessel should fail for the Havannah. On the other hand, a journey to Santo Domingo would present many difficulties to an individual unacquainted either with the roads or the usages of the inhabitants, and naturally alarmed by the accounts he received of the

little intercourse subsisting between the colonists of the two nations.

I was still wavering in opinion respecting the most prudent plan to adopt, when, by one of those fortunate events which, occasionally, in my travels, I was so happy to experience, I was relieved from all perplexity.

I learned that a merchant of Port-au-Prince was about to dispatch a brigantine to Havannah for the purpose of recovering the cargo of a vessel which had been wrecked in

its vicinage.

Instantly, altogether mindless of the comforts I began to enjoy in a country which I had so ardently defired to see; disregarding the want even which I physically experienced of some repose, I resolved to avail myself of this opportunity. Repairing,

^{*} The same with Oaxaca, pronounced 'Hooah'-haca.

therefore, to the intendant * of the colony, I obtained from him a paffport in which I was defignated botanist and physician. This latter title, to which I had just pretenfions, possessing a diploma for the practice of physic, I conceived would enable me to travel with additional pleasantness, and render me less suspected than I might otherwise be in my incursion into New Spain. To conclude, I received, in lieu of fix thousand livres promised me by the minister of the navy, no more than four thousand, a circum-

flance occasioned by the deficiency of money in the treasury.

However fmall this fum I refrained from all contention in the matter. I was indeed far more fearful of not undertaking the voyage than of the want of comforts to which I might be exposed; nay, after a nice computation of the amount I might need, I decided on carrying with me no more than two thousand livres; nor let my decision be charged with arifing from a fordid parfimony, it was not for my individual benefit I thus made a retrenchment from the expence incident on an undertaking of fuch importance, and refolved on fubmitting to every facrifice to enfure its completion: no; by thus acting I preferved a refource in case of the failure of my first attempts. Eventually I might meet with opposition to my views at the Havannah, and waste there much time and money; in which case I should have means left for trying other expedients, feeing that Porto Bello, Carthagena, and St. Thomas de Honduras, were fo many other roads I might attempt with prospect of success. Indeed, I computed on no other heavy expences than those which the different charges for passage would occasion, as I made up my mind beforehand to subsist on bread and water on my journey, supported by the pleasing reflection that should I meet with shipwreck I yet had two planks remaining, one in the hands of a trufty friend, and the other in the

My preparations were fimply and fpeedily effected: a few clothes, fome fruit and other refreshments, but especially a number of phials, flasks, cases, and boxes of all

fizes, comprized the whole of my little cargo.

I embarked † on the 21st January 1777, on board the brigantine Dauphin, pierced for fixteen guns, and an excellent failer. At ten P. M. we weighed anchor, and by eight the next morning, under favour of a breeze from the cast, were a-breast of the Point of Gonave.

We steered on different tacks the whole of the 22d, in the channel of Gonave; by eight P. M. we were under Mount Louis, and attempted to double the point of Saint Mark; the wind blew from the N. E., and enabled us to effect this object in course of the night, which was remarkably fine: a meteor, resembling an arrow of fire, shot horizontally from east to west through the atmosphere, at an elevation of eight hundred toises; its course marked by a broad train of light.

By morning on the 23d we had passed Point St. Mark, and distinguished the bay of Gonaves, and the table of St. Nicholas Mole; at noon we perceived from one point Gonave, Point Mayzi in the island of Cuba, and the crazy Cape (Cap a Fou) of St. Nicholas Mole. The shores of Cuba on this eastern side scened to me of equal

elevation with those of Santa Domingo.

The 24th, at ten in the morning, I observed two very light and broken clouds, resembling reeds, spreading through the space of a league, and crossing each other at obtuse angles, whence I conjectured that in the upper regions of air two different

* M. de Vaivne, now (at the publication of the book) intendant-general of the colonies.

‡ About 5000 feet.

[†] Notwithstanding this journal of the voyage from Santo Domingo presents little that is interesting, it has, for the benefit of scamen, been thought right to give it insertion.

currents existed, one of which, by obtaining predominance over the other, would necessarily cause the wind to change which at that period filled our fails. This day we coasted along the whole of the south-eastern shores of the island Cuba, in length at least thirty leagues. The lands in this part are so high that during almost the whole day the clouds sloated below the summit of the mountains. The coast, very losty towards the east, becomes insensibly less steep as you proceed south-west, until at length it sinks into a low shore. At Cape Cruz the country has a barren appearance; the mountains are steep and craggy, with many black rocks which project considerably, and there is no appearance either of cultivation or inhabitants: we were but four leagues off this coast, and distinguished at the time that of Jamaica. When the moon rose we noticed a repetition of the phenomenon of the crossing clouds.

On the 25th a moderate wind, affifted by the currents, carried us out of fight of the shores of Cuba. We caught a seine, two seet long, weighing six pounds, and beautifully marked with blackish vertical stripes. At eight P. M. the wind freshened to that degree we were obliged to lower our main top-gallants, take in our sweeps, and reef our top-sails: the sea ran high and the vessel pitched terribly; fortunately the

moon, now at her full, afforded us a welcome light.

The wind during the 26th still continued violent, with a heavy sea, but this gradually became more calm as the wind, which was from the north-east, abated of its force. The wind continued on our quarter during the remainder of the day, so that we made nine knots an hour. At noon we discovered the island of Caymans, very low, almost covered by the sea, and apparently four leagues distant; we were now on the parallel of the Jardin de la Reyna, expecting on the morrow to see the Island de Pozos (of Wells). At eight we caught a caranque, a kind of perch.

The evening was ferene, the wind abaft from the west. At eight o'clock more than five hundred porpoises were seen frolicking before us in the water; of these one was taken five feet long; this, which was a female, I dissected, and described. At three P. M. on the 27th, we perceived El Jardin de la Reyna, low islands adjacent to that of Pines: we therefore had made a progress of sixty leagues from yesterday.

The whole night we had fair weather with a good breeze; but as all the currents off this coast run towards the shore, we were under necessity of steering south-west till day-

break, with little fail out.

On the 28th we again fleered north-west. By eight in the morning we made the Isle of Pines; this is a very long island: on it are three mountains, and a flat country covered with lofty trees, and scemingly adapted to cultivation. At three P. M. we diftinguished the Eastern Cape, preceded by a chain of mountains, some of them separate from the others. This cape confifts of low lands, which firetch into the fea the distance of fix leagues. We made off here ten knots an hour, with a brisk gale from the N.N.E. In the evening we distinguished Cape Saint Antonio, but as there are breakers four leagues out at fea, we dared not venture to double it during the night; we therefore fleered with little fail till eleven at night, making frequent tacks; but the man at the helm being overcome with fleep, by two A. M., we found ourfelves fleering for land a league only a-head; immediately we changed our tack, and backed fails; at five A. M. we refumed our courfe, and doubled the cape at a league diftant. The low lands of this cape appear fertile, being covered with large and beautiful trees. At eleven o'clock we were near the shallows, on which we perceived the vessel whose cargo we came to demand. These shallows abound in little islets, and extend from feven to eight leagues out to fea, in a direction north and fouth. The water above them is of an emerald green, brilliant and pellucid when looked at in a glafs; the 5 D 2

colour of the furrounding fea is a deep blue. The greatest depth of water in this bank does not exceed eight feet; so that not the smallest craft dare venture to cross it at right angles. When upon the skirts of this shallow we saw distinctly the bottom veined black and white, though there was sifteen fathoms water. We immediately veered about and steered N. W. and saw a French vessel imitate us. We were obliged all night long to steer upon different tacks, first N. W. and then S. W., the wind being adverse.

The 30th the wind blew still from the same point, with less or greater violence: whether the men at the helm had steered false during the night, or whether the ship had deslected from her course owing to the currents, we found ourselves three leagues to leeward of our reckoning; indeed, we again distinguished the vessel belonging to the owner of our ship near the shore, bearing S. E., and by it a boat leaving a cove in

its vicinage.

The 31st we found ourselves fifteen leagues above the shoal; in fact, after tacking, by four P.M., we again had sight of Cape Saint Antonio, four leagues below us. In the evening a mizzling shower obscured objects from our view, but after the rain the wind

veered to the north, when we steered eastward.

The 1st of February in the morning, the wind blowing from the fouth-east, we directed our course northward: during the whole night we ran along the coast, steering E. N. E., but out of fight of land. The winds were this day so adverse that spite of our reckoning we were much embarrassed to know where we were, but supposed ourselves near to land, and being unwilling to continue out of fight of it, we steered S. E.

under eafy fail throughout the night.

On the 2d at day-break, we made land three leagues distant, but were unconscious what part. By noon, however, we clearly distinguished a forry hamlet, composed of a few straw-houses, which we ascertained to be Batcyaouda. We now continued our course with all fails set, and under main and mizen top-gallants; nevertheless, we were unable to setch the Havannah, though we had a highly picturesque prospect in our run of twelve leagues along the coast, of very losty mountains, with sudden and pleasing intervals; the mountains, from the effect of shade, occasionally appearing perpendicular. At length night came on, when we found ourselves opposite a very large mountain. Here we backed sails. This whole coast, bounded by shoals, the whole distance from Cape Saint Antonio, appears to be very unhealthy.

We remained opposite this mountain the whole night, for fear of passing the Havannah, the precise site of which was unknown to us, in order not to near the land too close, taking care to keep constantly founding. The wind, on this occasion, which was very violent, and the strength of the currents, gave us constant trouble, and much

fatigued our crew.

On the 3d at dawn of day, we had deflected nearly ten leagues towards the E. S. E. and were opposite Marian's Table, a remarkable object, the form of which is described in the journal of a previous voyage. This table is the annunciator of the Havannah, which is situate three leagues beyond, and is readily distinguished by two hills, near to each other, in the shape of the semale breast. We now unfurled all fails, and by nine in the morning distinguished the city.

As foon as within fight of it, we hoisted the French slag; an instant after we saw three slags raised as signals on a bastion of fort Moro. The view of the city, the Havannah, occasioned in me a singular emotion. The cities of our colonies refemble nothing better than an assemblage of sishermen's huts constructed in lines; but the fortresses of the Havannah, its numerous domes, its lofty steeples, the red tops of

its houses, its high and white buildings, all give it the appearance of an European

town, and powerfully awakened in me the recollection of my darling country.

From the rampart we were directed, through a speaking trumpet, to cast anchor; but the noise of the waves breaking against the rocks, the whistling of the wind, and the clamour of the crew, combined to prevent our comprehending exactly what was prescribed, and consequently our obedience of the prescription; nay, allowing that the injunctions had been fairly understood, as we could not conceive the necessity of them, they yet would have been difregarded; hence, partly from chance, partly from design, availing ourselves of the wind and tide, which carried us forward through the narrow strait almost in spite of exertion, we steered under full fail into the mouth of the port; thus, by one of those adventurous darings, which are common perhaps to Frenchmen alone, we cut short many ceremonies. It is indeed true, had the commander of the fort been a man more inclined to form and severity than the one who fortunately for us was in station, we should not have acted thus, without imminent risk of a few ungrateful falutes from twenty-four pounders.

The whole city affembled to enjoy the spectacle of a foreign ship entering the port without first casting anchor. The captain, who afterwards carried me to Vera Cruz, was among the number: he told me that our temerity occasioned him the utmost astonishment, and that ours was the only vessel which had ever made so bold an attempt

without having cause for repentance.

Be this as it may, beyond the Moro fort we were met by the barge of the-captain of the port, making towards us with great speed, and which completed our pilotage to an anchoring: by him we were conducted into the basin, and placed in front of the

government-house, under the cannon of the captain of the port.

We had fcarcely cast anchor before we were surrounded by a number of boats, in which were many idlers, and inquifitive individuals, who immediately boarded us; four officers of the customs came in the number, who were succeeded by a major of the navy, with four foldiers from the ship of the admiral of the port, a vessel of fixty-four guns; finally, the aide-major of the place, with a ferjeant and four fufileers feconded these; our brigantine was crowded, and resembled a prize; the officers of the contadors, and those belonging to the navy and the land fervice, separately interrogated us, and received our declarations in writing of the motives of our voyage. For my part, I stated that I was a botanist, and came with intention of herborising. In reply to the confequent question, if we had not plants in our own country? I acknowledged that we were not deficient in that respect, but that those of the Havannah had the credit of possessing fuperior virtues. This, like all those representations which flatter Spanish vanity, attracted towards me a degree of confideration which was the more augmented, when by a viso of my passport, they noticed I was a regular physician: at this instant also a paffenger fecretly, and in confidence, imparted to fome of the Spaniards that I was not only a physician, but one also of great eminence, who, however, wished to hide my abilities, fearful if they should become public, that I might be impelled to exercise them in the city: this communication much encreased the respect shewn to me from feveral quarters.

While at anchor we had notice given that we could not be permitted to land, and two guards belonging to the contador were left on board until orders should be received from the governor, who was absent, and not expected to return before a week should pass; learning this, we resolved on addressing a memorial to him, but were void of expectation of any answer before the lapse of two days; we were consequently

obliged to arm ourselves with patience.

One of our passengers having ventured to land, and proceeded so far as to pass for the captain of the ship, was detected in his imposture, and sent back under a guard of

four musqueteers.

This act of imprudence was nigh being of ferious injury to us: it caused us to be looked upon with suspicion, and we in consequence were very narrowly watched; for three successive nights I observed their boats, which relieved one the other every hour, and were constantly rowed round our ship, sounding with graplings to determine whether or no any thing had been cast overboard; in the day-time also nothing was allowed to

leave the ship without being first subject to the nicest scrutiny.

So little congenial with my feelings was this mode of life, that it caufed me to look upon our ship as a prison: the fancy had a powerful effect on me; and whether to this, whether to the thick and heavy air we breathed in the port, enclosed as it is by hills on every side, the complaint was to be ascribed, I felt a violent head-ach, and breathed with great difficulty; succeeded to these symptoms a fever, with prognostics of a serious disorder. I immediately had recource to a strict diet, and pectoral and refreshing potations; and the very day wrote to M. Dorrira, the intendant of the port, to the Marquis de la Tour, the governor, and to Don Juan Davant, the King's lieutenant, exposing in my letters that my profession was one which could give no room for suspicion, and my state of health such as rendered consinement on board the ship not only very irksome, but even dangerous; I represented to them, moreover, the persuasion I felt, from the high opinion held of them by the public in general, that, under the circumstances I detailed, they would offer no objection to my request to be allowed to go on shore.

By eight o'clock in the morning next day I dispatched my letters, and as early as nine I received a most obliging and favorable answer from the intendant; but already the King's lieutenant, apprehensive for my health, the injury I sustained, which had been confirmed to him, fent the aide-major of the place on board, to bring me on shore, and offer me the house of one of his friends for my residence until I should recover.

I immediately left the ship, leaving my effects on board, fearful of the arrival of some counter-order, and afterwards paid a visit to the two gentlemen mentioned, for the purpose of returning them my thanks. In M. Dorrira, formerly consul at Bourdeaux, I noticed a highly prepossessing physiognomy, a serious, but at the same time mild deportment, accompanied by much affability, every appearance of a worthy character, and, finally, somewhat of French in his manners. He is a knight of the order of St. Charles; and, respecting his deserts, his integrity, and benevolence, there exists but one and that a highly flattering opinion. Don Juan Davant is one of those veteran and gallant military characters whom experience has rendered consummate in his duty, full of frankness, and possesses whom experience has rendered consummate in his duty, stull of frankness, and possesses he is brigadier of the armies, and general inspector of the colony.

Both these gentlemen received me in the most handsome manner, begging my pardon even for their ignorance of my indisposition: they proffered their services to me in every respect, and to confirm definitively the order for my landing, which hitherto

had been but provisional.

I held a long discourse with the intendant on subjects regarding natural history, commerce, and manusactures; on his part he related to me, with much gratification to himself, the fact of certain bees which had accidentally been transported to the Havannah from Florida, having multiplied to such a degree as to produce a very important branch of commerce and taxation, and this in the very limited space of fix years.

For

For the King's lieutenant he made many enquiries respecting the population of our colony in St. Domingo; its actual strength in European soldiers, colonial troops, and militia: he frankly exposed to me those of the island of Cuba; and testified a full confidence in the perpetuation of the alliance subsisting between France and Spain.

He was so obliging to admit my request of being allowed to pay my respects to him, as also was the intendant: he even solicited me to make my visits frequent, an invi-

tation of which I availed myself with much satisfaction during my stay.

On leaving them I took a lodging in an inn in the great fquare, where then the palace of government was building, and where already the office of accounts (contadoria) had been completed.

The land air, liberty, the grateful reception I experienced, these combined had a very falutary influence on my health, which was almost instantly evinced: three days were sufficient to effect my perfect restoration.

I then had opportunity of furveying the whole of the town and its environs, and

began to augur favourably of my travels.

On the return of the governor I hastened to pay my respects to him. The intendant had already acquainted him with my landing: he received me with kindness, and granted me permission to herborise within the precincts of the city; but while the appeal of humanity to his finer feelings enacted a grant of wider extension, the imperious obligation of the law forbade the allowance; he even in express terms prohibited my advancing farther inland than ten leagues from the city. I returned him thanks in the most cordial manner for the licence I received, and not only, at my request, obtained leave to pay my respects to him; but, after taking coffee, was politely invited to dine with him the fucceeding day. I found him furrounded by many perfons of rank, as well military as others, to whom he introduced me, and especially Don Luis Huet, director-general of the engineers and of fortifications, whom he informed me was of French extraction. On my praifing a very beautiful fquirrel from Mexico, of which, as well as of a parrot, I begged his permission to take a likeness, he insisted on my accepting both the one and the other; but this excess of liberality I declined. Shortly after he made me withdraw into his cabinet to converse respecting France: his questions, as well as his eafy and noble manners, flamped him diffinctly a finished courtier: our conversation afterwards turned upon the arts. On this occasion he led me to an alley he had planted with trees, and which I had previously seen: I frankly imparted my difapprobation of the manner in which the ground was laid out; and after giving my reasons why, in fuch a burning climate, it ought rather to be covered with turf, he felt conviction. The stage formed the next subject of our discourse: he shewed me the design for the curtain of the opera-house he had built, and on the boards of which he had fucceeded in caufing the Didone of Metastasio to be represented: the design was a. delicately flattering compliment paid the governor by the inhabitants, and one that, for an American city, might juftly be confidered of lively invention; but the execution of the draught by no means corresponded. Phæbus was represented in the chariot of day, leaving the palace of the hours, and illuminating with his beams the city of the Havannah, personified under the figure of a female, seated at the foot of a tree, near the margin of the fea, and fronting the Moro castle: she was crowned with towers and battlements, and rested her right hand on a shield displaying the arms of the city, while with the other she wantoned with genii. The fault in the execution chiefly confisted in the forced compliment intended for the marquis, and the confequent inappropriate representation of "the gorgeous palace of the sun." Here, the name of the governor being de la Tour, the fun was represented issuing from a very small tower, the gate of

which, disproportionately small, resembled more that of a dungeon than a porta for the passage of the radiant car of the sun, and its sour impetuous coursers. I pointed out this defect to the governor, observing at the time that seemingly the painter was ignorant of the metamorphoses of Ovid, and the pompous description of the palace of the sun, in that work beginning Regia folis erat. He sought excuse for the painter, and recommended me to go to the opera; at length I left him, greatly pleased with my reception, and perfectly easy respecting my sojourn at Havannah.

The following day I visited the opera: the interior constructed on the plan of that at Naples, is truly handfome, and possesses an airiness and elegance peculiar to itself, arifing from the circumstance of the boxes being separated from each other only by delicate balustrades very wide apart: through every part of the house sound is conveyed diffinctly; and from every quarter there is a perfect view of the stage; add to thefe, the pit has the advantage, uncommon in France, of feats for the spectators. opera was performed in a manner, in my opinion, fuperior to any I had ever feen before. Æneas was represented by an Italian virtuoso, of exquisite voice, a most elegant figure, and noble countenance, and, with these prepossessions in his favor, who thoroughly comprehended his part, and acted in the first style: a Castilian was the Dido of the piece, her confident a mulatrefs, and Yarbe was given by a Spaniard: thefe three actors, a circumftance certainly not very common, alike fang with tafte and precifion, and admirably played alike the different characters. This was the first opera at which I had been prefent, where in lieu of the repeated thumps of a clumfy and noify truncheon, the time was led by a violin of extraordinary power and precision, played by the fecretary of the governor, which inspired the whole of the performers with an accuracy, a truth of expression, that rendered the harmony complete: through the whole piece I found no room for the flightest blame, except on the introduction of a folo, intended no doubt to display the superior abilities of an exquisite violin, and which perfectly effected this end, but which at the fame time interrupted the concatination of the piece, and necessarily caused a diminution of interest in it among the audience.

However pleased with the opera, with their comedia I was far from satisfied; so many things in it occurred opposite to the taste and rules by which we are guided in France, that I saw nothing but ridiculous defects, of which these are some specimens: the name of God, of Jesus, of the Virgin, and of various saints occur in almost every phrase: the actors generally, but especially the women, never make their appearance without a rosary of beads; in every scene a duel is introduced; do two lovers meet, the scabbard must of consequence be emptied, and between two parentheses you read (Saca la Spada); all pieces, whether comic or tragic, are not only comedias, but comedias famosas, however wretched the piece, however despicable the author: to complete the picture, the titles of their pieces are ridiculously filly, as an instance, La cabellera de

Abfalon. The long hair of Abfalom.

The comedia which fucceeded the opera, was of a fingular description: a fingle actor kills a dozen men, women, and children, without the slightest resistance on their parts, and ranges them in a row as he stabs them; the work complete, he calmly wipes his dagger on the upper leather of his shoe; this scene, so strange is the depravity of Spanish taste, was regarded as very fine. For my part, as it was carnival time, I imagined that this was an emblematic representation of the horrors attendant on drunkenness; but enquiring of one near me, I learnt I was mistaken: still, notwithstanding what I have observed, I have since discovered in their works of this kind abundance of wit, and many passages remarkable for their spirituality, delicacy, and gallant bearing. The author most admired at present is Calderon de la Barca.

The

The following day I again paid a vifit to the governor, and fpoke to him of what I had feen, when the account I rendered appeared to give him great fatisfaction.

I prefented to him, as I had previously to the intendant, a small packet of feeds for the kitchen garden, and flower-feeds: these he divided, giving part to Don Luis Huet, who dined with him that day; and, as I afterwards understood he was a planter, I begged his acceptance of another packet: he expressed with great civility the inclination he selt to form an acquaintance with me; in consequence, I invited him to my apartments, and a few days after he came in his carriage to take me to his country-house: here I found his lady, a Genoese of noble birth and extraordinary merit, one of his daughters, and an officer of the artillery. After breakfast, we went into the garden and sewed all the feeds which I had presented to him: our pastime was truly a sessival, enlivened by gaiety, wit, well merited compliments, and the most pleasing conversation, in which due regard was maintained to decorum; in short, so agreeably sped the moments that we past through four hours of toil and scarcely thought them one. After our gardening was simissed, a very delicate dinner was served up in the French stile: cards were then introduced; and when we had taken a walk through the plantation, we returned to town.

This villa is fituate under the cannon of Fort Principe, which was planned by Don Luis Huet himfelf; and the works of which he pointed out to me with as much confidence as if we had been for years acquainted: the foil is flony and dry; still manive, called by the Spaniards yacca, is cultivated here; and such is the industry of the proprietor of the ground, that its produce yields an annual revenue of three thousand

piasters.

Don Luis Huet is a man in high esteem for ability in his profession, as well as for his partiality to literature. With the confidence of the court he enjoys the respect of the people; and his rank of colonel, places him in a condition to look forward to a still more

distinguished appointment.

His house was that where I most frequently visited at the Havannah. Occasionally I went to pay my respects to the governor, the intendant, and the King's lieutenant: the rest of my time was employed in botanical excursions round the town, in studying the Spanish language, and pondering on the most material, the chief object of my travels.

Still I must confess time flew with leaden wings during my stay at the Havannah, a stay of more than six weeks.

The promife of the exterior of the city of the Havannah is belied by its internal appearance, which has little in it pleafing; its length is about a mile and a half (1240 toifes); its breadth three quarters of a mile (600 toifes); its fite is on a rock on the fea fide, and its form a femicircle, or rather femiellipfis, the greater diameter being along the shore; the houses are all of them built of stone, from one to three stories high; it contains four very extensive squares, which however are only half sinished, possess little symmetry, and are covered every where with rubbish; the streets are regular and straight, but narrow, with a foot-pavement on each side, and an unpaved road in the midst, in which two carriages can scarcely pass abreast; as the city is on a dead level, the water frequently stagnates on the rock, in which deep ruts have on progress of time been formed by the wheels of carriages; a plan has been proposed for repairing the road, paving it, and giving it a slope; but the mode of paving projected, a specimen of which I saw in some of the streets near the government-house, is too singular to pass unmentioned. The material employed is blocks of iron wood, ten inches square, connected with other blocks longitudinally laid like a

Vol. XIII. 5 E floor;

floor; the folidity of this pavement is fuch, that notwithstanding the roads thus made have been travelled over for two years by a vast number of carriages, no trace on the wood of any wheel is feen, nor have the blocks in any part been diffurbed from their original position. Should the plan be carried into effect, and the whole city be thus paved, it will display a very curious and special fingularity. Towards the land side the Havannah is not strong, as it is defended merely by a simple curtain, slanked by bastions, and almost in every part without a ditch, owing to the immense labour requifite to excavate the rock; it is however now fecured from any attack on this fide by the Fort del Principe, built eight hundred toifes (nearly one mile) in advance, on an eminence which stretches to the town: on the fide next the fort it is inaccessible. The port, one of the most beautiful and spacious in the world, is a bason nearly circular, which receives feveral finall rivers; it runs a league in depth from the neck to the extremity; the entrance is protected on the town fide by a fort, opposite to the wall and fides of three bastions, which, placed one above the other in tiers, command the anchorage in the road; on each of the flanks of these bastions there are commonly mounted eighteen twenty-four pounders: on the fide fronting the country, a wall built on a rock, till the arrival of the English before it, considered impregnable, defends the entrance of the port; the Cavana, another fortress newly constructed above the wall, commands both the port and city, and its fire croffes that of Fort del Principe; finally, two other small forts at the bottom of the port, two tiers of guns on low batteries beneath the wall, the Cavana along the shore, and a battery level with the water, render this city extremely formidable: it is supposed that its different defences mount altogether eight hundred pieces of cannon, chiefly twenty-four pounders. Never will it be attempted on the part of any nation to force the gut, for fuch an attempt would be madnefs: two English frigates which ventured the hazardous enterprize during the fiege of the place, were in confequence funk: nothing more beautiful than the appearance of the forts can possibly be imagined, their construction being on the most profusely expensive scale. The only recommendation of the houses of the town is a certain air of grandeur, large gates and courts, wide windows projecting two feet over the street, supported on pilasters, heavy balconies of wood covered with tiles on the upper stories, palistades of wood coarsely fastened, and of enormous size, all these give fomewhat heavy, fombre, and repulfive to the look of the houses; internally they have commonly a vast court surrounded by Gothic arcades, large, and in the Moorish ftyle; the gallery formed by thefe, communicates with large but ill-difpofed apartments badly furnished the doors and windows of them resembling those of a fort or dungeon, as much by the thickness of the portals as by their Gothic structure. In the vestibule, or in the chief apartment of the house, it is common to have the arms of the family blazoned in manner of trophies, an ufage derived from the time of chivalry, which if occasionally it be but vain parade yet again oftentimes ferves to excite true bravery and a fpirit capable of any daring enterprize. The houses of the lower orders have rarely any flat ceilings, and all, even those belonging to people in easy circumstances, instead of being favoured with wood, or squares of tile or stone, have merely an earthen floor, which by its preferving humidity, I found of injurious effects to health. With the wealthy, the furniture of the rooms is of wood partly gilt, curtains of crimfon damask with gold fringe, and some japanned works, paintings, and glass lustres. The beds are very fimple, and no pier-glasses or other mirrors are seen, no inlaid work of wood for floors, and neither carpets or tapeftry, in floort nothing corresponding with the fumptuousity or elegance of French apartments. The Spaniard is as modest in his dwelling as he is fober in his mode of living; the English have taught him the method method of cooking certain dishes, and the use of different pieces of furniture; of the talents of the disciple, a judgment may readily be formed by reslection on who were his masters.

The men wear coats of the French fashion, but the cut of the body is so short, that the pockets are nearly under the arm; above this coat, generally of cotton or tassity, a cloak is worn of buradilli or camblet; those who seek to render themselves conspicuous, wear a blue or scarlet cloak, embroidered or trimmed with gold; this is a sumptuosity, however, not within the compass of every one, as such a cloak costs sive hundred piasters; still those of the height of sashion decline wearing it, preferring the French dress. The hair, which is rarely seen powdered or frizzled, is enveloped in a net, and covered with a broad brimmed hat. Such is the dress of the men.

The women feldom wear gowns, but almost always are dressed in a corset and petticoat, with an apron of gauze or muslin, and a few ribbands; they wear no powder, nor is their hair frizzled, but braided and turned up, or worn in chignon under their cap; to this is added, attached above the hair, a sprig of rue or absynthum. Their ornaments consist of crosses, rings, gold necklaces, and large bracelets of massive gold, that weigh a quarter of a pound. Happy she who wears a bracelet on her left wrist! but how much happier if one on each! She amuses herself constantly in fastening and detaching them, as well as in pulling off and drawing on her glove, and all for the purpose of attracting attention to her beautiful and well turned arm. French women paint: for the Spanish ladies they have a black patch of a round or oval form at each temple; these at night are removed, and white patches are substituted (which pretty well resemble a plaister); in the morning, they wear instead the leaf of an orange tree.

Few handsome women, and still fewer who had pretensions to elegance, were seen by me at the Havannah; they never go abroad, but in the morning to mass, and the evening for a ride, hence they are not to be seen either in the streets, shops, or any public room. Constantly shut up in their own apartments, the pleasure of enjoying an airing out of the city is the only enticement can induce them to leave them. This indeed is their favourite pleasure, nor is it costly; four hundred piasters for a coachman, a hundred and sifty for a mule, sive hundred for a chaise, in all about a thousand piasters pay every expence; hence the city swarms with carriages. Even the meanest clerk drives his chaise; and it is as common to present one to a mistress, as in France a

box of fweetmeats.

It must further be observed, that in no part of the world is money so plenteous as at the Havannah. It circulates in taligas, resembling those bags of a hundred pistoles in course at Paris; and the counters of the officers of revenue are covered with piles of

reals of plate, which they exchange for hard dollars with fingular dispatch.

The markets are plenteously supplied with every kind of provision, but especially vegetables, which are quite as good as in France; fish and turtle are extremely cheap; beef fells at a real the four pounds; excellent mountain and tent wine at two rials the bottle; indeed, no town in America is better furnished with means of good living, or at a more reasonable rate. This advantage is to be attributed in great measure to the division of the real into quartillos of tin, for nothing is more favorable to occonomy than small coin.

The trade of Havannah and Mexico is in the hands of the Catalans, whose commonly active, laborious, enterprising and persevering disposition, have acquired for many of them confiderable fortunes; they are in consequence an object of envy to Spaniards at

large, who feck to difguife this feeling under the veil of contempt, an affumed fentiment as little commendable as that which is the real one. For one Castilian engaged in trade there are thirty Catalans. Intoxicated with success, however, they prayed for exclusive privileges, a kind of monopoly but too common in Spain. They had proposed, as speculators, to supply the colony altogether with wines from Malaga and Alicant at a real the bottle, whereas the actual price is two reals; but their petition was rejected; as it was accompanied by a request of being the only ones allowed to introduce and sell the commodity.

The articles of trade are iron, linen, iron ware, filks, clocks and watches, wines and

fpices.

At the Havannah, as in Mexico, little other is feen than Brittany linen, the coarfest of which fells at a dollar the vara *. The iron ware is all of it imported from Germany; the clocks and watches from England; the small quantity of Indianas and Persianas confumed, which are not from the fabrics of Mexico, are derived from France. The Genoese, for whom the Spaniards evince great partiality, furnish them with all silk articles for veils, cassocks, black hoods worn by the women on going to church, mantles for priests, &c. Their iron is partly drawn from Sweden, partly from old Spain. Spain likewise sends hither oil, wine, and paper of detestable quality. What is highly singular, neither at Havannah nor at Vera Cruz can blue paper be procured: I wanted some quires to dry my herbs between, but was only able to procure a few sheets in which certain goods had been inveloped, and which, notwithslanding, I was charged for at a very extravagant rate.

Neither at the Havannah nor in any part of America is such a thing known as a public promenade planted with trees. M. le Marquis de la Tour attempted to form one round the ramparts, but it did not succeed, and nothing but the walk remains unsheltered; another, attempted at an earlier period, and planted with orange trees, is likewise

gone to ruin.

The Havannah contains about twenty-five thousand inhabitants. The whole population of the island, including negroes and mulattoes, does not exceed a hundred and fixty-fix thousand souls, according to the statement in possession of the governor which I saw; and from a French engineer from Vera Cruz, who had lived a length of time at Mexico, I learnt that all this vast empire of Spain, in America, contains no more than a million inhabitants.

At the time I was there the Havannah contained no more than three thousand regular troops, there was, however, in addition to these, a body of militia, excellently disciplined,

confisting of fixteen hundred men.

Not a fingle church did I observe worthy an account of its architecture to be noticed; all of them are long buildings, dark as dungeons, ornamented on the right and left with innumerable chapels, with frontispieces composed of a medley of orders of architecture, wretchedly encumbered with useless trappings, and still more wretchedly disfigured by the utter absence of all proportion; though profusely covered with gildings, these were at the same time classed, if the term be applicable, in the most revolting and superstitious confusion: not one of these chapels but will have cost upwards of ten thousand piasters, and in every church are at least thirty or forty. At this time the church of the Jesuits, designed for a cathedral, is nearly complete; on surveying it you would imagine before you a structure of the ninth century.

Each of the thirty churches contained within the city, has feven or eight brotherhoods, who are conftantly making processions out of number, but these most especially at the

period of carnival. At this time, (the ceremonies on which occasion I had before noticed in France and St. Domingo,) at this time, I say, there could not have been here less than three thousand processions: nothing could be seen but processions, and no other talk or noise was heard but of which these were the cause or theme. They were everlasting, from morning to night, general processions, and processions of individuals, of parishes, communities, and of every brotherhood: the members of these patroled the streets with lanterns, deasening the ear with the discordant notes of hoarse bassoons, and twanging guitars, and driving the god of sleep from every eyelid as long as they lasted; finally, were processions of every father of a family, followed by his wise, his children, and domestics, who, chaplet in hand, repaired to their particular chapels.

Every house has its chapel, at which each month a particular festival is ce-

lebrated.

The festival of the dedication of the different churches, and still more particularly that of their several patrons, are grand celebrations: the evening before by nine o'clock the steeple is illuminated, and a grand concert is given, to which it is usual to listen from the roofs of the neighbouring houses. The succeeding day this same steeple exhibits a variety of streamers of different colours; the body of the church is filled with tapers to such extreme as not badly to represent a siery surnace, through the aisles of which bad music is badly heard, but in which also splendid offerings are made.

The bishopric of the Havannah reputedly produces forty thousand piasters. Don Fulano Echavaria, who is the present incumbent, is apparently high in favor at court. He caused an order to be published which bore for title "Eneuentra il execrable crimen de los contrabandistas," against the execrable crime of smuggling. I could not refrain asking a priest of my acquaintance, who happened to be his secretary, if such an offence was entitled execrable what epithet was in reserve for the crime of treason? but

my question remained unfolved.

Nothing can be conceived more rigid than the ordinances againft, nor more harsh than the punishments for sinuggling, since the very first delinquency detected renders both body and goods of the culprit liable to confiscation. Notwithstanding this, nothing is more common than contraband traffic: all alike pursue it: burghers, priests and foldiers. Does a vessel arrive? it instantly swarms with faces utterly unknown, and whose only business is to inform you, that such and such articles are prohibited, and officiously and out of pure good will to render you the service of conveying surreptitiously on shore your boxes of gold lace or other unlicensed articles of import; nor presume to shew or entertain the least mistrust: an insidelity in instances of this kind is a matter unheard of, so readily are all in league to evade a law so barbarous and unjust.

False coining is punished by the stake.

In fhort, every thing is either farmed or otherwise monopolised, which multiplies not only the temptation but the necessity of smuggling.

The baker of Havannah is obliged to buy a license to prosecute his trade, for which

he pays a hundred piasters to government.

Paper, gunpowder, wine, tobacco, all are farmed throughout the whole of Mexico, and what is still more fingular, still more odious, the tobacco and cacao grown in one province are prohibited articles in another. On the miserable, and, verily, most miserable, shores of Yucatan, I have seen the trade for boats, cables, cordage, and even hammocks exclusively engrossed by farmers under the government.

Thus it is, by erroneous calculations, that the Spanish government annihilates the commerce, the population, and comforts of its subjects; hence flow discouragement, in-

activity

activity and wretchedness, the infallible precursors of weakness, uncleanliness, disorders, and death.

To these causes, no doubt can be entertained, is the endemial leprosy of Carthagena, mentioned by the Abbé Raynal, to be ascribed. Already has it spread to the Havannah, where a leper-spital has been constructed for the reception of a hundred and fifty patients: in this very spital are at the same time admitted such as are afflicted with venereal complaints. I made a visit to it in company with a physician of the country, but consess the sight silled me with horror, and that I had need of great exertion, and the preservative of a slask of strong vinegar, with which I took care to be provided, to qualify me to support the disgust by which my senses were affailed. The management of the hospital is but indifferent, for, though surrounded with walls, the doors are constantly kept open in the day time, and the sick are perpetually going in and out, without any restriction even from their traversing the whole of the city.

Though France can boast of but little commerce with the Havannah, it is much to be apprehended that this frightful malady may eventually be introduced into her colonies; to effect this but little intercourse is required, and communication to a certain extent is continuous. I could not look on a negress whom I saw at Port au Prince, and who was completely covered with an elephantiasis, without shuddering at once with pity and horror: I saw the poor wretch, abandoned by her owners, begging through the streets and markets, where thousands of slaves were liable to receive the infection; and cannot refrain from observing, that much greater attention than is, ought to be paid to the prevention of those terrible consequences, to which this and similar occurrences

might lead.

For want of wells, all the houses at the Havannah have cisterns. Two of the squares are adorned with sountains which stream forth water conducted by subterranean channels from a small river, the course of which is defended by the Fort del Principe, so that an enemy would be unable to cut off this supply from the city, in case of a siege, without

first taking the citadel.

The air of the city is generally pure and healthy; the winds from the north, which prevail throughout half the year on the coast, cool the atmosphere to that degree that I always felt cold at night, and even in the morning, until by ten the sun's warmth dispersed it, raising the thermometer of Bourbon, to sive or six degrees above the freezing

point.

Already had fix months elapsed since my arrival at the Havannah, during which I had incessantly been tormented with the desire of completing my enterprize: the time appeared to me in consequence intolerably tedious. I delayed thus long the prosecution of my plan merely to prevent my becoming suspected by a people naturally jealous and mistrussful, and whose eyes were constantly upon me: the better to lull suspicion respecting the real object of my researches, I constantly affected the heedlessiness of a man intent on harborizing; but, at length, weary of the state of incertitude in which I lived, and yielding to the impulse which directed me to Vera Cruz, I began to think seriously of the means of reaching that city.

I thought it prudent still to use stratagem, and pretending to be actuated by that volatility and inconstancy of disposition, oftentimes with so little propriety ascribed to Frenchmen, and which occasionally is so favourable a cover to deep designs, I seigned to be overcome with ennui from my long stay at the Havannah, and the too narrow limits prescribed me as a botanist. I readily obtained belief, and met with commisseration; and by this trick partly, and partly by a fortunate occurrence of which I availed

myself, I succeeded to the height of my wishes.

One day Don Manuel Feliz Ruick, the factor of the Affiento company, at whose house I had twice before been to obtain change for some joes *, enquired if the report he had heard was true of my being a pupil of Mr. Justieu. On my fatisfying him in the affirmative, he informed me that he himself had been secretary to Don Antonio Uloa, one of the literary characters dispatched by the King of Spain, in company with our academicians to Peru; that he had been very intimate with him; and on account of his intelligence and social virtues, that he had a more tender regard for him than any man alive. This subject of our conversation gave room for my observing, that I also should have been delighted with an opportunity of visiting Peru; but that, as my time was limited, and my means descient for this purpose, I should feel much pleasure if any chance should enable me to traverse Mexico. Don Ruick instantly tendered me his fervice towards procuring me the facility of making this journey; he was already highly interested in my favor from my intimacy with Mr. Justieu, promised me letters for Don Antonio Uloa, at that time general of the fleet at Vera Cruz, and generously proffered to become my surety in a bond of a hundred thousand dollars.

This, certainly, was a very lucky incident, and a handsome progress towards the effectuation of my designs; but this was not all; I yet seared less the governor should object to grant me a passport, notwithstanding he had promised he would upon the inclination I expressed of seeing a country, in the praise of which he was no less lavish than the rest of his countrymen, prone to think well of their possessions. I perhaps mistrusted him unjustly, but certainly not without some grounds for my fear; as, amid the caresses and kindness I experienced from Don Lues Huit and his lady, I was able to trace a fund of curiosity, and was subject to questions, natural enough in themselves, and

efpecially fo coming from a woman.

I communicated my doubts to Don Ruick, which he eafily dispersed, and even promised to speak on the subject the succeeding day, to the Marquis de la Tour.

I now made preparation for my departure, without communicating my intentions to any one breathing, not even my host: the packet for Vera Cruz was to fail in three days time, and short as the notice, I resolved not to miss the opportunity before me.

The next day was Sunday, a day on which the governor holds a levee at his palace. The fuperior officers, on this occasion, the municipal officers of police and finance, repair to the palace between the hours of ten and eleven. The governor grants them audience, and receives their respects in the government hall: it may safely be said that if this custom establishes, and reminds the courtiers of subordination, it lesses the humiliation which the high spirited man, lost in the crowd, must feel at being obliged to render homage to individuals undeserving either of affection or esteem; for this levee also furnishes an occasion for soliciting and obtaining trisling favours, and for expediting affairs of little moment which would only tend to perplex or clog those particular audiences held for matters of graver import.

This was the first time of my being present at a similar audience, and the object of my attending it was to solicit my passport; but finding here Don Manuel Ruick, who repeated the promise he had made me of speaking himself on the subject to the Marquis de la Tour, I judged it expedient to leave the management of my solicitation with him,

and withdrew, well fatisfied with the prospects before me.

In the afternoon the militia cavalry was to be reviewed: I faw the Marquis in company with Don Luis Huet, and both bent to me with great civility; this appeared to me of

^{*} A Portuguese coin value 35s. 2d. the price of English standard gold being 37s. 101d, the ounce troys. TRANS.

good omen, and I hastened to the government house. As I ascended the steps I met Don Luis who was leaving the hall, and who enquired if I repaired thither in view of asking any favor; I answered in the affirmative, informing him of as much as was proper of my design: upon this he proffered to accompany me to second my request, at the same time adding, he thought his interposition would not be needed: in consequence

I thanked him for his politeness, and took my leave of him.

I waited but little ere the governor approached towards me with that benignant look his features commonly wore, and enquired what my wishes? I took the liberty of reminding him of the promise he had made of granting me a passport for Mexico; and stated I had come for the purpose of obtaining it. He gave it me at the instant, and without making it dear, as is but too common with his equals, by thousands of dissiculties and delays; he merely told me he was fearful I might not eventually meet with that gracious reception from the viceroy of Mexico which he himself desired; concluding with wishing me success on my voyage. I thanked him for his kindness, and after paying my respects withdrew. This excellent man remained a long time in the vestibule to see me depart; and when on the last stair of the slight of steps I turned again to make my last salutation, I had the satisfaction to see him return it, testifying by his features and gesture the interest he took in my welfare. Men in place! how easy is it for you to engender love and veneration! whence can you ever choose to be distant, harsh, and rude?

In possession of my passport the liveliness of my joy was proportioned to the inquietude I had felt respecting the possibility of my procuring it; folded in my pocket I kept it as the dearest treasure, and woe to him should dare to ravish it from my possession! That it might be perfectly secure I slew to place it in safety; I hastened light as air to Don Ruick, who gave me his letters for Don Antonio Uloa; I embraced him while I assured him of my devotion and gratitude, and returned to my host to sup with a feeling of contentment which desies expression. Then only did I speak of my departure: though apparently grieved to lose me, as he reckoned upon my longer stay, mine host yet condescended to share the joy I expressed, and gave me letters for a merchant at Vera Cruz, and a fettler at Theulchistan, on the road to Mexico.

I had now to treat for my paffage: the maîter of the packet would take no lefs than a hundred hard dollars; the demand was exorbitant, but it was vain to reason, his avarice was inflexible: to all my arguments he opposed a truly Spanish phlegm and gravity, and coolly pocketed my money without once taking his cigar from his mouth. We were to have failed the following day, but his departure was procrastinated three days longer, during which I made my farewell visits.

At length, on the 11th March 1777, we went on board, and weighed anchor at

eight in the morning, faluting the city and the feven citadels with one gun.

What then, and at all times feemed to me incredible, was the small number of veffels in this famous port; during the fix weeks of my stay I noticed no more than sisteen of from eighty to two hundred tons, including the packet from Vera Cruz, and in this last port, though I remained there afterwards ten weeks, I saw no greater number.

With what pleafure, as I left the port, did I contemplate those tiers of batteries, the citadels and forts which line the approaches to the Havannah, and the innumerable mouths of thundering cannon with which they are furnished! On my arrival I fancied them all directed against me, all pointed towards the prevention of my scheme of obtaining the cochineal insect: how much then must I not have felt elated! how grateful the self-applause I enjoyed, at having had the temerity of braving, and the great good

fortune of avoiding their terribly menacing rows! No; when the English captured this important place, they experienced no higher satisfaction at their success. Like them, I thought I held the key of Mexico: all suture obstacles vanished from my sight,

and already I possessed in idea the precious treasure which I sought.

The vessel on board of which I sailed was a brig of fixty seet keel, called the Vera Cruz Packet: it carried four carronades, two cannon, and a crew of nine persons: we had scarcely left the fort before a twelve-oared cutter, rowing towards us, hailed us on the part of the governor: what was my consternation! I instantly imagined that, repenting of having suffered my departure, the marquis had sent orders for my being relanded: this apprehension threw a deadly pale over my countenance, and occasioned such a trembling in my frame that, had I been observed, I should necessarily have been taken for a criminal. Dei, deæque! quam male est extra legem viventibus, quidquid meruerunt semper expectant. I was however quit from the panic I experienced: the mission of the cutter was merely to deliver letters on the part of the governor for Vera Cruz.

The sky was serene, a favouring wind rippled the easy sea, and the vessel was an excellent sailer: we kept in with the coast, steering as close to the west as possible,

and at day-fall were already eighteen leagues from the city.

