MODERN JUDAISM

Judaism has never been monolithically uniform. Made irreducibly complex by 3,500 years of turbulent history, it resists simplification. Its data refuse to be straitjacketed or handled

dispassionately. Impartial attempts to understand it are easily spoiled by the partisan sympathies and deeply held antagonisms it activates in observers. Consider a mere sampling of the evidence. Its implications startle. In 1920, the American automotive industrialist Henry Ford articulated a widely held opinion that was infected by virulent strains of secular anti-Semitism without which the Holocaust would have been impossible: "Poor in his masses, [the Jew] yet controls the world's finances. . . . The single description which will include a larger percentage of the Jews than members of any other race is this: he is in business . . . the Jew is gifted for business" (Mendes-Flohr, p. 513). Vast numbers of Jews, however, were politically active in the labor union movement and on the Left. Four years earlier, Rosa Luxemburg, born to a Jewish family in Poland, an ardent socialist and leader of the Communist Party in Germany, acknowledged "that I have no separate corner in my heart for the ghetto: I feel at home in the entire world wherever there are clouds and birds and human tears" (Mendes-Flohr, p. 262). In 1930, Bertha Pappenheim, a religiously observant German-Jewish woman, a pioneering feminist and energetic social worker, explained that "women [in contrast to men] showed a ready understanding to relate the command to love your neighbor to modern times. . . . Out of a new congruence of German cultural elements and Jewish civilization grew a spiritual substance of greatest importance . . . These women who did not know how Jewish they were through their inherited spirituality became strong pillars of the feminist movement" (quoted in Mendes-Flohr, p. 288).

Similar divergence over other fundamental issues abounds. In 1885, a Conference of Reform Rabbis gathered in Pittsburgh. Echoing the rationalist ideals of the Enlightenment, they declared that "we consider ourselves no longer a nation but a religious community . . . ever striving to be in accord with the postulates of reason" (Mendes-Flohr, p. 468). In 1917, Ozjasz Thon, a Polish Zionist from Kraków, broadcasting the zeal that ultimately led to the establishment of the State of Israel in 1948, announced that "the Jews are a nation, not a religious sect" (Mendelsohn, p. 17). Further complicating the challenge of defining Judaism, in 1966, in the refuge of Belgium, Jean Amery, a survivor of the Nazi death camps in Auschwitz, the son of a Catholic mother and a Jewish father, wrote: "The necessity and impossibility of being a Jew, that is what causes me indistinct pain" (Mendes-Flohr, p. 292). In 1913, Gustav Landauer, a German-Jewish intellectual, echoing the ideals of romanticism embraced by countless Jews, proclaimed that "I feel my Judaism in the expressions of my face, in my gait, in my facial features, and all these signs assure me that Judaism is alive in everything that I am and do" (Mendes-Flohr, p. 276). In 1926, Sigmund Freud, the founder of psychoanalysis, confessed that "what bound me to Jewry was (I am ashamed to say) neither faith nor national pride, for I have always been an unbeliever and was brought up without any religion. . . . But plenty of other things remained to make the attraction of Jewry and Jews irresistible—many obscure emotional forces . . . as well as a clear consciousness of inner identity, the safe intimacy of a common mental construction" (Mendes-Flohr, p. 278). The juxtaposition of these divergent, contradictory voices is cautionary and instructive. Judaism is elusive.

Lexicons reflect this reality. Meticulously preserving popular usage and conventional wisdom, they report that Judaism signifies a religion, faith, set of theological beliefs and ceremonial practices, culture, nation, race, people, polity, tradition, heritage, or ethnic identity. The long string of terms is baffling. It fails to note whether the terms are neutrally descriptive or ideologically prescriptive. This failure wreaks conceptual havoc. Many of the string's terms are ambiguous; others are anachronistic. In combination, several of the terms are logically incoherent or mutually exclusive. The search for clarity seems doomed.

For scholarly purposes, Judaism may nevertheless be characterized as the sum total of symbiotic interactions between the Jews and their diverse geographical, sociopolitical environments. Perceived in this strictly descriptive, all-inclusive light, Judaism appears to have completed three phases of pre-modern development: ancient Near Eastern; Greco-Roman; and medieval, both Christian and Islamic. Currently, Judaism is undergoing its latest phase, the modern. As the contradictory voices cited above suggest, the modern phase may be the most tumultuous, fragmented, and poignant of all.

Like Judaism, modernity is irreducibly complex. Scene of utopian achievement and apocalyptic terror, modernity resists simplification. It swarms with counterpoint and paradox: unprecedented prosperity and abject deprivation, revolutionary reform and conservative reaction, egalitarian liberation and fascist brutality. Modernity simultaneously produces satisfied customers and frustrated discontents. Its beneficiaries and victims offer radically different assessments of its character. Jews have been both beneficiary and victim; they bear witness of a different kind. Historians nevertheless tend to agree that modernity is coterminous with the emergence of the bourgeoisie, the rise of the centralized nation-state, and the subsequent establishment of global hegemony in the West, in places such as Europe and North America.

Modernity may be said to have originated with the French, American, and Russian revolutions. Acting on the belief that "all men are created equal," the revolutions reordered society. They outlawed the denial of citizenship, special taxes, demeaning sumptuary regulations, and physical ghettos that had segregated Jews from society for centuries. The revolutions abolished the privileges of the agrarian-based aristocracy. They retrenched or eliminated the direct influence of clergy on public governance. Modernity may also be said to owe its temper to capitalism and its muscle to ongoing revolutions in science, technology, and industrialized productivity. These revolutions have transformed all aspects of life, especially the spheres of labor, communication, medicine, and warfare. In turn, the opportunistic combination of capitalism, nation-state, and technology spawned diverse modes of thinking: secularism, naturalism, materialism, and cultural relativism together with their dialectical counterparts, religious fundamentalisms, and variously insatiable appetites for the certainty of metaphysical absolutes.

Dynamics of Westernization

In North Africa and the Middle East, for example, where vast populations of Jews had lived for centuries in premodernity as

dhimmis, one of several protected minorities, modernity witnessed the dismemberment and balkanization of the Islamic Ottoman Empire, establishment of European colonies, Westernization of the local cultures, subsequent wars of liberation, and eventual establishment of newly formed, autonomous states. The process was well under way in the 1820s when Georg Wilhelm Friedrich Hegel lectured on the philosophy of history. His words reek with Eurocentric propaganda. Hegel declared that Islam had surpassed Judaism's ethnic particularism by embracing universalistic ideals. He then acknowledged medieval European debts to Islamic "science and knowledge, especially that of philosophy." He also noted Europe's contemporary appreciation of Islamic "noble poetry and free imagination." Capping the argument, Hegel reversed directions. Performing feats of imperious Orientalism, he lambasted the "East" and triumphantly erased Islam from the later stages of history: "But the East itself. . . sank into the grossest vice. The most hideous passions became dominant . . . At present, driven back into its Asiatic and African quarters . . . Islam has long vanished from the stage of history at large, and has retreated into Oriental ease and repose" (Hegel, p. 360).

As with Islam, so too with Judaism. Hegel's remarks expose the underlying pressures that have shaped and reconfigured Judaism for the past three hundred years. Dangling numerous incentives, the West circulated an interlocking set of guidelines: To reap the benefits of unprecedented prosperity after earning and being granted legal emancipation, the Jews would have to eliminate the "Oriental" habits that Westerners find odious. The Jews must modernize, accommodate, secularize, adapt, acculturate, integrate, and assimilate. Convert to Christianity, if they will. Remain Jewish, if they must, but let them heed the counsel offered in 1866 by Judah Leib Gordon, the Russian Hebrew poet, who wrote: "Be a man abroad and a Jew [in the privacy of] your tent, A brother to your [European] countryman and a servant to your [European] king" (Mendes-Flohr, p. 384). Be universalistic in outlook and education. Let the Jews preserve and continue to nurture only those elements of their premodern, rabbinic culture that conform to European tastes in science, philosophy, and the arts of "noble poetry and free imagination." Jews must dismantle traditional communal structures that privilege aristocratic leadership. Jews must retrench or eliminate the direct influence of the rabbinate on public governance. If it pleases, let them re-enter "history at large" by wholeheartedly joining the contemporary nation-states of the West. Failing that, either for lack of interest in capitalism and global hegemony or because of virulent anti-Semitic backlash, let them re-enter "history at large" by creating an autonomous Jewish nation-state based on Western models.

Like all the other premodern societies that have encountered the hegemonic West in recent times, the Jews adhered to these guidelines, with varying degrees of resistance and success. Like all these others and the West itself, Judaism became a perpetual site of cultural demolition, construction, and renovation. Like them all, like memory itself, Judaism became a tangled work in progress where nostalgia for the past and hope for the future jostled for attention.

The pace, extent, and contour of modernization differed from one geographical location to another. Jews living in the heartland of the West—in France, North America, England, and Germany—were the first to be legally emancipated, culturally integrated, and professionally diversified. Pioneers, they underwent the crisis of transformation and adjustment long before their kin living in East Europe. In turn, the Jews of Europe became the beneficiaries of modernity earlier than their kin living in the peripheries of modernity situated in colonial North Africa and the Middle East. Alas, between 1933 and 1945, the Jews of Europe also suffered the worst of modernity's evils. The Jews fell victim to the dialectical waste products of liberal attempts to reform society: xenophobia and racism leading to bureaucratically managed and technologically enabled mass murder, genocide, the Holocaust.

Wherever they resided, the Jews were buffeted by an array of centrifugal and centripetal forces compelling them to formulate a livable equation that balanced loyalty to the past with openness to the present. The proportion of continuity and discontinuity with premodern Judaism differed in each of the equations. No single equation enjoyed universal consent. As the juxtaposition of contradictory voices cited above suggests, the equations provoked controversy. Among the Jews who preferred life in the Diaspora and identified Judaism primarily with religion, the spectrum of opinion and practice included Reform, Reconstructionist, Conservative, Orthodox, ultra-Orthodox, and Hasidic varieties. Among the Jews who identified Judaism primarily with nationalism, the spectrum of opinion and practice included political, cultural, Socialist, Marxist, utopian, and religious Zionists of every stripe imaginable. Among the Jews, like Freud, who identified Judaism primarily with a cultural heritage or a set of ethical ideals, the spectrum of opinions and practices defies description.

In the traumatic midst of adjusting to Westernization, the Jews availed themselves of every tool available to make sense of their predicament and to stabilize their fluctuating fortunes. In the realms of philosophy and theology, the Jews flocked to rationality and romanticism, pragmatic naturalism and religious existentialism, sober positivism and exuberant mysticism, taking freely and modifying extensively what they needed from the resources of premodern Jewish tradition as well as from Immanuel Kant, Friedrich W. Schelling, Hegel, Karl Marx, Friedrich Nietzsche, Martin Heidegger, Ludwig Wittgenstein, John Dewey, Jacques Derrida, and the entire host of speculative virtuosi. In the realms of literature, music, and art, they participated fully in both the avant-garde and in the popular rear. In their ranks stand Heinrich Heine, Shmuel Yosef Agnon, Sholem Aleichem, Franz Kafka, Marc Chagall, and Arnold Schoenberg. Composing in every language, they uncovered the depths of humanity and mapped the enigmas of Jewish selfhood. In the realms of scholarship, other Jewish intellectuals invented the strictly academic, scientific study of Judaism. In all these realms, as in the realms of innovative political organization and religious experimentation, the unsettling and creative traces of modernity are unmistakable.

JUSTICE.

This entry includes three subentries:

- Overview*
Justice in American Thought
Justice in East Asian Thought

OVERVIEW

Virtually everyone becomes involved in disputes about justice at some point. Sometimes our involvement in such disputes is rooted in the fact that we believe ourselves to be victims of some form of injustice, such as job discrimination; sometimes our involvement is rooted in the fact that others believe us to be the perpetrators or at least the beneficiaries of some form of injustice affecting them, such as unfair taxing policies. Elimination of the injustice may require drastic reform, or even revolutionary change in the political system, such as took place in the Soviet Union, Eastern Europe, and South Africa. In other cases, redress of the injustice may require only some electoral pressure or administrative decision, such as that required to end a war, for example, the Vietnam War. Whatever the origin and whatever the practical effect, disputes about justice

are difficult to avoid, especially when dealing with issues that have widespread social effects like access to employment opportunities, distribution of income, structure of political institutions, and use of the war-making capabilities of a nation.

Reasonable resolutions of such disputes require critical evaluation of the alternative conceptions of justice available to us. Philosophical debate at the beginning of the twenty-first century supports five major conceptions of justice: (1) a libertarian conception, which takes liberty to be the ultimate political ideal; (2) a socialist conception, which takes equality to be the ultimate political ideal; (3) a welfare liberal conception which takes contractual fairness or maximal utility to be the ultimate political ideal; (4) a communitarian conception, which takes the common good to be the ultimate political ideal; and (5) a feminist conception, which takes a gender-free society to be the ultimate political ideal.

All of these conceptions of justice have features in common. Each has requirements that belong to the domain of obligation rather than to the domain of charity; differences arise as to where the line between these domains should be drawn. Each is concerned with giving people what they deserve or should rightfully possess; disagreements exist about what those things are. Each is secular rather than religious in character because for justice to be enforceable it must be accessible to all who apply for it; only a conception of justice that is based on secular reason rather than on religious faith could have that accessibility. Each is thought to apply cross-culturally in virtue of its being accessible to everyone on the basis of reason alone. These common features constitute a generally accepted core definition of justice. What we need to do, however, is examine that part of each of these conceptions of justice over which there is serious disagreement in order to determine which, if any, is most defensible.

Libertarian Justice

Libertarians frequently cite the work of F. A. Hayek (1899–1992), particularly his *Constitution of Liberty* (1960), as an intellectual source of their view. Hayek argues that the libertarian ideal of liberty requires “equality before the law” and “reward according to market value” but not “substantial equality” or “reward according to merit.” Hayek further argues that the inequalities due to upbringing, inheritance, and education that are permitted by an ideal of liberty actually tend to benefit society as a whole. In basic accord with Hayek, early-twenty-first-century libertarians define “liberty” as “the state of being unconstrained by other persons from doing what one wants.” This definition limits the scope of liberty in two ways. First not all constraints, whatever the source, count as restrictions on liberty; the constraints must come from other persons. For example, people who are constrained by natural forces from getting to the top of Mount Everest have not been deprived of liberty in this regard. Second the constraints must run counter to people’s wants. Thus people who do not want to hear Beethoven’s Fifth Symphony do not have their liberty restricted when other people forbid its performance, even though the proscription does in fact constrain what the former are able to do.

Given this definition of liberty, libertarians go on to characterize their moral and political ideal as requiring that each

person should have the greatest amount of liberty commensurate with the same liberty for all. From this ideal, libertarians claim that a number of more specific requirements, in particular a right to life, a right to freedom of speech, press, and assembly, and a right to property, can be derived.

The libertarian’s right to life is not a right to receive from others the goods and resources necessary for preserving one’s life; it is simply a right not to be killed. So understood, the right to life is not a right to receive welfare. In fact there are no welfare rights in the libertarian view. Accordingly the libertarian’s understanding of the right to property is not a right to receive from others the goods and resources necessary for one’s welfare, but rather a right to acquire goods and resources either by initial acquisition or by voluntary agreement.

By defending rights such as these, libertarians can support only a limited role for government. That role is simply to prevent and punish initial acts of coercion—the only wrongful actions in the libertarian view.

Libertarians do not deny that having sufficient goods and resources to meet basic nutritional needs and basic health care needs is a good thing, but they do not believe that government has a duty to provide such goods and resources. Libertarians claim that some good things, such as the provision of welfare and health care to the needy, are requirements of charity rather than justice. Accordingly failure to make such provisions is neither blameworthy nor punishable.

A basic objection to the libertarian conception of justice is its claim that rights to life and property, as the libertarian understands these rights, derive from an ideal of liberty. Why should we think that an ideal of liberty requires a right to life and a right to property that excludes a right to welfare? A libertarian understanding of a right to property might well justify a rich person depriving a poor person of the liberty to acquire the goods and resources necessary for meeting the latter’s basic nutritional needs. How then could we appeal to an ideal of liberty to justify such a deprivation of liberty? Surely we could not claim that such a deprivation is justified for the sake of preserving a rich person’s freedom to use the goods and resources he or she possesses to meet luxury needs. By any neutral assessment, the liberty of the deserving poor not to be interfered with when taking from the surplus possessions of the rich what they require to meet their basic needs should have priority over the liberty of the rich not to be interfered with when using their surplus possessions to meet their luxury needs. But if this is the case, then a right to welfare, and possibly a right to equal opportunity as well, would be grounded in the libertarian ideal of liberty.

Socialist Justice

In contrast with libertarians, socialists take equality to be the ultimate political ideal. In the *Communist Manifesto* (1848), Karl Marx (1818–1883) and Friedrich Engels (1820–1895) maintain that the abolition of bourgeois property and bourgeois family structure is a necessary first requirement for building a society that accords with the political ideal of equality. In the *Critique of the Gotha Program* (1891), Marx provides a

much more positive account of what is required to build a society based upon the political ideal of equality. Marx claims that the distribution of social goods must conform, at least initially, to the principle from each according to his/her ability, to each according to his/her contribution. But when the highest stage of communist society has been reached, Marx adds, distribution will conform to the principle from each according to his/her ability, to each according to his/her need.

At first this conception might sound ridiculous to someone brought up in a capitalist society. How can people be asked to contribute according to their ability if income is distributed on the basis of their needs and not on the basis of their contributions?

The answer, according to a socialist conception of justice, is to make the work itself as enjoyable as possible. As a result, people will want to do the work they are capable of doing because they find it intrinsically rewarding. For a start, socialists might try to get people to accept existing, inherently rewarding jobs at lower salaries—top executives, for example, would work for \$300,000, rather than the much higher salaries they can actually command. Ultimately socialists hope to make all jobs as intrinsically rewarding as possible, so that when people are no longer working primarily for external rewards and are making their best contributions to society, distribution can proceed on the basis of need.

Socialists propose to implement their ideal of equality by giving workers democratic control over the workplace. They believe that if workers have more to say about how they do their work, they will find their work intrinsically more rewarding. As a consequence, workers will be more motivated to work because the work itself will be meeting their needs. Socialists believe that extending democracy to the workplace will necessarily lead to socialization of the means of production and the end of private property. Socialists, of course, do not deny that civil disobedience or even revolutionary action may be needed to overcome opposition to extending democracy to the workplace.

Even with democratic control of the workplace, some jobs, such as collecting garbage or changing bedpans, probably cannot be made intrinsically rewarding. Socialists propose to divide up such jobs in an equitable manner. Some people might, for example, collect garbage one day a week, and then work at intrinsically rewarding jobs for the rest of the week. Others would change bedpans or do some other unfulfilling job one day a week, and then work at an inherently rewarding job on the other days. By making jobs as intrinsically rewarding as possible, in part through democratic control of the workplace and an equitable assignment of unrewarding tasks, socialists believe people will contribute according to their ability even when distribution proceeds according to need.

Another difficulty raised concerning the socialist conception of justice involves the proclaimed necessity of abolishing private property and socializing the means of production. It seems perfectly possible to give workers more control over their workplace while the means of production remain privately owned. Of course private ownership would have a somewhat different character in a society with democratic control of the workplace, but it need not cease to be private ownership.

After all, private ownership would also have a somewhat different character in a society where private holdings, and hence bargaining power, were distributed more equally than they are in most capitalist societies, yet it would not cease to be private ownership. Accordingly we could imagine a society where the means of production are privately owned but where—because ownership is so widely dispersed throughout the society and because of the degree of democratic control of the workplace—many of the criticisms socialists make of existing capitalist societies would no longer apply.

Welfare Liberal Justice: The Contractarian Perspective

Finding merit in both the libertarian ideal of liberty and the socialist ideal of equality, welfare liberals attempt to combine both liberty and equality into one political ideal that can be characterized as contractual fairness or maximal utility.

A classical example of the contractual approach to welfare liberal justice is found in the political works of Immanuel Kant (1724–1804). Kant claims that a civil state ought to be founded on an original contract satisfying the requirements of freedom (the freedom to seek happiness in whatever way one sees fit as long as one does not infringe upon the freedom of others to pursue a similar end), equality (the equal right of each person to restrict others from using his or her freedom in ways that deny equal freedom to all), and independence (the independence of each person that is necessarily presupposed by the free agreement of the original contract).

According to Kant, the original contract, which ought to be the foundation of every civil state, does not have to “actually exist as a fact.” It suffices that the laws of a civil state are such that people would agree to them under conditions in which the requirements of freedom, equality, and independence obtain. Laws that accord with this original contract would then, Kant claims, give all members of society the right to reach any degree of rank that they could earn through their labor, industry, and good fortune. Thus the equality demanded by the original contract would not, in Kant’s view, exclude a considerable amount of economic liberty.

The Kantian ideal of a hypothetical contract as the moral foundation for a welfare liberal conception of justice was further developed by John Rawls (1921–2002) in *A Theory of Justice* (1971) and in *Justice as Fairness: A Restatement* (2001). Rawls, like Kant, argues that principles of justice are those principles that free and rational persons who are concerned to advance their own interests would accept in an initial position of equality. Yet Rawls goes beyond Kant by interpreting the conditions of his “original position” to explicitly require a “veil of ignorance.” This veil of ignorance, Rawls claims, has the effect of depriving persons in the original position of the knowledge they would need to advance their own interests in ways that are morally arbitrary.

According to Rawls, the principles of justice that would be derived in the original position are the following:

1. Each person has the same infeasible claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all; and

2. Social and economic inequalities are to satisfy two conditions: First they are to be attached to offices and positions open to all under conditions of fair equality of opportunity; second, they are to be to the greatest benefit of the least advantaged members of society (the difference principle).

Rawls holds that these principles of justice would be chosen in the original position because persons so situated would find it reasonable to follow the conservative dictates of the “maximin strategy” and maximize the *minimum*, thereby securing for themselves the highest minimum payoff and because these principles express an ideal of reciprocity.

Rawls’s defense of a welfare liberal conception of justice has been challenged in a variety of ways. Some critics endorse his contractual approach while disagreeing with him over what principles of justice would be derived from it. These critics usually attempt to undermine the use of a maximin strategy in the original position. Other critics, however, have found fault with the contractual approach itself. Libertarians, for example, challenge the moral adequacy of the very ideal of contractual fairness because it conflicts with their ideal of liberty.

This second challenge to the ideal of contractual fairness is potentially more damaging because, if valid, would force its supporters to embrace some other political ideal. The challenge, however, would fail if the libertarian ideal of liberty, when correctly interpreted, can be shown to lead to much the same practical requirements as are usually associated with the welfare liberal ideal of contractual fairness.

Welfare Liberal Justice: The Utilitarian Perspective

One way to avoid the challenges directed at a contractarian defense of welfare liberal justice is to find some alternative way of defending it. Historically utilitarianism has been thought to provide such an alternative defense. Under a utilitarian view, the requirements of a welfare liberal conception of justice can be derived from considerations of utility in such a way that following these requirements will result in the maximization of total happiness or satisfaction in society. The best-known classical defense of this utilitarian approach is that presented by John Stuart Mill (1806–1873) in *Utilitarianism* (1863).

In chapter 5 of this work, Mill surveys various types of actions and situations that are ordinarily described as just or unjust, and concludes that justice simply denotes a certain class of fundamental rules, the adherence to which is essential for maximizing social utility. Thus Mill rejects the idea that justice and social utility are ultimately distinct ideals, maintaining instead that justice is in fact derivable from the ideal of social utility.

Nevertheless a serious problem remains for the utilitarian defense of welfare liberal justice. There would appear to be ways of maximizing social utility overall that do an injustice to particular individuals. Think of the Roman practice of throwing people to the lions for the enjoyment of all those in the Colosseum. This unjust practice arguably maximized social utility overall.

Rawls makes the same point somewhat differently. Since utilitarianism sees society as a whole as if it were just one person, it treats the desires and satisfactions of separate persons as if they were the desires and satisfactions of just one person. Thus, according to Rawls, utilitarianism fails to preserve the distinction between persons.

But is Rawls right? Suppose we were to interpret utilitarianism to be constrained by the “ought” implies “can” principle, according to which people are not morally required to do what they lack the power to do or what would involve so great a sacrifice that it would be unreasonable to ask, and/or in cases of severe conflict of interest, unreasonable to require them to abide by. So constrained, utilitarianism would not impose unreasonable sacrifices on individuals, and so would not then have the consequences to which Rawls objects.

Communitarian Justice

Another prominent political ideal defended by contemporary philosophers is the communitarian ideal of the common good. As one might expect, many contemporary defenders regard the communitarian conception of justice as rooted in Aristotelian moral theory. In the *Nicomachean Ethics* (c. 335–322 B.C.E.), Aristotle (384–322 B.C.E.) distinguishes between different varieties of justice. He first distinguishes between justice as the whole of virtue and justice as a particular part of virtue. In the former sense, justice is understood as what is lawful, and the just person is equivalent to the moral person. In the latter sense, justice is understood as what is fair or equal, and the just person is one who takes only a proper share. Aristotle focuses his discussion on justice as a part of virtue, which further divides into distributive justice, corrective justice, and justice in exchange. Each of these varieties of justice can be understood to be concerned with achieving equality. For distributive justice it is equality between equals; for corrective justice it is equality between punishment and the crime; and for justice in exchange it is equality between whatever goods are exchanged. Aristotle also claims that justice has both its natural and conventional aspects: This twofold character of justice seems to be behind Aristotle’s discussion of equity, in which equity, which is a natural standard, is described as a corrective to legal justice, which is a conventional standard.

Note that few of the distinctions Aristotle makes seem tied to the acceptance of any particular conception of justice. One could, for example, accept the view that justice requires formal equality, but then specify the equality that is required in different ways. Even the ideal of justice as giving people what they deserve, which has its roots in Aristotle’s account of distributive justice, is subject to various interpretations. An analysis of the concept of desert would show that there is no conceptual difficulty with claiming, for example, that everyone’s needs should be satisfied or that everyone deserves an equal share of the goods distributed by society. Consequently Aristotle’s argument is primarily helpful in clarifying the distinctions that can be made within the concept of justice without committing oneself to any particular conception of justice.

Rather than discussing the particular requirements of communitarian justice, proponents have frequently chosen to

defend it by attacking other concepts. They have focused their criticism on the welfare liberal conception of justice.

Alasdair MacIntyre, for example, argues, in “The Privatization of the Good” (1990), that virtually all forms of liberalism attempt to separate rules defining right action from conceptions of the human good. MacIntyre contends that these forms of liberalism not only fail but have to fail because the rules defining right action cannot be adequately grounded apart from a conception of the good. For this reason, MacIntyre claims, only some version of a communitarian theory of justice that grounds rules supporting right action in a complete conception of the good can ever hope to be adequate.

But why not view most forms of liberalism as attempts to ground moral rules on part of a conception of the good—specifically, that part of a conception of the good that is more easily recognized, and should be publicly recognized, as good? For Rawls, for example, this partial conception of the good is a conception of contractual fairness, according to which no one deserves his or her native abilities or his or her initial starting place in society. If this way of interpreting liberalism is correct, then, in order to evaluate welfare liberal and communitarian conceptions of justice properly, we would need to do a comparative analysis of their conceptions of the good and their practical requirements. Moreover there is reason to think that once the practical requirements of both liberal and communitarian conceptions of justice are set out, they will be quite similar.

Feminist Justice

Defenders of a feminist conception of justice present a distinctive challenging critique to defenders of other conceptions of justice. In his *The Subjection of Women* (1869) Mill, one of the earliest male defenders of women’s liberation, argues that the subjection of women was never justified but was imposed upon women because they were physically weaker than men; later this subjection was confirmed by law. Mill argues that society must remove the legal restrictions that deny women the same opportunities enjoyed by men. However Mill does not consider whether because of past discrimination against women it may be necessary to do more than simply remove legal restrictions: He does not consider whether positive assistance may also be required.

Usually it is not enough simply to remove unequal restrictions to make a competition fair. Positive assistance to those who have been disadvantaged in the past may also be required, as would be the case in which some competitors were unfairly impeded by having to carry ten-pound weights for part of a race. To render the outcome of such a race fair, it may be necessary to transfer the weights to other runners, and thereby advantage the previously disadvantaged runners for an equal period of time. Similarly positive assistance, such as affirmative action programs, may be necessary to enable women who have been disadvantaged in the past to compete fairly with men.

In *Justice, Gender, and the Family* (1989), Susan Okin argues for the feminist ideal of a gender-free society. A gender-free society is a society where basic rights and duties are not assigned on the basis of a person’s biological sex. Since a

conception of justice is usually thought to provide the ultimate grounds for the assignment of rights and duties, we can refer to this ideal of a gender-free society as feminist justice.

Okin goes on to consider whether Rawls’s welfare liberal conception of justice can support the ideal of a gender-free society. Noting Rawls’s failure to apply his original position-type thinking to family structures, Okin is skeptical about the possibility of using a welfare liberal ideal to support feminist justice. She contends that in a gender-structured society, male philosophers cannot achieve the sympathetic imagination required to see things from the standpoint of women. According to Okin, original position-type thinking can only really be achieved in a gender-free society.

Yet while Okin despairs of doing original position-type thinking in a gender-structured society, she herself does a considerable amount of just that type of thinking. For example, she claims that Rawls’s principles of justice “would seem to require a radical rethinking not only of the division of labor within families but also of all the nonfamily institutions that assume it” (p. 104). She also argues that “the abolition of gender seems essential for the fulfillment of Rawls’s criterion of political justice” (p. 104). Okin’s own work indicates that people can engage in original position-type thinking and her reasons for arguing otherwise are not persuasive. It is not necessary that all people have the capacity to put themselves imaginatively in the position of others, just that some have the ability to do so. Some people may not be able to do original position-type thinking because they have been deprived of a proper moral education. Others may be able to do original position-type thinking only after they have been forced to mend their ways and live morally for a period of time.

Even among those in our gendered society who are, generally, capable of a sense of justice, some may not be able to do original position-type thinking with respect to the proper relationships between men and women and may acquire the ability only after laws and social practices shift significantly toward a more gender-free society. Others may have the ability to think in this way, having effectively used the opportunities for moral development available to them to achieve the necessary sympathetic imagination.

Conclusions

What conclusions should we draw from this discussion of libertarian, socialist, welfare liberal, communitarian, and feminist conceptions of justice? Is MacIntyre’s opinion, described in *After Virtue* (1981), that such conceptions of justice are incommensurable and, hence, there is no rational way of deciding between them correct? Many philosophers have challenged this view, and even MacIntyre, in *Three Rival Versions of Moral Enquiry* (1990), has significantly qualified it, contending that it is possible to argue across conceptions of justice.

One could also conclude that *if* the ideal of liberty of libertarian justice can be shown to require the same rights to welfare and equal opportunity that are required by the welfare liberal conception of justice, and *if* the communitarian critique of welfare liberalism can be rebutted, that it may then be possible to reconcile, at a practical level, the differences between

welfare liberal justice, socialist justice, and feminist justice. To reasonably resolve our disputes about justice, we then need only understand the shared practical requirements of these conceptions of justice and simply act upon them.

It can be argued, however, that even if these conceptions of justice can be reconciled in practice, such reconciliation would not have cross-cultural validity because the discussion derives primarily from Western philosophical traditions. While this objection cannot be fully addressed in the absence of a detailed examination of non-Western conceptions of justice and morality, there is good reason to think that, like the results of a well-reasoned discussion of mathematics derived from Western sources, this discussion of conceptions of justice also has cross-cultural validity. The conceptions of justice considered here arguably run the full gamut from least demanding (libertarian justice) to most demanding (socialist justice). Egoism is less demanding than libertarian justice, but it is not a moral view because egoism entails a rejection of morality. Pure altruism is more demanding than socialist justice, but no conception of justice could require us to sacrifice ourselves to the degree that pure altruism does; pure altruism goes beyond the requirements of justice and morality. If libertarian justice and socialist justice, and those conceptions that purportedly fall in between, can all be practically reconciled in the way suggested, there is good reason to think that the argument is valid not only for Western philosophical traditions but cross-culturally as well.

JUSTICE IN AMERICAN THOUGHT

Justice appears as a paradoxical concept in the history of the United States. On the one hand, it has been absent as a rallying cry in the major struggles that have shaped, and continue to shape, the plurality of identities of the American nation. The concept “justice” is not prominent in the Declaration of Independence or in the Constitution. It was not the cornerstone of the abolitionist movement, the Civil War, the women’s suffrage movement, or the civil rights movement. It did not surface in the demands of Native Americans against the encroaching and overwhelming force of local states and the federal government. Nor does it carry major weight in the pro-statehood movement that is still hoping to move Puerto Rico away from its colonial status and to see the island as a state of the American union. In contrast to the Platonic Republic, in which justice is viewed as the central virtue of an ideal society, justice seems to appear as an afterthought, as in the last sentence in the pledge of allegiance.

On the other hand, justice has infused the political ideas and practices that define the American society, and it should not be confined exclusively to the arena of legal procedures. Rather, justice has been refracted through the ideas of rights, liberty, equality, democracy, state institutions, and other concepts that have dominated the moral language of American citizens or the people who wanted to become, or were forced into the framework of, American citizenship. The absence of clear definitions of justice guiding public discussions since the arrival of the Puritans takes a different meaning when the theoretical inquiry focuses on the multiplicity of dimensions entwined with justice.

These dimensions include: a providential understanding of a communal identity; the conception of individuality; the relationship between individuals and the government; the view of political power and the proper nature of the state; the protections and bulwarks in the judicial sphere; and justice as the first principle that ought to guide both the individual’s life and governmental policies. All these dimensions place a high premium on rights, but the relationship between rights and justice is clarified by looking at the link between liberty and justice. This link presupposes that people must be free to choose rules of justice, but then justice is understood as the principle that delineates the scope of liberty, which means that justice defines the boundaries of rights. The refracted and yet ubiquitous presence of justice in American thought helps to explain why John Rawls’s philosophy, which dominated American liberalism in the last three decades of the twentieth century, portrayed justice as the standard by which to measure both a well-ordered society and a just citizen.

Puritan Conceptions of Justice

Though the Mayflower Compact (1620) stresses the importance of “just and equal Laws,” John Winthrop’s sermon “A

Modell of Christian Charity” (1630) is a reasonable point of departure in examining justice in the American context. This sermon is important not only for the location where it was delivered—on the ship *Arabella* en route to a new continent—but also for the distinction between mercy and justice as well as for its emphasis on an ordered and tightly knit community predicated on mutual assistance. According to the principle of mercy, Christians must help their brothers and sisters beyond their ability in order to fulfill the gospel. But in lending means of subsistence and forgiving debts, justice intervenes. If a Christian brother, for instance, possesses the resources to repay a debt, “thou art to looke at him, not as an Act of mercy, but by way of Commerce, wherein thou arte to walke by the rule of Justice . . .” (p. 32). When the probability of a debt being repayed is null, Christians ought to lend according to the rule of mercy, which expects nothing. Along similar lines, whether the loan was an act of mercy or of justice, when the borrower has nothing to pay back, “thou must forgive him (except in cause where thou hast a surety or a lawful pledge)” (p. 33). In this way, if there is a “lawful pledge,” justice overrules mercy.

The association of justice, commerce, and a lawful pledge delimits justice to the sphere of agreements and contracts sanctioned by the law. Though this view seems to narrow significantly the scope of justice, the refraction principle shows itself when the text is examined in more detail. At the end of his sermon, Winthrop presents the well-known analogy of the pilgrims as a “city upon a Hill.” But it must be emphasized that the city upon a hill does not refer to the original biblical reference found in the Gospel according to Matthew. In Winthrop’s reasoning, the context of the phrase is provided by the Israelites on their journey to the promised land. As in the Israelites’ case, Winthrop’s arguments center upon a covenant between God and the Christian community, and God will expect a strict compliance with the “Articles contained in it . . .,” for otherwise “wee shall surely perishe out of the good Land whether wee passe over this vast Sea to possesse it. . .” (p. 43). In other words, the relationship between God and Winthrop’s fellow travelers is one ruled by justice in the form of a covenant, and an intrinsic part of this justice was the possession of the land where they would live.

Seen from this perspective, justice is no longer limited to contractual relations between persons. Rather, the boundaries encompassing justice widen substantially. At the same time, a covenant that carries the high penalty of divine wrath is ominous for all people who are outside the particular community Winthrop is addressing. Justice thus straddled two conflicting points of departure. The city upon the hill echoes the love Winthrop found in the gospel, while the covenant belonged to the Hebrew warriors who were to possess a land already inhabited. The New Testament “law of grace” and the Old Testament justice were inseparable. The mention of the city upon a hill is preceded by an explicit reference to God’s command to Saul to destroy Amalek. In other words, the textual transplantation preceded the cultural transplantation. Justice, then, had two dimensions: a secular one defined by legal contracts among individuals as well as a providential dimension manifested in a covenant between God and a community bonded by shared beliefs.

The double character of Winthrop’s conception of justice insisted on the individual’s obligation to comply with his or her contracts and gave the community a privileged position in its dealings with non-Christians and even with Christians who did not share the same doctrinal tenets. Unity and fragmentation emerged as two central components that would be present in the understanding and application of justice. Winthrop’s view of love anticipated this conclusion. Love stems from the fact that people see in others what they see and cherish in themselves. In this way, the root of otherness, as a standpoint that demands the conversion and “civilization” of non-Christians, or as the establishment of boundaries to keep outsiders at bay, was thus inscribed in the view of justice sketched in Winthrop’s famous sermon. The “Dedham Covenant” (1636), a document specifying the form of government in the town of Dedham, Massachusetts, was more eloquent in describing the quest of unity and how exclusion was part of this quest. In section two, the limits of admittance into the community were specified: “That we shall by all means labor to keep off from us all such as are contrary minded, and receive only such unto us as may be probably of one heart with us . . .” (p. 68).

Several years earlier, Virginia had already put into place a system of legal clauses that contained both a mix of exclusion and a call for fairness. The “Articles, Laws, and Orders, Divine, Politic, and Martial for the Colony in Virginia” (1610–1611) stipulated that no man “of what condition soever shall barter, trucke, or trade with the Indians, except he be thereunto appointed by lawful authority upon paine of death.” (Article 15, p. 319). In the following article, the colonists were forbidden from despoiling any “Indian” who would come to trade, and the punishment would also be death (Article 16). By 1619, freemen were allowed to trade with the Indians, but offensive or defensive weapons could not be part of these commercial transactions.

The twofold nature of unity and exclusion should not obfuscate other features that would have a deep influence in the evolution and conceptualizations of the idea of justice. The “Plymouth Oath of Allegiance and Fidelity” (1625) contained an oath given to the governor and members of the council in which they would swear to administer justice “equally & indifferently without respect of persons.” (p. 34) The same principle of impartiality is present in the “Pilgrim Code of Law” (15 November 1636) and runs consistently in the founding documents of the early settlements. The historical evidence thus shows that the English philosopher John Locke’s (1632–1704) arguments about consent and impartial laws as the cornerstones of a political and just society were already present in the ideas animating the Puritans of the early colonies, the same ideas that permeated their providential and secular understanding of justice.