The wind encreased during the night, and veered from S. W. to E. S. E.: we loft fight of land, and by noon on the 12th March were parallel with the shoals which bound Cape Sant Antonio. From the period of our departure we had constantly run fix knots an hour with all fails fet. In the afternoon the fea which had been very rough became more calm, and its furface was entirely covered by those moluscæ, called by failors, (galeres); we saw several large trunks of trees which had floated down the Miffiffippi into the Gulf of Mexico, and which by the currents of the Bahama streights had been fped hither. I had before remarked others fimilar on the coast of Cuba, where they had been cast by a tremendous storm from the north: among these was one which exceeded a hundred and twenty feet in length, and of a diameter fo confiderable that, although on shore, I was unable to ascend it otherwise than by the branchy end. I conjectured from the nature of the knots on the tree that it belonged to the family of pines of the larch kind: from time immemorial the whole coast of Vera Cruz has been covered with them; and some are so completely buried in the sand, which encreases in this port daily, that nothing now but the roots are feen. These trees are dangerous, . no doubt, to approach in the night, but they ferve as resting places to an infinite number of aquatic fowl, who find rich pasture in the sea, infects which engender on them, and the shell fish, which, as to rocks, fasten on the trunks, roots, and branches.

At fix in the evening we had a dead calm. The whole night long we failed with the wind flack but abaft. At five in the morning of the 13th we were again becalmed, but a wind arose with the sun on that as well as on the succeeding day; though, throughout both, notwithstanding we had the wind abast, and the line shewed a run of ten knots an hour, we did not advance an inch: the sea, through which we cut at a great rate, soamed and broke hard against the ribs of our ship, like where the wheel of a mill is violently acted upon by a rapid torrent: the vessel bore on the same tack, riding very heavily, but with great celerity. We still on the 14th continued opposite to the same mountains of Cuba we had seen the night of our departure: in short, we actually had no change of position, a consequence when the violence of the current is adverse, and equivalent to the impetus of the wind. Nothing can be conceived more vexatious and tiresome than such a predicament; fortunately we had good hammocks,

and an excellent table: the strictest discipline and most profound silence reigned on board, and the captain, a prime sailor, was at the same time, though rather taciturn, extremely obliging. He assured us that for eleven years that he had frequented these seas, he never before experienced currents so powerful: he added, moreover, that the worst months for navigating the gulph are September, October, November, and December, on account of the prevalence of north winds; that in June calms are frequent; and that the months of June, July, and August, the rainy season, are subject to storms and hurricanes: from these observations I determined on returning, if possible, in January, but at any rate, and at furthest, by August or September.

At length, on the 15th in the morning, after having doubled the shoals during the night, we lost fight of land, and by reckoning had also doubled Cape Sant Antonio. At noon the wind had much encreased: we furled our stay sails and top gallants, and

directed our course south-west.

From this time we constantly had the wind either abaft or on the beam, that is to fay, east or south-east. On this day I saw Venus, the sun being at that time five degrees above the horizon. The 16th we were on the bank of Yucatan, in the Gulf of Mexico: on founding we met with fine white fand mixed with shells, in twenty-three fathoms water: in the gulf the winds were east and south-east: from ten in the morning they insensibly turned to the westward, and after sour P. M. revolved from west to east. Our line shewed the run fix knots; and as we were only a hundred leagues from Vera Cruz, we hoped, if the wind should continue favourable, to reach it in four days. In the three days preceding we had feen a number of fish of the phocas tribe, and three or four hundred porpoifes and fmall phocas sported and rolled about our ship, occafionally preceding it, and feemingly endeavouring the one to outstrip the other in velocity of fwimming, now fpringing to the height of a fathom above the furface, and falling with a dashing noise, now advancing in pairs by the side of the ship, and apparently careffing each other, while at a distance their dams were seen, half as large again as their offspring, feemingly pointing out to them the course they ought to take. How far more pleasing fure the innocent enjoyment of such a scene than amusing onefelf, as is customary, in pursuing, harpooning, and destroying these interesting animals! Fortunately for them our failors had not leifure for such an amusement; and, feparately from this circumstance, they lived too well to feek for better fare.

At four P. M. we again heaved the lead, and found thirty fathoms on a bottom of

remarkably white fand.

The 17th, with fimilar ground, we had but twenty fathoms. From midnight till noon the wind had flacked, and we made only three knots, but on its veering to the north after mid-day it freshened so as to double our speed. The sky, covered with clouds at sun-rise, became again serene. We distinguished certain white birds, the size of a duck, with the end of their wings fringed with black: I likewisewise remarked a pelican, or frigate-bird, with a complete tail: all this announced to us the neighbourhood of land.

During the whole night of the 18th the wind blew strong: on sounding, the lead shewed first twenty-two, then twenty fathoms, with fine blue sand mingled with shells. We saw a vast number of porpoises at ten A. M. At noon the wind, which had been south, changed to south-west, and sunk into a calm: we availed ourselves of this to throw out lines to the bottom of the sea: these lines have each a hook attached to them with about an ounce of bacon, and are precipitated by means of two shot of a pound weight: this little exercise is diverting and profitable: in an hour's time we had caught two hundred weight of excellent sist: they were of three species, but all of the

perch kind: one denominated the negro, another a beautiful red fardine, the third with long pectoral fins.

At four a wind sprung up from the north, and blew from that quarter the whole night through, but afterwards reverted to the fouth-east: we made fix knots an hour.

On the 19th we had forty-five fathoms water; from this we conjectured we were but eighty leagues from Vera Cruz, and that in three days time we might anchor before the town: this was the ne plus ultra of our wishes, but they were not so soon

to be gratified.

In the evening we were becalmed: the fun on fetting was dimmed by a vapour which, though it did not eclipfe its light, diminished the vivacity of its rays: the sky, as well as the horizon, wore a gloom prognosticating somewhat sad and mournful: from seven till eleven the wind was north, and our course four knots: by two in the morning it encreased to a gale: the sea ran frightfully high: we took in all sails, chained up the rudder, and left the ship to the mercy of the waves: a thousand times did they deluge the deck of our fragile vessel, which now rode on their backs, and now was enveloped by their overtopping spray.

The whole of the 20th the weather was horrid: never in Europe had I experienced the like. In these feas the winds from the north blow with violence for the space of four-and-twenty hours, after which they abate for thirty more, and cease for three days: they are piercingly cold and very frequent, so much so, that it is rare a fortnight

passes in these regions during the winter without their being felt.

On the 21st the wind was less violent, and veered to the north-west, the morning misty: at noon it blew north-east, and for three hours it continued to rain: in the space of eight-and-forty hours we had not advanced twenty leagues, and we yet had sifty to pass, which we no longer expected to make in less than three more days.

The night of the 22d was rather a bad one: the wind was inceffantly changing from fouth-west to south-east, and, as well as the mist with which we were eight different times enveloped, was every now and then succeeded by a dead calm: the rolling of the ship throughout the day was dreadfully fatiguing. In the morning a poor little bird of the size of a wren, but the colour of a green sinch, came and roosted on the vessel: it endeavoured, skimming on the surface of the sea, to siy against the wind, but, constantly overpowered, returned to us again: others made their appearance, one of which was taken, the residue were driven out to sea by the violence of the hurricane. At one o'clock a buttersty paid us a visit, and was greeted as an infallible index of our nearing the land, a trust to which we gave ourselves up with pleasing reliance.

At night the unchequered sky was spread before us in all its magnificence: a dead

calm prevailed, and the rolling of the veffel affected us exceedingly.

At length, on the 23d, we had fight of land: the captain at first had doubts, but these were soon dismissed: it bore south, and we sound ourselves twenty leagues to leeward of Old Vera Cruz. We should by this time have been at the mouth of the port had my advice been taken, which was, on the 22d, to sail direct before the wind from the north: what induced me to give this counsel to the captain was a knowledge that in the Gulf of Mexico the north wind is but of three days duration; now as that was then the third, and the regular winds blow from the south-east, by steering from north to south at the risk of over-reaching New Vera Cruz on the 23d, the south wind, which prevails throughout the whole day, would have been favourable to our encreasing our latitude, and recovering the lost way; instead of which, by being now to

leeward of the port, we had to beat up against the wind, and could scarcely hope to

reach the port even on the fucceeding day.

We steered within seven points of the wind, and made but slender progress. The lands of the coast we saw are more lofty than those of Santo Domingo: they ran west and north: at night we were but ten leagues off, and the sight of them dissured joy and satisfaction through every breast, but, the wind continuing as little savourable as ever, when within two leagues of land we tacked, and ran all night through to sea. The shore we by this means avoided is that of Las Terras Liones, which stretches to the mountains of Alvarado, from the midst of which, of a sugar-loaf form, rises the volcano Orissava, which we distinguished the day before, though distant sive-and-forty leagues, that is to say, as far as to Old Vera Cruz, it is, notwithstanding, unpeopled.

The 24th, in the morning, we had made about a league of progrefs: by noon the wind again came to the east, nearly large, and inspirited us with expectation of entering Vera Cruz on the succeeding day: at four it freshened from the north-east: at fix abated: by eight we distinguished the reefs in the vicinage of the port: we fired a gun, and immediately after distinguished a light, which we conjectured to be from the castle of Saint John de Uloa, and we answered it by a light at our main-top-gallant, and fired a second gun: we then perceived a second light, presumed from the ship of the admiral of the port. I thought it advisable another gun should be fired, but was fearful of communicating my opinion to the captain, mindful how little attention had been paid to my former observation: no doubt had a third gun been fired the major of the fleet, who in a galley with thirty men on board had left the port in search of us, would not have missed his way.

We however made fome way, but with little fail fet, and constantly founding: the fathoms indicate the passage into the port, for the reefs by which it is bounded render

it very difficult of access.

At ten at night we were boarded by two boats, each with thirty men on board, furnished with cables for mooring us, and with anchors and grapplings in case of need: they enquired after the major of the port, whom they expected to find with us, as he had failed before them.

They towed us along by dint of oars, favoured by a light wind: we threaded the tortuous labyrinth of the entrance, through which at length, by midnight, we reached

the port.

We anchored under the cannon of the ship belonging to the captain of the port; itself at anchor a half cable's length from the castle. All night long it rained; and we were exceedingly incommoded by the hot and moist atmosphere of this climate, as also

by the vapours from land.

At five in the morning I was preparing to land, when the major of the fleet joined us: this gentleman was Don Pedro de Verthuizen, with whom it will be feen I afterwards was on terms of closeft intimacy: at this inftant I paid but little attention to him; for, judging after the French manner, I esteemed him from the old coat he wore, covered by a rusty surtout, to be no better than a serjeant of marines: he requested my passport, which I gave him, and he kept, and I obtained permission to go on shore.

Uneafy in extreme respecting the reception I should meet with here, I put my baggage into the boat, and traversed the port: on landing at a jetty about ten sathoms broad, and a hundred in length, which terminates at one of the gates of the city, I

found

found there a numerous guard, contadors, officers of the port, and a multitude of curious idlers. It was requifite my trunks should be opened, but they were very loofely examined; as foon, however, as they came to my books they refused to let them pass before a permit for that purpose should be obtained from the vicar-general of the inquisition: I hastened to him, and found him a little old man with the air of a perfect faint, mounted on a chair near a table, and reciting his breviary. He held out to me his hand to kifs; for my part, but little accustomed to a ceremony of this kind, and not aware at the instant of his intention, I shook it in a cordial manner. He requested of me a catalogue of my books: I answered, that they merely consisted of works relative to physic and natural history, suitable to a medical man and a botanist, and were so few in number that I had made out no catalogue of them: he was fatisfied with my answer, and the bare mention of the names of the authors, and immediately gave me a licence for their entry.

Instantly the gates were opened to me, I waited on Don Thomas Taxueria, for whom my host at the Havannah, Don Bernardin Liagotera, had given me letters: the merchant of Vera Cruz appeared to feel perplexed at this recommendation, and informed me that he had no other knowledge of Liagotera than what was derived from certain commercial intercourse; and I set him much at his ease by informing him that, for the present, all that I expected from him was the kindness of indicating to me some good inn. He pointed out to me one opposite to the gate of Mexico, which I afterwards learnt was the best in the town; but, after this remark, what will be thought of the rest when I make known that the only furniture of my apartment consisted of a table sour feet by three, and that two benches six feet by three, formed the only bed, worthy, indeed, of a Spanish gentleman. As for mattresses, chairs, looking-glasses, &c. all these no doubt are regarded either as superfluities, or conveniences of

too extravagant a nature.

As foon as I had fafely deposited my effects in this charming apartment, I repaired to the general of the fleet, Don Antonio Uloa: at his gate I found a guard of ten men: his fecretary introduced me into a large hall with furniture of very ancient date, and announcing me as a gentleman who brought letters from Don Manuel Feliz Ruick, a little man, at most but four feet ten inches high, speedily made his appearance, dreffed in an old jacket of nankeen, with filver buttons, grey-headed, and his hair without either powder or pomatum, tied and hanging over his shoulders; his countenance was bad, but his looks extremely mild and affable, and his eyes lively: a little diamond cross, suspended from a button-hole, bespoke a man of rank. Such was Don Antonio Uloa: I faluted him as I prefented my letters: these explained the object of my journey, and intreated his affiftance to obtain a paffport for me to Mexico: he read them attentively; promifed immediately to write on my behalf to the vicerov, and advised me to write at the same time myself. He invited me to be a frequent visitor at his house and table, admonishing that dinner was regularly served at half past one, and infifted on my dining with him that very day to begin; finally, he caused me to be presented to the governor by the major of the fleet, whom I recognized for the fame personage who had demanded my passport.

On repairing to the governor's, Major Don Pedro de Verthuizen was fo kind as to tell me my acquaintance would be very agreeable to him: to this compliment I made a

fuitable reply, and I had full occasion to prove it perfectly fincere.

Don Fernan Palacio, governor of Vera Cruz, was a very different character to the general of the fleet: his four looks, his rough tone of voice, and rude speech, predisposed one against him at once. He readily granted me permission to reside at Vera Cruz,

and botanize in his government; but refused to return my passport, which the general recommended me to ask for; and at my departure pretended even it was mislaid. I afterwards learnt that he assumed the governor of the Havannah had no privilege to grant similar passports, and intended to avail himself of mine, to his discredit, for which purpose he was so obstinate in refusing it me.

I left him much chagrined at the reception I met with: it however occasioned me the less surprise on learning, as I did afterwards, that he was on unfriendly terms with

Don Uloa.

The next day the general did me the honour of introducing me to Dona Fulana de Boutilloz, the lady of the late intendant. She was a woman of fifty, who had been a perfect beauty, and still retained traces of her former charms: her lively and natural flow of wit, and her noble and open character, endeared her to every one. The recommendation of the general was undoubtedly of use, for that very day she offered me repeatedly her fervice. La casa es a usted, my house is yours, she several times obferved, and that in a manner fo cordial as perfuaded me of her fincerity. She afterwards prefented me to her daughters, and informed me that the youngest was on the point of marriage with M. de Verthuizen: in fliort, fle infifted upon my becoming as one of the family. At the instant her son made his appearance Don Juan de Boutilloz, a captain of the regiment of the crown. Soon as she saw him, "Ilither, my fon," fhe exclaimed, beckoning him, "here is a gentleman from your own country." This young man, in fact, had been educated in France, and had all the amenity peculiar to our youth. Such qualifications endeared him but more to his mother, who was as partial to the activity, politeness, and tolerant principles of the French, as disgusted with the idleness, want of nicety in dress, and the fanaticism of the Spaniard.

Young Boutilloz was foon on terms of closest intimacy with me: he acted as interpreter between me and all the family, and especially the ladies his sisters, who were constantly exacting French songs from me. I translated for them the romance of Berquin, at which they were softened even to tears; and I made hence the conclusion that this little piece is truly as excellent as individually it appeared to myself, observing the

effect it had on fenfible minds, though foreigners.

Some days after, at the fame house, I met with M. de Fersen, son of the lieutenant-general of that name: he advanced towards and embraced me, enquiring news from Paris, where he was born: he added that, being apprized of the arrival of a Frenchman in the country, he had for three days wandered in search of me, with all the anxiousness natural to a sellow countryman. When we left the house, the lady of it was so obliging to state, as M. de Fersen kissed her hand, that as we were both Frenchmen we ought not to be separate, and that it was a province he ought to fill, the bringing me with him, and rendering me partaker of those moments of recreation he occasionally passed at her house.

This amiable youth led me to his house, where I found M. Duparquet, a gentleman from Dauphiny, as well as himself a captain in the Corps de Genie. They made me stay dinner; and here I was not a little surprised at finding our beverage cooled with ice, nor less at learning that this enjoyment, ample compensation for a thousand privations experienced here, is obtained for a trifle at Vera Cruz: daily eight mules, relieved at regular stages, arrive at this city laden with frozen snow from the mountain Orislava, distant about forty leagues. By this plan a pound of ice is obtained for a real of plate, and ice creams a l'anana, or a la sapotilla, sour times as large as in Paris those charged

fourteen fous, may be had for an equal fum.

The dinners given by the lady of the intendant were ferved up equally well in town as in the country, and what tended to render them the more grateful to me, the cookery and ftyle were French.

In parties, formed by the individuals noticed, I spent my leifure hours; but my botanical excursions were not forgotten: they occupied daily the interval between four

and ten in the morning.

In the earliest of my walks I found the convolvolus jalappa of Linné. I gathered as many feeds of it as I was able, pulled up feveral roots, and had them verified by the druggists of Vera Cruz, who, without knowing whence they came, pronounced them the real jalap: their opinion, as it conformed with the description of Miller, convinced me of this plant being the true jalap of Mexico. I presented seeds of it to the general, and with them a root weighing five-and-twenty pounds: he caused it to be planted in a box, for the purpose of transporting it to Europe, and enquired if it was common in the environs of Vera Cruz: nothing however could equal his surprize, when I informed him that, if he was anxious for such a measure, I could engage to freight the vessel with it, that bore his slag from the exclusive produce of the vicinage. Such is the idleness, the ignorance of this people, that they give three reals * a pound for this root at Jalappa †, while they might have it for a quartetto at Vera Cruz, if they would but take the pains to collect it.

A discovery like this rendered me famous throughout the city: I was looked upon as a most extraordinary character in thus being able to discover a treasure in the very custody of those who were ignorant of its value. The esteem this gave me was grateful; and the good disposition of the people generally towards me, which my discovery occasioned, I endeavoured to maintain and augment, not only by the earnestness of my study of nature, which was no irksome task, but also by a species of quackery, which I reckoned serviceable towards concealing my definitive projects. Whether in the fields or in the streets I constantly had plants in my hand, and either employed myself in observing them through a magnifying glass, or in dissecting them with nicest care. My room was overspread with papers, covered with plants, and my tables with phials

and boxes containing feeds.

This policy indeed was requifite to form an excuse for my customs, and the walks I undertook, which else had been looked upon as purely vulgar; for the pride and vanity of the Spaniards was not a little shocked at seeing me journeying on foot every morning the distance of four or five leagues, loaded with a port-folio, and attended merely by a single negro, who carried my books, a hatchet, a mattock, and my breakfast.

I fucceeded even beyond my wishes in conciliating the admiration of every rank, and was known by no other denomination than the French physician. The failors and foldiers laid in wait for me to ask advice for their complaints; at first, with the best intentions, I prescribed remedies; but when this became irksome to me, from their repetition and intemperance, I got rid of them by charging the cause to themselves. The constant disorders to which these folks are subject are a permanent spasm, occasioned and maintained by the practice of sinoking tobacco, and the brandy and rum which they take without moderation: in consequence, I proscribed the use of these

* From 18d. to 19d. sterling.

[†] A town twelve leagues from Vera Cruz, at the back of a mountain, and handsomely built: here that famous fair is held ordinarily of four months duration, at which the interchange of the produce of Europe and America takes place.

articles, and forbade the applicants coming again to me for advice until after an abstinence of three days: the prescription speedily disgusted them, and they came to me no more; still I constantly saw and noticed them pointing me out to their companions, with signs of great respect. A number of other persons, tradespeople and individuals, of whom I had no knowledge, followed my steps with their eyes, and exclaimed with a kind of wonder, "Do but see that Frenchman, why he is going to Medelina on foot!" Unhappy people, so corrupted by ease and idleness were they, that these excursions, delightful to me, appeared to them insupportable; nay, to such a pitch is their inertness carried, that their meanest servants cannot go a quarter of a league without requiring a horse, nor enter a wood, till cased in leather to preserve their skin from musquitos.

La Medelina is a hamlet fix leagues from Vera Cruz, whither it is common to refort in order to bathe in the river of that name. The fpot itself has nothing to recommend it but its happy fite, which draws thither many of the inhabitants of Vera Cruz. The bathing season begins in May; for the houses they are but wretched huts, almost lost in the aspiring grass; and for refreshments, scarcely is there a sowl or an egg to be had for money. Here, however, I past two days in the most agreeable manner, in

company with the general of the fleet and the family of the intendant's lady.

But it is time now I should give some idea of Vera Cruz.

This city stands in the Gulf of Mexico, on the margin of the sea, in a fandy and barren plain. Not the slightest culture embellishes its neighbourhood: on the south infectious exhalations from stagnant-marshes contribute to render it exceedingly unhealthy. On the north, where, from the arid sand, salt in crystals may constantly be collected, is the road to Mexico, which for seven or eight leagues runs parallel to the sea. On the west downs of sand, ejected by the waves, obstruct the view of all but the lostiest trees.

In proportion as this fand, heaped up by winds from the east and north, becomes dry, it is again dispersed by the same winds, and thrown forward, either into the town, so as to cover all the houses, or farther inland: to this circumstance are to be attributed the downs by which it is surrounded. Whirlwinds, by raising this sand, occasionally obstruct the fight, and render breathing difficult.

Beyond this fandy plain and the mountains by which it is enclosed, are woods full

of wild beafts, and meadows covered with flocks.

Vera Cruz is built in a femi-oval form: its largest diameter along the sea-shore meafures from fix to seven hundred fathoms. It is surrounded merely by a wall or parapet fix feet high by three broad, surrounded by a palisade of iron-wood in bad condition. This wall, at intervals, is slanked by six indifferent bastions, or square towers, twelve feet high by twenty each side, some of them terrassed, but the rest empty; the wall has neither ditch, counterscarp, nor any outward work. On the sea-shore, on the fouth-east and north-west of the town, are two redoubts, or rather terrassed bastions, more regular than the others, with a cavalier, and a battery of cannon: the entrance into the port is commanded by these bastions.

The whole of the houses are of stone. The lime which mixed with sand forms the cement, is obtained from madrepores, drawn up from the bottom of the sea; as for the stone for the houses, it is brought from Campechy. M. L'Abbé Raynal, led into error no doubt by the information he received respecting this city, describes it as being built of wood, but I have the evidence of my senses for the contrary, and the engineers, to whom I shewed the passage in his philosophical history, assured me that the whole place did not contain a single wooden house: it cannot even be affirmed that such ever

was the nature of its structure, as I have seen at least twenty houses, mayorasgas*, which have laid in ruins for fifty years, the whole of the walls of which were of mason's works; I however imagine that persons have been induced to commit an error thus gross in their description from noticing the heavy and massive balconies of wood which entirely surround the houses as at the Havannah, and which principally exciting and engrossing their attention, will have caused them to make the statement they have done.

The houses are neither built with greater regularity nor are they more elegant than those of the Havannah, but the streets are wider and less close: they are straight, perfectly well paved with pebble, level, and well kept, which contributes to their neatness,

and gives them the better appearance.

The only remarkable buildings are the churches; like those of the Havannah, they are rich in filver plate, as are the houses in porcelaine, and other furniture from China: in this confists the whole of the luxury of the inhabitants, for they are so temperate that chocolate and sweetness constitute almost the whole of their food.

Vera Cruz has three gates, that of La Medelina, that of Oriffava, and that of Mexico. Its only inhabitants are a flender garrifon, the agents of government, failors, and a certain number of merchants, or rather factors, for the vanilla, anifeed, and cochineal, which could not be exported by the galeons, the chief commerce for European goods being transacted at Jalapa, iron only excepted; which is taken from Vera Cruz. This collective population may amount to from fix to feven thousand persons, among whom if the governor be excepted, the administrators and the officers belonging to the land or sea fervice, there are very sew you can visit on social terms.

The men are, generally speaking, losty minded and proud; either from this being the specific character of their nation, or owing to their excessive wealth in a country where gold stamps so much value on its possessor. They comprehend trade very well, but here, as elsewhere, their natural indolence, and their rooted habits, and superstition, render them irremediably averse from labour. Incessantly are they seen with their chaplets and relics on their arms and round their neck: their houses are filled with

flatues, and paintings of faints; and their life is a feries of devotional practices.

The women live recluse in their apartments above stairs, to avoid being feen by strangers; though it is by no means dissicult to perceive that, but for the restrictions imposed on them by their husbands, they would be far more easy of access. Whenever they go abroad it is constantly in a carriage, as I have before noticed is the case at the Havannah; and as for those who have no carriage they are wrapped up in a large cloak of silk, which covers them from head to heel, and has merely a small opening on the right to enable them to see their road. Within doors they wear over the shift nothing but a small silk corset, laced with a gold or silver cord: the whole art of dressing their hair is confined to braiding it, turning it up, and sastening it on the top of the head. Still, though so simple their dress, they wear a gold necklace, bracelets at the wrist of the same metal, and at their ears pendants of emeralds of greatest value, so true is the observation, that sashion and a taste for luxury is prescribed by no rule! Generally speaking, the fair in this city are not handsome; for however rich their dress they shew a desciency of grace and sancy, and, under an apparent reserve, are strongly inclined to lasciviousness.

The only amusements are the negeria, a fort of cossee-house, whither the genteeler fort repair to take ice-creams, and some imitations of bull-fights for the vulgar; unless

* Noble estates which devolve in the male line ad perpetuitatem.

⁺ At Vera Cruz are seven or eight houses of commerce, in every one of which might be found a million of pesos-suertes (225,0001.)

indeed under this denomination be comprized the processions and flagellations of the

holy week, a period at which I arrived at Vera Cruz.

Twenty times during this week was I called to my window by the clinking of chains. What a shocking spectacle presented itself! now a penitent in a woman's dress, in a petticoat and body of linen cloth of a flate colour, with arms extended and fastened tightly in an horizontal position, his back and shoulders supporting seven old swords such as are used for signs by our armourers, and whose points collected in a stuffed pad pressed on the os coccis, his legs loaded with chains and iron weights, and in this garb marching slowly along through the city, and paying his devotional visits to every church.

An inftant after this miferable object was fucceeded by another mask, likewise in a woman's dress, but in white muslin and naked to the waist, a handkerchief covering the bosom, the legs loaded with chains, but the hands left at liberty. This penitent in the left hand held a crucifix, and in the right a rough whip with which at every hundred steps he lacerated his shoulders and reins till streams of blood ran from the wounds,

and crimfoned the petticoat he wore.

In the space of a week I reckoned not less than eighty masks of this description.

The processions present nothing more attractive: every chapel has its patron saint modelled in wax, of the natural size, but of frightful aspect, which is carried on a litter by eight men who are relieved at intervals: all are dressed in women's apparel, the petticoat, the corfet, and the mask of all are similar; that is to say, of linen cloth of a bluish slate colour. They hold those exhibitions in such esteem that penitents are to be seen thus accounted all day long, nay, even from the evening before, the next and the

following day.

Among these processions is one which, on account of the object of it, is deserving of mention: it was inflituted on occasion of a fund of fix thousand piasters, established to portion off annually four poor marriageable girls; but by an abuse too common, the lot now falls, by means of connivance, very often on those in easy circumstances, and at times on children of feven or eight years of age; and while the object of the institutors of this benevolent charity was the folace of mifery, and the inculcation into these future mothers of children, of a spirit of religion and a modest deportment, the intent of the ceremony appears rather to be the inftilling into their minds a tafte for expence and a love of frivolity. The chosen parties are conducted to church in superb carriages covered with cloth of gold or filver, trimmed with magnificent lace, and adorned with the richest pearls and diamonds, which opulent ladies take pride in lending for the occasion. A squire, or a kind of sponsor, one of the most respectable persons in the city, gives the female his hand, and leads her, as in triumph, in the procession which. follows the nuptial bleffing. During my ftay I twice witneffed this celebration; but out of the eight elected I certainly would have refused to have taken seven for fervants.

Fronting Vera Cruz, at the distance of four hundred fathoms, is an islet on which the castle of St. John de Uloa is built, the fire of the batteries of which cover and defend the town: this fort, long after its first erection, was strengthened by more regular fortifications: it is a parallelogram, composed of four large bastions and three demi-lanes, with ditches, counterscarp, covered way, palistades and glacis from the south-west to the southeast, where the islet is daily encreasing, owing to the accumulation of sand, shells, and madrepores: on the south the port forms a sufficient soffe, as the ship of the captain of the port is anchored at half-cable length from the rampart, which has an elevation of from thirty-sive to forty seet. Nevertheless, to prevent a landing, and the approach of

boats under cover of the cannon, the whole of the curtain, which is bare, as well as of the flanks of the two bastions bearing on the port, are fraized with stakes of a remarkably hard wood, as black as ebony, which sharpened, and rising a foot and a half out

of the water, hinder any veffel approaching within musquet shot.

Here are three-hundred pieces of cannon carrying balls of from twelve to thirty-fix pounds. Still the place is not impregnable, spite of the reefs which bound it on one side, and the fort by which on the other it is defended; and in this opinion I was confirmed by the casual glance of a French engineer with whom I conversed on the subject; for while he supported the contrary, he cast his eyes towards the south-east, where in fact is a landing-place of much less length from the fort than the principal one, and off which vessels assaulting would not so long be exposed to the fire of the batteries which crown the fort from the south-east to the north-west, and might even anchor under the curtain, a vestige of ancient fortifications raised very high, the fire from which would hence be of no avail.

A square tower fixty feet high above the rampart, or the bastion of the south-east side, commands the city, the port, the whole road, and the entire vicinage, and serves for exhibiting signals, which are repeated by the ship of the captain of the port. I ascended this: on the first story is a terrace, on which is a battery of sour brass twenty-four pounders, with a corps de garde of ten men. On the last story is a centinel who is relieved every half hour, and gives advice of all he observes; and from his account it is, verified by the corporal of the guard, that the signals are made. At the time I was there there was but one battalion in garrison, with one company of artillery, and about a

thousand convicts employed on public works.

The port of Vera Cruz is closed by this eastle and the islet on which it stands. From forty to fixty ships of war and a hundred merchant ships may anchor here in from four to ten fathoms. The reefs which surround it as far as the Island of Sacrifices, towards the south-east and the north-east, break the waves, and render it secure against winds blowing from the intervening points; but to winds from the north-east to the west-north-west the port is exposed, and the north wind, which blows with great violence, frequently drives ships from their moorings and casts them on shore. To this road however, it is, the only one in the gulph of Mexico, that all ships laden with goods for Mexico repair, and hence also is remitted to Europe the precious metals and merchandize rendered in exchange by these extensive countries.

Seen from the castle the city presents a very handsome appearance. On the south it has a natural meadow, which forms an agreeable promenade except in the rainy season, when it is overflowed by a rivulet which forms a marsh at about a mile from the town, and furnishes the city with water; as, however, the rivulet is not the produce of a spring, but arises from siltrations from the neighbouring downs which collect and form a marshy pond, the water is neither fresh nor palatable, whence that is preferred by the inhabitants during the rainy season which is kept in cisterns in the castle; but in dry weather, when the water is siltered through a greater depth of sand, and consequently

more purified, it is conducted to the city by means of a stone aqueduct.

Though this rivulet can boaft but little depth of water it nevertheless nourishes caymans (alligators) from seven to eight seet long. I have myself frequently traced their footsteps, and even seen them plunge into the pool; but they are by no means dangerous.

Vera Cruz has but one fuburb, which is very small, and lies south-east of the town. It contains two chapels, a bowling-green, and some few gardens; but these are in bad cultivation, and without any ornaments. The lemon, the palm-cabbage, and a few cocoa-

trees are all the productive ones that are feen: a bombax or cotton-tree with red flowers, the azaderach or bead-tree, and piftachio trees (plumaria) with red, white and yellow bloffoms, are the only trees pleafing to the eye: hence the city is rendered fo dull, and sterile of a pect, that but for the meadow on the fouth which ferves as a refort for carriages, and the verdure of which recreates the eye, Vera Cruz would be one of the most tirefome refidences in the univerfe. Fortunately nature, fo niggard of her boons in the vegetable kingdom, has compensated in the animal by a large display of bounty. The city and furrounding country fwarm with birds, whose various plumage and enlivening fong, at once delight the eye and charm the ear. The streets of Vera Cruz abound in innumerable flocks of magpies of three different species, all of them of a jet black: the finallest is of the same fize, as lively, and as numerous as our sparrows, but less noisy, and less troublesome; the second, of the size and colour of our blackbird, resembles it to much as often to deceive one as to its species; the third, called in our colonies bout de tobae, is a kind of parrot. Thefe three species of birds are remarkably tame, and highly entertaining by their different antics: they never attack the feeds of plants, but prey on infects and the dung of mules, horses, &c. Larger than these three species succeeds the vultur aurea, fo well described by Mr. Jaquin: the name of this animal would induce a fupposition of its being formidable; it is however one of the least daring and most stupid of all the birds of prey, and never pounces on any thing alive: it is of the fize of a turkey polt, and much refembles it by its brown colour, and bare head, covered with a carunculated fkin, and it has just sufficient courage to steal and fly away with pieces of meat from kitchens; for this purpose it lays in ambush until nobody is at hand, when it founds fwift and lightly in at the door or window, finatching up whatever chances to be in its way, and flies out at the opposite openings. Its most assured reliance is however on the fewers, the flaughter-houses, and the chance of the country; occasionally it is feen partaking with dogs, when these happen not to be very hungry, the carcase of a mule. The tropillot (thus the Indians denominate our vulture) is incessantly eating, and when at length full, fleeps by the carrion, nor leaves it till it picks the very bones. I have on a morning feen a dead mule lying in the road, and at night noticed only the skeleton remaining, though on the fand where it laid, I could not discern the minutest trace of the footstep of a dog; the carcase consequently must have been devoured by vultures: this bird is fo little timid that it will fearcely trouble itself to remove from the way of a paffenger, but, at the the fame time, it is fo fearful when caught, that it instantly difgorges the contents of its craw, which forms a resource for its enemy the frigatebird, a species of pelican.

The tropillot is eafily taken, rifes but to a small height from the ground, and the scent of a piece of meat takes from it all inclination to fly away: if, then, this bird be pursued, all it relies on for escape is its legs, when it is easily run down: the cooks and children then amuse themselves with it, and after fastening tight round its wing a little bell, a bladder, or a ribbon, release it again; for the Spaniards, more humane than Frenchmen, take no pleasure in destroying life. We know very well that, instead of the flocks which now enliven the air, if Vera Cruz were peopled by the former nation, not a bird in time would be seen. El tomar sol, enjoyment of sunshine, so much the delight of Spaniards, appears to be not less grateful to these birds. To witness the seeming pleasure they receive from the presence of the god of day, they should be seen at sunrise, as, at the summit of a tree, or the top of a steeple, they simultaneously, or in succession, extend their wings, and keep in this attitude to receive on every part its warming rays, and again when they rise in air at noon, and skim over the town in swarms,

which almost obscure the sky.

On the margin of the fea, skimming incessantly over the waves and the shore, is feen a species of larus or gull, which has the gait and slight of a snipe, but which is scarcely half its size, and of a greyish blue plumage. Does a temporal make its appearance, or a shark seek its prey in the port, instantly swarms of little sish, smaller than our gudgeons, throw themselves out of the water on to the sands; then does this little gull, after a most amusing spectacle, as it pounces down with the rapidity of lightning from the regions of air, rises again, and repeats this evolution incessantly for the space of a quarter of an hour: I once had the curiosity to reckon the descents of one of these little birds: in the lapse of seven minutes, I counted eighty: it is indeed true that its extreme impatience oftentimes causes the loss of its prey, but nothing can be conceived more admirable than its excellent management and dexterity in seizing the fish at the surface of the water without even moistening its wing.

The buoys in the fea, and the bowsprits of the vessels in the port, are covered with onocrotali, (the tantalus of Linné, the tree-pelican of America), the pelican with a large craw, denominated by Linné the true pelican, boobies, and ducks of every

fpecies.

On fhore the rivulets and marshes are inhabited by swarms of spoon-bills, four species of storks, as many of divers and coots, and snipes more than twice the size of those which are seen in Europe.

The meadows are covered with beautiful starlings of a black colour, with the shoulders

and half the wing a blood red.

On the bushes and hedges the male and female cirris or heron, appear to form three species, equally rare in their kind: the male from the splendid hues of its plumage, and the female from the blue mantle which forms its summer garb, and which in winter changes to grey. Here too is seen the cardinal of as bright and shining a red as that of Louisiana, its song, not so varied nor so melodious as that of the nightingale, is yet as powerful and as bold. Here a lark, of the fize and colour of the wit-wall or golden thrush, but more handsomely feathered, and of sweeter song than our European lark; the ramphastas, toucan or American goose, whose beak marked with yellow and black, is longer than its body from head to tail: honey-suckers or humming birds, (trochili) of all colours and of various size: one species of them which soars aloft in air, singing like the rising lark, has its head and belly, which it proudly displays, of a scarlet colour; in another species it is of the most splendid azure.

In the woods are found a kind of partridge as large as, and of plumage much refembling that of our guinea fowl; another species no larger than quails; craces or hocos of two species with crops and crests of the colour of wax, as large as turkeys, and truly a royal dish; green perroquets, no larger than sparrows; aras or araracoyas; Amazonian perroquets of a green and yellow hue; four kinds of turtle doves, in which class is that species denominated ortolans by the colonists of Sant

Domingo.

Vast numbers of bulls and cows, almost in a wild state, rove through the forests; a species of rabbit makes these likewise its haunt; it is smaller, but in far greater plenty, than with us. Bucks and does, more than two feet high, are here so common that venison is fold in the markets at only three reals the pound. Tortoises are very numerous; land-crabs too, as large as a man's head, which leave the forests for the town, penetrate into the houses, and climb into the granaries; another species is met with so audacious that when surprised, instead of attempting to escape, raised on two claws, it defends itself with the others. A kind of squirrel much larger than ours, and perfectly of an ash colour, is another inhabitant of the sylvan kingdom, with ignans

or lizards, which grow to the prodigious fize of two feet in length, by ten inches in breadth, and furnish an exquisite dish for those not affected with venereal complaints.

Finally, the fea fwarms with fish of most delicious flavour, which are fold almost for

nothing in the markets.

Such are the riches I remarked in this country, where my ftay was limited to but one feafon, and where on this account, and owing to the important object of my mission, I was enabled to pursue my remarks to no greater length; such are the objects it presents, so worthy of the curiosity of a naturalist, and so well calculated

to render interesting a sojourn at Vera Cruz.

Though the general affured me that the country produced rattlefnakes, I met with none, whether my deviations were along the marshes sides, or whether I strolled through the woods; but every where was I peftered with gnats (maringovins) mufquitos, and chicos or karapattas: had I ever the misfortune to brush with my cloaths the branch of a tree, or any herbage, I was inftantly covered with these insects: the dress of the centaur Nessus, that so fatal present of Dejanira to Alcides, had not a prompter or more tormenting effect than the intolerable itching occasioned by the bite of this last tribe of insects: they penetrate in an instant through wool and silk, and the Spaniards, in order to preferve themselves from the torture they occasion, are conftantly accustomed to clothe themselves in pantaloons of Orissava leather, and boots. and never venture through woods, except where they cross the roads they have to pass. What however is extraordinary, this species of tinea or wood-louse (the karapatta) is only found in the neighbourhood of the sea, the interior of the country, ten leagues inland, being free from its tormenting perfecution. These insects at first occasioned me dreadful sufferings. Three or four times on my botanical excursions, was I obliged to pull off my breeches and boots, and scrape them off me with a knife; on reaching my lodgings, I was used to strip in haste and throw all my dress into water, and found full employment during a couple of hours, in washing myself, and separating with a pen-knife these tiniæ from my skin; these are truly the dragon, multiplied to infinity, which guards the fruit of the Hesperides.

I had now been fix weeks at Vera Cruz, nor would my ftay have feemed long to me, but for the anxious, the impatient defire I nourished in the inmost recesses of the heart, of penetrating deeper into the country, and attaining the end of all my fecret

prayers.

Not all of this delay however was thriftless; as a furtherance of my designs, I listened to all I heard; and put opportune questions occasionally, as if on a matter of indifference, and merely for the satisfaction of an idle curiosity; and by such means succeeded, without the least indiscretion, in forming conception of the measures by

which my enterprize might be carried into effect.

One day while converfing with M. de Fersen on the subject of the riches of our colonies, and the commerce they induced, he enquired of me if we cultivated cochineal? I answered in a careless manner "yes, certainly." "What," replied he with astonishment, mingled with vexation strongly depicted in his countenance, "do the French then mean to deprive us of this branch of commerce hitherto exclusively our own?" "Why not," rejoined I, smiling, and rallying him: "do you then fancy yourself privileged wholly to monopolize this excellent boon of nature?" "In what part of St. Domingo then is cochineal cultivated?" enquired he. "At Fond des Negres," I boldly answered, for having already deviated from fact, I thought it improper to draw back, and was at the time far from being aware of speaking the real truth;

'

and that the white or Sylvester-cochineal did indeed exist at the time at Mole St. Nicholas; but I wished to prepare resources against surprise and mistrust, in case of being in

the end detected in bringing away the infects.

At another time the major of the fleet, who had repeatedly promifed to flew me cochineal in the vicinage of Vera Cruz, took me an airing with him along the meadow, and proud of his rare knowlege, pointed out to me on a cactus called by the Spaniards tunas, for the cochineal infect, a fort of caterpillar enveloped in white cotton, which turned out to be merely the worm of the phalena or moth which preys on that precious infect, and from which I had fo much difficulty in cleanfing my nopals; I positively denied that it was the cochineal, and this mistake of my preceptor led me into a direct error, I mean to say, a persuasion, opposite to the fact, that the insect did not exist in the neighbourhood of Vera Cruz, a wrong persuasion which prevented my

purfuing my fearch for it any further here.

The major undoubtedly related to Don Uloa what occurred during our ride; for the next day, while at dinner with that general, he enquired if I had not feen cochineal the day before; I was apprehensive that this question was meant as a snare, and this the rather as I fancied he was observing me as he looked in the glass before which, with his back towards me, he was adjusting part of his dress; and assuredly, if such had been the case, he must have seen my confusion; I endeavoured however, as well as I could to compose my countenance, and answered, that what I had seen was not cochineal but a worm; that worms were without feet, and that the one which had been shewn to me was long and cylindrical, whereas, either the cochineal must have legs and a body of hemispherical figure, or the works of Linné, and of Pedro Gaza and Hernandez, both Spanish naturalists, who had thus described the infect, deserved to be

given to the flames. I had fcarcely escaped from the peril I have related, before I had to encounter another: in the course of dinner the general of the fleet offered to procure for me from the governor of Mexico the appointment of botanist on board the fleet then equipping at Acupulco for the purpose of making discoveries north-west of California, and to infure me a falary of two thousand dollars a year, with besides a thousand in hand for my equipment: he dwelt strongly on this proposition, and offered to present me himself to the viceroy of Mexico, to whose court he was about to repair. By accepting this offer I must necessarily belong to the fovereign of Spain as a botanist; but I did not fuffer myself to be persuaded by the great advantages held out to me, from ferving my country; the hope of rendering it a fervice weighed with me more than the feductive offers of Don Uloa. I, however, returned him unfeigned thanks. and excused myself without evincing any distain of the proposal; he again pressed for my acquiescence, when I replied that, having sustained no wrong, having no cause of complaint against the country to which I had the honour to belong, I could not esteem myfelf justified in abandoning it; and that, being a subject of the King of France, it was not allowable on my part, at least without his permission, to dispose of my services to any other prince; I added moreover, that being unprepared for any fuch expedition, I could not refolve on creating in my whole family, and especially in a father who felt for me the tenderest solicitude, that uneasiness which would follow the ignorance of what had become of me, and where I was; at last, as his solicitations were still continued with much earnestness, I waved the conversation, and began some other topic.

We spoke of the Paraguay tea; from the description of it given to me, I was unable to comprehend farther than that it was the leaf of some tree. I asked the governor in a joking manner, whether the consumption being so very considerable, there was no

tax on it when fold; and he answered, laughingly, that it really was in contemplation. After which, folicitous of turning the conversation on cochineal, he added that it was about to be farmed in Mexico. The very mention of cochineal startled me, but I was

upon my guard.

I am unaware whether my refufal had or not engendered any ill will towards me in the general; but some days after he affected to speak of botany in a very slight manner: he could not conceive, he faid, how any one could take the trouble of making collections of plants; that, for his part, had he the fineft herbal in the world, he should think it of no other value than to light fires with. Hurt at an attack so rude, I looked at him with attention, and warmly answered, that for my part I was fo unfortunate as to be ignorant of mathematics, of aftronomy, and navigation, but that, if perchance a book treating of those subjects fell into my hands, far from committing it to the flames, I should carefully preserve it for my children, or for some other person who might better than myself be capable of appreciating its value: I could not observe that Don Uloa felt any ways offended at the firmness of my remark; nay, I have generally noticed that the Spaniards, though naturally lofty and proud, despife those who have not the hardihood of thinking or expressing themselves with becoming boldness and dignity. Still had I to ascribe to this conversation the afflicting confequence, that, though he never gave me occasion for complaint, the general never after feemed to entertain the fame esteem for, nor confide in me to the extent I wished, and that, for the future, I should have to place little reliance on his interest.

I felt the uneafiness this affurance occasioned me, materially increased upon reflecting on the observation of the captain of the quarter-deck, who one day dining with the general, in a naif manner, confessed, that when a lieutenant, he had been appointed in conjunction with one of his comrades, to accompany the Abbé de la Chappe on his journey from Vera Cruz to Mexico, apparently as a mark of distinction, but in reality for the purpose of watching his movements, and preventing his visiting the works of the fortress of Piroté in the vicinage of Jalappa, which were then under hand: I drew, as a conclusion from this, with greater reason as I had come to the country without a passport from the court, that I also was beleaguered with spies; these I reckoned could be no other than my officers of the corps de genie, and under this impression, it was not without much disquiet I observed their noticing every thing, and ferriting every corner of my apartment: however, reslecting that I had had the prudence of concealing myplan from every body, and that no papers I had could betray me, I became less alarmed; I even passed my time very pleasantly with my fancied spies, visited them very frequently, and professed great attachment to, and considence in them.

They told me much respecting the Abbé Chappe-de-Haute-Roche; they themselves had made corresponding and simultaneous observations in the province of Sonora, at the time of the expedition against the savages, while the Abbé was observing the transit

of Venus over the disk of the sun.

The arrival of learned men in this dull country is fo remarkable that it is traditionally preferved in the memory of every body, and forms an epoch as noted as the appearance of the celeftial bodies they come hither to observe. A Peruvian marquis whom I met with at the Havannah, never swore by other name than de la Condamine; he was indeed generally well beloved, and his departure was seen with sentiments of regret by all the Peruvians; this by Don Uloa was not however attributed to any honorable desert in him; he told me that he was a jocose character, much addicted to pleasantry in his conversation, and complimentary, even to adulation, towards the Peruvians,

5

Peruvians, whose friendship and affection he was solicitous of captivating; that at bottom he was a shallow brained fellow, full of presumption, and ready to sacrifice every thing to the acquirement of same; he added, that he had the meanness to obtain a classical description from Mr. Justieu of Quinquina, and robbed him thus unfairly of the honour

due to him of its discovery.

I availed myself of the opportunity a conversation on this head afforded, to learn the truth of the relation given by M. de la Condamine, of the murder of Segniergues, respecting which I had always had my doubts; I confequently put many questions on the subject to Don Uloa, the refult of which was as follows: Segniergues fell in love with a tradesman's daughter, who was under promife of marriage to an Alcalde of the place: he met a return, and even more than a return to his passion; but, satiety cooling his warmth, he fancied he could not flew his gratitude towards the lady in a better manner than by endeavouring to renew the engagement between her and the Alcalde. Now in matters of this nature, the Spaniards are to the full as delicate as the French. The Alcalde turned a deaf ear to all fuggestions on that head, and Seguiergues threatened compulsory measures; inde ira. As ill luck would have it, Segniergues went to a bull fight, and was feated in his miftress's box, at the inflant the spectacle was beginning. and the Alcalde was iffuing his orders for all the masks to leave the arena. The father of his dulcinea, obflinately determining to remain, was greeted with a threshing, and the daughter, in the box where the was feated, recognizing him by his cries, wrung her hands in greatest trepidation and alarm. " My God! my God! she screamed out, it is my father they are beating!" At these words, another Don Quixotte, Segniergues jumps into the arena out of the box, and, fword in hand, cutting and pulhing, attempts to force a passage through the posse of officers; the number of alquazils increases, and the mob fly to their assistance; disorder and tumult are at their height; and though the Alcalde issues no other order than for the arrest of Segniergues, he gets killed in the fray. In this event there is nothing but what is perfectly natural, and what might be expected from the petulance common to Frenchmen, and the arrogance of a young furgeon, who, intoxicated by a fortunate opening, fucceeded by the most happy fuccefs, imagined in himfelf a right to do as he pleafed with the Peruvians, and injure them in their very home-steds. D. Uloa further assured me, that no one but M. de la Condamine would have instituted the process which followed. He likewise related to me the adventure of the night, passed in Pichincha, by M. de la Condamine, who, out of bravado, had separated from his party, and lost his way, and how he jeered him upon it in the morning, on his reaching the rendezvous, drenched with wet, benumbed with cold, and dying with hunger: "What a fine night this, eh, M. de la Condamine, faid he, what a precious page for your journal!"

On another occasion the conversation turned on the Duchess of Pompadour, with whom he had acquaintance when in France. From the affectionate manner in which he spoke of her, I guessed he was indebted to her interference for his advancement at

the Spanish court.

What however to me was far more interesting than all, was his account of the affair of New Orleans. Though he might appear to me inclined to relate facts in a manner widely different from that used by certain enthusiasts, the unaffected manner in which he described the rude treatment he had to endure, the little animation or vivacity he mingled in his recital, persuaded me that the revolution was no other than, as he affured me, the effect of misconduct and imprudence; and that it was kindled and blown into a slame by the cupidity of the chief administrators of the affairs of the colony. The revenge taken by the Spanish court was not merely a consequence of vol. XIII.

the reprefentations of Don Uloa; it was a merited punishment of what was considered an act of rebellion, and fuch as in any other nation would probably have been extended to a far greater number of delinquents. The general agreed that the vexation of the people, at feeing themselves turned over like inanimate beings, or animals fold in a market, to another mafter in Lewis XV. was not without foundation: "But then," he observed, " as governor, what had I to do with this vexation; how could I remedy it; or how even the King of Spain himfelf, fufficiently chagrined at being obliged to be content with fo fmall a compensation? Circumstances," added he, " alone were to blame, and the hard necessity to which, and to the infistance of a powerful monarch, he was obliged to fubmit; while for the new government it has not after all been either injurious or severe to those by whom it was opposed." I have heard much fault found with Don Uloa; but all the fubjects of complaint that were alledged against him were charges of familiarity unworthy of his rank, and a shabby meanness in his domestic concerns. He has never given room for any one accufing him of injustice or cruelty; he was in fact the log of fable, his excessive patience made him be despited and difmiffed. O'Reilly, who fucceeded him, was the ftork.

However much amused by these narratives of the general, I never lost fight of the object I had in view. I frequently visited Don Athenas and Don Lobo, two Spanish merchants; but saw them thus often merely for putting myself in the way of hearing

matters relating to my plan.

One day while in company with my French engineer, at the house of the latter merchant, I faw him examining certain packages of vanilla. I enquired, as if casually, from what quarter it was obtained, and learnt that it came from Guadalaxara, fixty leagues diftant, or from Guaxaca, the diftance of which latter place was a hundred leagues from Vera Cruz; also that it was cultivated by the Indians. They next talked about cochineal: I did not, as may well be conceived, begin this fubject, but I profited by what I heard. I learnt that the cochineal from Guaxaca was preferable, and yielded a more beautiful colour than that from Flafcala, or Guadalaxara, which made me refolve on choofing Guaxaca for the fpot I should repair to. I had moreover two other reasons equally weighty for this decision: the first, the better opportunity I should have of obtaining the most perfect information respecting the cochineal, in a country where it is largely cultivated; the fecond, the circumftance of this road being lefs frequented than that leading to Mexico by Flafcala and Guadalaxara, and this circumfrance affording me a greater facility in avoiding highwaymen, and inquifitive eyes. It is a certain matter, in fact, that, refolved as I was on the journey, though I should not even obtain my passport, and in spite of all the viceroys in the world, I ran much less risk of discovery on the road to Guaxaca, on which I should not be suspected, than on that of Mexico, the only city worth feeing, that only for which I had fought a passport, and on which I should be fought after on the first notice of my departure.

Thus, with a refolution, if I should obtain a passport for Mexico, to use it merely for Guaxaca, the route to which I had adroitly learnt from a Frenchman who had been in the service of the late viceroy, I waited with impatience an answer to the three memoirs which in succession I had addressed to the viceroy of Mexico, to obtain the so much wished for passport*, and ceased to frequent the house of Don Uloa, except to

enquire respecting it.

^{*} Even Spaniards themselves, from whatsoever part of the world they arrive at Vera Cruz, are not allowed to leave it without a passport from the viceroy.

At length, on Wednesday, the 30th May, he in a very cool manner before dinner announced, that he had received an answer from Don Bukarelly *, in which he plainly fignified it was not in his power, as I was a foreigner, to admit of my entering et famoso reyno, except by special order from the court of Spain. This news affected me far more in reality than I choice to flew, and I made a very bad dinner, though without attending to what I did I devoured a great deal. The general did not fail to enquire what I meant to do. I pretended to be fatisfied, and to be determined to demand the necessary passports through the court of France, and wait for them at Vera Cruz, or in case of my being sent out of the country, to go myself in search of them; but I had already made up my mind in case of such an event occurring as had happened. As Don Uloa had a quarrel with the governor, I naturally concluded that the latter would have no knowledge of the objection raifed by the viceroy, and decided on requesting of him a distinct passport for Orisfava, which was within his jurisdiction, and about forty leagues from Vera Cruz. By means of this paffport, to the licence in which I meant to give the triffing extension of fixty leagues, I hoped to reach Guaxaca, but hardly to itself did my soul unburthen this design, and with much more reason was it then referved from others.

I went in consequence to Mr. Fersen, and, concealing from him the refusal I had experienced, intimated how impatient I was to reach Mexico, what vexation so much tardiness occasioned me, and how happy it would make me if even I merely obtained permission to herborize on the volcanic mountain of Orislava: he stopped me upon this, and proffered, in the handsomest manner, himself to solicit the governor for the favour I sought. I slew into his arms, embraced him in the most affectionate manner, and that very evening, as a token of my grateful feelings, sent him certain books which he had manifested a desire to possess.

I faw him the next day; he had dined with the governor, and obtained the paffport. On Saturday he brought it me in good order: I concealed from him in a great degree the transport I felt, left he should recognize the great importance I attached to this

paper, and be anxious to fearch into its motive.

The next day (Sunday) I passed in preparations for my journey, and dined with the

general, that he might have no suspicion of my project.

Monday I was to have hired horses in order to set off the next morning. The morning of this day, this fatal Monday, I rose in raptures of traitorous joy, and gayer than ever before; I repaired to the dwelling of Mr. Fersen for letters of recommendation to Orissava, breakfasted with him, and returned home to complete the packing of

my things.

Of a fudden I perceived a man in a blue coat with a red cockade, enter my apartment: he was quite out of breath, and looked wild, finister, and angry; as soon as he was able to speak, he announced himself as the secretary of the governor, and ordered me, in Spanish, in the name of the King, to give up the passport which the governor had entrusted to Mr. Fersen. These words, which I but too well comprehended, affected me as would have done an electric shock. I alternately became pale and red, and feigned, in order to have time for recollecting myself, that I could not understand what he said; but he so often and so distinctly repeated to me, el papel que el senor gobernador entresó al senor D. Francisco de Fersen, that I thought it vain any longer to

^{*} However ungrateful to me the name of this nobleman, I here give it for reasons which it may not be difficult to comprehend: he was called El Excellentissimo Senor, y Beato Fraile, Don Antonio Bukarelly y Ursua Teniente General de Los Reinos de Nueba Espana.

turn a deaf ear: then all at once, with another turn of features, and affuming a gay and gracious air, as if I began to comprehend him, I faid I was incapable of making any improper use of a kindness I might receive from the governor, and delivered up the papel so much sighed for by me, begging him at the same time to present my respects with my thanks.

I wished, as he seemed much fatigued, to induce the secretary to rest himself; but he begged to be excused, assuring me that he had express orders to make no stoppage any where until he had brought back my passport, and not to appear before his master

unless he took it with him.

I readily conceived from these words that some alarming storm was bursting over my head; but still, using dissimulation, I asked him, apparently with the utmost indifference, what possibly could be the motives of so sudden a change in the sentiments of the governor? He answered, that the post that day had brought certain orders from the viceroy concerning me, in virtue of which he verbally notified that I was forbidden, in

the King's name, to leave the district of the city of Vera Cruz.

I haftened to Mr. Ferfen with fuch impatience that I almost flew. I faw, I heard nothing, and was unable, but hastily, and in half-ejaculated words, to relate to him my difaffrous adventure, conjuring him at the fame time to conduct me to the governor, in order to have this matter elucidated. We repaired to the palace, and found there the governor; for his part, perfectly fatisfied with recovering his papel, and making no computation beyond, he received me very politely, but at the fame time repeated to me the forbiddance before announced by his fecretary, of exceeding the limits of the jurisdiction of the city; an injunction, he said, which by order of his fuperiors, he was bound to communicate. M. de Fersen joked with him, observing that, if I had taken his advice, he would have found the bird flown; but afterwards, in a more ferious tone, he enquired what possibly could have originated for rigid an In answer, Don Palacio exhibited to us the letter of the viceroy, written after a deliberation of the audiencia real of Mexico, and the conclusum of the procurator general, grounded among other matters on the apprehension of opening to strangers the secrets of the rich culture of the country. Here my heart panted fo violently that I no longer heard any thing but the order for my leaving the country, (an order quite the reverse of that I folicited) beginning: pero de regresa in su tierra. On this the governor, who read the whole with much emphasis, laid still greater stress. reading it even thrice over, and flewing me the letter where it was written: in fine. he was expressly enjoined to be himself present at my going on board, to draw up a declaration to that effect, and certify the same to the viceroy. He then, speaking for himfelf, defired I would inform him when I meant to depart, and what ship I meant to fail in. This I promifed: after which he took leave of me, making a thousand excufes and professions, and even going the length of calling me hijo mio, or fon; but I was not his dupe.

On leaving the palace I took a hasty leave of Mr. Fersen in the street, and repaired to my lodging, deadly sick at heart: I walked backwards and forwards, now threw myself on a feat, and now into my cot, swinging it from one side to the other with such violence as to risk breaking my head against the cicling; not the least ray of comfort beamed on my mind; in vain did I exclaim to myself aloud, if possible, that I might listen and become less distracted. In vain did I exclaim, Be calm, thou mad man! poor intemperate sool, take pity on thy intellects! Art thou not yet at Vera Cruz? hast thou not reached this distance on thy road? and dost thou not still remain? Oh! yes, retorted anguish, but thou art ordered hence, thou must go, and empty-

handed

handed go thy ways! Thy plan of four years standing, even in the very port, now falls to wreck; four years are lost of the profession thyself selecteds; that hope of fortune vanishes! so fondly pictured in thy mind; the advances made by thy family, the bounty of thy sovereign are vain, and foolishly gone; thou failest in an affair undertaken in contradiction to the advice of thy father, thy friends, and every one; an affair which for four years has subjected thee to nothing but alarms, chagrin, mortification, toil, and dangers of every description; and what a blessed profit hast thou gained! Thou hast rashly pledged thyself to the minister, and what account hast thou to render? Shame, humiliation, ridicule, contempt, will be thy lot on every fide thou turnest; and worst of all, thy object will remain unessed the Spaniards exclusively possess their cochineal! Thinkest thou of this, and dost not die of anguish? What then, is grief so little to be seared; is it so powerless of suffocation?

I passed the whole morning a prey to such tormenting reslections, and under the greatest agitation, swallowing three quarts of lemonade, but without the least appetite

for food; no, the smallest morfel would certainly have choked me.

At length, tired and overcome by the weight of so much affliction, my mind made a last effort for relief; by dint of perpetual repetition,—thou art still at Vera Cruz—the fundamental point of a desperate project presented itself to my ideas; I calculated, that as no appointed time was fixed for my departure, and as there was no ship in the port which would fail for three weeks to come, I might in a fortnight's time complete a stolen journey. Thou absolutely must, said I to myself, penetrate into the interior, though destitute of passport, must bear away the sleece for which thou hast sailed, despite of all the dragons in the way. Instanted by this idea, the very apprehension of being unable to realise it threw me into a cold sweat.

Gelano le vene, bollon i Spiriti.

But this beam of light dispersed the former gloom, and brought with it a portion of tranquillity. I now thought of nothing but developing my plan, and digesting its detail. I walked out in the evening to take an airing, and went to the Nieveria, where I treated my engineers. They complimented me on forgetting fo foon the vexation to which I had in the morning been subject. I suffered them to remain in their error, and returned home where, without taking any supper, I passed the night in reviewing the plan I had projected in my mind; in retrenching, adding, and changing its minutiæ, and in calculating on probabilities and accidents. At length I fell affeep, and, refreshed after three hours, found my foirits lefs heated, and my head more clear: at day-break, however, I reflected with fome furprize that there was no room left for any alteration in the plan projected the night before, a circumflance arifing from my peculiar and constrained position: Malum eft confilium quod mutari nequit, says Tacitus; this I repeated to mytelf but in vain. I could find no plan better than the whole I had in mind, and no choice left but either to put it in execution, or return unfuccefsful: the latter to me was more dreadful than death itself, and this at once justified in the eye of reason the evident rashness of the attempt.

I rose in the morning rather less content than on the morning before, but sufficiently so to look on the maximum of danger I risked with a dispassionate eye; I sound the worst that could happen to me, in case of arrest, would be to be sent back, tied hand and soot, to Vera Cruz, and there to be imprisoned in the fort, or on board the ship of the general of the port, until my embarkation; in short, merely a failure, that probably might not take place, in my object, which would be the case however at

certainty if I did not attempt the journey.

Every thing tended to strengthen me in my last resolves, though I reslected upon

many obstacles I should have to encounter.

In the first place, nothing less than a miracle, on a road over which so many pikemen were dispersed for the purpose of arresting deserters and strangers, could guard me from being asked by some one or other of them for my passport.

In the fecond place, my drefs was not that of a Spaniard, and this inconvenience neither time nor my means allowed of my remedying; this circumstance shewed me a

foreigner, and exposed me the more to the looks of curiofity.

Thirdly, an appendage to the last noticed predicament, I spoke the Spanish language

very indifferently.

In the fourth place, I was almost entirely ignorant of the road, and it was only by the merest chance and nicest management I was enabled to learn by what gate I had to leave the town.

Finally, it was necessary I should set out on foot, in a climate where I should have much to encounter from the season of the year, and the sands through which I had to travel. I must also go unprovided with linen, provision, change of dress, and books, and without instruments to reap the possible result of my excursion, in encreasing our

knowledge of natural history.

The plan I framed for remedying these inconveniencies was as follows: I shall travel on foot, said I to myself, as a botanical physician resident at Vera Cruz, in search of simples; I shall assume the appearance of taking a walk rather than being on a journey, shall lodge only in the poorest huts of the Indians, and in places away from the high road, pretending to have lost my way; I shall avoid all towns, hamlets, and villages, where possible, and where not, pass through them by night; I shall declare myself a Catalan from the frontiers of France, which will explain the reason of my speaking French well, and the Spanish but indifferently; I shall always go neatly drest, wear some trinkets, affect a good-humoured and free disposition, and pay liberally for all I take. With all these precautions I must indeed be unlucky if I should be taken for a foreigner or a deferter.

In fine, after some little provision against the most urgent wants, for example, a broad brimmed hat, a net for the hair, a rosary, an indispensable article, &c.; and after fetting aside about three hundred gourds in quadruples, I sixed upon the Friday night

following for my departure.

In the mean time I visited my friends and acquaintance, whom I apprized in a loofe manner that I meant to pass the remainder of my stay with Madame de Boutilloz, at Medelina.

On the Friday I dined with the general, to whom I related the trick I had played the governor. It feemed to pleafe him greatly; and he affured me, if I had fuddenly made my departure after obtaining the paffport, no notice had been taken of the matter.

The remainder of the day I passed with the engineers; and returned home to reslect a few moments on my undertaking.

It was about nine o'clock when, after carefully locking up all my effects, I departed, as if merely to take a walk.

I foon reached the rampart, scaled it, and bade adieu to the city.

For a long time I travelled britkly along through the fands, under favour of the light afforded by the flars; but a violent wind effacing all traces of the road, and the fky being overclouded, I found myfelf wandering I knew not whither, at the diffance of more than a league from the town: undecided, I went first one way then another,

to the crowing of cocks, and observed the rising of smoke, but all in vain. Though I had twenty times before travelled over these spots, night, by enveloping all objects with the same shadowy veil, disfigured the rallying points which otherwise might have struck my memory. I climbed large mounts of sand, some sirm, and others moveable, until I was utterly exhausted. At length anxiety, combined with satigue, made me determine on re-entering the city; but now was the embarrassment to find it, for I no longer distinguished its sires: at length I saw one at the distance of three hundred toises, I ran thither, it was the cabin of a free negro whom I had seen before in my neighbourhood. I told him I had lost my way in returning from Medelina; he directed me on the right road, and I was exceedingly surprized at finding myself a quarter of a league south of the city, while I imagined myself in the west. I immediately scaled the rampart, and returned to my home, terribly satigued, and still more vexed at my bad beginning.

However, after changing my linen, I threw myfelf into my hammock, and enjoyed a fleep as fweet as it was necessary. The next day, at three in the morning, I left home a fecond time, and again fealed the ramparts, this time with fome rifk of breaking my

neck; — behold now Don Quixotte in the country.

I used every precaution not to miss the road; but directing my steps too much towards the north, I again strayed from my way, and was lost nearly an hour in the fands; however, recognizing in the heavens the ear of corn of the conftellation Virgo, and Mars, and Saturn, which were already in the east, I directed my steps westward till day-break: at four I over-heard the country people going to market, and, guided by their voice, kept on a parallel with the road, but about a hundred fathoms diffant, to avoid being feen. At length, by dawn of day, the road taking through a forest, I was obliged to enter it, but I took the precaution to flacken my pace as often as I diffinguished any Indians, negroes, or Spaniards; after they had passed I made up for loft time. At five o'clock I had cleared the forest, and was two leagues and a half from Vera Cruz: here the road divided, and occasioned a new embarrassiment. Perceiving a muleteer with a train of a hundred and twenty mules advancing, I put questions to him with caution, and learnt that he came from Guaxaca, by the road of Monte Calabaça, which he pointed out to me, observing at the same time, that he paffed it the day before. After this, Very good, faid I to myfelf, to-night I shall sleep at Calabaça; and fauntering leifurely along till he was out of fight, proceeded on my way; but when no longer visible to the muleteer, I got on at such a rate that by eleven o'clock I had travelled nine German leagues. I drank a glass of brandy and ate a bifcuit in a tavern by the road fide near the forest: this satisfied me till nine o'clock, when I was parelied with thirft. I was walking in a level favanuah thinly ftrewed with copfes of mimofa cornigera, bombax, ceiba, and wild fig-trees; fave where thefe made their casual appearance the earth was bare; for we were now at the close of winter, that is to fay, of the dry heats, which parch all the herbage; and the cottagers had fet fire to the dry grafs, to admit of the young blades pushing after the rain. It was to me a spectacle truly pleasing to behold, already, from the plain where I stood, the mountains Alvorado on the fouth, those of Orissava on the west, and the Sierra Leona on the north-west, forming a natural rampart extending the space of a hundred and fifty leagues, and which mountains I trusted foon to furmount; but in the mean time I was dying with heat and thirft. I met two muleteers, conducting two hundred and fifty mules: I entreated them to fell me fome water: they answered they were not water-fellers, but at the fame time one of them unfaftened from the pummel of his faddle, a bottle full and prefented it to me. When I had drunk after this fashion much

at my eafe, I pulled out my purse; but, slicking the spurs into their mules, the mule-

teers merely called out, Va ufied con Dios, God be with you.

I continued my way: by eleven I found myfelf as thirsty as ever: I fancied I distinguished a hut; it turned out however to be only one of those Mexican ornaments, of which on my road I met with feveral, formed of earth in a pyramidal shape, from thirtyfive to forty feet high, on a base of twenty, and bearing a perfect resemblance to our ice-houses. I looked round in vain on every side, no habitation was visible nearer than fix leagues towards the north: I could not travel thus far out of my road. I felt no fatigue, the road was good, but I was dying with thirst. I imagined I had made a charming discovery on distinguishing in a thicket a kind of sphirical cucumber; it is but infipid, faid I to myfelf, but it is aqueous and refreshing. I ran to the spot, gathered, and even bit one. The electric shock is not more sudden of effect: I thought myself poisoned; in this dry and spungy fruit I found a hot and corrosive bitterness, which increased my thirst in the proportion as sulphur and bitumen would the slames of a burning pyre. Foolish botanist, then said I to myself, did you then imagine that all coloquintidas must necessarily be small? This will teach you more carefully to study the different species. The fize of the fruit, equal to that of our melons, and its round figure completely deluded me; I therefore fought fome other affuager of thirst. I faw fome fruit of a certain cactus, called by the Spaniards tunas; it is a species of opuntia found in St. Domingo, with red fruit. I took two or three of thefe figs, peeled and ate them. These greatly lessened my thirst, when I plucked others, and devoured near thirty; but failing possibly of peeling them with due care, their burning cottony covering occasioned my tongue and lips to fwell immediately, and I found myself on the point of suffocation. I still continued my journey, and met with no one. At times the leaves of trees agitated by zephyrs, struck the ear in the manner of distant waterfalls, or fome murmuring brook: while liftening to this pleafing promife the winds ftilled into calm; I no longer heard any thing, and almost resigned myself to despair.

In the mean time, the god of day, already four-and-twenty degrees above the horizon, darted his unsheltered beams upon me, a thousand times reslected by the burning plain beneath. I had merely a very light fea breeze at my back; before an immense plain eighty leagues deep, prefented to my view at the extremity nothing but lofty mountains: it feemed as if all nature confpired against me. I thought at one instant I plainly distinguished the roof of a hut. I quickened my steps, but after going three quarters of a league in the direction I faw it, I found myfelf in a little thicket, where, no longer perceiving the object, I fancied myfelf mistaken, and for once lost all patience. I halted, and looking carefully round a bombax, to fee if there were neither a ferpent nor mufquitos to dread, I laid down under its fhade, and flept nearly two hours. The fun had now paffed its meridian, I rofe, and fad enough, continued my journey; but oh! unlooked-for happiness, I had scarcely proceeded a quarter of a league before I distinely faw the house I thought I had seen before. It was still about fix hundred yards from me on the fummit of a hillock, near the river Jamapa; to reach it took but an inftant, and enchanted with the fight of that beautiful river, I would fain have leapt into its waves. I entered the cabin about three in the afternoon. The hoft was a fliepherd: him I conjured, as well as the hostes, por amor de Dios to give me drink and food: this they did with all diligence. I drank fucceffively a quart of water, two quarts of milk, and as many of lemonade, and devoured the wing and thigh of a turkey, with three fresh-laid eggs, before I answered the least question. The shepherd asked me if I was a Spaniard (Castillano). I antwered, I was a physician of Casalonia. I judged as much, faid he, from your gait; you Europeans take longer strides than we Creols. Thus Thus do those who are most nearly connected with nature observe her with keenest eye. As the shepherd seemed to me rather curious and discerning, I paid him, and complaining of a dreadful head-ach, threw myself on a hurdle made of branches, where I fell asseep. Four reals which I gave my host earned me at least four thousand benedictions.

I flept fo tranquilly that I did not wake until three the next morning. The morning broke on the world here only at four, still I did not fail pursuing my journey, without

taking leave of my hofts, for fear of awakening them.

I descended the hill and reached the side of the river: at first I was under some embarrassiment respecting the means of crossing it; but recollecting that it is but a branch of the same river which slows by Medelina, and that it is not deep, I was on the point of undressing myself to wade over, when about twenty fathoms higher up I distinguished a slat-bottomed canoe: I jumped into it, and seizing a boat-hook, pushed over in an instant to the other side: in no part did I find more than three feet water, though the river was two hundred yards broad. By jumping on shore I awakened a dog, which began to bark, and soon after I noticed a negro looking at me over a hedge. I asked him what was the fare of the ferry? A real was his reply. Then give it me, said I, jokingly, for having done your work for you: he at this was content to receive nothing, though I left him his fare.

At this fpot I avoided the first danger I had to encounter. The right passage, as I learnt on my return, is lower down, and there a corps de garde is stationed, and a picquet of pikemen: my ignorance of the right road thus freed me from many inter-

rogatories.

After passing this river I had no other to cross for fixteen leagues. I tripped along lightly by narrow but good and easy paths: for the space of fix leagues I saw not a single human being, and should willingly have fancied myself for an instant the only one in nature, but for an immense number of rabbits, far from wild, that gambolied in my pathway. Few deserts are seen equally beautiful: more than half the ground consists of an excellent staple of loamy earth, yellow, or black, and well adapted to cultivation, the remainder of Savannahs. At six in the morning I heard turkeys on my right, which made me imagine myself near some dwelling. About seven, I saw a dozen of them spring forth from some withered herbage before me, and sly away with a terrible noise: their slight was so rapid, and so long continued, that I was satisfied of their being wild turkeys. A quarter of an hour after, two others ran from the ground about a hundred steps from me, and afterwards, three more from my left; circumstances which convinced me of their being an Indian production, or at least of their having become naturalized in the country, and shook off the domestic yoke.

By nine in the morning I found myself within reach of what is called a rancho, (a fort of canteen.) Here I found an old, curious, and impudent negress, but neither bread, nor meat, nor eggs, nor brandy: I was fain to be content with a dish of hard beans, badly stewed, and a morsel of bread I had brought with me from Vera Cruz. Happy precaution! I made myself some punch with tassa, and afterwards took three

hours rest on a frame of bamboos in shape of a bedstead.

At one in the afternoon I continued my journey. The fky was overclouded, and a brifk wind blew. In the morning I had croffed five arroyos, or torrent-beds, and in the afternoon passed again twelve others. Nothing can be conceived more fatiguing and unpleasant than these passes, owing to the trunks of trees, blocks of stone, and monstrous pebbles, with which they are strewed. I was indeed in a slight degree indemnished by the variety of the plants I found in them. I saw a mimosa perfectly

VOL. XIII. 5 I fimilar

fimilar in leaf and port to the pomegranate-tree, yucas fixty feet high, ferns of very fingular kinds, an arum with an upright but low flem, and a palmated-pinnatifide leaf, a plant of great beauty, but fo large that a root would weigh ten pounds; polyanthi, amaryllides, &c. I found among these torrent-beds likewise several wild horses, but

very rarely any water.

At length I reached mount Calabaça by five in the evening, much fatigued. The apprehension of losing my way, and of not readily finding any other resting-place, made me determine on halting here. I expected to have found it a village: it was but a rancho or mefs-rooms, round which horfes, horned and other cattle, were reared, and nothing but maize was fown, which ferves for food as well to the cattle as their guardians. These ranchos are composed of three or four wretched huts: the demeshe dependent on them is formetimes from ten to twenty-five fquare leagues, in which were about a hundred horses, three or four hundred sheep, and a few hundred cows: this rancho was extensive, the farmer, a Spaniard, or at least of mixed breed, was about fixty years of age, of handfome figure, civil, but grave, and of rather, as he feemed to me, a harsh character. I accosted him, and entreated shelter: he granted my request, admonishing me beforehand that he kept no inn, and had neither bread, nor meat, nor wine, nor brandy, but to what he had I was heartily welcome. I begged of him half a dozen eggs, which I ate with tordillas. These tordillas are cakes made of maize, first boiled in water, into which a handful of lime is cast to soften the exterior skin: the fkin is afterwards washed off, and the peeled maize is crusted with a cylindrical stone, by rolling it over a flat one eighteen inches long by ten broad: after this first process, it is kneaded with the hand, and rounded and flattened to the thickness of about four lines: it is then baked on a stone or iron plate, heated for the purpose, and turned, that both fides may be properly baked: in two minutes the cake is made. It is always an infipid food, but very flomachic, never causes indigestion, and at no time occasioned me any inconvenience. In a family confifting of two women and five or fix men, the former are conftantly employed, morning and night, in preparing tordillas: five or fix are requifite for one perfon at each meal, and they are conftantly eaten new.

My hoft, who appeared to me to be an old foldier, and who, as I afterwards learnt, was really one of those pikemen whom I so much dreaded, seemed a wily old fox, at leaft by the questions he put to me; but as I had undoubtedly every resemblance of a physician, he could but give me credit for my tale. Notwithstanding this he pertinaciously refused me a horse for the next day, for I thought myself now far enough from Vera Cruz to venture this indulgence: I was however forced to forego it. offered to pay him for his supper, but he refused to take any recompence Upon this I gave four reals to his wife or miftrefs; for though he had a number of children I could not learn from him whether or no he was married. My liberality earned me for the night the enjoyment of an old cloak, which had ouce been blue, but which from fervice had become grey. In this I wrapped mylelf, and laid me down on a mat on the floor of a neighbouring penthouse: but for this kindness I risked to have died of cold for fearcely had I left the door of the hut before one of those dreadful fforms of rain fell which are termed at St. Domingo avelaffes, and of which the drops are as large, and fall with as loud a found as the most formidable hail-stones of Europe. The noise they made was frightful: the rain driven by the wind penetrated the branches and leaves which covered the penthouse, and ran through as from so many spouts: in an inftant the whole of the interior was drenched: one would have thought a water-fpout had burst over the place. The weather caused me the most mournful reslections. a country interfected by torrents and rivers, if this ftorm should only be the precursor of others, how should I be able to travel, especially on my return with the booty I hoped to gain? Could even the best horse in the world carry me safe among the rocks and trees which are almost always brought down the ravines after such storms? These reslections were very far from comfortable; but having planned every thing for the best, I had no other reliance than on Providence: with this conclusion I covered my head with the cloak, and enjoyed a prosound sleep till sour the next morning.

The melancholy ideas which had afflicted me the evening before vanished with the shades of night: a clear and serene sky, a cool morning, the prospect of the mountains of Oristava, from which I was now but twenty leagues distant: their branch, which advanced forward about eight leagues like a steep and inaccessible rampart along the whole contour of the plain, delighted me, and instilled fresh courage in my breast. From Vera Cruz I constantly advanced south-west: here the mountains in front of the plain, having no opening on the west, the road bends several points towards the fouth.

It is worthy of remark, that throughout this vast plain the course of the torrents and rivers is from north-west to south-east, and that their beds, though in a country so slat as to seem a level, have considerable depth: this singularity arises no doubt from their descending uniformly from the mountains of Orissava, and from the immense volumes of water proceeding from the melted snow, and the hot springs of these mountains having, by their weight and impulse, gradually excavated the country to a vast distance, and thus, in the lapse of time, worked a slope for themselves, which they do not seem to have possessed at an earlier period.

Though the rain was dreadfully violent during the night, such was the parched state of these sandy cantons, that the ground was moistened scarcely two inches below the surface. On this day's journey I sound oaks with ovate leaves slightly dentated; a white amaryllis, which I brought back with me; a polyanthus, whose rasped root is used by the Indians in lieu of soap; three large slocks of sheep; twenty coveys of partridges, not so large as quails, and rabbits out of number: I had to pass, moreover, no less than sixteen arroyos. The soil appeared to me generally more fertile and of better staple than that observed the day before; still is it not the less uncultivated, and without inhabitants.

By eleven in the morning I had travelled eight leagues without eating, and without drinking any thing but a little lemonade, which I procured of two Indians who were building a hut, and who were the only rational beings I met with. I now found myfelf at the foot of the first chain of mountains, but the steep and almost perpendicular declivity before me, the projecting rocks of which were discernable through the hanging woods, formed only a portion of the obstacles which nature, not fatisfied with this bulwark, has opposed to the entrance into Mexico. In advance of these steeps, and at the very foot of them, she has formed an enormous fosse, at the bottom of which runs a river ten fathoms broad, of fuch rapid, fuch violent current that it has dug itself a bed, through ten strata of different kinds of stone, of eighty feet deep; over this bed it winds its course like a serpent amid the sands, almost without a murmur, but foaming, and with the rapidity of lightening: on throwing a pebble into the river, I judged the depth of it to be fifteen feet: when from a wretched bridge made of half rotten bavens, by which this river is croffed, one looks down on the torrent below, the head turns dizzy. At the extremity of this bridge is a rock which commands and covers it in fuch manner that ten men might keep as many regiments in check: in the rock an angular and zig-zag passage is cut, through which the road lies, and in which no more than two perfons can march a-breaft; add to this, a few pieces of artillery placed on the fummit could thence deftroy an entire army venturing to force a paffage.

Half a league lower down is another river, which empties itself into this, called the Rio de la Punta, or of the Point: this is not fo deeply incafed as the one it joins. I found at the end of the bridge by which it is passed a Spaniard who received toll; as he had neither bread nor wine, I refolved on proceeding to dine at San Lorenzo, though the diffance was full three leagues. The toll-gatherer warned me, de las aguas, (the coming rain,) I heeded him not, but had cause to repent: a heavy shower quickly brought me back, and subjected me to his jeers. On its ceasing I resumed my road, and foon reached fome fugar grounds, which feemed to me forfaken, notwithstanding the buildings were capacious, the plantations very extensive, and the canes fifteen feet high. At length I came to a ravine, the bed of a torrent, a hundred and fifty fathoms broad, and forty feet deep. I fancied before me the enormous skeleton of some extinct river, if fuch an expression be permitted, the only one I could fancy adequate to depicting the gigantic ideas enforced on my imagination by the fingular spectacle of the rocks, the immense trunks of trees, the enormous stones of all colours, rounded by long and violent friction, which were piled on each other in confusion in the chasin. What a horrid spectacle, but yet how magnificent, how terrible! All these masses, now motionless, and surrounded by deepest filence, had erst been driven with resistless impetuosity, had experienced, amid the noise of horrid crash and dashing foam, an active change of station: how mightily powerful then must have been the vast and inconceivable volume of water, that thus could have made the fport of weights and bulks like these! Scarcely, though the bed was dry, was I enabled to pass these obstructions to my way. Picture to yourfelf, reader, this chafm, winding, vast, and deep, enclosed on either fide by a forest of trees, equally lofty, still, and sombre, and ask, what painter could venture the display of scenes so wild and monstrous? O Vernet! 'tis thou alone perhaps wouldst not in vain have dared.

Here it was I faw many pairs of those beautiful parrots of the Brazils, with pointed tails, called araracaunas; of the Amazons, with green plumage, mixed with the yellow of the jonquil, and of the fize of the Guinea parrot; and a bird of prey, black and white, with red feathers round the beak, the fize of our buzzard.

A most excellent staple, in addition, presented me on every side a vegetation equally abundant and varied; but, alas! it was impossible for me to load mysels with such a mass of treasure; I therefore made the best of my way, with my eyes cast down, and solicitous almost of avoiding the sight of objects I could not choose but sigh for.

At length I arrived, exceffively fatigued, at San Lorenzo. The inn here is for a Spanish inn a charming one, and to me was truly so. The mistress was civil, and I was ferved with diligence. I had four fresh eggs, a chicken, and some excellent bread, together with some tent wine. Immediately after I departed, resolved on reaching Villa Cordova that day, but scarcely had I left the church-yard, where I had been to examine at leisure its plumeriæ, (frangipaniers) with purple coloured, rosy, and yellow slowers, and thirty feet high, before the rain again began to fall. I took shelter under an Indian hut, when at the instant a negro passed me with three horses, the same I had before seen at La Punta: I did not venture to accost the negro before the Spaniard, but with Indians I was rendered bold by necessity. I asked him to let me one of his horses, and he agreed to conduct me as far as to his village, two leagues beyond, but the name of which I forget. I jumped on horseback, upon this, without either boots, spur, or cloak: the negro, in order to shelter me from the rain, contrived to cover my

head with a mat, which hung down before and behind like a Dalmatian mantle: never

was Robinson Crusoe more grotesquely apparelled.

We had got, at a pretty brifk pace, a league on our way, when my guide pointed out to me the garita, or guard-house of the custom officers, by the side of the road. I trembled on remembrance that I had no passport: the guards had the right to stop me, but we were now too near to seek to avoid them; I therefore conceived I could do no better than pretend to be asseep on my horse, and even half dead, in case they should attempt to force me to alight or speak. How over-charitable my opinion of Spanish centries to nourish such disquiet! The rain prevented these vigilant gentry from leaving their shelter, and even, no doubt, from seeing us; and we reached the village by night, without any accident. In the shop of a grocer I met with bread, wine, eggs, and chocolate, and went to rest, after agreeing with the negro to conduct me in the morning to the city of Cordova for thirteen reals.

I flept badly: at two in the morning I ran to the hut of my negro to awaken him, and haften our departure; but in vain, we were not able to fet off before four.

We entered the gorge of the first chain of mountains through an immense forest. It seems the Spaniards, at one epoch, deemed this passage of importance; for at every league we discerned the ruins of forts, redoubts, intrenchments, and other fortifications, more or less dilapidated, by which the gorge had once been defended. This gorge is about a hundred fathoms in breadth. Between San Lorenzo and the city of Cordova I reckoned seven of these forts, all of them built of stone, but not any of them in an integral state: in lieu of these it is, and near them, that some guard-houses, called by the Spaniards garitas, have been constructed. Never did I look upon these guard-houses against simuggling in such an odious light, or as such a shocking proof of the arbitrariness of power as in the New World. In a country where with difficulty the most absolute necessaries of life can be obtained, is it tolerable, that by the exertion of atrocious barbarity, an indigenous plant, which nature strews beneath the very sootsteps of the inhabitants for their comfort, should become so far a scourge to them, that they are not at liberty, without the liveliest dread, to stupify themselves by its narcotic quality, and steep in oblivion the memory of their sufferings!

The foil we travelled over confifted of a deep and inexhaustible red earth, fingularly fertile. I saw again another sugar plantation, and canes of monstrous size, beyond immense fields of tobacco: thus the most productive ground in nature is in the hands of a lazy people, who merely cultivate a plant which can give no nourishment to its

cultivator.

Four leagues brought us to the Villa de Cordova. Domes, towers, numerous steeples, announced a large city, and gave me great apprehension. A fresh garita at the gates of the city! Might there not be some information given respecting me? Might not a troop of pikemen be waiting to put me into irons? Alone, on foot, I might have avoided the town, as I intended; but to act thus in the face of an enemy, to implant suspicion in the mind of my guide, or even to make him a consident, him, an African, an individual of a nation the most persidious, one of the subjects of the King of Spain, the most devoted to his service. This could never enter my head: to send him back was by no means a safer plan; on the contrary, I treated him with great kindness. I therefore resolutely entered the city, but I deemed it right to play the same part I had done at the last village. How little I knew of the Spaniards! they are by no means so vigilant or active: they never enquired for my portmanteau, nor subjected me to the least scrutiny.

Lalighted.

I alighted at an inn in the fuburbs, where I fell fuddenly ill. I laid me down to rest, and had a soup made ready for me. I slept till two o'clock, and arose radically cured. After eating an indifferent soup, made with excellent mutton, I paid my reckoning, and enquiring for the residence of the Alcade-Mayor, I pretended to direct my steps towards it, and traversed the whole length of the city without meeting any other than

Indians or Negroes.

The city of Cordova may be a thousand fathoms square. Although an ancient town, the iflets are still, at least the greater part of them, gardens excepted, in the centre of the city, where is a large square, equal in fize to the place Vendosme, at Paris, with three fides of Gothic or Moorish arcades, ornamented with a tasty fountain, which iets forth a prodigious volume of exquifite water: the fourth fide is occupied by the great church: the streets are paved, broad, and rectileniar: three-fourths of the houses are of stone, but the inhabitants are poor. Whenever nature is peculiarly bounteous to man, there is man constantly least attentive to nature: accustomed to her boons, he contracts a liftless lazy habit, which prevents him from laying up store against her viciffitudes. The city is built on a raifed plain, formed by a long hill, between two valleys, each of them bounded by lofty mountains, which form the pais into Mexico. The opening between the mountains may be about a league wide, but no where is fuch rich and beauteous vegetation apparent; no where a field for culture which would be fo luxuriantly repaid as on this long plain. The foil here is a red loam, from ten to fifteen feet deep. In the gardens, cherry-trees, apples, peaches, and apricots, are intermingled with fapotiliers and orange trees, thus combining the fruits of both hemifpheres. In the hedges are elders and ash trees, with a fort of arborescent tegetes or convolvolus, the feed of which I could not procure; and a fecond kind of this plant with bell fhaped flowers, which, eight inches in length by a breadth of three, are pendent, the margin terminating in long laciniæ.

The quantity of rain that fell at noon was confiderable, and the road was very flippery; still, in order to avoid all interrogations, I determined on setting off: the most difficult point was to find the road to Orislava, seven leagues distant: I followed one at all risk till I reached the extremity of the suburbs, where I met some Indians who put

me in the right way, from which I had deviated about a hundred steps.

After an hour's travelling it began again to rain. At this inftant I met a train of more than two hundred mules: their loading had been deposited under tents, and as for the mules themselves they remained quietly feeding in the high road, which is constantly a space two hundred yards broad, covered with turf of perpetual growth, but without any ruts, or tracks of carriages, as there are none used in the whole distance between Vera Cruz and Tecuacan. I was obliged to enter an Indian cabin, where I drank a glass of pine apple water, a beverage, if well made, equally pleasant with lemonade: for this I

paid a real, and the rain ceafing, refumed my journey.

Two leagues thence I descended a deep ravine, in which I perceived a very solid stone building, without any roof, and long deserted; but whether it had been a citadel, a temple or a private house, I was unable to ascertain, owing to the trees and herbage with which it was covered, and which concealed the plan of it. I merely remarked that the walls, still twenty feet high, were three feet in thickness: the windows resembled those of our ancient churches; but of what utility a church in this position, where not the smallest vestige of a village could be seen? It is therefore more probable, it was originally some fort intended to desend a bridge, over a small but very rapid river, which runs by its walls: still, for this purpose the fite could not have been worse chosen, for by ascending or descending the river, the fort would have easily been avoided;

avoided; and it is, moreover, commanded by the fummit of the hill, on the flope of which it is conftructed.

A few paces distant are seven or eight huts, near another river, which like this has its course from the north-west: in the ravine in which it run were some elders and ash trees of singular beauty. A league beyond, on the left, and at a hundred paces from the high road, I saw sour Mexican monuments, forming a quadrangle: each consisted of a pyramid about twelve yards high, with a base of twenty. The soil here was excellent, yet, notwithstanding, destitute of cultivation, if a little tobacco be excepted. As for the pastures they were so exuberantly clothed, that on a plot of about a square league, I counted no less than eleven slocks of sheep, each consisting of six hundred.

Night was now drawing on, when fortunately I met an Indian, whose directions pre-

ferved me in the right road to Oriffava.

Thanks to the rain and the shades of night, I was not stopt either at the garita of the

city, or at another which I passed on an en inence near the ravine.

I was much fatigued with a march of eight leagues, through the rain, and over a bad road. I entered three inns in fuccession, but could meet with refuge in neither, their hosts objecting to receive me, and recommending me as a stranger to the casa reale, a kind of hospital for travellers, the name of which, however respectable, was repugnant to my feelings; fo much does ignorance at times give formidable fhape to names! At length I entered a fourth inu, called la cafa grande: the front of it was a grocer's shop: within was a vaft court, furrounded by arcades, which ferved as a corridor from top to bottom, and four fides of building; the casero introduced me at first into a room, bestrewed with the dung of the poultry which roofted in it. I looked at him indignantly, with my flick raifed * and ready to ftrike him, in case of his not shewing me some other apartment. Though less filthy, the chamber he gave me was nowife better furnished: a bed-frame of bambo, a table, a wretched feat, with one of its legs rotten, a door-way fimilar to that of a citadel, and the rufty hinges of which would not admit its clofing; fuch was the lodging I had to fhare with a posse of flapping bats: for supper I had four eggs, a dish. of flewed beans two Spanish radishes, and half a dozen lettice leaves; as for bread and wine I was obliged to feek them myfelf at the shop. Such an expenditure made me be confidered of confequence, and for two reals I obtained a mattrafs: my supper cost me four.