During King Philip’s War (1674–1677), between the New England colonists and the Indian tribes in the region, the providential character of justice showed the consequences of its privileged standpoint. Increase Mather would remind his listeners that their unfaithfulness was the cause of the violent upheaval that threatened them. But he saw the destruction of the

heathens as an act that abided with the justice expected from a people ruled by a providential design. For the war was just, and the army was executing “the vengeance of the Lord upon the perfidious and bloody Heathen” (p. 107).

Providential View of Justice

The same providential view of justice that erected boundaries against outsiders and allowed Mather to justify the obliteration of a community of Native Americans also called for universal descriptions that would later haunt institutions tethered to partiality and particularity. That is to say, it was contradictory to use a universal language of justice to justify political institutions and then attempt to circumvent and ignore the consequences of this language. The phrase “all men are created equal,” a phrase that belongs to the domain of justice, could not be used to justify slavery. In his 1858 debates with Stephen Douglas, Abraham Lincoln could confidently use the Declaration of Independence and the Constitution to oppose the extension of slavery. This task was fraught with obstacles, though. The universality of categories pertaining to justice transformed the American Constitution into a battleground of competing conceptions of morality and conflicting views of the relationship between individuals and the government. For William Lloyd Garrison, the Constitution was a covenant with hell that vitiated its potentiality for individual liberty. Frederick Douglass followed, at first, the Garrisonian view, but he concluded that the founders had bestowed enough room to challenge the institution of slavery. In his speech of May 28, 1856, addressing the radical abolition party convention in New York, Douglass said: “This Constitution sets forth several propositions, which, if carried out, would abolish slavery. What are they? The Constitution declares its object to be ‘to form a more perfect union.’ How can you form a more perfect union with slavery? . . . The Constitution is declared to be established for the people, and who are the people? The men and women of the country. We are part of the people” (pp. 389–390).

While Douglass found refuge in the universal goals that the Constitution clearly pursued, Ralph Waldo Emerson and Henry David Thoreau invoked transcendental categories that were congenial to the providential view of justice. In his opposition to slavery, Emerson saw the universe, nature, power, justice, and the moral order as transcendental realities of a divine unity. The universe, Emerson wrote in 1845, “is not bankrupt: still stands the old heart firm in its seat, and knows that, come what will, the right is and shall be. Justice is for ever and ever” (p. 36). The planter’s predicament is always unsafe, no matter how powerful he might appear to be. Nature fights against him, and “as power is always stealing from the idle to the busy hand, it seems inevitable that a revolution is preparing at no distant day to set these disjointed matters right” (p. 37). In the twentieth century, Martin Luther King, Jr., followed Douglass’s footsteps and resorted to the universality embedded in the American conception of justice to challenge civil inequalities, and to fulfill Emerson’s hope of setting right matters that were still “disjointed.”

The providential covenant as a central component of the American conception of justice has shown a remarkable

resistance to the passing of time. In 1795, Bishop James Madison painted the providential character in a language that was more emphatic than Winthrop’s. God had thrown a veil upon the American continent in order “to conceal it from the nations of the east,” thus saving America from the ravages of tyranny and inequality that went untrammelled in the European nations. The veil would not be lifted until the emergence of “a new race of men” that would be responsible for the redemption of humankind. “It is in America,” Bishop Madison declared, “that the germs of the universal redemption of the human race from domination and oppression have already begun to be developed” (p. 1312). In 1820, Daniel Webster echoed similar themes in his “Plymouth Oration,” and in 1900, Albert Beveridge, the Republican senator from Indiana, portrayed the divine plan that was in the offing.

In addressing the question of acquiring and administering territories whose population, he opined, was not yet ready for self-government, Beveridge asserted that God “has marked the American people as His chosen nation to finally lead in the regeneration of the world” (p. 704). “[O]ur place, therefore, is at the head of the constructing and redeeming nations of the earth” (p. 712).

It is worth noticing that the emphasis on redemption, covenant, natural rights, and government evinced a duty to carry out the designs of divine justice refracted through human institutions. The secular and providential notions of justice thus complemented one another. While the emphasis on legal contracts might have led individuals to seek their own interests, the providential covenant would bring them back to their public duty. It is in this providential notion that one finds the centrality of a legitimate government anchored upon the principle of consent.

The Individual and the State

Another sphere of justice revolves around the proper role of state power and the relationship between individuals and their government. The Federalists bestowed on the American intellectual landscape the best articulation of justice in connection with social order and public institutions. The Federalist view made clear that the institutional framework ought to exist to protect the basic rights of citizens, and property stood out as one of the most important personal rights. Clearly, the root of the centrality of property was derived from Locke’s reasoning in the *Second Treatise of Government* (1690), which postulates a civil or political society founded on just laws, which are not available in a state of nature, no matter how rational men could be or how harmoniously they might work together. Even in this scenario, common rules of justice, accepted as part of a free compact, were necessary to avoid the vagaries of the individual’s judgment. As already indicated, in the first half of the seventeenth century, the Pilgrims anticipated Locke’s reasoning. In “Federalist Paper number 10,” however, James Madison was more explicit than Locke. Justice, according to Madison, was needed to regulate the potentially lethal conflicts arising from disagreements on property. This regulation envisaged the rise of factions as inevitable, but sought to contain its effects by dispersing those factions through the whole society.

It might appear that Madison's vision of a society fragmented into different factions would be a denial of Winthrop's concern for a strong community. But this is not the case. Winthrop's community was one among many others and, in this sense, it might be seen as a faction in Madison's use of the term. In a nutshell, Madison argues that the diversity of factions would be the warranty against the prospect of a tyrannical majority. In a fragmented milieu, this majority would lack the means to arise, let alone to succeed. Hence the Lockean need of a central government that was conceived as the embodiment of a just social order seeking to regulate the disparity of interests. The anti-federalists consistently applied the logic of fragmentation. Just as a fragmented society was a guardrail against a tyrannical majority, so also a fragmented legislature would cancel the proclivity to factionalism. Hence a government in which all the classes of society should be represented as both the Federal Farmer and Brutus, two of the leading voices in the anti-federalist cause, insisted.

The slavery question that led to the Civil War (1861–1865) was the lightning bolt that limned the fissures underlying the moral and political landscape of the American society. Even when Lincoln's paramount concern was the preservation of the Union, and both the thirteenth and fourteenth amendment sought to create a new juridical reality for all people born under the jurisdiction of the United States, justice, understood as a set of principles and regulations serving as the moral compass of both individuals and public institutions, became more fragile and malleable. Neither women nor Native Americans were part of the notion of citizenship implicit in the post-civil war constitutional amendments. And in a series of decisions, the Federal Supreme Court reinstated inequalities and legal boundaries that the fourteenth amendment wanted to remove.

In the *Slaughterhouse Cases* (1873), the Supreme Court established a distinction between citizens of the United States and citizens of particular states, and concluded that Congress lacked power to regulate state actions in matters of local government, property, and civil rights. In other words, the court reasserted the "disjointed matters" that Emerson had mentioned in 1845. According to the legal doctrine of the *Slaughterhouse Cases*, the states, not the federal government, would be final arbiters in controversies pertaining to the same issues that had led to the Civil War. It would not take long to show how the purview of the state would perform when dealing with the rights of black citizens. In *United States v. Cruikshank* (1876), a case involving the murder of African-American citizens in Colfax, Louisiana, the sane court struck down the conviction of three white men. Writing for the majority, Chief Justice Morrison R. Waite found that the right of the victims to "peaceably assemble," as well as their right not to be deprived of life and liberty without due process, had not been violated. Furthermore, Waite argued that the power to initiate prosecution for murder belonged, exclusively, to the states. This was another way of saying that the dominant beliefs of particular states would prevail. If the states decided not to act, there would be no crime. In the *Civil Right Cases* (1883), the Supreme Court upheld racial segregation in public places, and in *Plessy v. Ferguson* (1895), put the seal of legality not only

on segregation, but also on the social inequalities that the fourteenth amendment intended to overcome.

These cases show that the providential view of justice of the puritans was superseded by all the ramifications embedded in the very first phrase of the preamble to the Constitution: "We the people . . ." It was a phrase that departed from the self-evident truths so prominent in the Declaration of Independence. And this phrase carried a foreboding about the unstable and precarious role of natural law arguments in the American conception of justice. More than a democratic sentiment, "We the people . . ." expressed the design of a secular order without any transcendental anchors. Since the phrase, along with the whole constitutional text, would receive its authoritative interpretation from a political institution presiding over a society that blurred the line between diversity (in which there are some common links) and fragmentation (in which common links are absent), the outcome would be far too evident. It is ironic that Representative John A. Bingham, Republican from Ohio, referred to the universal and "higher laws" principles that he saw inscribed in the Declaration of Independence when he argued for the need of the Fourteenth Amendment, while the Supreme Court would resort to the particular beliefs of the states when eroding the clear meaning of this amendment.

The fractures of a social order continued unabated in the early twentieth century, especially with the territorial expansion of the American empire. The newly acquired territories after the Hispano-American War (1898) would be excluded from the constitutional protections available to white citizens.

In the *Cherokee Nation v. Georgia* (1831), the Supreme Court abandoned the providential view of justice, and upheld rights emanating from an idea of cultural superiority; namely, upheld rights stemming from the power to define and impose a definition of a superior culture. In the *Plessy* case the Supreme Court mangled the constitutional meaning in order to demarcate a new reality that justified segregation and inferior citizenship. Thus, the trajectory of the United States Supreme Court clearly suggests that the idea of justice as a dimension of natural law has stood on precarious grounds and not played any significant role in legal controversies concerning minority groups. Natural law served neither Native Americans nor African-Americans. Natural law presupposes an agreement on universal principles of morality, an agreement that, in a context of moral and cultural fragmentation, was nowhere to be found. Native Americans had to be civilized. A civil war was needed to alter the juridical classification of African-Americans. Yet, natural law arguments continue to lurk in judicial decisions addressing private conduct or decisions. The right of privacy seems to be the closest area whose underpinning insinuates natural law principles.

John Rawls

As Gordon Wood argues, the pluralism so dear to the anti-federalists triumphed in the short run and became the dominant conception of politics in the American society. It was in the context of this pluralism that John Rawls developed and polished what turned out to be the most influential theory of

justice in the intellectual vistas of American society during the last three decades of the twentieth century.

With the publication of *A Theory of Justice* (1971), John Rawls set out to establish the institutional framework and the moral principles of a well-ordered society conceived in perpetuity. He did this by constructing an imaginary scenario that he called the “original position” and designing the parties who were to deliberate about the agreement that would rule their society. The arguments were then premised on the social-contract tradition to the extent that the end of deliberation was to reach a binding agreement for present and future generations. In the first version of his theory, Rawls saw the agreement on justice as a paradigm that would apply to all societies. In the original position, “a veil of ignorance” covers the parties, which means that they lack knowledge about their gender, race, social status, philosophical beliefs, and religious beliefs. In other words, they are selves that, placed in a context of fairness, would arrive at a fair agreement. This is why Rawls calls his theory “justice as fairness.” The assumption is that the lack of knowledge about personal and social features would lead the parties to advocate an institutional arrangement that would benefit all of them. The original position brings forth a basic agreement on two principles of justice: the principle of equal liberties and the difference principle. In *Justice as Fairness. A Restatement* (2001), Rawls offers his last articulation of these principles:

- a. Each person has the same inalienable claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all; and
- b. Social and economic inequalities are to satisfy two conditions: first, they are to be attached to offices and positions open to all under conditions of fair equality of opportunity; and second, they are to be to the greatest benefit of the least-advantaged members of society (the difference principle). (pp. 42–43)

The principle of equal liberties protects constitutional essentials that will be settled once and for all. There is no need to deliberate about them. The difference principle sets a goal, which is to maximize the long-term expectations of the least advantaged members of society over the long run. This maximization, Rawls believes, is achieved by providing a social minimum to the disadvantaged. It is worth mentioning that the right of property does not count as one of the constitutional essentials. Rawls even defends the creation of a distributive branch with the responsibility of watching over society to rein in excessive inequalities, though what counts as excessive is not specified.

In a second version of his theory, Rawls abandoned the quest of universality and declared that the parties were representatives of democratic citizens; namely, historical members of a particular society. His theory depended not on a metaphysical view of persons as empty shadows but on the political culture of the United States. In *Justice as Fairness: A Restatement*, Rawls says that his theory takes into account three

kinds of contingencies: social class, “native endowments,” and “good or ill fortune.” In light of this political culture, Rawls believes, there are two intuitive ideas that will justify the choice of his two principles of justice. The first idea stands for the moral equality of all citizens, while the second defends a system of fair cooperation. Bound together, these two intuitive ideas are seen as already embedded in the political vocabulary and practices of a constitutional democracy. More importantly, they are completely free of what Rawls calls “comprehensive moral doctrines,” which are doctrines that seek to provide all or partially encompassing answers to the deepest questions surrounding the meaning, if any, of life and the human good.

In the three decades after the publication of *Theory*, Rawls expanded and modified his arguments in several areas, while leaving intact its basic tenets. The most important upshot of his reflections was the articulation of what he called “political liberalism,” a liberalism that is bereft of questions of truth, the human good, and any transcendental realm; that is, it eschews any form of comprehensive doctrines. These doctrines are seen as belonging to the private sphere, and citizens should not use them in deliberations about justice. Furthermore, justice is expected to supersede the injunctions of comprehensive doctrines even in the private domain.

Under the aegis of political liberalism, the emphasis is not so much on distributive justice as it is on the quest of an overlapping consensus embracing all reasonable doctrines that may flourish in a constitutional democracy. Political liberalism is deeply aware of the fact of pluralism in modern times and the impossibility of having a universal agreement on a single conception of the human good. Hence the need of fair principles of justice to achieve the overlapping consensus Rawls seeks to undergird stability. Rawls assumes that “justice as fairness” is capable of commanding the kind of support a theory of justice needs to provide stability. He further assumes that, in a well-ordered society, citizens see themselves as fully cooperating members of society over their whole life. The terms “reasonable” and “fully cooperating” mean that people will see the two principles of justice as moral principles, abide by their outcomes, and use them in choosing and revising their conceptions of the human good.

Rawls’s theory is vulnerable to a question that “justice as fairness” leaves unanswered: how could the second principle maximize people’s long-term expectations when all Rawls expects from the state is the allocation of a social minimum? This question leads to a problem that haunted the Rawlsian view. In both *Theory* and *Political Liberalism* Rawls accepts that his well-ordered society is compatible with the existence of large economic inequalities. As long as the constitutional essentials are preserved and the difference principle is in operation, these inequalities will not tarnish the moral character of a Rawlsian society. Though the issue of large inequalities is present in *Justice as Fairness: A Restatement*, Rawls introduces the following modification. Instead of writing about maximizing the long-term expectations of the least advantaged over the long run, he writes about “an appropriate interval of time” in which the expectations mentioned above should be maximized.

Other theories of justice. Though John Rawls's theory of justice set the context for discussions of justice in the last three decades of the twentieth century, it was not the only theory advanced. Ronald Dworkin developed his own theory that he calls "Equality of Resources." This theory insists that, without the need of resorting to an original position, people ought to be aware of the true cost of their life-plans for other people, and to be willing to redesign these life-plans when they go beyond the fair share of resources available to all citizens. Unfortunately, Dworkin is not clear about the criteria and the institutions that will decide what a "fair share" of resources is and when the individual is taking more than what this "fair share" demands. Iris Marion Young brought to the fore an alternative conception of justice that relies not on an abstract equality but on the recognition that different groups have different needs and, accordingly, may require unequal allocations of public resources. At first sight, this view seems to reject the universal understanding of justice that imbued the Rawlsian philosophy, but, ultimately, Young advocates general rules of justice to regulate the competing interests of a group-based politics.

Communitarianism and Liberalism

During the 1980s, the American conception of justice revolved around the conflicting arguments of liberalism and communitarianism. The ensuing debates had at their core the role of visions of the human good and the question of how the individual's identity is formed, and not issues of distributive justice. Michael Walzer, Michael Sandel, and Alasdair MacIntyre stood out as thinkers who challenged the Rawlsian view and its design of a situation in which selves who are bereft of any contingent traits are expected to arrive at a universally binding agreement on justice. On this issue, the communitarian side won the day. Rawls admitted that the parties to the original position are representatives of democratic citizens, thus introducing a substantial element of contingency into his assumptions. On the further issue of the need of shared values to sustain a just order, the communitarian standpoint also prevailed. Rawlsian justice obtains guidance and derives its principles from the common values that distinguish the constitutional democracy of the United States.

But for all its insistence on how conceptions of the human good ought to guide visions of justice, communitarianism did not muster enough theoretical resources to deal with the fact that, in contemporary societies, multiple and opposing views of the human good are fated either to accept one another or to compete for supremacy via state power. This is not to say that the different versions of political liberalism articulated, among others, by John Rawls and Charles Larmore, fared better. In Rawls's and Larmore's theories, the agreement on principles of justice has an important rider. The agreement is only concerned with people who may hold reasonable conceptions of the human good. And a reasonable conception is one that accepts the principles of justice. Communitarianism excludes conceptions of the human good at variance with the dominant views of a particular society, and contemporary liberalism excludes comprehensive doctrines that justice has not certified as reasonable. Yet, the liberal argument that, in a context

ridden by conflictive ideas, an agreement on principles of justice is more feasible than one on a conception of the human good, remains unassailable.

The end result is circularity, which according to Richard Rorty is the most that can be expected in a world devoid of ultimate foundations. Individuals ought to justify their principles, Rorty argues, not by invoking a transcendental realm or a universal or true morality, but by referring to those principles and institutions that have proven, so far, to provide stability and respect for people. A conception of justice should be described by making reference to its outcomes, and these outcomes ought to be described by referring back to the principles of justice.

Michael Walzer was the only philosopher who put forward a communitarian version of justice. Walzer's theory distances itself from the Rawlsian paradigm by positing a diversity of social goods that obtain their meaning from their society and inhabit different social spheres. These spheres are not meant to cross their boundaries. The sphere of need is not the sphere of desert and, accordingly, they should not be judged according to a single criterion. Similarly, a social good in one sphere should not carry any import in another or, in Walzer's words, should not be "convertible." Wealth in the economic sphere should not be translated into more political power or access to better health care. He calls his theory "complex equality" as a contradistinction to "simple equality," which is the term he uses to describe Rawlsian justice. In simple equality, the state needs to intervene frequently to curtail any hindrances that may undermine the difference principle. In complex equality, "the autonomy of distributive spheres" is vindicated, and individuals, not the state, would have "local monopolies," but social conflicts would be diffused across the social and political spectrum. Local monopolies refer to the goods some people may control. Physicians, through their education, experience, and talents, control their areas of expertise. But it does not follow that this monopoly entails power to determine people's needs. These needs ought to be defined by the community. "Equality," Walzer writes, "is a complex relation of persons, mediated by the goods we make, share, and divide among ourselves; it is not an identity of possessions. It requires then, a diversity of distributive criteria that mirrors the diversity of social goods" (p. 18). The demarcation of the spheres of justice will depend on the dominant morality of a particular society. While Rawls argues that his arguments belong in the realm of ideal theory, Walzer goes into historical examples to buttress his theoretical reflections.

Moral Context of Justice

The last word on the moral context of justice in American thought might belong to William Connolly and Alasdair MacIntyre. Connolly defends an agonistic ethos in which a person's identity, the same identity that the Puritans saw as fixed by God's grace, could recognize its contingent character. In this recognition, Connolly sees a conversation in which cherished assumptions about the individual's character and the United States' foundations would be open to redefinitions and negotiations. MacIntyre did not feel at home in this conversation, which in his view is sequestered by a liberal marketplace

of ideas regulated by justice. In his discussion of virtue, he envisages a rather dark horizon for the American intellectual landscape. Current times, he argues, are analogous to the era when the Roman Republic dwindled and finally fell. As in those times, citizens should retreat from the public sphere and move to small communities that may share the same conception of the human good. This, again, is the fragmentation that has been a constitutive element of the American landscape. Rawls himself is not free from the suspicion that his theory, though envisioning a stable interplay between a multiplicity of social unions, is ridden, too, by a fragmented ethos.

Indeed, Rawls's theory treads its way along two paths that are prone to deny one another. There is a strong sense of community to the extent that members of particular groups see their worth as being determined by the appreciation they receive from others. For self-esteem, in Rawls's view, does not depend on the individual's convictions, but on the external approval of his or her peers. This is similar to Winthrop's understanding of love, which is an "apprehension of some resemblance in the things loved to that which affects it . . . soe a mother loves her childe, because shee throughly conceives a resemblance of herself in it" (p. 37). As in the Puritan context, the Rawlsian sense of community requires clear delimitations. Since a Rawlsian society may have large inequalities that, through envy, may bring havoc to stability, the plurality of associations comes to the rescue. These associations tend "to reduce the visibility, or at least the painful visibility, of variations in men's prospects. . . . The various associations in society tend to divide it into so many noncomparing groups, the discrepancies between these divisions not attracting the kind of attention which unsettles the lives of those less well placed" (Rawls 1971, p. 537).

From John Winthrop's message that the rich and the poor ought to accept their place as part of a divine order, to the Federalist recognition of the unavailability of factions, the anti-federalist advocacy of a fragmented legislature, and John Rawls's call to avoid the "painful visibility" of "variations in men's prospects" by dividing society into "noncomparing groups" that would not intersect in their respective paths, unity and fragmentation stand as consistent strands in the way justice has been woven into the inner fabric of American thought. In this consistency, "justice as fairness" appears as a dim echo of the arguments John Winthrop put forward aboard the *Arabella*.

JUSTICE IN EAST ASIAN THOUGHT

East Asian thought should include a wide range of Japanese, Korean, and Chinese concerns covering more than twenty-five hundred years of history. This article is limited to the Chinese sphere, and its primary focus is on the preimperial period (before 221 B.C.E.).

How issues related to justice have appeared in the preimperial Confucian (“Ruist”) and Daoist traditions involves both historical and philosophical investigation. While penal codes (“corrective justice”) were enforced even by the ancient sage, Confucius (Master Kong; 551 B.C.E.–479 B.C.E.), the political emphasis of Confucian scholars in general was to support an elitist system where humane forms of fairness provided flexible standards for determining the appropriate distribution of opportunities and goods (“distributive justice”) and so sought to lessen the need for corrective justice. Early Daoist philosophical texts advocated an alternative way, something like a benign form of anarchism. Their rulers would be compassionate, frugal, and unobtrusive, allowing every person within the kingdom to follow the Way (*Dao*) in a spontaneous and uncontrived manner.

In what follows, central themes and institutions related to justice that appeared within Confucian and Daoist teachings in preimperial China will be explained and evaluated, followed by brief comments about later developments.

Preimperial Confucianism

Three persons stand out as fulcrum figures in preimperial Confucian developments: the pioneer sage, Confucius; the apologist, Mencius (Master Meng; c. 371 B.C.E.–c. 289 B.C.E.); and the secular rationalist, Master Xun (Xunzi; active c. 298 B.C.E.–c. 230 B.C.E.). While the influence of Confucius’s life and teachings overshadows the other two, the latter pair produced more systematic worldviews, including questions related to justice that continue to have historical significance.

Confucius, or “Master Kong.” Records about political policies and concepts in ancient China began at least five hundred years before Confucius, but his teachings provided the first philosophical basis for its ideological and institutional development. His political vision rested on these earlier sagely antecedents but sought to provide moral and political justifications for reestablishing the monarchical form during his own instable age. Conceiving of a ritually articulate group of intellectuals who could balance the interests of smaller political states and establish a larger and harmonious kingdom, Confucius promoted cultivated humaneness (*ren*) as the necessary cultural foundation for the king, government ministers, and his people. Any person who achieved this exemplary status knew how to properly subdue selfish interests in order to perform ritually appropriate services according to their given roles and duties (*Analects* 12:2). All these ritual actions (*li*)—whether among humans or toward spirits including a supreme deity known as “Heaven”—were consequently conditioned upon a sense of rightness (*yi*). Propriety between humans should always seek an appropriateness intuited through analogical projection (*shu*) and faithful consistency (*zhong*). Embodied in these two methods was a generalized sense of

Tzu-lu said, “If the Lord of Wei left the administration of his state to you, what would you put first?” The Master said, “If something has to be put first, it is, perhaps, the rectification of names. . . . When names are not correct, what is said will not sound reasonable; when what is said does not sound reasonable, affairs will not culminate in success; when affairs do not culminate in success, rites and music will not flourish; when rites and music do not flourish, punishments will not fit the crimes; when punishments do not fit the crimes, the common people will not know where to put hand and foot.”

SOURCE: Confucius, *Analects* 13:3, translated by D. C. Lau (Harmondsworth, U.K.: Penguin, 1979).

personhood, though ancient traditions indicate how Confucius recognized limitations in their application to women, slaves, and angry persons (*Analects* 14:34, 17:25).

Some scholars feel that this account of ritual-based personhood offers a generalizable humane alternative to modern human-rights-based litigation. So, for example, while Confucius did mediate in litigations (*song*), he sought to create social conditions where they would not be needed (*Analects* 12:13). In defining the roles of rulers and ministers, he de-emphasized punishments (*xing*), seeking that they humanely fit the crimes rather than produce fear of authority (*Analects* 2:3; 4:11; 13:3). Nevertheless, later Confucian teachings in the *Book of Rites* advocated moral justifications for blood-revenge as a putative principle supported by Confucius, illustrating limits to this elitist form of fairness in later imperial history.

Mencius, or “Master Meng.” Political justifications for humane government were explored at greater length in the *Mengzi*, a work named after Mencius. Cultivated humaneness and rightness became twin virtues grounding all moral and political life, nurtured initially in familial relationships and extendable into other appropriate social ties. Both virtues were intended to be augmented by wise elaborations, ritual articulateness, and harmonious music (*Mengzi* 1A:7; 4A:27). Significantly, a society dominated by a humanely cultivated lifestyle would entail in Mencius’s philosophy various claims and liabilities within relationships, even to the extent that a tyrannical ruler could be resisted and justifiably deposed (*Mengzi* 1B:1, 3). Maintaining rightness (*yi*) was more important than life itself, whenever dilemmas forced a choice between them (*Mengzi* 6A:10). In this emphasis there are tendencies toward asserting a humanely inspired form of social justice, based on a positive account of human nature.

According to Mencius, all persons are defined as humans because they possess four basic moral sensitivities without which they could not appropriately participate in human society: compassion, shame, respect or yielding, and discerning between right and wrong (*Mengzi* 2A:6; 6A:6). When these inward sensitivities are nurtured into full-fledged virtues (humane cultivation, rightness, propriety, and wisdom), any willing person becomes exemplary and may attain sagely status. Once these virtues are embodied in exemplary persons and leaders, social obligations are fulfilled and beneficent forms of government can be realized and sustained. The crucial social transformations they would inspire would be nurtured by worthy officers and cultivated scholars. This would result in a harmonious society expressing just and accountable relationships.

Mencius also offered details about how this elitist form of social justice would operate. He envisioned opportunities for fair treatment by providing public education and coordinating publicly and privately owned farming, so that government institutions were sustained by appropriately cultivated personnel and sufficient material resources, and no one family was overburdened by taxes. While there is no indication that these institutions were ever realized in his own time, they do reveal how Mencius's philosophy could bear a populist flair. Never democratic in polity, his political philosophy manifested demophilic (*minben*) principles of regal concern for commoners, and so set limits to any ruler's authority by arguing for these moral restraints within a kingdom.

These early Confucian scholars promoted justice as arising from virtues cultivated among a chosen elite, in some ways like Plato's conception of a righteous city-state in his *Republic*. Aristotle's support for limited democracy also suggests that justice should produce harmony between different classes within society, but these early Confucian philosophers preferred monarchy, and their vision of social harmony was not worked out in detail. Both early Confucian and Greek visions of social justice rely on rational criticisms and selective adoptions of received traditions, but the former relies more heavily on sagely precedents, while the latter promoted rational development through education and practices leading to ethical competence. Clearly, the predominance of a rational method and rationalized ideal of human nature in Plato's discussion is qualified by the early Confucians' multidimensional account of human nature based on a harmony of emotive and rational constituents. Here Aristotle and these early Confucians have much in common, but Aristotle retains a preference for rationalized understandings of ethics and social justice, while the Confucians placed more emphasis on basic emotional sensitivities. All of them nevertheless agreed that the best form of society would be achieved through the guidance of cultivated rulers imbued with the virtues they promoted.

Master Xun. Unlike previous Confucian philosophers, Master Xun conceived of ritual and role attunements as a result of teaching rather than of internal personal cultivation, so that sociocultural values were inculcated rather than nurtured from within. Believing that human beings were naturally bad, Master Xun highlighted the roles of cultural change agents—sages, teachers, good friends—in educating willing persons. He explained

differences in cultivated attainments and social roles as a result of different intellectual capabilities and various degrees of courage (*Xunzi* 23). Consequently, his account of *yi* aligns well with Platonic understandings of justice: an enlightened ruler (*ming jun*) must clearly distinguish class divisions and their appropriate roles, supporting them by ritual principles, righteous laws, and uniform administrative policies (*Xunzi* 10). Standards of distributive justice, while providing certain privileges to the elite leadership class, operate generally under utilitarian conditions: the whole society (*qun*) is always more important than the ruler or any other member or clique within it. Consequently, what is good is “correct, in accord with natural principles, peaceful, and well-ordered”; what is bad is “wrong through partiality, wickedly contravenes natural principles, [is] perverse, and rebellious” (*Xunzi* 23). These standards are also applied economically in considering distribution of limited resources, fully recognizing that the ruler and the people will either thrive or devolve together because, even in spite of their class differences, each one constitutes only a part of the social whole.

Master Xun manifestly employs a more rationalized methodology in accounting for varieties in human personalities, social classes, and roles, as well as the methods for attaining and maintaining social order. In spite of his utilitarian standards for administering distributive justice, his use of criminal justice is still inspired by a humanely cultivated ideal, that all persons can ultimately be transformed and become sagely. In this way he balances punitive and distributive justice by means of a rational appeal to a more secularized, but still firmly ritually oriented, form of harmonious society.

Given the importance of ritual orientations for Confucian society, women and slaves seem clearly to have been relegated to subservient roles in many settings. Ritual formalization became complete in the imperial period, greatly influenced (somewhat paradoxically) by the female politician Ban Zhao (c. 48–c. 120). These restrictive rites and their attendant values set the stage for later nonegalitarian developments.

Preimperial Daoism

Both the historical identification of Old Master (Laozi) and the nature of the famous Daoist text normally associated with him, *Dao de jing*, have become controversial topics of debate. Rather than some ancient text scripted by a mysterious pioneering recluse, the book of *Laozi* is now generally associated with the same period as the *Zhuangzi*, appearing during the fourth century B.C.E. Nevertheless, political themes are a major aspect of the eighty-one chapters of this Daoist scripture, whether in its standard or earlier forms. In the case of the *Zhuangzi*, it is the first seven chapters of the book that are considered most representative of the historical person, Master Zhuang (c. 369 B.C.E.–286 B.C.E.). These early Daoists' views of society have been put into sharper contrast by developments within the so-called Huang-Lao school occurring in the fourth and third centuries B.C.E., which provided mediating and positive social doctrines carrying much influence during the early imperial period.

Dao de jing and the Zhuangzi. The form of social justice found in the *Dao de jing* has been described as a benevolent

anarchism, but in fact it does speak of sagely rulers and supports some overriding moral and political values within Dao-centered communities. Taking spontaneity and noninterference as major principles of communal life, the text vigorously opposes artificial impositions of Confucian elitist values (such as sageliness, wisdom, humaneness, rightness) or other utilitarian interests (such as military aggressiveness or social benefits), since all of these are considered to be contrived restraints that harm the people (ch. 19). Instead it urges all, including the ruler, to have “little thought of self and as few desires as possible.” Under these conditions, people will be able to lead Dao-centered lives without interference, being naturally kind and faithful, and so will become self-transformed. Whether a large or small political state, each takes a “lower position” (ch. 61) and so they become harmonized through mutual responsiveness rather than aggressiveness. Images of an ideal state suggested that the people would live simply, being contented with what they have, and so may even live and die in a place without ever leaving it (ch. 80). This is because a Daoist ruler would be exemplary in embodying “three treasures”: compassion, frugality, and “not daring to take the lead” in the community (ch. 67). So unobtrusive is this way of ruling that people would feel all things move naturally, and would only know the fact that the ruler is there. Any other form or ruling (whether by charisma, fear, or rules) could not achieve the personal peace and social harmony that the Daoist ruler attains by unobtrusive and spontaneous action (*wu wei*). Daoist justice of this sort is therefore manifest in stoic-like naturalness, for the Way will be followed by avoiding extremities and learning the paradox that greater and lasting strength lies in what is putatively weak. Guided by sympathetic and frugal leadership, people living within Dao-centered communities would be unconcerned about any rationalized worldview and its attendant values, such as penal codes and rules regarding possessions. Among other values promoted by Daoists, feminine qualities were raised to a new height, defining the fecundity of the Dao in maternal terms. As a consequence, roles for women and feminine values in general were enhanced within early Daoist circles, but this would change later when Daoist religious ethics gradually adjusted to Confucian precedents.

In the *Zhuangzi* there is a vigorous skepticism at work, challenging any attempt to go beyond the principle of noninterference. Expressing sarcastic opposition toward government and other social institutions, the “Inner Chapters” (the first seven chapters) view these matters regularly from a transcendent perspective. Narrow pettiness and self-inflicted harm are the regular results of government policies. This is a Rousseau-like vision: humans who follow the Way can be free and creative, but society has imposed institutional shackles that make this impossible. As a consequence, Master Zhuang supports a more anarchistic vision of a simple life expressed in radical egalitarianism, letting everyone live by means of the Way according to their own inclinations and without external restrictions.

The Huang-Lao school. Archeological discoveries in the 1970s stimulated further consideration of another facet of Daoist reflection, one that developed more positive doctrines of governance and rightness. Living about the time of Masters

Zhuang and Xun, intellectuals from the state of Qi developed a mediating approach to earlier Daoist doctrines. They understood the secret of life and governance by responsiveness to proper timing, and so sages and institutions must be responsive to the natural changes that occur over time. Consequently, institutions that are outdated (such as Confucian rites) should be reformed to become suitable. Their worldview included the idea that laws and institutions could emerge from an understanding of the Way, and would necessarily reflect the needs of people as well as historical change in society. Political life continued to assert that the ruler be spontaneous and unobtrusive, but this was because appropriate institutions and laws were in place, and ministers were taking care of the administrative details associated with them. In this way, the Huang-Lao tradition advocated a version of justice closer to the position of Master Xun, but without its rationalized and utilitarian emphases.

Subsequent Developments

Once the Qin dynasty was established and a greatly enlarged Chinese imperial state was brought into being (221 B.C.E.), standards of ethical and political life shifted gradually from legalistic and Huang-Lao forms of life to a dominant Confucian cultural standard. For most of the 2,200-year-long imperial period, Confucian advocates dominated the political arena. Nevertheless, the Huang-Lao school did have a revival and development during the third and fourth centuries, especially as seen among the writings of “neo-Daoists” or advocates of Abstruse Learning (*Xuánxué*). They envisioned the “lone transformation” (*dubua*) of all persons, developing a theme advocated by Master Zhuang. This included a radical form of egalitarianism, but also advocated a reformist vision of changing institutions according to the times and conditions of life.

The most outstanding contributions to Confucian traditions came during the Song dynasty (ninth to twelfth centuries). Confucian scholars then promoted a form of political justification that based all social values on heavenly patterns (*tianli*), resembling many aspects of a natural-law system of ethics and governance. Justice was then determined by alignment with patterns of heavenly harmony and was rationalized in a rigorous manner by Zhu Xi (1130–1200), whose interpretive precedents became the standard Confucian teachings for much of the subsequent seven hundred years. Under these more expansive cosmological influences, the roles of women became framed within a set of more subordinate conditions associated with universal symbols systematically denoting the passiveness and receptivity of earth, flexibility, coolness, fecundity, and hiddenness. Family rituals were established by Zhu Xi that formalized these relationships in a manner that reflected patriarchal values and that had been less systematic during earlier centuries. Though mothers in particular were highly honored within systems of filial allegiance, their own roles within the family were largely restricted. This became all the more entrenched in general society during the Ming and Qing dynasties (fourteenth to early twentieth centuries).

Alternative Confucian visions included remarkably advanced democratic ideals opposing imperial policies in Huang

Zongxi's (1610–1695) writings—ideals that were never realized and became justifications for revolution in 1911—and the utopian egalitarian vision of a great commonwealth (*datong*) advocated by the influential reformer, Kang Youwei (1858–1927). This latter vision was unusual in both its pseudoscientific idealism, promoting government-sponsored eugenic reconstructions of human societies, and its advocacy of a radical egalitarian worldview based on a relatively hedonistic ethic, thus offering much more freedom to women than had been previously considered proper or feasible.

Law and Justice during the Ming and Qing Dynasties

Legal codes during the last two dynasties of imperial China were framed under values undergirding patrifamilial order and class differences. In principle, lands belonged to a family in perpetuity, but when faced with the need for survival many commoners sold these lands under leases that often brought privilege and power to the already wealthy. Courts did uphold reclaiming these properties, as a form of traditional justice, when the previously needy families had overcome their difficulties, but otherwise debts were in principle to be paid. Only in the case of economic desperation, hinging on basic survival, were compromises reached, mostly outside of court. These compromising tendencies, however, led to situations in which women could be sold as daughters, wives, or widows in order to raise adequate funds to meet basic needs. Though a woman might be able to return to her natal home if other needs were demonstrated, she was seen always as a passive agent in a social context where men's choices dominated. So, for example, a married woman could be expelled from marriage and sent to her natal home for seven basic reasons under these patrifamilial assumptions: barrenness (especially, bearing no male child), licentiousness, negligence in the care of her parents-in-law, talkativeness, theft, jealousy, and chronic illness. Though female virtues could also be employed legally to protect a woman's dignity, such an endeavor regularly required extensive evidence, and the burden of proof was often costly in both social and personal terms. In this regard, traditions generally supported patrifamilial structure, so that women were disadvantaged in inheritance, personal choices, and political options. Major legal changes in these areas began to take place only after 1911 with the advent of republican China.

K

KANTIANISM. The philosophy of Immanuel Kant (1724–1804) radically transformed the rationalism and empiricism of the seventeenth and eighteenth centuries and has set many of the problems for epistemology, metaphysics, and philosophy of science, moral and political philosophy, aesthetics, philosophy of history, and philosophy of religion ever since. Almost all philosophy after Kant could be divided into either “Kantianism” or “anti-Kantianism,” but it is natural to reserve the term *Kantianism* to designate the philosophy of Kant himself, his immediate followers, and a variety of movements in the late nineteenth century and the twentieth century that have explicitly identified themselves with Kant.