At dawn next day, I pondered on the means of learning distinctly the route and distance to Guaxaca. After long meditation I entered a convent of Carmelites, where I begged to speak with the prior: I was no doubt thought to assume above my sphere in such a request, and the sub-prior came to me. Judging from his round and jolly countenance, I deemed him a person in whom I might conside. I therefore told him, as in secret, that being a physician and botanist, my occupation was the study of natural history and plants; that for three years I had been on my travels in view of persecting myself in this branch of science; that during a tempest I had made a vow to go on foot to Nsra. Snra. de la Soledad, in Guaxaca, which till now I had faithfully executed, but that, seeling myself exhausted with-satigue, and pressed for time in order to return for embarkation, I was solicitous of learning whether such a favorable interpretation of my vow could be admitted, as would allow my completing the residue of my pilgrimage on foot, in presenting, as was but reasonable, for the indulgence of deviating from the letter of my vow, certain pious offerings and alms. After a learned discussion on this

^{*} It is fit I should remark that no respectable tradesman, nor any one in easy circumstances, vouchfases to keep an inn; inns are consequently let at so much per day to a casero; a description of men regarded in a meaner light than our footmen, and who may be roughly treated with impunity.

point, my Carmelite was of opinion that I certainly might, by means of prayers and alms, acquit myfelf towards our Lady of the Solitude: taking him at his word, I drew from my purfe four medios d'oro *, and begged of him to take upon himfelf the offering I wished to make: this he refused, affirming the sum to be thrice too large. In vain did I insist: I could not prevail on him to accept any thing, which not a little disconcerted me, as I hoped by dint of bribery to obtain from him the information which I needed; nevertheless I did not lose all hope from the civility he shewed me: he even presented me to four other fathers, shewed me the house, the garden, and was in raptures at the description I afforded him of different plants, of which the community was wholly ignorant. At length I was on the point of losing my sub-prior, when I bethought of inquiring whether there was not a convent of Carmelites at Guaxaca, and how far that city might be distant: this time my good monk fell into the snare. Anxious to appear well informed on what I enquired, he afforded me an itinerary so minutely detailed, league by league, and village after village, that the general of an army might have trusted to it for the plan of a march, as I had full means afterwards

of afcertaining.

Highly charmed, after a route of forty leagues, in which I had, as it were, been obliged to feel my way, at meeting with a perfect and unfuspected guide, I was preparing to take my leave, when the brethren obligingly pressed me to take a survey of the upper apartments of their house; hence it was that I could but admire the delightful fituation of Oriffava. This city is about three thousand yards long, by a thousand in breadth; the streets, spacious, clean, and well paved. Excellent water, pure as crystal, is found in every quarter, but the cool proceeding thence gives fuch a spur to vegetation, that, spite of every precaution, the pavement is overspread with herbage, nay, even the houses though of stone are covered with moss, evergreens, and ferns of every species: its population is 3000 whites and 1500 negroes or Indians: its manufactures confift of some tanneries and coarse cloths. This is the entrepôt for the traffic between Vera Cruz and the cold countries: here the caravans of mules are wont to rest and sojourn a while; and here the clerks of different houses fix their prices on the articles brought from the interior and from Europe. The city stands in a valley a league wide. The country about enjoys the advantage of yielding the fruits of Europe by the fide of those of America. The air is mild yet lively, and the temperature enchanting. At nine in the morning, the thermometer of Bourbon denotes 12° above the freezing point. The city is furrounded by infulated mountains, which leave between them fo many little gorges or openings: the fummits of these mountains present the effect of a palifade of pyramids covered with forests of the liveliest verdure, delighting while they eafe the eye: their angular points refemble fo many pines, while above them, proudly eminent, rifes the volcano of Oriffava, clad in perpetual fnow, and prefenting at once, in conjunction with the minor mountains, the fingular contrast of boreal winter with the fummer's grateful garb. Let the reader figure to himfelf an immenfe fugar-loaf, its apex obliquely truncated towards the city, and evincing a proof that, when it burnt, the ignited eruption rolled towards the plain of Vera Cruz, and he will have the image of the volcano of Oriffava. The fact of the eruption of the lava in the direction affumed, is confirmed by the pumices found by me on the very margin of the Gulf of Mexico, in the neighbourhood of Vera Cruz, a fact the more furprifing when it is confidered the diffance is not less than five and thirty leagues from the city of Oriffava, a city which affuredly was not founded previous to the extinction of the

volcano, which feems even now to threaten the city. When in the morning the plain was still enveloped with the darkness of night, I saw, and with sentiments of admiration and delight, the towering fummit of this lofty mountain, fhining like filver, but

filver gilt with the faffron beam of day.

The convent of the Carmelites built with a magnificence, truly barbarous, poffeffes in its massive structure somewhat noble and striking: internally it is lively, very clean, and kept in excellent order. Paintings, in the most extravagant stile, are lavished on every part, but their bright colouring pleases the eye: the church, as usual, is gilt in ridiculous profusion; but in the fanctuary, worthy of remark, is a very extraordinary picture, representing the Assumption of the Virgin: Mary is seen, still prostrate, but in a superb chariot with fix wheels: two bishops drest in copes and mitres, hold the naves of the wheels in one hand, and a flambeau in the other: fix others are mounted behind on the footman's fland: the trainers are twelve cherubims with blue wings, and in Roman dreffes, a helmet on the head with feathers, and their hair floating in the manner of dancers in a ferious opera, and they are harneffed to the car, with traces like our cannoneers, to the gun. Elias on the box, with a lily in his hand held like a

whip, acts as coachman; and his disciple Elijah, on horseback, as postillion.

After having thus furveyed the whole of the convent of the Carmelites, I departed loaded with civility; when in the middle of the street, a new incident, which I had not forescen, disturbed me an instant: I knew every stage on my road by heart, and all but the most essential matter, the gate by which I had to leave the city: I ventured to enquire, and a rogue of a shopkeeper directed me opposite to the right, I had in confequence to retrace my steps, and on return, met my gentleman, who merely laughed at me, but a frowning brow and an angry look I darted upon him, changed his countenance, and made him pale as death. I at length passed the right gate into the road, over a bridge that croffed a fmall river, which bathes the exterior of the city: a very large street, which serves as a suburb, led me to the barrier at the foot of another bridge. This pass was guarded by customs officers; one of them enquired whither I was going: I told him to collect plants; and that I lodged at the Carmelite convent, from which I was shortly about to go to Vera Cruz. In turn, I put many questions to him; and the fellow conceived himfelf highly honoured at having in his power to give information to a foreign physician so learned as myself. The chief of the officers then took me afide, into a room well furnished with spears, pistols, and swords; and now, thought I to myfelf, you are caged; I was however quit for a moment's dread, and a fight but little agreeable indeed, though without danger: the spectacle displayed, was the confequence of a malady faid to have originated in the country where I was, and with which our chief was dreadfully affected: I prescribed to him a mode of treatment; after which, dying with impatience to refume my journey, I left him, in spite of all his offers of service, and his invitation to take chocolate.

I left Oriflava fatisfied with having some claim of fervice from a man whom I should elfe have reason to fear on my return. I marched on in high spirits, and mended my pace in view of gaining the mountain before me, and even of climbing it, if possible, to enjoy the beautiful prospect I promised myself from its summit; but when I had travelled about four leagues, I found myfelf tired, and in need of nourishment.

I refolved on entering an Indian cottage on the road, where I was well received, and treated with bread and eggs, all that can well be expected from this wretched class of men: but what struck and charmed me far beyond my meal, was the perfect beauty of the mistress of the cottage: I looked for faultiness in her, but, almost naked as she was, having nothing on but a furbelowed muslin petticoat, trimmed with a rosecoloured cord, and a shift which left her shoulders bare, the nicest scrutiny discovered no defect, her whole figure emulating in fymmetry the regularity of her features. I told her she was very handsome: it seemed to please her and two old women who were prefent; the one her mother, and the other her aunt, laughed heartily on the occasion. I put many questions to her; and learnt she was married and had children; these circumstances but rendered her the more interesting, and her charms had even a diforderly effect on my fenses. I ventured to draw forth a piece of gold; but recollecting myself: wretch! faid I, what wouldst thou? Is fuch the object of thy toil? In a foreign country, friendless, and without support, environed by myriads of dangers still ever springing beneath your feet, wouldst thou lose thyself? wouldst yield to the enervations of voluptuoufness? Madman away! With these self-reproofs I left the cottage without speaking a word, or daring to take another glance, and dragged myfelf, fighing along. When I had journeyed half a league, I found myfelf better: a thousand different ideas came to my affistance and consolation, and I found myself quite refreshed, proving what is said by La Bruyere, that "nothing more enlivens the fpirits than the reflection of avoiding a folly.";

Despight of the bad roads, I journeyed on a league and a half, and found myself opposite to Aquulsingo, where the dedication of a belfry was celebrating: I did not choose to stop, for I could have halted only at the Casa Reale, and I had imbibed such

a dread of lodgings of this kind, that I had no inclination for experiment.

I must observe that, in every village, the Casa Reale is the court in which the Alcalde fits, and justice is administered: when not appropriated to this august purpose, the Cafa Reale is only a wretched caravanferai, or rather penthouse, in which travellers obtain shelter gratis. Commonly the whole furniture consists of two or three frames of bamboo for beds, a table, a feat, and a hemisphere of crescentia or vessel, which ferves at once for pail, for pifs-pot, and to drink from. An Indian is kept in guard of these precious articles, and to wait on travellers, that is to fay, to fetch them whatever eatable can be found in the village for their money: this guardian is denominated a casero, he is also a cook; but his whole knowledge of cookery is confined to boiling an egg hard, and burning a cliicken.

I travelled on, and came to about fifty Indian huts built on the road fide: wavering in opinion whether or no I should stop here, or attempt to climb the mountain at the risk of being caught in the rain, I remained some time irresolute; at length fatigue, the dread of lofing my way, and the more weighty dread of being thoroughly foaked, determined me, though it was yet broad day-light, to enter the last of the Indian huts which I faw on the road: it was built like the cabins of the charcoal-makers in the woods

of France, but fo low as prevented one standing upright.

I found here a female Indian and a little girl, bufily employed in making tordilyas: they received me without ceremony, but yet with respect. They did not comprehend a fingle word of Spanish, nor I the least of the Mexican tongue, fo that our conversation was necessarily by figns. The mother prefented me a tordilya, which I took and ate, but with no appetite, giving her in return a real. I prefented the little girl a packet of pins, which she accepted, and found mighty curious: immediately another tordilya was ferved up, covered with an egg and chili: the latter dish I found excellent, and paid for with another real. I faw they were preparing me still others, but I made them figns to defift.

Tordilyas have before been noticed: they form the chief food of the Indians. As for chili it is a Mexican fauce made of pimento and tomatas, or love-apples, pounded together in a mortar, and mixed with falt and water: it is the common fauce, and indifferently indifferently for bread, meat, and fifth, and is the most delicate ragout known to these worthy people. Those who are in easy circumstances, always keep it by them to eat their tordilyas with, which are without it insipid. The Indian when he has no tomatas, knowing without doubt the affinity between them and nightshade and physalis, or the winter-cherry, substitutes alkekengi, or the winter-cherry, as I frequently remarked

on my way, a circumstance which put me on my guard in eating this fauce.

Night coming on, the father of the family arrived with five children, the oldest about fifteen: three others, one of which at the breaft, had remained at home; thus in all eight children, the father, mother, and myfelf, were collected under a little roof of fly fly figure in a hut, but fifteen feet fquare. The poor Indian, tired with labour, and half flarved, prefented a mild and benignant physiognomy: he shewed me some little attention, but overflowing with affection, he fmothered his children with kiffes, while the tenderest love beamed in his looks, which were constantly directed to his wife, save when from courtefy they were turned to me. He spoke a few words of Spanish, but our converfation was little. A profound filence reigned during the whole repair ferved up, confisting of tordilyas and chili: it was the stillness of delight, interrupted at intervals by the tones of a language fweet and short, and by sounds which resembled the melodious notes of the bullfinch; thus joy, tenderness, and repose awaited the worthy Indian, as compensations for his daily toil. He gained by his work but two reals, I gave him in addition two, but profit feemed to interest him little. Avarice finds rarely entrance in the heart of the child of nature, awake to the feelings of a husband and a father!

I laid down to rest, my heart sull of this scene, and adverting in thought to that at my dinner, such, said I, such are the hearts in which you would have plunged ten thousand daggers by the seduction of a wife, the joy and only solace of her partner.

To these reflections a thousand insects joined their troublesome hum to drive away repose. I laid stretched on two bad sheep-skins, but the night was cold, and I had no covering, the rain even penetrated our slender roof. As therefore I could not sleep, I rose and lest these good people in silence, but deeply affected with what I had observed.

The evening before I noticed near their house a bath of rather a curious construction: it was a little house eight feet long and six broad, with walls two feet in height: its roof, shaped like ours, covered with ridge tiles, overtopped a wall built of brick, and resembling that of an oven: the floor also was paved with brick: it was raised near a fountain or rivulet, and beneath its level. Within the building a fire is kindled, as in an oven to heat it: the fire is afterwards withdrawn, and the streamlet suffered to enter. After a few minutes the invalid, about to avail himself of the bath, is placed in it, feet downwards, with no means of breathing, but by the door which is about eighteen inches square; this remedy is rarely used, and only in desperate cases, as I was enabled to gather from the broken sentences and gestures of the Indian: of stoves similar to this I met with several on my way.

I have observed that on quitting the plain, the road lays through a gorge which begins at La Punta. This gorge is bounded on the fouth-west by Aquustingo, and suddenly by an appendage of the volcano of Oristava, which forms, as it were, a kernel, or tenant, that unites the frame of the two ranges of mountains which form the gorge in which the cities of Cordova and Oristava are situate. This kernel or tenant it was necessary I should pass to enter into Tecuacan. I had observed it attentively the day before, and noticed the road traced on its reverse. However high and steep the mountain, this road, which is very well planned, and paved even in certain parts, would be

far

far less laborious to traverse, were due care taken to repair the injuries to which it is subject from springs precipitated from the top of the rocks in a thousand singularly curious cascades; and from the torrents which, during heavy rains, bear every thing before them.

I was on this road by two in the morning. The atmosphere was replete with moisture, owing to the night dew and a thick fog which covered the mountain: the cold in confequence was so benumbing that I could scarcely move my fingers. I ascended rapidly, and by day-break was on the ridge of the mountain. I saw there a number of oaks, similar to those of the plain, the savin shrubs*, and arbustæ, which I took for myrtles, but which the obscurity prevented my ascertaining. I was pleasing myself with the magnificent prospect I should enjoy; the ease with which I should contemplate the volcano, and the birds-eye view I should have of the gorge I had quitted, and the plain I had to enter on the rising of day, as I ascended the mountain, but my expectations were frustrated by the fog, which did not disperse the whole day long.

I faw on my way two dealers in poultry; and farther on, two caravans of mules

feeding around their encampment.

Scarcely had I gained the fummit before I had to descend, for the crest of the mountain is barely ten fathoms broad. I now tripped lightly down, satisfied within myself I had nothing further to apprehend, and as much at my ease as if a thousand leagues from those whom my fears represented in pursuit of me.

I fancied myfelf in quite another country; and in fact nature prefented a volume perfectly new to my delighted eyes, and treated them with a most superb display of

plants of various genera.

Here the geranium[†], there a species of heliotrope[‡], of a very curious species, no seeds of which unfortunately were ripe: beyond these misletoes ||, tradas cautias §, of very singular kinds; a species of medlar, yucas ¶ thirty seet high, and finally, at the bottom of the mountain, magueys, a plant which became the most predominant.

The gorge I traverfed now prefented a road of beautiful turf, and now a foft and

At feven in the morning I discovered a village, the huts and houses of which divided from each other by long intervals, gave me an idea of what the Spaniards call a pueblo, it was clapuleo, divided into a rectory and curacy, and about a league in length.

. This spot may be reckoned the vineyard of the country; but what a vineyard!

A valley extending three leagues by half a league in breadth, is enclosed by mountains covered with some cacti, but chiefly with the agave Americana or aloes. This plant, which is indigenous, in addition, is here cultivated and multiplied ad infinitum by the Indians. Its leaves, three or four feet in length by a foot and a half broad, serve the inhabitants in lieu of tiles; and some cottages I have seen were very skilfully covered with them. The plant yields a beverage esteemed by this people delicious, but of which the mere appearance was sufficient to excite disgust in me: it is of a whitish colour, thick, constantly turbid, and unsufficeptible of clarification. The following is the manner in which it is extracted. Previous to the aloes shooting forth its spear, the Indian, after cutting away some of the leaves in order to form a passage, on arriving at the heart of the plant, tap it to the pith in nearly the same manner as an artichoke,

^{*} Dioecia monadelphica.

Dioecia tetrandria.

[†] Monadelphia decandria. § Hexandria monogynia.

[‡] Pentandria monogynia.

¶ The fame class, a species of aloes.

he removes the crown of upper leaves, enclosed the one within the other, and after hollowing in the stem of the plant a cavity capable of containing two or three quarts, he places the crown on again, and leaves it. In the course of that day and the following night the sap of the plant transludes from every part of the young leaves cut off with the crown, and falls into the well below; this the next day great care is taken in emptying, and this process is repeated until the plant becomes exhausted, when it perishes: it is then hewn down, and renewed by the pipings it generally bears.

This fpecies of aloes is fometimes fo large as to measure fifteen feet in diameter: it throws out its leaves like the fpears of chevaux de friz, but of far more folid structure: it occupies all the backs of the hills of Clapuleo, a talky and stony foil: the bottom is fown with barley and other corn. The morne of Port-au-Prince grows many of this species of aloes.

This forms one of the chief objects of culture at Clapulco, which furnishes the confumption of a circuit of eighteen leagues radius. There are Indians who have confantly forty of these wells, which I could fafely wager they empty every day. I am ignorant at what price this beverage is fold, but it is in great request, and I have seen

it on its way in skins to every quarter round about.

I had travelled fix long leagues without eating, after a very indifferent night, and but a bad supper the evening before. It was nowife astonishing therefore that I felt hungry: I enquired of the first Indian I met where the tienda was (the eating-house); but neither he, nor feveral others I met with in fuccession, understood me: at last I ventured to enter a hut, where I found two women and a young man: I made figns to them by pointing to some eggs, that I wanted food: they brought me half a dozen, which I caused to be roasted in their shell, and devoured, with four tordilyas. I afterwards for beverage made a kind of lemonade, and might have been content with this meal, but feeing my fly Indian had a fowl in the pot over the fire, well feafoned, I without ceremony asked him for a part: he gave me first one wing, then another, and afterwards a leg. These I ate entirely, to the great astonishment of the bye-standers, who thought me, no doubt, but ill qualified in purse for such an appetite. To dismiss their fuspicions I took four reals from my purse, which they received with pleasure, and would have had me take the remainder of the fowl, but this I refused, as I did also a beverage made from the maguey, and called by them pulqué, as the whitish, troubled, and dirty appearance of it, infpired me with difgust. I afterwards laid me down for an hour to rest in this little hut, constructed in the same manner as the huts of our foldiers, and but ten feet long, but fo clean, with every thing in fo much order, that nothing can be imagined more fo. These good people were simplicity personified. Their language, different from that of the Indians of Aquulfingo, is fingular, and little The only founds diffinguishable are a multitude of lya's, or I mouille's, The man who comprehended and spoke a few Spanish words, enquired of me how far it was from there to Castile? I answered, two thousand leagues, but here I fpoke beyond his understanding. He readily conceived the numbers ten, twenty, nay a hundred, but beyond this number his ideas did not extend. He admired the knot of my cane and its handle, my watch and fnuff-box, observing them with the most innocent curiofity, but without defire or anxiety to possess them.

At nine in the morning, finding myfelf sufficiently resreshed, I left my kind hosts. A cooling breeze, a cloudy sky, every thing promised me a pleasant journey, and I

determined on fleeping beyond Tecuacan.

Scarcely had I gone a hundred steps before I was accosted by an Indian, who enquired of me whither I was going? I answered to Guaxaca: upon this he offered me horses, but as he had a beggarly and ideotish appearance, I paid no attention to what he said. He continued obstinately to follow me, and stopping me at the end of a street, he shewed me a horse held by a young man. His pursuing me engendered suspicion: I took him for a thief, or at best, a spy; and treated him in such manner as induced him to go his ways. I have since learnt that my suspicions of him were groundless, and that he was only one of those people called topiths, whose office it is to seek horses for travellers, and serve them as guides. Still, I was not forry on learning this, that I had not taken advantage of his prosser, for he would most assured have conducted me on horseback, in broad day, through the streets of Tecuacan; a risk would have made me die ten thousand deaths with fear.

On leaving the pueblo, I faw a number of pretty rabbits, by no means wild, feveral birds of charming plumage, and the arbol Peruano, which yields a species of pepper.

After three leagues through beautiful vallies, in which the harvest had been reaped some days before, and where already the husbandman was employed in sowing again, I discovered from an eminence the plain of Tecuacan. Hitherto I had only travelled through the gorge leading to it: the scene which afterwards struck me was singularly delightful, but the pleasure it occasioned was lessened by the revival of my cursed fears, at the sight of a country so well peopled, and the reslection that I must necessarily travel through so large a city as Tecuacan, which I painted to myself swarming with corps de gardes, alcaldes, and alguazils of every description.

As it was too early to wait till night-fall, I bethought myfelf of the expedient of rounding the town, without entering it; in confequence, I continued my way at a

quick rate, but not so quick as to be blind to the beautiful prospects around.

From the extremity of the gorge I had just traversed, on reaching the slope of the hill, is seen the vast and superb plain of Tecuacan. Its breadth is six leagues, and it extends in a south-east and north-west direction some twenty leagues beyond Jalappa, between two chains of mountains, which bound it east and west, and separate the province of Tecuacan from that of Mexico Proper. The river of Tecuacan, and generally speaking, all the waters run in the same direction for the space of sisteen leagues towards the fouth. The eye embraces with delight in a country covered with eternal verdure, intersected by innumerable rivers, and chequered with five or fix cities, and

villages, and pueblos, and habitations, without number.

This fine country, however minutely examined, does not appear to be naturally fo fertile as a view of its whole announces. The plain, properly fo called, is indeed very productive, and yields every grain peculiar to Europe; but the foil is of a greyish colour, abounds in clay, and requires, in order to render it fit for fowing, a long continued inundation; and when the growing crops appear to fuffer from drought, it is again watered, by means of fluices contrived at its different falls with much ingenuity and care, in the banks of the river of Tecuaean: this is one of the best managed regulations I had hitherto observed in the whole country, and doubtless the population were taught in its institution by necessity, for the only compost necessary for the foil is water; and here it is distributed to all the different farms, in the same manner as it is to the sugar plantations of Santo Domingo. The lands are tilled with the plough, and they yield two crops annually, the one in May, the other in September. Corn does not rife to the same height as in the Beauce in France, but the straw stands thick, and the ear is well filled. It is trampled on by ten or a score horses, on an area in front of the barns.

barns, to get out the grain, and the straw sells at a very high rate. By the home stalls the lands appeared to be divided into large estates; but as there are no slaves in this country, and as the small number of negroes here are free, and commonly hire themselves out at four piastres per month, every process of cultivation necessitates the employment, on the part of the proprietor, of other hands in addition to those regularly kept in his service: to obtain these he is obliged to present a request to the alcalde, mayor, who assigns him the requisite number of Indian labourers, at two reals per head per day. The alcalde of the pueblos conducts them every morning by eight o'clock to the rendezvous, always about two hundred yards out of the village, where the bailists of the farms meet them, and point out their work, which continues until sun-set. These bailists remain constantly on horseback all day long, exposed to the heat of the sun, for the purpose of overlooking their labourers.

The upper part of the plain, which comprehends the midway up the mountains fides, is susceptible of no species of culture, owing to the impossibility of furnishing water, as much as from the nature of the soil, which consists of little more than an inch of vegetable earth on a bottom of talc. Here nothing grows in fact but mimose, cacti, and certain shrubs which, seen at a distance, induce a conception of the soil possessing a

degree of fertility.

The fummit of the mountains is covered with many kinds of trees, oaks, pines, &c. But whichever way the eye is turned it constantly embraces a view of disruptions, erasions, and chasms among the mountains, visibly occasioned by violent convulsions; for the ground there seems not to be a deposit of waters, but entirely free from such accumulations. Among the innumerable species of casti that I distinguished was especially the castus nobilis, icosandria monogynia, Linn., mantista: it does not rise more than a foot from the ground, and may be ten inches in diameter. I remarked twenty other species, which I have no where seen described, and which, unfortunately, I had no time to form a description of. In order to have brought with me all I found worthy of the school of botany, I should have needed an additional cart at every twenty leagues. I therefore continued my journey, sighing to leave behind me so vast a heap of treasures.

After croffing a division of the river, I arrived at the suburbs of Tecuacan. I saw a trellis covered with grapes, yet green: what would I not have given for ripe ones!

There I left the high road for the plain. The corn had been just reaped, and I noticed that abundance was left behind, yet green and growing, which proved to me that it does not ripen evenly, an observation which I made every where along the road.

I thus avoided the city, as far as the real bed of the river which runs through it. At this part it is fix yards broad, and about three feet deep. In order to pass it, I was obliged to undress, but at the instant I was about to enter it, so prodigious a number of turtles, which I had not observed, plunged into it, that I was extremely frightened: on seeing them my apprehensions were dismissed: these turtles are no larger than the palm of the hand, of an oval shape, of a dirty mud colour, not striated, plated, nor flated, or in any degree resembling others, but even backed like land-turtles or tortoises; the sternum, which is all of a piece, is joined by an offisication, and level with the back, except the openings for the paws, the head, and the tail of the animal: the fize appears to be regularly as I have stated, for though the number I saw was considerable, there was no difference.

Unfortunately I drank of the water of this river, I fay unfortunately, for all the night and all the following day my lips felt as if ulcerated. I attributed this incon-

venience to a rash proceeding from my drinking of it when warm, and after being weakened by fatigue; but on my return, the same accident happening, and not to me alone, but to several others, I learnt that such is the common effect of its waters, which are briny, but which I had not before observed, on account of my eagerness and thirst.

I entered the extremity of a suburb, bought some bread there, and drank a glass of

wine: this refreshed me; and of refreshment I had urgent need.

It was now but three in the afternoon, and I had already travelled twelve leagues; but defirous of not entering the city, I resolved to push on to San Francisco, still five leagues further.

I then journeyed E. S. E.; and the fun enlightening from behind me the beautiful

plain I had in front, my profpect was exceedingly varied and enlivened.

The high road in which I travelled is twenty yards broad, and bordered with hedges of cifalpine and mimofa. On every fide I diffinguished nothing but spacious dwellings, lands well cultivated, or covered with crops, which were being gathered: such an afternoon would to me have been most delightful, had I not been so perfectly tired.

After three hours walk I refolved on resting, but scarcely had I stretched myself on the turf, before I felt my tendons stiffen, and my muscles swell: I rose hastily, in order not to catch cold. The fun was on the point of fetting; the fummit of the mountains on my left was beginning to be covered with clouds, whence lightenings flashed, and the noise of thunder proceeded. I feared being caught in the rain, and to avoid it, determined on halting at the very first inn. I enquired of a labouring negro where I fhould meet with one. He answered, that there was one at San Francisco, about two leagues farther, but that I might meet with shelter at a farm (la hacienda) of Don Joachim, the herald (armorial) of Castile, which he pointed out to me the distance of a quarter of a league from where I flood. I was fearful of straying from the high road, during the night, from which I had already deviated, and above all, I dreaded the rain. I therefore followed the advice of the negro, and repaired to the farm-yard. The house was well built. I found in the yard a bailiff employed in causing the corn to be gathered in, which had been trodden from the sheafs, and be fanned in the barn. Mistaking him for the owner, I explained to him my embarrassment, and claimed his hofpitality, offering at the fame time to pay for what I might have. He received me with politeness, and informed me he was not the master; but if I could wait till he had completed the business which engrossed his attention, he would have the pleasure of introducing me to him. I confented to wait his leifure, and entered the barn, where I stretched myself on some trusses of straw: there I gave myself up to the reflections fuggested by circumstances. Here, said I, is corn, trusses of straw, a barn; here is the fame mode of culture as in France; but what a difference does locality make in fentiments! There, with what pleafure should I contemplate their labours, always mingled with innocent pastimes; there, with security, might I give myself up to the contemplation of nature: should I change my fite, it would ever be at pleasure, and with certainty, at a trifle of expence, of fatisfying all my wants; here, in the fame manner as a malefactor, a smuggler, it is requisite I should wear disguise; that I should dissimulate in order to procure for my fellow-citizens the enjoyment of a benefit which nature herfelf defigned no lefs for them than this jealous nation, from whom it must be stolen; I find myfelf at length obliged to beg for shelter and subfistence; to be indebted to men who, not knowing me, perhaps may treat me with contumely!

These ideas, undoubtedly a presage of what was about to happen, were interrupted by the arrival of the bailist: he conducted me instantly into the hall of the house,

which, properly fpeaking, was no other than a penthouse, while he went to speak to his master.

I faw myfelf immediately furrounded by a crowd of negroes and Indian fervants, fome in livery, others in cloaks; I felt cold, approached a flove where chocolate was boiling, and feated myfelf on the ground, my back to the fire, and wholly indifferent to

the stupid admiration, and the brutal laughs of the fervants' hall.

At length, after half an hour had passed, the bailist made his appearance; he brought the answer of his patron, who was willing to allow me shelter, but excused himself from seeing me: indignant at such behaviour, I immediately decided on my reply: I told the bailist that I thanked his patron; but not being of a quality to bear with indignity, nor accustomed to such uncivil treatment, I would neither sleep under his roof, nor owe the slenderest obligation to a man whose vanity selt a shock at receiving me in person; and raising my voice at the instant, and pulling from my pocket a purse of gold, I took out a piastre, and shewing it to the servants, exclaimed, "Who will earn this, by shewing me the way to San Francisco?" Twenty voices answered, "I:"—and I was only embarrassed respecting choice. I sixed on a strong and hearty negro, of good physiognomy, and took my leave of the bailist, whom I lest consused at the insult I had received; it seemed to me even that this imitation of Spanish pride was not dipleasing to the whole troop of servants; and that one and all they blamed the conduct of their master.

It will readily be gathered, that my offended pride caused me to make this hasty determination, and I must confess that this weighed strong with me; but at the same time, it occurred to me that a man who could act in this ignominious manner might be capable of still greater baseness and persidy; hence in my resolve a portion of pru-

dence was mingled.

When I left this unwelcome abode I breathed with greater freedom, and, as if I had just escaped from some impending danger; and whether the result of my indignation, whether of the rest I had taken, I felt myself reanimated, and in a short time reached

San Francisco, but not without a lowering atmosphere which threatened rain.

Then I entered the dwelling of a tradefman, as indifferent and eafy as most of his countrymen. I found in the house nothing to eat save eggs and peas, but at the same time some tolerable wine, and above all valuable, two mattresses, of which I availed myself with the more willingness, from its being the first time since my departure that I had sound so comfortable a lodging. I undressed myself, and after well barricading the doors of my room, slept peaceably.

The next day I left my hoft at four in the morning, after paying him fix reals, with which he appeared fatisfied: he informed me that at Sant Antonio, two leagues further,

I should find horses, and instructed me how to procure them.

I travelled along, fprightly as the lark, the morning cool and refreshing, and the road good as on the preceding day. Before I arrived at Sant Antonio I had to traverse the river Tecuacan, which at this spot is ninety yards broad, its bed twelve yards deep; it was now, however, nearly dry, owing to the drainage of the fluices for watering the fields. I conjectured, from the enormous depth of the bed of this river throughout a space of five leagues from Tecuacan, that its swells must be frightful, and attributed them to the torrents of the mountains of the north-east, in which precipices are frequent; whereas in those of the north-east there are none to be seen; thus affording a conclusive proof that the heaviest rains throughout the gorge are brought by winds from the west.

By then I reached San Antonio, it was fix in the morning. This is a vast pueblo of Indians, extending from one side of the river, the space of a league, to the first rise of vol. XIII.

hills which precede the mountains; there is but little land in culture; the objects attended to are pimento, French beans, &c. The streets are large, and covered with a mimofa, exceedingly guminy, and of which the bark, of whatever age the tree, is conflantly of a bright green. I forwarded some feeds of it to the King's garden. I took my dinner at the house of the Spaniard who keeps the shop (at the same time the inn) of the hamlet: he was a good kind of man; he fent for topiths for me for horses: there was but one mule to be had, and while it was got ready, I vifited the church in the neighbourhood. It was adorned as much as possible after the Spanish manner; but before all the faints I noticed bouques, formed of liliacrous flowers, white and fcarlet, in very pleafing clusters. I requested the vestry-keeper in vain to furnish me with fome of its bulbs; he could not comprehend what I asked of him; and I had no leifure to extend my researches the length of seeking for the roots of them. What, however, afforded me the most delight, because it depicted naturally the simple manners of the inhabitants, was the fight of two candelabras of a fingular description, one on each fide of the chief altar: thefe were fo many plantain-trees, which in the shade of the church had rifen to the height of thirty feet, and nearly touched the roof: and why, thought I, should these simple, these natural gifts of heaven, seem a less suitable decoration to the temples of the Eternal, than those vales of gold and filver, displayed with such oftentation on his altars? Must not the fight of these plantains, so valuable in their productions to man, imprefs more feelingly than those rich metals the benevolence and power of the Creator of all?

On leaving the church I bestrode my mule, which was an excellent one; and five hours brought me to San Sebastiano, seven leagues from Sant Antonio: the hire was seven reals for the master, and two for the topith, or guide, who ran before me.

However great the heat, I yet could not refrain from alighting three or four times, to collect fome pieces of a talc, so beautiful, and so brilliant, as at first to be mistaken

for native filver, or at least the most fplendid mother of pearl.

The whole country was richly cultivated in corn; the plants I faw, as throughout the whole of the plain, are very various; the borders of streams yield a species of bignonia *, with yellow flowers, and leaves refembling those of the ash, bearing a similitude to the bignonia stans, except in being merely a shrub, whereas the other is a tree which rifes to the height of from fixty to one hundred feet. The hedges are covered with the paffi-flora fætida † (paffion flower), the fruit of which, finall as cherries, are of the fame colour; finally, in these trees, which bearing plums of a yellow colour, and tolerably pleafant, mimic in appearance fo well the pear-tree, that one might with eafe be deceived; but above all are remarkable the erect cacti, every where feen half way up the hill, of prodigious fize, and a great ornament to the landscape; cerei t, of eight or ten different species, their common height from thirty to forty feet on a trunk or stem rising from fifteen to sixteen feet, and five or six in circumference. From this trunk iffue vertical branches, which give origin to other fimilar, the one supporting the other, and dividing like the branches of a chandelier, in fuch manner that the collective ftock fometimes occupies a circular space in the air of from forty to fifty feet in diameter, and reprefents a kind of chandelier of a fea-green colour, and of fingular beauty: all the branches, as well as the main flem, are furnished, at about ten or fifteen thumbs breadth apart, with a fascicule, covering the space of an inch, and comprifing about eight or ten thorns, stronger and thicker than the largest needles; the fruit, fimilar to that of the opuntia, or prickly pear, is like that defended externally

Didyamia angiospermia.

with thorns; in order to eat of it (for its tafte is pleafant) it is necessary to wait till it opens, and the pulp, of a crimfon colour, falls; the Indians then extract the pulp with a fpoon fastened to a long pole, if the birds should not be beforeliand with them. A vast number of birds build their nests among the branches, after the manner of our magpies. Nothing is more dangerous than the fall of the leaves of these trees: these leaves are beams twenty feet long by one broad, covered with thorns, and would infallibly kill the unfortunate traveller who should happen to be beneath them: but as they never fall, except on occasion of violent storms, or when rotten, it is easy to be prepared. This singular tree is more common than any other in this gorge, through-

out a space of thirty leagues.

The pitabiaha, one of the species of cerei, is commonly of minor fize; its fruit is not covered with thorns, but scales, which are the leaves of the cup of the flower; it is truly a delicious fruit, and of vast variety of flavour: it is acidulous, and has a fragrant taste like raspberries, which gives it a great superiority over the other species that have no poignancy; within it is of a purple colour, without brown, and its fize is that of a small hen's egg. In order to gather it, the Indians make use of a long perch, to the end of which is sastened a basket of twisted branches, of an oval shape, open at the sides, closed only at the bottom, and the top covered with two cross-bars; they elevate the perch, and entangle the fruit in the bars, when the slightest motion disengages it from the tree, it falls into the basket, and is emptied into another; this, indeed, is the only method that can be adopted to obtain the fruit, for neither man nor beast can climb the tree.

Throughout the whole country the Indian lives on the fruit of this tree; even the young branches, when yet but half a foot long, and while the thorns are yet foft, are cooked. He makes ragouts of the buds and of the flowers before they are open; for the feeds, which are black, and covered with a hard fkin, he dries them, lays them in flore, and pounds them to make him bread. At Guaxaca, I faw in the market leaves of a kind of opuntia, which, long, narrow, and flender, are boiled and eaten like afparagus, with butter, oil, or lard. Thus the prudent and frugal inhabitant of these parts complying, without murmur or difficulty, with the laws of nature, draws from the native productions his means of substiftence; while the capricious European, not fatisfied with the precious boons of Ceres and Pomona, or the animals which he has succeeded in naturalizing in the country, is yet anxious, at an enormous expence, for those fruits and viands with which nature here resuses to pamper his infatiable and gluttonous appetite.

The pueblo of San Sebastiano is pleasantly situate; it is in particular thickly planted with trees, and in the midst is a public square, and a casa reale. For the first time I ventured to alight at this formidable hotel, which had been represented to me in such an unsavourable light. I called immediately for horses. The alcalde, who was an Indian, happened to be intoxicated; the casero, more sober, shewed me a schedule in the house, on which the charge of travelling on every road was noted as established by royal authority: it is commonly a skilling (un escalin) a league for each beast of burthen; to the topith one, two, and sometimes three skillings are given. The roads here

are excellent, and connect the neighbouring cities and hamlets.

I met here neither with wine nor bread: fortunately I had brought fome bread with me from Sant Antonio, which I ate with fome eggs, but for drink I was fain to content myfelf with water. In getting supplied with horses I had no such difficulty, for the providers of them went to loggerheads for who should furnish me.

I now fet out, mounted on a most excellent horse. On leaving this place, the beautiful valley of Tecuacan begins to become narrow, and is no more than a league broad; cultivation is also more frare, the track of fertile land being of less extent; little is feen but fmall hills of talky foil huddled together, clogging the gorge, through which ftill runs the river of Tecuacan, receiving another stream about a league beyond: its banks are mostly fowed with corn or maize as far as Los Cues, after which its banks are barren declivities: however, before I reached this village, I faw a fugar plantation,

the fecond only I had feen in culture in all my journey.

Here I distinguished canes of monstrous fize and height, a mill of wretched structure, moulds a foot in height, and loaves of coarfe fugar, just taken from the pans; in fine, a few negroes, who appeared to work very leifurely. Sugar-works must necessarily be very expensive in this country; as for hard and laborious works, negroes are indifpenfible, and as the price of a negro here is from five to fix hundred piasters. Indians who can be hired only for a month or forty days, sufficient time for other objects of culture, would not be adaptable to this, as owing to the continual change, they would not have time to learn their business; and as, moreover, they could not very often be obtained at those moments when the fugar-works most urgently require their affistance.

I arrived at Los Cues about feven in the evening: the necessity I was under of perpetually afcending and defcending the hills I have mentioned, rendered the wav

tedious, and made rest desirable.

The village of Los Cues, feated on a fleep rock, and covered with a mount, which was represented to me to have been at some period a fortress belonging to the Indians, feemed a pass which might with ease be fortified. All that would be requisite for this purpose would be to place a battery on the mount, to command the river and road. I ascended this mount to see if I could trace any vestige of a wall, but the only thing

I noticed was the remains of an Indian dwelling.

On going to the cafa reale, I overtook a Spaniard of good appearance, who was travelling with two horses: after exchange of falutation, he offered me some pitahiahas, which I ate with much gratification. We converfed together for fome time; he informed me there were robbers towards Atletta, whither I was going, but that fome of them had been taken. I learnt from him also, that the topiths were by birth the alguazils of the villages, and authorized to arrest all thieves; that this, however, they rarely effected, being great cowards, except when backed by Spaniards.

At Los Cues again I was obliged to have recourse to my stock of bread, and to be fatisfied with water. There is not in the village a fingle inn, or rather, it contains nothing to be had, except the fruit of certain trees with which it is shaded. This shade, combined with the cool of a rivulet, which trickles through the town, gives it a pleafing appearance, that, without these recommendations, it would fail to possess.

Here also I was obliged to pass the night, on a sofa of bamboos; but notwithstanding

the hardness of my pallet, my flumber was found.

At three in the morning I awakened my topith, and fet off for Aquiotepec, after giving my horse a bundle of facates. This caution often seemed to me necessary, either

on account of the avarice of the owners, or the knavery of their fervants.

On the road, at the creft of a hill which commanded the highway we travelled, I perceived fome men, who feemed as if concealing themselves behind bushes. relation I had of the existence of robbers in this part now occurred to me, and I made preparation to defend myfelf with my knife, the only weapon I had; but on nearing the

fpot,

fpot, we saw the supposed thieves were only a poor Indian and his son, with poles and

baskets, gathering pitahiahas.

As we fet off early we reached Aquiotepec by ten o'clock. At three leagues on this fide of it, the gorge of Tecuacan is but a hundred toifes broad; at the village itfelf it diminishes to the breadth of the Rio Grande, the name of the river of Tecuacan, which previously has received the contribution of another; at this place it has a rapid course over very bulky round pebbles, which render it highly difficult for a horse to pass when there is any water in the river, as the horse, unable to fix his feet with any security, risks being carried away with the current: we were to the girths in water, but arrived at the opposite bank without any accident.

Aquiotepec, built on the back of the north-eastern mountain, is a pretty considerable hamlet, furrounded by a number of cocoa-trees, sironelliers, zapotes, &c. A copious rivulet washes all its streets, and diffuses a delightful cool to the mild and tranquil inhabitants; for here, as in every other part on my journey, mildness and tranquillity are the

characteristics of the Indians.

Generally they are stout and well made; the women are tolerably fair, and have pleafing, nay mostly handsome features. I did not see a single individual either distorted in person, or marked with the small pox. They do not seem destitute of industry, but they neither possess the liberty nor means of putting their talents to use: still the Spanish mob (for perfons of any knowledge are far from entertaining fuch an opinion) imagine they possess wealth, and conceal their treasures, and in consequence of this rooted and popular belief, they are subject to continual vexations, notwithstanding the positive edicts in their favour issued by the Sovereign; but again, how fillily stupid is the obstinate perfistance of the people, in maintaining so wild a fancy! When a person has gold, will he not purchase with it the first objects of necessity? will he not seek for more to multiply his means of enjoyment, and to possess some property which he may transmit to his children? Such is the constant bias of the human mind: cupidity indeed may induce a mifer, who prefers to the pleafure of enjoying and diffusing the means of happiness the base and disgraceful employ of hoarding; cupidity, I say, may induce such a being to hide his wealth, and he may fucceed in concealing it from every eye; but to suppose a whole people would subject themselves to a thousand, privations while in possession of treasures which would afford them every enjoyment; that they should yet roll in wealth where not the flightest trace of it is visible, and where so many watchful eyes interested in detecting fuch a fact have never been fuccefsful, however well they might be difposed to deceive their cruel oppressors, this is a charge against them which never can be admitted.

By what happened to me at Aquiotepec, a judgment may be formed of the extreme poverty of the inhabitants of that pueblo: on my arrival I asked for horses, which were immediately brought; but when about to pay in advance, as is usual, I found I had no filver: upon this I presented a medio d'oro, but neither the master of the horses, nor any one in the village, could give me change for it. Much embarrassed, I repaired to the alcalde (a very civil Indian, as all are to whom the Spaniards entrust this charge), and entreated him to give me small coin for my gold, which I shewed him; but he protested por dios, por la madre de Dios, por todos los Santos, that he could not, he even prostrated himself at my feet, and implored me to believe him: his astonishment, and that exhibited by his whole family, at the sight of the medio d'oro, convinced me still more than his words. Will Spaniards presume to say all this was a farce? For my part I cannot think so, and I testissed my opinion by raising the good Indian from the ground; I begged of him, moreover, seeing how impossible it was I could manage other-

wife for want of money, to order the topith to conduct me to Quicattan, where undoubtedly I should obtain change, and would pay him. He agreed in the reasonableness of my request; and as the fundamental laws of the country expressly enjoin him to give all aid and protection to travellers, he accompanied me to the cafa reale, and in a dignified tone, of which I did not imagine him capable, ordered the topith to proceed with me to

Quicattan.

I departed therefore at eleven in the morning, after taking some refreshments: it was necessary in order to pass the mountain, at the foot of which Aquiotepec is situate, to ascend by a path only two feet broad, cut in the side of the rock. Let the reader sigure to himself two hundred steps of this tremendous staircase, from each of which a precipice was visible below, six hundred yards deep, in which with horrid crash Rio Grande forced its way, and then conceive the dread which froze my faculties; I trembled in every limb, my head turned dizzy, and I was obliged to alight, and lead my horse behind me; I held him by the bridle, but without looking back, and constantly ready, in case of the least false step, to leave my hold, and let him drink alone of the water of that stream, which would for him have been the river of oblivion. Oftentimes at a slippery spot, there was merely the branch of a tree, laid on infecure stones, to hinder the passenger from rolling into this frightful abys; beyond, it was requisite to make a turn in a very narrow passage, where the body of a horse could only pass by twisting; I know not how the poor animal contrived, though one might freely venture a wager he had done so a hundred times.

By three o'clock I found myfelf on the crest of this mountain; spite of its elevation, as nothing is great but by comparison, it seemed but a hillock by side of those mountains I saw on my left: we travelled on this crest the space of three hours. I found here some new species of cactus with slat and rampant leaves, and an aloe with crenelled leaves, dentated at the edges with thorns.

The neighbouring mountains, however lofty, presented to our observation several villages; one of them termed San Juan del $R\acute{e}$; but which was not the village of that

name we fought.

I was now enabled to enjoy at leifure one of the most beautiful prospects in nature; behind me, still were distinctly visible the environs of Tecuacan; in front the two prominences of La Corta, a mountain six leagues from Guaxaca; Rio Grande ran on my right between frightful steeps; finally, on the left, an immense country confisting of hills and gorges covered with wood, extended between me and the mountains on which San Joan del Ré was situate, and terminated with an insensible slope towards Tecuacan.

I began to be fatigued and weary of fo long a route, when an opening shewed me the end of my toils, at least for this day. This was Quicattan, which we discovered two leagues before us, in a tolerably handsome gorge; we descended into it by a road somewhat less bad than that of the ascent; but the aspect it presented was not less horrible: it was a perpendicular chasin of eight hundred yards, by a breadth of thrice that number, seemingly occasioned by a mountain which had been swallowed up in this spot, and the fragments and ruins of which strewed around Quicattan formed so many eminences.

Combined with this fcene of horror was yet fomewhat pleafing; on the falient stones of the fciffure of the mountain, up rose the cereus Peruvianus, which formed a

very grateful decoration.

But how much was the pleasure of beholding Quicattan interrupted by the appearance of a garita, which seemed to forbid my entrance! How to pass without being stopt, interrogated, and delayed by these wretched guards! These were the continually renascent subject

fubject of my fears; to fleep on my horfe, to counterfeit ficknefs, thefe were flender ftratagems now worn thread bare, and which I felt no inclination to repeat: I chofe a plan more fimple, founded on the little confideration thefe kind of people had infpired me with, as defpicable here as elfewhere. On getting near them, I defcended my horfe in a bold and determined manner, and my gold cane hanging at my button hole, and my diamond ring on my finger, entered the garita without ceremony, and pulling out fome gold before the tobacco guards, related to them the embarraffment I was under for want of change. I mingled the ftatement with a thousand incidents relating to my dread of thieves, and the unevenness of the road; finishing with begging change for some medio d'oros, or doublons. Such prattle no doubt made them so filent; they never put a fingle question to me: on the contrary I met with civility from them, approaching even to meanness, and they gave me change for as much as I wanted. I then thanked and left them, inviting the chief of the guard, in a manner a superior accosts one beneath him,

to pay me a vifit at the cafa reale.

Quicattan, the capital of an ancient kingdom, is still a pretty large town, containing about two hundred families. It is planted with trees of every kind, beneath which many fountains of fresh water, spread health and coolness. I made the tour of the town: its population appeared to me confiderable, for every where I faw men walking about, and women, feated in the current of the rills which flowed from the fountains, combing, washing, and foaping themselves, for bathing is very usual with the Spanish women here, efpecially the head; after well washing the head, it is soaped with the powdered root of a polyanthus, which I brought back with me, and which is fold in the country by the pint; with this fubilitute for foap, the shoulders and bosom are likewise washed. fight of the beautiful black hair of these women, hanging down the neck and shoulders, extremely fair, was highly interesting, nor did their simple dress delight me less; their long hair, divided into two treffes, and interwove with a rofe coloured ribbon, falls down to the ground; a very white shift, a furbelowed muslin petticoat, a scarf of gauze, or Alençon lace, fometimes bordered with a fringe of gold or filver; this, with a little bouquet on the fide of the head, compleats their neat costume, a costume, if feen, which would not be despised even by our nicest coquettes.

In this part I remarked a degree of emulation in culture, which I noticed no where else: corn is fown, and the trees are lopped and grafted. I remarked, in the hedge which furrounded a very pretty garden, a species of crescentia didynum angiosperm, which would have delighted Linné, seeing he enquires if any new species exist; the leaves of this species are in bundles, of the same form and colour, though smaller than in the one noticed by the sather of botany; but the fruit, which is but two inches in diameter, is ten inches long, angular and tuberculous like the cacao; the seeds of the shape of a heart, so thered in the pulp, are not larger than those of the capsicum. The fruit is used in kitchens as a pot-herb, or in ragouts: I met with the same again in

the markets at Campeechy.

I was folicitous of feeing the parfonage house and the church: the first was very commodious; its owner, the rector, received me at first with coolness, but on learning I was a botanist, he made amends by a profusion of civilities, and consulted me on some complaints under which he laboured. This clerical gentleman was of good appearance, with ruby countenance, which bespoke good living.

The parith church is large, well lighted, and kept remarkably clean; it is true, on this occasion it was put in order, as the feast of Pentecost was to be celebrated the next day. A matter that surprised me, was to see a school-master there practising motets for

the following day, and fix chorifters repeating the mufick in very good time. To me

the air was pleafing, and not without tafte.

The belfry is not more fingular; it is raifed on a natural mound of earth, and confifts of four piles, eighteen feet high, fastened and crossed at top: from the cross bars the bell is suspended, weighing not less than ten thousand weight. The roof of the belfry is of straw thatch, like the roofs of our ice-houses.

I returned to fupper; and in the interval arrived the officer of the tobacco guard, from whom I learnt whatever I would by means of a few glaffes of brandy. The rogue was perfectly well acquainted with the whole country from Panama to Acapulco, and from Carthagena to Vera Cruz: he talked fluently on politics, declaimed against the government; and in case of need, affuredly was open to seduction.

The cafero introduced to me likewife another traveller, in an honest Franciscan friar, about to preach at Guatimala. I enquired if he was inclined to accompany me in the morning; and he confented, provided I would wait until he had celebrated mass: this

being agreed upon, I retired to rest, and he to supper.

The next day we fet off at five in the morning, and arrived, after a finart ride of a league and a half, at the passage of Rio Grande. Rain had fallen in the mountains; another day's rain would have rendered the river impracticable. Here it is much wider than at Aquiotepec, its breadth not being less than four hundred yards, and the fides confequently much lefs precipitous. An Indian, beckoned to from the opposite fide, came, and took the leading horses by the bridle, and, perfectly naked, conducted us over the river; for our part, we were in the water up to the faddle bow, and he to the breaft; and this took place to leifurely that I had full opportunity of noticing all the danger. The current was fo rapid, that it confounded me. I was obliged to fleady myfelf by the pummel, my legs on the horfes rump, and my breaft on its neck. The animal itself trembled, and advanced not a step without first feeling his way, on account of the enormous rounded fromes at the bottom. At length we got through, and my fellow traveller, breathlefs with fear, and not lefs pale than myfelf, remarked in good French, that if we had been drowned without having first gone to mass, the people would not have failed to ascribe our death to a failure of devotion. I laughed heartily at the fancy, and feeing whom I had to deal with by this fally, I was no longer under any conftraint with him: he was indeed one of the pleafantest fellows, for a monk, I ever met with; and with this a man of fense, one who had feen the world, lively, and inquifitive as much as becomes a man; finally, he was highly engaging, obliging, and unceremonious.

We continually kept along the banks of the river till dinner time: it was covered with twenty fpecies of water-fowl, both large and finall, especially the crow, or goofe, corvus aquaticus minor, Linn., which I much regretted not having time to examine.

We arrived at an early hour at Don Dominquillo, where, thanks to the good father,

who took with him a well fupplied larder, we made an excellent dinner.

Don Dominquillo is fituate at the confluence of the Rio Grande, and the Rio de las Vueltas, or the Turns, fo denominated from its frequent windings: it abounds in fruit

trees, and is plentifully watered.

As we were faddling our horfes in order to depart, we heard a horn, and immediately after faw a Spaniard, dreffed in blue turned up with red, with a large filver plate, in form of a fhield, on his fide, and a finall horn of the fame metal depending from a cord which passed over the shoulder; he was a courier. As a specimen of his diligence, he left Tecuacan the day before, and reckoned on reaching Guaxaca on the

morrow by fix in the morning. I held difcourse with him for a few minutes: he feemed inquisitive, but I readily concealed from him my designs: he took a different road to ours, over the mountains, in order to avoid crossing the rivers, no doubt from

apprehension of being stopt by their course.

As for us, we passed through the gorge in which slows the river de las Vueltas: this gorge is in places a hundred paces broad, at others scarcely a dozen yards: in order to go in a direct line through the windings of this gorge, it is necessary to cross the river seventy times: my fellow travellers reckoned the number; the muleteer by means of small pebbles, and the monk by the beads of his rosary, and their accounts tallied; for my part, after the twentieth time I was tired of counting, and was so much fatigued that I could willingly have halted midway in order to take a nap.

I found on the banks of the river a plant much refembling cockle *, a tree covered with flowers, which I recognized immediately for the cuftard-apple, or annona, but which in the country is commonly called the chirimota, which makes it almost certain that the famous chirimota of Mexico, fo much extolled, is really nothing elfe than a reticulated annona. I moreover found here the Mexican folanum, arborescent, and with large lanceolate leaves, which I had before noticed in the King's garden, and a species of fruit-bearing asclepias, with leaves like myrtle, a straight stem, and yellow flowers of the shape and size of our small yellow jestamine.

At length the gorge through which we were travelling, enlargening to a quarter of a league, we left the windings of the river, and arrived at Atletlauca, a pueblo fituate in the gorge, and most desirably on account of its excellent water. On the left of the mountains and on a glacis, the slope of which is towards the river, stand the church

and the cafa reale.

I felt unpleasantly from having my feet fo frequently wetted, and retired to rest without supper, in spite of the solicitations of my fellow traveller: tormented by the gnats, I rose the next morning by three, and wakened everybody: it was so cold that we were obliged to make a sire: my thermometer stood at 9° above the freezing point, (48½° of Fahrenheit). We made a hearty breakfast from the store of the good father, and when about to saddle my horse, I was witness to a spectacle which frightened and surprized me exceedingly: the riding mule of the master of the house, tastened to a post, had all night long been sucked, some said by a vampire (a spirit), but really by a living animal, a bat, which had bit it between the left ear and the mane, below the occiput, and had drawn from it more than four quarts of blood: the whole head and neck of the mule was covered with gore, as well as the post, against which it no doubt had rubbed, in order to disengage itself from this cruel harpy. I was in complete associated in thus opening the vein of a horse or mule, all the rest come and satiate themselves from this source.

I gueffed this place to be wretchedly poor, from the care I noticed with which fome women were collecting a few grains of maize, from a fpot where a caravan of mules had been recently fed. I learnt also that the maize which was the most esteemed in the country, and most common, is long, flat, and quadrangular, and the straw white.

At about four o'clock we departed, and, four leagues from Atletlauca, after having croffed the river of Turns feven or eight times, we distinguished Galiatitlan: charming hamlet! no, never shall I forget thee. I no longer wonder at the anxiety I felt that morning to set off, the impatience I experienced to arrive: these were, doubtless,

forebodings of my good fortune. Not mines nor metallic wealth dost thou enjoy, perhaps, but for me, nothing that is curious; but thou first presented me with the object of my prayers and researches: yes, thou art the most lovely of hamlets!

At Galiatitlan it was that, for the first time in my life, I saw the cochineal alive on the nopal by which it is nourished: I even trembled with extasy: the day before, my capuchin, who was very well acquainted with the country, on detailing its riches and cultivation, had mentioned to me cochineal. I merely expressed to him a desire of having some in my possession, that I might the better be enabled to describe it; but when he told me it was likewise to be found at Los Cues, which I had passed through, I was vexed with myself exceedingly, at missing the opportunity I had had of finding it sooner, and at less expence.

Still I had nothing wherewith to reproach myfelf, for how was I to have known there was cochineal at Los Cues? Under apprehension of disclosing my secret, I had imposed on myself a restriction from even mentioning the word cochineal. In this village I met not with a single Indian who understood Spanish; and the only Spaniard I encountered, though he did indeed speak to me of cochineal, by no means even hinted at its being cultivated there; I never thought, therefore, of looking for it at that place,

and chance alone could have thrown it in my way.

After all, I had no cause to repent my going so far in search of it, as my extra journies afforded me the opportunity of seeing more of it, of speaking of it more largely, of procuring excellent vanilla, and finally, of meeting with more safe means

of transporting and preserving all my treasures.

To return to my dear cochineal. On arriving at Galiatitlan, I faw a garden full of nopals, and had no doubt I should there find the precious insect I was so desirous to examine. I therefore leapt from my horfe, under pretence of altering my stirrup leathers, entered the grounds of the Indian proprietor, began a conversation with him. and enquired to what use he put those plants? He answered, " to cultivate la grana." I feemed aftonished, and begged to fee the cochineal; but my furprize was real when he brought it me, for instead of the red insect I expected, there appeared one covered with a white powder. I was tormented with the doubts I entertained, and to refolve them bethought me of crushing one on white paper; and what was the result? It yielded the truly royal purple hue. Intoxicated with joy and admiration, I hastily left my Indian, throwing him two reals for his pains, and galloped at full fpeed after my companion, who was waiting for me at a wretched fugar-work, the canes about which, however, were superb. At last, faid I to myself, I have seen this insect, have held it in my hands, I shall undoubtedly meet with it again, as I am now in the country where it is cultivated: the Indians affuredly will fell it me; and I thus shall be able to bear off my prize, the object and end of all my ardent wishes!

Still certain reflections mixed gall with my delight: I could not hide from myfelf the difficulty I should have to bring to a safe haven an animal so light, so pliable, so easy to crush; an animal which, once separated from the plant, could never settle on it again: the shocks of the horse, a journey of a hundred leagues by land, could I hope with these to preserve it? and the enormous plants on which I saw the insect, was it possible for me to transport them? how was I to hide them? and what a case must it

not require to contain a tree eight feet high, by a diameter of five or fix.

These mournful ideas occasioned me a deep revery, which not all the gaiety of the capuchin could disperse. I excused myself, by pretending fatigue, and the vexation I endured from my horse, the worst, in real truth, I had hitherto crossed.

To San Juan del Ré the distance was fix leagues, with but one intervening mountain, called La Costa. It is nearly a league perpendicular in height, and the road over it is almost as difficult as that of Aquiotepec; while to complete our trouble in passing it, we were beleaguered by two caravans of loaded mules: the road was so narrow, that we were obliged to alight from our horses, and climb upon rocks, in order to leave room for them to pass, and made way for five hundred animals following each other one by one: the sound of the bells, and the whistling and smacking of whips of thirty muleteers, echoed by the surrounding mountains, occasioned a strange consuston, a noise with which we were almost stupisfied.

However, after attaining a certain height, the road becomes wider and of more gentle afcent. The foil confifts of vegetable earth, yielding in abundance excellent herbage, on which, at their halting, the mules are wont to pasture. This mountain, constantly enveloped in fog, is remarkable for its perpetual cool, and the deep shades; its pines, its oaks, and large timber of various kind, occasion regret, that to remove

them to the plains, should be a work so difficult and expensive.

The prospect from the crest of the mountain is wonderful: behind is seen Quicattan, and that mountain of Tecuacan, from which we had distinguished the one on which we were, in part extended the magnificent plain of Guaxaca, and the valley, between two chains of mountains, which reaches to Guatimala, three hundred leagues distant. On the right and left, the cye embraces distinctly a scope of forty leagues of beautiful country; but in front it was that a real paradise was displayed. The views of Guaxaca in the distance, and of sifty villages or hamlets on this side of it, vying with each other in beauty and pleasantness of site. The splendor of the stone with which they are built, their roofs of curved tiles as in Lorrain, the gardens and charming trees with which

they are encompassed, had certainly a ravishing effect.

The road prefented us with objects no lefs curious: I might have collected more than twenty herbaceous plants and shrubs of a curious and novel kind, but all my attention was attracted by a flower of a splendid blood-red colour: it was a lily of St. Jago, amaryllis formofiffima •; the whole neighbourhood was covered with it. I recollected having feen it in flower in the royal apartments at Verfailles; and I promifed myself to pluck some bulbs of it on my return, for my friend Mr. Thouin, the head gardener of His Majesty; he had made me a present of two, for the purpose of naturalizing them at Santo Domingo, but having left that island so soon after reaching it, I had entrufted them with an inhabitant of the colony, by whose negligence they perished: and here I cannot refrain from remarking how little curiofity, invention, or industry, except indeed in what regards the peculiar objects of culture, such as coffee, fugar, or indigo, is displayed by the inhabitants of Santo Domingo. His immediate culture alone engroffes all his faculties; what is merely commodious or ornamental never enters his fancy; from fuch a character is not to be expected any care for the naturalization of different fruits and flowers, or a folicitude of perfecting fuch as have been transplanted there: why should I? he questions; am I not sufficiently occupied in making my fortune? I look, as the end of my labours, for enjoyment of life, and next year I shall set off. Even ten years after, the colonist is still found on the island; and finally there he terminates his days.

We arrived at Sant Juan del Ré at noon. The lands fown with corn through which we travelled, reminded me of Europe. The first thing that struck me on entering the pueblo, was a plantation of nopals in most excellent order. I was dying with impa-

tience to enter it, but was obliged to accompany my party to the cafa reale: while, however, fupper was being prepared, I flipt away. Thinking it the house of the rector of the village to whom the plantation of nopal was stated to belong, I entered that of a tall and frout negro, who was the alcalde of the place. After first compliments, I fixed my attention on a pewter bason on the table, in which I saw a quantity of dry cochineal, mixed with dirt; respecting it, I put a thousand questions to him, and flated how much I should be gratified in seeing his plantation of nopals; my reque feemed to please him as much as my condescension; for this description of people is in general treated by European Spaniards with the most profound contempt. He led me with readiness to his garden, at the gate of which I saw a singular affixture; it was a leaf of the nopal nailed to the threshold, on which, fastened by as many pins, were fluck a number of caterpillars, and two or three species of coccinelli, one of which was the coccinella cacti coccinelli feri, coleoptris atris duobus punctis luteis, Lin. This, at first, I regarded as some amulet or charm, and of bad augury with respect to the religion of my African; but the lady of the alcalde, though as black as her hufband, undeceived me in the most satisfactory manner, by informing me that there were los enemigos de la grana, the enemies of the cochineal, which were thus immolated at every harvest, and which were placed there in order that they might be universally known and devoted to general perfecution.

The plantation of nopals might have an extent equal to an acre and a half; it was neat, kept in good order, and the trees loaded with the last crop, which appeared to me a very abundant one. The nopals, all of them of the same age, were about four feet high, by as many broad; the order in which they were planted like as at Galiatitlan, was from east to west. I fancied that I discovered the male infect in a species of coccinellus, of a very lively red colour, but I have since been satisfied by experience, that I was in error. The proprietor informed me, that he collected from four to eight arobas of cochineal annually, and that its price on the spot was from eighteen to twenty-

four reals the pound.

While in conversation with the alcalde, my travelling companion became impatient for his dinner, and sent out in search of me. I ate with a good appetite, imagining we should make another stage after dinner, and reach Guaxaca that day, from which we were yet eight leagues distant; but the monk, who loved his ease, signified that he did

not mean to proceed farther.

For my part, I refolved on fetting off immediately after dinner; and returning thanks to my monk as well as his major-domo, to whom I made a small present, I jumped on my horse, and already anticipated the sound of the clack of the whip in the faux-bourgs of Guaxaca: how wide in my reckoning was I! The rascally topith had furnished me with a mare in foal, which could not be made to exceed a walk. I was perfectly in a rage, but soon became calm from the reslections to which the incident gave rise. I saw confirmed the old observation, that the depravity of man is in proportion to the extent of society; in sact all the Indians I had seen in my way as far as Sant Juan del Re, were generally speaking simple, mild, and ingenuous, because at distance from great towns; but from this place to Guaxaca, they are sly, subtle, and even knavish and idle: it may truly be said, that the neighbourhood of European Spaniards has been a pest, a plague equally unfortunate and prompt of disfusion.

How different the conduct of the topiths who had been my conductors before this one! I had had tolerable good horses, or at least had not been led into error, but this scoundrel had had the impudence to extol the excellence of the mare I rode, though a truly good-for-nothing beast; but this was not all, tired at length with the obstinacy

of the wretched animal, I enquired if there was no place where I might rest? the topith answered no. I had heard of the band of thieves of Attetla, and now had strong suspicions, not only that my conductor was a rogue, but also that he might be one of the band.

Night was drawing on, I fearcely knew what plan to adopt, when fortunately I distinguished a procession, which satisfied me we were at but a short distance from Attetla. I made all diligence to reach the rectory, alighted from my horse, kissed the sleeve of the rector's surplice, according to the custom of the place, and enquired for the casa reale: we entered by the lower part of the hamlet, he pointed out the casa in the upper part, about a quarter of a league distant, whither I repaired: it is situate in an immense explanade, and forms part of a large pile of building, which seemed to me a farm-house: in front there is a large gallery paved, on the left a prison, on the right a tienda, or shop, kept by the lieutenant of the alcalde; on the north-east the explanade is terminated by an immense building, which seemed a magnificent castle. I had the curiosity to visit it, and found it to be a convent of Dominicans which had formerly belonged to the Jesuits, but which their successors had suffered to fall to decay. The architecture of it, half Roman, half Arabesk, notwithstanding the excellence of the masonry, was, in my eyes, poor: I entered the hall in which the courts are held, the ornaments of which announced that the district of this alcadia is large.

While waiting the return of the lieutenant of the alcalde, in order to procure supper, ten or twelve men in cloaks passed in succession before me, making low bows, and as if desirous of accossing me. Their little promising physiognomy was a sufficient inducement with me to fend them about their business; and I afterwards learnt that they were idle scoundrels, who lived (in the language of our excellent La Fontaine) merely by franches-lippeés, or spunging: men sit for those employments only which exact neither labour nor sidelity. I concluded, as must every one, that such fellows are of no value,

and that the fooner the country should be quit of them the better.

In the mean time the lieutenant of the alcalde returned: I paid him a vifit, and found him feated at his counter in the middle of the fliop: he received me with the gravity of a monarch giving audience to ambaffadors, and fearcely vouchfafed a look; but I had for my part too contemptible an opinion of the wretch to take any offence at my reception. All I wanted of him was somewhat for supper; he furnished me with bread, four eggs, and a gallon of wine; but shortly after I had occasion for him, for perceiving that my knave of a topith gave my horse nothing to eat, I requested the interference of the lieutenant of the alcalde, who attended to my request, and even threatened to make him pay for its food himself.

After this I laid myself down to rest on some very clean mats in the auditory, and slept with that tranquillity a many may do in a court of justice, who have nothing to

dread from the laws.

The next morning I departed at day-break; the cold very sharp: my mare, thanks to my pains, went somewhat better than she had done the day before, but she soon became tired, and at two leagues from Attetla, I was fain to send away my topith, not without a strong inclination to give him a sound threshing: fortunately for him, pity interposed and pleaded his cause, so that he escaped punishment.

I continued my road on foot. The town was no more than a league and a half diffant, the country along the road delightful. I fancied myself transported into our plains in Europe, and proceeded to Guaxaca between hedges filled with trees and plants unknown to me before: among these were a juniperus sabina* of twelve feet in dia-

meter, convolvuli, palos, cordovans, &c. The fuburbs of Guaxaca were thickly fet with plantations of nopals, at which I glanced an eye occasionally, but without exhibiting any fymptoms of curiofity. Finally, I entered the town with the appearance of a person who had recently left it for a walk, and halted at an inn pointed out to me on my right, a hundred paces distant from Nostra Sra de la Soledad, the term of my

pilgrimage.

Nothing can be conceived more magnificent than the fite of Guaxaca. From Sant Juan del Ré to this town, opens a plain two leagues in breadth, which extends the length of five or fix to the environs of the town. On the lowest part of the slope of a hill, which appends to the chain of mountains on the north-east, stands Guaxaca, the capital of the province of the fame name, at a diffance of fomewhat more than a league from the mountains. It fronts the opening of three plains, that of Sant Juan del Ré, that which leads to Guatimala on the fouth-east, and another on the fouth-west, of which I forget the name. This position has rendered it a centre at which the first fale takes place, of all the annifeed, cochineal, and vanilla collected in the gorges between the high mountains, by which it is encompassed at distance of five, fix, and sevenleagues. It is amply furnished with cereal productions, and fruit of all kinds from the plain; the foot of the flope on which it is built, is bathed by a beautiful river; and well planned aqueducts supply it with abundance of water of the utmost excellence. The air, constantly refreshed by eastern breezes in the morning, and at evening by others from the west, is pure and delightful, and of such moderate temperature, that at eight in the morning in May, my thermometer denoted 16° above the freezing point, and at noon 22°*. From this happy circumstance, notwithstanding it is situate about the 20° of latitude, it enjoys an ever-blooming fpring. Finally, magnificent and highly ornamented prospects, excellence of soil, profusion of fruits as well European as American, which fucceed each other in unremitting continuance, would make an actual paradife of Guaxaca, were it only possessed by a more industrious and active race of men.

Its numerous steeples and elevated domes give this city, at a distance, an air of grandeur; and it may be truly affirmed, that its interior corresponds. It is sixteen hundred fathoms long, by about a thousand broad, and nearly quadrangular, if the suburbs be included, which are replete, as I have before remarked, with plantations of nopals and gardens. Its streets are wide, straight, well-paved and level. The houses on each side are built with stone, two stories high. At the time I was there, a town-house was building on a plan which evinced some taste, and will prove a great ornament to the great square on which it is built: the stone is of a sea-green colour. The same square is adorned by the bishop's palace and the church, which form two of its sides, and both of which, after the manner of the Spaniards, are entirely surrounded by areades, strongly constructed, and of infinite utility in protecting passengers from the sun and from rain; to conclude, all the churches, which are numerous and finely built, are neatly whitened without, and richly ornamented within.

The population of this city, including negroes, mulattoes, and Indians, amounts to fix thousand; it is the residence of a bishop and a governor of the province, and is under the jurisdiction of the audencia of Guatimala, to the viceroy of which province the

governor of Guaxaca is fubordinate.

The inn to which I had been directed was fo wretched and filthy that I could not rest satisfied with making it my abode. I made haste in dressing myself, deposited in my room the packet of clothes which I had constantly earried with me, and which I

found, however fmall, yet cumberfome, and left the place, much embarraffed at my appearance, and not knowing whither to go. Without a cloak I looked at once a foreigner; a net for my hair, and a broad-brimmed hat scarcely in any degree protected me from a crowd of inquifitive eyes. To get rid of the curiofity of the people, I entered the first church I met with, and thus without suspecting it, accomplished my vow; for it turned out to be that of Nostra Sra de la Soledad. After admiring its treasure, its gildings, the dome, in a bad taste, but built of brick varnished externally with chequer-work, and a multitude of ex votos, equally ridiculous and fanatic, I left the church as little forwarded as, and in no better heart than when I entered. I wandered about at random in the streets, when at last I noticed that I was followed by a man in a cloak, whom I had feen at the inn. He was loaded with rofaries and scapularies, and at first fight might be mistaken for a very devout zealot. When in the church he kneeled as I kneeled, role as I role, walked in my steps, and stopped when I halted. I was feized with fear. I imagined him to be a fpy employed by the police, and fixed there purpofely to watch my motions, or perhaps those of all new comers. I refolved on knowing the truth, and accosted him, enquiring whether his rosaries were for fale; he answered in the affirmative, but that he had another occupation, which was to learn where I should pass the day: where I please, was my instant answer, in a tone demonstrating a greater fund of assurance than what I actually possessed: but why this question? Because, said he, simpering, and in a mysterious manner, I should feel myself so happy if it should be in my power to procure any enjoyment to a stranger so kind and generous as you appear to be. At these words, which at once unmasked his character, I breathed with greater freedom. I now perfectly comprehended that this gentleman was no other than what at court, where all things are painted in their fairest colours, is termed the prince's friend. Gracious powers! faid I to myfelf, and is it in the very fanctuary of the immaculate Virgin that vice prefumes under the veil of hypocrify to exhibit her allurements? Turning then to the unknown; friend, faid I, you follow then a pretty and very obliging fort of trade; but I have no need of you, and beware how you follow me any further.

After this incident, I penetrated into the city, where I met with fome tolerably handsome coaches, and crowds of people. I was folicitous of seeing the cathedral. It was now the third festival of Whitsuntide, and high mass was celebrating; the music was fine, grave, and majestic, the voices excellent, the cadences in good measure, and the numerous and solemn pauses well calculated to inspire devotion and reslecting thoughts: I was in a profound extacy, when at the elevation of the host, a grey-headed priest, holding a silver cross in one hand, like our choristers in France, and in the other a wand of the same metal, like our porters, touched me gently with the latter, and requested me to take off the net from my hair, which hitherto I had constantly worn unnoticed in all the churches; I did immediately as I was desired; and could but admire this regulation, though feeling hurt at the species of affront I had

unwearily drawn upon me, I immediately left the church.

I had occasion for some repairs to my watch, and after looking about, at length found a watch maker's. He was absent, but his wife received me in such a manner as almost to put me to the blush; she was a woman of six and thirty, a brunette who had been handsome, and was still tormented with that immoderate desire of pleasing, which some women lose only with life itself. She made me a thousand questions, and succeeded in learning I was a botanist. She concluded thence that I was a physician, and endeavoured to persuade me to six at Guaxaca, telling me, that notwithstanding the extent of the city, there was not in it either a physician or surgeon, and that she would

vouch that her hufband, who was a corregidor, should forward me to the full of his ability; she even in pretty distinct terms told me she could herself be of service to me; and I began to feel somewhat for the gratitude she might expect, when fortunately her husband entered: he was an excellent machinist, and drew extremely well, as he satisfied me by a multitude of works, which he displayed as well in relief as on paper, of his doing. He had moreover rather a curious garden, in which I gathered some

feeds of mira-fol, and fage with corn-rofe flowers.

After leaving the corregidor, I obtained a direction to a trunk maker's. My plan required I should be furnished with cases or coffers easy of transport. The tradesman to whom I was directed shewed me some of all fizes. I chose eight two feet long by sourteen inches broad, and of similar depth. They were of a white and very light wood, dove-tailed, even bound at the corners, and with locks; they were moreover so folid and so well made, that better could not have been produced in any workshop in Paris. The price also was reasonable. They cost me seventeen reals the pair, or about four shillings each; I asked for no abatement, and my liberality purchased me the present of a basket of apricots which had just been given to the trunk-maker, and which he observed nie notice with longing eyes. This European fruit is so much degenerated from not having been grafted, that it is but little larger than the Montmorency cherry. It has notwithstanding preserved its original slavour.

I now perceived that I should never have been able at Los Cues to have met with the same resources as at Guaxaca; there indeed I might have obtained cochineal, but this was not sufficient, the means of transporting it were alike necessary. I was consequently very well satisfied with my bargain: I merely conditioned, over and above the purchase, to have partitions made in each of the boxes, and I brought away

with me the keys.

Delighted at having thus affured in a degree fuccels to my undertaking, aftonished at finding myself so far advanced, and at having so readily overcome all the difficulties I had to sight against, I was scarcely able to bear my weight of joy, and imagined myself in a dream from which I dreaded to awake, but which every instant I found would be the case; the greater the facility I had hitherto met with, the more was I apprehensive of the obstacles which I painted to myself would attend the future. This mixture of satisfaction and inquietude occasioned an oppression on my mind, a melan-

choly which I was utterly unable to shake off.

In this state I walked through the streets without well knowing whither I went; at length I found myself in one of the suburbs called de las Bueltas or the Turnings, 2 name distinctive of the gardens of this country, where it is considered beauty to interfect them by walls and partitions, which occasion so many windings and recesses in the fame inclosure. Among others were fome plantations of nopals, the order of the rows in which I observed to be still the same as I before had noticed, that is to say, from cast to west, but in almost all of which the crops had been recently gathered. In fome plantations I faw men employed lopping off the branches, in others planting; at length I diffinguished one which appeared to me magnificent, and fo thickly loaded with cochineal, that not a fingle leaf could be taken from the nopal without crushing a thousand of the infects. In order to take a furvey at leifure, I entered into a garden, parted from the plantation only by a hedge, under pretence of buying flowers. The first objects in this garden which excited my attention, was a violet coloured after, as large as those grown with us, but produced on a shrub resembling, by its pinnated leaves, our elder tree, and which had a very fine effect: what however engroffed almost the whole of my attention and thoughts, was the beautiful plantation of nopals, and while the bouquet I had ordered was being gathered, I fatiated my eyes with the spectacle before me. The nopals were thickly planted at about four feet distance, in lines fix feet apart. I learnt that this nopal ground belonged to a negro who was not there at that time, I fed myself with hopes of buying of him both the nopal and some of the insects.

After traverfing feveral other gardens, I returned to the city, and caused those to be pointed out to me belonging to an apothecary whose name was Don Antonio Pisa, and which had been highly extolled by the gardeners I had spoken with. The proprietor, conceiving by my dress that I was a Frenchman, shewed me the utmost civility, and prossered me his services: after which, informing him, that being a botanist I was anxious to see his garden, he caused his nephew to accompany me to it, politely excusing himself from not being of the party, owing to his advanced age and infirmities.

This garden, interfected by five or fix walls, which, no doubt, announced fo many fresh acquisitions, appeared to have been framed at great expence. A copious fountain, very pleasingly ornamented, delivered its waters at the height of eight feet, into an antique vase, whence through four spouts, they descended into a spacious basin, from which they were conducted into different reservoirs. A number of indifferent pinks, a quantity of salvia othecas, a species of sage, some agaves, mililot, blue everlastings, oxal * or forrel, pot-herbs, malvæ (mallows), apricots, grapes, and peaches; these formed the whole of the rarities I found in this garden, which moreover was kept in very indifferent order.

While I was there, I faw a female enter the garden, the lady of a corregidor, in a rich veil of black velvet trimmed with gold fringe. She came efcorted by a very handsome man for the purpose of seeing, as I afterwards learnt, the sace of a Frenchman. I paid my respects to her in the most polite manner, yet, hurt at thus becoming the object of general curiosity, and much vexed at my foreign appearance. After she had retired, I went to return thanks to the apothecary, and spoke in high terms of this garden.

Much pleased with me, Don Antonio Pisa was solicitous I should visit another garden not less curious: I repaired thither, and did indeed find a garden which would have done honour to the marshes of Paris, by the fine display it afforded of cabbages, artichokes, rafpberries, apricots, and grapes. Water was every where distributed in little gutters along plots planted with parfley, turnips, radishes, and well hearted lettuce. Five or fix workmen Indians, or of mixed breed, were at work here; here alfo I found the owner Don Gregorio Meuta, one of the corregidors of the city, a man about five and forty, of handsome countenance, and graceful deportment: he condescended to applaud my researches and curiofity, and pointed out to me every thing that was curious. What however appeared to me most worthy of remark, was a tree which at first fight resembled much a reine claude plum-tree, but which was no other than a malpighia which I had not hitherto feen. I begged the proprietor to allow me to gather some of the fruit in order to obtain the stones: the fruit it yields is as large as our white-heart cherries. I wished to pay for what I gathered, but was not fuffered; nor would even the Indian workmen who attended accept the two reals which I proffered them.

I again returned to my apothecary, and having given him a picture of the wretched inn at which I had taken up my abode, a picture which, from the difficulty I had to

express myself in Spanish, made him laugh till the tears dropped, I besought him to point out to me some one where I might get a decent meal; and this he promised to do. The conversation next turned on the different objects of culture in the country: he enquired if I was acquainted with them, to which I answered in the affirmative, with the exception of vanilla, which I was anxious of seeing in order to describe it with the precision of a botanist. A priest, who happened to be present, interrupted me, to state that he had some in a wood dependent on a farm belonging to him, about six leagues thence, and that, if I wished it, he would send one of his Indians thither with me the next day as a guide: he even offered to obtain a horse for me, and this with all that politeness and kind anticipation which we Frenchmen are wont to deem peculiar to ourselves.

I then took my leave, exceedingly pleafed with my day's work, and well convinced,

that with a little hardihood and activity much may be effected.

I repaired to my new inn, recommended by Don Antonio Pifa, conducted by a fervant of that gentleman: it was kept by a Frenchman, who had been cook to the late governor. I accofted my countryman with a fenfation of pleafure, and with that confidence which might eafily be conceived by any one who for the inftant would place himfelf in my fituation. I did not even take into account the difference of our flations in life, nor had I any reason to repent my condescension, for he was really, and not merely in appearance, a very good kind of man. I could perceive he was rich, though he complained of his bad fortune, and plainly faw that this was only the better to hide his prosperity, and not excite envy, in a people always jealous of our industry and success, and at the same time, possibly, that he might the better be enabled to leave the country, at a favourable opportunity.

I begged of him to give me a good supper, assuring him that it would be the first fince my leaving France: he promised he would, and kept his word, for I had one truly worthy of a governor's table; and afterwards was enabled to take a delicious night's rest, undressed, and between sheets, on a tolerably good bed, an enjoyment I

had not experienced for a length of time.

The plan I had arranged, to purchase some nopals and cochineal on the succeeding day, occasioned me to wake very early in the morning: I was up therefore by three o'clock, and taking with me two Indian servants belonging to the inn, each with a large basket and towels, I repaired to the plantation of nopals I had seen the day before.

I left the fervants at the gate on entering, and myfelf took charge of their bafkets. The negro owner was fcarcely awake. He came towards me with a fimple, modeft, and civil air, quite different from what is usual among people of his stamp in the kingdom of Mexico. I informed him that being a physician, I wanted, for the purpose of making an ointment for the gout, a few leaves of the nopal, with the cochineal upon them, which I begged him to fell me, as the cafe was urgent; telling him I was willing to pay for them whatever he might require: he permitted me to take as much as I pleased. I did not require twice bidding, but immediately selected eight of the handfomest branches, each two feet long, and confisting of seven or eight leaves in length, but so perfectly covered with cochineals, as to be quite white with them. I cut them off myfelf, placed them in the best possible manner in the boxes, and covered them with the towels. I then enquired what they were worth. He protested they were well worth two reals: I readily believed him: I, who would not have held them dear at as many quadruples; but, that I might not render him aware of how good a bargain I reckoned upon having made, I merely gave him a dollar, telling him I had no change, and begging him to keep the remainder to drink my health with. The good old negro

-3

 ${f r}$ ubbed

rubbed his eyes, fancying himself still asleep; and while he overwhelmed me with gratitude, I called in my Indians, loaded them with the two baskets, and made off

with the rapidity of lightning.

My heart beat in a manner that beggars description: it seemed to me as if I was bearing away the golden sleece, but, at the same time, as if the surious dragon, placed over it as a guard, was following close at my heels; all the way along I kept humming the samous line, At length I have it in my power, and should willingly have sung it aloud, but for fear of being overheard. I arrived at my inn out of breath, and slipped in unperceived, and without having met with a single person in the streets. The dawn was opening, but nobody yet had risen in the house. I shut myself up in my room, and then packed my dear nopals, with inexpressible satisfaction, and in the tenderest manner imaginable, in two of my small boxes, taking the precaution to lay them two at top, and two at bottom, separating them by the partition, and sticks of a dry and pliant wood.

Thus, by five in the morning, I found myfelf in poffession of a fine cargo of cochineal, which not a foul had either seen me purchase or pack. The negro who sold it me was a simple, good kind of man, and the Indians, whom I liberally rewarded, enjoining them at the same time to secrecy, with respect to where they had been with me in

the morning, were themselves ignorant of what the precious load they carried.

Tranquil on this head, I went to enjoy, beneath fome orange-trees in the court, the pleasure of my reflections, and the cool of morning, waiting the period of my host rising. Never had the sky before appeared so beautiful, never the climate so pleasing. The day before my imagination was filled with monstrous chimera: this day every thing was of charming aspect, and admitted of my giving the reins to fancy.

Whatever my future fortune may be, faid I to myfelf, I have now completed the end of my journey; I may now fet off. Yes, even directly; but no; vanilla, which I had been told could be obtained no nearer than at a distance of twenty leagues hence, vanilla comes as it were of itself to invite my taking it: let us effect this second conquest.

At length the people of the house roused from their slumbers. Breakfast was served up, to which I did more justice than any one, and at which I noticed a singular fruit: it was an apple, the pulp of which was soft, and black as raisin. The Spaniards call it sapota negra: I opened several, and took out their kernels. As I meant to set out at noon in search of vanilla, I ordered a good dinner to be provided for me at eleven o'clock.

I then fent my compliments to the priest Don Jose Ortiz, and reminded him of his promise, after which I drest myself, for the purpose of taking a survey of the city.

My countryman, who was my guide, had the kindness to lend me a cloak: with this, my hair in a net, and my broad brimmed hat, I looked perfectly a Spaniard, and had no longer the vexation to endure of hearing constantly rung in my cars, aqui sta

Francese, there goes a Frenchman.

We made the whole tour of the city, and I measured its streets: it appeared to me, on this occasion, even more handsome than it had done the day before. The only thing which seemed wanting, and which, not only here, but throughout Spanish America, if Mexico be excepted, is every where a desideratum, is an alley of trees, or a promenade: one indeed had been planned here below the aqueduct. There are even basins of stone prepared for conducting water to it from a fountain; and this spot, its situation considered, would without doubt have been a most delightful one for a public walk, but the plantation was never carried into esset, and the whole plan dropt to the ground.

We

We visited the market, one the best supplied of any I had seen fince I left the Havannah. I found in it all kinds of fruit; but what most forcibly struck me, was the fight of raw cochineal exposed for sale: when I say raw, I mean undried, and with the infects yet alive. The price of it was eight reals the pound. I at length returned home loaded with plants, leaves, and branches of all kinds; among the rest with a species of palma Christi, or ricinus*, of an uncommon species, which I have since dispatched for the King's garden.

After having packed my plants in my chamber, I went to a man who had been pointed out to me for one who let horses, and without a fyllable said to my host on the subject, who reckoned on having me as a guest at least for a fortnight to come, I hired sive horses, at eight reals each, to carry me the next morning to Sant Juan del Ré.

At eleven o'clock I had another meal worthy of a governor's table, and ferved with equal promptitude and elegance; but what again? Doubtless the reader, in perusing this narrative, will take me for an absolute glutton; but let him pause an instant. I was intoxicated with joy. I sought for gratifications, as a compensation for my labours, and possibly this was of a less dangerous nature than another, for there surely could be no harm in strengthening my poor body, weakened by the fasts and bad fare it had endured, and rendering it capable of withstanding the mortifications it had yet to undergo.

Don Ortiz had not forgot me: by noon his horfes were at my door. I immediately rose from table, and leapt into the saddle, loading the muleteer, my guide, with a linen sack, four feet high, which I had bought for the purpose in the morning. After this we set off at full speed, each of us with a handkerchief round the head, covered by a large slapped hat, and the crown of this surmounted with a cone-shaped cap of cotton.

to cause a divergency of the rays of the sun, a precaution highly necessary.

We reached, without halting, a mountain four leagues from the city, which it took us a quarter of an hour to ascend. After this we went down into a valley, in which the farm of Don Ortiz was fituate. The produce of the valley nothing but wood and maize. We continued our journey two leagues farther, when we met fome people belonging to the farm. I wished to address them, in order to know where we might find what we were in fearch of, but the muleteer pretended to know vanilla very well: and boasted that he could shew it me himself. We in consequence alighted, and during half an hour fought for it in vain among all the trees. I slill waited for my muleteer doctor to point it out to me, and, at last, whether from ignorance, whether from defign, he shewed me instead of it an arum scandens, with palmated leaves, the stem of which, it must be confessed, pretty much resembles that of the vanilla. I told him he was an afs, and that inflead of thus making me lofe my time, he would have done much better had he called for one of the Indians. It was, in fact, five o'clock, and I was under the greatest anxiety lest I should be obliged to return without the vanilla, or have to fleep at the farm, which would defer my intended departure on the next morning. I was almost mad with vexation.

At length an Indian, with a hoe in his hand, made his appearance. Brother, faid I, holding out a dollar, shew me some vanilla, and this is yours. He coolly bade me follow him; and advancing a few steps through the underwood into a thicket, in which were a number of trees, he immediately climbed up one, threw down to me two cods of vanilla, perfectly ripe, and pointed out to me a branch on which several others were hanging, yet green, together with two saded slowers, of which the nectarium still

remained. I recognized it for an epidendrum. The form of the leaves, the stone, and the fruit, perfectly well described, the peculiar smell of the plant: every thing convinced me it was the real vanilla, in every thing corresponding with such I had seen at the house of Don Athenas, at Vera Cruz. All the trees of this little copse were covered with it. I saw a quantity of green fruit, but collected no more than six specimens of these, and sour large cods, which were ripe. I caused the Indian afterwards to part from the root some of the scions which had sprung up. These I tied well together, wrapping up the whole in the leaves of an arum, which at their base are three feet wide. After thus packing a saggot, which weighed upwards of thirty pounds, I placed it in my large sack, which I sastened on the rump of my horse. I was so well satisfied with my Indian, that besides the gourd I promised him, I gave him in addition two reals. For his part, unwilling to be outdone in generosity, he ran to his hut, and brought me three other cods of vanilla.

Who now was more confused than my mulatto? for me, I was highly pleased with

not having liftened to him.

We again mounted our horses, and we made such good speed, that by nine in the

evening we reached Guaxaca.

I directed my guide to make my best respects to his master, and repeat how much I held myself obliged to him. I gave him, for the use of the horses, fix piastres, and two for his individual trouble, after which I again entered my inn, with the vanilla,

without any one knowing what it was.

It was late, and I fupped by myfelf. After fupper, I defired my landlord and countryman to make out his account, and announced my departure on the next morning. He feemed greatly furprifed at my intention, but answered, that he had no demand to make; that he had entertained me with great pleasure, as a countryman, but without any view of gain. I easily comprehended his drift, and, presenting him three dollars, enquired if that was sufficient. He still assumed that he had received me as a friend, and that I might pay him nothing if I pleased. To this I drily answered, that he, being a Frenchman, was capable of discerning, by my exterior manners, that I was not a person to be treated gratuitously by him; and that, moreover, his situation in life obliged him to fell his services to every one. I thought it right with this to add three more dollars to those I had before placed on the table, at the same time requesting him to prepare me a sew provisions. When our host noticed the tone I assumed, with a fatissised look he placed the fix dollars in his pocket, and in very polite terms returned me thanks. Shortly after he sent me what I had required.

I now that myfelf up in my chamber, and passed a part of the night in examining and arranging all my plants in my boxes. Two of these were destined for the vanilla, which I marked, and mingled with a thousand other plants, collected at hazard. As while doing this I frequently opened and shut the boxes, my hostess, on hearing the noise, became exceedingly curious, and sought to satisfy her inquisitiveness, under pretence of making me a small present of chocolate. She therefore knocked three or four times at the door of my room, but I constantly objected to opening it, so that at last she was tired out, and decided on leaving the chocolate on a chair in the adjoining

room.

I flept but a little time. By four in the morning my horses being come, I awakened mine host. His astonishment was at its height, for I had not apprized him of the measures I had taken. My cases and baggage were all laid on my cattle in an instant. I mounted on one of the horses, and obliged the topith to lead on the others before me at a good rate.

Day-light had not yet beamed on Guaxaca, when I fet off. On account of my train I found the streets exceedingly long, for I was anxious to avoid examination, and the excitement of curiosity; at length by day break I gained the open country. The morning was remarkably cool. I struck my heels into the sides of my horse, and increased our pace. My horses turned out to be excellent ones, and speeded so well, that by half past seven we reached Atletta, whence, without halting for refreshment, I proceeded onwards to Sant Juan del Ré, occasionally alighting to gather plants.

On the road I met with a doctor, who, conversing on the objects of culture, informed me, that nopals had been transported into Castille, for the purpose of attempting the naturalization of the cochineal, but that the project failed, from which he drew the very wise conclusion, that it was impossible the culture of it should succeed any where but in the kingdom of Mexico. This anecdote, whether fabulous or true, was calculated not-withstanding, to give me at the time some uneasiness; but now, while writing this, that I am well assured of the fallacy of the assumption, I cannot but smile at the folly of those people who make deductions, which they generalize from circumstances true only in

particular cases.

By then I entered Sant Juan del Ré, it was eleven o'clock. I was in hopes of purchasing here some cochineal, but the black alcalde not being at home, I determined to wait till his wife returned: she came in a little time, and I immediately asked her for four branches from her nopals; and without giving leisure for reflection, shewed her a dollar, which persuaded better than words: I at the same time enquired of her respecting a variety of matters, which I had either omitted to obtain information upon before, or which I thought might need comparison with what I had learnt at Guaxaca, though chiefly respecting the mixture of the sylvestre or wood cochineal, with the black or fine. She illustrated the different points I questioned her upon, and to my satisfaction; and permitted me to select four branches from the nopals, which I placed in a fifth box.