Immanuel Kant

Kant developed his philosophy after thirty years of reflection on foundational problems in contemporary natural science; on the rationalism of René Descartes (1596–1650), Gottfried Wilhelm Leibniz (1646–1716), and Christian Wolff (1679–1754); on the critique of rationalism by Christian August Crusius (c. 1715–1775) and David Hume (1711–1776); and on the political and educational views of Jean-Jacques Rousseau (1712–1778). Kant presented his mature views in the *Critique of Pure Reason* (1781, substantially revised in 1787), the *Critique of Practical Reason* (1788), and the *Critique of the Power of Judgment* (1790); in the *Prolegomena to Any Future Metaphysics* (1783) and *Groundwork of the Metaphysics of Morals* (1785); in two detailed works applying his general principles, the *Metaphysical Foundations of Natural Science* (1786) and the *Metaphysics of Morals* (1797), comprising a “Doctrine of Right” and a “Doctrine of Virtue”; and in polemical works such as *Religion within the Boundaries of Mere Reason* (1793), a bold argument that the central concepts of Christianity can have only symbolic value for pure reason, and *The Conflict of the Faculties* (1798), an argument for the freedom of philosophical thought.

In these works, Kant argued that both ordinary experience and natural science rest on informative but certain principles, or “synthetic a priori cognitions,” such as that every event we can place at a determinate position in time must be linked to antecedent events by causal laws, which we can explain only by supposing that they reflect the forms of our own thought, in particular the spatial and temporal forms of our intuitions or perceptions and the logical categories of our understanding that we impose on our experience. But by the same token, these forms of intuition and thought can determine only how things appear to us, not how they are in themselves (Kant called this doctrine “transcendental idealism”). Kant then ar-

gued that when we conceive of the soul, the world as a complete whole, or God, we overstep the limits of our sensory perception and can have no genuine knowledge of such things.

However, the gap between appearance and things in themselves that explains the certainty of the application of the fundamental principles of our knowledge to the former also makes it at least possible for us to conceive of, if not know, the latter, particularly to conceive of ourselves as being free to make moral choices that may seem inconsistent with the determinism of our actions in the empirical world and of a God who is the author of laws of nature that are ultimately consistent with the laws of morality. Kant argued that the latter are given by our own pure practical rather than theoretical reason and that we can know them without any appeal to God; the laws of morality are discerned by pure reason as necessary to achieve autonomy, the independence of our actions from determination by the mere inclinations of ourselves or others.

Kant then argued that the fundamental principle of justice is that each person must be allowed the maximal freedom of action consistent with a like allowance for all others and that we have ethical duties to promote the free and effective use of our capacities to set and pursue our own ends and those of others, which cannot be coercively enforced within the political sphere. Finally, Kant argued that our pleasures in the beautiful and the sublime are experiences of the disinterested freedom of the imagination from constraint by the direct demands of science and morality, but also that as an experience of freedom of the imagination, aesthetic experience is indirectly conducive to moral and political development. He also argued that a teleological view of nature as a purposive system, while of merely heuristic value for the pursuit of natural science, is also a morally valuable perspective on the world and our place within it.

First Response

Kant’s work immediately produced both acclaim and hostility. It was first popularized by the 1786 *Letters on the Kantian Philosophy* by Karl Leonhard Reinhold (1757–1823), but by 1789 Reinhold had turned against Kant’s dualisms—his distinctions between sensibility and understanding, between appearances and things in themselves, and between theoretical cognition and practical reason—and initiated the attempts to derive all of philosophy from a single principle that would be taken up in the “absolute idealism” of Johann Gottlieb Fichte (1762–1814), Friedrich Wilhelm Joseph Schelling (1775–1854), and Georg Wilhelm Friedrich Hegel (1770–1831). Other thinkers remained closer to Kant, especially the poet

and historian Friedrich Schiller (1759–1805), who, in “On Grace and Dignity” (1793) and the *Letters on the Aesthetic Education of Mankind* (1795), argued for a greater confluence between our inclinations and our moral principles than Kant thought possible without being tempted by the monism of the absolute idealists. Johann Wolfgang von Goethe (1749–1832) was also deeply affected by Kant’s third critique in the development of his own conception of nature.

Neo-Kantianism

Hegel’s dominance of German philosophy in the 1820s through the 1840s ended the first wave of Kantianism, but the version of Kantianism propounded by Arthur Schopenhauer (1788–1860) in the *Fourfold Root of the Principle of Sufficient Reason* (1813) and *The World as Will and Representation* (1818) became influential after 1848 and prepared the way for a tremendous resurgence in the influence of Kant in German philosophy beginning in the 1860s. The “neo-Kantian” movement begun at that time dominated German philosophy until the 1920s. This movement took many forms. The scientist Hermann Helmholtz (1821–1894) gave a psychological interpretation of Kant’s conception that the mind brings its own innate structure to perception, which influenced research into perception well into the twentieth century. But within academic philosophy, the two main forms of neo-Kantianism were the Marburg and Heidelberg schools.

The main representatives of the Marburg school were Hermann Cohen (1842–1918), Paul Natorp (1854–1924), and Ernst Cassirer (1874–1945). Cohen made his reputation with a series of commentaries on Kant’s three critiques, published between 1871 and 1889, and then with his own system of philosophy, published between 1902 and 1912. He also published *The Religion of Reason out of the Sources of Judaism* (1919), an influential work on Judaism modeled on Kant’s *Religion*. Cassirer’s main work was the three-volume *Philosophy of Symbolic Forms* (1923–1929; trans. 1953–1957 with a fourth volume posthumously published in 1996). The Marburg school developed Kant’s idea that we bring to both ordinary experience and more formalized science presuppositions reflecting the structure of our own thought; but especially by the time of Cassirer the school also recognized that we bring a multiplicity of such principles to our experience and that they may change over time. Cassirer’s views were to some extent paralleled by those developed by the British philosopher Robin George Collingwood (1889–1943) in his *Essay on Philosophical Method* (1933) and *Essay on Metaphysics* (1940), although Collingwood did not call himself a neo-Kantian.

The chief representatives of Heidelberg neo-Kantianism were Wilhelm Windelband (1848–1915) and Heinrich Rickert (1863–1936). They stressed Kant’s distinction between the principles of theoretical and practical reason and focused attention on our projections of values as well as knowledge into our experiences. Rickert developed the philosophical views of the school in *The Limits of Concept Formation in Natural Science* (1896–1902; trans. 1986) and *Science and History* (1899; trans. 1962). Both Windelband and Rickert also stressed the difference between the methods of natural science and history and thereby greatly influenced the methodological thought of

the sociologist Max Weber (1864–1920), especially his theory of “ideal types” and his distinction between fact and value in the practice of social science.

Kant in the Later Twentieth Century

Kantianism in the early twentieth century was not limited to the self-designated neo-Kantian schools, however. The 1928 *Logical Structure of the World* (trans. 1967) by Rudolf Carnap (1891–1970) was clearly a modernization of Kant’s theory of our application of the forms of logic to the raw data of our experience, as was the nearly contemporaneous *Mind and World Order* (1929) by the American Clarence Irving Lewis (1883–1964), who was himself influenced by the many Kantian elements in the works of Charles Sanders Peirce (1839–1914). The main revival of interest in Kant in the Anglo-American world came after World War II, however. In Britain, a great revival of Kantian philosophy was stimulated by two books by Sir Peter Strawson (1919–), *Individuals: An Essay on Descriptive Metaphysics* (1959) and *The Bounds of Sense: An Essay on Kant’s Critique of Pure Reason* (1966). Strawson based his appropriation of Kant on a theory of meaning, arguing that a subject can apply the concept of his own self only in contrast to a concept of an objective world, while Jonathan Bennett (1930–) stayed closer to Kant in his *Kant’s Analytic* (also 1966), arguing that it is our judgments about our own experience that can be confirmed only within a structure of judgments about the external world.

The work of Strawson and Bennett initiated a major debate about “transcendental arguments” in the United States as well as Britain that continued into the twenty-first century. Meanwhile, in the United States interest in Kant was independently inspired by the work of Wilfrid Sellars (1912–1989), whose famous attack upon the “myth of the given” in his “Empiricism and the Philosophy of Mind” (1956) was clearly intended as an alternative to C. I. Lewis’s version of Kant and whose *Science and Metaphysics: Variations on Kantian Themes* (1968) presented a Peircian version of Kant using the resources of contemporary philosophy of language.

The strongest influence of Kant on contemporary philosophy, however, was mediated by the political philosopher John Rawls (1921–2002), whose *A Theory of Justice* (1971) was Kantian in both method and substance. Rawls argued that principles of distributive justice should be chosen in an “original position” of impartiality that models Kant’s conception of universality and that the principles that would be so chosen would prioritize equal liberty over other forms of equality, reflecting Kant’s emphasis on autonomy as the fundamental moral and political value. Rawls’s work has inspired a great deal of further work on Kantian moral and political philosophy in Britain and the United States and has also been influential in Germany, although there an independent version of Kantianism, the theory of Jürgen Habermas (1929–) that political principles should be chosen in an “ideal communicative situation” has also been widely influential.

KINSHIP. See **Monarchy.**

KINSHIP. Kinship—which can be initially described as the study of the links between people established on the basis of descent, marriage, or adoption—has been a defining domain of anthropological investigation since the inception of this discipline in the last twenty years of the nineteenth century. The detailed description of the complexities of kinship systems was for many decades considered essential to the understanding of non-Western societies. This field went through an intense phase of restructuring from the end of the 1970s to the late 1990s as a result of major paradigmatic shifts within the discipline of anthropology, such as the cultural turn, feminism, and political economy. In the early twenty-first century kinship studies, profoundly redefined, have experienced a re-

vival, also in light of tremendous technological changes, such as the emergence of new reproductive technologies, the development of genetics, new family forms, the gay and lesbian movement, immigration, globalization and such correlated phenomena as transnational adoption that have opened new frontiers to anthropological investigation.

The publication of *Systems of Consanguinity and Affinity* (1870) and *Ancient Society* (1877) by Lewis Henry Morgan have traditionally been recognized as steppingstones in the history of anthropological kinship. In line with his evolutionary thinking, Morgan saw kinship as a social institution identifying the earlier steps of societal organization. In other words, kinship was presented as the epicenter of so-called primitive societies' social organization. According to this line of reasoning, kinship was less central in modern societies. Territoriality, the social contract, and the state dominated modern society. As a result, politics and the economy, as distinct fields of social action, regulated important aspects of modern women's and men's lives. Morgan's work is representative of a certain understanding of what were then called primitive societies. He saw them as societies based on blood (kinship), a view that dominated anthropology until the early 1970s. Morgan also established the approach that would characterize anthropological studies of kinship for several decades; that is, the emphasis on kinship terminology and the partition of kinship as a field in a number of constitutive "blocks"—that is, descent, marriage, postmarital residence, inheritance, and so on.

Kinship maintained its centrality in the history of the discipline until the cultural turn in anthropology in the 1970s. Kinship was indeed a central theme of investigation within functionalist and structuralist paradigms. Kinship allowed scholars to answer some fundamental sociological questions. It offered a plausible explanation of the problem of the maintenance of social order in the absence of state-based organizations. Indeed, anthropological knowledge came to question a well-established tradition of Western political thought that had identified in the state the only viable solution for the maintenance of social order and discipline.

One major systematic trend within the traditions of kinship studies is represented by descent theory, the dominant paradigm until the mid-1960s (Kuper, 1982). Classic examples of this approach are *African Political Systems*, *The Nuer*, and *The Political System of the Anuak*. Proponents of descent theory presented non-Western societies as based on their kinship organization. According to this view, a person's place in society was largely determined by his or her position within the kinship system. Crucial was the determination of an individual's position within the line of filiation privileged by a given society (descent). Anthropologists singled out various principles of descent—unilineal with its patrilineal (through the father's line) and matrilineal (through the mother's line) variants and double (through both lines of descent). Non-Western societies were seen as emphasizing one particular line of descent whose analysis was believed to unpack their social mechanisms and account for the maintenance/reproduction of the social order. Thus in the classic studies of the Tallensi (e.g., Fortes, 1949) or the Nuer (Evans-Pritchard, *The Nuer*, 1940),

the modalities of kinship organization and the functioning of descent as a structuring principle were presented as central to understanding these societies, their boundaries, and their internal equilibrium.

Key within functionalist and structural-functionalist approaches was the distinction between de facto descent (biological descent) and de jure descent (the lines of descent a society effectively recognized). In other words, anthropologists distinguished between facts of nature and the selection or play with natural facts of which each kinship system was the recognized expression. Each society was seen as characterized by an emphasis on certain genealogical links and a disregard for others. Thus in a matrilineal society a father's position was generally perceived as marginal. Meanwhile a mother and her relatives, in particular the mother's brother, were seen as the center of a child's social life and largely determine his or her future prospects.

Many functionalists and structural-functionalists claimed to investigate the domain of the social as separate from other domains of social analysis, namely the biological and the psychological. Building on the work of French sociologist Émile Durkheim, they were concerned with the delimitation of objects and methods of enquiry exclusive to the social sciences (with some notable exceptions, of course, such as Bronislaw Malinowski and his theory of needs and corresponding cultural institutions). Despite their intentions, later research has demonstrated that they were often unaware of the biologism that tainted some of their own theoretical constructions. As David Schneider and other anthropologists after him have highlighted, the realm of nature (natural kinship) was left out from traditional anthropological accounts. Yet each kinship system, with varying degrees of adherence, was seen as reflecting certain aspects of the natural order, but the latter was taken as a given and thus unquestioned realm. However, conceptions of nature and its relations to culture vary and change over time, across and within societies. An important contribution in this direction was constituted by the publication of *Nature, Culture, and Gender* by Carol MacCormack and Marilyn Strathern in 1980, which showed the inapplicability of Western dichotomies between culture and nature, men and women cross-culturally, and the historical variation of such constructs within the West.

As Janet Carsten (2004) has highlighted, anthropologists' study of kinship did not entail an interest in domestic life or other forms of connectedness aside from genealogical links, thus excluding the study of women, children, alternative forms of solidarity, or the more intimate aspects of sexuality from anthropological accounts. This gap can also partly be explained by the belief that non-Western people were deemed not to have an individualized Western sense of self but were seen as identifying with the collectivities they belonged to (read descent groups), with the latter seen as corporate entities (which found collective expression in their male elders). In addition, only the more public aspects of kinship (the so-called politico-jural aspects) were of privileged interests to anthropologists. Within kin-based societies, kinship defined people's economic, religious, and political rights and

obligations.

Claude Lévi-Strauss, the leading proponent of the structuralist turn in French anthropology and beyond, introduced in the 1960s a conflicting paradigm known as alliance theory. Influenced by structural linguistics, Lévi-Strauss turned his attention not to descent but to marriage, the latter interpreted as a system of exchange and communication. In his theoretical constructs marriage is presented as the matrix of the kinship social order. Marriage produces at once two fundamental classes of kin, consanguineal kin (blood relatives) and affinal kin (in-laws). In the course of marriage transactions, women “serve” as the vectors via which social alliances are established (a perspective whose androcentric bias feminist anthropologists will readily point out). By renouncing to marry their own sisters (via the imposition of the incest rule) and by agreeing to marry other men’s sisters outside of their own biological family, men establish the foundations of human society.

According to Lévi-Strauss, kinship marks the overcoming of the state of nature (determined by the rule of the biological) and the imposition of the cultural order by humans. In this sense kinship is a cultural universal—that is, something shared by all societies—although its content varies across cultures. By unpacking the systems of marriage and unveiling their deeper logic, Lévi-Strauss came to complement British anthropologists’ privileged attention on descent. However, his reliance on linguistic structuralism enabled him to further capture the symbolic quality of human life and distance himself further from the biologism of functionalist and structural-functionalist accounts.

An important turn in kinship studies was marked by the publication of David Schneider’s work. In *American Kinship: A Cultural Account* (1968) and *A Critique of the Study of Kinship* (1984), Schneider developed an important critique of the study of kinship, one that ultimately laid the foundations for contemporary approaches to the study of kinship. According to Schneider, kinship studies were mostly the expression of anthropologists’ ethnocentric biases and disciplinary preoccupations. The centrality of biological reproduction was indeed a character identifying Western perspectives on kinship. Indeed, within a number of other societies, such as the Yap of the West Caroline Islands, it is “hard work” that cements what we would call kinship ties, not biology. It followed that kinship as a field of study was the outcome of the biases of Western scientists who once carved out a predefined interpretive scheme based on their own experience of kinship and then proceeded to investigate other societies, thus missing local understandings of kinship and the relationship between social and natural aspects of kinship (as well as the usefulness of such categories in the analysis of a specific society/culture).

A number of lines of research emerged from this initially seemingly devastating critique. This of course happened after a critical reassessment of Schneider’s symbolic theory. Indeed, several aspects of this have been questioned by successive generations of anthropologists. Schneider’s view of culture as an integrated whole and his exclusive focus on symbols are now seen as too schematic and limited (Stone, 2004). Twenty-first

century anthropologists typically share a more complex and less bounded understanding of culture, an attention to practice and processes in addition to meanings, and a keen interest in the social construction of science (a topic left unresolved in Schneider’s writings as Carsten [2000] clarifies). Post-Schneiderian kinship is characterized by the inclusion of the study of Western kinship systems. This is partly due to the realization that an increased understanding of a researcher’s own cultural assumptions and social practices is a powerful strategy to come to terms with researchers’ biases, as well as changes in the object and methods of anthropological studies. In addition, nature is no longer taken for granted. Indeed, changing conceptions of nature and the varying relationships between culture and nature are regarded as central topics in order to understand kinship within Western and non-Western societies.

Post-Schneiderian kinship studies are often characterized by the insertion of kinship into a wider analytic field. Indeed, kinship studies have benefited from the insights of feminist anthropology, historical anthropology, and postmodern anthropology.

The feminist turn in anthropology in the mid-1970s (that is, the study of the much-neglected study of gender in a cross-cultural perspective) brought new life to anthropology as a discipline and to kinship studies in particular. The relationship between gender and kinship was the topic of Jane Collier and Sylvia Yanagisako’s edited collection *Gender and Kinship: Essays Towards a Unified Analysis* (1987). These authors argued for a unified theory of gender and kinship. Indeed, they suggested that gender relations and gender asymmetries are central to the understanding of kinship systems cross-culturally (see also Yanagisako and Delaney). For instance, how would one understand, within the patrilineal Bamana families of Mali, women’s differential positions and their limits and possibilities as mothers, daughters, and sisters if gender and kinship are not taken into consideration. The coupling of studies of gender, kinship, power, and inequality has contributed much to a renewed interest in anthropology. These studies also reflect the decline of the traditional separation between social studies and social activism, disclosing indeed a well-formulated agenda for the expansion of human rights. (See, for instance, the 2004 statement by the American Anthropological Association in support of gay and lesbian marriage at http://www.aaanet.org/press/ma_stmt_marriage.htm.)

Particularly rich is the study of new reproductive technology (NRT) (Strathern, *After Nature*, 1992 and *Reproducing the Future*, 1992; Ginsburg and Rapp; Ragone and Winndance Twine). The study of NRT has led people in Western societies to begin to deconstruct traditional distinctions between nature and culture/choice, given that NRTs have widened human possibilities of intervention and modification of what were once believed unchangeable biological phenomena. Similarly, the growing body of literature on gays and lesbians cross-culturally has led to a more complex understanding of the complexity of gender, which once were viewed more simplistically (see, for instance, Weston). It has also promoted new understanding of people’s mediations with Western dictates of kinship.

Political economy and later developments (for example, historical anthropology) have added an important dimension to the study of kinship. From the path-breaking work by Jack Goody (1958) that included attention to the temporal dimension in the study of kinship, as well as the work of Esther Goody on marriage as a process (1962), the work of Claude Meillassoux on kinship and the formation of social inequalities (1981) to more recent accounts of political and economic processes that look for more satisfactory mediations between neo-Marxist and interpretive analyses (for example, work by McClintock; Cooper and Stoler), that kinship phenomena do not stand in a vacuum; instead they simultaneously reflect and affect wider societal trends. Kinship is indeed a privileged site for societal reproduction and the construction of local, ethnic, and national identities. (See, for instance, Kahn on NRT in Israel or De Jorio on kinship and politics in postcolonial Mali.)

In sum, early-twenty-first-century studies highlight the importance of local conception of kinship and the impact of such constructs on people's identity formation. Some anthropologists look at kinship as conceived in the West as a specific network of relatedness whose generality and interest should be ascertained in the course of open-ended fieldwork. Other trends also consist of broader approaches to the study of kinship (e.g., in the context of larger paradigms such as political economy), the inclusion of relatively recent developments (NRT), or traditionally excluded phenomena such as sexuality and third genders, thus contributing to new understandings of different lifestyles and cultural traditions.

KNOWLEDGE. Four words of ancient Greek are important to the first philosophical discussions of knowledge in the Western tradition. In a given context any of them might be translated with the word “knowledge”: *epistēmē*, *technē*, *mētis*, and *gnōsis*.

Epistēmē names the most philosophical idea of knowledge: contemplative, disinterested, logical knowledge of truth and reality. Such knowledge is not merely true; it is self-certifying, indubitable, a rock-solid foundation on which to build scien-

tific understanding. That was important. Philosophical thinking begins with the idea that belief or opinion (*doxa*) is not knowledge even if it happens to be true. *Doxa* is changeable, especially in a city, where people may be swayed by sophists and demagogues. Through its root (*histēmi*, “to stand firm, to set up”), *epistēmē* evokes ideas of firmness and stability. That is what the philosophers sought in the best and highest knowledge: an immovable point no persuasive speech can overturn.

Stoic philosophers defined *epistēmē*-knowledge as “apprehension (*katalepsis*) that is safe and unchangeable by argument,” according to the *Florilegium* (extracts from Greek authors compiled by Joannes Stobaeus in the late fifth century). About two generations earlier, Plato (c. 428–348 or 347 B.C.E.) had put forward his highly influential vision of philosophical progress from *doxa*, the opinions of the crowd, to the correct opinion (*orthodoxos*) of specialists, and finally the summit, *epistēmē*, the best and highest knowledge. In the *Theaetetus*, what sets *epistēmē* apart from true opinion is called an *aitias logismos*, a reasoned account, explaining why the knowledge is and must be true. In the *Republic*, however, what sets *epistēmē*-knowledge apart from *doxa* is the object that it apprehends—a Form or Idea. Opinion cannot turn into knowledge because the “objects” of opinion are ultimately incoherent particulars for which no reasoned account is possible. Plato also explains how the Form of the Good is the cause of things being knowable at all. It is not the presence of a Form as such that makes *epistēmē*-knowledge possible; rather, it is the Form’s place in the cosmic system. Form becomes logical and Ideas intelligible only when grasped in the light of the whole (the Good).

The philosophers did not invariably construe *epistēmē* as disinterested. The ordinary sense of the word is simply to have a good understanding of a thing, anything, archery, for instance. Aristotle (384–322 B.C.E.) divided *epistēmē* into three parts: theoretical (science and philosophy), practical (ethics, economics, politics), and productive, an *epistēmē* he called *technē*. *Technē* (from which *technology*, *technique*, and so on) refers to the knowledge of a recognized expert, like a physician, musician, or carpenter. Such knowledge is skillful, artful, reliable, specialized, and usually organized in professional associations. Plato explored the comparison of *epistēmē* and *technē*, using the words interchangeably in some dialogues. Could the best and highest knowing be some kind of art? One difficulty is that *technē*-knowledge aims at something concrete—a ship, a healthy human, a drama. The objects of philosophical *epistēmē*, however, are not these mundane artifacts, but the eternal Forms in which particulars merely participate. A further difficulty is that *technē*-knowledge can be used for good or ill alike. Such knowledge is instrumental, serving other ends, and the effectiveness of technique is no guarantee that the ends are good, whereas *epistēmē* is knowing in the light of the Good itself. This intrinsic value for knowledge of truth became traditional in Western thought, seldom questioned until Friedrich Wilhelm Nietzsche (1844–1900) at the end of the nineteenth century.

Mētis is cunning, clever, effective knowledge, as exemplified by the mythical figures of Odysseus and Daedalus. This knowledge combines flair and wisdom, subtlety and deception,

By A.D. 600 each inhabitable island of the south and central Pacific had been discovered and settled. . . . Magellan [1480–1521] traversed the whole Pacific from the tip of South America; he never sighted any land until he reached the Marianas, just east of the Philippines. Not only had Pacific islanders discovered and settled all the suitable islands of the Pacific, but there is solid linguistic, ethnobotanical, and archaeological evidence that they made two-way voyages among them. They sailed, for example, between Tahiti and Hawaii and back again, a distance over three thousand miles of open sea. All this was done by stone age people without writing, charts, or navigational instruments of any kind. In spite of a long series of fanciful theories of lost continents, primitive navigational instincts, and accidental drift voyages, we now know the secret of what made Pacific Island voyaging possible. *The secret was knowledge.* The navigational abilities of Pacific Islanders depended on a profound general knowledge of the sea, the sky and the wind; on a superb understanding of the principles of boat-building and sailing; and on cognitive devices—all in the head—for recording and processing vast quantities of ever changing information.

resourcefulness and mastery of many skills. Far from disinterested or contemplative, it proves its value most concretely, especially in situations that are shifting or ambiguous, where art outweighs the force of violence. The philosophers either pass over the qualities of *mētis*-knowledge or mention them with hostile irony. Plato (in *Gorgias* and *Philebus*) condemns the inexactitude, oblique procedures, cunning, and guesswork. Everything about *mētis*-knowledge confirms its limitation to the shadow theater Plato famously depicted our life as being. The philosopher seeks to penetrate those shadows to an immortal knowledge of the changeless Source of change.

Gnōsis usually has the sense of an intelligent grasp of a thing or situation. In the common account of Heraclitus (c. 540–c. 480 B.C.E.), Parmenides (515 B.C.E.), and Plato, only one who fully *knows* (*gignōskein*) can be sure to have grasped a thing as it veritably is. All that is required to transform this *gnosis* into the lauded philosophical *epistēmē* is the rational account by which we understand things in the light of the Good and the Whole. The so-called *Gnostics* were heretical sects of the early common era. They conceived of knowing as an immersion into the divine energy, to be possessed and transformed by it. The *gnōsis* sought by the Gnostics is an *epignōsis*, or knowledge of the self, its origin and destiny, a supernatural superknowledge that is supposed to save our lives.

The European Middle Ages divide into two parts, before and after about 1200. The thought of the first period is broadly Platonic, a legacy of St. Augustine (354–430). Later medieval

thought benefited from the recovery of the works of Aristotle and the Islamic commentators. Augustine’s outlook is notably Plato’s: the senses depreciated in favor of immutable truths directly intuited, and a grudging admission of practical knowledge (*technē*) as a lower use of reason directed not toward wisdom but practical necessity. Human knowledge is possible because God illumines our minds, showing us the divine ideas, the archetypes of phenomena.

The most original, if not influential, medieval philosopher of knowledge is Roger Bacon (c. 1214–c. 1292). Interested in problems that would occupy Galileo three hundred years later (especially falling bodies and optics), he anticipated the Italian astronomer’s conviction that the solutions to these and other scientific problems lies in mathematics: “He who is ignorant of mathematics cannot know the other sciences nor the affairs of the world” (*Opus majus* 4.1). Even more against the scholastic grain was his enthusiasm for experiments: “He who wishes to rejoice without doubt in regard to the truths underlying phenomena must know how to devote himself to experiment” (*Opus majus* 4.1).

Thomas Aquinas (1225–1274) dominates the later period. He was the greatest of medieval Aristoteleans. Aristotle had argued that the object of the *epistēmē*-knowledge (*scientia* for Thomas) is immutable and necessary, incapable of being otherwise. Such knowledge is true and certain, being deduced from first principles. A thing is known when we learn its cause, and it is not known without the certainty of deduction from

principles, confirming that the thing could not possibly be any other way. As John Buridan (c. 1300–1358) explains, “Science differs from opinion because . . . opinion does not judge with certainty but with fear and science judges with certainty and without fear” (*Questions on the Nicomachean Ethics of Aristotle*). This remains the view of practically all the European philosophers down to René Descartes and John Locke.

Modernity

The early modern philosophers of the seventeenth century accepted most of ancient thought about knowledge. The clear and distinct ideas that alone count as knowledge for René Descartes (1596–1650) are not notably different from the reasonable account that is Plato’s criterion of *epistēmē*-knowledge. Even supposedly “empirical” philosophers like John Locke (1632–1704) assume that there is a strict and proper sense of knowledge that requires nothing less than rational certainty.

The break with tradition came from outside philosophical epistemology, in the new experimental natural philosophy of Galileo Galilei (1564–1642), Robert Boyle (1627–1691), Isaac Newton (1642–1727), and others. The first attempt to describe the experimental method was by Francis Bacon (1561–1626). The most influential account, however, is in Immanuel Kant’s *Critique of Pure Reason* (1781). Kant famously explains how concepts are empty without a content they acquire from experience, and how sensations are chaotic noise without a priori concepts we bring to the process of understanding. In this account, empirical knowledge is a synthesis, a mental construction, combining what the senses offer with concepts that, in their broadest features, are a priori forms of human understanding.

Conceiving of knowledge as something put together in the service of understanding suggests that the control of experience may be a more important cognitive goal than the fidelity (or “correspondence”) of a disinterested representation. This idea was explored in the nineteenth century by Arthur Schopenhauer (1788–1860) and Nietzsche. Further reflection on scientific experiments confirmed a similar view. What we learn from experiments is how to produce highly controlled effects, not how things are “in themselves,” apart from the experimental intervention. This idea of knowledge as an external force of control was taken up by the Vienna positivists, including Ernst Mach (1838–1916), and the American Pragmatists—Charles Sanders Peirce (1838–1914), William James (1842–1910), and John Dewey (1859–1952), who reached conclusions not dissimilar to those of Nietzsche.

Sociology of knowledge. Twentieth-century thinkers influenced by Auguste Comte (1798–1857) and Karl Marx (1818–1883) proposed a sociological theory of knowledge. The first premise of these theories is that no knowledge is entirely autonomous in structure or development from the group that produces it. How one looks at data, how one construes given facts, what one takes seriously, depend on social position. Karl Mannheim’s seminal *Ideologie und Utopie* (1929; translated as *Ideology and Utopia*, 1936) argued that social circumstances determine both what we seek to know and the validity of knowledge attained. Later accounts abandon

the idea of *validity*, rejecting the philosophical distinction between knowledge and *doxa*, an ideal subject matter for sociology.

Skepticism. For much of the twentieth century, philosophical discussion of knowledge was preoccupied with the problem of skepticism. Originally, *skeptikos* meant an inquirer, and later came to refer to followers of the Greek philosopher Pyrrho of Elis (c. 360–c. 272 B.C.E.). Their school flourished in the classical world between 100 B.C.E and 200 C.E. These Skeptics taught the radical suspension of judgment, liberating the self of dogmatic convictions (and all convictions are dogmatic), as the way to mental tranquility (*ataraxia*). The point of skeptical arguments is to instill doubt about the most obvious matters, to show that belief is futile. Nothing can be proved because anything can be proved. There is no argument so convincing that an equally convincing argument for the opposite cannot be constructed. Mental peace lies in getting over the vanity of knowledge.

Skepticism fell into decline after Roman times. By the Middle Ages the school and its arguments were forgotten. This situation changed abruptly in the latter sixteenth century, when long-lost texts of ancient skepticism were republished. From then on skepticism played a role in early modern thought, especially in the work of Michel de Montaigne (1533–1592), Descartes, Pierre Bayle (1647–1706), and David Hume (1711–1776). Yet Kant and Georg Wilhelm Friedrich Hegel (1770–1831) both suppose they have overcome skepticism or shown it to involve a mistake, and for most of the nineteenth century skeptical problems were not much discussed in Euro-American philosophy.

In the twentieth century the so-called Analytic philosophers rediscovered skeptical problems as ideal for their methods of precise, rigorous, often logically formalized argumentation. Their problem is to prove the objectivity of knowledge, which usually means refuting the skeptic, who asks how you know that you are not dreaming, or are not a brain in a vat, or that the universe did not come into existence a minute earlier, complete with your faulty memories. The presumption is that unless we can prove *that* we can prove nothing, and unless something is *proved* there is no objective knowledge. Over a period of two thousand years, then, skepticism changed from being a way of life, as it was for Pyrrhonians, to a mood and method of self-knowledge in Montaigne and Descartes, to a technical problem for the most formidably technical work since high-Medieval scholasticism.

The Linguistic Turn

The linguistic turn in twentieth-century philosophy refers to the rising influence of logical positivism (especially the work of Rudolf Carnap [1891–1970]), as well as positivism’s discontents (Willard Van Orman Quine [1908–2000]), heretics (Ludwig Wittgenstein [1889–1951]), and satellites (Bertrand Russell [1872–1970], Karl Popper [1902–1994]). The movement began in German-speaking countries in the 1930s but rose to predominance in English-language philosophy after World War II. It mingled with an independently evolved linguistic analysis and so-called ordinary-language philosophy, as

in the work of George Edward Moore (1873–1958), J. L. Austin (1911–1960), and Gilbert Ryle (1900–1976). For all these thinkers, everything in philosophy is a matter of language. The problem of knowledge is a problem of semantic analysis: how is the word used? What is the language game, the logic of the concept?

Gettierology. In a widely discussed article, “Is Justified True Belief Knowledge?” (1963), Edmund Gettier claimed to prove that knowledge is not conceptually equivalent to justified true belief. Gettier’s paper shows the style of the then-new analytic approach, using contrived scenarios as logical counterexamples to the definition of *knowledge* as justified true belief. The counterexamples usually work by drawing a reasonable inference from a justified though false belief, inferring something true by accident. Suppose I believe that a neighbor, Jones, owns a Ferrari. I have evidence: it is parked by his house, I see him in it, and so on. Because I believe Jones owns a Ferrari, and because Jones is my neighbor, I infer that *a neighbor* owns a Ferrari. Jones, however, does not own the car, which is owned by my neighbor on the other side, who, unknown to me, works with Jones. Still, it is true that *a neighbor* owns a Ferrari, and I believe that truth on good evidence. I have a justified true belief, but do I know that a neighbor owns a Ferrari? To most people it seems wrong to say so, especially since the neighbor I am thinking of is not the neighbor who owns the automobile. Apparently, then, knowledge is not justified true belief.

Gettier’s argument spurred an academic industry. The problem was to render the justified-true-belief formula invulnerable to Gettier-type cases, or replace this “classical” definition of knowledge with something equally plausible and immune to counterexample. Nothing memorable came of it. And contrary to what is often said, the definition of knowledge as justified true belief is not in any sense “classical.” It has never been widely accepted and first entered philosophical discussion (in Plato’s *Theaetetus*) as a *refuted* theory.

Between Gettier-inspired concerns about the analysis of knowledge and the project of refuting the skeptic, epistemologists fell into two broad camps, depending on whether they considered knowledge to require an element of justification or understanding, or whether, contrary to tradition, true belief might be enough. The idea that knowledge requires only true belief, provided the cause of the belief is appropriate or reliable, is known as *externalism*. Such theories reject the traditional assumption that knowledge requires the knower to understand the reason why a belief is true. They thereby finesse both the Gettier problem and the problem of skepticism. If knowing does not require understanding, then neither must a person who knows be able to refute the skeptic. And if knowledge does require that the cause of belief be reliable, even if the reasons for trust are unknown to the knower, then Gettier-scenario counterexamples fail due to an unreliable source for the (accidentally) true belief.

The heyday of linguistic philosophy had passed by 1980. The movement had led to little in the theory of knowledge. Pure conceptual or semantic analysis was largely abandoned. Exchanging those discredited methods for the richer data of

the sciences, Quine called for a “naturalized epistemology.” The idea was to reframe the theory of knowledge in terms of empirical hypotheses about the neurological, cognitive, and evolutionary matrix of human knowledge. Quine’s project attracted many followers, and Analytic philosophers formed new and often quite deep alignments with scientific research in these areas.

A second trend in post-linguistic-analysis philosophy is a movement of internal critique, a deconstructive diagnosis of epistemology as a pseudoproblem. Wittgenstein inspired this turning of philosophy upon itself, claiming to find conceptual confusion and intellectual neurosis everywhere. The autocritique of epistemology was led by Richard Rorty’s *Philosophy and the Mirror of Nature* (1979). Rorty finds the very idea of a “theory of knowledge” premised on an untenable concept of mental representation as a kind of “correspondence” or “isomorphism” with things in themselves.

Evolutionary epistemology. The word *cognition* relates to the ways in which people (and other species) draw information from the world, combine and interpret it, and make decisions about the information. Identifying this cognitive, information-processing function with *knowledge* seemed to open the way to a biological, evolutionary theory of knowledge, as by Konrad Lorenz (1903–1989). Later evolutionary accounts usually make two claims. The first is that human knowledge is an evolved adaptation, an outcome of natural selection. The second is that *any* adaptation of *any* species is a kind of knowledge, that evolutionary adaptation is the *primary* way of knowing the world. In these accounts an insect’s camouflage coloration is knowledge of its environment; the fleshy water-conserving cactus stem “knows” that water is locally scarce; the shape of the hummingbird beak expresses knowledge of the structure of the flowers it lives on. Human knowledge is a special case of this primary and ubiquitous biological knowledge of adaptation.

Feminism. By the latter twentieth century feminism had established a presence in the academy, criticizing and developing theories in several areas of philosophical research, including the theory of knowledge. Most feminists have nothing good to say about what has been done in epistemology. Presuming to speak in a universal voice, philosophical theories of knowledge are gendered and do not know it. Feminists challenge epistemology’s concept of knowledge (as objective, transcendent, disinterested) and its conception of the knower (as autonomous, self-interested, isolated). They deepen the discontent of the postpositivist philosophy of science and urge points similar to the sociologists of knowledge. Distinctive is the attention to early experience, emotion, racism, class, and, above all, gender as vectors of knowledge repressed from a sexist epistemology.

Continental Philosophy

For much of the latter twentieth century philosophy in the Western countries was divided into two camps, usually called Analytic and Continental. The division is not a happy one for many reasons, not least because the idea of dividing philosophy this way is an invention of the positivists, foisted upon an

otherwise heterogeneous selection of mostly French and German thinkers who often had little in common. Continental research did not pursue the theory of knowledge with anything like the industry of the Analysts. Many agreed with Hegel's assessment that the whole idea of a theory of knowledge (which would presumably itself be knowledge) is naive and superfluous.

Habermas. Three European thinkers are exceptions to the tendency to dismiss the theory of knowledge. One is German social philosopher Jürgen Habermas (b. 1929) and his work *Knowledge and Human Interests* (1968). By "human interests" Habermas means orientations of thought and action rooted in the fundamental evolutionary conditions of our species, which he reduces to the interests of work, social interaction, and emancipation. He describes three categories of possible knowledge corresponding to these interests: (1) instrumental, technical knowledge, expanding our power of control; (2) knowledge of language or, more broadly, of language games and cultural traditions, which orient people in common action; and (3) critical-social knowledge about political legitimacy and subordination. The conditions of objectivity differ in each case. When we are interested in a device that works, objectivity has one meaning; when interested in a social interaction, for instance a negotiation, objectivity requires different criteria. And when our interest is in emancipation, we require knowledge of the real conditions of social power in a given society. Social-scientific methods should take their objectivity from this emancipatory interest and not imitate the differently funded objectivity of the natural and technological sciences.

Liotard and Foucault. Jean-François Lyotard's widely read *The Postmodern Condition* (1979) was subtitled *A Report on Knowledge*. Under the conditions of what he calls postmodernity, knowledge has become discontinuous, catastrophic, nonrectifiable, and paradoxical. Getting used to knowledge in such a condition should refine our sensitivity to differences and reinforce our ability to tolerate incommensurables. Another French thinker contributing influential ideas about knowledge is Michel Foucault (1926–1984). The point of his neologism "power/knowledge" is to indicate a reciprocity linking the production and circulation of knowledge with the political economy of government. Power and knowledge flourish together, confirming each other, reproducing each other's authority. Power so entrained with knowledge need not falsify or repress any truth that may be discovered, nor must research sacrifice scientific credibility merely because it owes a debt to coercive social power. To reach these conclusions, however, Foucault had to reduce knowledge to socially prestigious discourse, the arbitrary output of an institutional "discursive apparatus," generating statements its authorities take seriously. There is in this account no more to "knowing" than who gets to say what and say it impressively enough to leave a trace, to have an effect, to make a legible difference in the archive.

Knowledge and Truth

That knowledge must be true is a longstanding presupposition of Western thought. Yet there are many instances of knowledge that cannot be called true. These include knowledge expressed in technological objects like a bridge or satellite, or in

works of art and the imagination. A technological artifact or a work of art is not true (or false) in the way a proposition is. In the face of this discontinuity between knowledge and truth, one may question whether truth properly has the value for knowledge philosophers tend to suppose, or one may make subtle distinctions, dividing knowledge so as to preserve the necessary truth of its best and highest instances. Unsurprisingly, philosophers prefer to distinguish and preserve. Where ancient philosophy distinguished a scientific *epistēmē* from the *technē* of art and craft, twentieth-century analysts discovered a "semantic" or "conceptual" distinction between *knowing how* and *knowing that*.

This distinction is not a neutral analysis. It may be no more than a linguistic rationalization for the assumption that knowledge must divide along lines of intrinsic truth and mere instruments. Western thought consistently ignores, misdescribes, and underappreciates the knowledge involved in art and technology. The philosophers seldom have a good word for artisanal *technē*-knowledge, or the ingenuity and cunning (*mētis*) of the architect or hunter. Although these other knowledges are indispensable to human existence, that very thing has seemed to make them base, materialistic, unsuited to higher minds. To the philosophers, how-to (or *technē*) knowledge is routine, mechanical, and thoughtless, while knowledge of truth is a disinterested grasp of nature and reality.

Philosophers even preferred to invent new concepts of truth rather than reconsider whether the best and most important knowledge has to be true. Kant's theory suggested (though not to Kant) that truth may not be a matter of "correspondence" between thought and reality but merely a coherence of experience. The pragmatists took experimental knowledge as exemplary and promptly introduced a new theory of truth, defining it in terms of "working." It would be equally logical, however, to simply *drop* the condition of truth on the best sort of knowledge.

Certainly there is *some* difference between knowing that the earth rotates around the sun (a true proposition) and knowing how to play the flute (a skill or art). But is the difference one in kinds of knowledge? What is obviously different about them is how the knowledge is expressed. In one case by producing a proposition, in the other by a musical performance. But that is a difference in the artifacts that express knowledge, and does not prove a difference in what makes these examples of knowledge at all. In both cases the knowledge concerns artifacts, constructions of ours, whether propositions or musical performances. And in both cases these artifacts must rate as notable accomplishments. Not just any true proposition expresses knowledge; it has to be informative, important, an insight or discovery. And not just any playing constitutes knowledge (mastery) of the flute.

Helio-centric astronomy and musical artistry are therefore not so different *as knowledge*. Whether we speak of *knowing that* (such and such is true) or *knowing how*, we are qualifying capacities for performance at a certain high level with artifacts of some kind. As examples of knowledge, a surgical operation or a bridge may serve as well as any scientific truth.

Their quality as knowledge depends not on their truth but on other, equally rare qualities of artifactual construction. Knowledge has much less to do with theory and truth than philosophers assume. What makes knowledge desirable and worth cultivating is the enhancement it brings to the effectiveness with which we operate in an artifactual environment. *Knowing how* and *knowing that* are not different kinds of knowledge. They are different kinds of use for different artifacts, all expressing the only kind of knowledge there is: a human capacity for superlative artifactual performance.

L

LANDSCAPE IN THE ARTS. The *Oxford English Dictionary* defines landscape as both a verb and a noun, signifying not simply its multiple references in vernacular and specialized parlance or its active and passive modes but more importantly the varying perceptions of landscape as an artistic, cultural, and religious entity. Among the definitions of landscape as a noun, the *OED* proffers first “A picture representing natural inland scenery, as distinguished from a sea picture, a portrait, etc.” Further definitions include “The background of scenery in a portrait or figure-painting,” “A distant prospect: a vista,” and significantly, “The object of one’s gaze.” While as a transitive verb, landscape proposes “to represent as a landscape; to picture, depict.” This verbal form further connotes “to lay out (a garden, etc.)” as a landscape. Western art history classifies landscape as both iconography and theme; that is, as a series of signs and symbols that form the visual

vocabulary that is encoded with specific meanings, such as the metaphor of the “errand into the wilderness,” or the Garden of Eden. As a topic, landscape is either the subject matter of a painting or a series of prominent elements in a painting that coordinate the diversity of public understanding of the idea of “landscape.” The early nineteenth-century transformation of landscape into an acceptable category of painting by the academy equal to history and portraiture signaled a shift in Western cultural and religious values.

Traditionally landscape is designated by such explanatory signifiers as pastoral, ideal, naturalism, and picturesque. Further, landscape is discussed as a background, a symbolic element, a historical setting, and a motif, so that the visual diversity of the paintings that form this visual essay are all appropriately identified as landscape paintings. The journey in the history

Overwhelmed by the natural world. *Monk by the Sea* (1809) by Caspar David Friedrich. Oil on canvas. PHOTO CREDIT: BILDARCHIV PREUSSISCHER KULTURBESITZ/ART RESOURCE, NY

of the idea of landscape—from the symbolic stylization found in classical Egyptian frescoes and early Christian mosaics to the awesome sublimity of Caspar David Friedrich's *Monk by the Sea* (1809–1810; Schloss Charlottenberg, Berlin) and Georgia O'Keeffe's *Red Hills, Lake George* (1927; Phillips Collection, Washington, D.C.)—are interwoven with artistic, cultural, economic, political, and religious influences. Perhaps the most significant issue to be considered is whether or not any discussion of landscape painting is privileged as Western in orientation and classifications, especially following the attitudinal metamorphosis toward landscape shaped first by Edmund Burke's eighteenth-century treatise on the sublime and reaffirmed by Immanuel Kant's discussion of the sublime in his *Critique of Judgment* (1790). Essentially Kant argued that the sublime was premised upon the immeasurable extent and stunning intensity of nature and the sense of awe that these expressions of *dynamis* effect in humanity. The amalgamation of terror and delight edged simultaneously from the sight of such phenomena as fulminating cataracts and colossal mountains, thunder and lightning, volcanoes and hurricanes, elicits both a fascination with and a distrust of nature.

The Dictionary of Art (1986) has a major entry of nearly one hundred pages under the rubric of "landscape painting" that details the history and variations of landscape painting in the West and references descriptions of landscape as either a motif or a category in discrete entries dedicated to the world beyond the West, for example, China. This is not to suggest that landscape painting in the West is not a significant or an enormous entry topic in its own right but rather to recognize that the universality of landscape as a visual recording of human attitudes and perceptions of the natural world has been abbreviated. Therefore the tradition of defining and describing landscape requires reformulation of it as a pandemic idea. With that in mind, this essay will discuss origins and modern examples of landscape in Europe and the United States as well as in Japan and China. Whether rendered as ideal or real, harmonious or discordant, bucolic or refined, the landscape communicates solace, spiritual grandeur, and space for solitude.

Panoramic depictions of the subtle but expansive beauty of nature are incorporated into the landscape designs and themes found on Japanese screens. Sequential visual episodes are depicted upon individual panels, which when encountered as a unity create an effective visualization of the natural order, with its coordination of foreground, sky, middle ground, and flora and fauna. As a public or private form of display, these Japanese screens may be unfolded either in full or in segments, providing an ever-renewing composition of natural elements. Varying in size from personalized miniature screens to public monumental exhibition screens, the visual image extends from right to left in a horizontal flow of natural symbols ranging from cherry blossoms to gnarled branches to recognizable species of birds. As in Chinese landscape paintings, the most distinctive element of the Japanese landscape screen is the void or empty space for "no-thing-ness," which offers a spatial threshold for contemplation and quietude, for refreshment and solace.

The dramatically unique depiction of a diminutive, almost miniature, human figure in solitary contemplation of the

limitless and enveloping expanse of sky, sea, and sand in Friedrich's *Monk by the Sea* stunned its original Western viewers. The minimizing of the natural elements to a state of abstracted essences transformed the conventional relationship between humanity and nature as the monk stands silently, almost belittled before the void. The traditional Western presentation of human dominion over nature had been reversed so that nature overpowers this "everyman," who is confronted by the enormity of the emptiness before him. Hypothesizing that Friedrich, who never ventured out of his native country, would not have seen or been influenced by the Eastern religio-aesthetic that informs the Japanese landscape, it is necessary to consider the cultural and artistic route to this singular yet artistically significant presentation of communion with nature by a Western painter. Even without any contact with the Eastern idea of landscape, Friedrich's new vision transformed the Western visual tradition of depictions of saints seated as the prominent subject in size, scale, and placement within a canvas. The normative pattern both of design and iconography was to site a large—usually out-of-proportion figure in comparison to the landscape imagery—human form in such a position as to garner the viewer's immediate attention thereby reaffirming human dominion over nature. Friedrich, on the other hand, eliminates all elaborate details and symbols within the frame of this painting; thereby, he creates and controls the visual emphasis on the atmospheric conditions and the immensity of nature. The miniaturized rendering of the monk required the viewer's complete attention to be located, perceived, and introduced almost to the shock of the viewer. The subject is no longer that of attesting to the human dominion over nature but rather that of the power of nature.

A dual interpretation of landscape. *Sacred and Profane Love* (c. 1515) by Titian. Oil on canvas.

The Path toward Landscape

Throughout the course of Western history, the concept of landscape and the technique of painting changed, interchanged, and exchanged with social, political, and religious modifications. Classical Egyptian art privileges depictions of the human figure and human activities over the landscape, which is more often than not included to provide a background or setting for an event or activity. The classical Greeks were biased toward humanism, human values, and, thereby, the human figure, so that feelings or artistic expressions of nature were as a background or historical setting. Although disputed among scholars, the connections between Hellenistic poetry and art may signal the origin of both landscape painting and of the concept of *amoenus*, or the “lovely place,” a term thought to have been introduced by Theocritus (c. 310–250 B.C.E.). The Romans, however, who might be aptly defined as hesitant in their depictions of nude human figures, greatly admired nature and the landscape. Roman poets sang of the delights and beauty of the countryside and natural realm, and writers including Horace, Pliny the Elder, Ovid, Vitruvius, and Virgil discussed the mutualities between the image and the poetry of landscape, with Virgil identified as the originator of the concept of the Georgic landscape. The finest examples of the visualizing of the Roman idea of the landscape are found in the decorative walls covered with illusionistic landscape that redefined the size and borders of individual rooms. During the early Christian and Byzantine periods, presentations of the landscape were related in terms of decorative designs and symbols. These were bifurcated: paradisaical gardens or the wilderness exile were

rendered through a symbolic vocabulary of flora and fauna, topographical elements, and human presence.

While the Middle Ages saw a retrieval of classical naturalism in presentations of the landscape, symbolic codings of nature, especially in the metaphorical paradise garden, continued. Medieval attention to the landscape involved the introduction of meteorological properties. Renaissance attitudes toward the landscape were divided between idealization and visual poetry, with an artistic concern for the interplay of light and spatial relations. With the religious and cultural revolution known as the Reformation and its southern European correlative, the Counter-Reformation, landscape painting began its journey toward an independent genre, as evidenced by Albrecht Dürer’s employment of the term *landschaft* and the contemporary appearance of the *paese* in the Italian center for landscape painting, Venice. The secularization of the arts in the Reformed countries emphasized the turn to history, portraiture, still-life, and genre themes, which included landscape. Dutch landscape painting in particular experimented with effective displays of light and weather and was fostered by the Calvinist dictum that God’s largesse is manifested in the natural world. The economic prosperity of the rising middle class created a new audience and patronage for landscape paintings in northern Europe. The next major shift in the idea of landscape came in the eighteenth century with the delicate pastoral formulated by Jean-Antoine Watteau. In the nineteenth century the famed Kantian turn to the subject and his discussion of the sublime conjoined with a

Human as subordinate to nature. *Harvesters* (1565) by Pieter Bruegel the Elder. Oil on panel. THE GRANGER COLLECTION, NEW YORK

variety of technological advances in painting, the economic and societal ramifications of the Industrial Revolution, and the political modifications of revolution and democratic governance to support first the development of romantic landscape, then realist and impressionist landscape by midcentury, and expressionist and abstract landscapes at the end of the century. The twentieth century, with its cultural and religious pluralism, provided new lenses affected by science, technology, and societal revolutions through which the landscape could be interpreted no longer as a major artistic topic but as a nostalgic vision of spiritual values. Landscapes of the late twentieth and early twenty-first centuries were affected by ecological concerns, computer technology, and the development of specialized movements such as land art. From the middle of the nineteenth century to the present, Western art was first challenged and then influenced by the development of photography; similarly the technological advances of moving pictures, television, and computer art have re-formed the modes through which landscape is perceived and imaged.

Despite the variations in attitudes, interpretations, and perceptions of the landscape in Western painting, there are two consistent and fundamental modes of artistic representation employed by Western artists: classic and romantic. Essentially the classic type reorders and enhances nature in an expression

of emotion tempered by technical perfectionism evidenced by smooth surface, measured if not invisible individual brush strokes, and careful delineation between colors, forms, and figures often identified as painting with a hard line. The romantic landscape is characterized by its visioning of the undisciplined and savage dimensions of nature as connotative of the sacred mysteries of the divine, signified by textural variations in the layering of and brushwork for paint and the indecipherable borders between colors, forms, and figures identified as painting with a soft line. The art historian Joshua C. Taylor counseled that what is here identified as the classic has prevailed during periods of economic, political, and social unrest whereas the romantic style has been favored during times of economic, political, and social stability.

Two works from the Renaissance era provide an important series of visual comparisons that can be “read” to clarify the classic and romantic modes: Giorgione’s *La Tempesta* (*The Tempest*; 1507–1508; Galleria dell’Accademia, Venezia) and Titian’s *Sacred and Profane Love* (c. 1515; Galleria Borghese, Rome). Neither of these two paintings is a dedicated landscape painting; rather, they incorporate nature into the background, Giorgione more speculatively than Titian. The theme and subject of Giorgione’s mysterious *La Tempesta* remains an encoded secret, as it appears to be without a narrative, historical, mythic,

A pastoral landscape with figures. *Departure from the Island of Cythera* (1717) by Jean-Antoine Watteau. Oil on canvas. THE ART ARCHIVE/MUSÉE DU LOUVRE PARIS/DAGLI ORTI (A)

religious, or cultural referent. Such a task of aesthetic discernment should reveal the meaning of this painting and the relationships among the three human figures and between the human elements and nature. The juxtaposition of an undressed nursing mother holding her suckling child at her right breast with a standing, fully dressed male pilgrim may signify everything and nothing. The mysterious positioning of the indecipherable human figures and their story (stories) within the boundaries of this canvas are secondary to the physical presentation that Kenneth Clark identifies as “the quintessence of poetic landscape.” The creation of space within Giorgione’s canvas is enhanced by a series of triangular intersections of topographical and architectural elements that lead the viewer’s eye into the center space, which then evaporates into the wafting storm clouds. This mixture of hard- and soft-line effects evokes an atmospheric aura of ambiguity and heightened emotion as the storm either approaches or passes over.

Titian’s equally difficult-to-interpret canvas is visually divided between the characteristics of sacred and profane love represented anthropomorphically by the two female figures, one dressed, the other nude. This same dialectic is signified in the two attitudes toward landscape, as untouched natural vegetation flourishes behind the elegant figure of sacred love while an idyllic pastoral vista proffers its mannered display behind

the classical figure of profane love. Titian’s ability to present both approaches to the landscape connotes his artistic recognition of the symbolic values attributed to nature.

The visual transition evident from Pieter Brueghel’s *Harvesters* (1565; The Granger Collection, New York) to Jean-Antoine Watteau’s *Departure from the Island of Cythera* (1717; Musée du Louvre, Paris) to John Constable’s *Salisbury Cathedral from the Bishop’s Grounds* (1825; Metropolitan Museum of Art, New York) provides a progression toward the idea of pure landscape in Western painting. Paralleling this evolution in attitudes to the landscape are the economic and social influences of the move from an agrarian to a mercantile to an industrialized society. Brueghel’s harvest scene follows the medieval tradition of the “labors of the month” first captured in cathedral carvings and adapted later in the fourteenth century into richly elaborate paintings. Brueghel’s harvesters incorporate those currently at work and those at rest. The canvas is bifurcated by a diagonal path that separates the reapers who are integrated into the tall hay on the left side of the canvas from those who rest under the shade of a single tall tree in the right foreground. The right-hand side of Brueghel’s canvas displays the cut hay either onto rectangular or tentlike forms. The distant background is also divided into a mannered mountain vista on the left and a verdant wilderness on the right. Although premised, one could

argue, upon scriptural passages related to the Fall, *Harvesters* is devoid of mythological, political, or literary referent, and yet the familiarity of the theme makes commentary unnecessary and its appeal immediate and widespread. Brueghel has moved the viewer beyond the landscape as symbolic setting or backdrop for a painting to the landscape as subject, with its allusions to the eternal passing of the seasons and the vastness of space. The abundance of nature herein affirms the transition to a situation in which the human is subject to nature.

On the other hand, Watteau's ethereal re-visioning of the pastoral landscape emphasizes soft colors and lines as the large group of revelers crosses the undulating horizon line. This famed rendering of a romantic idyll incorporates handsome couples who apparently will attend the *fête galante*. The freshness and informality of the artist's vision is highlighted by his development of a new genre painting of a pastoral landscape with figures. Demonstrating his debt to Giorgione and the evocation of a poetic mood, Watteau positions his strolling lovers in a garden setting in which the division between foreground and background is a semicircular arrangement of figures over a gentle central knoll. The background vista, like that of

Giorgione, is softer in line and color as the floating wispy clouds fuse with the lofty trees and airy mountains. The idyllic garden then becomes simultaneously a setting for an event and the event itself as the poetic tranquility, fluidity, and atmosphere create an aura of intimacy and magic much like the enchanted gardens of classical and medieval landscape painting.

Constable's sunlit pastoral landscape is one of his many simple and quiet scenes anchored in his childhood memories of life in Suffolk. In this version of Salisbury Cathedral, he divides the canvas both horizontally and vertically to highlight the painting's centerpiece—the cathedral building itself. On the narrow pathway on the left side of the canvas are diminutive male and female figures walking together away from the viewer, while two rows of grazing cows are located on the right-hand side in parallel relationship to the strolling couple. The association between humanity and nature veers toward a recognition of the awesomeness and mystery of the romantic landscape. Constable's use of sunlight predetermines his disposition toward the heightened color of fresh greens, bold brushwork, and the meteorological modulations between stability and

Humanity's spiritual relationship to the natural world. *Two Men in Contemplation of the Moon* (1819–1820) by Caspar David Friedrich. Oil on canvas. PHOTO CREDIT: ERICH LESSING / ART RESOURCE, NY

change. Like his contemporaries, this British artist was torn between science as a mode of observation of nature and religion as the center of values. As this painting demonstrates, however, restitution of a moral high ground was his clear choice. Nature, thereby the landscape, is the direct messenger of God's divine providence, and landscape painting conveys moral ideas and values.

This transformation from Brueghel's agrarian landscape with its overt partnership between humanity and nature to Watteau's ethereal enclosed garden in which humanity continued in a major role and finally to Constable's resplendent pastoral in which the human figure is so diminished as to be noticeably absent is signified by the transition from populated to nonpopulated. The journey toward landscape, then, is a process of both definition and liberation.

Landscape East and West

Expanding the art historian Benjamin Rowland's now classic comparative discussions of *Art in East and West* (1954), we recognize that landscape is not simply a Western idea or artistic

theme. Indeed, for Chinese, Korean, and Japanese artists, landscape was a primary artistic motif centuries earlier than in the West, and their religious and cultural attitudes interpreted nature and thereby landscape as an independent topos at least from the early tenth century. Perhaps best represented by the Chinese name, *shanshui*, or "mountains and water," this Eastern esteem for landscape was predicated upon more than an appreciation or respect for nature, its awesome wonders, and its universal processes; there was also a recognition of the place of humanity within the natural world. It was believed that a retreat or temporary withdrawal from society or "the modern" into a situation permitting contemplation of nature—countryside, mountains, or desert—facilitated a revelation of the ever-present pervasive spirit of the universe. Thus the idea of the landscape was as a retreat for renewal of an individual's mind and refreshment of the spirit. However, this landscape, which had its own life force, was not to be depicted as an illustration, that is line for line, form for form; rather, the real essence of the landscape was to be captured in a style prophetic of "the romantic." The distinction is simply understood if the Greek signifies the West and the Chinese the East. Where the

A visual harmony of tones and forms. *Old Battersea Bridge* (1872–1875) by James Abbott McNeill Whistler. Oil on canvas. TATE GALLERY, LONDON. © THE ART ARCHIVE

Greek sought the personification (or anthropomorphization) of a grove or a tree, the Chinese saw a manifestation of the divine through the labors of the universal spirit.

Consider, for example, the renowned Chinese *shanshui* of *Sage Contemplating the Moon* by Ma Yüan (1200; Kuroda Collection, Tokyo), in which the economy of line and classic asymmetrical composition extends an invitation to the viewer to participate in the quietude and meditation of the reclining sage entranced within his contemplation of the vast emptiness before him and the singular present of the full moon. A potential Western conversation partner is Caspar David Friedrich's romantic vision of *Two Men Contemplating the Moon* (c. 1830; Metropolitan Museum of Art, New York). As beautiful a visual recording of this mysterious partnership between the two men and nature is, and as carefully as the viewer is invited through the painterly convention of interlocuter figures to participate in this experience, the visual differences between the Eastern and Western images are telling and help the viewer to recognize the cultural distinctions in the idea of landscape. Both paintings express the emotive power of the human connection with nature and the spirituality of this relationship. Both paintings could be classified within the Western category of romantic, with their soft edged forms, artistic focus on the evocation of mood, and presentation of nature mysticism.

Flatness of landscape, figures, and fireworks. *Fireworks at Ryōgoku Bridge* (mid-nineteenth century) by Hiroshige. © CHRISTIE'S IMAGES/CORBIS

However, Friedrich designed a series of internal spatial connectives between the mountainous foreground, the evergreen and gnarled empty trees, the distant mountainscape, and the two men that so clutter the canvas as to obscure the focus on the moon and thereby of the spiritual potential of nature. Further, his inclusion of two men who appear almost as partners in physical stature and social position suggests a common search for, and thereby discussion and explication of, the meaning of this encounter. Alternatively, Ma Yüan offers a simpler, more restrained vision of a mountainous landscape that includes a distorted gnarled tree and two men. However, these two men are separated not simply by the internal topographical barrier of a small mountain but also by their own physical size and social status. There is no internal conspiracy between them; rather, the sage and the boatman contemplate, each in his own way, the mystery and spiritual power of nature—the sage by concentrating on the moon, the boatman on the mountain. The large internal space given over by the artist to the void provides a sense of both the monumental vastness of the night sky and the place of the human within the context of the natural world. Further, this void provides a space in which the viewer, like the contemplative sage, can write her own story. One additional

Mountains surreal, yet geologically precise. *The Virgin of the Rocks* (c. 1483) by Leonardo da Vinci. Oil on wood. © NATIONAL GALLERY COLLECTION. REPRODUCED BY KIND PERMISSION OF THE TRUSTEES OF THE NATIONAL GALLERY, LONDON/CORBIS

and perhaps ironic difference to note is that Friedrich employs a horizontal canvas and Ma Yüan a vertical one. Normally the former would be described as accessing the aesthetics of immanence and the latter the aesthetics of transcendence. However, this is open to debate, as these two paintings create internal attitudes toward the relationships of humanity with nature and of the human with the spirit.

Reversing the horizontal and vertical references is another comparison of Eastern and Western romantic views of landscape in James Abbott McNeill Whistler's *Old Battersea Bridge* (1872–1875; Tate Gallery, London) and Hiroshige's *Fireworks at Ryūgoku Bridge* (1858; Fogg Art Museum, Cambridge, Mass.). Perhaps this visual consideration of the universal elements of landscape is enhanced by the fact that the American expatriate painter had seen, owned, and was influenced by Japanese woodblock prints such as Hiroshige's prior to his painting of the *Old Battersea Bridge*. *Japonisme* swept through Paris, especially among the artistic circles Whistler frequented, beginning in the late 1850s and reaching a fervor in the

An interplay of vertical and horizontal forms. *Mont Sainte-Victoire* (1902–1904) by Paul Cézanne. Oil on canvas. PUSHKIN MUSEUM, MOSCOW, RUSSIA. © ALEXANDER BURKATOWSKI/CORBIS

mid-1860s. *Japonisme* was a major influence on the development of both Impressionism and the art for art's sake movement. Whistler, foremost among all his Impressionist, symbolist, and art for art's sake colleagues, was affected by the visual principles and religio-aesthetics of Japan. Although much of the Japanese woodblock art and pottery that entered the European and American markets was made for export, thereby not necessarily within the proper boundaries of theme, design, and execution for a Japanese audience, Whistler had a discerning eye, and his own approach to painting was transformed by the finest among such objects.

Hiroshige's depiction of a summer fireworks display is visualized at early evening when the bridge is covered with diminutive figures who stand above the water and mountains almost like birds looking down on the natural environment. The foreground and background of the print is divided by the vertical lines forming the Ryūgoku Bridge, with the fireworks boats and the boats with passengers viewing the display, almost obliterating the river waters. The bridge also partially obscures a series of mountains and beaches in the background. The falling lights of the fireworks are condensed into a small segment of the night sky, yet again diffused by the bridge. The internal tonal arrangement of soft, neutral colors works in tandem with the complex patterning of lines and curves to create on first glance an abstract pattern distinguished by the character of "flatness." The details of the fireworks, the varied audiences, and even parts of the natural environment became homologous elements in the visual pattern of colors and forms. A work such as Hiroshige's requires careful looking, as the first glance suggests an unpopulated landscape.

Whistler's painting is even more abstract in its presentation of form and figure. He sought to create a visual harmony of tones and forms that create a mood similar to that evoked in a listener by music, even unto his minimizing of titles to musical parallels: *Old Battersea Bridge* is among his "Nocturnes."

The enchanted garden. *Humay and Humayun in a Garden* (c. 1430). Manuscript illumination. PHOTO CREDIT: GIRAUDON/ART RESOURCE, NY

To attain this effect he minimized the details, colors, forms, and lighting in paintings such as this, which he also distanced from a narrative. Through his presentation of the atmospheric relations of water, earth, and sky in a moment of poetic enchantment, Whistler invites the viewer to contemplation of the spirituality of landscape. However, what Whistler has also created here is a new vision, or perhaps a retrieval, of the classic mode, of the landscape of symbolic potential.

One of the major distinctions between Eastern and Western presentations of the landscape is the void. In the Chinese *shanshui* (landscape painting) the visual emphasis is as much upon the void as it is upon the sparsity of detailed renderings of botanical and topographical forms. Despite the economy of line, these paintings project the visual effect of nature. The placement of the majority of pictorial imagery left of center balances the void right of center to comprise the traditional asymmetrical composition favored by Chinese, Korean, and Japanese artists. However, the void has multiple roles, including a spiritual threshold for preparation to encounter the universal spirit and an aesthetic invitation to participate in this image of contemplation by painting or writing the viewer's own story in this otherwise empty space. The important socio-political function is clarified when a landscape with an empty poetry hall is contrasted to a landscape with the poetry hall filled in. The texts written into the poetry hall record the thinking of those who have contemplated the image with great care and, when the calligraphy includes seals, those of rank who saw the image in situ. The verses provide the viewer with a recognition of what others have experienced in front of this painting, perhaps as a spiritual guide or entry point for viewers who find images disturbing but words comfortable. Neither of these *shanshui* is a precise transcription of what this natural vista looks like; each depicts the spirit or essence of this landscape episode in the world of nature.

When these *shanshui* are compared with Western paintings in which the mountains perform a central, if not dominant, role, it becomes apparent that the fundamental distinction between East and West is in the spiritual and symbolic significance of the idea of landscape. The mountain connotes a variety of Western symbolic references, ranging from the classical Mediterranean "home of the gods" to the Hebraic monumental setting for conversations with Yahweh to the Christian site of transfiguration. The Chinese attitude toward the mountain is also multivalent and ranges from a site for celestial activity to a symbol of permanence and immensity. Shrouded in mist, clouds, or shadows, the mountains dissolve into a delicately splendid form that speaks to the senses rather than the intellect as the essence of the landscape.

Consider, for example, the surrealistic mountain formations found in the art of Leonardo da Vinci, which provide both a form of geological precision and an aura of mystery. His investigations of nature, and thereby his depictions of the landscape, were premised upon careful observation of the natural world and the anatomy of vision. Leonardo captured the rhythm and quiet energy of plants, water, and light. His passion for scientific investigation may have led him to the prominent inclusion of atmospheric blues in his renderings of the landscape, as in *The Virgin of the Rocks* (c. 1483; The National Gallery, London). The surreal shapes of the background mountains and

After the Fall: the earth as a place of exile. *October*, calendar miniature from *Les Très Riches Heures de le Duc de Berri* (1413–16) by the Limbourg Brothers. PHOTO CREDIT: RÉUNION DES MUSÉES NATIONAUX/ART RESOURCE, NY

surrounding rock distinguish this as a Western landscape premised upon the Greek principle of the personification: visual parallels between the rocks and human figures are evident in the gesturing hands and fingers and other extremities. By contrast, the Chinese strove to present the living spirit that vitalized the mountain in a painterly vision of mystical and lyrical aestheticism.

Paul Cézanne's *Mont Sainte-Victoire* (1902–1904; Pushkin Museum, Moscow) provides a Western approach to imaging the harmony of and within nature. A technical exercise in the interplay between vertical and horizontal forms, Cézanne's painting is divided into the traditional tripartite foreground, middle ground, and background. However, he creates a new way of understanding this perspectival relationship as his use of line and color moves the viewer's eye back and up toward Mont Sainte-Victoire, which is the object of his gaze. His experiments with brushwork provided him with the skill to create a rapid, loose brush stroke that results in an internal interplay between surface and depth, so that the viewer experiences a sense of perspective, depth, mass, and volume when there isn't any.

America as the “new Eden.” *The Oxbow: The Connecticut River Near Northampton* (1836) by Thomas Cole. Oil on canvas. METROPOLITAN MUSEUM OF ART, NEW YORK CITY. GIFT OF MRS. RUSSELL SAGE. © FRANCIS G. MAYER/CORBIS

Nonetheless, his explorations of the vista and monumentality of Mont Sainte-Victoire resulted in a series of regulated and erudite renderings of the landscape far removed from the spiritual attachment to nature fundamental to *shanshui*.

Attitudes toward the Landscape

A series of universal attitudes toward the idea of landscape in painting can be found in Eastern and Western cultures through the centuries. These are identified through the motifs of garden/paradise, space/place, awesomeness/sublimity, and form/formlessness. These attitudes relate to developments in religious values, philosophy, economics, and politics as well as to technological and stylistic changes in the arts.

Garden/paradise. Traditionally understood to be derived from the Persian for “a walled enclosure,” the paradise, particularly the paradise garden, is a widespread visual motif among world cultures and mythologies. Oftentimes synonymous with the enchanted garden, the paradise garden signifies first and foremost a place of safety where love and friendship can thrive. The glorious details of its flowery meadows, sweet aromas, shade-giving trees, and gentle animals are important, especially in its connotation as a metaphor of the heavenly paradise. The motif of the garden denotes both a space of beauty and vegetation and, in a number of religions, the site of the origins of humanity. A major metaphor for the earthly paradise,

the Garden of Eden was first the home of Adam and then of Eve, in which all the terrestrial gifts of the creation were abundant until the primordial couple fell from God’s favor and was expelled from the garden.

Early Christianity reformulated the classical perception of the natural world as a place of delight into a metaphor for our exile from the garden. Thus early Christian artists formulated an image of landscape as a symbolic paradise, as seen in the glistening apse mosaic featuring heaven and earth in the *Transfiguration* (c. 548; San Apollinaris in Classe, Ravenna, Italy). The highly stylized trees and plants are in keeping with the early Christian concern with flatness as an attribute distinguishing image from idol. The decorative glorification of the natural world denotes what Kenneth Clark identified as the “landscape of symbols” present in this Ravenna mosaic alluding to the lost but not forgotten garden. The garden motif was regularly contrasted to the desert and/or the wilderness in early Western monotheism; the “land of milk and honey” was the earthly locale providing a foretaste of the heavenly paradise.

During the twelfth century, the enchanted garden motif was reformed and aligned with the Christian *hortus conclusus* (enclosed garden) and the Islamic enclosed garden, as exemplified by the Master of the Upper Rhine’s *Paradise Garden* (1410; Städelches Kunstinstitut, Frankfurt) and the manuscript

illumination of *Humay and Humayun in a Garden* (c. 1430; Musée des Arts Décoratif, Paris). In the former, the normative medieval elements of a garden are fused with the Hellenistic poetic *amoenus*, or “lovely place,” as the delicate sights and smells of flowers—including the singular form of thornless rose that medieval Christianity reserved as the sign of the Virgin’s

“enclosed garden”—and other flourishing vegetation create a visual delight. The Christ Child merrily plays music as his mother reads peacefully in this place of love, comfort, and safety. Similarly the earthly Humay and Humayan find happiness in both their pronouncements of love and in the enchanting setting for their rendezvous. This flower-filled garden is surrounded by a series of appropriately decorated screens that extend the floral and arboreal patterns against a romantic night sky. The presumably perfumed atmosphere, tender bird songs, shade-giving trees, and cool water of these enclosed gardens continue their visual analogies to the lost paradise of Adam and Eve.

The earth as a place of exile is fundamental to the medieval motif of the “labors of the months,” which eventually was transformed into the fifteenth-century illuminations in books of hours, in particular, those of the Limbourg Brothers such as *October* from *Trés Riches Heures de le Duc de Berry* (1413; Musée Condé, Chantilly). The Limbourg Brothers here combine the “lost garden” motif with the result of the Fall, that is, that humans must toil in the fields. So as one man rides a horse to till the earth and another sows the winter seed in front of the then Palais du Louvre, the viewer experiences the sensation of the enclosed garden, because the wall in the background can be interpreted as a closing off of the farmed lands from the world of aristocratic and political activity. The passing of the seasons is highlighted by the astrological calendar that frames the top of this illuminated page. Further, the Limbourg Brothers connect the natural with the spiritual in their concern for the meteorological effects of the changing

We are surrounded with things which we have not made and which have a life and structure different from our own: trees, flowers, grasses, rivers, hills, clouds. For centuries they have inspired us with curiosity and awe. They have been objects of delight. We have come to think of them as contributing to an idea which we have called nature. Landscape painting marks the stages of our conception of nature.

seasons, evidenced by the costuming and postures of the farmers as well as by the landscape. That which had been the happy home of the primordial couple has become the site of exile for their descendants, who must contend with the challenges of nature's bounty and powers.

Space/place. The notion of space in landscape is twofold, that is, it occurs both inside and outside the frame. Further,

there is a philosophic if not psychological reality to the transformation of space into place. This idea of land as space and place is promoted in the work of the geographer Yi-Fu Tuan. The activity of transforming space into place encompasses the acts of identification, naming, possession, and privileging. Perhaps, as in the journey toward landscape, the path toward place is a metaphor for the process of individuation. Further, the spatial relationships within and without the frame have implications beyond the vista of a landscape.

Thomas Cole's now classic rendering of *The Oxbow: The Connecticut River near Northampton* (1836; Metropolitan Museum of Art, New York) is a multivalent reading of the idea of landscape in nineteenth-century American art. A diagonal line runs from the painting's lower right corner upward toward the swirling storm clouds in the upper left corner. To the left of this diagonal line Cole's landscape is a classic display of the wilderness: untamed and unmannered, with lushly green vegetation, decaying broken trees, and a storm-filled sky signaling the tempestuous conditions of nature. Correspondingly the landscape to the right of the diagonal is basked in sunlight, carefully managed and arranged, implicitly under human dominion and exuding a sense of serenity and silence. The founder of the Hudson River School of painters and later also of writers, Cole is further identified as the first American landscape painter. A devout Christian, Cole used his renditions of the landscape as a visual mode of moral and spiritual reflection. Knowing the date of this

painting, it becomes necessary to consider the effect of the economic disasters of 1835 and the then-common reading of this painting as an omen of future disasters, most notably the Civil War. *The Oxbow* is also a depiction by Cole of America as the “new Eden,” an artistic and literary motif popular in the early period of American landscape painting that both offered a connection to the European tradition of landscape painting and served as a vehicle for an American “Christian” art.

However, it is Cole’s development and evolution of the intersecting concepts of space and spatial relations into “a place” that characterizes this idea of landscape in America. As a horizontal canvas, *The Oxbow* offers its viewers a peripheral range of vision as well as the traditional foreground, middle ground, and background. The meteorological effects of the stormy and thunderous clouds on the left of the center diagonal, and of the available sunlight with a series of soft clouds on the right, reflect a modernizing of the Limbourg Brothers’ point of correspondence. Providing his viewer with a horizon line through which one can enter into this wilderness and pastoral landscape, Cole did not forget that Western characteristic

necessity of the presence of the human. Toward the lower right-hand corner, as the wild vegetation begins to soften into the mannered presentation of the river and the farmed pastures, the disciplined viewer espies a white and red umbrella slanting away from the now decipherable diminutive portrait of the artist.

The twentieth-century painter Georgia O’Keeffe dedicated the last years of her life to the depiction of the landscape in the American Southwest. However, earlier in life she painted landscapes reflecting the places where she lived, including Texas, New York City, and Lake George. Influenced by the modernist ethos that incorporates Oriental (as in Chinese and Japanese) art and philosophy, her paintings such as *Red Hills, Lake George* (1927; The Phillips Collection, Washington, D.C.) are minimized presentations of economical delineations of forms that express the ideas and evoke the emotions that characterize the artist’s theme. Like Cole, she leaves an empty space in the upper sky that can be correlated to the void in Chinese and Japanese landscapes. Further, her use of hot- and cool-toned colors, in coordination with the simplicity of her forms, leads us to experience the essence of her idea of the landscape.