While thus endeavouring to diffipate the tirefomeness incidental on a long journey, I perceived that my muleteer had turned out of the king's highway, which topiths are expressly forbidden to do; and I was violently enraged at his conduct, promising, within myself, at least to withhold his trinkgilt, or drink money. However we began to descend by roads, very bad it is true, but which lessened our way by a league. I then allowed that my guide was not so much in the wrong, and was pacified. At the bottom of the slope I found the beautiful sage, with corn-rose slowers, which I had seen at Guaxaca: from this I extracted seeds, as well as from another variety with blue and

highly beautiful flowers.

While

While threading a narrow path cut out of the rock, I had a fingular rencounter: it was of an Indian who was driving two hogs to Guaxaca. They were of monstrous fize; and I was obliged to fland afide, in order to allow them to pass; while, in consequence, I was attentively looking at them, I observed, and not without a hearty laugh at the whim, that they had pumps, or rather boots on. What, faid I to myfelf, a hog in pumps, while the poor Indian that drives them is barefoot! The hogs had, really, on each of the joints of their parted hoof, a boot with a fole of strong leather; and the whole fo neatly fewed, and fitting with fuch exactitude, that at first I thought them natural appendages belonging to the animal. It was in vain for me to puzzle my brain for the reason of fuch a whim, and I was fain to apply for information to the Indian. For him, he feemed to pity my ignorance, aftonishment, and laughter; and in a very phlegmatic manner answered, that it was to prevent their becoming foot-fore. Reflection made the motive feem but reasonable, for the animals were so fat, and are naturally so lazy, that if they had not been booted, having a journey to make of five and twenty leagues, and should wound their feet, they would have fallen away, and even have remained on the road. When at dinner, at an after period, with the intendant of St. Domingo, on his asking me respecting the roads in Mexico, I felt a strong inclination of relating this fact, in order to qualify him to form himself an opinion; but as there was a large company at table, to whom I was unknown, I was fearful, on giving account of a circumstance fo fingular, to pass for an inventor of sables; I therefore merely answered his interrogation by telling him in general terms, that I found them very bad; and in good truth, though the road I was now travelling was that of Guatimala, and the only highway on which is transported the various produce of a valley, which extends four hundred and eighty leagues, I did not find thirty leagues of road on which a carriage could pass.

After a long journey of fixteen larger leagues, I again revifited my charming hamlet of Galiatitlan. I faluted it on my arrival full of gratitude, for its having first presented me with the delightful spectacle of a plantation of nopals. It was too late, and I was too much fatigued, to vifit the Indian into whose grounds I had entered on my way to Guaxaca; I therefore thought only of getting my supper, and retiring to rest. I slept but little. I had judged it requifite to give air to my plants; and for the purpose placed my boxes, opened, in the court of the cafa reale, and every half hour paid them a vifit. In the intervals between I took a walk in the church-yard, which was at no great diffance. A beautiful moon light shewed me the way; and with pleasure I collected the roots of amary uidas from the tomb. At this instant, calling to mind the Night Thoughts of Young, I faid to myfelf, Is it then really confequent that reflexion on the immortality of the foul should give rife to melancholy, as the case with that gloomy doctor? By no

means, but rather

Let us, while through this vale we fpeed, Cull every flowret in our way.

At two in the morning, I again closed my cases, carried them in-doors, and laid down

to fleep till dawn.

As foon as I arose, I hastened to the garden of my Indian. The cochineal harvest had been gathered; and I merely took from him four plants of the nopal, which had already

rooted, and for which I gave him fix reals.

It is to be observed that I burthened myself with these nopals, and with four other plants which I collected at Sant Antonio de Los Cues, apparently from an excess of caution, and that I might not have any thing wherewith to blame myfelf: but how wife this caution will be feen; for of all the branches loaded with cochineal, which I had

bought at Guaxaca, and Sant Juan del Ré, and on which I placed my chief dependence, not one was preserved to the end of my voyage, as I had the affliction of seeing them all rot one after the other, and of being obliged to throw them into the sea while traversing the gulf of Mexico. It was to those plants on which I placed the least reliance that I had to ascribe the ultimate success of my project, as these were the only

ones which furvived the voyage, and which have multiplied.

The Indian who fold me the nopal plants was the fame who let me my horfes; and his fon acted as my topith. This afforded me means to hold a very interesting conversation, and acquire considerable information respecting that culture, to which he paid his chief attention. It was this man who presented me with some of the sibrous net work of the cocoa, of which he informed me the nest for the cochineal was made: it was from him also I understood, and at his plantation that I saw, that the mother cochineals for the succeeding harvest are preserved in open air and on the same plant, and not as averred by the Abbé Raynal, and that even in his last addition, on detached branches put under shelter in the house. I made, as very natural, remark on hearing this, that I should have thought them liable to be destroyed by the rains; but this objection he fet at rest, by the answer he gave, which was, that in the stormy scason of the year, Se tapan con petales, they are sheltered under leaves.

At the plantation of this Indian I likewise, as I had done before in some of the church-yards, collected some buds of a beautiful syringa asperisoliis, but they

perished.

When on point of departure with his fon we perceived near a fountain his young fifter, who at that inftant was fetching water. She was a lovely brunette, about nine or ten years of age, with blue eyes, and the most beautiful complexion. I had just before given her a real. She drew nigh her brother, and without uttering a fyllable flipt it into his hand. My poor brother, she no doubt reasoned, is now about to travel on foot over fix weary leagues of ground for merely a wretched real, and which even my father puts in his pocket, and has but four tordillas and some pimento for his dinner. Suppose I give him this real, he will be able to fare better, and better be able to endure the tediousness of the way, and the burning heat of the fun. Such in short was the reflection I read in the expressive eyes, full of interest and compassion, of this amiable child, and in the look of gratitude the young lad directed at his fifter. I was deeply affected by this little incident. Come hither, my child, faid I. She came blushing and uneasy about the motive of my calling her. I gave her another real, which I bade her keep for herfelf. The little maid laughed with joy, took the real, and turned her back on me, without the flightest thanks; but what thanks were necessary? Did she not smile? Throughout the whole morning I amused myself with pleasing reflections on fraternal love; and this incident confirmed me in the idea I had ever entertained, that a tender affection for their brothers is not uncommon with females; and that it could not have been fcenes like this which originated the observation of rara concordia fratrum. Incidents like these it is which render one disposed to love mankind; but how rare are they in large associations of the fpecies! and where did I meet with this? Was it not among the fteepest mountains, in the most distant parts of America, amid people little removed from the wild state of nature?

After proceeding three leagues on my way, I met a herd of fwine, confisting of about fixty, all of them in new boots. Now, indeed, faid I, accossing the Indian who was driving them along, I plainly see that this is not a mere whim, but a fashion, quite the fashion of the country: in truth, now all that these gentry want, to draw down not only admiration, but even the envy of their drivers, would be to make an addition to their dress

dress of a cloak, hat, and ruffles; but all I could say failed of exciting a smile, for the

Indian was of a most grave and ferious turn of mind.

When I arrived at Atletlanca, I was obliged to go to the rector to change fome gold: he appeared to me to have great partiality for this shining metal, and to be ready, if needed, to give me filver for all I had. He shewed me the stuffed skins of two animals, which he called tigers but which were just as much the skins of tigers, as of Mexican bears; of this I am satisfied, as at an after period I bought some of both the one and the other, these much smaller: those of the rector were six feet in length from head to tail, and two feet and a half in height; the head, face, hair, and teeth of them were similar to those of the cat; but the colour of the hair was that of the sawn, very bright, perfectly smooth, and without any longitudinal stripes, or ocellary * spots; these monstrous animals, said to be very ferocious and sanguinary, had been killed within two leagues of the village: would I could have borne them away with me! the rector would assuredly have parted with them for gold.

On disuissing my topith I gave him another real, as well because he was the brother of the sweet little Indian girl, as because he had conducted himself with propriety, and that on such occasions I seldom restricted myself to abiding by the regular prescriptions for drink money: these kind of people are commonly so wretched, and at the same time appeared to me so worthy, that I always considered a real or two extra not idly thrown

away.

I again croffed the numerous windings of the river de las Vueltas, and again with the like impatience and vexation, but at the fame time with lefs inconvenience, on account of being better mounted. I was unable however to reach Don Dominquillo before night, where I again met with a jubilee and proceffion, for it had been ordained I think that from Paris to Mexico had I gone I should constantly see nothing else: this one I sound interesting; the music of the charming Salve Maria, which I took down in notes, is really excellent; it was sung in chorus, the parts given in perfect unison, and was a

piece of music altogether capable of pleasing even the most delicate.

When Justice and Peace, tired of living with mortals, by whom they daily were insulted, abandoned for ever their ungrateful hosts; Fame says, they took refuge in heaven, from whence they came. The rumour here was wrong: after wandering over the different portions of the globe, constantly vagabonds, and constantly abused, these celestial beings withdrew to a corner of North America; yes, the village of Don Dominquillo. This little hamlet, simple in appearance, unadorned by the meritricious works of art, but rich, but charming from its site on the slope of a hill, at the confluence of the Rio Grande, and that of Las Vueltas, appeared to them worthy of their abode; and here I enjoyed the mild presence of these amiable but slighted powers.

The circumstance which called for this remark I shall relate: While I was at supper, I sent for a topith, with whom I had entered into contract for furnishing me with horses for Quicatlan; the knave had the address to cheat me of three piastres, without my noticing the fraud; his lively and seemingly ingenuous looks, and possibly the cares with which my head were filled, combined to lay me open to deception: the keeper of the casa reale, however, perceived the fraud, and pointed it out to me, but the topith was already out of fight with my money. In the mean time, after the procession, while walking in the public square, I saw two Indians carrying each of them a staff fix feet long, on which they supported both their hands. I paid at first but little

[•] Ocellaire, in the original, from ocelli, little eyes an Italian word.

attention to this incident, till at length I heard a cry repeated thrice in the Mexican language, and three whiftles. In an instant, my rogue of a guide presents himself, out of breath with running, and makes a number of low bows to the men with staffs, the diffinctive marks of their office: the one was the alcalde, the other his affelfor. As I faw them advancing towards me, I met them half way: in my prefence, in a very deliberate manner, they interrogated the topith respecting the number of horses I had requested, and the price he had asked. He confessed the whole he had asked, except two reals. They next enquired of me, how much I had paid. I told them the exact fum. Turning next to the topith, they asked him, if he had shewn me the table of fares; and, on his confessing that he had never even mentioned it to me, the alcalde very feverely, though at the fame time without the least symptom of passion, reprimanded him; first, for having exacted more than the ordonnance prescribed; and fecondly, for having stated the fum he had received at two reals less than what it really was. While they were fpeaking, I minutely observed, by help of the moon-light, the features of these simple officers: they exhibited not the least symptom of rage or indignation, not even the least emotion. Immutable as the law, they judged and decided by its rule, and never did fenator, counfellor, or judge, with all their fumptuous paraphernalia of office, in filk and ermined robes, in fearlet or in black, in coronets, caps, or periwigs, never, I fay, did either look more august or majestic than did, on this occasion, these poor and tattered Indians.

After convicting the culprit, on his own confession, they made him restore the whole fum he had received; after which, entering my apartment, where was a light, they attempted to calculate what was justly his due, but, little used to handle money, they were unable to succeed, and I was obliged to take on myself this task; when, having shewn to their satisfaction, that I had given three dollars and two reals more than I should have done to the topith, the alcalde restored them to me, and gave the remainder to the topith, enjoining him to have his horfes ready at the hour appointed. I was dumb with admiration. I thought myself in a dream; a judgment so unartificial, so speedy, so perfectly equitable, was what I could not conceive: actuated by the enthufiafm by which I was filled, I gave the cafero, by whose instituting the process I had enjoyed this interesting spectacle, a dollar, and begged the alcalde to keep in his own hands the three dollars and two reals, for the purpose of distributing them among the poor of the hamlet. I would willingly have given, had I means, a thousand piasters, to have perpetuated the memory of this honourable act of justice; for it cannot be difguifed, that the best means of enforcing among mankind the practice of wisdom and virtue is to honour and reward even the most infignificant actions which denote its existence: men always act from some interested motive; and what motive can be regarded as more valuable than that which has for its end the efteem of one's fellow creatures and posterity? Let us then but applaud good actions, and those same applauses will prove the feeds of others.

With these pleasing fancies I retired to rest, and sweet was the slumber I enjoyed; but at two in the morning, solicitous of making a long day, I awoke my topith: the rogue was out of temper, which I noticed the most plainly at the passage of Rio Grande. In this river I saw an animal swimming, which I took to be either a crocodile or a cayman, though its muzzle did not yet seem to be so long as theirs. I enquired what animal it was, but instead of informing me, in order to prevent the gratiscation

I might receive from fatisfying my curiofity by a more minute examination, the malicious rogue picked up a stone, and threw it with such nicety, that, though at eighty paces distant.

distant, he struck it on the head, which occasioned it to dive under water, and it did not appear again. At dinner he met with his reward, as I neither gave him a meal,

nor money to buy drink, as I was elfe accustomed to do.

I reached Quicatlan at nine, and after purchafing a provision of bread, left that place at ten, passing, without stopping, by the guard-house: the chief of it, whose good-will I had insured on passing before, whether on this account, whether owing to his being employed in counting the mules laden for Guaxaca, paid no attention to mine, but made a sign to my topith to proceed without unloading his cases: I squeezed his hand in token of gratitude, and clapped spurs into my horse.

But little after noon, the fun almost at its zenith, and vertical above me, I had to climb the terrible and satiguing mountain Aquiotepec; I found it necessary, in order to bear up against the distress occasioned by the toil, and the heat of the day, to seek revivisication from advertence to my worthy and faithful friends in France; this was my ordinary practice; perpetually were they present to my imagination, and often did I hold converse with them. Oh, could you only see me here, said I, and with what formidable difficulties I have to contend, then, partners of my heart, then would you learn the cost at which I seek to merit your esteem.

At length I attained the fummit of the mountain, by half past one, as I found by the clock then striking at Quicatlan, the found of which I still distinguished, and by three had attained its foot, on the banks of the Rio Grande: here it was I first saw the sylvester cochineal on a thorny cactus, with leaves nearly round: I took away two articula-

tions, which I preferved for a long time at fea, but which at last decayed.

I had laid in a store of bread, but this was not enough. I recollected the bad fare I had to expect if I depended on the supply of the hamlet whither I was journeying: fortunately I saw an Indian who had just been sishing; in answer to my interrogatory, of what success he had experienced, I learnt he had caught a trout; but this pretended trout turned out to be a species of mullet, which however was delicious.

While changing horses at Aquiotepec, I gathered from the margin of a fountain a paneratium foliis lingulatis strictissimis *, which I continue to cultivate at Port au Prince; but on this occasion, my curiosity, or rather my imprudence (for I made use in raising the plant of my hands) was nigh costing me dear; a serpent, sour feet long, of a yellowish colour, issued from the ground I had just been disturbing, but without doing me the least injury, it glided under some other plants: this serpent was the first that I met with in my botanical collections in North America. Farther on, on crossing the Rio Grande, I saw a liliaceous plant, less eminent, but which was similar to that I had sound on the brink of the sountain of Aquiotepec.

I did not reach Los Cues before half past nine at night; I was dying of hunger, and my fish was most welcome: it was so large even that I was enabled to spare a part for my topith, who had been able to procure nothing better throughout the whole hamlet than a couple of tordillas of blue maize, so much resembling pieces of slate in their appearance, that I was obliged to bite them, in order to be convinced of the con-

trary: as fauce for these he had some little chili.

The next day, Trinity Sunday, I proposed, as it would be the last time I should meet with plantations of nopals, to make some fresh purchases of nopal and cochineal: informed of the existence of them at this place by my Franciscan, on seeking I readily found them; nay, there was one close even to the house at which I lodged: this, however, did not appear to have been sown, so thinly was the cochineal spread over

the leaves. I then entered another, in which were many young plants that had taken root, and were loaded with fine cochineal. I was very folicitous of procuring fome of these, but the owner was at mass. In a third I met with some women, who consented to sell me eight branches richly loaded for ten reals: this was rather dear, especially when compared with what my good negro of Guaxaca had asked me; but on my expressing such to be my opinion, they remarked to me, that there was upon them at least twelve ounces of cochineal, and, on the other hand, these were what I wanted. I saw in addition, the plantation of a poor cultivator who was drying the seeds of the cactus, with which to make bread: the garden had not been planted more than sisteen months, and from him for six reals I bought as many sinall rooted plants. He was willing even to have spared me a greater number, and at this rate even would gladly have parted with his whole garden; but I was now most amply supplied, and had great difficulty to stow my last purchase.

I however fucceeded and fet off with my cases, mounted on an ass, which transported me to Santo Antonio by noon, according to the estimation I made by a singular means. I noticed that the ears of my ass, at every turn, whether eastward or westward, to the north or the south, constantly both the one and the other threw their shadow on the earth, at an equal distance from the head and body, the shade of which latter was immediately under the belly of the animal: followed that the sun must be at its zenith, and consequently that the hour was noon. This meridian, so novel and so whimsical, made me laugh much, and for an instant consigned to oblivion my cares and jading

ride.

At San Sebastiano I swallowed two new-laid eggs, and immediately set off again with excellent horses: the one I rode, however, was difficult to manage, and had no bridle, a circumstance to which I failed to pay attention on setting off, or till I had left the village: every thing, however, went on well until I reached Santo Antonio: thrice had I alighted to collect feeds from plants, and thrice had I again quietly mounted; but the fourth time, the reflive beaft rifing on its hind legs, flruck at me on the stomach with the fore ones, and with such force as to fell me to the ground; not content, he fpurned again his hind legs at me, and gallopped away at full fpeed. For an instant I thought all was over with me, and far as the little power of reflection allowed, which remained with me, I was anxious only for my dear cochineal. I dreaded lest it would yet remain buried in Mexico, and be for ever lost to my country: the thought went near to kill me; however, resuming, after a few instants, the faculty of breathing, and my stomach by degrees recovering its tone, I gathered that I did not immediately need extreme unction. Collecting strength, I rose, though with great difficulty, and drew as a conclusion from the incident, that a botanist should travel on foot.

I took no trouble about the horfe. It carried away not any of my property, and should I have recovered, I should not have mounted him again: so giving him heartily to the devil, I continued my journey on foot, at a very gentle pace, quit for a few grazes

and a torn jacket.

In vain did I call after my topith, who travelled at a brifk rate before me; and when I arrived at San Francisco, I found he had already been there an hour. I related to him what had happened, and was apprehensive he might insist on my paying for the runaway; but he was fatisfied with merely asking for a note, which might account for his not taking it back, which I gave him, stating the restiveness of the animal, and the want of a bridle, as the cause. I moreover presented my guide with four reals for himself.

The

The next day I took care to be provided with gentler horses, and more complete furniture, and by ten o'clock arrived in fight of Tecuacan. In the course of my journey, I remarked a nicotiana (tobacco plant) with narrow and pointed leaves, which

was confpicuous as a weed among the corn of this beautiful plain.

I was anxious to pass round Tecuacan, as I had done on my way coming; but with all my baggage this was not practicable, and the topith, in fhort, flatly refused: it was necessary therefore I should travel through it: the town appeared to me a defert, and I compared it to those enchanted cities the work of genii, when a magician of the most formidable kind, in my eyes, made his appearance before me, and drove awaythe pleafing ideas of enchantment. This magician was no other than a stout, sharking customs officer, mounted on an excellent horse, his faddle bow befet, both in front and behind, with piftols. This redoubted champion advancing, fummoned me, in the King's name, to return to the customs house. I answered to him, in a tone of voice which denoted vexation, that I certainly should pay all the respect due to the King's orders; but that if he had had the least notion of civility, he would not have suffered me to have rode through the whole of the town mercly for the pleasure of making me return. However high the tone I assumed, my heart was chilled with fear; the word customs house turned my brain, and I gave up all for lost. I shall have, faid I, to open all my cases, my pilferings will all be exposed; there may be laws which prohibit the transport of cochineal on nopals; nay, this ought necessarily to form a part of the policy and ordonnances of this people, one fo anxious to maintain the exclusive possession of this Should this be the case, adieu to all my treasures, all will be ravished from me, and confiscated: what grief for me! what shame! cursed rencounter! unlucky travels!

I was in a dreadful state, though it must be allowed, that at times danger affords resources which are gathered merely from its presence. On reaching the customs house, I instantly determined on my plan: composing my countenance, therefore, I entered with an easy air, and expressed much discontent at the trouble which had thus unnecessarily been occasioned me. I found two Spaniards in the office, one of whom, the director, lessend my colour by the affable and prepossessing manner in which he received me. I told him that I was a botanist, that I had been employed in collecting medicinal plants throughout the whole province, with which my trunks were full, and that I had with me nothing else. I added, moreover, that I begged they would satisfy themselves on this head, and proceed through the examination as speedily as possible, as I was solicitous of reaching Vera Cruz for the purpose of going on ship board.

The director faid that this was enough, and entered into the most friendly converfation with me; however I notwithstanding caused my boxes to be opened, although against his inclination, for the purpose of fatisfying him, and out of bravado towards his deputy, who appeared to be inquisitive and suspicious. On looking over the cases, in which, among a variety of herbs and roots, with which he was altogether unacquainted, was the vanilla which was equally unknown to him; he shrugged up his shoulders, and smiled. I opened others which contained cochineal, covered and mingled with other plants: aqui sta grana,— this is cochineal, said he, apparently with surprize, but at the same time, with an air of indifference which argued nothing displeasing. In my notice of his observation, I seemed equally indifferent. He afterwards noticed the double bottoms, and fancied for an instant he had caught his bird, signifying as much by a glance, which at the same time seemed to hint that he could shut his eyes occasionally to what he could not see without injuring; but, rendered bold by the affurance I had acquired, that no objection would be taken to my cochineal,

I raifed

I raifed the bottoms, partitions, and the pieces of wood, which separated the plants, when my nopals were distinguished among other plants, carefully folded in fine white paper. What are these nopals for, this cochineal? For an unguent. For what inalady? The gout. Ah ah! do but see, exclaimed he then, laughed heartily as he pointed out among my collection the nuts of the most common fruits of the country, and feeds even of its most despited herbs.

The director now obliged me to flut all my cases; before I did this, I pieked up even the smallest leaves which had fallen, but with so much care, that they could entertain not the slightest doubt of my placing on them a value, far greater than on the cochineal: they could not indeed help admiring to see a Frenchman come from such a distance to collect some of the meanest herbs of the country; and frankly confessed, that no Spaniard could be found possessed of equal resolution. Walking in the court, I saw drying in the sun the fruit of a certain cactus, not larger than currants: in turn, I enquired what use it was applied to? To making of tarts, was the answer. He invited me moreover to taste them: I found them delicious, and preserved some of the grains.

From all he had feen the director concluded within himfelf, that I was an eminent doctor, and in confequence entreated me to vifit a friend of his who was ill: I told him, that unless His Majesty himself required my assistance, I could on no account procrastinate my ftay: at the same time I enquired of him to whom I had to address myself to obtain horses: he informed me I must apply to the alcalde-mayor. This circumstance difpleafed me. I apprehended a fecond inquifition, and could not hope perpetually to be favoured as I had hitherto been, by good fortune: however, no choice was left, nor could I draw back; I therefore paid him a vifit, and found him employed with a man dreft in black, whom at first I mistook for the aleade himsels. It was not long however before I was undeceived; Don Marcos Chopin, Cavallero de Sant Jago, Gobernador de Tecuacan, alcalde-mayor informed me in person, that it was he to whom I had to address myself; he converfed with me with an affability, a fuavity of manners which could not be furpaffed by the most amiable among our French gentry, and immediately directed an alquazil to go in fearch of horfes for me. I entreated that they might be gentle, and with good bridles, as a cause of which injunction I related the adventure which had befallen me: he laughed heartily at my narrative; and observed that I must in this case have been but an indifferent horseman. Pardon me, Senor, replied I, but my horse was unufually reftive.

By accident a mirror happened to hang before me, and feeing myfelf in it, dirty and with my clothes torn, I could not but feel amazement and high gratification at the little difficulty I had hitherto met with. In France, taken for an highwayman, I fhould have been ftopped by the police: in Mexico I was not even asked for my passport; I fearcely knew to what I had to ascribe this distinction; possibly in a small degree it is to be attributed to the inertia and negligence of the Spanish people, but at the same time much liberality and nobleness of mind are apparent in their custom of not suffering themselves to be influenced towards, nor their confidence diminished in, a man and a traveller, because of the garb he wears: their conduct moreover may be owing, and principally perhaps, to the officers of the interior relying on the governors of the frontier cities and towns for care that no one be admitted into the kingdom but Spaniards,

or individuals furnished with regular passports.

However this may be, the alcalde-mayor behaved to me with the fame politeness as if I had been drest in the nicest manner; he even played me a little trick, which, no doubt, afforded him considerable anusement, and which made me laugh myself: he sent me to the farmer of the tobacco duty, whom he represented to me as being ill,

and

and at the fame time a Frenchman, two motives for my rendering him whatever affistance my art was capable of. In vain did I deeline going, on pretence that not pertaining to the college of physicians in New Spain, the confequences of such a procedure on my part might injure me; he insisted and prossered to take all responsibility on himsels: but what was my astonishment, on complying with the wish of the governor, at suding my dear countryman plump as a partridge, and with a complexion ruddy as the morn: I was not able however to draw from him a single word of French: and when I explained to him the nature of my visit, he answered me coolly in Spanish, that the alcalde might keep his physic and physicians to himsels; as for his part he was in want neither of the one nor the other. I was much pleased with having to render account to the governor of the success of my mission: he received me with less kindness than on the former occasion; but this was merely to hide the trick, he laughing all the while in his sleeve: he thought me his dupe this: however I frankly forgave, on reslecting how much more so he was mine.

I afterwards went to his fecretary to beg him to change me fome gold, and this I perceived had a good effect; for in this, as in my dear country, gold is closely cherished,

and gives much confequence to those who are its masters.

Soon as it was known I had gold, I was well enough dreft, and the fecretary received me in a manner no less courteous than the alcalde. I found him a man of sense, and who diffinguished the value of study after the French manner: he enquired how many academies we had; and when I informed him that, befides five or fix in the capital, we had more than twenty in the provinces, he was wrapt in aftonishment, and mute with wonder. Happy country! he exclaimed; thrice happy country! He was in the right. In what other country do the arts, does science flourish in the same degree? Where else is truth and knowledge of every description so fully placed within the reach of all! What refources does Paris furnish as well to the inquisitive who merely skim the surface, as to the studious who seek for perfect acquaintance with truth! Public and private libraries, academies, focieties of amateurs in which literature is cultivated, models, chefs d'œuvres of every kind, these are all found in the capital of France, and found but there alone. Does one wish to estimate the value of these? Let us cast our eyes over the neighbouring nations; thefe, though competitors, are obliged to yield us the palm: and however disposed to give their due to them on the score of their individual merits, a Frenchman placed in any of them fighs for his darling home.

From the fecretary I went to the alquazil, who was to furnish me with horses; and not choosing to leave the spot until I had seen them, I sent word to the director who had invited me to dine with him, not to wait. I had a trifle served up for me, which I swallowed with good appetite, but of which I should have partaken with more zest in any other situation; the reason this: the alquazil chanced to be the jailor of the royal prison, so that I actually took my meal between two wickets, surrounded by guards, in a place whose only decorations were bundles of keys, locks and chains; a place where I heard incessant moans and lamentations; and where all the time I stayed, I was witness to the tears of a multitude of poor Indians, who had slocked hither to comfort a father

or a friend.

As foon as the horfes arrived, I made all haste to the customs house to load my effects. The director reproached me, yet kindly, for not dining with him, and repeated his argent entreaties, that I would call on his fick friend: he is, added he, on your road at four leagues from here; and his name Don Joachim Armoral de Castilla: Great God! exclaimed I, what turn out of my way for the sake of a man who treated me

with fuch indignity? Heaven forbid! Upon this I recounted the humiliating refufal of this gentleman to fee me, and the reft of my adventure at his house. I however added, that, out of respect individually to the director himself, I would yet consent to prescribe for his complaint at Tecuacan, and wait for him there, provided the director would fend for him: but, as for ever setting foot again on his threshold, it was that to which I never could consent. The director was consounded and mortised, and made me a hundred excuses for the sick man, concluding with abandoning his cause altogether, and persisting from further persuasion. Thus had I my turn; and without being actually a physician myself, physic was revenged for the slight it had received in my person. At length I departed, escorted by the guards belonging to the sobacco farm, as far as the suburbs, either to do me honour, or, which is most likely, to be sure I took the road to Vera Cruz.

I now was happy as if I had escaped from the galleys, and breathed with freedom; but I also made such use of my liberty, that I was soon at a distance, spite of the extreme heat of the day, reaching Chapulco by sour in the afternoon. The great heat and extreme thirst induced me again to drink of the water from the river Tecuacan, and my draught was sollowed by the same effect which I had experienced before. I enjoyed this day a sight perfectly new to me, and exceedingly singular; it was a mountain of snow, situate within the Torrid Zone. Oristava, on my passing it this time, was perfectly free from clouds, and I had an unmolested view of its mighty mass, though from a distance of ten leagues. Its form seen from this spot is that of a sugar-loaf, and appears but a quarter of a league from Chapulco. It is inconceivable, notwithstanding the extreme warmth of the atmosphere where I was, what pleasure I received from the sight of this frozen mountain; it seemed even to cool and revive me: my very mouth, as is said, watered at seeing it, and I selt almost persuaded I could have swallowed the whole, if it were but within my grasp.

I prefented myself immediately before the alcalde, whose house, according to custom, fronted the prison. He caused his people to go in search of horses for me, and, as none were readily to be found, he was on the point of ordering men for transport of my luggage. Eight Indians, each laden with about two hundred weight, would have been equal to the task, and have carried it for the same price paid for beasts of burthen. The idea appeared to me shocking; I intreated the alcalde therefore to have patience; I would in fact rather have halted a week than be witness of so fad, so humiliating a spectacle, in my esteem, for any human being. At length assessment obtained for carrying my boxes, and for myself a horse, I paid as customary, before hand, and ordered all to be in readiness to set off next morning by three.

After these precautions, I took a walk in the village, where I enjoyed a coolness as pleasant as if in Europe. I entered the grounds of a worthy Indian: the garden was full of pear trees, and from these I gathered and ate about a dozen pears, smaller than and not equally good with the rousself. In another garden I saw a species of cherries called cappuline, the stones of which I preserved: in a third, I was shewn sold worms; and the good folks were astonished to find that these insects were known to me. After my walk, I returned to my inn, where I supped off a meagre fowl; and opening all my trunks to give air to the cochincals, I laid down to rest; but on what do you imagine? A hundred times shall the reader guess, and yet be wide of the truth; it was on the old gate of a prison. These gates are made in the same manner as the gratings to the hold of a ship: and such a gate or grating was the only bedstead the casa rease could boast. I might here be said with reason to be sluttering about the

flame, and was full of causeless apprehension lest I should burn my wings; the thought reminded me of the verse of Marini.

Corre la vaga, farfall' al chiaro lume.

Still, after chafing from their usurped territory the gloomy thoughts which haunted my brain, and committing myself to Providence, I sunk into a slumber, and, bad as my bed,

enjoyed refreshing rest.

I was wakened at the hour I appointed in the morning by the feverity of the cold. I determined on walking for a time to keep myfelf warm, but as day-light appeared, I bestrode my Rosinante to rest my legs. Oh, what a number of rare and curious plants did I again behold! Sed omnes illastrymabiles urgentur longa noste. At the summit of the mountain I met with the three litters of a Spaniard of some rank. The two first were occupied by women and children, the third by himself alone: notwithstanding the extreme acclivity of the mountain, he had ascended it in this manner from the side whence he came.

This morning the mountain Oriffava, being again enveloped in clouds, was not

visible.

I arrived at Aquulfingo at noon, and left it an hour afterwards, but at a flow rate. I was folicitous of not reaching Oriffava before night, not only that I might escape fearch, but to avoid being confulted on their maladies by the guards; however, what is

predeftined must have its course.

I reached the town as I intended at night: the guard-house on the right was shut up, and I hoped to pass without any mischance: but there was another on the left which I had not remarked. My horse was stopped by the bridle; a new alarm, though now not fo lively as that I had experienced at Tecuacan. I had become better accustomed to fuch events; I halted, and began with my customary peroration: Gentlemen, I am a botanift, I have nothing but herbs, nothing which is contraband. I was now interrupted by the chief of the guard, who clasped me in his arms, and exclaimed, Ah, Senor! and is it indeed you! you have long been gone, where do you come from? Angel fure from heaven! you it was who fnatched from the hands of death the chief of the other guard-house, for God's sake deign to visit my poor wife. It will readily be conjectured from this accost, that my boxes would need no fearching, but in turn I must necessarily vifit the fick person. She was a young woman, reduced by that dreadful disorder which has been said to derive its origin from America, to the very last extremity: this I did not conceal from her husband and parents, at the same time declaring what the malady was; for it is fo common in this country, that the mention of it never gives offence. I ordered fome palliatives, and promifed to return; after reasoning in a manner which enchanted all who were present, I was led back to my horse, passing, no doubt, for a most extraordinary personage. My vanity was not excited by this, for grief alone had possession of my faculties, as I reslected on the dreadful effects of this formidable malady.

The next day I thought only of my departure, but being detained, owing to the negligence of the alguazil, I had occasion to pass by a shop where I saw some very handsome Asiatic tygers' skins; I purchased sour for housings for horses, which I meant to fend to my father, and two small skins of tyger cats, fit for making muss for women, which I intended for my sister; but being injured by mites, I was obliged to sell both the one and the other, and was thus deprived of the pleasure of presenting to my dear parents these intended tributes of my gratitude and affection. I sold them

VOL. XIII. 5 P

at the rate of a piaster a-piece at Port au Prince; and one with another they cost me four reals.

From Oriffava I proceeded to Villa de Cordova, which I reached by noon, after having had my trunks examined at the gate, but in a careless manner. I made a very indifferent dinner in a very indifferent inn; but I saw there a singular painting: it represented a Spanish youth at dinner at that inn, and behind him a young negro, who, with a loaded pistol, was amusing himself in shooting at a painting of Christ suspended from the wall: but wonderful to behold! from the wound, so great a quantity of blood issued, as to fill a large tub. The whole of this happened in this very inn, at least, if reliance could be placed on the affeverations of my hostes, who affirmed it with the most solem oaths. I did not take the trouble to contradict her, but coolly enquired what she had done with such a large quantity of blood? This she could not answer.

I left her for the purpose of hiring horses, and was able to obtain them upon no other condition than the promise of a piastre to the alguazil of the district: it was then so late that I could not arrive at San Severo before the close of day. At this place I alighted at the grours, where I had lodged before on coming; my first care was to urge him to procure horses for me, as owing to the darkness of the night, I could have no chance myself of success, especially considering the numerous windings of the pueblo, the houses of which are as it were buried in thickets. I promised mine host, if he would procure me them, a couple of dollars; but the idle scoundrel would not budge an inch, though to earn before he retired to rest more money perhaps than he had gained in the whole preceding week.

Nothing could exceed the ignorance, the folly, and the pride of this fellow and his brothers. They laughed out like idiots at feeing me bring back nothing but plants, and at the fancy that for matters of fuch little value I should have daily exposed myself to

the risk of perishing of hunger and fatigue.

I was in consequence obliged to go myself to the alcalde, groping my way through the bushes. The alcalde was a negro whom I found in a sick state; I entreated his wife to interest herself in my behalf, and gave her six reals, with promise of an additional remuneration in case of success; but whether owing to pride or idleness, when some hours after I returned, the alcalde informed me there were no horses to be had. I was in a violent rage, and suspected strongly that the idle sellow had not even given himself the trouble to enquire: in order to convince myself therefore, I defired the woman to return me the six reals I had given her, with which without any hesitation she complied. This conduct I regarded as shewing much good faith and delicacy. Good saith, inasmuch as it would not have been difficult for her to have maintained that she had really endeavoured to get horses; and delicacy, seeing she might think she had no right to keep a sum of money which had been given her for a purpose she had not effected.

At length I was obliged to return to my lame negro *: he confented readily to take me to La Punta, but I wished to go as far as Calabaca: he swore he would take me no farther than La Punta; and for my part, I swore to myself in silence that, if I could not find horses at that place, I would make him go on to Calabaca.

We did not depart till day-break. The whole road in the gorge we traversed from Orissava to this place is marked by a cut, a hundred and fifty fathoms broad, anciently intersected by small forts, redoubts, and other strong buildings, the vestiges of which,

^{*} This relates to some antecedent passage in the narrative, which is lost.

in masonry, are still to be seen. This is one entrance into Mexico, which formerly was more frequented than is now the road which leads from Vera Cruz to Jalappa. At the square where, near these ancient redoubts, the guard-houses for tobacco are constructed, I was again visited three times in the course of the morning, and was unmercifully obliged to open all my cases; but I have no cause of complaint; for to this rigorous conduct it is that I was indebted for the preservation of the major part of my cochineals.

On this occasion it was that I perceived a species of moth, which having made itself a kind of nest of their cottony down, committed a dreadful ravage among my insects. I was shocked at the loss I had sustained, and halted to cleanse my nopals from these

murderers, an operation which cost me upwards of an hour.

While thus occupied, one of the officers of the guard, who recognized the cochineal, advanced in a familiar manner, observing I must certainly be fond of travelling, since I could choose to go so far to obtain what might be had at Vera Cruz. I observed to him that the species was not the same, and that this alone was the only one proper to use in unguents for the gout. On his part, he insisted on the contrary, and assumed that with this matter he was much better acquainted than me: I on my part, was obstinate, and maintained my opinion as long as I thought necessary to encourage his misconception as to my real objects, and at last I gave up to him, promising to follow his advice; there was, no doubt, abundant field for laughter in the folly and impudence of this ignorant chap; but I had special reason for keeping my countenance, and merely stored on the occasion this observation: that ignorance, filly pride, and self-conceit, are constant companions.

I arrived at La Punta about ten o'clock. The Spaniards and Indians, all in their holiday cloaths, were flocking hither from every part of the country. It happened to be the feftival of the Holy Sacrament; the most folemn of all in Spain. They were about to begin the procession in the square planted with plumeria, a species of jessiamine, with slowers of a yellow, red, white, nay of almost all shades of colours. I repaired thither, and found there had been a gallery of verdure constructed by means of the leaves of plantains, through which the procession advanced. I made one in it,

and afterwards went to breakfast with my former hostess.

At her house I found an Indian alcalde, whom I recognized by his black staff, the diftinguishing mark of his office. I begged of him to obtain horses for me, but notwithstanding the most diligent search, there were none to be had. Why, said he, do not the fame horses take you forward to Calabaca? Why did not the alcalde of San Severo, give fuch orders to the negro who brought you hither? I had no time to answer; a score of Indian voices remarked, oh 'é su nacion: Their infinuation was, that the alcalde himself being a negro, favoured those of his own country. After this, I was enabled to obtain a hearing. I reprefented that though I had offered fix reals to the alcalde of San Severo, as an inducement for him to procure horses for me as far as Calabaca, neither my money nor my entreaties were of any avail. At these words my Indian knits his brow, fends for the topith, and commands him to carry me forward to Calabaca. The people applaud the determination, delighted at feeing a negro punished. The black however does not fo foon acknowledge defeat; he afferts that the alcalde has no jurisdiction over any but the inhabitants of his own district, and that, for his part, belonging to another, he was by no means under his controul. The countenance of the alcalde at this afforded an admirable fight; his looks denoted passion, and could his eyes have darted lightning, they would have struck the negro

to the earth. Come with me Senor, faid he, taking me by the hand, we shall let this scoundrel see (this picaro) whether or no my orders go for ought, while he is in my jurifdiction. He then led me to the house of the lieutenant of the alcalde-mayor, whither he ordered the negro to follow, and was accompanied by all the crowd. While the alcalde was making his report, I drew the rector afide, and after making him my friend, by proposing to him to give me change for some gold, of which he appeared to me very covetous, I entreated him to interest himself in the matter: this he promifed me, and drawing the lieutenant on one fide, he pointed out to him, with much energy, that the ordonnances of the King of Spain are precise, in directing officers to render affiftance and fervice to all travellers, and that there are no injunctions which ought to be more rigidly enforced. This remonstrance had the defired effect; the lieutenant enquired how many horfes I wanted, whither I was going, and what I offered? I faw the bent of these very judicious questions, and that my answer would thortly occasion a decision. I therefore stated, that I wanted five horses for Calabaca, feven leagues distant, and that I was willing to pay nine piasters. My offer appeared fo handsome, that it excited a general burst of admiration. The audience raised their hands to heaven, looked at each other, and finished by murmuring at the obstinacy of the negro, who still made objection to going farther. The alcalde, however, threatening to cast him into prison, and cause me to be forwarded by another topith, he at length agreed, and withdrew, purfued by the hootings and hiffes of the Indians. This, however, was not all; the lieutenant caufed him to be brought back, and requested me, in his presence, if any injury or ill conduct was shewn towards me on the road, to advise him of it immediately. The recommendation was applauded, and drew forth fresh hootings of the insolent topith. This scene convinced me of the truth of what I had read in the work of the Abbé Raynal, respecting the jealousy and animofity fubfilling between the Indians and negroes in this country.

I departed from La Punta at two in the afternoon, and had to travel feven tedious leagues by a very bad road. The unfortunate negro, defirous of fhortening the way, lengthened our journey still one league more, for after reaching a ford, in a river which empties itself into the Rio de la Punta, he found it impassable, and we were consequently obliged to return. Above the junction of the two rivers, I again noticed the frightful passage over the wretched bridge, and the tremendous fosse in the rock through which this deep and rapid river glides, foaming in many a curve. After crossing this bridge, we proceeded at full gallop over the savannahs of the plain on which we entered. I had some words with the negro; but as I assumed a commanding tone, he was soon calm, and in spite of all the torrent beds (arroyas), we reached

Monte Calabaca by eight o'clock in the evening.

I lost a milled quadruple from my purse on this stage; it had, no doubt, got out of my purse into the waistcoat pocket, and thence through some opening had fallen on the plain of sand we had now entered upon. I regretted it, as it was lost to every body. Alas! said I to myself, were it not far better I had given it to the beautiful Indian of Orissava, or rather, to the kind and worthy family I had seen at Aquulsingo.

At the village of Calabaca I again beheld my old fox of a hoft, much aftonished at feeing me, whom he had observed going on foot, return on horseback, and with such a train. I asked for horses, which at first he told me it was impossible to procure, that there were none, that none were at hand. He used many other contradictory and frivolous excuses for not supplying me. The end of all this I saw plainly was only extortion, and at length I obtained what I wanted; though for six horses to Vera Cruz,

a distance of eighteen leagues, he exacted no less than twenty dollars. The horses

indeed were excellent.

Before I left the place I cast a glance about me. The whole landscape was changed in the interval of a fortnight. The rains that had fallen, in lieu of barrenness and perfect nudity, had occasioned the display of the most charming and lively verdure. The whole green carpet before me, and every shrub, were enamelled with slowers, while innumerable birds gave, by their pleasing notes, a charming animation to nature. I here purchased a nest of six beautiful green parroquets, with blue wings, no larger than sparrows. I brought them in safety to Vera Cruz, in a calabash suspended from my saddle, but they perished at sea.

We travelled the first stage at a brisk rate, and reached the miserable rancho of the old and ugly negress, at which I had halted on leaving Vera Cruz. Fatigued, harrassed, and half-dying with hunger, I entreated of her four eggs that I saw; but she would spare me only two. She had brandy, but no wine, so that I made myself a kind

of lemonade. This was all I could get for my forry dinner.

As an additional vexation, I was subjected to a thousand ridiculous questions from this talkative and impertinent woman, and to raillery such as were admissible only from an equal. I was nearly out of patience with her, but rightly reekoned that contempt was the only return due from me to such a creature.

I took much pains, in course of my long excursion, in examining the character of the Africans and Americans, and marked distinctions highly favourable to the latter, notwithstanding their nearly similar condition in life under the dominion of Spain.

The African constantly appeared to me to be proud, passionate, vindictive, and esseminate, base, and intolerably idle. The Mexican, on the contrary, is phlegmatic, mild, and submissive, faithful and laborious. His humility is in no respect allied to meanness. The negro is humble from fear alone, the Indian from reslection, and oftentimes from attachment, for he is truly as partial to Spaniards as abhorrent of negroes. With the former he frequently intermarries, but never with the latter. The negroes are spies over the conduct of the Indians, and in their charges are almost always calumniators, either with a wish of slattering their masters, or from jealousy of their fellow-servants: similar to those dogs which guard the weak and timid slock, they avenge themselves for the sufferings they endure from their master on those subject to their vengeance, and frequently tear them to pieces.

The Americans have that natural benignity of foul which makes them prepoffessing in their manners, and hospitable to every one. I met on my way with a thousand Indians: their falute was made when yet at a distance: their gratulation always uttered unaffectedly, at the very instant of our meeting; and how thankful ought I not to be for the constantly kind reception I experienced from them. For the negroes, scarcely would they deign to bow on my passing; and at the last place that I halted at, and elsewhere, how did I prove their want of complaisance to travellers. The first in following their employments, stray ten and even sisteen leagues from their hamlets, and carry enormous loads; but never did I meet a single negro on foot, or carrying the

lightest burthen.

The dream of certain authors that the liberty of America will be the inftitution of a negro, is furely chimerical. Liberty is indeed a bleffing, by whatever hand beftowed; but, that an African, a voluntary flave, a man of the most depraved nature, the scoff even of his equals, and thrown like the foam of the sea on the shores of America,—that such a vile, wicked, and cowardly people, should appreciate justly the value of

liberty,

liberty, and fo far lose their known illiberality as to share its benefits with their masters, is what cannot be expected. No; should a revolution happen, I can far more readily believe it will proceed from a people, mild indeed, but endowed with sense; a people who still occupy the soil on which their ancestors lived free, who still hold this tradition, and whose temper, soured at last by the indignities to which they are subject, may break their yoke in pieces, and distain their forced subjection. The negro by no means possesses that energy of mind, nor that love for his country, which are the origin of great enterprizes; his heart, essentially corrupt, and dastardized by interest and debauchery, is incapable of sublime seeling, as his soul of grand conceptions. True bravery exists only in the worthy soul; and who can boast a more noble soul, one consequently susceptible of real courage, than the inhabitant of America; so little yet removed from the pristine state of nature? Let then the Indian unfold the banners of freedom. This prospect most delights me. This is my view of futurity.

After these reslections, suggested to me by circumstances, I reverted to those which more immediately affected myself. I had ample room for congratulating myself at having reached the last day of a journey so interesting, and at seeing it thus crowned with the most complete success, despite of two viceroys, fix governors, thirty alcaldes, and twelve hundred customs-guards; still, in midst of my self-gratulation, two gnawing worms interrupted the perfectness of my happiness, and constantly tormented me; in the first place, I was not yet clear of the perquisitions of the governor of Vera Cruz, and I dreaded his reproaches, if he should come to the knowledge that, in spite of his orders, I had exceeded the limits of the jurisdiction of the city he governed. I was precisely in the condition of the truant, who sneaks into his father's house after a holiday he has been making, while his parents thought him at school.