Physically small in scale and squarer in shape than *The Oxbow*, O'Keeffe's painting creates the visual sensation of a wide-open space with the intersecting "v" formations of mountains. The viewer is without an entry point but comes to the recognition that this is a new way of seeing and expressing the idea of the landscape: the viewer is standing within the frame.

Awesomeness/sublimity. The expression of energy and power found in the landscape is delineated by the categories of the awesome and the sublime. Depictions of extraordinary meteorological events, natural disasters, and spiritual intensity in landscape capture the essence of these categories. The nineteenth-century American painter Frederic Edwin Church created an image merging the awesome and the sublime in *The Icebergs (The North)* (1861; Dallas Museum of Art). Overcast by an aura of solitude and silence, *The Icebergs* draws viewers into the eerie blue-green water, the reflected colored lights on the other icebergs, and the almost surreal iceberg formations reminiscent of Leonardo's rock. One may not even initially see the broken, half-sunk ship frozen in the wintry waters of the north, the only sign of human presence.

Katsushika Hokusai's *Mount Fuji Seen below a Wave at Kanagawa* from his *Thirty-six Views of Mount Fuji* (Tokugawa period, 1830–1835; Museum of Fine Arts, Boston) communicates a moment of simultaneous awe and terror. The dramatic energy of the inland sea is seen in the large, threatening waves, most significantly in the tallest ocean wave, which curls over with such intensity that it froths with foam and dwarfs Mount Fuji, which is visible in the background. The frothing waves extend talons of water and foam that reach out to overturn the boats cascading over the curvilinear water slides. Despite all these raging waters and potentially overturned boats, Mount

Fuji, the sacred mountain, stands calmly, majestically, and reassuringly in the distant background. The awesome and the sublime fuse into an image that at once captures nature's swirling energies and its stability.

Vincent van Gogh's *The Starry Night* (1889; Museum of Modern Art, New York) coordinates warm and cool colors with an intensity of line to express a passionate vision of the landscape. The undulating swirls electrify the night sky, enhancing the white, blue-white, and yellow circles of "fire" that traverse the upper realm of this canvas. The large yellow crescent moon in the upper right corner is balanced by the flamelike vertical cypress trees in the lower left corner. The country village unfolding beyond these two reference points is accentuated by the church that stands almost at the center of the frame. The rhythm of the internal forms creates an atmosphere of spiritual intensity and reawakens the primordial awe at the vast magnificence and limitless powers of the natural world.

Form/formlessness. The common perception is that natural objects such as trees, mountains, and flowers should be depicted accurately in Western painting. Representational forms, that is, those recognizable through their resemblance to what is seen in everyday life, are the most comfortable to the human eye and the least threatening to the human psyche. However, abstracting forms in order to artistically distill the essence of the thing or idea became an artistic convention in Western landscape most prominently with the influence of *Japonisme* in the 1860s. Thus a formless style of characterization became a visual mode for evoking emotion and response from viewers. Although a new practice among Western landscape painters, this "formlessness," or abstraction, had been common to Eastern artists almost from the inception of interest in nature as an

universal reflection of spiritual values. Fuyake Roshu's *Utsunoyama: The Pass through the Mountains* (Edo period, 1699–1757; Cleveland Museum of Art) incorporates highly stylized but nonrepresentational forms for his mountains, vegetation, and river. This patterning of undulating masses, curvilinear flattened forms, and decorative vegetal shapes present the essence of landscape in a dynamic yet challenging mode.

Translated into Western art first by Whistler and then by the Impressionists, this artistic interest in formlessness, or “formless form,” reached new heights in the late nineteenth century with paintings such as Paul Gauguin's *The Day of the God (Manaha no Atua)* (1894; Art Institute of Chicago). In this work, one of the paintings influenced by his Tahitian sojourn, the exotic is referenced not simply by title or attitude toward the human figure but also the expressive quality of Gauguin's colors. In this canvas he clearly merges form with formlessness in the abstractions of landscape in the foreground, where the discarded garments of the ritual celebrants are almost indistinguishable from the topography and the pool of water.

Pursuing the idea of landscape as a merger of form and formlessness one step further, Salvador Dalí painted images

such as *The Persistence of Memory* (1931; Museum of Modern Art, New York) in which the viewer's normal concept of proportion is also skewed, as for example in the larger-than-life-size limp watch that hangs over a bare branch of a diminutive tree. Objects fuse with anthropomorphic elements in this landscape of dreams, as the formless foreground is absorbed into the recognizable forms of the lake and mountainside by Dalí's home in Port Lligat, Spain. In this way he coordinates the known with the unknown, dream with reality, and form with formlessness within the idea of landscape.

Scholarship on the Landscape

Formal discussions of the idea of landscape date, as mentioned earlier, to the philosophic and poetic texts from the classical era of Greece and Rome. In the early Christian era, however, beyond scriptural and patristic references to landscape as the garden, the wilderness, the land of milk and honey, or the desert, little attention was given to either landscape as an art form or as nature until the time of Francis of Assisi (1181 or 1182–1226), who retrieved and reshaped the pre-Christian understanding of the beauty of the natural order as a reflection of God.

Giovanni Paolo Lomazzo (1538–1600) is recognized as the first author to discuss formally an aesthetics of landscape through his distinction of “privileged places” and “places of delight” in his *Trattato dell'arte della pittura, Libro VI* (1584). Seventeenth-century commentaries by Roger de Piles, André Félibien, and Samuel van Hoggstraten, among others, continued to define, classify, and elevate the idea of landscape in art. The eighteenth century produced significant philosophic reflections on the idea of landscape, particularly with relation to the sublime, by Edmund Burke, William Gilpin, Uvedale Price, and Immanuel Kant. Curiously, nineteenth-century painters wrote more influential texts on landscape than philosophers or theologians, including Caspar David Friedrich, John Constable, and Thomas Cole, although the writings of John Ruskin and Ralph Waldo Emerson would be formative on later aesthetics of landscape. With the advent of the twentieth century, critical assessments of the idea of landscape, particularly in painting, began to appear; however, most were limited to studies of “modern” attitudes toward landscape.

There is no single classic study of the theme of the idea of landscape either in the arts or more specifically in painting throughout the history of either Eastern or Western culture.

However, classic studies such as Michael Sullivan's *The Birth of Landscape Painting in China* (1962) and Barbara Novak's *Nature and Culture* (1980) consider the development of landscape painting in relation to a specific geographic location or chronological period. Kenneth Clark's singular *Landscape into Art* (1946) is an observant analysis of the cultural concepts of landscape in Western culture with a subthesis that the artistic move to landscape as a recognized category of “high art” corresponds to the secularization of Western culture and values.

A variety of intriguing texts including Leo Marx's now classic *The Machine in the Garden: Technology and the Pastoral Ideal in America* (1964) and Yi-Fu Tuan's *Space and Place: The Perspective of Experience* (1977) provide lenses through which to expand the boundaries of art-history-based analyses of landscape. Similarly Robert Rosenblum's *Modern Painting and the Northern Romantic Tradition: From Friedrich to Rothko* (1975), Denis E. Cosgrove and Stephen Daniels's edited volume *The Iconography of Landscape: Essays on the Symbolic Representation, Design, and Use of Past Environments* (1988), and any of Barbara Novak's texts provide specialized studies integrating theological, cultural, scientific, and philosophic influences on the meaning and presentation of landscape in painting.

Why does a virtuous man take delight in landscapes? It is for these reasons: that in a rustic retreat he may nourish his nature; that amid the carefree play of streams and rocks, he may take delight; that he may constantly meet in the country fishermen, woodcutters, and hermits, and see the soaring of the cranes, and hear the crying of the monkeys. The din of the dusty world and the locked-in-ness of human habitations are what human nature habitually abhors; while, on the contrary, haze, mist, and the haunting spir-its of the mountains are what human nature seeks, and yet can rarely find.

SOURCE: Kuo His, *An Essay on Landscape Painting*, trans. Shio Sakanishi (1936), p. 30.

The reality of both the interdisciplinary motif and methodology for the study of this theme, that is, the idea of landscape (through painting), has been emphasized by Western scholars within the categories of Western art and cultural studies. The most creative work being done appears to come from the research and curatorial presentation for special exhibitions. For example, the reader should consult *The Natural Paradise: Painting in America, 1800–1950* (1976), edited by Kynaston McShine; *American Light: The Luminist Movement, 1850–1875* (1980), edited by John Wilmerding; and *American Sublime: Landscape Painting in the United States, 1820–1880* (2002), edited by Andrew Wilton and T. J. Barringer.

Diane Apostolos-Cappadona

LANGUAGE AND LINGUISTICS. Estimates of the number of languages spoken on earth at the turn of the twenty-first century range between four and six thousand. Considering that this number has been rapidly declining for the last couple of centuries, there must at one time have been many more languages, perhaps upwards of ten thousand. Of the languages spoken in the twenty-first century, a few have tens or hundreds of millions of speakers spread over enormous stretches

of land, while most languages have severely restricted population distribution. No matter exactly how many different languages there are or how many speakers each of them has, the multiplicity of human speech patterns is staggering, and any attempt to reduce this overwhelming plethora of sounds, meanings, and structures to a finite set of rules and procedures is both daunting and humbling. Yet that is precisely the charge that linguists take as their solemn duty. No wonder that linguistics is probably the most contentious of all academic disciplines; there is no easy, transparent mechanism for bringing order to the wild proliferation of human speech (not to mention writing).

The varieties of linguistic experience are so profuse as to defy accurate enumeration: grammar, syntax, etymology, phonology, phonetics, morphology, psycholinguistics, anthropological linguistics, sociolinguistics, educational linguistics, taxonomy, philology, historical linguistics, lexicography, and so on. It would be futile to attempt any sort of exhaustiveness with regard to the branches and sub-branches of this protean discipline. What is more, each division and subdivision of linguistics has its own generation after generation of leading lights. Thousands of linguists have left their imprint on the field, but here it will be possible to mention only a few of those who represent major trends, particularly in the realm of thought (both about the discipline itself and about human beings and their world).

Philosophers, Grammarians, and Neogrammarians

Throughout most of human history, the study of language has been subsumed under philosophy. The distinction between philosophical linguistics and linguistic philosophy is subtle but telling: Is the driving concern language or philosophy?

The Austrian-born English philosopher Ludwig Wittgenstein (1889–1951) was instrumental in bringing language-related questions to the fore for those who were not professional linguists. He accomplished this in two respects: (1) discussions on the philosophy of language, and (2) elaboration of logical theories. Wittgenstein was a protégé of Bertrand Russell (1872–1970), absorbing features of the analytic philosophy of Russell and Gottlob Frege (1848–1925), but fundamentally posing a whole series of innovative questions of his own devising. Wittgenstein's genius is enshrined in his *Logisch-philosophische Abhandlung (Tractatus Logico-Philosophicus, 1922)*, a brilliant work that is only about seventy-five pages in length. Despite its extreme brevity, the *Tractatus* manages to raise provocative questions concerning the nature of language, logic, ethics, death, and other, often disturbing, topics. How is language possible? How does a sequence of words come to mean something? How can it be understood? For Wittgenstein, a sentence is a depiction of reality, thus he presents what might be called a picture theory of language. The *Tractatus* deals, above all, with the limits of language: "What can be said can only be said by means of a proposition, and so nothing that is necessary for the understanding of *all* propositions can be said." (In such statements by Wittgenstein, "said" means "represented.") The limits of language correspond to the limits of thought, hence there are certain things that cannot be thought, which accounts for the famous last sentence of the book: "Whereof one cannot speak, thereof one must be silent."

In *Tractatus*, Wittgenstein expressed the idea that there was a unifying essence beneath the diversity of language, and that the philosopher strives to discern this essence. In his posthumously published *Philosophische Untersuchungen* (Philosophical investigations, 1953), he had come to the conclusion that this supposed underlying essence was illusory. Rather, one demolishes obsessive concern with such perplexing questions as knowledge, intuition, and assertion by simply describing what one experiences in the daily use of language. In short, throughout his philosophical studies, Wittgenstein was perpetually in quest for *das erlösende Wort* ("the redemptive word").

Another important British thinker who followed the later Wittgenstein in pursuing philosophical analysis through detailed study of mundane language was John Langshaw Austin (1911–1960). Austin maintained that linguistic analysis can solve philosophical problems, but was opposed to the language of formal logic as contrived and incomplete. According to Austin, daily language is actually more subtle and complex than formal logic, and hence better able to get at the crux of critical issues. His approach helped to underscore the significance of language for philosophy.

One tradition of thought in which philosophy and concern with language are given almost equal weight is semiotics. Simply stated, semiotics (or semiology) is the study of signs and their diverse applications. The notion of *sign* is fundamental to the study of language, but its protean ubiquity (including for nonlinguistic purposes) makes it extraordinarily difficult to define. One of the earliest sign theories is that of St. Augustine of Hippo (354–430) as enunciated in *De Doctrina Christiana*: "A sign is a thing that causes us to think of something beyond the impression the thing itself makes upon the senses." The semiotic frame of reference is vast, being designed to encompass all other types of inquiry, but it became an independent mode of investigation with the American philosopher Charles S. Peirce (1839–1914). Originally a logician, Peirce did not offer a systematic presentation of his major principles and frequently changed his doctrines. He basically contended that all human experience could be organized at three levels that, roughly stated, are felt qualities, experiential effect, and signs, the latter being the abstract class of all sensorially perceived "signals" that refer to the same object or phenomena.

The German mathematician, logician, and philosopher Gottlob Frege contributed to the early development of semiotics by adding, among other things, the crucial distinction between *Sinn* ("sense") and *Bedeutung* ("meaning"). Frege enunciated the principle of *compositionality* whereby a sentence can be described according to the functional interdependence of the meanings of its appropriately formed elements.

In his *Foundations of the Theory of Signs* (1938), another American philosopher, Charles W. Morris (1901–1979), offered a tripartite organizational scheme for semiotics: syntax (the interrelations among signs), semantics (the relation between signs and the objects they designate), and pragmatics (the relationship between the sign system and the user). Morris collaborated with the German scholar Rudolf Carnap (1891–1970), who developed an ideal language that became a model for semioticians. A major figure in the development of

symbolic logic was the Polish-American scholar Alfred Tarski (1902–1983), who is well known for his concept of truth in formalized languages.

Semiotics was further developed in the monumental work of another German thinker, Ernst Cassirer (1874–1945), entitled *Philosophie der symbolischen Formen* (The Philosophy of symbolic forms, 1923–1929). Cassirer recognizes the vital role of language in articulating and conceptualizing a preexisting reality, but his project is primarily philosophical. He emphasizes that human beings are *animal symbolicum* (“the symbol-creating animal”), not merely because of their ability to manipulate verbal language itself, but also because of their creation of other symbolic spheres: art, myth, religion, science, history, and so on.

Semiotics and grammar converged in the synthesis of the American logician Richard Montague (1930–1971), who followed in the path of Frege, Tarski, and Carnap. Based upon the semantics of formal languages, Montague grammar puts forward the premise that there is no theoretically relevant difference between artificial (formal) and natural (human) languages. Therefore, the logical structure of natural languages may be described through universal algebra.

Having pursued the philosophical path thus far, this article now follows the grammatical thread. Classical grammarians were concerned with prescriptive principles. This suited the sharply defined structure of Indo-European languages. It is one of the perennial questions of linguistics, however, whether such principles apply equally well (or at all) to non-Indo-European languages. China had its own sort of language studies, known as *xiaoxue* (“minor learning,” in contrast to *daxue* [“major learning”], which signified ethics), for at least two millennia. An early philosopher named Xun Zi (c. 310–210 B.C.E.), moreover, had elaborated a doctrine of “names” that bore striking similarity to doctrines about language expressed by Plato (c. 428–348 or 347 B.C.E.) in his “Cratylus.” But it was not until the end of the nineteenth century that Literary Sinitic (Classical Chinese) was forced into a Latin grammatical mold—and it fit very badly. This question of the appropriateness of classical Western grammar for non-Indo-European languages shall return below (both directly and under the guise of universal grammar). For the moment, however, the focus will be on Western grammars for Indo-European languages.

The Modistae (also known as Modists and speculative grammarians), who flourished around Paris from about 1260 to 1310, wrote medieval treatises on the *modi significandi* (“modes of signifying,” the semantic and deictic functions of words and word classes). They were generally Aristotelian in their aim to explain language, not simply to describe it, and had a large impact on the terminology and systematicity of later grammarians.

After having investigated grammars for various specific languages (Greek, Latin, Hebrew, Spanish, etc.), Claude Lancelot (1615?–1695), professor at the Petites Écoles of Port-Royal des Champs, in collaboration with Antoine Arnauld (1612–1694) wrote the *Grammaire générale et raisonnée* (1660), often referred

to as *Grammaire de Port-Royal*. This is a general grammar that enunciates certain principles that presumably govern all languages and are meant to define language in general, while individual languages are thought to be particular cases of the universal model. By and large, eighteenth-century grammarians followed in the footsteps of their Port Royal predecessors. Lancelot and Arnauld imply, and later grammarians (for example N. Beauzée) specify, that communication of thought by means of speech demands that the latter be a sort of “picture” or “imitation” of thought (cf. Wittgenstein). That is to say, the function of language is to be a representation of thought. Already in the seventeenth century, Gottfried Wilhelm von Leibniz (1646–1716) and other thinkers subscribed to the belief in the imitative value of language sounds. This leads to the consideration of the place of phonology in the history of linguistics.

In comparing Old Norse, Greek, and Latin, the Danish linguist Rasmus Rask (1787–1832) had discovered regular sound differences. In 1822, the German philologist and folklorist Jacob Grimm (1785–1863) construed these differences as systematic sound changes that had led to the development of Germanic as a separate branch of Indo-European. This recognition became enshrined as Grimm’s Law (also referred to as the Germanic sound shift) and was a major milestone in the evolution of linguistics as a rigorously scientific discipline.

The neogrammarians (*Junggrammatiker* in German, also known as the Leipzig School), subscribed to positivistic atomism. During the 1870s, they arose in staunch opposition to the metaphysical and biological approaches to language then current. Their name was actually a pejorative term applied to them by the older generation of traditionalists in language studies. The school is said to have its inception from the publication of Karl Verner’s (1846–1896) celebrated explanation of apparent exceptions to Grimm’s Law in 1877, of August Leskien’s (1840–1916) postulation of the inviolability of sound laws in relation to declension in 1876, of Karl Brugmann’s (1849–1919) studies on the morphology of Indo-European, and of Hermann Paul’s (1846–1921) *Prinzipien der Sprachgeschichte* (Principles of the history of language) in 1880. They insisted upon the absolute autonomy of phonology from syntax and semantics, with phonology having the most important position. Their main aim was to describe historical change, plus they had an overriding interest in diachronic aspects of language and the development of precise methods of reconstruction. The structuralists and transformationalists of the twentieth century criticized virtually all of the basic premises of the neogrammarians, yet the neogrammarians arguably did more to establish linguistics as an independent science (in the strictest sense of the term) than any other school.

The Structuralist Era

The father of structuralism (and many would say of the modern science of linguistics) was the Swiss linguist Ferdinand de Saussure (1857–1913). But Saussure was a reluctant father whose seminal *Cours de linguistique générale* (Course in General Linguistics, 1916) was edited and posthumously published by two colleagues and a student who assiduously took notes at his lectures. The peculiar nature of its composition has resulted

in a work that is fraught with contradictions and puzzling self-doubts cheek by jowl with superbly confident, dogmatic assertions. Despite all the vagaries of its composition, *Cours de linguistique générale* is a hugely influential work and has probably done more to establish linguistics as an independent discipline than any other single book.

Although Saussure had a background in the historical study of language and had made significant advances in the understanding of the Indo-European vowel system, he was unusually critical of neogrammarian philology, which he accused of being overly absorbed in diachrony (that is, issues of the evolution of languages). Saussure also criticized traditional grammarians for neglecting entire aspects of language and for lacking overall perspective, but allowed that their method was fundamentally correct and that they properly emphasized synchrony. Hence, whereas the discipline of historical linguistics that grew up in the nineteenth century was almost wholly diachronic in its orientation, linguistics in the first half of the twentieth century—following the lead of Saussure—became a largely synchronic enterprise. It was not long before European structuralism crossed the Atlantic to become the predominant methodology of American linguistics.

The German-born American anthropologist Edward Sapir (1884–1939) was responsible for many enduring concepts in linguistic research. Author of the landmark volume *Language* (1921), Sapir emphasizes that language is tightly linked to culture. For Sapir, language is an acquired function of culture rather than being biologically determined. This view is diametrically opposed to that of the transformationalists (see below), who believe (but have not proved) that human beings possess a genetically determined predisposition for language—including many of its most specific and distinguishing features—that is already present at the moment of birth. Sapir is undoubtedly correct when he points out that, sans society, an individual will never learn to talk in meaningful terms—that is, to communicate ideas to other persons within a given community. This can easily be demonstrated by observation of feral or mentally abused children and in children suffering from autism or other psychological disorders that affect the acquisition and manipulation of language. Similarly, infants who are born into one linguistic environment but are adopted into a completely different linguistic environment will obviously not grow up speaking the language of their biological parents. If there is any “hardwiring” of linguistic abilities, it occurs around puberty, after which time it becomes increasingly difficult to attain full fluency in a second language or to lose all ability in one’s mother tongue. Sapir, of course, could not have foreseen the degree to which the transformationalists would divorce language from its social and cultural matrix, but he would undoubtedly have been horrified by this turn of events and would have regarded it as a fallacious approach to language. While Sapir may not be around to point out the speciousness of the transformationalists’ so-called LAD (Language Acquisition Device, also styled the “language module,” “language instinct,” and so forth), which stipulates hardwired language ability at birth, that has been done ably by Jerome Bruner (b. 1915) with his cognitive learning theory that builds on the cultural-cognitive developmental model of the Russian psychologist Lev Vygotsky (1896–1934).

Although Leonard Bloomfield (1887–1949) was a contemporary and colleague of Sapir, and the two are widely regarded as the founders of American structuralism, they were quite dissimilar in temperament and outlook. Whereas Sapir was more dramatic and imaginative, Bloomfield tended to be methodical and preferred as much as possible to rely strictly upon evidence in formulating his positions. In 1914 he wrote *Introduction to the Study of Language*, which in later editions was called simply *Language* (1933). Bloomfield was responsible for an enormously influential synthesis that brought together three earlier traditions of language study (historical, philological, and practical), and forged them into a coherent whole. He was fiercely determined to establish linguistics as a science. In particular, he wished to distinguish linguistics from the speculative philosophers who assumed that the structure of their own language embodied universal forms of human thought or even the cosmic order. In addition to the speculative philosophers, Bloomfield censured the grammarians of the old school tradition who strove to apply logical standards to language, ignoring actual usage in favor of prescriptive rules. Bloomfield was especially critical of those who took the features of Latin as the normative form of human speech. He was much more favorably disposed toward the grammatical studies of the ancient Indians because the latter were themselves excellent phoneticians who had also developed an intelligent systematization of grammar and lexicon.

In Europe, structuralism did not remain a monolithic linguistic monopoly. The Prague School (which grew out of the Prague Linguistic Circle) is a branch of structuralism, but with a difference. The members of this school hold language to be a system of functionally related units and focus on the observation of linguistic realia at discrete moments. They are interested in language change, not in maintaining a strict dichotomy of *langue* and *parole* (linguistic system versus linguistic utterance)—a key tenet of Saussure—or of synchrony and diachrony. The starting point of the Prague School is to clarify the function of the various elements of actual utterances. The Prague School has made a lasting impact upon many areas of modern linguistics, particularly with regard to the analysis of the sounds of language and their effect in literature.

Another noteworthy structuralist school is the Copenhagen Linguistic Circle. One of its leading theoreticians was Louis Hjelmslev (1899–1965), whose *Prologomena* (1943; English edition 1953) is intended as a series of preliminary statements essential for the formulation of any theory of language. Laying down the most basic ground rules for linguistics, Hjelmslev faults the humanities for being overly descriptive and insufficiently systematizing. He is opposed to the confusion of philosophy of language with theories of language. Hjelmslev views language as a self-sufficient totality of its own. He foresees the emergence of an “algebra of language,” which he calls “glossematics.” This novel linguistic approach, which strongly emphasizes form, is intentionally designed to distinguish the ideas of the Copenhagen School from more traditional forms of structural linguistics, such as those of the Prague School. Hjelmslev does adhere to Saussure’s basic principles of structuralism, but attempts to make his theory more axiomatic, having been influenced by the logical empiricism of Alfred North

Whitehead (1861–1947), Russell, and Carnap. With the ostensible goal of eliminating confusion between the object (language) being studied and the methodology used to describe it, Hjelmslev tries to create noncontradictory descriptive terminology by employing carefully crafted abstractions and mathematical logic.

Around the middle of the twentieth century, Morris Swadesh (1909–1967), a student of Sapir, devised a statistical method for determining the family relationships of languages and the probable dates of their separation from a common parent. This technique, which is called lexico-statistics or glottochronology, is premised upon the idea that the vocabulary of a language is replaced at a constant rate, much like the steady radioactive decay of carbon-14 that is used to date organic remains. The Swadesh lists select a core vocabulary of one hundred or two hundred words consisting of body part terms, lower numerals, pronouns, primary kinship terms, common flora and fauna, words for ordinary topographical features, and so forth. Widely used in the 1960s and 1970s, glottochronology provoked an emotional debate, with all manner of objections being raised against it: the rate of decay is not universal, cognates may be partial and may or may not be recognizable, even core terms may be borrowed, and so forth. Despite the outcry, glottochronology is still employed, but in mathematically increasingly complex and conceptually more sophisticated models. For example, a geographical dimension may be incorporated into the tree, and more careful attention is paid to historical reconstruction.

Another controversial legacy of structuralism that continues to attract attention is the Sapir-Whorf hypothesis concerning the relationship among language, thought, and culture developed by Benjamin Lee Whorf (1897–1941), who was also a student of Sapir and who based his hypothesis on the approach of his mentor. The Sapir-Whorf hypothesis has two main facets: (1) linguistic determinism (the language one uses conditions the way one thinks), (2) linguistic relativity (the complex of distinctions made in a given language are unique and not to be found in any other language). Both of these facets are somewhat at odds with the Bloomfieldian notion (broadly ascribed to by modern linguists) that all languages—like all people—are equal in their ability to express whatever thoughts their speakers need or want to convey. Whorf did intensive work on North American indigenous languages that have dramatically different grammatical and lexical properties from Indo-European languages, so it is altogether comprehensible that his intimate familiarity with their distinctive outlooks would lead him to develop the hypothesis that he did. While the two main facets of the hypothesis would appear to be innocuous, commonsense propositions, they are anathema to certain sectors of the modern political spectrum. Furthermore, continuing the tinctorial theme, the strong form of the Sapir-Whorf hypothesis (that a given language determines the thought and perception of its speakers) is seen by many to have been refuted by the study of Brent Berlin and Paul Kay on basic color terms and their supposed universality (1969). The conclusions of Berlin and Kay, however, have not gone unchallenged: John A. Lucy and Richard Shweder have demonstrated significant behavioral differences in regard to color

perception on the part of speakers of different languages. In any event, the Sapir-Whorf hypothesis should be easily testable by extensive investigation of the thought patterns of individuals who are thoroughly bilingual (or multilingual) in markedly dissimilar languages. Simply asking such individuals whether it is easier to think certain thoughts in a given language than in another language, or whether it is impossible to think the thoughts of one language in another language, should go far toward determining the validity of the Sapir-Whorf hypothesis.

The Transformational Generative Insurrection

Few would disagree that Noam Chomsky (b. 1928) was the dominant figure in linguistics from the late 1950s through the 1970s. Two early works, *Syntactic Structures* (1957) and *Aspects of the Theory of Syntax* (1965), laid the foundations and set the tone for Chomsky's linguistic project that has lasted (albeit in increasingly attenuated versions) into the twenty-first century. From the very beginning of his career, Chomsky adopted a highly combative stance against his intellectual and ideological opponents. Since Chomsky is a clever debater, he usually wins his arguments, and this has been one of the main factors in his meteoric rise. Chomsky's highly polemical orientation spills over into many nonlinguistic fields. Although he has been remarkably prolific writing about language-related matters, Chomsky's publications on a wide range of politically sensitive topics would appear to be still more numerous.

In general, Chomsky is favorably disposed to traditional grammar but is hostile to structural linguistics. His hostility to the structuralists seems to stem from their emphasis on anthropologically grounded fieldwork and formal description of numerous languages, which is in stark contrast to his own psycho-philosophical orientation and nearly exclusive attention to English. Chomsky is opposed to reliance on what he calls "discovery procedures" and "objective methods," opining that linguists are simply awash in the particularities of data unless they possess profound notions of linguistic theory to guide them. For Chomsky, theory is clearly more important than data, intuition more desirable than induction. Chomsky is an introspective mentalist who believes that the methodological purity and attention to minutiae of the structuralists and behaviorists prevents them from asking the big questions about language that really count.

Chomsky posits a perfectly competent, ideal speaker-hearer whose actual linguistic performance may display deviations from rules but who is capable of correctly analyzing the underlying processes of language. This accounts for his well-known concept of generative grammar, a synonym for transformational grammar, which is made up of formal operations that are said to mediate between the deep structure underlying linguistic utterances and the surface structure of the sentences that are actually produced by a speaker. Transformational-generative grammar (hereafter TGG) is asserted to be a universal grammar that is supposedly innate in all human beings.

As a complement (or rather supplement) parallel to the mastery of internalized generative grammar of the individual, Chomsky posits an externalized universal grammar that

possesses profound regularities. Although he is strongly in favor of determining linguistic universals, Chomsky is vague about how this is to be accomplished. Chomskyan linguistics also touches upon other areas, such as Cartesian rationalism (to reinforce his faith in innateness), and has evolved into other forms, most notably government and binding theory, which focuses on modularity of syntax. Yet all of the elaborations and refinements of the 1970s and 1980s only serve to underscore the concerns that Chomsky had already embraced in the 1950s and 1960s. By the 1990s, while still residually influential, Chomsky's linguistics program had essentially run its course and was badly fragmented in its second generation. A few younger disciples, such as Steven Pinker, however, still carry the torch.

The last main restatement of Chomsky's theories was his minimalist program that followed government-binding theory and principles and parameters theory. This final designation gives the distinct impression that the Chomskyan insurrection has at last imploded, ending with a whimper, not with a bang.

Chomsky claims that one of the chief inspirations for his generative grammar was the concept of language as "activity" (Greek *energeia*) rather than as a "(static) entity" (Greek *ergon*) waiting to be surveyed in its entirety. This view of the dynamic, "continuously self-generating" processes inherent in language is attributed to Wilhelm von Humboldt (1767–1835) and has become a linchpin of what is now called ethnolinguistics.

Chomsky was a student of Zellig Harris (1909–1992) and borrowed extensively from the analytical procedures that the latter devised. To be sure, it was Harris who had developed the concept of linguistic transformation, which he borrowed from mathematics, and this was the crux of the entire Chomskyan enterprise. The distinction was that Harris worked within the structuralist paradigm, whereas Chomsky rejected it. Chomsky began by giving the impression that he was following Harris's still fundamentally Bloomfieldian approach, but soon made clear that it was his intention to extend it. Not long thereafter, he launched attacks against all of the main pillars of American structuralism: positivism, behaviorism, and descriptivism.

The most vulnerable was behaviorism, which maintains that psychology should be based solely on observable, measurable phenomena. Bloomfield applied these guidelines to linguistics, holding that language researchers should concentrate on observable, precisely describable verbal behavior and refrain from unnecessary theorizing. In 1957, the Harvard psychologist B. F. Skinner (1904–1990) published *Verbal Behavior*, which attempted to interpret language in strictly behaviorist terms. In that same year, Chomsky penned a harsh denunciation of Skinner's book, with the result that many young linguists were persuaded to embark upon theorizing as a safer path than that of mere observation, description, and measurement.

But all was not peace and calm within Chomsky's own camp, which we may refer to as transformational-generative linguistics (TGL). Disputes had begun to erupt within TGL already during the 1960s and 1970s, some of them quite nasty. There is no point in chronicling the vitriolic arguments that took place during this period. Suffice it to say that, at base,

many of them had to do with how to handle linguistic structures that were larger and more complicated than the phrase.

The most productive departure from the TGL camp is that of George Lakoff, who, together with Mark Johnson and his collaborators, has led the development of conceptual metaphor and cognitive linguistics. Lakoff was one of the early generative semanticists who questioned the validity of syntactic deep structure. This led him to formulate metaphor as a schema in the Kantian sense. One of the most fascinating aspects of cognitive linguistics and conceptual metaphor theory is that it is data-driven, not theory-driven. That is to say, it has to be (empirically) responsible to meaning making as it occurs in human communication, which is why meaning exists in the first place. Consequently, grammar cannot be conceived of as an algorithmic process that proceeds regardless of the constituent meanings. Furthermore, if human meaning making uses the same elements and principles (namely, conceptual metaphor and blending), then all aspects of human creation—literature, religion, history, philosophy, art, music, science, even mathematics—are constituted by these elements and principles, and subject to analysis through them. Cognitive linguistics, conceptual metaphor, and conceptual blending have been adopted by a second generation of students who are every bit as enthusiastic about it as were the second generation of adherents to TGG back in the 1960s and 1970s. They believe that this new, interdisciplinary approach to language will revolutionize our understanding of ourselves and our world. The fact that their numbers are growing impressively indicates that, to a certain extent, they may well be right.

Other Voices

Although structuralism and TGL were respectively paramount in the first and second halves of the twentieth century, this is by no means to say that competing approaches were lacking. During the period when structuralism dominated linguistics, other interesting approaches to language proliferated. One that caught the popular imagination was that of general semantics, a philosophical movement originated by the Polish-American philosopher and mathematician Alfred Korzybski (1879–1950). Korzybski, who once famously declared that "The map is not the territory," called for a heightened awareness of the conventional relationship between words and the things to which they refer. It was his intention to promote clear thought (to free human beings from the "tyranny of words," as enunciated by one enthusiast) and thereby to improve systems of communication. That is to say, it should be recognized that language does not directly reflect reality. Indeed, the structure of language may be said to distort our perception of reality. This deficiency can be remedied by insight into the nature of mundane language and, further, by the creation of more refined language that is structured in the same way reality is. Korzybski's fundamental ideas are spelled out in *Science and Sanity: An Introduction to Non-Aristotelian Systems and General Semantics* (1933). General semantics was further popularized by S. I. Hayakawa (1906–1992), whose *Language in Thought and Action* (1938) has been a bestseller for decades. After serving in the United States Senate from 1977 to 1983, Hayakawa founded U.S. English, Inc., which is dedicated to making English the official language of the United States.

Also showing how politics and linguistics can become tightly intertwined is a nonstructuralist school of a very different sort. Marrism, founded in the 1920s by the Soviet archeologist and linguist Nikolai Y. Marr (1865–1934), was quintessentially Marxist in holding that all linguistic phenomena are purely a reflection of economic functions and social forces (superstructure). Marr considered Caucasian as the proto-language of Europe (the so-called Japhetic theory), which oddly coincided with German racist theories of Johann Friedrich Blumenbach (1752–1840). Joseph Stalin (1879–1953) (who, incidentally, had much to say about language), however, put an end to Marr's influence on Soviet linguistics when in 1950 he refuted the superstructure theory of language, declaring that it was independent of human productivity.

Politics aside, there were plenty of other nonaligned linguistic practitioners during this period, both in Europe and in America. Bringing together the philological exactitude of Antoine Meillet (1866–1936) with the conceptual grandeur of Georges Dumézil (1898–1986), the French scholar Émile Benveniste (1902–1976) was the author of the redoubtable *Le vocabulaire des institutions indo-européennes* (1969; English trans. *Indo-European Language and Society*, 1973). In it, employing what has been referred to as ethnosemantics (or ethnographic semantics), he strove to “elucidate the genesis” of the vocabulary of Indo-European institutions in six fundamental realms: economy, kinship, society (status), authority (especially royalty and its prerogatives), law, and religion. Benveniste was particularly interested in the religious doctrines of the Indo-Europeans.

J. R. Firth (1890–1960) was one of the chief founders of linguistics in Great Britain. He held the first chair in general linguistics in England, which was established at the School of Oriental and African Studies of the University of London in 1944. Firth is noted for his development of prosodic phonology, and insisted on analyzing both sound and meaning in context. Furthermore, Firth held that no single system of analytical principles and categorization could adequately account for language; different systems are required for different situations. Unlike most theorists, but very much like Benveniste, Firth recognized the importance of religion for the history of linguistics. Himself an Orientalist, Firth acknowledged the great merit of early Indian grammars (the first in the world) and the tremendous significance of Sanskrit for understanding the development of Indo-European. At the same time, he admits that the classical grammarians (Panini for Sanskrit, Dionysius for Greek, Priscian for Latin) were not concerned with the vernacular. Firth is thus also one of the few major linguistic theoreticians who is aware of the great gulf between classical and vernacular languages, a subject that awaits future research.

One of Firth's outstanding students, M. A. K. Halliday (b. 1925), countered Chomsky on many points, including the central concept of competence, against which Halliday adduces the notion of “meaning potential.” This is defined in terms of culture, to which Halliday is unusually sensitive, not mind. He possesses a keen sense of the social functions of language and its existential acquisition during childhood. Halliday developed a grammatical theory according to which language is

viewed as an intersecting set of categories and scales operating at different levels. He is also responsible for creating systemic functional grammar, which is particularly well adapted to non-Indo-European languages.

In the United States, one of the most estimable twentieth-century linguists whose work lay outside of both structuralism and TGL is Kenneth Lee Pike (1912–2000). His *Language in Relation to a Unified Theory of the Structure of Human Behavior* (1967) is a massive, ambitious tome. In keeping with the combative atmosphere pervading the discipline, Pike speaks of the “battle ground” of language study and his determined efforts to promote thoroughgoing changes in language theory. Pike's theoretical work (he is also celebrated for his achievements in applied linguistics) derives from an attempt to describe empirical data drawn from a literally worldwide range of languages in the absence of a satisfactory grounding in contemporary linguistic theory. It was due to his search for a theoretical basis that would permit him to analyze and make sense of a vast amount of empirical data that he developed his brand of tagmemics. (A tagmeme is normally defined as the smallest functional grammatical element of a language. It is parallel in usage to the morpheme [the smallest functional lexical unit of a language] and the phoneme [the smallest functional phonological unit of a language].)

Pike's tagmemic approach differs from mainstream American linguistics in various technical respects, but above all in its complexity. A key feature of Pike's thinking about language is that he abandons the Saussurian distinction between *langue* and *parole*. His reason for doing so was because the large amounts of materials that he and his collaborators collected showed that speech itself was highly standard, an analytical characteristic that was normally reserved for formal, written language according to the mainstream view. As elaborated by Pike, tagmemics remained an important branch of American structuralism, but he distanced himself from other leading linguists of his day in striving to describe linguistic regularities in accord with sociocultural behavior instead of abstract models. Part of the methodology of tagmemics was determined by the sheer necessity of the chief task that its practitioners faced: translating the Bible into previously unwritten, unresearched, “esoteric” languages. Pike goes further in combining tagmemes to form syntagmemes, thus enabling him to engage in advanced syntactical analysis. Pike's most profound and far-reaching contribution to the history of ideas, however, is his application of etic and emic analysis to linguistic research. This distinction between the material and functional study of language had an enormous impact upon anthropology and other fields, albeit often in poorly understood and badly distorted guises.

After a couple of decades in which theoretical research reigned supreme, the restoration of empirical studies of language was furthered in the 1970s and 1980s with the inauguration of discourse studies. A landmark in this development is *Strategies of Discourse Comprehension* (1983), co-authored by Teun van Dijk, a linguist, and Walter Kintsch, a psychologist. A salient feature of their work is its interdisciplinary quality, requiring linguistic and computer analysis of texts, experiments in psychology laboratories, sociological field studies, and so

forth. They also relied on literary scholarship, classical poetics and rhetoric, Russian formalism, and Czech structuralism, as well as sociolinguistics, ethnography, and folklore studies. All of these approaches were integrated under the umbrella of “the wide new field of cognitive science.”

A linguistic loner who has had a remarkable impact on the classification of languages is Joseph H. Greenberg (1915–2001). Greenberg started out as a language typologist. Language typology identifies ideal types (for example, agglutinative, [in]flexional, isolating, etc., but there are, of course, many other characteristics that must be taken into account) and proceeds to group individual languages under these categories. Greenberg’s fame rests in part on his seminal contributions to synchronic linguistics and his indefatigable quest to identify language universals. His typological approach contrasts with that of genetic classification, which is premised on delineating the development of languages from older precursors. Greenberg was always collecting data, which he copied down in countless notebooks. Known as a “lumper” (as opposed to a “splitter”) par excellence, in 1955 Greenberg reduced more than 1,500 African languages to just four supergroups. Later he would ascribe all of the indigenous languages of the Americas to just three main waves of migrants, whereas they had formerly been grouped into hundreds of families. Greenberg achieved these nearly miraculous feats through the application of what he styled mass lexical comparison or multilateral comparison. Mainstream linguists were outraged, with one of the most distinguished among them publicly calling for Greenberg to be “shouted down.” At stake were sacrosanct issues of methodology relating to phonology, etymology, and other vital components of linguistics. Undaunted, Greenberg dedicated the last years of his life to the study of Eurasiatic, which brought together all of the languages of Europe and Asia (and then some—except isolates) and was similar to earlier proposals for Nostratic, minus certain African languages.

In linguistics and language studies, writing is often overlooked. When attention is devoted to writing, it is usually minimized as secondary to speech. The Akkadian specialist I. J. Gelb (1907–1985) aimed to lay the foundations for a new science of writing that he called grammatology. This approach would not be merely descriptive, as were earlier histories of writing. In his classic work, entitled humbly and plainly *A Study of Writing* (1952), Gelb attempted to establish general principles governing the use and evolution of written forms of language through comparative and typological analysis. His is the first, and still the only, work to present a universal theory of all known writing systems. Gelb was able to achieve this considerable synthesis by distinguishing clearly between fore-runners of writing and writing proper, and by distinguishing further between word-syllabic systems, syllabaries, and alphabets.

In the opinion of those who are involved in computational linguistics, the most important development since the 1980s has been to resurrect the use of statistical methods for analyzing distributional evidence. This general approach was pioneered by Zellig Harris in the early 1950s, but starting around 1955, his student Chomsky simultaneously cast doubt on the viability of such methods and presented a different vision of

how to proceed, employing a more axiomatic approach based on explorations in formal language theory. The “cybernetic underground” began skirmishes in the engineering hinterlands during the 1980s and took over computational linguistics entirely by the 1990s. By the early twenty-first century, psycholinguistics had largely succumbed, though there are pockets of resistance. Plain or unhyphenated linguistics is increasingly influenced by statistical methods, both in methodology and in terms of the empirical techniques that are used.

The phonetician Mark Liberman is responsible for building gigantic corpora of data that are used to solve both theoretical issues and practical problems of great merit (such as voice recognition by cybernetic-electronic devices). Many of the brightest minds in linguistics are now laboring quietly at the task of figuring out how to enable human beings and machines to talk to each other. One of the leading theoreticians engaged in this area of research is Roland Hausser, whose *Foundations of Computational Linguistics: Man-Machine Communication in Natural Language* (1999) offers a prescient look at what the future holds in store with regard to the human-machine interface.

One of the most exciting new realms of investigation in historical linguistics is the application of genetics. According to Luigi Luca Cavalli-Sforza, one of the leading researchers in this field, the genes of modern populations contain a record of the human species stretching back 100,000 years. What is more, conclusions drawn from the study of modern genetic material are now being corroborated by direct recourse to ancient DNA. It is striking that genetic and linguistic trees match each other closely, and archeological data provide further confirmation of the movements and intricate interrelationships of ancient peoples.

Conclusion

Although human beings have for millennia taken an intense interest in the languages they speak, modern linguistics has gradually developed as an independent discipline (some would be willing to call it a science) only during the past few centuries. Hundreds of major figures have contributed to this development, and thousands of others have had a significant impact upon linguistics and its host of subfields. It has been possible here only to introduce briefly some of the main ideas of several of the individuals who have been instrumental in making language study what it is at the beginning of the twenty-first century. In many cases, it has been possible to do little more than mention some of their names and their areas of expertise to signal to the interested reader the necessity of investigating further the full range of their work. Scores of other truly outstanding linguists have not even been mentioned at all.

Linguistics is a vibrant, unsettled field, one in which passions run high. In the end, as with so much else pertaining to the intellectual pursuits of humankind, it is evident that a goodly portion of the contradictions and energy that suffuse linguistics can be attributed to the perennial dichotomy between the Aristotelian and the Platonic, between unity and infinity, between the fox and the hedgehog.

LANGUAGE, LINGUISTICS, AND LITERACY.

Language and writing are not the same (although people now confuse them), and the former is far older than the latter. Human spoken language developed late in the Paleolithic, probably 100,000–120,000 years ago, whereas true writing—the representation of language, element by element, in a permanent medium—was not invented until about 5,200 years ago.

Language

Our current estimate of when language itself evolved is based on skeletal evidence for a swift evolutionary push toward the modern human vocal tract during the Upper Paleolithic. These changes—away from the throat, tongue, and mouth configuration typical of other primates—made rapid spoken speech possible while making it easier to die of obstructed air passages (choking, etc.). Such difficulties for the individual must have been well offset for the species by the survival benefits of rapid, voluntary, and abstract communication, one of humankind's most powerful "ideas." Indeed, language's most important design characteristics are that it is:

1. voluntary (unlike the call systems of other primates, speech is initiated from the voluntary part of the motor cortex);
2. arbitrary (we can talk even about things that do not exist, allowing us to solve hypothetical problems and form abstractions; language is not tied to immediate reality);
3. productive (we can use already known vocabulary and syntactic patterns to generate an infinite supply of new messages, not to mention new vocabulary and patterns);
4. largely linear (messages unfold rapidly through time, a choice that places major constraints on the details of language design); and
5. two-way (individuals can both produce and understand messages).

As a result of being arbitrary, languages must be learned. Only the propensity to learn language is instinctive, not the individual languages themselves. Hence, babies must have a long period of apprenticeship to learn to communicate linguistically, a fact equally true of spoken tongues and visual languages like American Sign Language (ASL). (ASL has all the structural features and design complexities of a spoken language, only in a different—and equally evanescent—medium.) Research shows that children deprived of early exposure to linguistic communication (which happens sometimes with deaf babies) do not develop the neurological structures in the brain necessary for handling the complexities of language later.

Because languages are arbitrary, they change constantly, adapting easily to the changing world of things to talk about and social messages to send. As a result of this constant change, speakers of a single language who move away from each other will change their systems differently, a process that may continue until we perceive them as speaking different dialects or even (after many centuries) different languages. This process is called *language divergence* and leads to what linguists call *language families*.

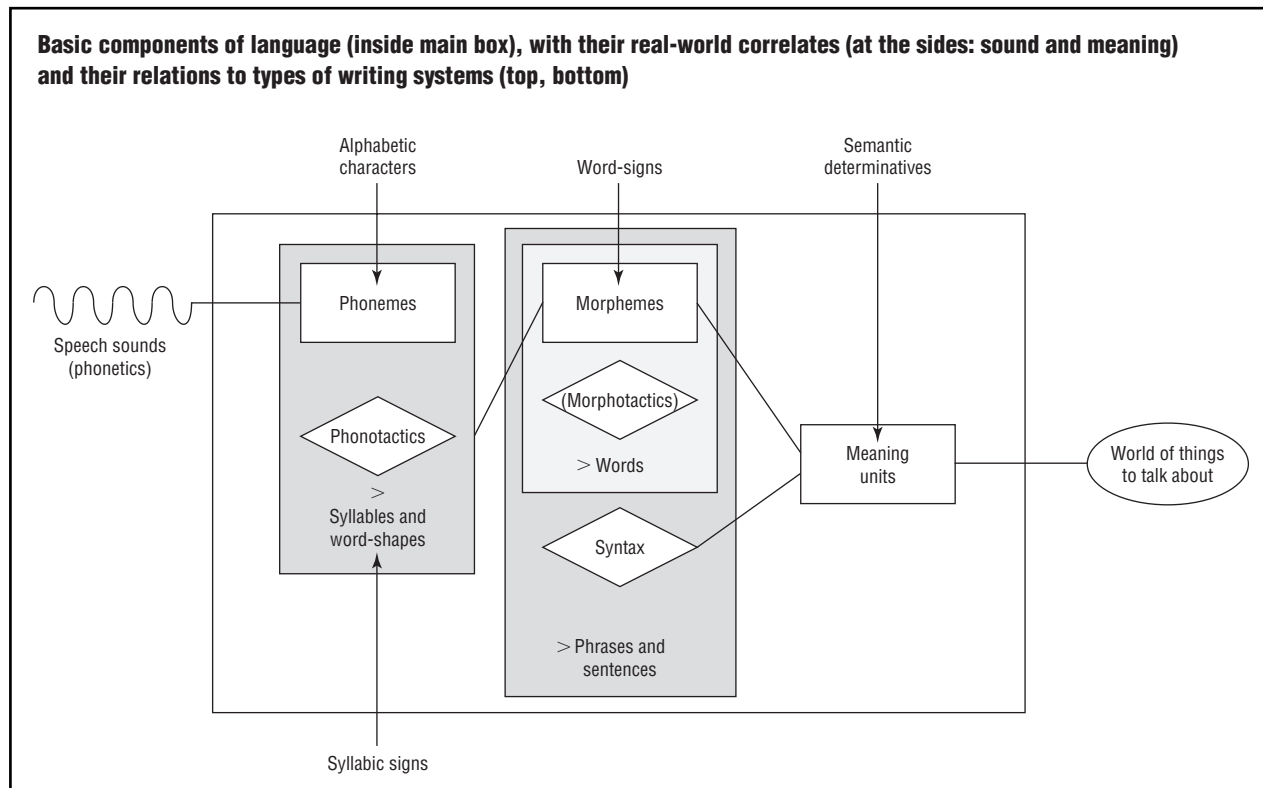

The members of a language family are simply changed later forms of what was once one language. For example, the speakers of Latin fanned out across the Roman Empire 2,000 years ago, but after the breakup of the empire, when travel became dangerously difficult, the local versions of Latin began to diverge, producing the so-called Romance language family, consisting notably of Italian, French, Spanish, Portuguese, and

Romanian (along with several other dialects and languages, less well known because they have fewer speakers). But Latin itself was a changed later form of yet older languages, going back to something we call proto-Italic (for lack of knowing what its speakers called it), and even further back to one we call proto-Indo-European.

Linguistics

Modern linguistics—the scientific study of language in all its aspects—began in the eighteenth and nineteenth centuries with the investigation of just such historical questions. The 2,500 years of continuous written records of Latin and the Romance languages provided one useful “laboratory” in which language change could be observed. The brothers Grimm (Jacob Grimm [1785–1863] and Wilhelm Grimm [1786–1859]), in recording verbatim their famous collection of German folktales, accidentally created another linguistic data set in which they kept noticing interesting relations among the Germanic dialects of the crones who recounted the tales. Elsewhere, other scholars were noting the more distant relations among Greek, Latin, Sanskrit, and other languages we now recognize as Indo-European.

Eventually linguists realized that the relationships between languages within a family were in certain ways regular (if complex), especially in how their sounds changed. This fact allowed scholars to begin to reconstruct forms of the ancestor languages, even when those forms were not attested in writing. To facilitate this linguistic reconstruction, they needed to

SOURCE: Courtesy of the author

study the structural properties of each language, since, before they could compare thoroughly, they had to know in detail what they were comparing. In this way, the systematic study of the synchronic (as opposed to historical) features of languages was added to the field of linguistics around 1900.

The most basic components of a spoken language, all needing study, are the speech sounds themselves (*phonetics*), the system of using certain sounds to tell words apart in a given language (traditionally called *phonemics*, although other approaches to sound contrast are sometimes used), the forms of words (*morphology*), the structures by which words are combined into phrases and sentences (*syntax*), and the meaning components (*semantics*). In the mid-twentieth century, linguists began to explore beyond the sentence level to analyze the structure of discourse, poetry, formulaic speech, and other large units.

Nineteenth-century European scholars were not the first people, of course, to inquire about language history or structure. (For example, around the fifth or fourth century B.C.E., the Indian scholar Panini compiled a thorough grammar of Sanskrit, including what amounts to an excellent structural analysis of its sounds.) But it is their work on which modern linguistic science is principally based. They, in turn, were continually spurred on by the masses of inscriptions that archaeologists were turning up, many in unknown and unreadable scripts.

Writing

The most important scripts deciphered in the nineteenth century were Mesopotamian cuneiform and Egyptian hieroglyphics. Their importance came from the fact that they belonged to the two oldest traditions of true writing: the representation of connected linguistic structures rather than only single concepts or situations.

Jean François Champollion (1790–1832) deciphered Egyptian hieroglyphics in the 1820s. Using the Rosetta Stone discovered in 1799, he recognized that the hieroglyphic pictures represented the successive elements of a normal language (some phonological, some semantic) and not some sort of lost religious magic, since the Rosetta Stone clearly had the same message in Egyptian hieroglyphics, Demotic (everyday Egyptian script), and Greek. Champollion's progress was greatly speeded when he recognized that the language in question was the immediate ancestor of Coptic, the still-used religious language of a Christian sect in Egypt and, therefore, a version of a known language.

Cuneiform required more of a team effort, in part because "it" turned out to be more than one script, and because even the mainstream version had serviced several languages over nearly 3,000 years and had evolved considerably in form during that time. *Cuneiform* means "wedge-shaped" and refers to a whole family of scripts written by impressing wedge-shaped marks into clay with a stylus. The first breakthroughs occurred in the 1840s, and scholars gradually disentangled the various scripts and languages, from later to earlier (although some, like Elamite, remain undeciphered because we do not know enough about the language family represented). Most of the languages written in cuneiform belonged to the Semitic language family, although at least one (Hittite) was Indo-European and several belonged to still other families.

Ancient cuneiform engraved into stone. Cuneiform writing was utilized for thousands of years by the purveyors of many varied languages, making it difficult to decipher. Progress was achieved in the mid-nineteenth century thanks to the work of several different scholars. © DIEGO LEZAMA OREZZOLI/CORBIS

In fact, the very first language written in cuneiform was not Semitic, it was Sumerian, a language that we still cannot relate conclusively to any other known language or family. Sumerian cuneiform writing first appeared in the early cities of Mesopotamia (Iraq) late in the fourth millennium B.C.E.

Origin of Writing

Although many nations have claimed to have invented writing from scratch, only one culture in the Eastern Hemisphere, Mesopotamia, can show in its archaeological record the long series of steps needed to develop this significant invention. It is easy to invent a writing *system* once someone points out that language can be represented in a permanent form by making visible squiggles, each standing for a word or sound. But the notion that *one can write at all* is far more difficult to conceive the first time, truly one of the world's great ideas. Evidence shows that such an abstraction did not come easily. To trace its origin in the Near East, we must go back another 5,000 years to 8000 B.C.E., to early Neolithic sites in Syria and Iraq.

The Neolithic, or New Stone Age, differs from the Paleolithic, or Old Stone Age, in that people now had domestic plants and animals, permanent open-air settlements, and stone tools ground to a fine edge instead of merely chipped. At a number of Neolithic Near Eastern sites, along with evidence for early experiments in architecture and weaving, we find experiments with clay: hundreds of tiny balls, cones, disks, and other simple geometric shapes, which archaeologists at first took for children's game pieces. We now know they were used for keeping accounts of livestock, grain, and other possessions, each shape denoting a different commodity and each animal or unit of goods tallied by a separate piece of clay. Thus, five disks with crosses might correspond to five sheep, and three balls to three measures of grain.

The developmental history of this accounting system (which soon spread across the Near East and into southeast Europe), together with linguistic reconstructions indicating the lack of abstract number words (for example, *six*, *seven*, *eight*) in any

language prior to 3000 B.C.E., indicate that Stone Age peoples did not have an abstract notion of number yet. Lacking number words, they counted simply by matching the animals or jars in question to an equal number of concrete tokens. (Such systems continue to be used in a few societies.) With a simple Neolithic economy, this was sufficient for keeping track of things, although, apparently for security against swindlers, the Mesopotamians added the habit of sealing the little clay tokens of a transaction into a clay ball onto which each token had been impressed once. (This enabled everyone to see what the account was, but no one could snatch or add tokens.) But when, in fourth-millennium Mesopotamia, people began gathering in huge cities and needed to redistribute goods for labor in complex ways, they were forced to devise a more powerful and more flexible system.

The later history of writing systems shows that each new idea for restructuring writing to make it more efficient (such as moving from word writing to syllabic writing, or from syllabic to alphabetic) came from a new group learning the old way of doing things and saying, in effect, “There’s got to be a better way.” Just as each new generation of children restructures slightly the language data learned from its elders, so systems of writing and notation have been restructured by those with a fresh view. The same presumably happened here.

About 3100 B.C.E., in the Mesopotamian city of Uruk, we suddenly see a new “take” on the meaning of the impressions on the clay envelopes holding tokens. Before, the impression of a small cone meant a small measure of grain and that of a big cone meant a larger measure of grain (which happened to equal sixty of the little measures, just as a gallon happens to equal sixteen cups in our system). But now the small cone was reinterpreted as meaning “1” and the big cone as “60,” and another measure in-between (similar to our quart) was reinterpreted as “10” (since it was equal in volume to ten of the smallest unit). With these impressed shapes reinterpreted as designating the *number* intended, however, the scribe now had to specify separately the *object* being counted. At that moment, the system developed into two types of signs: one kind for abstract numbers, the other for names of objects. The latter corresponded to the vocabulary words of language. Thus, if we want to speak of four rings, we don’t say “ring ring ring ring” (or write “oooo,” which is how the Neolithic scribes did it); we use only two words, one for the number (*four*) and another for the object (*rings*). To write this as “4 o” would then correspond unit-for-unit to the words we speak.

The only problem with this system was that words for abstract numbers did not exist. Because we see such words hastily cobbled into being at just this time, we know that they must have been forced into existence by the reinterpretation of the impressed tokens. Now humans had two new ideas to expand upon: the notion of abstract numbers (numbers independent of any particular thing being counted), and the notion that the impressed patterns could correspond to the successive words in a spoken phrase or sentence (*four rings*).

Drawing little pictures to denote words like *ring* or *tree* (pictograms) was fine, but what do you do with grammatical words and other unpicturables like *the* and *or*? The easiest way was to use sound-alikes (homonyms or near homonyms), as in the modern game of charades. Thus, if one did this in English, *or*

Sumerian clay tablet showing livestock tally. Sumerian was the first language represented in cuneiform script. In Mesopotamia, around 3100 B.C.E., a new system evolved in cuneiform wherein some shapes represented numbers and others represented objects.
© GIANNI DAGLI ORTI/CORBIS

could be denoted by a picture of an oar, and so on. (This game, called *rebus writing*, was easier to play in Sumerian than in English because most Sumerian words were only one syllable long.) To tell which word with that sound was meant, scribes began adding extra signs to give clues to the semantic realm. Thus the “oar” pictogram might have a schematic tree beside it when it meant “oar,” warning the reader to pick the word sounding that way that denoted something wooden (eliminating *or* and *ore*). In this way the script gradually became adequate for representing anything in the language, although it was centuries before grammatical words were consistently written along with the “content” (lexical) words. As this writing system became more adequate, it also became more unwieldy, requiring the student to learn hundreds of signs.

Spread of Writing and Literacy

Other early scripts were equally large and unwieldy, and their structures give some clues to their origins. The Egyptians appear to have gotten the idea that *one could write with pictograms and rebuses* from the Mesopotamians around 3100 B.C.E., almost as soon as the Mesopotamians invented true writing, and then made up their script themselves, basing some signs on traditional proprietary marks and drawing pictures for others. So far we lack evidence showing the Egyptians working up step by step to the abstract notion of writing, and we know they borrowed a number of other cultural ideas from Mesopotamia at exactly this period, so this hypothesis of borrowing is the best one we have to date. The Egyptian push to write, unlike that in Mesopotamia, seems to have been chiefly religious rather than economic, especially the desire to preserve personal names for an eternal afterlife. The very earliest

Egyptian inscriptions that have come down to us are names of kings and pharaohs.

Egyptian writing maintained its predominantly religious character to the very end, even though faster cursive forms of the script were eventually devised for writing mundane secular documents. But the Egyptian script never became simpler, retaining its many hundreds of signs until it fell out of use in Roman times.

The Chinese script, which began to blossom during the first great dynasty of China, the Shang (1500–1100 B.C.E.), appears so much later than cuneiform or Egyptian hieroglyphics, in a period when Chinese already contained loan words from Iranian and possibly other Indo-European languages from the West, that probably the script was jump-started like Egyptian, by diffusion of at least the idea that one could write. The signs themselves seem to have been created indigenously, but the writing system closely resembles the Near Eastern scripts in being composed of several hundred pictograms, rebuses, and semantic determinatives. On the other hand, archaic Chinese (like Sumerian) contained mostly words of one syllable, so the Chinese were in a convenient position to (re)invent for themselves the notion of rebuses.

When a script contains hundreds of signs and considerable ambiguity, an individual must devote enormous time and energy to becoming literate. In early societies this had two major consequences: (1) scribes/writers were specialists (fully supported by the rest of society with food, etc.), and (2) there were very few of them. In other words, literacy was not something that many could attain, and, with so few writers, only the most important things got written down. For the Mesopotamians the important topic initially was economic transactions, for the Egyptians, religious matters pertaining to eternity, and, for the Chinese, oracles about future events. Gradually other matters—both religious and secular—came to be recorded, but the cost of educating scribes was always a bottleneck, while the past investment by each of these cultures in their systems made throwing them out unthinkable.

Such was not the case for neighboring cultures. Over and over neighbors restructured these systems as they borrowed them, usually recasting them in such a way as to make the writing more efficient. Living with the Sumerians in Mesopotamia were speakers of various Semitic dialects, such as Akkadian. When Sargon of Akkad took over Mesopotamia soon after 2400 B.C.E., his scribes took the Sumerian pictograms at their *phonetic value alone* (no meaning whatsoever implied) in order to spell out their native Akkadian syllable by syllable (syllabic signs). Conceptually, this was a big step forward because there are so few sounds in a language compared to the huge number of words. Unfortunately, the scribes only went halfway, retaining many Sumerian pictograms as a shorthand for Akkadian words, since a Sumerian word required only one sign, in general, whereas Akkadian words, which typically contained two to five syllables, required many more. So, although the Semitic scribes had made a major conceptual breakthrough (one that the Chinese never made), it remained for others to benefit from this simplification.

Hieroglyphs from the *Book of the Dead*, in the Tomb of Ramesses VI, Valley of the Kings, Thebes, Egypt. First deciphered by Jean François Champollion in 1822, hieroglyphs represent one of the earliest types of true linguistically structured forms of writing. Hieroglyphs are descended from Coptic, an ancient religious language. © GIANNI DAGLI ORTI/CORBIS

The Hittites, an Indo-European group in Anatolia (modern Turkey), attempted to simplify the Sumerian system. When they borrowed cuneiform they dropped most of the duplicate ways of writing a given syllable, whittling down the syllabary to just over one hundred basic signs. But these scribes, too, found it handy to keep the Sumerian pictograms as shorthand for many of their vocabulary words, which on average were even longer than Akkadian words. (If you had to write out absolutely everything by hand, with no word processor, photocopier, or even typewriter, you, too, would look for *faster* ways to write, even if the *system* ended up more complex.)

The people of the Aegean, however, when they borrowed the idea that one could write, eliminated everything except the notion of signs for syllables, creating their own sign-shapes from scratch. They also simplified the notion of “syllable” from the four sorts used in cuneiform (V, CV, VC, CVC, where V = vowel, C = consonant) to two (V, CV), which meant they could manage with a mere eighty or so signs. (Well, almost: for economic accounts, they also used a roster of single signs—pictograms or ideograms—for each different commodity, but these signs were not mixed together with syllabic signs to form a sentence.) This sort of system took much less time to learn and made it possible, at least theoretically, for

more people to become literate in their spare time. The people of Minoan Crete, who used this system for a short time in the mid-second millennium B.C.E., left us elegant inscriptions on jewelry and stone, economic accounts on clay, and graffiti on walls and pottery, suggesting widespread literacy. Unfortunately, they wrote most of their texts on perishable materials that have not survived.

A similar reinterpretation, leading to an even more radical simplification, occurred in the Sinai peninsula, around 1900 B.C.E., where Semites from the north encountered Egyptians from the south at the local copper and turquoise mines. The Semites apparently saw the Egyptian writing system and learned something of its structure, but concluded, "There must be a simpler way." The Egyptian script, unlike cuneiform, did not specify the vowel that a syllabic sign was to convey, only the consonant(s). So when the Semites, like the Minoans, pared away all the duplicate ways of writing syllables, they found themselves with a mere twenty-some signs, specifying that many different consonants.

This new script, the so-called Sinitic consonantal syllabary, was clearly based on Egyptian sign-shapes at first, and it had a tremendous advantage: anyone could learn this tiny number of signs in a few hours. Spelling consisted simply of sounding out the words as one wrote, so spelling did not need to be learned as such. The drawback, of course, was the ambiguity for readers. The writer knew what spoken vowels were intended, but *th rdr hd t gss thm*, leaving much potential ambiguity, unless writers wrote only for their own use. This may have been the dominant use, however, because variants of this simple script quickly spread up the coast all the way to Syria. Along the way it generated what became the Hebrew, Phoenician, Ugaritic, Aramaic, and Arabic scripts (and more), all of which are/were consonantal syllabaries, and generated a much wider range of uses, implying wider literacy.

We know all these scripts are related because they all use(d) the same canonical order of signs for teaching the script, an order ancestral to our modern alphabetical order. One clear and early document of this sort is a tablet from a schoolroom in the city of Ugarit, on the coast of Syria, in which the signs have been modeled for the pupil in this standard order. Because Syria was heavily influenced by Mesopotamian culture, the letters are written with wedge-shapes on clay, but those shapes have nothing to do with the shapes of signs in mainstream cuneiform. Only the cheap clay medium was borrowed.

The final step in developing the most efficient possible writing system was to add separate signs for vowels, eliminating the guesswork without adding many more signs. Remarkably, this step was first taken around 1400 B.C.E. in Ugarit, six centuries before the Greeks produced their alphabet. The structure of Hamito-Semitic languages is such that vowels are not so important for determining the basic semantic contents of a message as they are in virtually all other languages. (It is surely no accident, therefore, that it was Semites who made the big step in simplification to the consonantal syllabary.) But Ugarit had two main linguistic populations: Western Semites and Hurrians. The Hurrian language belonged to yet another family, centered in the Caucasus to the north. The Hurrian

merchants, searching for a better way, reused a sign here and added a sign there to obtain the vowel signs they needed to write their language readably.

As they did so, however, the system cracked into two entirely new types of signs—signs for single vowels and signs for single consonants—such that the latter were no longer signs for entire syllables (of a consonant plus an implied vowel). Each sound in the language now had a sign of its own, and each sign represented a single sound (the definition of a true alphabet). Now readers could read unambiguously what the writer wrote, and for only the cost of learning a couple of dozen symbols.

Unfortunately, this brilliant idea was almost immediately lost in the massive destructions curtailing the Bronze Age (1200 B.C.E.), and it remained for the Greeks to reinvent the same step around 800 B.C.E. as they pondered the ambiguous consonantal syllabary still used by Phoenician traders. The canonical order of the Sinitic script thus passed to the Greeks and is still visible despite the reuse of some unneeded consonantal signs as vowels, the addition of a few letters, and the retention of some unnecessary signs. The Greeks passed one version of their alphabet to the Etruscans, who passed it to the Romans—each time with minor modifications. With a few more changes in medieval times, it came down to us today as the "Roman" alphabet. (The Cyrillic alphabet used in Eastern

Greek funerary stele. Limestone, fourth-third century B.C.E. The Roman alphabet used in North and South American countries and those of Western Europe is based on one version of an ancient Greek alphabet that was passed through the Etruscans to the Romans. © ARCHIVO ICONOGRAFICO, S.A./CORBIS

Europe branched off in medieval times directly from the Greek alphabet.)

Alphabetic Literacy

The simplicity of the alphabet should have meant that now everyone would learn to read and write. Yet the evidence tells a somewhat different story: everyone *could* learn to write, but for centuries few did. Early Greek inscriptions are few, mostly labels and short dedications. The first person we know who used writing systematically to record everything he wanted to “make note of” was the great Athenian statesman Solon, living around 600 B.C.E., who apparently kept personal notes of what he learned abroad and what he thought about political matters. This is a use of writing not seen before, but soon to become commonplace. (The fragmentary nature of our evidence may, of course, have hidden some other earlier examples in other scripts—one might suspect the Third Dynasty Egyptian genius Imhotep (fl. c. 2650 B.C.E.) of similar practices—but clearly such a use was not common elsewhere.) When Solon had something he thought important for his countrymen to remember, he habitually put it into verse so they could memorize it easily, a fact indicating that most of the population was *not* literate.

By 500 B.C.E., however, citizens of Athens (that is, those inhabitants who were free and male) were expected to know how to read the public notices and write their own ballots, although anecdotes show that not all could. And throughout the fifth century—the Golden Age of Athens—literature was still primarily oral, still experienced communally in the theater, as the great dramas of Aeschylus (c. 525–456 B.C.E.), Sophocles (495–406 B.C.E.), Euripides (484?–406 B.C.E.), and Aristophanes (c. 448–385 B.C.E.) attest. Written copies of the plays were, however, increasingly available. Our first reference to a new form of literacy, reading to oneself for one’s own idle pleasure, occurs in Aristophanes’s *The Frogs*, written in 405 B.C.E., in which a not very bright Athenian citizen says he was sitting around on shipboard between practice maneuvers reading one of Euripides’s tragedies to himself. In fact, at this time both Aristophanes and Socrates (469–399 B.C.E.) voiced concern over the rise of mass literacy, worrying that a flood of written information would cause people to forget the important things of life.

Then the flood hit: from then on great drama on the stage was replaced in Greek society by great books to be read—the philosophical works of Plato (427–347 B.C.E.) and his successors (which start, interestingly, as “oral” dialogues in form, although too deep to be fully appreciated in one hearing). And there were new types of lesser works, such as novels to be read purely for fun. A major watershed had been crossed.

The new literacy entailed new problems. How could so many literate people obtain the works they wanted to read? Copying by hand was very slow, so the idea of libraries, where numerous readers could share copies, was conceived. The famous library at Alexandria (destroyed in the mid-seventh century C.E.), although the largest, was only one of many. But with increasing amounts to read, people wanted to be able to read faster, so in Roman times letter shapes became simpler and more regular, allowing the eye to take in and distinguish the letters more rapidly.

In the West, most of this progress was lost with the destruction of the Roman Empire around 400 B.C.E. by illiterate hordes. Literacy retreated to the monasteries, where the storing, copying, and reading of books became sacred tasks. Letter shapes ceased to be clean and simple, since now the criteria were different. The desire to shorten the task of copying (rather than speed the reading) led to complex ligatures and other methods of abbreviation, while serifs, curlicues, and other scriptal flourishes embellished the page even as they impeded easy recognition.

Books had been printed in China since at least 868 B.C.E. (and probably earlier), using carved wooden blocks, but Johannes Gutenberg’s (c. 1397–1468) idea of printing with movable type, in the mid-1400s, changed all that. His first printed books are very difficult to read, but simplicity of letter design returned quickly as easier access to books fostered greater literacy, and greater literacy, together with the possibility of multiple copies, fostered more new texts to read. The Renaissance of learning, already started among the rich merchants of southern Europe, could now blossom fully.

But there was a new bottleneck: the high cost of a printing medium. Vellum and parchment were very expensive and paper a little-explored craft (although invented long ago by the ancient Egyptians and Chinese). With the invention of pulp paper late in the eighteenth century, however, books could be printed so cheaply that even lower-class workers could afford them, carrying in their pockets not just novels but printed manuals for the increasingly complex machines they had to operate. In a sense, it was manuals printed on pulp paper that fueled the Industrial Revolution. In the twentieth century, people were so inundated with printed materials that computers were invented to manage the glut, and those computers are inevitably changing patterns of literacy once again.

LANGUAGE, PHILOSOPHY OF.

This entry includes two subentries:

Ancient and Medieval
Modern

ANCIENT AND MEDIEVAL

Only in recent times has philosophy of language been considered a distinct branch of philosophy. But ancient and medieval philosophers had different, sophisticated theories about the relation between language—both individual words and whole sentences—and reality, and the thirteenth century saw one of the most thorough attempts ever to give an abstract, analytical account of the grammar of a natural language.

Words and Things: Plato and Aristotle

In the *Cratylus*, the one dialogue he devoted exclusively to questions about language, Plato (c. 428–348 or 347 B.C.E.) contrasts two ways of explaining how words link with things. Is it purely a matter of “convention and agreement,” so that “whatever name you give to something is the right one”? Or are some words naturally suited to stand for certain given things? Superficially, Plato certainly seems to lend support to the latter, naturalist answer, exploring through usually fanciful etymology how words can be analyzed into significant elements (for instance, *psuchos*—soul—“derives” from *echei*—has/

holds—and *phusin*—nature), and even attributing aspects of meaning to the sounds of individual letters. Yet Plato also points, by irony and more directly, to the inadequacies of such naturalism. Other philosophical schools, such as the Stoics and Epicureans, held to a naturalist view without such reservations.

But not Aristotle (384–322 B.C.E.). He was clearly a conventionalist: a name is “a spoken sound significant by convention.” But how do such spoken sounds link with the world? In *On Interpretation* (16a), Aristotle writes that

Spoken sounds are symbols of affections in the soul, and written marks symbols of spoken sounds. But what these are in the first place signs of—affections of the soul—are the same for all; and what these affections are likenesses of—actual things—are also the same.

Aristotle’s semantic scheme, in which things are signified by words only through the intermediary of thoughts or mental images (“affections of the soul”), is underwritten by his psychology and metaphysics. Human beings know about the world through being affected by the forms that account for things being as they are: the heat of a hot stone, for instance, or the humanity that makes someone a human. Aristotle is therefore justified, to his own way of thinking, in supposing that although words vary from language to language, the mental signs they stand for are the same for all people and can correspond directly with the objects themselves.

Sentences and Facts: Aristotle and the Stoics

Aristotle’s aim in thinking about language was not merely to look at the relation of naming-words to things, but to explain how words combine to form assertoric sentences, which can be true or false. *On Interpretation* studies the functions of nouns and verbs and the mechanism of predication in some detail, but Aristotle remains rather vague about how sentences as a whole link up with reality. In the *Categories* (14b) he talks of what makes a sentence true (what we might call a state-of-affairs) as a *pragma*—a vague word, meaning act, thing, or matter.

In the following centuries, it was the Stoics who gave deeper consideration to the semantics of sentences. They distinguished between signifiers (words and groups of words as utterances: for instance *Dion*), name-bearers (for instance, Dion himself), and significations. They called these significations *lekta* (“sayables”) and understood by them the states-of-affairs revealed by utterances (for instance, Dion’s standing, the *lekton* of “Dion stands”). From this description, it sounds as if the Stoics had an ontology that included both things and states-of-affairs, and the latter were called *lekta* because they neatly filled the role of being what assertoric sentences signify. The concept of *lekta* may well have originated in this way, but there are two important qualifications to consider. First, the Stoics held that not only complete assertoric sentences, but also other types of sentences, such as commands and questions, have their *lekta*; and also that, in addition to these complete *lekta*, there are incomplete *lekta*, which are the meanings of predicates (for instance, standing, the *lekton* of “stands”). Second, the Stoics were materialists, and they considered *lekta* to be not merely incorporeal but not even to exist.

Abelard and the Early Middle Ages

Early medieval philosophers were deeply influenced by the semantic scheme of *On Interpretation*. The way in which Boethius (c. 480–c. 524) discussed it in his commentaries (early sixth century) linked with ideas they found in the writings of St. Augustine of Hippo (354–430) to suggest the following, widely accepted basic scheme: written language signifies spoken languages, which in turn signify a mental language common to all humans, and the terms of this mental language signify things in the world. In medieval texts signification is usually therefore a causal, psychological relation: *w* signifies a thing *x* if and only if *w* causes a thought of *x* in the mind of a competent speaker of the language. There were, however, other influences, especially the grammatical writings of Priscian (fl. 500 C.E.), who was heavily influenced by Stoic theories.

By the eleventh century, there was already a strong philosophical interest in questions about language. For example, St. Anselm of Canterbury (1033 or 1034–1109) wrote a dialogue about the problems caused by a word such as *grammaticus*, which means “grammarian” but also has the adjectival sense of “grammatical”: is *grammaticus* a substance, then, or a quality? In Peter Abelard’s (1079–?1144) logical writings (c. 1115–1125) the semantics of both words and sentences receive careful and searching attention. Abelard accepts the usual psychologico-causal understanding of signification, but his nominalism—the view that nothing except particulars exists—made it problematic. He accepts that predicates signify universals, and then (in accord with his theory) goes on to identify these universals with what are not things—mental images or, in the latest version of his theory, a thought-content. Abelard also developed an account of the semantics of sentences. Assertoric sentences signify what he calls *dicta* (literally, “things said”)—by which he means states of affairs or (on some occasions, something nearer to) propositions. *Dicta*, however, are not things; they are, literally, nothing. The parallel with the Stoics’ *lekta* is striking, although direct influence does not seem possible. Thirteenth-century thinkers talked of sentences signifying *enuntiabilia* (things able to be said), and some fourteenth-century thinkers use the term *complexe significabilia* (complexly significables)—in both cases bringing themselves even closer to the meaning of the Stoics’ term.

Speculative grammar. Speculative grammar was a striking, though short-lived, episode in medieval thinking about grammar. Its outstanding exponents, Boethius and Martin of Dacia, and Radulphus Brito, were arts masters at the University of Paris in the period from approximately 1250 to 1300. They aspired to give grammar the universality demanded of an Aristotelian science and, although they worked entirely with Latin, they believed that the underlying structure they were uncovering was that of any language, although each language represented it using different combinations of sounds.