On the other hand, whatever reliance I placed on Spanish dilatoriness, I trembled lest I should not arrive before the departure of the two ships destined for the Havannah, in the forward part of June, and by which I reckoned upon returning. That I might so do, had been the motive for my hastening my departure from Guaxaca, and making such speed on my way; and on this head I had verily no occasion to reproach myself,

for I had used the utmost diligence.

By four in the evening we arrived at Rio de Jamapa. Though this river was greatly fwollen, we were affured it was paffable. The Indian, my guide, went before; in a little time the water was up to our faddle-bows. Most luckily, I had constantly had my boxes packed very high, but for which all my treasures had been lost; for us ourfelves the risk we ran was imminent. This was no longer the broad and tranquil fiream but three feet deep which I had passed before in a boat, but a rapid river, whose impetuous current bore every thing before it, and which was more than fix hundred yards over; befides the oblique line which its rapidity forced us to take, we were moreover obliged to make an angle, in order to ford it, and reach the proper place of landing. I found all my exertion requifite in keeping myfelf fleady on my horfe, which trembled with dread beneath me, and all my courage not to be intimidated at the fight of our danger. I found it utterly impossible to look at the current without being dizzy, fo much fo, indeed, as almost to lose my feat. Our horses, feeling their way at every flep, were twenty minutes in relieving us from the frightful fears we endured throughout this dangerous passage. It was certainly the most perilous fituation I ever was placed in in my life, and were a million offered, I would not have yentured to return to the other fide. On landing, I was pale and faint, and needed a

draught of brandy to bring me to myfelf. Three hundred paces from where we landed we faw a cabin at which we should have made the shore but for the depth and extreme rapidity of the flood.

Night overtook us at two leagues from Vera Cruz. It was unfortunate for us not to be able to reach that city, but to attempt it would be running the risk of losing ourfelves in a country where the tracks made in the fand one day are effaced by the winds on the next; moreover, our horses were exceeingly tired; and after all we should have

found the gates of the city shut.

We were therefore forced to stop, and halted for the night by the side of a caravan, confishing of three hundred mules. I had before met with fimilar caravans, and at first conceived, as may be gathered from my narrative, a very high opinion of the population and commerce of the country; but I have fince, on weighing these circumstances more maturely, been convinced of the contrary, and that, compared with the confumption and commerce of the whole of Mexico, the number of mules is far from great. During my ftay at Vera Cruz, I faw more than ten thousand mules loaded there; but then it must be considered that the exportation and import of a country four times as large, though not a twentieth part fo populous as France, is all carried on at this one port: that these animals convey the produce of the whole of the north of Mexico, Vera Cruz, Guaxaca, and Guatimala, a gorge between the mountains of more than five hundred leagues in length; and that the returns brought by them are either of great bulk, or very heavy, for example, wine, oil, iron, &c.; nor is this all, though the common load of the Mexican mules is from five to fix hundred weight, it is not the less true that thirty, or even forty of them, on account of the necessity of relays for shifting the loads, fcarcely carry as much as one of our broad-wheel waggons, fuch as are used between Nantz and Strasburg, and which carry twelve thousand weight; after this computation, fix of fuch waggons in reality effect as much as two hundred mules, though they make a far less conspicuous appearance: to these considerations, let there be added that these numerous caravans are only seen every other year when the galeons are off the coast, and then we shall be enabled to appreciate at their just value this pompous and imposing display of mules and muleteers.

We hoped to meet with some supply of food from these muleteers, for we were utterly destitute of provision, having reckoned for certain on reaching Vera Cruz. I therefore entreated them to sell me some of their thin cakes of maize, but this they statly refused; however, a few moments after, they brought me a dish of beans, and some maize, prepared in a manner I had never seen before: they take the finest part of the flour of this grain, after sisting it, which is formed into a putst paste, and they afterwards bake it in the same manner as biscuit. They thus make chippings of white bread, which are eaten in pieces, and are really both very good and wholesome, but require long massication, as they are very dry and hard. The present of the muleteers

I shared with my topith.

I opened all my cases, in the same manner I had done the day before, to give air to my cochineals. After this I was anxious for rest; but in vain did the cool of night combine with fatigue to close my eyelids, a cloud of gnats hovering constantly about prevented the gentle influence of the poppies of Morpheus. How vexatious, how tormentingly vexatious the struggle between exhausted nature and the continual buz of myriads of winged adders, now alarmed with their hum, and as often with a sting: a sting, the pain of which, of long duration, and severe, ceases only to be succeeded by a terrible itching, which nothing alleviates, and which is only the more encreased by scratching, till bathed in blood; scratches, indeed, are often followed by danger-

ous ulcers. Ever fummoned and still ever driven away, my disturbed slumbers were to me a real torture, and at the close of night, I found myself still more weary than if I had passed a whole week in the most exhausting labour.

At length I faw on the horizon the brilliant flar of the ship Argos, and concluding

thence it was two o'clock, we departed.

We arrived at Vera Cruz, at the gate of Oriffava, before day-break. I was in a condition fo little fit to be feen, that I thought it best to go and change my dress before I entered the city. Leaving, therefore, the Indian to take care of my trunks, I fcaled the walls, entered my lodgings, where I found every thing as I had left it; dreffed myfelf in a decent manner, and repaired to the gate of Oriflava, which was then opening. I was a little furprifed and fomewhat terrified at not finding there my horfes; but I learnt that, there being no officers at that gate, they had been taken to that of Mexico. I ran through the town thither, and reached it at the instant of their making their approach. The guards wished to fend me to the customs house, which did not open before eight o'clock: I instantly felt all the inconvenience consequent on traverfing the city, and exposing my prize to the looks of every one, and shuddered at the thought: I therefore faw no better expedient of difembarraffing myfelf than tickling the natural vanity of the Spaniards. What, faid I to the chief clerk, do you then fo foon forget the French physician? and is it possible you could wish to make him kick his heels in attendance like a footman, for the space of four hours? Besides, are you fuch novices? Cannot you yourfelves make the requifite examination? You cannot be fuch geefe but know your bufinefs, and how to act without advice. Do but look, what I bring is nothing but herbs, nothing but botanical collections; and as I fpoke, I opened my boxes. They were not disposed to take the trouble of examining more than two, and the only things to which my good folks took exception were the flicks which supported my nopals: they fancied these must needs be some precious wood, and enquired its name of me. I found it no difficult matter to invent one, and I obtained my difmission. Vay usted con Dios, Pass in God's name, was all they said. I did not require twice bidding, but foon reached my own home.

There was nobody yet up in the house, not a foul stirring in the street, and every

thing was placed fecure in my apartment without a fingle person observing me.

I had now attained my wifhes, and my fatisfaction was extreme; my expedition was complete, and in the fhort space of twenty days, the half of one of which had been uselessly spent. I had also stopped two days at Guaxaca; so that I had travelled in fixteen days I had journeyed two hundred and forty leagues, of which forty on foot, over roads so bad as often to be almost impassable, under a burning sun, in a wretched country, without resources, and among people of whose language I was ignorant; in a country, in short, where I was destitute of a protector, or any connections, and where every public officer from his station ought to be inimical to me; to have effected, under such circumstances, so long and tiresome a journey, without illness, and without accident, was a matter so extraordinary, so lucky, that I scarcely was able to persuade myself of its reality.

In order to fecure my felicity, and more fully enjoy my thoughts, I refolved on shut-

ting myself up, and not going out the whole of the day.

After breakfast I sent out for some mould, in which to plant my nopals, which I had taken out of the cases, and exposed to the air. I found they had sustained some trivial injury from rubbing, but this was inconsequential; and all considered, I had no room to complain. I put the nopals into my bed-room, the most retired of my apartments; as for the vanilla and other plants, they were oftentatiously exposed in the hall, in

order to attract the attention of those individuals, from whom I must necessarily receive visits.

However great my fatisfaction (and when is it ever perfect?) I could not difguife from mytelf the reverse of the picture. My return by sea to St. Domingo was adventurous, but my chief embarrassment was how to get my treasure on board at Vera Cruz, in conspectu omnium, in the sace of all Israel; and then the second gauntlet I had to run at the Havannah, where I presumed I should have to touch; for to how many accidents and inconveniences must I not be subject, if in the crowd of inquisitive spectators I must encounter, there should happen to be but one of them malevolent?

I was moreover anxiously disquieted about the means of fixing my plants on board ship in such manner that they might be least liable to harm; however, after forming one general plan, I afterwards made a point to dismiss the care of particulars till time

should require their adoption.

Following this rule, the first thing which claimed attention was my passage. Before my departure, I had been presented to the Marquis of Harisson, then two months at Vera Cruz, who had arrived with a cargo of wines, and who, on going to the Havannah, was anxious to have a Frenchman for his companion: he had accepted of me, and we had agreed to treat for my passage in three weeks from the time of our conversation. I arrived in good time therefore, and proposed visiting him that very evening, for the purpose of learning what day he meant to fail: at dusk therefore I went out, calling first on my friends the engineers, who I knew would not be at home, in order to gather from the fervants how the land laid. These good folks were delighted to see me; and by their attentions, I reasonably judged that no change had taken place in their masters with respect to me. They informed me, that I was still conjectured to be at La Medelina, employed in botanizing and enjoying the baths. I next vifited the general of the fleet, under like certainty of not meeting with him; my furprize, on this occasion, was of the most pleasing kind, when I was informed by his major-domo, that Don Antonio Uloa was at Mexico. This incident was the more favourable, owing to the constant visits I received from this inquisitive gentleman, who would have examined every thing, and infallibly have discovered what I wished to conceal. I have had confirmation of my being supposed at La Medelina. It was indeed known that I had brought back cases with me full of plants; but if nothing further was suspected, of what concern to me was this?

I returned home to supper, therefore, perfectly tranquillized. I had here my mattresses, pillow, and white sheets, which I found the more delightful from having long been ill-accustomed to a good lodging and comfortable repose. There is, in

truth, nothing like privations to teach one the real value of comfort.

The next morning, after a refreshing night's rest, I rose, and was dressing myself to call on Mr. Harisson, when Mr. Fersen entered. So, so, my little libertine, said he to me, you have not been all this time at Medelina, of that I may safely wager? Confess now, said he smiling, that I am not wrong in my conjectures. I wished first to learn if the governor had mentioned me, and was informed that, in answer to interrogations twice made at his table, he had been told that I was still at Medelina: upon hearing this, I made him partially acquainted with my journey, telling him that in my excursions I had been insensibly attracted by my curiosity as far as the volcano of Orissava: he was all astonishment at my having been able to go so far in the time, and solicited a detail of my expedition. I found it no difficult matter to vamp up a story with little embellishments, and suited to the spots I had seen, but of which I placed the scene between Vera Cruz and Orissava. I afterwards shewed him, with an

air of triumph, all my plants. Why what the deuce will you do with all these? said he jeeringly. I let him enjoy his laugh; but I had my turn, for he, having entered my bed-room, saw my nopals there, and no more, for knowing nothing of the cochineal infect, he paid them no attention; I therefore laughed in my sleeve. Confess, however, added he, that you have had the fight of a most beautiful country. Yes, retorted I, and also a most wretched one. With this he agreed; and on my noticing with astonishment the scarcity of cultivation and inhabitants I had remarked, he enhanced my wonder exceedingly by informing me that from Panama, on the south-west, to California and Sonora, on the north-west, and from Carthagena to the Mississipi, embracing a surface of two millions of square leagues, the enumeration of the inhabitants does not exceed a million, including not only all the Spaniards, but likewise Indians,

mixed breeds, (metis) and negroes.

M. de Fersen likewise informed me, that M. de Harisson would not fail for a month to come, when he left me, inviting me to dine with him: I promised him I would; but in the interval I wished to find out a carpenter, to order different cases for my plants, and concert with him on the best mode of constructing them with security to bear the rolling of the ship. Having planned all this, I ordered sixteen boxes of twenty inches long, ten broad, and six deep, for each of which I was to give him two reals. I likewise wanted two large chests to hold them, but for these he asked me ninety-sive livres of the money of our islands, for each. The grossness of the sum displeased me, and I thought no farther on the matter, till, in crossing the market, I saw in a carrier's shop, two large trunks, which served him for locking up his goods at night; these I purchased for eight dollars a-piece, and I found them larger than those I had intended, made of good ash plank, well bound with iron, and with good locks.

One effential matter thus complete, I began to think of my departure. I went to my cook's, and learnt there with inexpressible delight, that D. was about to fail that very week for Guarico: (thus the Spaniards denominate Cape Francois). Ail that was wanting now was to agree with the captain; but this was what gave me fome uneasiness, on account of the possibility of some inveteracy he might entertain against me, upon the following occasion: at the hotel of Mexico, I had been a near neighbour of his, and he had oftentimes intruded upon me at those moments which were the only ones I could dedicate to study; but what even more than this had made me averse from him was his common practice of speaking on religion and politics, of declaiming against the fanaticism of his countrymen, and extolling to the skies Voltaire and other authors, who have the most freely written on these subjects. This at the first only made me look on him as an eccentric character; but it afterwards originated a suspicion of his being a spy, who only meant to pump my sentiments: on this I cut him quite short, by observing that it by no means suited his station to meddle with affairs which naturally pertained to the civil and ecclefiaftical powers, to whose imperative decisions and superior intelligence it were better he should submit.

I was fearful left when I needed him he might retain refentment at my hastiness. I was at the time unacquainted with the circumstance of his being on intimate terms with the lady of the late intendant, and that she had inspired him with that good-will towards me which I had so constantly experienced in herself: of the good effect of this

I had foon the most ample proof.

On my very first enquiry if he would take me as a passenger on board his vessel, he answered, without the least hesitation, that he would with the greatest pleasure; and when, on my agreeing to accompany him, whatever course he might steer, I enquired

what I should pay him for my passage? Nothing, sir, was his reply. He afterwards asked me, if I was aware of his actual destination? and on my informing him of my suspicion of its being to Cape Francois, he acknowledged it was, and on this head enjoined secrecy; this I solemnly vowed, and again adverted to the price for my passage; but he would listen to nothing on this head, and leaving me, begged me to have every thing ready by the next Wednesday. His liberal demeanor affected me; yet, still not having altogether dismissed the prepossession against him which had haunted my mind, I feared less the circumstance of his giving me a free passage might engage him to treat me, or what was more consequent with me, my plants, with less attention: in order therefore to come to a clearer understanding, and conclude our agreement, I conducted him to the ice-house, where I proposed to treat him with creams, but this he would not suffer; in short, all I could obtain from him was that I should have allowance to put on board some refreshments; in consequence, I shipped in his vessel fixty bottles of wine, sifty sowls, &c. &c.; and as early as Tuesday embarked all my effects, my

nopals only excepted.

While this was passing, my small cases were in hand: when completed, I found that eight of them readily entered, but exactly filled each of my large chefts. I afterwards planted in each case four large plants of the nopal, covered with living cochineal, befides twenty leaves or articulations of nopal, just taking root, which would form for many plants, without reckoning fixteen large ones, part of which had begun to root; in all nearly three hundred plants; with these I mingled a number of other plants of wild cactus, from Vera Cruz; upon which, on my return from Guaxaca, I had feen and recognized the fylvester cochineal, without suffering myself to be deceived, as I had been before by the caterpillar of the destructive moth, which Don Uloa mistook for the cochineal infect itself. As for the plants of vanilla, I placed them, divided into pieces two or three feet long, in a dozen casks and cases, but so intermingled with twenty other kinds of plants, that none but a botanist could have distinguished the valuable ones from those which were not. I watered all my plants to complete saturation, in order that they might want no water for fome time to come on board, and all being ready, I waited only the inftant for failing, the moments to which period were as tedious to me, and counted with as much impatience, as the intervening time which divides an expecting lover from the mistress on whom he doats.

I fpent the interval of my stay in bidding adieu to all my acquaintance, but especially Señora de Boutillos, who was returned from the country, for the celebration of the nuptials of her daughter and the general of the sleet. She, as well as her daughters, tendered their services in the most obliging manner, and even testified regret at my departure. In return, I wished them happiness, and the prosperity of their family; nor

ever were wishes more sincere.

Messrs. Duparquet and M. Fersen were not forgotten; I in like manner wished them every blessing of life. They pitied me much for having gathered so little fruit from my expedition; I thanked them for their commisseration, but was not so candid as to undeceive them.

What was most irksome to me was taking leave of the governor. I however prefented myself before him, for the purpose of advising him of my departure; intelligence which occasioned him as much pleasure as I pretended regret, on announcing it to him. He at the same time enjoined me to acquaint him what hour I went on board, in order that he might be present at the entrance of the port, to take a deposition on the occasion, in company with his secretary. This I promised, but with settled resolution

refolution to the contrary, so absurd did such forms appear to me, and so humiliating for myself! At bottom, however, it was a subject for laughter; his presence undoubtedly was for the purpose of ascertaining that I bore off nothing with me, and

already were all my effects on board.

I was folicitous of bearing away with me the letter of the viceroy of Mexico *. This was a curious piece, and had I obtained it, I should have suspended it from my nopals The governor had indeed promifed to give it me; but, leaving him time for reflection, he perhaps confidered that it would not much redound to the honour of his fuperior, and in confequence flatly refused it; on my last audience, I infisted upon it. You are very bold, faid he angrily; but did you offer me a hundred thousand crowns, you should not have it. His pretended anger had no effect on me; I told him therefore, that it was requifite for me that I should possess the means of fatisfying my patron that I had not been at liberty to follow up my botanical refearches in the kingdom of Mexico; still however he remained obstinate; he even went so far as to add that he would not give me the letter, though my patron were the King of France himfelf! The King of France, faid I, in a modest manner but still with firmness, is as much the protector of his meanest subjects as the King of Spain can possibly be of his, however elevated. When a criminal is banished, he receives the minutes of his trial; and fhall I, who am free from crime, be treated lefs favourably? My boldnefs pleased him; he did not indeed give up the object itself which I solicited, but he became calmer, and confented to notice in my paffport the order of the viceroy.

He moreover withheld from me the passport for Vera Cruz, given me by the Marquis de la Tour, at the Havannah; and I even suspected that this was done for the purpose of making it the base of a charge against that excellent man, which occasioned me

great uneafinefs.

As for the letter of the viceroy, I, in good truth, cared little about it; at the fame time it gave me pleasure to have the governor fancy, as well as the rest, that I left the country much vexed at not having penetrated the interior; as such an opinion tended to remove any suspicion which might be entertained of the value of what I

bore away.

On my return to my lodgings, I wrote a letter to Don Antonio Uloa, at Mexico; it was in a complaining ftyle. I observed, with respect to the resultal of the viceroy, affecting a liberality, or rather, a fort of rhodomontade, that however vexed I might feel on the occasion, I should never place this circumstance, or any exertion of mine, in the way of those Spaniards who might come to France for the study of the arts and sciences; but, on the contrary, if it rested with me, they should experience even more indulgence than they had before been wont to enjoy, were it only to shew that a Frenchman has too lofty a spirit to attend to trivial injuries.

After this I fettled all my bills: in order to discharge the whole of my debts, I found myself obliged not only to dispose of every article of furniture I had bought at Vera Cruz, such as my bed, chairs, tables, &c. but also of my watch and ring, after which, and all paid, I found myself with only two gourds (dollars) remaining, a sum which I reckoned would about cover the charges for going on board. Had I sought it, there is no doubt the purse of some one or other of my friends at Vera Cruz,

^{*} It will be recollected, our author addressed letters to the viceroy for permission to travel in that kingdom: the answer, as is stated, was unfavourable; and the substance of the letter is given in the early part of the narrative. TRANS.

would have been open to me, but I thought fuch a procedure beneath me, and adapted to create suspicion of my individual character, and that even of the nation itself to which I belonged; I therefore preferred depriving myself of every thing, and thus avoided a possible obloque.

I had yet a few days to ftay, which I spent in visiting and walking about: a singular procession, to which the delay of my departure enabled me to be a witness, on the octave of Corpus Christi Day, was of too curious a description to admit of my

paffing it over in filence.

At the head of this proceffion were feen fix gigantic figures, in pasteboard, twenty feet high, representing a male and female Indian, a negro and negress, and a Spanish man and woman, carried by shoe-blacks, and dancing an allemande; these were succeeded by a flout fellow carrying a French figure made of straw, with a distorted haunch, and all its limbs out of joint; this figure, which is fixed at the end of a pole, as on a pivot, is made to move its limbs like the pasteboard harlequins of children, and its fomerfets and aukward motions are a fubject of confiderable merriment to the Spanish populace; follow this harlequinade ten other fellows in the guise of fish, with each a blown bladder with peas in it, fastened to the end of a stick, and with this they strike at random, right and left, whoever may be in their reach. These porpoifes are precurfers of a whale, framed on a large waggon, which is moved along by men beneath the exterior, reprefenting the whale: thefe men likewife occasionally make the whale open and shut its mouth, as if about to devour the filly fools afraid of it; after these, the different brotherhoods and religious orders, each with the image of their founder, in filver, carried on a platform by fix men, march in regular order: the refidue of the procession presented nothing extraordinary.

I remarked another religious practice at Vera Cruz, which will not appear lefs fingular: when the facrament of the wafer is carried to the fick, it is taken in a coach, magnificently gilt, and adorned with plate glass in the same manner as the carriages of state of sovereign princes; it is drawn by mules, four a-breast, which go a foot pace; at each of the angles of the imperial is a lamp: the person who carries the wafer sits at the extremity of the coach, in a species of niche, purposely made for him; opposite is a priest, his employment to drive away the slies, that the person who carries the facrament may not leave his hold of the pix which he carries in his two hands. The coachman wears a great coat of scarlet, with silver lace and silver buttons, like our vergers at Paris. At the doors are two grenadiers, and two miquelets, and behind, the coach is followed by double basses, basoons, violins, guitars, and other instruments, escorted by a crowd of people: during the procession, the great bell of the

church is founded gently.

At laft, Wednesday arrived, the day on which I had to embark. I was not without some dread, and, in real truth, this appeared to me the decisive day. At day-break I caused all my cases of plants, as well as all my empty boxes, series longissima rerum, to be carried from my lodgings, and every thing before six had reached the gate of the quay. I computed that at this hour the idle would be yet assep, that the soldiers and officers, tired with the night-guard, would be at rest in their hammocks, and that all unoccupied and inquisitive at the market: my conjectures were well sounded, for if a few failors be excepted, three or four officers, and the guard, I met with very sew in the streets. I reached the port, sollowed by thirty porters, hired a boat, and returning to the quay, caused my cases, filled with earth, to be placed on the ground before the searchers: thus far, all went on very well; but in a few minutes, soldiers, sailors, and trades-people all rushed forwards to see the plants which the French

botanist

botanist was bearing away. The officer of the guard complimented me on my refearches and collection of herbs; the fearchers admired them in stupid astonishment, but at the fame time were fo civil as not to found any of the cases, though they might have done so without injuring any of my plants; and the head of the office, satisfied with my readiness to suffer examination, told me I might pass on. It is a certain matter, that I had it in my power to defraud the King of his dues, and might have carried away in gold to the amount of a million, or a dozen talegas; but I was fo well known, that no one suspected my being capable of such baseness. I, however, made hafte to get away with my things, left fome one more enlightened fhould play me, either unintentionally or from defign, fome fcurvy trick or other. The whole of my goods being now in the boat, it put off, and I followed it, when I placed the cases in the chefts, which I locked, and caufed to be fecurely faftened on the deck. I recommended the failors to be careful of them, and, as an entrance fee on coming on board, presented them with a couple of gourds, which, for the purpose, I borrowed of the captain.

I returned now on shore to announce to the governor that I should go on board at eight o'clock; I could not see him, but held my promise effected, and never set foot in his house again: we did not, however, sail till several days after, which gave me much uneasines; my plants, shut up as they were, necessarily suffering greatly. I had, indeed, at each side of the chests caused four holes to be made of four inches square, that I might be provided against stormy weather, when I should not be able to open the chests, and I went on board twice every day in order to give them air; still, that I should be obliged to be separated from my dear plants, to sleep away from them as I did for three nights, this occasioned me indescribable torment, and never certainly could a miser feel more pain from the fear of losing his gold: the different trips on these three days cost me three piasters, which made the whole I was indebted to the captain, five; to acquit myself of this debt, I fold some very beautiful sleeve

buttons, and this done, found myself poor as Bias.

At length, even Spanish dilatoriness seemed near its end; the captain swore he

would weigh anchor on Saturday.

That day I went on board, according to custom, to give air to my plants at five o'clock in the morning. The captain's boat came on board, to direct the pilot to weigh anchor. Imagining now his promise would be fulfilled, I put on board the rest of my things; but after waiting for the captain in vain till three in the afternoon, I gave up hopes of failing that day: this night, however, I slept on board.

On Sunday the necessity of attending mass again delayed us. I went on shore, and took a last farewell of Mr. Fersen. I brought back with me on board likewise sive or six cases of mould, in order to give more room to my jalap and vanilla plants.

8th June 1777. At length, by eleven o'clock, we quitted the port, faluting the castle and the captain of the port with one gun, and seven times exclaiming, viva el Ré, to which salute the captain's ship answered by one exclamation only. The weather was sine; we had a light breeze, and the log shewed sive knots. When a league from the city, we perceived a boat making after us, which was soon alongside. On first distinguishing it, I had again, as at the Havannah, the weakness to fancy that I was the object of its pursuit. I conceived, with some appearance of reason, that the governor, piqued at my having avoided the procés verbal which he meant to draw up on my departure, had sent an order for me to be put again on shore. I was, however, soon undeceived, and saw that it came merely to bring a man on board who had sailed of being ready at the time of the last boat putting off; but this gave me an

oppor-

opportunity of learning a curious circumstance, which was, that on the captain's waiting on the governor to receive his orders for Campeachy, the latter made inquiry if I was on board, and exacted a receipt from the captain for my body: he likewise enquired if I seemed very melancholy; to which question the captain answered in the affirmative. It will be readily conjectured that this little narrative anused me greatly. The whole of the bay abounds in excellent fish.

9th June. The night has been dreadful; storms of thunder and lightning and torrents of rain feemed to threaten a second deluge; still, we had little wind, and the

ship rolled dreadfully.

In the morning, I had a very interesting conversation with the captain of the ship,

with whom it was now plain I should have every reason to be satisfied.

As observing me giving air to my plants, I have found you out, faid he to me in a low tone of voice; you most affuredly are not about to transport this cochineal to your own country, but with a view of naturalizing it there? The liberality he had shewn towards me, the frank manner of his accost, determined me on confessing to him that which it was now of no fervice to deny; nor had I any room to repent my confidence, but, on the contrary, by his assistance, perfectly cajoled the failors, who, as well as the captain, flood near me, and one of whom, more cunning than the rest, had taken one of the infects, and crushed it on a white deal board, and observing the purple hue it gave, cried out to his fellows, why, this is cochineal, and cochineal is contraband. To divert them from the idea they might elfe entertain on this fubject, the captain and myfelf planned a fhort fcene, which played off feriously before them, estranged their fancies a hundred leagues from the track they were taking. One afternoon, the captain being on deck, with his officers and most of the seamen, asked me in a grave and inquifitive manner, what I meant to do with all those plants? They are, faid I, in as candid and eafy a manner as I was capable of affuming, they are intended for a preparation, a remedy. A remedy? for what complaint? For the gout? Indeed, and pray what is the process of making it? Why, this; the nopals, cochineal, vanilla and jalap are pounded together in a filver mortar; the mixture is afterwards boiled; the expressed juice, in proportion of an ounce at a time, is administered to the patient internally, and of the mark a cataplasm is formed which is applied to the feet. And are there no other ingredients in the prescription? At this I seemed loth to tell the whole fecret; I, however, acknowledged that the balm of Mecca was a component, incenfe, gold dust, leaf filver, (and, in a half whisper, but loud enough to be heard without difficulty) fome bleffed lint which had touched the relics of Santo Torribio; this, with a few Latin words I intermingled in my answers, rendered my receipt exceedingly respectable in the minds of my auditors. Never indeed was nonsense listened to with more attention, and the bamboozled failors as well were convinced of the purity of my intentions, as of the efficacioufness of the prescription. I fighed, however, as much as I laughed at this ridiculous imposition; but it was indispensible, that I might parry the denunciations which might have been made against me otherwise at Campeachy, by fome one or other of the crew.

We were no more than twenty leagues from Vera Cruz. The wind at first very variable, afterwards strong, and then again a dead calm. We distinguished the Campeachy packet, which failed a little before us, at three leagues to leeward. In the evening we saw a shark.

10th June. The whole night through it rained, and the calm lasted till half past three P. M. I planted some vanilla, jalap, and nopals which I had remaining. Three leaves of my large nopals, loaded with cochineal, rotted, (a sirst cause of anguish); but I

was fomewhat confoled by having fucceeded in fettling the new-born cochineals upon

other nopal leaves in a very healthy state.

At half past three we had the wind abast, making for the E.S.E. We were accompanied throughout the whole day by a shoal of bonitos, which played about our ship, and which, though against the wind, frequently swam round the vessel: this circumstance appears to me worthy of consideration. I likewise saw a number of beautiful dorados. The sky was clouded throughout the whole day, the temperature

highly pleafing.

11th June. The fun again made its appearance with encreafed fplendour; there was no rain in the night; we made but little way, and by reckoning were only thirty-five leagues from the point of departure; from nine till three a dead calm, a clear fky and high temperature; we were followed by the fame efcort of bonitos, and by a number of other finall fish, which had followed us from Vera Cruz; at three o'clock a wind from the north sprang up, and we ran four knots. Additional losses gave new cause for regret: I was obliged, after collecting the cochineal, to throw five other leaves of my large nopals into the sea. What a mournful prospect for the future, provided, as it is threatened, we should be two months out at sea!

12th June. The north wind continued till three in the morning, when it veered to the fouth-east: the night fine and without rain. At eight the wind sunk into a calm,

but a very light breeze from the north sprang up at ten.

13th June. The night beautiful, and the morning lovely: at eight a calm, a breeze at ten, rain at noon, succeeded by a calm till five. Again had fight of the brigantine for Campeachy; it advanced no faster than ourselves. Rain and a storm at eight in

the evening.

14th June. The night tranquil, the wind changed from the north to the fouth-eaft; though it blew hard, it yet did not prevent our progress; the whole morning, squalls with rain. By reckoning, according to the pilot, we were fifteen leagues from soundings, and forty from Campeachy. I lost the beautiful brood of Mexican parroquets which I brought with me, and three other leaves of my nopals. My cochineals exacted all my attention; it was their time of bringing forth; I had nests to make for them; nor was this all; the hurricanes that blew, threatened to fill all my cases with falt water, which is utterly destructive of these plants. I was obliged to stand centry over them on these critical occasions, and cover them with thick matting, giving them air only by means of the small side openings. Were it not for the extreme tediousness of navigation in this gulf the voyage would have been pleasant; but the winds which prevail at this season in alternation with calms, being south-south-east and north-northeast, they blow to no port whatever in a direct line.

We enjoyed the fight of an infinite number of dorados; the most beautiful fish that swims the fea; still, we had not a fingle man on board who had any inclination

to fish.

15th June. The whole of the following night we had a terrible hurricane, the rain fell in large drops, and with a noise like balls of lead. The wind blew furiously from the north-east, till three in the morning, at five it got round to the south-east; neither on this nor on the preceding day was there intervention of calm. We had been upon soundings from ten in the morning, and might expect to arrive in five or fix days at Campeachy. We saw a great number of birds. The colour of the sea underwent a change, and was of a greenish blue.

16th June. It blew hard all night long, with fqualls of rain, the morning grey, the remainder of the day remarkably fine. In fpite of all my care, my cases were washed

10

by a wave. The young cochineals did not fucceed in fastening on the cactus sylvestris of Vera Cruz, called tunas. Ten other of my opuntia had become rotten. Irremediable loss!

The whole night through adverse wind. Abundance of porpoises of enormous

bulk.

17th June. Saw land on the fouth, and hoped to arrive the next day at Campeachy; but the wind, which blew from fhore, kept us at diffance the whole day: the lands low, and nearly level with the fea. A flock of boobies and frigate-birds. The colour of the fea changed by ftripes, according to the greater or lefs depth of water: at noon we had but nine fathoms: the fky clouded.

The captain added this day to the fund of continually regenerating inquietude with which I was affailed: he apprized me that at Campeachy we should have guards and

foldiers put on board; and who knows how long we might lie off this place?

A hurricane still more violent than that of the 15th, was experienced this night. The thunder roared in loudest peals. Incessant slashes of lightning surrowed the atmosphere in every direction. Rain fell in torrents; and the whistling of the blast was even louder than the noise of the thunder and the waters. Dread and consternation seized upon every one. We were obliged to take in every inch of canvass. Fortunately, my chests were well sastened and covered, but for which precaution adieu to my nopals: they would have perished with my plans, and probably myself with them.

18th June. After the storm the wind blew strong from the south. We must have been driven far indeed during the tempest, for we had from sixteen to twenty-six fathoms water; whereas the day before, when we made land, we had but six fathoms water, and were only eight leagues from shore; for in this part the number of fathoms denote pretty nearly the number of leagues from land, the soundings lessening in gradual proportion as the distance becomes less. We saw a shark and a number of birds.

19th June. The foundings various in proportion as the north carried us forward or the fouth drove us from fhore. It feemed as though we were under some enchantment, and as if this wretched country fled from our approach. In thirteen days we had not been able to go more than ninety leagues. This day we could not distinguish land, though the line gave but fix fathoms in the evening, and though all night long we smelt the land and its flowers; but we had a dead calm. After the calm, a gust of wind succeeding, we got into three fathoms water, and cast one of our anchors. We had had no rain for four-and-twenty hours.

20th June. This day we faw land by five in the morning: it is more lofty eaftward than towards the fouth. At fun-rife we raifed anchor in order to get nearer in to land, and at feven we diffinguished the town of Campeachy on the fouth-fouth-east. It has no port, but merely a bad open road liable to every wind, and lying three leagues from the town, which cannot be approached nearer by any vessel carrying more than

ninety tons: at nine we anchored.

The Bylander of ninety tons, which brought us from Vera Cruz, was laden with maize, for which the captain expected to find a market, intending to replace it by a loading of dyeing-wood, which at Cape Francois would have paid him a confiderable profit; but in order to fucceed great fkill and circumfpection were requifite, as this was an act of finuggling, and as finuggling is punishable with flavery and confication of property. The captain fold his maize to great advantage, as it was fcarce; but, no doubt intoxicated with fuccess, he idled away his time, and missed the opportunity of profiting to the full extent of his means.

For my part, the delay to which he subjected us, and the additional losses I every day sustained among my nopals, not less than forty of which I was obliged to throw into the sea, were sources to me of extreme vexation.

I had moreover much room for complaint against the crew; and for the purpose of acquainting the captain with their conduct, I went on shore; and thus had an oppor-

tunity of vifiting the town.

San Francisco de Campéché is a town of a square form, each side measuring upwards of twelve hundred yards: it is perfectly well built of hewn stone, in the Spanish style, with rectilinear streets, kept very clean, and of tolerable breadth. It is surrounded with curtains and bastions, but is without ramparts or terraces. The walls are thirty feet high by from five to fix in thickness, but have no sosse. On the side towards the land an immense pueblo or suburb of Indians encloses it, which much delighted me on account of the trees and thicket by which each house is surrounded. fuburbs may contain about a thousand Indians: the population of the town, including the garrifon with the citizens, may be about three thousand. Money at this place is fo rare that nuts of cacao form the currency: for eight of these nuts you purchase an egg at the market, and you are boarded at the inn for two reals the day. Debauchery is here prevalent to the fame extent as wretchedness, but its ministers are such as could pleafe but failors alone, yet thefe fo well that they reckon this a paradife. Such was the extremity of mifery throughout all Yucutan about fix years back, that, according to the account, even of the Spaniards themselves, there died from want no less than forty thousand persons. It is however doubtful, notwithstanding the immense extent of this province, whether it ever contained fo many inhabitants; but, on the contrary, should it be true, should any credit be due to the Spaniards when they give such a shocking lift of deaths, have we not to charge government with the most reprehensible neglect? How can it have been careless to such degree as to suffer this province to remain fo destitute of provision, while with so much facility grain might have been supplied either from the Havannah, where all kinds of European corn abounds, and which is but two hundred leagues distant, or from Vera Cruz, but eighty leagues away, and where a fimilar plenty reigns! This extensive region has the more need of affiftance from the frequency of dearth. The cause is to be attributed to the droughts so fatal to this country, the foil of which confifts merely of a flight quantity of vegetable earth on a rocky base; and so frequent, owing to the land lying low, and the want of mountains to break the clouds, which, in confequence, except where the north winds encounter others from the fouth, and occasion them to break over the land, are constantly borne out to fea. Should the months of May, June, and July, those in which maize is fown, unfortunately pass without rain, all the hopes of the colonists are lost, and they are left wholly destitute of resource.

The only trade carried on at Campeachy is in stone sent to Vera Cruz, and dyewoods, immense piles of which, cut for upwards of thirty years, are seen in different parts, which the Spaniards prefer seeing rot before their faces to selling to any interloper, though they cannot possibly export them themselves. The whole time I was there, I saw but three brigantines loaded, and at no time perhaps is there a greater number here. The culture of cacao is not allowed in this country: I know not from what lamentable policy, for it would succeed admirably. Cacao, in consequence, is so dear that the nuts or beans are used as money. The poor, who in consequence of the dearness of chocolate are deprived of the enjoyment of that beverage, substitute for it the pips of the zapota marmue, whose fruit is large as an egg and bitter as colo-

quintida.

I traversed the whole of the gardens in Campeachy, and found not one that was curious. I culled here at hazard fixteen plants of two species of cactus without thorns, which afterwards were of great use to me.

However, on the 6th July, the captain repaired on board with intention to put off to sea, and within three days at farthest three barks were to bring us out to sea the

Campeachy wood we were to take on board.

Notwithstanding all my pains I never was able to procure either branches, leaves, or feeds of this tree to fatisfy myself whether or no it is different from that we possess in our own colonies. I paid a failor beforehand to procure me some, but they never came.

We were just on the point of weighing anchor, when the master of a boat which had brought us in a stock of wood for cooking, saw my nopals and cochineal, and told me that they were cultivated within six leagues of Campeachy. Though I have strong doubt of the truth of this statement, I nevertheless felt much vexed at not having had an opportunity of ascertaining whether it was true or not, and in the

former case of renewing my plants, and recruiting my insects.

Whether in hopes of other little prefents in return, whether as a compensation for the vexation I endured from his having made so long a stay, the captain gave me the handsomest parrot, not larger than a dove, that ever perhaps was seen: its beak yellow at the base, and black at the extremity, the whole of the body a bright green, the cheeks and the circle round the eyes of a blood red, the forehead, shoulders and thighs of the same colour, the upper part of the head crowned with yellow, the centre white, and the hinder part azure blue, the wings green, blue, slame-coloured, and purple, finally, the legs yellow, the eyes blue, but the iris yellow. The captain moreover presented me with a cardinal, and three tigers' skins.

all hopes of the dye-wood coming on board. The poor captain thus faw all his dreams of fortune vanish, and in addition lost the twenty piastres he had paid down as earnest of the bargain to the person who was to have procured him the wood: thus, either owing to negligence, or to want of management, the unlucky man lost a profit of at least three thousand dollars, for the wood which at Campeachy fetches but three reals, at the Cape is worth three piastres. I was exceedingly hurt that he had not made a consident of me at an earlier period, as it struck me I might not only have given him

good advice but have obtained for him a hundred ton of wood.

We weighed anchor at ten in the morning, and with a wind from the fouth-west advanced in a direction E.N.E. at about half a league an hour. At two o'clock the wind changed, and we steered W.S.W. We were sain to anchor at four in four and a half fathoms. The whole night through it blew hard with much thunder, but no rain.

12th July. After looking out for a wind, but in vain, throughout the whole of the night, it blew from the fouth at three in the morning; we, in confequence, quickly raifed anchor, and made north-east with a fine sea and beautiful weather, which continued till half-past ten, when we were becalmed. After advancing, notwithstanding, about half a league, by half-past one we had a breeze from the north-west, which was of much service to us. The water now again changed colour, and from a blueish green became of an azure hue; but at four o'clock the wind rounding to the northeast stopped our further advance, and we cast anchor to avoid being thrown nearer the shore, but not till, as the day before, we were within sight of land. At nine

o'clock, after many threats of rain, which however were followed by no effect, the

wind veering again to the fouth-west, we weighed anchor.

13th July. This day the wind funk into a calm at ten o'clock in the morning: during the time it lasted, which was two hours and a half, the Spaniards took it into their heads to fish. They caught in the time eighteen perch of a monstrous fize, the fmallest of them weighing upwards of nine pounds, it is the perca philadelphica defcribed by Linné. This fifth is of exquisite flavor, and is caught in depths of about five fathoms, with a hook two inches long, and as thick as a crow's quill. The bait is a piece of bacon, meat, or entrails of fowls: about a foot above the hook a ball of about a pound weight is suspended to make the line sink: the sisterman has rarely time to throw out lures on the top of the water. About noon we had a breeze from the north-west, when we set fail anew, and at three again came to an anchor. Such is the navigation common along this coast, which runs north and fouth: the fouth-east drove us out to sea in the night, and in the afternoon the north-east again sent us in fhore. These are the winds predominant in these latitudes; but the winds blow sometimes fouth or fouth-weft, and north or north-weft, when a veffel may make fome way under favour of them. It is requifite for two reasons to keep at not more than from four to eight leagues from the coast; in the first place, because, at a greater distance from fhore, cayos (rocky fhoals) and other fand-banks occur, on which a veffel might be driven by the north-east wind; and secondly, because in the open sea winds being more uncommon, and always, as well as the currents, adverfe, a voyage would be of eternal duration: indeed no navigation in any part of the world is more difficult than that of the Gulf of Mexico. Should you leave foundings for the open fea you are engaged in perpetual currents; should you keep in foundings you have only light winds, and can make but four or five leagues in four-and-twenty hours. On proceeding, whether from the North or South Seas, towards Vera Cruz, or any other part of the Gulf of Mexico, it is not only necessary to reconnoitre the bank or foundings of Yucutan but also that of Florida. The terms fondas, or foundings, is applicable to the whole of the fea, of little depth, which borders the Gulf of Mexico, from Cape Catoche as far as and even beyond Cape St. Augustin, to a distance from shore of from fix to fixty leagues, and in fuch gradation with respect to depth, that from the deepest foundings, that is to fay, in fixty-eight fathoms, you may judge, proceeding in shore, how far you are from land, the depth diminishing a fathom at each league, fo that at one league from shore there is feldom more than three, and sometimes but one fathom water. To this notice respecting the Gulf of Mexico is to be added that the north is the predominant wind, and is felt here with more violence than in any part of America, and with fuch in the months of October and November as to render thefe feas almost impassable.

13th July. The north wind very strong. We were obliged to anchor till mid-

night.

14th July. At ten in the morning the land-breeze fell, the wind again blew from the north, and in the afternoon we fteered E.S.E. at the rate of four knots an hour. The temperature of the atmosphere on this sea is moderate, for, notwithstanding the sky was clear and the sun exhibited itself in all its splendour, my thermometer at noon did not rise higher than 20° (77° of Fahrenheit). We were now about fifty leagues from Campeachy.

At five in the evening we came to our inn for the night, for somewhat similar must our constant practice of casting anchor every evening at the same hour be esteemed.

We

We had, an hour before, feen a ship which was nearer in shore than ourselves: we likewise saw another brigantine, which we imagined to be the Havannah packet: it sailed with the wind abast, and all its canvas out, but still made less way than as though we had an adverse wind. The whole day and night passed without rain, but the quantity of dew that sell was considerable.

At eleven at night the wind changing we weighed anchor, but made very little way, the breeze from the fouth-east being very light, and finking to a dead calm by seven in the morning, a calm which continued till the next day at ten, when the north again

fprang up.

15th July. This day the north-east, at first feeble, encreased in strength so as to

advance us a league.

A new anchorage at five o'clock. We had no rain at fea, though we diftinguished it falling on shore. We avoided a projecting bank, which makes the water appear of a yellowish green colour, three leagues from the shore; we likewise discerned the Havannah packet: it was the same which had sailed five days before us from Vera Cruz, and was now on its return to the Havannah. The captain informed us, that the governor, the Marquis de la Tour, had been recalled: a new motive for felf-gratulation at having effected my object without delay; for could I slatter myself with ever meeting with in any other governor who might succeed him, so much kindness as I had met with from him? As this packet was destined to Campeachy our captain forwarded letters by it. At midnight we weighed anchor, the wind south-

west blew very feebly, and by eight o'clock funk into a calm.

16th July. At noon the north-cast admitted of our tacking and making a little way, but by three the wind encreasing, we were threatened with a storm. After a violent sall of rain we cast anchor, and sent a boat on shore opposite to a garitu, or centry-box, to take in twelve barrels of water and twenty-four fanegas of salt. I was solicitous of visiting the salt-pans here, and of making a slight harvest of the plants of the country, and of sea shells, but the dread I had lest any injury should befall my insects and plants during my absence, prevented my indulging myself with this gratification; this was another facrifice I had to add to the number I had already made on their account. I had, however, on the other hand, the satisfaction of already being in some degree compensated: my vanilla threw out some branches, my jalap and my nopals were budding: I had indeed lost a great many, but the residue were in good condition, and I had well-founded hopes of the most complete success.

17th July. We were detained all day by our pilot, who with four failors had gone on fhore, and never returned. As he was an habitual drunkard, we conjectured that intoxication had been the cause of his delay. The breeze of morning had been feeble, calm succeeded as usual, and at three o'clock rain, with but little wind. The brigantine,

which kept us company, advanced only a league the whole day long.

After passing the day in greatest anxiety of mind, I advised the captain in the evening to fire a gun. I was mad with vexation. A charming breeze blew from shore, and this night we might have advanced at least ten leagues; unfortunately, the captain was by no means a good failor, and we had not sufficient hands remaining on

board to work the ship.

18th July. At length, in the morning, the boat returned with the failors. They had heard the report of the patereros, though a league and a half distant to windward of us. The pilot dispatched them with the falt, but himself did not reckon upon getting on board before noon, as he was waiting for fowls, eggs, and swine, which the Indians were to bring him. The captain in a rage sent the boat again on shore, with

orders for his coming instantly on board. He came by four o'clock, and we weighed

anchor; but we had conftant calms the whole day.