At the basis of speculative grammar is the Aristotelian semantics, which aligns things in the world, thoughts, and words. The speculative grammarians held that there are modes of being (properties of things, such as being singular or plural, active or passive) and, parallel to these, modes of thinking (as when the intellect thinks of a thing as being singular or plural,

and so on). The modes of signifying (*modi significandi*—from whence the term *modistic grammarians* or *modists*) parallel these modes of being and of thinking. So, a first imposition links a sound with a certain sort of thing, and this root becomes a part of speech by being given *modi significandi* that first of all make it into one of the parts of speech (noun, verb, and so on) and then add features such as case and number (for nouns) or tense and person (for verbs). The modists’ assumption is that the Latin grammatical categories are precisely molded to the general structure of reality, which is captured accurately in thought.

The terminists and Ockham. A little earlier in the thirteenth century, logicians at Paris and Oxford were busy developing a different approach to the relation between words and things, the theory of the properties of terms, which was given its most popular exposition in the *Tractatus* (the so-called *Summulae logicales*) of Peter of Spain (Pope John XXI; d. 1277). The theory of the properties of terms concerns the way in which nouns refer in the context of a sentence. One distinction (in the terminology of the English logician William of Sherwood) is between material supposition, where a word refers to itself (“Man has three letters”)—a medieval equivalent of quotation marks—and formal supposition, where it refers to something in the world. Formal supposition can be either simple or personal: in simple supposition, a word refers to a universal (“Man is a *species*”), whereas in personal supposition it refers to particulars in various different ways, which the terminists further distinguished. The theory provided for the (personal) supposition of a word to be “ampliated” or “restricted” by its context. By adding *white* to *man*, one restricts the supposition of *man* to just those men who are white; by making it the subject of a future-tense verb, one will restrict the supposition of the noun to men in the future. Expressions like “think of” and “it is possible that” amplify the reference of nouns in their scope to include all thinkable or possible such individuals.

Terminism did not fit the interests of mid- and late-thirteenth-century thinkers, but it was revived again in the fourteenth century. William of Ockham (c. 1285–?1349) uses it, in an adapted form, in setting out one of the most elaborate medieval theories about mental language. William is so fully committed to the idea of our thoughts being naturally structured in a language-like (indeed, Latin-like) way, that he breaks the Aristotelian mold and holds that, rather than words signifying thoughts, both words (natural language) and thoughts (mental language) signify reality in much the same way. Since Ockham—like Abelard before him—was a nominalist, he could not accept the usual idea that simple supposition is of universals: according to him, a word has simple supposition when it supposits for a mental term, but does not signify it.

Linguistic Diversity: Dante and the Arabs

The mainstream Western medieval tradition of thought about language concentrated on a single language, Latin. By doing so, it gained the advantage of allowing philosophers to see more clearly the large, abstract questions that concern the relation of any language to the mind and to reality. It also suffered, because scholars (as appears strikingly in the case of the speculative grammarians) simply assumed that features in fact special to the structure of Latin were universal to every language. By

the later Middle Ages, however, there was at least some analytical investigation of the facts of linguistic diversity. The great poet Dante Alighieri (1265–1321), writing his *On Eloquence in the Vernacular* in Latin to defend writing in Italian, tried to explain how all languages derive from the original tongue spoken by Adam, and how they have changed and developed.

Things were very different in the Arabic tradition. During the eighth and ninth centuries, a great quantity of Greek scientific and philosophical work was translated into Arabic. In the earliest period, at least, those thinkers in Islam who thought of themselves as followers of the Greek philosophers tended to play down the value of grammatical study. Their attitude led to a famous confrontation in 932 between the grammarian Abu Sa'ïd al-Sirafi and the philosopher Abu Bishr Matta. While Matta held that logic provided a universal key to thinking, al-Sirafi's contention was that Greek logic is based on the Greek language: writers in Arabic need, rather, to study their own language. The contrast with thirteenth-century Latin thought is piquant. There, grammar was made into a sort of universal linguistic logic; here logic itself is argued to be as particular as the grammars of different languages.

John Marenbon

MODERN

Although discussions of language in seventeenth- and eighteenth-century philosophy foreshadowed many issues that came to full bloom in the twentieth century, before the twentieth

century language was thought to have a secondary role in understanding the special place human beings have in the world. The fundamental concern was the problem of knowledge. How is it possible for human beings to have knowledge of the world? The solution for both rationalists and empiricists was to be found in the nature of mind since, as was universally held, all we can know directly are the ideas of our own minds. To solve this problem of knowledge, philosophers had to account for how we grasp generalities (and not just particulars) and how we determine which of our ideas represent the world truly.

Language was seen as the public conventional medium for communicating private thought. A simple denotational theory of meaning predominated. The meanings of words are their denotations, the objects that the words stand for or denote, or the ideas of particular objects. Proper names, like "Silver," denote particular objects. There was great controversy over what general terms, like "horse," denote. Three major positions emerged: (1) realism or Platonism, the view that general terms name real abstract objects (horsiness); (2) conceptualism, the view that terms stand for abstract ideas or concepts (the concept of horsiness); and (3) nominalism, the view that a term is general if it denotes more than one particular object. The important problem concerned the nature of abstract ideas. The solution to the problem of general words would follow from this.

Founders of the Twentieth-Century "Linguistic Turn"

In the twentieth century, Anglo-American philosophy took "the linguistic turn." Instead of seeking solutions to problems of knowledge and thought in an examination of the nature of our ideas, philosophers looked to the nature of language. This great shift began with Gottlob Frege's foundational work in mathematical logic.

Logical Syntax and Semantics

Well into the nineteenth century, Aristotelian logic dominated. Logic was seen as the study of thought itself. Gottlob Frege (1848–1925) revolutionized our conception of logic and its relation to thought and language. Frege's key insight was to see that formal arithmetic modeling can be used to display the structure of language. Just as " $x + y = z$ " expresses the form of all instances of addition through the use of variables (x , y , z) and a special sign for the addition function ($+$), so language can be modeled. "Horses are mammals" can be written in a special concept-script (*Begriffsschrift*) that displays the different roles that the constituent words play in the sentence, " $(x)(Hx \rightarrow Mx)$." This is done in a way that abstracts from the meaning of any particular sentence. The new logic, thus, distinguishes the formal features of language from meaning, laying the groundwork for the tripartite distinction between syntax, semantics, and pragmatics.

Syntax concerns the rules for combining expressions into well-formed sentences within the language while *semantics* gives us a theory of the meanings of words and sentences. On this view, language is a formal object that consists of a finite interpreted lexicon and a finite set of recursive rules for combining lexical items. Recursive rules are rules that can be

applied repeatedly. This permits the construction of any of an infinite array of possible sentences. The lexicon consists of several kinds of terms—proper names, predicates, and relations, each distinguished by its distinctive role within a sentence. This conception of language, which continues to dominate discussion, is a *representational theory of language*, for it treats the essence of language as the representation of possible states of the world using finite resources. *Pragmatics* studies whatever practical and contextual aspects of language use are left.

Frege's semantic theory. In trying to apply the traditional denotational theory of meaning to language, Frege identified a number of problems. One of the most important arises with "contingent identity" statements. The sentences "The Morning Star is the Morning Star" and "The Morning Star is the Evening Star" have different "cognitive values." If meaning is just a matter of denotation, then it is hard to see how this could be so. Frege's theory distinguishes two kinds of meaning: *reference* (what the term denotes) and *sense* (the mode of presenting the denoted object). Each meaningful expression must have both a sense and a referent. Names ("Walter Scott") and definite descriptions ("the author of *Waverley*") denote particular objects by way of their mode of presenting the object. The sense of a predicate expression is the mode of presenting a concept, the referent of the expression. Questions about the nature of, and relation between, sense and reference have been at the center of philosophy of language ever since.

Logical analysis. Frege came to logic and the philosophy of language through concerns with the foundations of mathematics. Bertrand Russell (1872–1970) and Ludwig Wittgenstein (1889–1951) shared this concern but saw the new logic as the key to philosophy in general. Both held that the new logic would enable philosophy to break with its metaphysical tradition, by showing that metaphysics had resulted from mistakes and confusions rooted in a failure to understand language properly. One must distinguish between the surface grammar of ordinary sentences and the underlying logical form of these sentences. The new logic is the means for characterizing this deep structure (or logical form), a structure hidden by surface grammatical form. Logical form is reached through a process of *logical analysis*.

Russell's classic example of an analysis that removed puzzlement was his treatment of definite descriptions. It was thought that definite descriptions ("the author of *Waverley*") should be treated like proper names; to be meaningful they must refer to some particular. But this creates a problem for non-referring definite descriptions like "the present king of France." This is a meaningful phrase and yet there is no individual answering to this description. Russell's solution was to argue that the underlying logical form of the expression is quite different from what it appears to be on the surface. Analysis reveals that the sentence "the present king of France is bald" has the logical form of "There is one and only one person such that that person is now king of France and is bald." Russell's analysis eliminates the apparently referring expression "the present king of France." Correctly analyzed, this puzzling sentence turns out to be merely false.

Wittgenstein took this idea even further. In his first work, *Tractatus Logico-Philosophicus* (1922), Wittgenstein argued that all sentences (in any language whatsoever) have a *determinate* meaning. A sentence says that things are thus-and-so. Wittgenstein took this to imply that any sentence must be analyzable into a set of "elementary" sentences composed of constituent words that denote simple objects. Complex sentences are just functions of combinations of elementary sentences. Strings of words that look like sentences, but resist analysis, are not really sentences at all. They are nonsense. Only the sentences of ordinary factual talk and the natural sciences are meaningful. Ethical, aesthetic, and religious statements, though important to our lives, are strictly meaningless. Most (if not all) traditional philosophy is nonsensical on this view.

Logical Positivism and Its Challengers

The next important step was taken by a number of leading physicists, mathematicians, and philosophers who formed a group in Vienna known as the Vienna Circle. The Vienna Circle was committed to a repudiation of metaphysics in favor of science, and they saw in the ideas of Frege, Russell, and Wittgenstein the philosophical foundation for their movement. They embraced a philosophy of "logical positivism." At the heart of this movement was the thesis, known as the *principle of verification*, that only sentences making empirically confirmable claims are meaningful at all. Unverifiable sentences are nonsense. In the 1930s, many positivists had to flee Austria and Germany. As émigrés, they exercised a profound influence on philosophy in the English-speaking world.

Challenges to the positivist conception of language. The 1950s and 1960s saw a reaction against the positivist theory of language. The challenge had two sources: the ordinary language movement of Oxford University and a powerful critique of the very idea of meaning by the American philosopher W. V. O. Quine of Harvard.

Ordinary language movement. Wittgenstein's *Philosophical Investigations* (1953) and J. L. Austin's writings were the mainsprings of the ordinary language movement. These philosophers retained the positivist suspicion of metaphysics as confused theorizing, but they rejected the celebration of science at the expense of all other forms of understanding and its theory of language. Wittgenstein and Austin, in their different ways, argued that the theories of language represented by Frege, the *Tractatus*, and the positivist movement are themselves as confused as the metaphysical theories they deride. One of the striking consequences of the verificationist theory of meaning is that ordinary objects, from pigs to chairs to electrons, are logical constructions out of our sensory experiences, a view called "phenomenalism." Phenomenalism is the theory that all empirical sentences are analyzable into sets of sentences about actual and possible observations that would confirm (or disconfirm) the truth of the sentence. Meaning is ultimately rooted in sensory experience. "This is a penny" is thus analyzable into a set of experiential sentences: "this is copper-colored, round, hard and cool; or this is copper-colored, elliptically shaped, hard and cool; or . . ." The full analysis would consist of a potentially infinite disjunction of experiential sentences, one for each possible experience of a penny.

Critics argued that the positivist theory is belied by the realities of ordinary language. They used nuanced descriptions of our actual uses of language to challenge the claims both that language has an underlying logical form revealed through analysis and that referential theories of meaning, and phenomenalism in particular, are correct. Early referential theories state that the semantic relation between words and the world is fixed by ostensive definitions, that is, by naming an object. But ostensive definition cannot fix meaning since any object has many distinct properties, which the ostensive definition in itself does not distinguish. Defining “horse” by pointing to Silver does not show whether the expression is intended to be a proper name or to pick out Silver’s horsiness or his being four-legged or white. So, it is concluded, reference cannot explain meaning, but presupposes it.

Meaning seems better explained in terms of how words are used in connection with our actions and interactions with the world and each other. Meaning is not the denoted object, but the use to which the word is put in practice. This idea of meaning as use brings with it a *holistic* conception of meaning rather than the *atomistic* conception of referential theories of meaning. A number of different positions developed within this movement: (1) Some advocate a use theory of meaning, which replaces the idea of language as a single systematic totality with that of an array of overlapping ways of using language. It replaces the search for necessary and sufficient experiential conditions for the applicability of an expression in favor of criterial grounds, where *criteria* constitute necessarily good evidence for the presence of some object while nonetheless falling short of entailment of the presence of that object. (2) J. L. Austin and others introduced the speech act theory of language, according to which the act of utterance and the context within which it occurs is the starting point for a theory of meaning. This too leads to a holistic conception of meaning and blurs the distinction between what belongs to semantics (the meanings of our words) and what belongs to pragmatics (the background and contextual considerations that inform actual speech). (3) Lastly, there are those who see in the ordinary language critique of the representational picture a rejection of the possibility of theorizing about language at all. There can only be the diagnosis of error in any such attempt.

Quine’s philosophy of language. The second great challenge to the dominant picture of language comes from W. V. O. Quine (1908–2000) with his critique of the distinction between *analytic* and *synthetic* truth (“Two Dogmas of Empiricism,” 1951) and his more general attack on the very idea of meaning (*Word and Object*, 1960). Sentences that are analytically true are true solely in virtue of the meanings of the constituent words. The truth of synthetic sentences, on the other hand, is a function both of the meanings of the words and of the nature of the world. It is the difference between “Bachelors are unmarried” and “Sam is a bachelor.” Quine argues that the sentences we accept as true hang together holistically in a “web of belief” that can be adjusted at any point. He concludes that there is no point in classifying some sentences as true by meaning and some as empirical.

In *Word and Object*, Quine introduces what proves to be the greatest challenge to the dominant view. With “the museum

myth of meanings” (words as labels for objects) fully discredited, we must look at language in a new way. The way to understand meaning is to ask what translation preserves. Much translation is customary, so we should look at *radical translation*. The situation of radical translation is one in which the linguist seeks to translate a language that is wholly alien to him. We find that there is no uniquely correct way to specify the translations of the unknown language into the known language (“the indeterminacy of translation”) and no way to specify determinately what objects or properties the terms refer to (“the inscrutability of reference”). Further Quine attacks the idea that language has a logical form that is captured by formal logic. He argues that such an ideal is at best the regimentation of a part of our language. Quine’s challenge set the agenda for the 1960s and 1970s.

Philosophy of Language since Quine

Donald Davidson (1926–2003) builds on Quine’s project, developing his own interpretationist theory of language. Davidson argues that truth is the fundamental semantic notion and that meaning is given by specifying the truth conditions for a sentence. This specification can only be achieved by a method of radical interpretation, which requires treating the speaker as holding mostly true beliefs. This approach differs from the representationalist picture in the following ways: Reference is not the fundamental semantic relation between language and the world, but a derivative relation; meaning and belief are interdependent—there is no way to separate them in a principled fashion; the method of radical interpretation requires, as a normative constraint, that the speaker be rational.

The 1990s brought a defense of inferentialist theories of meaning against representationalist theories. On an inferentialist view, the meaning of a sentence is a matter of the inferential relations that acceptance incurs. Instead of thinking of a sentence as representing a state of affairs, we should think of the sentence as entitling and committing the utterer to say and believe other things. To assert “Horses are mammals” is thereby to be committed to holding true “Horses are warm-blooded” and to rejecting as false “Horses lay eggs.”

New theories of reference. The second reaction to Quine was the construction of new theories of reference that are held to avoid the problems of the simple denotational theory. These are causal theories of reference and “direct reference” theories. Causal theories of reference identify the reference relation between words and properties with causal relations. Direct reference theories state that the object or property referred to just is the meaning of the expression; the reference relation is not explained by way of ostensive definition or some special causal chain. Both approaches free the notion of reference from necessarily involving some kind of mental act. Saul Kripke introduced key elements of both theories in his highly influential book *Naming and Necessity* (1972). There he maintains that referring terms “rigidly designate” their objects. Once an object has been baptized, that name denotes its object in any possible world in which the object (is specified to) occur(s). What secures the link for those who have no direct relation to the object is the socially transmitted causal chain that extends from the baptism to subsequent uses of the name. Kripke extended

his theory of rigid designation and socially sustained causal chains to natural kinds as well as individuals.

Realism vs. Anti-Realism. This debate concerning the nature of reference and whether it can explain the meaningfulness of language is at the heart of a philosophical debate that dominated the 1980s and continues to be felt. In the 1980s, the great metaphysical debate between realism and idealism was recast in terms of the relation between language and the world. This debate concerns both how reference and truth should be understood and whether the correct theory of meaning for language is a *truth-conditional theory* or an *assertability conditional theory*. A truth-conditional theory holds that the meaning of a sentence just is the truth condition for that sentence. An assertability conditional theory of meaning states that the meaning of a sentence is given by its assertability conditions, namely, the conditions by which one can recognize the statement is true. These are distinct versions of the representationalist picture of language. This debate became focused on vying theories of truth. Michael Dummett, the leading defender of the assertability conditional account, characterized the difference between realist and antirealist positions in terms of whether a statement could be meaningful and yet transcend any possible evidence for its truth or falsity.

This interest in truth as a semantic value has generated a lively debate. Both the realist and the antirealist hold substantive theories of truth. The realist identifies the truth of a sentence with its corresponding to the facts. The antirealist assesses truth in terms of coherence with other sentences and our recognitional capacities. Challenging both of these positions are “deflationary” theories of truth. Such theories deny that truth has a substantive nature (whether correspondence or coherence). The truth predicate is a device for semantic ascent, for moving from the sentence “snow is white” to the sentence “the sentence ‘snow is white’ is true.” There are things that one can say by talking about sentences that are not easily said in other ways.

Other issues. The 1990s saw a number of developments. Most important was the debate between inferentialist theories of language and representationalist theories. Other important issues concerned the nature of “vague” predicates like “bald” that have fuzzy borders (is the “fuzziness” a feature of the property itself or our ignorance?), the compositionality of meaning (is it essential to the explanation of meaning?), innate rules of grammar, and the infinite reach of language. Many of these issues have become highly technical and specialized, but they are all in the service of the great debates about the general character of language and meaning.

Meredith Williams

LAW. The development of law and jurisprudential ideas since the 1970s represents a significant change from the conventional models that had earlier dominated the province of legal theory in the history of ideas. This entry focuses on two salient theoretical emphases that have continued to influence developments of conventional legal theory and postmodern paradigms of legal thought: the analytical tradition, and the jurisprudence inspired by the revolt against formalism, or legal realism.

Twentieth-Century Schools

Within the received tradition, the rules-based model (which regards law as a pure science), identified with Herbert Lionel Adolphus (H. L. A.) Hart (1907–1992) and the Oxford school of analytical positivism, was subjected to both strong internal critique and important development by such figures as Ronald Dworkin, a Yale law professor who later became professor of jurisprudence in Oxford. Dworkin’s redevelopment of the analytical model focused centrally on the development of a powerful rights-based theory of law. The approach moved the consideration of conventional legal theory strongly in the direction of the moral foundations of political community. This created an awkward fit for analytical positivism, which traditionally strove to separate law from moral discourse, that is, to radically distinguish the law that *is* from the law that *ought* to be. Dworkin’s work led him to stress the principle that the foundations of a rights-based approach to law are indeed rooted in the values of equal respect and dignity, the core moral

precepts in a political community committed to taking rights seriously.

Responses to legal realism. In the United States the dominant version of legal realism (an intellectual movement that advocates policy-oriented jurisprudence informed by developments in social and behavioral sciences, such as psychology and anthropology), which had reached its apex in American legal culture prior to World War II, also remained influential. The general criticism leveled at legal realism argued that an approach to adjudication that is result-selective and that only makes sense from an external observer's point of view is flawed. It compromises the conventional view of law and in particular undermines its special juridical character rooted in the ubiquity and special characteristics of rules governing social and legal relations. This criticism reflects the idea—implicit in pragmatic approaches to philosophy—that law, like all human relations, should be conceived in terms of process.

Three distinctive responses to legal realism developed in the United States. The first was an acceptance of a rules-rights-based approach to law from an internal point of view, with the corresponding conclusion that the foundations of any legal theory from an external point of view (an about-law point of view) was simply incompatible with a professional internal perspective of law based on rules. This critique gave analytical jurisprudence an important place not only in developments in the United States, but more broadly in the general development of legal theory.

The second response, associated primarily with the Harvard Law School, is known as the legal-process school. At Harvard, Henry M. Hart Jr. (1904–1969) and Albert M. Sacks (1920–1991) focused attention on the nature of adjudication from the point of view of a principle of institutional competence. Instead of asking the classical questions of analytical jurisprudence: “What is a valid law?” and “By what criteria might we objectively determine what a valid law is?,” they asked a different question, namely, “What is a legal question?” They were particularly interested in the objective indices used to distinguish administrative, executive, legislative, or indeed more broadly, political questions from those distinctively legal. This approach provided more flexibility and focused, so to speak, on law as a process requiring a continuing definition and redefinition of legal/professional roles, distinguishing these roles from other roles in the broader processes of settling community disputes. A central feature was the principle that one could still use an objective standard to interpret either what the law is or what falls within the scope of judicial competence. In this sense, analytical jurisprudence and the legal-process school shared a deep commitment to the role of objectivity in law.

Doubtless, ideology could influence the nature of the indicators used to either broaden or narrow the scope of what an appropriate judicial role is or should be. It cannot, therefore, be said that the legal-process approach settled deep ideological differences about the role of law in governing human relations. Rather, it provided a framework that justified greater flexibility in managing the tasks of judicially settling disputes while maintaining fidelity to the importance of objectivity in law.

Morton J. Horwitz summarizes the essential challenge to which the legal-process school responded as follows:

The legal process school sought to absorb and temper the insights of Legal Realism after the triumph of the New Deal. Its most important concession to Realism was in its recognition that doctrinal formalism was incapable of eliminating discretion in the law. The task was instead to harness and channel that discretion through institutional arrangements.

The third response, generally associated with the Yale Law School, is known as “Law Science and Policy.” It was identified with the political scientist Harold D. Lasswell (1902–1978) and the international lawyer Myres S. McDougal (1906–1998). These scholars were deeply influenced by legal realism, but were dissatisfied with the implication that at the end of the day legal realism might lead to legal nihilism. Their initial collaboration, which came during World War II, resulted in the 1943 publication of “Legal Education and Public Policy: Professional Training in the Public Interest.” In this article, they raise the broad question of what the purpose of professional training is and, indeed, how professional training relates to the public interest. In this view, the professions are not neutral, but rather have a great deal to do with the nature and quality of the system of public order a society promotes and defends. From this article, they developed a system of jurisprudential thought for a free society and developed a wide range of specific applications of their theory to international law. Their work in international law became identified with the so-called New Haven School of International Law.

Jurisprudence in this view had a radically different, but distinctively scientific orientation. Jurisprudence was to be a theory for inquiry about law. The theory had a deliberate focus on policy- and decision-making. Indeed, law would now be defined as a process of authoritative and controlling decision-making wherein members of the community seek to clarify and implement their common interests. The approach would be radically context-sensitive, it would be problem-oriented, goal-guided, multidisciplinary, and solution-oriented. Among the central elements of this jurisprudential emphasis was the meaning it gave to the task of problem definition. Law, in this view, is not about the scope of different rules created by current or past elites, or about how to interpret or reconcile contradictory rules created by the same legal sources. A problem is to be observed from the perspective of the subjectivities of individuals involved in social interaction in society itself. In short, human beings in society are making subjective demands for value allocations, and these demands often reproduce social conflict for which the community provides institutional mechanisms specialized with whatever degree of efficacy for responding to them. Thus, law is one of the specialized mechanisms in social organization that responds to the raw, subjective claims of individuals in the larger social process.

By focusing the lens of legal inquiry on individual subjectivities, that is to say perspectives, for example, of identity, demand, and expectation, the Law Science and Policy approach

radically changed the starting point of the central ideas required for legal inquiry. This had large-scale impacts on the development of ideas within the framework of legal culture. Lasswell's work in the social sciences and his collaboration with McDougal also anticipated the later development of post-modernism in the social sciences and its particular application to law, influenced by such theorists as Michel Foucault (1926–1984), Jacques Derrida (b. 1930), Jacques Lacan (1901–1981), and Jürgen Habermas (b. 1929).

Since human subjectivities are the central raw materials from which human problems evolve, and if law is a response to these problems, then human subjectivities are a critical element in a realistic and comprehensive understanding of jurisprudence and law. When, for example, human beings make distinctively economic demands, we bring in the relevance of microeconomic theory. When we consider that the rules and doctrines of the past in virtually all legal cultures have been largely made by men, we see that we must account for women's perspectives in law, which leads to the development of feminist conceptions of jurisprudence. Critical conceptions of jurisprudence, such as critical legal studies and critical race theory, as well as Lat/Crit theory (a branch of critical race theory), such as it is, have entered the discourse about legal culture as a result of the breach in the edifice of legal objectivism identified with conventional legal theory, as well as the legal process perspective.

The Law Science and Policy approach is a theory *about* and *not of* law. The insistence on a theory about law was a cardinal tenet of legal realism and was central to unpacking confusions of vantage point generated by both participants (decision-makers and claimants) and observers who represent a degree of scientific detachment required for the scientific study of law. However, the most direct influence of the McDougal-Lasswell school was in the area of international law, which they styled the public order of the world community. It is, of course, not the case that all of international law reflects their basic tenets; however, their work has had substantial influence on how international law is conceived and on the salience and importance of many of its important doctrines.

International Law

McDougal, Lasswell, and W. Michael Reisman sought to apply jurisprudential insights and ideas directly to the study of international law. Apart from the relevance of context, the problem orientation, and the salience of multiple methods of inquiry about law, their approach stressed the importance of specific intellectual criteria for the study of jurisprudence in international law. These criteria included goal-thinking, trend-thinking, scientific-thinking, predictive-thinking, and alternative-thinking. The approach was also explicit in articulating the standards by which one could compare and evaluate all systems of legal thought. These criteria included the procedures used to maintain and establish a clear observational vantage point, the critical importance of focusing both comprehensively and specifically on the actual processes of policy and decision, the development and use of critical intellectual tasks, and the importance of the provisional postulation of fundamental public-order goals. These criteria could be applied in the study of a national system or the entire global system.

The central feature of the New Haven School of International Law was its insistence on universality and comprehensiveness. This approach coincided with the creation of new states out of the debris of colonial rule. The new states were not always new. They were often old and dependent. In order to stake a claim for statehood, doctrines had to be invented and supported by contemporaneous developments in international law and jurisprudence. Nationalist elites seeking freedom from colonial rule would stake a claim to self-determination and independence. This claim of course would be an attack on sovereignty, or at least the colonial version of it. American idealism in the form of Wilsonian internationalism succeeded after World War II in making German colonies a sacred trust of civilization while at the same time paying service to colonial hegemony. Thus, for example, German South West Africa, which was conquered by South Africa in 1917, was given to South Africa to administer as a special international mandate. The precedent created here was that colonial rule was not altogether to be insulated from international responsibility, in particular the sacred trust for the well-being of the inhabitants. After World War II, the dominant victorious allies, namely the United States and the Soviet Union, shared a common objective, supported for radically different reasons, that colonialism become obsolete. The United Nations was created, and a part of its growing mandate was to facilitate decolonization, self-determination, and independence.

The paradox of claims to resist colonial rule was that they were also claims to weaken the sovereignty idea in international law. If self-determination and independence were supported by international legal precepts, then international support for the integrity of sovereignty would be constrained by these competing claims. In short, sovereignty admits limitation, particularly limitations based on international obligations. Thus, the sovereignty idea began to evolve within the framework of a global constitutive process, as expressed in the theories of the New Haven School.

Problems of Sovereignty

The model for expanding the community of nation-states became the model of a sovereignty-dominated world order, which included the new Afro-Asian sovereigns. This model was largely Eurocentric, and its juridical roots are often identified with the Peace of Westphalia (1648). The claims about sovereignty now represented a paradox. Colonial sovereignty was to be seen as weaker and permeable: "soft sovereignty," as it were. However, the new sovereigns were based on political foundations that were both internally and externally vulnerable. The same elites who demanded a weak version of sovereignty to justify decolonization were now demanding something akin to an absolutist version for national survival. In short, they were frequently demanding a form of sovereignty identified with the international legal culture prior to World War II, a version largely unconstrained by respect for international obligations (hard or thick sovereignty).

The problems of weakening sovereigns coincided with the Cold War, and the hegemon could find surrogates to spearhead strategic interventions intended to weaken sovereigns ostensibly identified with one superpower or another. The

normative status of sovereignty thus generated two powerful contradictory trends. The first trend was the high priority given to principles of sovereign equality and nonintervention. The second was the high priority given to the imperatives of international legal obligation and the competence to intervene when fundamental international values, such as peace, security, and humanitarian values, are compromised.

Thus, while the nation-state system was still expanding in the early 2000s—with approximately 192 sovereigns—sovereignty, in fact, was changing, as nations found that in giving up some sovereignty, they, in effect, *strengthen* their sovereignty. The expansion of NATO (North Atlantic Treaty Organization) is an illustration of this phenomenon; the development in the direction of the European Constitution is a further example; and the development of the African Union Constitution is a major doctrinal shift in the dynamic of sovereignty. This suggests that the political and juridical conceptions of sovereignty had the possibility of embracing theoretical reification and practical obsolescence, or becoming more refined, flexible, fluid, and relevant to the practicalities of governance.

The importance of understanding the context in which sovereigns are created, maintained, and possibly changed is a reflection of the insistence in legal theory that international sovereignty itself is the outcome of problems of power in the international system. What is apparent in the complex global network of institutions and participant actors is that there are many active participants in this process, such as international, continental, and regional organizations, and private-sector institutions of business, capital, and labor, as well as the vast organization and partial structure of nongovernmental operators and individuals who constitute national and global civil society. Therefore, it will be seen that the meaning of sovereignty itself derives not so much from state absolutism, but from the ways in which global society constructs and orders political identity and participation through sovereigns and other institutions of global salience.

Statehood. The concept of sovereignty in the twenty-first century is, of course, tied to the concept of statehood. For a state to be recognized in international law, the state must meet certain practical and normative requirements. The first set of criteria relates to practical matters of power and control. The state must have control over territory, people, and institutions of governance, and must be competent to handle the international environment.

These matters are often collapsed into what is sometimes known as the declaratory theory of recognition. In order to become a member of the United Nations, a state must not only meet these criteria, but it must also meet certain normative standards. It must indicate a willingness to respect and honor the principles on which the United Nations is founded, including respect for peace and security, the rule of law, human rights, and more. In practice, governments have—from time to time—unilaterally indicated that certain states do not maintain standards of behavior consistent with the concept of international obligation. Thus, the United States has a list of states it regards as “terrorist,” and has expanded this notion to include what it calls “rogue states.” This indicates the beginning

of a discourse that is more substantive with regard to the nature of the state itself and therefore the nature of sovereignty. Thus, the notion emerges of the abuse of sovereignty, and some writers have suggested that descriptive typologies of states could include such descriptions as failed states, anarchic states, genocidal states, homicidal states, rogue states, drug-influenced states, organized-crime-influenced states, kleptocratic states, terrorist states, authoritarian states, garrison or national security states, totalitarian states, and democratic rule of law states. Behind this discourse is the evolving notion of sovereignty itself. The older idea of sovereignty was identified with state absolutism. Among the elements of the new concept are the ideas and ideals of transparency, responsibility, and accountability in the analysis of both sovereignty and the state.

Sovereignty and the International Order

Sovereignty is ambiguously defined in the Charter of the United Nations. The first principle holds that the charter derives its legitimacy from the people of the earth-space community, but the constitutional scheme is weighted heavily in favor of the state-sovereignty paradigm, and limits, in some significant measure, the role of nongovernmental participation. Membership is open to sovereign states only. However, the basis of sovereignty is further clarified in the International Covenant on Civil and Political Rights. Individuals who constitute the “people” according to Article 16 “shall have the right to recognition everywhere as a person before the law.” Article 18 specifies the people’s right to freedom of thought; Article 19 stresses the people’s “right to hold opinions without interference” and that the people “shall have the freedom of expression;” and Article 25 puts stress on the right to participate in the political welfare of the State, and the universal rights to vote and to participate in public service.

Thus, a significant change created by the UN Charter (along with subsequent practice) is that the conceptual basis of sovereignty is rooted not only in the monopoly of effective power, but also is predicated on authority and legitimacy, which are rooted in the expectations of people. The Declaration on the “Guidelines on the Recognition of New States in Eastern Europe and in the Soviet Union” made recognition and sovereign acceptance into the European community of states, subject to strong normative standards of international justice. The Guidelines include “respect for the provisions of the Charter of the UN and the commitments subscribed to in the Final Act of Helsinki and in the Charter of Paris, especially with regard to the rule of law, democracy and human rights.” The Summit of the Americas Declaration of Principles and Plan of Action articulated that democracy is the sole political system that guarantees respect for human rights and the rule of law. The 1990 Charter of Paris is another important expectation-creating instrument wherein sovereignty is predicated in the will of the people. Participating states affirmed their respect for human rights protections and fundamental freedoms as “essential safeguards against an over-mighty State.” Democracy is “based on the will of the people” and is the “foundation of human respect” (pp. 193–194).

These examples illustrate that fundamental expectations of the nature of the state, including its sovereignty and governance,

are being conditioned by what scholars call a right to democratic governance. The idea is that the formal historic requirements for the de facto recognition of a state have been enhanced by the normative constraints and demands of critical symbols of authority associated or identified with the human right to democratic governance. These demands include transparency, responsibility, accountability, and a commitment that the rule of law must be an intrinsic component of the nature, scope, and practical functions of sovereignty.

The newer meaning of sovereignty, which ties control to authority and to decision-making, also raises the question about how power and authority (i.e., governance) and decision-making are constituted in the global environment. For example, there are nation-states with constitutions in Africa. There is also the Constitution of the African Union, which is a form of constitutionalism with linkages to the constitutions of African member states. In Europe, nation-states are tied together in an economic and political union. Each nation-state has its own constitution, which is an overt indicator of how governance is constituted in the state, but the continental linkages of these states are to a larger political and economic community, and a draft constitution has been formulated that will obviously have linkages to the constitutional scheme within each state.

At a more inclusive level, all of these developments (national and continental) have evolved complex constitutional orders, which fall under the umbrella of the global constitution: the Charter of the United Nations. It will be very obvious that sovereignty now involves complex clusters of competence; some competences are shared, and smaller states (pooling their economic and political capital) might now have a larger say in the important decisions affecting them in the larger international environment than would be the case if they were acting as individual, isolated sovereigns. However, collected powers also require submission to the rules of the game. In short, in the early twentieth century, sovereignty can be described as a strengthened expression of its former self to some degree, but it is nevertheless much changed.

Sovereignty and the International Community

The conceptual positioning of national sovereignty within the framework of constituting authority and control permits us now to see the importance of the fact that there are many other participants in the global community, power, and constitutive process. As a technical matter, the question of whether an international organization, such as the United Nations, could have an international legal personality for the purpose of suing another state at the international level was decided by the World Court in a case called *The Reparations Case*. In this case, the World Court recognized that even though the United Nations was not a state, it was nonetheless an organization with an international legal personality and the right to sue or otherwise act in the international environment within the framework of its constituted competence.

It was the Nuremberg Tribunal that, in fact, opened the breach to the possibility that individuals might have some sovereignty in the international legal environment. The Nuremberg defendants were made directly accountable for war crimes and

crimes against humanity under international law. But these defendants were also given the right to a fair trial under international law. They not only had duties under international law, but they could also exercise rights. Thus the narrow principle was established that individuals could have rights directly under international law; for some purposes, the individual could exercise these rights and, thus, rights and duties in international law were not confined to formal sovereign entities. Two important developments were born of these events. The first was the development of the human-rights provisions in the UN Charter through the Universal Declaration of Human Rights (UNDHR) and the extensive treaty-based regime for the protection of global and regional human rights. The preamble of the UNDHR states that member states recognize:

[T]he inherent dignity and . . . the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world . . . [and] disregard and contempt for human rights have resulted in barbarous acts which have outraged the conscience of mankind, and the advent of a world in which human beings shall enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people . . . [and that] it is essential, if man is not to be compelled to have recourse, as a last resort, to rebellion against tyranny and oppression, that human rights should be protected by the rule of law.

The second development was that in the aftermath of the Cold War, two ad hoc tribunals were established to try governmental officials and others for humanitarian and grave human-rights violations. The relative successes of the International Criminal Tribunal for the Former Yugoslavia (ICTY; 1993) and the International Criminal Tribunal for Rwanda (ICTR; 1994) provided a renewed impetus for the creation of an International Criminal Court (1998), which was indeed established. It is therefore critical that we see the development of international legal order since the 1970s as having finally been able to capitalize on the revolutionary breakthrough established at Nuremberg, where it was determined that individuals could not hide behind the veil of the state when they committed horrendous crimes against the peace and against humanity. For example, Article 7 of the Statute of the International Tribunal for the Former Yugoslavia and Article 6 of the Statute of the International Tribunal for Rwanda harmonize on the issue of individual criminal responsibility. Both state that:

1. A person who planned, instigated, ordered, committed or otherwise aided and abetted in the planning, preparation or execution of a crime referred to in articles 2 to 5 of the present Statute, shall be individually responsible for the crime.
2. The official position of any accused person, whether as Head of State or Government or as a responsible Government official, shall not relieve

such person of criminal responsibility nor mitigate punishment.

3. The fact that any of the acts referred to in articles 2 to 5 of the present Statute was committed by a subordinate does not relieve his superior of criminal responsibility if he knew or had reason to know that the subordinate was about to commit such acts or had done so and the superior failed to take the necessary and reasonable measures to prevent such acts or to punish the perpetrators thereof.
4. The fact that an accused person acted pursuant to an order of a Government or of a superior shall not relieve him of criminal responsibility, but may be considered in mitigation of punishment if the International Tribunal determines that justice so requires.

With regard to Yugoslavia, the former president of that country was tried in The Hague in the early 2000s, and in Rwanda, high governmental officials had already been convicted. The question is, what do these events mean for the history of ideas?