My pretty cardinal having got out of its cage, and fallen into the fea, the captain, without my knowledge, promifed a good fwimmer on board a bottle of brandy if he recovered my bird. The failor jumped at the propofal, and the profpect of gain blinding him to the danger, he precipitated himfelf into the fea from the cabin window, and after fwimming about ten or twelve fathoms, recovered the little bird, held it in his mouth, and making for the rudder of the boat, feized on the ring of it, by which he held till a rope was thrown out to him, by means of which he got on board. I was uneafy in extreme the whole time he was in the water, left fome of the sharks, which are so common in this sea, alarmed by the noise he made on plunging in, should make for the spot, and devour my bold adventurer; and I felt mortisted that the captain, for a matter of such little value, should thus have exposed the life of one of his crew: fortunately, he escaped, and besides the bottle of brandy, he earned a handsome pulicat handkerchief, of which I made him a present.

We were at anchor, opposite to a garita, or watch-house, in three fathoms water. These watch-houses are huts of wood, in form of square towers, forty feet high, and raised at the distance of every four leagues along the coasts of New Spain. In these centinels are stationed, whose duty it is to give advice of all vessels they perceive;

and these centinels, who are Indians, are relieved every four days.

It so fell out, that one of those appointed on guard at one of these watch-houses, being tired of his occupation, asked our people to take him and his luggage on board with them, and they very imprudently consented. I say imprudently, for it is expressly forbidden, under the most severage penalties, that any captain should receive an Indian on board. I had the curiosity to examine the packet of this poor fellow: it contained provision for four days, and consisted of a dozen tordillas of eight ounces each, and about two pounds of the paste of maize, coarsely ground, which, steeped in water, forms a beverage singularly pleasing to the Indians. The man who came on board was stout and well made, twenty-one years of age, but had not a single hair on his chin. He had been married two years, but expressed not the least regret at leaving his wife. On my enquiring whether he had any children, he at first answered, no; but correcting himself, as if he just recollected the matter, he said he had one pequenito, or very little baby; and as he said this he knitted his brows, as if he wished to express that it was too small to be worth mentioning. The fancy diverted us much.

19th July. We weighed anchor in the morning, and steered the whole day before the wind: a very light breeze from the south-west. At seven we anchored, and raised anchor again at eight, the wind changing to the south-east: it was but a puff, which soon abated into a calm, and we anchored; but a breeze springing up, we again

heaved anchor, and kept under fail the whole night through.

20th July. This day the north and fouth winds enabled us to proceed at the rate of a league an hour. The fky all the morning was overcaft: at three the wind fell, and changed four times in lefs than half an hour: at length came on a dreadful ftorm of rain. After much entreaty, I fucceeded in inducing the collection of half-a-dozen barrels of rain water: thirty at leaft, if care had been taken, might in the time have been filled. After the rain we fleered eaft-fouth-eaft, for our pilot pretending his object was to avoid the currents, would not keep off from fhore: we therefore made frequent tacks, and remained a long time at anchor. In the evening we found ourfelves opposite to the Prio de Lagartos, or the River of Crocodiles, which announced

to us our having made eighteen leagues fince the day before. This was indeed a good

day's work, but we had yet forty leagues of shore to coast along.

At length we quitted these melancholy and tiresome shores for the open sea, and deposited all our anchors in the hold; but being immediately after overtaken by a calm, we let down a small anchor. At eleven at night, the wind blowing again from the fouth-east, we made sail ane w: it freshened soon to such a degree, that from midnight to two o'clock we had advanced nearly twenty leagues, and the sea had again resumed an indigo blue colour: had the weather thus continued, we should have required but four days to reach the Havannah. This was the first instance of fair weather we had had since our departure from Vera Cruz. The circumstance delighted me so much as to serve as a counterbalance to the grief I experienced at the loss of sisteen or sixteen leaves of nopals, in the space of three days. To leeward we descried a wretched little boat: soon we should have to see a number of considerable ships. Seas of our fortunate colonies, how different your appearance from that of this melancholy gulph! Numerous and rich vessels furrow your bosom in every direction, like our gay carriages on the magnificent roads of Paris, while the Gulph of Mexico is as bare of vessels as the cross-roads which lead to its insulate and wretchedly poor habitations!

22d July. At three in the morning the wind had much flackened, though from the 20th we notwithstanding reckoned our progress to be fifty leagues, and consequently that we were beyond a shallow which extends the space of two leagues, at the extremity of foundings, in the direction north and fouth, and in latitude 23° north, longitude 286° 10' from the meridian of Teneriffe. In our reckoning we had erred, for by two in the afternoon, a fcream of horror from the deck called us to the fearful fight of this bank, which, concealed under water, extends itself right and left, in branches, through a space of a league in breadth, by three in length: instantly we changed our tack, and on founding had a bottom of reddish rock, in forty-five fathoms: the rock apparently fragments of coral, was blended with herbs. The shelf feemed of a reldish colour in every part, and gave a ruddy appearance to the water. Fortunate was it for us that we encountered this shelf in the day-time: had it been night, we should have paffed over it, and probably have perished; for though the sea does not break on this bank, and though it appears to be covered by a depth of water, the actual foundings upon it, as well as the nature of the shelf, are altogether unknown. In remembrance of our having escaped this danger, we drank two bottles of excellent cyder, of which the captain made me a prefent, and which was equal to Champaigne, and found our fpirits heightened by the libation.

23d July. We passed the night without any danger: the south wind had blown, but the ship made no way. We caught a prodigious porpoise, eight feet long, by five and a half in diameter. Its tail was two feet broad. The sish caught was a semale: in cutting up, no doubt, some of the lacteal ducts were separated, as the animal yielded more than a quart of a very pure and remarkably white milk. One of the vessels from which this milk slowed was in diameter of equal breadth with my little singer. The womb, in which I very distinctly saw the fallopian tubes, measured at the entrance of the vagina four inches and a half. The exterior orisice was very strait, callous, wrinkled in folds, and of a substance and tissue so close, that with difficulty could one introduce the little singer: nor did it appear susceptible of farther expansion. The diameter of the vagina, easy of dilation, was an inch and a half: at the extremity of the vagina from the interior was a species of valve, resembling that of the sucker of a pump, very much wrinkled, and highly capable of expansion; and the internal

capacity

capacity of the canal it formed, of inferior length to the vagina, appeared to be of fimilar diameter, and equally fit for diffension: at the end was another sucker-like valve, which served as a door to a second similar receptacle, of rather greater capacity than the former: finally, there was a third receptacle, closed by a similar valve, with the extremity of which the two fallopian tubes communicated: these were of a spongy substance, and, internally, displayed an infinite multitude of vessels, part of which seemed lacteal or lymphatic, others, conductors of blood, but folded one within the other, and crossing each other, so that at the first glance they might be mistaken for a mass of little worms rolled up together. In the stomach of the animal were several small sish, which had already attained that state of digestion which made them look as if somewhat too much boiled. The ship was surrounded by a numerous troop of these animals, which, notwithstanding their enormous size, seemed in the water no larger than carp of eight or ten pounds weight.

24th July. In the night we had a light wind, but the day a dead calm. At the

rifing of the moon in the evening the wind again arofe.

25th. At ten this morning we caught a fhark: it happened to be the fqualus tiburo of Linné.: it was five feet long, had a fin at the anus; five lineary ports in the neck, for the bronchiæ of the pulse; a large head, and a broad neck: its teeth in the lower jaw triangular, of fimilar breadth, but even sharper than lancets, and about an inch in heighth, of these teeth the animal has three rows: the immost row turns back on the gums: those of the jaw are subulated like the teeth of pike, and, as the others, are an inch long. This animal is of hideous appearance in the water, and shines by day as well as by night: it was harpooned with a javelin a foot long, attached to a pole of fix feet; however hard its skin, which resists the point of a knife, it was not proof against this weapon; and the monfter made less refistance in the water, and fought less on deck than did the porpoife we had before caught: it was furrounded as usual by the pilotfish, so called on account of its constantly advancing in front of the shark: this fish is a kind of perch, transversely striped with alternations of black and yellow. Part of the fhark was cooked and placed on table, but I could not prevail on myself to touch it, notwithstanding it is a favourite dish with the people of Campeachy, a predilection which speaks little for the delicacy of their taste, as there is abundance of fish in their roadsted of exquisite flavour. We afterwards caught another of such monstrous size that we needed tackle for lifting it on board: it was a female, but of a different species. This animal was ten feet four inches (French) in length, and from the back to the belly measured two feet and a half: the skin of the back was perfectly blue, of the belly white: it had the fame proportions as, and refembled the one before described/ with the following exceptions: the teeth of the upper jaw were curved towards the throat, from the base: they were moreover sharp, pointed, but rounded like barley, and jagged like the teeth of a faw. In the upper jaw it had but one row of teeth, but in the lower three: the head was not proportionately large, though fomewhat of the fame shape, being only more oblong, and fomewhat lefs flattened than that of the male. The vagina was fix inches in diameter, and was not callous and in folds, as I had observed in the dolphin. The rectum terminated with the vagina in one common orifice, which may be regarded as the anus. By the fide of the matrix were two prominences which might be taken for teats, and of which the interior orifices terminated in the womb, but had no communicant ducts, whether glandular or lacteal: the vagina was fix inches long: at the extremity it divided into two cavities, two feet and a half in length, by a breadth of a foot, but fusceptible of considerable distension: the orifice of either of thefe trunks was filled with a fpermatic matter: the interior occupied by an extremely fine

fine and fpongy membrane, attached throughout its whole length to the inward and upper part of the cavity, and full of an infinite number of cells, each containing an egg with its yolk, and an embrio, or fœtus, an inch and a half long: the yolk of the egg was like, but fomewhat paler than that of a hen, but the mucilaginous part, inftead of being white, was of a greenifh yellow, refembling bile. In order to extract an egg from one of the cells, it was necessary to break the cell: this cavity was assuredly an oviary; the substance of it was of a whitish colour, transparent, lymphatic, greasy, and the membrane easy to break. Disgust prevented my counting the number of eggs, but in every oviary I certainly saw at least a hundred. I took some of the sæti and preserved them in rum. I am not certain whether or no amphibious animals have two vaginæ, but it appears very evident from dissections that they have two oviaries. This shark was viviparous, as I believe are all. Some of the sæti, which I notice my having preserved, I sent to Mr. Daubenton.

At noon we had a heavy fall of rain, and for two hours fuccessive showers: this, by occasioning wind, enabled us to make a slight progress; but at five we were becalmed,

and continued so until the moon rose, when it began to blow pretty fresh.

26th July. The wind of the night was fucceeded by flight fqualls, by which we advanced about half a league an hour. Some flowers fell, but unattended by wind. The crew were uninterruptedly employed in manœuvring fo as to catch the leaft puff, but without fuccefs. Did we stand on either tack, the fails scarcely filled, and the ship barely obeyed the rudder. We fell in with two amazingly large pieces of floating timber, loaded with birds. The pilot stated us by reckoning to be five-and-twenty

leagues from the Florida foundings. Our latitude was twenty-five degrees.

27th July. The morning a dead calm, provoking quietude, difcouraging inertia! Why must I thus be stayed, exclaimed I repeatedly, when it would be so grateful to my heart to reach our destination? My cochineals brought forth now a fecond time, and I had no more plants on which I could multiply them. One young leaf of a nopal, and one old one had just died; one half of another had been consumed by a blatta lucifera, and I faw that I ran great hazard of lofing the new generation; however, I had the consolation to see two plants of vanilla throw out other branches. A number of bonitos fwam about our ship. The name applied to this species of coryphena is derived from the Spanish buenito, the augmentative of bueno good, and fignifies very good, or excellent. We likewise saw some dorados, another species of coryphæna, the equisolis of Linné. One of these was caught by our men: from head to tail it measured four feet three inches, and at the stomach was a foot and a half in diameter. The sea contains no fish more beautiful, nor indeed another that equals this in beauty. The body is of a golden yellow, resplendent above a changeable green, marked with round spots, an inch in diameter, of an ultra-marine blue; the fins and tail are a brilliant green. In calm weather its shining colours render it distinguishable at the depth even of fifty feet.

28th July. We had some wind again at night, and the horizon was so much over-clouded that we apprehended a terrible storm. The wind we had, however, was adverse, and all night long we had our head to the south. In the morning we made a tack N.N.E., but were stopped by a calm. Ever since eight o'clock, I had observed in the north-north-east division of the sky, a cloud shaped like a horse's tail, spreading in the direction from N.N.E. to S.S.W., and which appeared to be the precursor of calms, in the same manner as the procellaria, in my opinion, truly indicates wind.

29th July. By midnight the calm ceased, and we made about five leagues in nine hours; from nine to eleven again calm, then wind till one, when my horse-tail cloud vol. XIII.

5 s

appeared

appeared anew. We founded but found no bottom. The pilot, who fancied himfelf upon the Florida Soundings, was thus in error, and I the more vexed on reflecting that, although but fixty leagues from the Havannah, we had fcarcely effected half our

voyage: what tirefome navigation!

30th July. At four in the evening of the 29th, a wind sprang up, which, from its direction, we recognized for a brisk and regular gale: this continued till the morning of the 30th, when the wind from land succeeded. By observation we had now passed the Florida Soundings, and all night long were on the look out to avoid Las Tortugas, an assemblage of four or five small islands on the border of the soundings of the peninsula of Florida. All this day the sky was over-cast, and we had several showers of rain.

On vifiting my nopals I found three leaves dead: I cleaned all the others, and dusted them to remove the white powder with which they had become covered. I likewise exterminated all the sylvester cochineals, which had intermingled with the fine, and which had smothered a considerable number. Finding myself overstocked with those cacti of Vera Cruz, frightfully armed with thorns, I threw thirteen of them into the sea; after which I dried the sylvester cochineals I had collected, in order to send them to my father, and to Messrs. Rostagin and Jussieu. While thus cleansing my chests, or rather my gardens, I discovered three chacherlas and a scolopendra morsitans; fortunately these infects are no devourers of cochineal, or otherwise adieu to my treasures. The employ I undertook was for some time an amusement to me, though fatiguing.

3 1st July. After luffing up the whole night long to avoid the shore, at day-break we discovered the coast of Cuba, and had advanced twenty leagues into the channel: the next day we should distinguish the Havannah, and two days after be out of the Bahama

channel; a prospect which assured us a prompt return.

In the meantime our crew infifted on entering the Havannah, but the captain and myself could not consent to this, without running the greatest risk, not only of our liberty, but even of our lives; we therefore determined on forcing obedience, and, in case of any obstinate persistance on the part of the ship's company, to put the most mutinous to death, at a preconcerted signal. However violent such measures may appear, it must be considered that it could be of no consequence to our crew what port they made, whereas it was important for us to avoid the Havannah.

Carried forward by the wind and current, by noon we were opposite to Bahia Konda, (Deep Bay); for two days we had had the most charming weather possible for our voyage, but we had still four hundred leagues to sail, and had not yet attained the end

of our toils.

In fact the wind increased, and we had a terrible night. From the heavy shocks ourfmall vessel received, I was fearful she would founder. We lowered the sweeps of the foresail, and reefed the mainfail, spite of which the vessel rolled so dreadfully that we were constrained to sleep on the floor, an inconvenience, thanks to my apprenticeship to

travels, which was to me no great hardship.

Ift August. This morning, spite of contrary winds, the currents having impelled us all night long, we distinguished the table-land of Mariana; and at four in the evening a fresh tack had carried us under the guns of the Moro castle. From a distance I distinguished the country-house of Senor Huet, the neighbourhood, and the Fort del Principe, the works of which he had shewn me. The day was sine; but a violent wind from the north-north-east, occasioned us at six in the evening to reef again our fails, which we had spread to the gale. An unlucky manœuvre was near being stall to us. All was noise; and the men running about with precipitancy increased the evident alarm;

and for myself I experienced the greater dread from the consideration of my being so rich, so truly rich; possessing what I had so much coveted: I had no such fears on my

voyage to Mexico.

2d August. The wind keeping at north-cast all the night through, we had made but little way by nine in the morning. This morning, the first time I had ever seen a storm in the morning in America, I was witness to one most violent. The whole of the day, and all the succeeding night, was a period of toil and satigue, owing to our perpetual tacks. At three o'clock we distinguished the pine-tree of Matanza. The sea ran dreadfully high; and we were the more loth to enter the mouth of the Bahama channel from our sails and rigging being in the worst possible condition: here was a fresh evidence of Spanish idleness. During the frequent calms we had experienced, nothing would have been more easy than to have taughtened the shrouds; and for want of this precaution, which I so strongly but inessectually recommended, we were obliged to lay to, and lose much time.

3d August. After numerous tacks this day, the sea constantly rough, we were fain

at night to take shelter in the Bay of Matanza.

This bay is nearly a league over at its mouth, by a depth of two. Three rivers, or rather rivulets, empty themselves into it. Towards evening we anchored about half-cable length from the shore. The fort a square building, slanked by sour bastions, is about fixty yards long. The curtain, which fronts the sea, is defended by a crown work, which seemed in excellent condition: I entered it as a conqueror, and sound no centinels either at the barrier of the covered way, or at the gates, so that without interruption I marched to the parade, where I found fix soldiers playing at cards: these without leaving their game, or asking me any questions, suffered me as quietly to depart as I had entered.

However well fortified this castle, it seems to me of no other utility than to prevent a landing, and hinder merchant ships or privateers from taking in water; for it could not

certainly withstand the fire of a fixty-four gun ship.

Matanza, (the Place of Slaughter) which lies at the bottom of the bay, is an ill-built spot, in a low, marshy, moist, and unhealthy position: it has no trade, nor any cultivation about it. The people who inhabit it present the most disgusting spectacle, and render it the scene of the most abominable silth and frightful misery: they are covered with crabs of a monstrous size, which prey on them, and which, in turn, serve them for food. The village stands at the union of two small streams, which serve to float down timber, for the Havannah, from the interior of the country. A wretched redoubt of stone, denominated a castle, stands in front of the village, and defends the bottom of the bay.

We put into this miferable place merely for the purpose of taughtening our shrouds, and taking in water; but the desertion of a sailor, and the drunkenness of the pilot,

delayed us two days.

5th August. This day I bought, at Matanza, six cardinals, two ciris, two larks, and eight other very pretty birds, of the names of which I am ignorant: I brought thence, likewise, a number of leaves of a cactus, called in our colonies, la raquette Espagno'e, and the value of which I intended to prove by my cochineals. Again had I the misfortune to see three leaves of my nopals rot: what losses! what regret at not having reached Santo Domingo!

6th and 7th August. At length we weighed anchor, and lest the bay. On the 7th we were twenty leagues from Matanza. Our wretch of a pilot again steered a wrong course, owing to which we did not reach Los Martires before night, which we

ought to have made in the morning, in order to enter the mouth of the Bahama channel.

8th August. In consequence of the error of the pilot we were obliged to lust up all night in a dreadful sea; and it was not till the morning of the 8th, at five o'clock, we took a direct course N. E. with a wind from the S. E.

The currents had carried us on fo far that by noon we were in latitude 26° 6'; thus, notwithstanding the wind in course of the night, we had advanced forty-two leagues. The sea ran high the whole day, but it became calmer in the evening. We had three separate showers.

This day we caught a booby, the plumage of which was brown without any spots, its beak blue, its eyes fiery, and capable of direction with ease towards the beak, which renders it of frightful aspect: its legs and feet of a chamois colour. After examination I

gave it liberty.

oth August. Had the wind been favourable we might this day have got out of the channel, but blowing from the north-east we were obliged to lust up through the night, steering on a north-west and south-east course, for fear of running on the shoals, right and left. The sun rose with a horizon covered with clouds, a prognostic, in these seas, of bad weather, which failed not in this instance: we had a dreadful sea, the wind suffocating, the waves of monstrous size dashing against the ship; and the natural class occasioned by the opposition of the wind and current, made a terrible noise. We constantly suffed up in the same direction, but still advanced thirty-sive leagues. Such indeed is the force of the current, that however high the sea may run, it never breaks with that surge noticed in other seas, but each wave, impelled variously and in adverse direction by the wind and current, and with equal power by each, rises in a pyramidal form, and sinks with a crash on its base: it may hence readily be conjectured how great the labour and fatigue to which the ship and its crew in these parts are exposed.

In order to form an opinion of the origin and effect of the famous current which carried us along, we must reslect that this channel is the vast outlet of the waters of the Gulphs of Honduras and Mexico, and the more southern seas, as well as of the accumulations these gulfs receive from the rivers Amazon, Orinoco, Madelena, Mississippi, and an infinity of others of inferior volume. The waters of these seas and rivers, confined by the barrier formed by the archipelago of the Caribbee Islands east and west, rush forward to the channel of Bahama, the deepest of all, no doubt, formed by the different islands, and thus find an exit into the north sea. In a dead calm this current runs four knots an hour, with a contrary wind sour and a half. The Trident, a Spanish ship of war, of sixty guns, was on one occasion adversely carried from before the Havannah, notwithstanding she had the wind abast, and all sails set as far as off the coast of Carolina, without being

able to ftem the flood.

The fea was fo frightful during the night that we merely hoisted the mainfail. The wind was east, our direction north, and according to my computation, the current ran westerly; this caused me to imagine that by drifting we should run towards the coast: thrice did I feel an inclination to make the observation to the captain, and as often was I prevented from the fear of passing for an importunate and ridiculous interferer. It was not long however before I had to repent of my filly modesty, for by two in the morning the captain, or rather terror personisied, came to waken me: he was in tears, and in persect despair. What is the matter, captain? Malé sumus, perditi sumus, we are all lost! How so, what is the matter? Hay sundo, we have soundings! In fact the plummet had been thrown, and forty fathoms was the result, the wind as well as the current bearing

on shore. Paciencia, paciencia, said I. I went on deck, and now assuming more boldness and confidence, I advised our steering south-west. The captain, the pilot, and mate, agreed with me in opinion: we tacked, and in less than two hours were out of

foundings.

10th August. The sun rose, lowering with a sadly portentous sombrezo of thick black clouds. A number of gulls and other sea-birds slew towards shore at the sight. My birds picked up their food hastily; and the song of my larks, infallible bassandras, foreboded a perilous day, and in fact squalls and hurricanes succeeded one the other with the greatest rapidity. I was fearful we should not be able to take an observation; but fortunately a gleam of sunshine allowed us to ascertain our latitude, which was 29°: thus, as I told the captain would be sound the case, the vessel, spite of opposite winds, had, by the mere force of the current, drifted more than twenty leagues, and carried us through the channel. Now was the time to steer for Europe, had we that course to take; but we were bound for St. Domingo, where, not only on my own account, but also on account of my insects, which had light only once in sour-and-twenty hours, I was so anxious to arrive.

11th August. The violence of the wind gradually abated, the sea was pretty calm, the heavens serene, but the currents had borne us forty-four leagues to the north-northeast. The wind veered towards the south in such manner as to premise we might be able to shape an eastward course, after which we should only have to lessen our latitude in order to reach St. Domingo, where with the wind abast we might arrive in a week.

We found ourselves this day in 31° 30', on parallel with Charlestown, Carolina. At four in the afternoon, caught a bird, called by the Spaniards tinosa, the larus of Linné.

12th August. Calms prevailed till evening: the little wind occasionally breathed was from the fouth-west. We steered, S. E. by E. At three the wind freshened in the same quarter, and we directed our course south-east.

13th and 14th August. The wind gradually increased on the 13th, so as to allow our making four knots an hour. On the 14th at noon we were becalmed, but a gentle

gale sprung up at four. Our latitude this last day was 31° 6'.

The whole of the 14th we fpread all our canvas to catch the little wind that blew. Our failors again caught a tiburo. Their avidity for this wretched fish, characterizes, at once, their laziness and want of taste: being easy to catch, they prefer it to the dorado, a fish exquisitely delicate, but which would have required more pains to take. They devoured the whole of it in one day, notwithstanding it weighed upwards of thirty pounds.

15th August. A light wind from the south-west advanced us two or three leagues in course of the night, but was succeeded the whole of the following day by a dead calm; a cruel calm, which threatened the frustration of all my toilsome, tedious labours! Four more of my nopals I found this day had perished, one of them with three young leaves, and an ample progeny of young cochineal. What on this, as on similar occasions, surprised me greatly, my misfortunes proceeded constantly from the plants too weak to resist the injuries of the sea air and their consinement, and not from the insects, as I the most expected, but which proved to be extremely patient, and assonishingly hardy: not one of them died; I had therefore considerable reason for self-gratulation, on having collected three other species of cacti at Campeachy, all of which assorbed nourishment to the cochineal, though more sparingly and with less advantage than the nopal.

At fun-fet, the wind conftantly feeble, after veering from the fouth-west to the fouth-east, sunk into a calm.

16th August. The wind still south-east: after luffing some time we steered nearly south-west, advancing about half a league an hour. At eleven at night the wind freshened.

17th August. Saw to leeward a frigate and another armed vessel, in company with four ships under colours with red and white stripes, and a number of golettas. We hoisted a red flag with a Burgundy cross, and fired a gun: they made fail for us; and the frigate, mounting thirty guns, and commanded by Captain Cherry from New York, placed us between him and his galley, in which were eight men, with four cannonades ready levelled, and with matches lighted. She hailed us in English: we were able to answer in Spanish only. She then failed round our stern to our starboard fide. The frigate put out her boat with an officer and fix men on board; but the officer understanding no other than the English language, could but give us the longitude, which was 75° 17' W. of Paris. We shewed him our passports from Vera Cruz, and our register; and after fignifying that we came from that port, we prefented him fome provisions, such as potatoes, bananas, and calalon, with which he left us perfectly fatisfied. What however is fingular enough, we omitted to enquire the name of the commander of this finall foundron, and which party it espoused, that of the English or the rebels: we were however led to conclude that it was the former, from his telling us his veffel, formerly the Boston, was now called the Daphne. The four vessels under escort, all of them mounted royals: the first I had ever seen.

We continued our course N.E. The full moon, on rising, brought us wind with showers; and I constantly found that every change of the moon was accompanied by

fimilar variations.

18th August. The last observation was more clearly verified this day. At three in the morning we had a brisk wind and rain, and successive showers coming from every point of the compass. The whole of the morning we were crossed by contrary winds, and obliged to tack every instant. At noon the wind increased, blowing first from the south, and afterwards from the south-west. A gloomy sky now threatened a storm: the wind still increased, and some rain fell. We deemed it right to lower our stay-sail and reef the main-sail; but we lost much precious time by our vain alarm, for the storm blew over, and the night was sine. From noon we had advanced about a league and a half an hour; and caught a fish the gasteros-terus of Linné.

19th August. A cursed calm from three in the morning till nine. At this hour, and till the next day, we had wind from the south, and steered north-east by east,

advancing but three knots an hour.

A colony of small migratory sish followed us on the right and left of our rudder, consisting of perch, gasteros terus, and pilot sish. These shoals of inhabitants, from a different hemisphere, which are occasionally seen in different seas, resemble so many wandering colonies seeking an asylum. Do they encounter a ship, to them it seems a rock, a bank, an island, a shore: they constantly sind food in its vicinage, and exertion in swimming, unnecessary borne as they are in its wake. At length the vessel arrives, and the colonies shift to their quarters.

20th August. The wind blowing N. E. by E. we steered S. W. by W.; it afterwards vecred to the fouth wavering. We made scarcely three knots an hour. This slow failing is little less vexatious than a calm, but more advantageous. We had to-day no rain; the pilot reckoned us in the longitude of the point of Mezy, in latitude three

degrees

degrees twenty-one minutes *, fo that we were yet two hundred-and-fifty leagues at leaft, from our destination: the land we fought for thus seeming to fly before us. Indeed it appeared to me, that the captain and pilot had acted very wrong in suffering us to be carried by the current from the Bahama channel, to so high a latitude as thirty-three degrees. I make no doubt that the elevation of our latitude above what we need have made it, was the cause of our being subject to all the calms and contrary winds we had experienced; as, if we had avoided the current, in latitude twenty-eight degrees, we should have been secure of the trade winds much earlier, and at any rate, if we had coasted by the Lucayos, should have been certain of land breezes. The captain, in answer to my observation, pretended that on the day we were in latitude twenty-eight degrees the wind was unfavourable to our making eastward; but this lame excuse was contradicted by my journal. The wind on that day was east, and by steering south, the composite action of the east wind and the current, which ran to the north, would assured.

This day I had to regret the loss of other nopals; and I felt it the more bitterly from the circumstance of the impossibility of fixing the infects attached to the dead plants on any other, as will appear in the appendix, wherein I treat of the cochineal

infect.

I was perfectly in despair, and almost gave up the hope of being able to transport my little colony in health and fasety to Santo Domingo, the cause of which I could only attribute to the length of our voyage and the want of friends, which had prevented my

making more favourable arrangements.

21st August. This day the wind, which during the night had blown but gently N. E. by E., at six in the morning veering to the N. E., blew with greater force, and we advanced five or at least four knots an hour, and found ourselves in the longitude of Cape Nicholas Mole, latitude twenty-nine degrees forty-nine minutes north. The sky was beautiful, a line of clouds branching in slips sine as the slax which is spun from the distast, in the direction north and south indicated, at length the speedy presence of the winds for which we sighed. Should they continue savourable but only six days, they will carry us to Cape François.

I observed Mercury an hour before fun-rife, in the constellation Cancer.

22d August. While running N. N. E. †, at the rate of five or fix knots an hour, the wind increased to such a degree, that by five in the evening we were obliged to lower our tops and reef our main-sail. At noon by observation, we were in latitude twenty-eight degrees forty-sour minutes, and in the longitude of Tortuga. The sun rose through a red and lowering atmosphere. At setting it was entirely obscured by

vapour, which covered the horizon in every direction.

At ten, notwithstanding we had lowered our tops and top-gallants, we failed at the rate of five knots. The waves beat with a deep and hollow found against the sides of the vessel, and shook it by the violence of their percussion: twenty times did they break over the deck, and a violent rain falling at the same time, we were fain to close the hatchways, and put up all our dead lights. I endeavoured to sleep, but in vain, one could rest no where. Every billow threw the ship on her beam-ends, and not any thing could be kept steady on the deck. The sea ran dreadfully high: our fragile vessel was now raised an hundred seet from the level, and now engulphed in a hollow abys, while the noise of the winds in the rigging was equal to the roaring of thunder.

* This is an error, it should be 33°, 21' as is seen by what follows. TRANS.

⁺ It should be, as the signal shews, S. S. W., that is the directly opposite rhumb. TRANS.

I wished much to contemplate this horrible scene, but there was no keeping the deck; and what, in fact, could be seen in a night as dark as Erebus? We distributed brandy to our men, who seemed in spirits, and sang in midst of the storm *, while we were a prey to the most alarming apprehensions. At first, I was inclined from this circumstance to conclude that the danger was not imminent, but the solace of this fancy endured but for a moment. I resected on the nature of these beings, so differently

modified to us, and blamed my first conclusion.

23d August. Day beamed, yet brought us no alleviation, for the tempest raged with undiminished violence. The impetuous winds howled in the shrouds, dark clouds overhanging obscured the whole horizon, and the sea ran mountain high. Our crew were harrassed to death, the captain dejected, our rigging slack, and our fails in shivers; every thing, in short, made us dread exceedingly a night like that we past, while, spite of some reddened clouds in the west, towards six in the evening, which we were willing to hail as a presage of a calm, or at least an abatement of the tempest, the winds seemed to redouble their force, and a heavy storm of rain continued till

midnight.

24th August. This morning, though the sea still ran very high, the violence of the wind had somewhat abated: it blew now from the south-south-east. On rising I distinguished a gleam of sun-shine shooting through some light clouds; and as the day advanced the sun shewed itself at intervals, and enabled us to take the latitude at noon, which we found to be twenty-six degrees twenty-eight minutes: our longitude was that of the Western-Cape of Maguana, so that, notwithstanding the storm, as I had premised, we had lost nothing of our longitude, and on the other hand, had diminished our latitude by nearly sifty leagues. We steered east-north-east †, certainly a bad course, for had we directed the vessel to the south, we should in two days had Maguana under our lee, and in three days after might have made the Cape, from which we were only a hundred-and-twenty leagues distant.

Though I have made feven voyages at fea, I never was witness to fuch dreadful weather, unaccompanied with lightning and thunder. The storm had driven from us most of the shoal of colonists which surrounded our rudder, for of all their number remained only two small white pilot-sish, and two large black perch. My parrot, and indeed all my birds, foreboded the bad weather by their agitation, sluttering, and louder and hoarser notes than usual. I lost none of them. My jalop suffered so much set to make me apprehensive of its perishing; but fortunately my insects and nopals received less injury than I expected. My first object was the preservation of the former,

for I conjectured that I might meet with nopals in the King's garden.

25th August. The wind blowing east-north-east, we steered fouth till noon, when it appeared by observation, we were in twenty-six degrees twenty-sive minutes, and on the meridian of the Caicos. The winds variable and light throughout

the day.

26th August. Calms and contrary winds again fettered us to these seas: it seemed as if we were never to be released from our captivity, and as though the captain and pilot were in league to prolong it. The last fault they were guilty of was in not making way to leeward by a west-south-west course: we should, it is true, by this means have got lower down than Maguana, but by help of the south-west winds,

^{*} Ma refo esperto si poco teme
Che dorm' al suon' del mar che freme
O sul' prora cantando va.

† It should be E. S. E. the current running S. W. TRANS.

which afterwards prevailed, we should have recovered our latitude *, and have advanced eighty leagues on our way. It certainly was most vexatious to have been upwards of three months at fea, and have run nearly two thousand leagues, to fetch a place but five hundred leagues in a direct line from our point of departure.

At night however we had westwardly winds, but so feeble, as also on the two following days, that we fearcely proceeded at the rate of a league an hour. This however was

a better fate than befell us on the 29th, when we had a dead calm.

27th August. At nine in the morning this day we fancied we discerned a shelf, a white band thirty toifes long t, was feen nearly in the direction we were failing. Was this the trunk of fome enormous tree, fuch as is fometimes feen in the Gulf of Mexico? Was it fome veffel which had capfifed? Round it was feen a number of fharks, and skimming about flocked a variety of sea-fowl, whence I conjectured it to be the carcale of fome valt monster of the fea. The captain, against my will, as I regretted the lofs of fo much precious time, fleered towards it, and approached it within the distance of thirty fathoms, but at a hundred we already distinguished what it was by the putrid finell it exhaled. One fingle piece of this leviathan appeared to be fifteen fathoms long, besides which were seven or eight continuous but disjunct pieces of from two to three fathoms in length: the breadth of it was feven fathoms, and its thickness, besides about three feet which sloated out of the water, from fix to seven fathoms. It had been rotting, no doubt, a confiderable length of time, for it refembled nothing but a hide blown out, mishapen, and without trace of any form; the entrails, floating on the water like the filaments of mollufcæ, extended in network the space of eighty feet: many feparate parts were feen about it at the diffance of about twenty fathoms from the main piece: we clearly diftinguished the whole to be rotten slesh notwithstanding a greafy froth of dazzling whiteness sloated all around. Some parts of the carcafe were of a blackish hue, and gore like: the whole undulated irregularly with the water, whence I concluded that the bony frame was diffolved, and that, of courfe, the monster must have long been dead. But again, to what enormous animal could these vast relics have belonged? This it is the province of our illustrious Pliny * to decide, of him to whom is known the whole furprifing volume of nature's grand productions.

This day the observation at noon gave for our latitude twenty-fix degrees twenty-

one minutes: our longitude was the meridian of Fort Dauphin.

30th August. Our latitude this day was twenty-five degrees twelve minutes north: our longitude that of the Caicos. At fix in the evening, a gale sprang up. During the calm, a flock of birds, frigates, gulls, lari, and boobies, availed themselves of the pursuit, on the part of dorados and bonitos of the flying-fish, to make them in turn their prey. The sea was beaten and covered for the space of a league by the flying-sish, alternately in the air and the sea, by the bonitos, who pursued them, and the winged tribes which caught these latter from the surface. Who has ever seen the king hunting in the plains of Choisy, Mount Rouge, or St. Denis? Here game enclosed is driven from all quarters as into an enclosure: the hunt is a hunt no longer, but the field of sport a slaughter-house: such was the hunt of the doradoes and birds.

The aspect of heaven was through the whole night frightful: here dingy clouds, there grey were furrowed by incessant flashes of vivid lightning: the wind south-east:

our courfe fouth-west by west

31st August. This day we were unable to take an observation: the sky still overcast, the wind less strong, after passing to the south again, veered to the east. An unfor-

^{*} It should be longitude. TRANS. † 190 feet English. ‡ Busson.
VOL. XIII. ‡ Busson.

tunate swell from the north had prevented our enjoying rest or comfort, whether by day

or night, for four preceding days.

1st September. This day at noon we found ourselves in latitude twenty-five degrees, twenty-four minutes. The wind, constantly east-south-east, seemed regular, and continuous. We hoped to see Maria Juana, called otherwise Maguana; but not succeeding in our expectations, laid to, for sear of running on the shallows. Some sew drops of rain fell this day.

2d September. This morning we proceeded on our course at five o'clock, and at fix hoisted our square sail, or sail of fortune, steering west-south-west to make the land. At length, at eight o'clock, we perceived to windward some extremely low lands, bounded by reefs, on which the surges breaking, rose to upwards of twenty feet: this at least we computed, as at four leagues off the breakers resembled the latten sails of sishermen. We thought these lands the Caicos, and slattered ourselves with reaching the Cape next day: the land, however, turned out to be Moguana, as was verified, not-withstanding the different opinion of the pilot and captain, our joint observations shewing the latitude twenty-two degrees, twenty minutes, the exact latitude of Moguana.

So many errors on the part of my conductors encouraged me to offer advice. I recommended the captain to run on opposite tacks, in order to double the Heneagas to windward, seeing we were steering direct upon them. He heeded me not, but laid to. What was the consequence? At eight in the morning we saw Little Heneaga: it was mistaken for the Caicos, and we did not change our course. At noon, land! land! was called out. Some said it was Tortuga, some the Main: neither were in the right: it was Greater Heneaga, along which we were obliged to coast from east to west the whole afternoon, in order to double it to leeward, with the disadvantage of a wind in opposition to the currents.

In coasting along Greater Heneaga, entirely surrounded by shoals, while from three to four leagues from shore, we saw bottom a-head: terror now was general, and the clamour usual on similar occasions with Spaniards, served only to increase the alarm. Scarcely had we time to tack about. This would indeed have been a wreck in port, and, thanks to the drunkenness and inexperience of our pilot, who, notwithstanding, reckoned himself a very clever fellow, we were in this instance placed in greater danger than we had experienced before throughout the whole three months of our voyage.

4th September. The wind blowing strong from the north-east, we kept under fail all night, and in the morning, by ten, got sight of the head-lands of St. Domingo.

At noon I recognized Point Jean Rabel and Cape Fou to the fouthward. I was exceedingly affected, for I had reckoned on reaching the Cape that day, which it now was impossible we should do while the wind blew from the quarter it did. The vexation prevented my eating any dinner: the captain, noticing this, enquired the cause with much folicitude and kindness. I seized the opportunity presented to me by this question, to entreat him to land me at Saint Nicholas Mole, offering to pay all the charges of anchorage and port dues his compliance might occasion: he was grieved even to tears at the thought. He faid, that the moment was at hand when we must separate. What, observed I, did you then imagine we were never to part? Have we not through the whole course of life constantly before us examples of separations in all men from every object of their fondest attachment, separations which every one of them but precurfors of others? Do we not fee that nothing is durable, nothing stable? Alas, my friend, this is an established law to which of necessity we must submit either with good-will or per force! You have been kind to me in extreme: the talk your generous heart prescribed has been most amply accomplished; would to Heaven

Heaven I were able to render you still more effential services; yes, my future task

shall be to shew my gratitude by every poslible means.

The captain liftened to reason, and readily agreed to steer for the Mole, though still in melancholy mood. Soon, however, the pleasure of being on land earlier than he expected, and of not having to busset with the waves for two or three days longer, which possibly it would take him to reach the Cape, in case the winds should not become more favourable, unrussled his brow, and we entered the bay of the Mole, each alike gay and cheerful: as for me, I was so pleasingly surprized to see myself on St. Domingo, that I rubbed my eyes, and dreaded to wake from a dream.

My first care was to wait upon M. de la Valtiere, the King's lieutenant, at Saint Nicholas Mole. I informed him who I was, and what the object of the voyage I had undertaken. He loaded me with kindness, sought how to render me service by every means, and punished according to their merits some sailors who had given me cause of complaint. I had here also the good fortune of forming an acquaintance with Messrs. Dunsteville and Dumanoir, of the engineer service, who shewed me the

greatest civility.

I now wrote to the intendant of the colony, but burning with impatience to reach Port au Prince, without waiting his answer, I availed myself of the offer of M. de Vassal to repair thither, in a King's galley, which he commanded. We failed on the 17th September, and on the 25th arrived at Port au Prince.

The intendant gave me a most kind and gracious reception: he ordered payment of the two thousand livres due to me, according to the direction of the minister; and moreover, gave me an appointment under himself, with a thousand crowns a-year.

The pleasure I felt at seeing my friends again, the satigue I endured on my voyage, the change of air and diet, all combined, occasioned me a sickness of more than six

weeks duration.

As foon as I recovered, I wrote to my parents and friends. I forwarded a relation of my voyage to the minister, and dispatched the first specimens of the plants I had brought from Mexico for the King's garden; but all these were lost with Captain Gillet, on his return from the Cape, whither he had come in the Postillon of Rochelle,

with the first intelligence of an embargo.

My Spanish captain, from whom I thoughtlefsly separated myself at the Mole, while he was careening his boat, without taking leave, revenged himself of my incivility, in a manner highly honourable to himself, by sending me back a bill for fifty-four dollars, which I sent him before my departure, that is to say, sourteen to repay advances he had made me, and forty which I held it my duty to pay him for my passage. I much regretted and still remember with the liveliest affection, this excellent and obliging young man, whom I never can think of without inquietude, as since our parting I have not once heard from him, notwithstanding his promise of corresponding with me. May I never hear but good news of this youth, to whom I was indebted for my return, however accompanied, as it happened to be, with tedious toil and danger!

I did not enjoy the fweet arising from the success of my expedition without some bitter mingled in the cup. I had effected a matter of public utility, and could but become a butt for the arrows of envy; still the shaft which struck the deepest, and caused the greatest pain, was an infinuation attributed to have been circulated by the Spanish

captain, by a man fo truly my friend, that I had stolen my cochineal.

It was however impossible that any such like charge could have been made by the captain; for, separate from his being most assectionately attached to me, I never had told him so; but, on the contrary, as was the truth, that I had bought them at four

different places in Mexico; and I have fuch opinion of his honour, as to be fecure he could as little be guilty of falfehood as of calumny. If it be faid, however, that the captain might have committed fuch a double outrage, for his own defence, and in order to disculpate himself in the eyes of the Spanish nation, for being an accomplice in carrying off the prize, I must answer, that while at the Cape he could not have been in a predicament requiring such procedure; nor even if he were in his own county do I believe that any charge on such account could be alledged against him, since, however severe the laws which prohibit the exportation of dry cochineal, there are none which forbid the transport of it alive. There is not, therefore, the slightest likelihood that this dart was lanced by the captain; no, it was the poisoned javelin of a secret enemy, some soe to my tranquillity, or rather of some infamous miscreants who look on all that is meritorious only with invidious eyes.

And after all, can it be imagined, if it had been impossible for me to have purchased this precious insect, an insect I was so anxious to naturalize in our country, that I should endure the abortion of my project on account of a salse and ridiculous delicacy? Most assured I should not, any more than a savage coming to France in search of

grain, with which to enrich the land of his birth.

After fuch an avowal, doubtless my testimony will admit of credit; but more may be said: have I at any time passed with any one for a fool or an ideot? and should I deserve to be esteemed other in stealing a matter, precious certainly in my eyes, but which might be obtained for a mere trisle, and in thus exposing myself to the attacks, the mortification, the obloquy, which must naturally follow? In fact, what at the first custom-house could I have answered, on being interrogated, how I had got his production? A lie in such case would not have been less dangerous than a confession hurtful: I should have been exposed to the loss of the whole fruit of my travels, and in the eyes of

Spaniards have incurred an opprobrium more painful to me than death.

I think I do not deceive myfelf with respect to right and wrong. To have stolen the cochineal would, in my opinion, have been an act of social injustice, as far as regards the cultivator whose garden I might have despoiled, an injustice which I sought to avoid, and I think successfully; for by buying it, I only committed a wrong against the nation from whom I bore it away: now, in my position, I regarded myself as the prototype of a different nation, on whom nature has bestowed the same prerogatives, the same right to her savours; and if, after offering payment for the cochineal at whatever price might have been imposed, all the Indians to whom I might have applied had combined to refuse my request, I should then have considered myself, as in case of war, absolved from the restrictions of social laws; but in infringing them, in carrying away by stratagem what had been denied to entreaty, I would have compensated the individual towards whom I might be guilty of a real injury, and have covered with piasters the ground from which I bore off my prize.

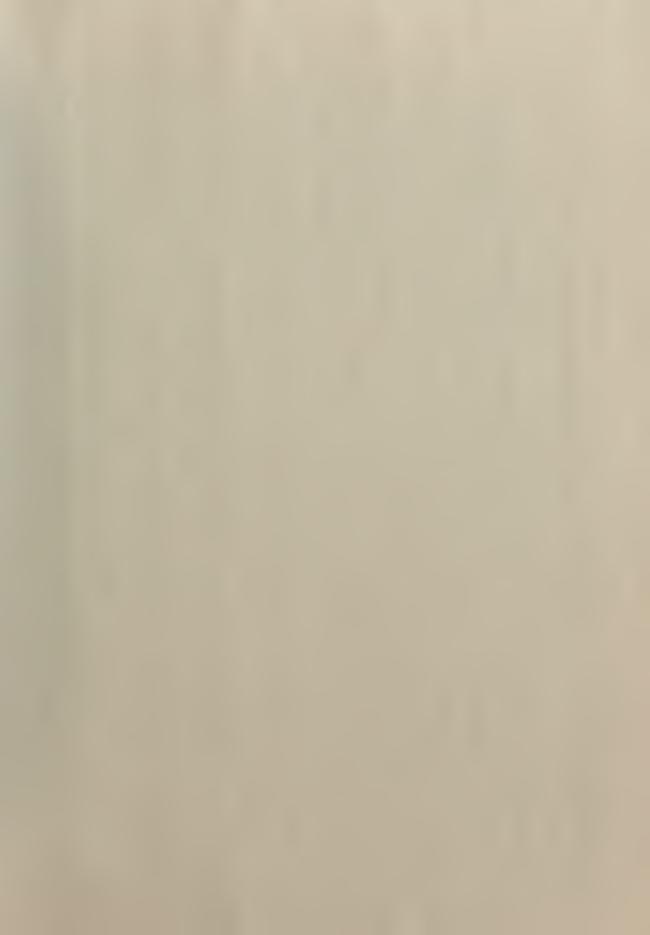

From the fentiments which thus with the utmost fincerity I have exposed, let it be judged if I have ought wherewith to reproach myself. Were I to decide, from my heart should I gain acquittal; but on a subject so delicate, and involving myself, I must

leave with others to decide.