These ideas establish the revolutionary principle that, both politically and juridically, the international community may directly hold governmental officials to account (in certain circumstances) and punish them accordingly. It also establishes that the conditions of governance, such as transparency, responsibility, and accountability, are integral features of the authority foundations of the state, and therefore the normative foundations of the state itself have changed on a continuum that moves from state absolutism to rooting governance and constitutionalism in the foundations of authority. What is even more critical as a complement to these developments is the growth not simply of human-rights law, but of human rights as an integral part of governance and constitutionalism and as a deeply rooted expectation in the political and legal culture of the global community. What is important in these developments is that the human-rights culture finds strong intellectual roots in the development of rights-based jurisprudence, as well as in the jurisprudence that roots law in fundamental policy. The rights-based approach seeks to ensure that individual rights are taken seriously. The policy-based approach insists that law be responsive to the claim, the identity, and the fundamental expectation of the individual participation in the international legal and political environment. Central to each concept is the idea of fundamental respect, which is seen as the heart of responsible constitutionalism and accountable sovereignty, and which is fundamental to all human rights.

Human Dignity

Central problems emerged—at least in theory—with regard to how to justify the principle of respect as the cornerstone of the principle of human dignity. It is unclear whether the concept of human dignity can itself be objectively justified, and indeed modern philosophers have even suggested that at a fundamental level, human values about dignity may be

incommensurable. Apparently conflicting values might have to be contextualized (or more deeply analyzed) in light of broader, more abstract formulations of value judgment. Thus, values including power, respect, rectitude, affection, enlightenment, well-being, skill, and wealth must be construed in terms of their enhancement of a more abstract human-dignity postulation. The policy-maker seeking the development of universal dignity must develop technical methods of decision-making, including sophisticated standards of construction and interpretation. Perhaps at this operational level, practical lawyers, social scientists, and real-world policy-makers must render decisions regarding how to integrate what are often regarded to be ostensibly conflicting values and norms in order to genuinely enhance the universal ethic of human dignity.

The South African Constitutional Court, for example, dealt in 1998 with a political party's claim regarding the "Truth and Reconciliation" statute that provided individuals who would otherwise have been prosecuted for human-rights violations with amnesty; essentially, this party contested the constitutionality of the statute and regarded it as a grave violation of international law. The Constitutional Court was confronted with a mechanism to explore truth and guide reconciliation that comprised a critical foundation for the internal peace and security of the entire Republic of South Africa, as well as of the effort to afford each South African political freedom. This statute, however, was in ostensible conflict with universally accepted tenets of international law, which do not accept excuses to mitigate the commission of grave crimes against humanity. It is possible to argue that the ethic of universal respect and human dignity demands universal compliance, but at what cost?

To ensure that respect, humanitarian law, and democratic entitlement are continuously adhered to and honored demands in-depth analysis and delicacy with regard to the process of decisional interventions. Rules of construction and interpretation painstakingly pieced together articulate, for example, that even if a peremptory norm of international law comprises an *erga omnes* obligation, it should be appraised and applied to enhance similar rights, which might also have to be accommodated. The currency underlying the ethic of human dignity is that it affords practical decision makers standards and goals that permit the transformation of regional, continental, and international law into a greater approximation of the standards and goals embodied in the United Nations Charter.

Principle of equality. A central element in the development of the respect-human dignity precept is that it is rooted in the principle of equality. The principle of equality has a longstanding normative basis in the rule of law. For example, rule-governed behavior works on the principle of equality, namely, that rules cover like cases, regardless of identity, status, or personality. The more normative expression of the equality principle is established in the idea that all participants are formally equal before the law. Practical experience suggests, however, that even if formal equality is embraced it too often entrenches hierarchy, a lack of equity, and a depreciation of substantial justice. The specific way in which the international legal system approached the equality principle was a clear-cut recognition that the business of why World War II was fought

was, in part, rooted in the racialism and Herrenvolkism of the Nazis. It would therefore be no surprise that both the preamble and the purposes of the UN Charter would codify not simply the importance of human rights, but would establish that racial and gender equality were crucial to a meaningful expression of the human-rights principle. Two of the most important covenants that reflect the specific development of the equality principle are the 1965 International Convention on the Elimination of All Forms of Racial Discrimination (ICERD) and the 1980 Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW).

International human-rights law has also made criminal the practice of seeking to destroy groups of human beings in whole or in part based on race, nationality, ethnicity, and religion as labels of identity. Thus, the very first human-rights treaty following World War II made genocide a human-rights crime. The full development of the equality principle in international law has also permitted regional developments and has deeply influenced constitutional development on the principle of equality. The race relations convention, for example, goes further than the idea of formal equality in race relations. It specifically holds that affirmative action to achieve substantive equality is not unfair or prohibited discrimination. It cannot be said that the public order of the world community has achieved a community in which both substantive and formal equality are, in fact, realized. However, enormous developments have been stimulated by the development of the equality principle at the international level through the prism of universal human rights. This rise has served as a base of power for important levels of social activism within the framework of civil society to improve the condition of women discriminated against because of sex, as well as minorities discriminated against because of race.

Globalization

One of the most important factors influencing international society in the early 2000s is the principle of globalism. The impact of globalism on sovereignty is fueled by the vast growth in the flow of goods, services, capital, and labor across state and national lines. This process has been dramatically accelerated by the communications revolution, and the impact on state sovereignty suggests that these global forces have seriously weakened the territorial boundaries of states. This intense flow of values across state and national lines also invited instant comparison and appraisal. As barriers to human interaction have been liberalized, what has been the social benefit and the social cost? There is no clear answer to this question. We know, for example, that without the communications revolution, it is possible that the global HIV/AIDS pandemic might have been containable. Thus, following the SARS (Severe Acute Respiratory Syndrome) outbreak of 2003, dramatic limitations were placed on communication to prevent the disease from spreading globally.

If nation-state barriers are not as salient, other barriers in the global age challenge the concept of global equity and fairness. While the world has generated more wealth than mankind has ever before achieved, the conditions of impoverishment throughout huge sections of the planet suggest a global

economic apartheid rather than a global vista of improved and shared equity. It is widely recognized that a planet that is radically divided between the haves and the have-nots, in which there is an acceleration of short-term gains for the haves and an acceleration of poverty and deprivation for the have-nots, will ultimately result in the depreciation of all. In short, underdeveloped as the concept of global equity is, it may be the cornerstone upon which the improvement of the global condition of deprivation is built, not because this is necessarily a spiritually beneficial thing, but because the long-term prosperity—and possibly the survival—of the human race may depend on it. The history of ideas in the future will therefore be challenged by the ideological and jurisprudential relevance of the concept of equity and whether equity can be the critical lever that provides us with universal concepts of respect and freedom in a global commonwealth of dignity.

LAW, ISLAMIC. Islam, like Judaism and unlike Christianity, is a nomocracy, a religion of the law as opposed to theology. It is evident from the Koranic text that sacred law is a crucial feature of the covenants that God establishes, through prophets, with the various nations of mankind. Prophets are united by their main directive, to worship God alone, by their moral exhortations, and by accompanying miracles proving that their messages are of divine and not human origin. Some prophets also bring with them a Scripture: the Koran mentions the *Scrolls* of Abraham, the *Torah* of Moses, the *Psalms* of David, and the *Gospel* of Jesus. Some prophets also bring with them a new sacred law. In the Koran, the term that corresponds to this sacred law is *din*, now the ordinary term for “religion” in Arabic, and individual fundamental laws are termed *hudud Allah* (“God’s limits”). However, the term for the sacred law that gained general acceptance from early Islamic history on is the *shari’a* (“the way, or path”), parallel to the Jewish term for the sacred law, *halacha* (also “the way, or path”). The *shari’a* is Islamic sacred law taken in toto: the

idealized system of all religious obligations God has imposed on believers.

Muslim scholars of the sacred law devote themselves to discovering the rulings of the *shari’a*, in effect seeking to determine God’s intentions concerning the specific obligations of believers on the basis of available evidence. Law as a branch of academic study or as a product of human discourse is termed *fiqh* (literally, “understanding”). A jurist or specialist in law is termed *faqih* (“one who understands, is perspicacious.”) The goal of the jurist is to determine reliably, given a set of circumstances—including time, place, identity of the legal agent, and so on—the legal status of particular possible acts. There are five main categories for the legal assessment of acts: forbidden (*haram*; e.g., marrying one’s aunt); disfavored but allowed (*makruh*; e.g., a husband’s repudiation of his wife without cause); indifferent (*mubah*; e.g., eating raisins); recommended but not obligatory (*mustahabb*; e.g., a man’s marrying as soon as he can afford to do so); and obligatory (*wajib*; e.g., supporting one’s elderly parents, fasting during the day in Ramadan). Other legal assessments, such as valid (*sahih*) and invalid (*batil*), do not apply to acts, but to contracts of sale or marriage contracts, for example. Islamic law is also a moral system; it is intended to preserve morality and not simply mete out justice. It does so by maintaining a stable social order, whereby the five cardinal values of religion, life, offspring, property, and rationality are conserved.

By the late eighth and early ninth centuries C.E., from which date the earliest extant compendia of the points of law, such as the *Kitab al-umm* of Muhammad b. Idris al-Shafi’i (d. 820), Islamic law was already a sophisticated science with a substantial tradition behind it. In such works, the law was organized into chapters in a more or less standard order, falling into three main sections: *‘ibadat* (“devotions”), including ritual purity, prayer, almsgiving, fasting, the pilgrimage, and related topics; *mu’amalat* (“transactions, contracts”), including sales, debt, rental, pawning and mortgage, partnership, loans, inheritance, marriage, divorce, slavery, gifts, endowments, etc.; and *ahkam* (“verdicts”), including payment of indemnity for injuries, criminal punishments, and court procedure. Obviously, the law includes not only topics directly related to religious devotions and rituals but also general topics of family, commercial, and criminal law. Not all legal issues were addressed by the jurists in their theoretical writings, and even some that were rarely enforced by them. For example, Islamic penal law only prescribes punishments for six specific crimes: adultery or fornication, false accusation of adultery or fornication, robbery, drinking intoxicants, and banditry. Other offenses, except injury and murder, which are covered by *lex talionis*, or the payment of indemnity, are subject to discretionary punishments that may be determined by the ruler or the judges he has appointed. For this reason, large bodies of extra-religious law were created by various dynasties, the most developed example being that of the *qanun* of the Ottoman Empire, which covered many areas of public, fiscal, administrative, and criminal law. Islamic jurisprudence recognizes that not all areas are covered by the scriptural law, and it is generally held that *urf*, or the custom of a particular locale, may serve as the basis of law as long as it does not contradict other legal principles. Custom has played a particularly

important role in commercial arrangements, which varied widely from one area of the Muslim world to another.

As in Rabbinic Judaism, in Islam it was primarily expertise in the law that endowed one with religious authority. Although legislative authority, the right to set the law itself, theoretically belongs to God alone, interpretive or declarative authority belongs to the jurists, on the grounds that their interpretations represent the closest possible assessment of God's will with regard to legal questions. Other groups have claimed religious authority in the course of Islamic history, including theologians, mystics, and charismatic leaders, but the jurists have succeeded in establishing and justifying their authority as a group more than any other ever since the tenth century C.E. Nevertheless, the jurists regularly assumed the existence of an Islamic polity under a Muslim sovereign with absolute political authority. In a historical compromise, the jurists carefully delimited the sphere within which the sovereign could exercise his authority, granting him a great deal of latitude in public law, such as taxation and public safety, while endeavoring to maintain the jurists' own control over private law, including marriage, divorce, sales, and so on. There therefore exists something akin to a split between church and state, but it is between private and public law, and both the jurists and the rulers justify their position on claims to religious authority and divine sanction.

Islamic law differs from the common law in some important respects. In the Islamic judiciary system, there are no lawyers (i.e., advocates for the plaintiff or defendant), nor is there a jury. Trials are conducted by the judge, and the plaintiff and defendant represent themselves. They may call witnesses or produce evidence as needed. The decision is up to the judge alone, though he may consult other jurists, experts, and so on. Attached to the judge's court were one or more notary-witnesses (*shahid*) and a document clerk. Their function was to serve as character witnesses for the people of their district, draw up and execute legal documents, record the court proceedings, and certify the judge's verdicts and other documents. However, court decisions or judges' verdicts do not have law value; they do not set precedent, as in the common law system. Law value resides in the jurists' theoretical elaboration of the law, found in *fatwas* ("consultative legal opinions" or "answers to legal questions"). The *fatwa* is a responsum to a legal question posed by a lay petitioner (*mustafti*) to a legal expert or issuer of legal opinions (*mufiti*). The problem may be potential or actual, but the answer is not binding on the petitioner, in contrast with a judge's verdict, which must be carried out. It is this process of legal consultation and response, followed by the open debate of disputed questions among the available authorities, that creates new law. Nor were there traditionally any codes in Islamic law, in contrast with the Napoleonic legal system, and, surprisingly, with Rabbinic law since the sixteenth century, which has treated the *Shulchan Aruch* by Joseph Karo more or less as a code. All later development of the law is presented in the form of commentaries on that law. Scholarship to date has emphasized that Islamic law is a jurists' law, developed by the jurists themselves without governmental interference. It was therefore relatively uninfluenced by rulers' edicts and decrees. It was, however, shaped by two crucial institutions that have lasted from the tenth and eleventh centuries until the modern period: the *madhhab*,

which one may render variously as "legal school," "jurists' guild," or "tradition of legal study," and the *madrasa*, or college of law.

Legal Literature and Institutions

The origins of Islamic law are obscure, mostly because many seminal works have been lost. As mentioned earlier, the oldest extant legal compendia show that the study of the law was already quite sophisticated; there are indications that its systematic formulation dates back to the first half of the eighth century. It is likely that it was significantly influenced in its early stages by Roman provincial, Byzantine, Sassanian, and Rabbinic law. A few specific instances of influence have been suggested, such as P. Crone's study on the law of the patronate, but scholarship in this field is still in its infancy. The theoretical development of the law seems to have taken off in Iraq under the Abbasid caliphate (750–1258 C.E.). By 900 C.E., all the main genres of legal literature had been established, including extensive legal compendia (*mabsut*), epitomes of the points of law (*mukhtasar*), collections of model legal documents (*shurrit*, *watha'iq*), collections of model court records (*mahadir*, *si-jillat*), manuals for judges (*adab al-qadi*, *adab al-qada'*), collections of responsa (*fatawa*, *masa'il*), and manuals of jurisprudence or legal method and interpretation (*usul al-fiqh*).

In the course of the ninth and tenth centuries, the *madhhabs*, or schools of law, were formed, in an attempt, it has been claimed, to maintain autonomy from the caliph and exclude the dogmatic theologians and sectarian groups from religious authority. They had no charters, patents, or membership lists; their organization was informal. Nevertheless, by the mid-tenth century, it became impossible to study and teach Islamic law without belonging to one of the established schools. Six legal *madhhabs*, each named after a famous jurist of the past, gained recognition in Sunni Islam: the Hanafi *madhhab*, named after Abu Hanifah (d. 767); the Maliki *madhhab*, named after Malik b. Anas (d. 795); the Shafi'i *madhhab*, named after Muhammad b. Idris al-Shafi'i (d. 820); the Hanbali *madhhab*, named after Ahmad b. Hanbal (d. 855); the Dawudi or Zahiri *madhhab*, named after Dawud b. Khalaf al-Isbahani (d. 884); and the Jariri *madhhab*, named after Muhammad b. Jarir al-Tabari (d. 923). The projection of the institution back to the time of these jurists is anachronistic except in the case of al-Tabari, and perhaps Dawud b. Khalaf. The Dawudi and Jariri *madhhabs*, although important in the tenth century, dwindled and died out in the eleventh; the four remaining *madhhabs* survived until modern times. In general, the jurists of the *madhhabs* recognized each other's traditions as legitimate and their opinions on disputed legal questions as equally valid. Together, the four surviving legal *madhhabs* have represented Sunni legal orthodoxy, an idea confirmed by such historical developments as the establishment of four chief judgeships, one for each *madhhab*, under the Mamluks (1250–1517) in Egypt and Syria. They played the crucial role in shaping legal interpretation and the transmission of legal knowledge, and at the same time provided a strong element of continuity and homogeneity in Islamic society over space and time.

Closely related to the *madhhab* was the institution of the *madrasa*, or college of law, which began in the eleventh century in Baghdad with the founding of the Nizamiyya in 1067 and subsequently spread throughout the Muslim world. The

madrasa was usually a building that provided space for teaching large classes as well as lodging for students, often on an upper story. It was supported by a perpetual endowment (*waqf*) that generated income from the produce of agricultural land or the rent from a row of shops, for example. These funds paid the salaries of the overseer of the endowment (*nazir*, *mutawalli*), the professor of law (*mudarris*), the repetitor (*mùid*), and other staff, as well as student stipends, repairs, and other expenses. Generally, the *madrasa* was devoted in the endowment deed (*waqfiyya*) to the law of one of the four *madhhabs* and had one professor who taught the law of that *madhhab*. Stipends were also provided for students who studied the law of that particular *madhhab*. *Madrasas* soon became the most important institutions of learning in the Muslim world. They tended to exclude the teaching of the Greek sciences, including philosophy, medicine, astronomy, and so on, relegating their teaching to private settings, and to accept the teaching of other religious sciences, such as Arabic grammar, rhetoric, hadith, scriptural commentary, and so on, but as ancillary to the study of the law. The system of legal education that developed in conjunction with the *madhhab* and the *madrasa* involved three main levels: ancillary studies in Arabic grammar, rhetoric, and related fields; intermediate study of the legal tradition of the *madhhab*; and advanced study on the disputed questions of the law (*khilaf*). Disputation and dialectic (*jadāl*) were major foci of the advanced law student's training; they played an important role in the elaboration of the law. Certainly by the thirteenth century, but possibly earlier, the completion of legal study was recognized by the conferral of a diploma termed the *ijazat il-iftā' wa'l-tadris* ("authorization to grant legal responsa and teach law"), granted by a master jurist to his student.

Jurisprudence: The "Sources" of the Law

Overall, the main focus of Muslim jurists has been the interpretation of scripture. Classical Sunni Islamic jurisprudence has at its heart a theory of four "roots," or bases, of the law, generally listed as (1) the Koran, (2) the *Sunna* of the Prophet Muhammad, (3) consensus (*ijma'*), and (4) legal analogy (*qiyas*). The Koran is granted pride of place as a legal source, yet many do not realize how little of the law is based on the text of the Koran itself. Muslim jurists reckoned that only five hundred verses of the Koran, about one-thirteenth of the entire text, have legal content. A genre of legal literature styled *Ayat al-ahkam* ("The Verses of Legal Rulings") developed that was a commentary on these verses in particular, extracting the legal content. Of these verses, many are not very specific, such as the many commands to hold prayer and give alms that do not specify how, when, and where to perform these actions.

In addition to the Koran, early jurisprudence relied on *Sunna*, which seems to have originally meant the general or time-honored usage of the community, and *ra'y*, which at this stage meant "sound opinion" or "considered opinion." With the work of al-Shafi'i, and generally for Sunnis in the course of the ninth century, it became standard theory that there was not one scripture in Islam, but actually two. The definition of *Sunna* narrowed to refer to the usage of the Prophet, and then further narrowed to mean "the usage of the Prophet as established

by *hadith*," oral reports concerning the Prophet's statements and behavior transmitted from the Companions, early Muslims who were eyewitnesses of the Prophet's mission. These reports were gathered and published in collections arranged according to the Companion transmitters (*musnad*), or in collections arranged for easy reference by jurists according to the standard chapters of the law (*sunan*). Six collections, dating from the middle to late ninth century, came to be recognized as more or less canonical by Sunni Muslims of all *madhhabs*: the *Sahih*s of al-Bukhari (d. 870), Muslim (d. 875), and al-Tirmidhi (d. 892), and the *Sunan* of Ibn Majah (d. 886), Abu Dawud (d. 888), and al-Nasa'i (d. 915). In the ninth and tenth centuries, the relative importance of hadith as a body of scripture was highly contested. Some rationalist jurists threw it out completely; most rationalists restricted the use of individual reports severely, setting very stringent requirements for establishing its authenticity. Many traditionalists, on the other hand, based their understanding of the law almost entirely on hadith reports and sought thereby to emulate the Prophet's *sunna*, or exemplary behavior, as closely as possible, even in everyday matters such as trimming one's mustache and letting one's beard grow long, or using a *miswak* twig as a sort of toothbrush. They set out to avoid all innovations, *bid'a* in opposition to *sunna*, which could lead one into error. Even these traditionalist scholars realized that many hadith reports were forged: some hadiths spoke for and against sectarian and other theological positions that had only arisen generations after the Prophet. Others contained translations of Bible verses or other Jewish or Christian lore. They devised criteria for establishing the authenticity of hadith reports, but most of these were formal, probabilistic criteria, based on examination of the authorities in the chain of transmission (*isnad*) of the hadith report. If they were all known to be reliable and each could have met the preceding person in the chain, then the report was considered formally reliable, even if the text itself was recognized to be odd.

In the genre of *usul al-fiqh*, Islamic jurisprudence developed sophisticated scriptural hermeneutics, focusing on the interpretation of God's address (*khitab Allah*) to mankind, in which He conveyed the law. Particular attention was paid to commands (*awamir*) and prohibitions (*nawahi*) in the text, for they establish obligations and set up legal boundaries. Several concepts were developed to cope with apparent contradictions in the text, including abrogation, according to which a later proof-text canceled out the legal effect of an earlier proof-text, the distinction between general and particular proof-texts, which allowed jurists to distinguish the intended audience or set of legal agents to which a particular command was addressed. Over the centuries, the discussions of these topics grew more and more elaborate and linguistically sophisticated, anticipating a number of theories of modern linguistics and philosophy by many centuries.

The third "source" of the law according to classical Sunni jurisprudence was consensus, usually defined as "the unanimous agreement of legal authorities of a given generation on a particular legal." This has often been confused with popular opinion, but is in essence the agreement of the community of interpretation constituted by qualified master jurists, after debate has subsided. The existence of consensus is established

through the absence of dissent. The legal questions subject to consensus, together with the disputed questions, on which a number of authoritative variant opinions are held, form the range of orthodox opinion.

The fourth "source" of the law has been variously designated as *qiyas* ("legal analogy") or *ijtihad* ("exhaustive investigation"). They both came about in an attempt to eschew *ra'y* ("considered opinion") as a source of the law and to tie elaboration of the law more closely to scripture. By the tenth century, and particularly in traditionalist circles, *ra'y* came to take on the pejorative meaning "completely unfounded or idiosyncratic opinion," as opposed to its early usage. All four Sunni *madhhabs* eventually renounced *ra'y* and accepted *qiyas*. *Qiyas*, in its simplest form, is an analogy tying the ruling of Y to the ruling of X based on a crucial similarity, termed the *illa* ("cause") of the ruling. For example, it is established from the Koranic text that drinking alcoholic beverages is forbidden, but there are no scriptural texts that apply to other drugs, such as hashish or opium. If jurists could show (1) that God declared drinking alcoholic beverages forbidden specifically because they intoxicate and (2) that hashish and opium intoxicate in a manner similar to alcohol, then the consumption of hashish or opium should also be forbidden. The jurists of the short-lived Zahiri *madhhab* rejected *qiyas* altogether, arguing that it is impossible for humans to assign a cause to God's legal declarations without explicit designation in scripture. To do so is to usurp God's legislative power. *Qiyas* also came to serve as a general rubric encompassing a number of logical arguments, many of which were not actually based on analogy, including *reductio ad absurdum*, *a fortiori*, and other logical arguments.

Ijtihad (literally, "effort") is the term used to describe the process of legal interpretation undertaken by a qualified expert in jurisprudence. Such an expert is termed a *mujtahid* and is forbidden from adopting the opinions of other experts on authority (*taqlid*). Only a layman, or a jurist who is not fully qualified, is permitted to perform *taqlid*. A great deal of controversy surrounds the term *ijtihad*; it was until recently commonplace to claim that "the gate of *ijtihad*" was closed long ago, as early as the ninth or tenth century, and that from that time forward, "independent" interpretation was forbidden. This is not true. Those who claimed that the gate of *ijtihad* was closed meant that it was forbidden or impossible to establish a new legal *madhhab*, not that there was a moratorium on independent thought. Manuals of jurisprudence throughout the middle ages and up until the present have stressed the necessity of performing *ijtihad* on the part of the qualified jurist, and Muslim jurists have been addressing novel issues in the law and coming up with new interpretations throughout history. Nevertheless, it is true that many jurists felt that their interpretative leeway had narrowed considerably by the late middle ages and that they were constrained by the tradition of their own *madhhab* in ways that earlier jurists had not been.

By the eleventh and twelfth centuries, Sunni jurists had come to accept the role of probability in legal interpretation. In the absence of clear scriptural prooftexts, the individual jurist, after exhaustive investigation of a legal question, professed that answer that was preponderant in his mind. This

opinion did not rest on certitude (*yaqin*) but on strong presumption (*ghalabat al-zann*). Although it was not guaranteed to be correct, the *mujtahid* was not held to have sinned for coming up with the wrong answer as long as he had investigated the topic exhaustively, and the lay petitioner was permitted to perform his religious obligations according to this opinion. Probable answers to legal questions acquired authority in the absence of a certain answer.

The Modern Period

In the modern era, traditional Islamic law and its institutions have been eclipsed by secular law and institutions at the hands of the colonial powers and modern nation-states. In most Muslim nations, the endowment properties that supported legal education have been confiscated by the government and put under the control of a government ministry. The professors and others who teach and work in these institutions have become government employees. Secular education has radically reduced the importance of the *madrasas* in the contemporary world. There has been a widespread application of Western legal codes, whether the Napoleonic code or the related Swiss code, on the law of modern nation-states in the Muslim world, especially in the areas of commercial and criminal law. The only areas that have remained under the purview of Islamic law in most countries are family law, including marriage, divorce, inheritance, and related topics. In these areas, the flexibility of the law has been radically reduced by attempts to establish a standard code. In British India, for example, the *Hidaya* by al-Marghinani (d. 1196), *Minhaj al-talibin* by al-Nawawi (d. 1277), and *Shara'i' al-Islam* by al-Muhaqqiq al-Hilli (d. 1276) were chosen to serve as the law codes for Hanafi Sunnis, Shafi'i Sunnis, and Twelver Shiis, respectively.

At the same time, beginning in the nineteenth century, Muslim reformers such as Muhammad 'Abduh, Rashid Rida, and others attempted to reform Islamic law from within. Approaches have varied widely. Some thinkers have criticized the insularity of the individual *madhhabs*, arguing for a sustained study of comparative law (*fiqh muqaran*) within traditional institutions. Other methods include choosing freely (*takhayyur*) among the opinions of past authorities, or combining the legal doctrines of various *madhhabs* to come up with an appropriate solution, a process termed *talfiq* ("patching, piecing together"). These last methods have been used in many actual reforms of Islamic family law, such as the well-known reform of Anglo-Muhammadan law that drew on the Maliki tradition to alter Hanafi marriage law so as to facilitate access to divorce for women in bad marriages. Other, more radical thinkers have argued that the law of the *madhhabs* should be jettisoned altogether and that a new Islamic law should be derived directly from the scripture, from the Koran alone, or from that portion of the Koran that was revealed at Mecca. These radical reforms have met with little success, as most movement in the Muslim world today seems to be in the opposite direction. In Saudi Arabia, Iran under the Islamic Republic, Afghanistan under the Taliban, and Sudan, various forms of Islamic law have been applied. In addition, Islamist political groups throughout the Muslim world are clamoring for application of the *shari'a* in an attempt to fend off Western cultural influence, fight corruption, and engender public morality and social

justice. The classical legal system has not lost its vitality, and, given the centrality of a divinely ordained law to Islam, it cannot easily be replaced or substituted.

LEADERSHIP. Although there are seemingly as many descriptions of leadership as there are men and women who fill leadership roles, most meaningful definitions echo the one commonly ascribed to former U.S. president Harry S. Truman: leadership is the ability to get others to willingly move in a new direction in which they are not naturally inclined to move on their own. While the related but distinct concept of *authority* has since antiquity been a subject for scholarly analysis, the field of *leadership theory and development* has emerged more recently. It is primarily an American phenomenon, although its influence has quickly spread across continents.

Leadership in Historical Context

Of the myriad forms of human and social capital, leadership may be the most rare and precious. One can point to hundreds of companies that were collapsing despite legions of consultants and new plans and policies, until finally its chief executive officer

was removed, a new head was brought in, and the company turned around as though by magic. History abounds with similar examples among armies, universities, churches, and nations.

Conversely, the untimely loss of a talented and effective leader can prove disastrous for the organization she was leading. Try as they may, a succession of new leaders cannot stem the inexorable decline of the very same organization that a few months or years before was at the peak of health and vitality.

Moreover, sometimes whole societies lose their ability to produce great leaders. There are numerous cases of societies that lost their earlier, highly developed culture and retrogressed to a more primitive way of life. In some of these cases, external factors such as invasion or drought played a role, but in many cases it would seem that the retrogression was due to a failure of will and a lack of leadership.

History's Slaves or History's Masters?

A striking contrast in worldviews about leadership can be found in the writings of Leo Tolstoy, who believed that history shapes and determines leaders, versus those of Thomas Carlyle, who believed that leaders shape and determine history. In his epilogue to *War and Peace*, Tolstoy contended that kings and generals are history's slaves. Tolstoy believed that leaders merely ride the crests of historical waves that have been set in motion by myriad forces beyond these leaders' control or comprehension. "Every act of theirs, which appears to them an act of their own free will," wrote Tolstoy, "is in an historical sense involuntary and is related to the whole cause of history and predestined from eternity."

On the other side is Carlyle, the nineteenth-century British historian and essayist, who was convinced that "history is the biography of great men," the greatest of them being kings. The very word *king*, Carlyle contended, derives from the ancient word *Can-ning*, which means "Able-man" (although his etymology can be disputed). In Carlyle's view, the Ablemen (and Ablewomen) of the human species direct the course of history and determine humanity's destiny.

Leadership as a Skill

Learned examinations of the lives of great leaders abound, among them Arrian's *History of Alexander* and Plutarch's *Parallel Lives*, bona fide leadership manuals have been relatively rare; only a few have survived the centuries, among them Niccolò Machiavelli's *The Prince* and Sun Tzu's *The Art of War*. Most such works were military in nature, where meritocracies tended to flourish.

Popular opinion through the ages has typically held that leadership flows from the throne of the gods to a privileged few, as evidenced by most societies' willing subjection to and adulation for inherited royalty. In the biblical account contained in the first book of Samuel, the Israelites beg Yahweh to abandon his plans for a pure theocracy, asking in exchange not for democracy but for "a king to lead us." The equation began to change at the end of the global tendency toward dynastic succession and the advent of republican government and other broad meritocracies.

Currently, in an era that can be considered far more Carlylean than Tolstoyan in its worldview, the analysis of living and dead authorities has given way to a dramatic development: the belief that leaders can and should be trained. The worldwide explosion of leadership study and leadership development is an even more recent phenomenon, launched primarily at American universities. Beginning in the 1960s, the most informed academic opinions held that leadership could be taught effectively if prevalent past assumptions about human nature could be overcome. The concept grew in popularity through the 1970s and 1980s, and the result by the turn of the twenty-first century was a \$250 billion industry—the amount spent annually on management training and executive education around the world.

Leadership theory and development was to a degree an offshoot of inquiry into organizational life, as industry and government bureaucracies evolved rapidly, with figures such as Vienna-born economist and management editor Peter Drucker forging roles as key commentators. Theories of organizational life gradually gave way to theories of leadership as an exalted vocation.

Once scholars began not only to assess the impact of leaders but to dissect the traits that fueled their success, a legion of authors and consultants rose up to offer seven habits, ten techniques, or twenty secrets of top leaders. Eventually American corporations, universities, and even secondary schools began setting aside funds for leadership development programs.

The Rise of Contemporary Leadership Theory

Theories of leadership in any period are driven by a set of convictions and hopes on the part of the theorist. One conviction is that rapid societal evolution makes it imperative to keep one's pulse on social changes and their implications for how groups of human beings can best be led, an inherent assumption in the writings of leadership theorist Rosabeth Moss Kanter and numerous other scholars. A competing view is that human nature is static and unchanging and that the lasting lessons of history provide surer instruction in leadership than do the passing ripples of modernity. Ironically, the exemplars of this view are relatively ancient figures such as Lao Tzu and Machiavelli.

A core Western assumption about leadership is that leaders who succeed have "vision," a tangible end goal toward which they and their followers can strive. But countless Eastern leaders have been more influenced by the worldview of Lao Tzu, who observed, "A good traveler has no fixed plans and is not intent upon arriving. . . . Let go of fixed plans and concepts, and the world will govern itself" (Lao Tzu, chapters 27 and 57).

In a related manner, some maintain that the leader must be an idealist set on speaking to that which is highest, while others hold that a leader must be a realist who is aware of human limitations. Plato contended in *The Republic* that:

until philosophers are kings, or the kings and princes of this world have the spirit and power of philosophy, and political greatness and wisdom meet in one, and those

commoner natures who pursue either to the exclusion of the other are compelled to stand aside, cities will never have rest from their evils.

Yet as though he were responding directly to Plato, Machiavelli soberly observed in *The Prince* almost two thousand years later:

Many have imagined republics and principalities which have never been seen or known to exist in reality; for how we live is so far removed from how we ought to live, that he who abandons what is done for what ought to be done will rather bring about his own ruin than his preservation; for a man who strives after goodness in all his acts is sure to come to ruin, since there are so many who are not good. Hence it is necessary that a prince who is interested in his survival learn to be other than good, making use of this capacity or refraining from it according to the need.

The collective tendency has tilted toward idealism in recent decades. This shift is not a current echo of Plato's philosopher-king. It is, rather, an expression of *democratic* ideals, positing an assumption that intrinsic in human nature is a capacity to lead that only need be unearthed and cultivated in order to flourish.

The participative management and leadership style ascendant in the late twentieth century was exemplified by the work of Douglas McGregor of the Massachusetts Institute of Technology (MIT). In his landmark work, *The Human Side of Enterprise* (1960), McGregor distinguished between a traditional Theory X, which fundamentally viewed humanity in a negative light (the view classically ascribed to Machiavelli), and a newly emerging Theory Y, which viewed human beings in a more positive light. Given Theory X's assumption that human beings are essentially flawed and resistant to work, a successful leader presumably needed to manage them in an authoritarian manner, with rigorous controls.

McGregor heralded his new Theory Y, which demonstrated that human beings are far more willing to invest themselves in their work if it bears personal meaning. If they can escape the suffocation of being overmanaged and begin to make a collaborative investment through their labor, they will bring untapped new fountains of creativity and energy to an organization or cause. The democratic model of organizational leadership began to develop, with its flattened organizational pyramids and concepts such as empowerment and shared vision.

Unlike the so-called hard sciences, the tenets of the social sciences cannot readily be subjected to the test of falsification, and, as a consequence, are often viewed with suspicion. Nevertheless, since the mid-1950s, the social sciences produced a large number of attractive theories of leadership. Management expert Tom Peters noted that Warren Bennis's work at MIT during the 1960s "foreshadowed—and helped bring about—the early twenty-first century's headlong plunge into less hierarchical, more democratic and adaptive institutions, both public and private." Bennis, a protégé of McGregor, found

among other things that hierarchical and autocratic approaches were the best way for teams to carry out simple tasks, while democratic and collaborative approaches were the best way for teams to carry out complex tasks. In such cases, all team members experienced a high average level of contentment in their work, unlike in hierarchical arrangements, where the top person enjoyed maximum contentment and the others experienced minimum contentment.

American corporations were shaped most dramatically by such new models. The gradually increasing tendency toward participative management received a kick-start in the 1980s, when American and European business executives came to admire their Japanese counterparts. Japanese industry was remarkable for its emphasis on the group rather than the individual, and for team processes and a participative work style. Not out of idealism but out of pure self-interest, Western managers began to adopt similar practices. Within a few years, programs for and courses in leadership theory and development were more often housed in American universities' business schools than in departments of political science, psychology, history, or social science. For many years this resulted in an amoral emphasis on technique rather than ethics—in other words, democratic leadership was good for the bottom line as opposed to being intrinsically right—although some business-school-based experts such as Bennis and James O'Toole championed a more deontological approach.

By the last decade of the twentieth century, few successful American leaders in any profit-seeking or not-for-profit organization had avoided participating in at least one seminar, visioning session, or strategic-planning task force built on democratic management principles. However, the good intentions of democratically inclined managers and consultants collided with the limitations of human nature—and a wave of satire (as evidenced in the “Dilbert” comic strip) and public cynicism followed. This cynicism, or frustrated idealism, offers a study in contrasts with Machiavelli's brutal unsentimentality, which had seemingly been discredited by modern practitioners of democratic management and leadership. Machiavelli was above all a coolly detached student of human nature. His repeated advice to leaders was to believe in the *reality* of human nature, as opposed to what they *wished* it were.

Quoted again more widely in an era of renewed global realpolitik, Machiavelli has proved to be neither inerrant nor irrelevant. He illustrated sides of human nature that must be closely examined by every leader, painful though that process may be. The good news for leaders is that there are nobler facets of human nature that have just as great a chance of asserting themselves as those identified by Machiavelli. As such, his greatest legacy may be his ability to help leaders develop a more integrated understanding of human nature and leadership.

Theories in Flux

Just as popular and scholastic leadership theory has been shaped and reshaped by the epochs of industrialization, bureaucratization, the communications revolution, and the widespread entry of women into management, leadership theory

will continue to undergo changes, determined in part by prevailing societal values such as idealism or realism.

Through it all, a middle ground appears to exist between Tolstoy's persuasive fatalism and Carlyle's enthusiastic activism. It may well be that this world is largely Tolstoyan, subject to historical forces that no man or woman can fully measure and analyze and the consequences of which no person can fully predict. To that extent, leaders are in fact history's slaves. However, Carlyle's Ablemen (and Ablewomen) have still made an impact on the course of human events; their decisions have had a lasting influence on the world, so that historical determinism has never quite had the final word.

Finally, leadership tends to be remarkably situational and contingent: what works for one person at one point in time will not necessarily work for everyone else or even for that person at a different time. Thus, in a very real sense, leadership is an art, not a science. Effective management may be a science (though that too is questionable), but effective leadership is most certainly an art. In this sense, leadership is more akin to music, painting, and poetry than it is to more routinized endeavors. And just as there is no comprehensive theory of art, there is no comprehensive theory of leadership.

Every leader is therefore locked in a moment-to-moment struggle with the context and circumstances of his own place and time. This excruciating yet exhilarating aspect of leadership is what makes the study of great historical figures so timelessly appealing—and, in this democratic age, makes millions of would-be leaders such eager students of this peculiar calling.

LEARNING AND MEMORY, CONTEMPORARY VIEWS.

People have long wondered how best to characterize learning and memory. Most people typically conceive of memory as a place in which information is stored. As Henry Roediger has noted, this spatial metaphor has dominated the study of memory: "We speak of storing memories, of searching for and locating them. We organize our thoughts; we look for memories that have been lost, and if we are fortunate, we find them" (1980, p. 232). Aristotle compared memory to a wax tablet, Plato invoked the image of an aviary, and St. Augustine of Hippo suggested similarities to a cave. Increasingly, the metaphors involved the most recent or most impressive technological accomplishment, as with René Descartes and his analogy to the water-powered automata in the French royal gardens and later by comparisons to the gramophone (an updating of the wax-tablet metaphor) and then a telephone exchange.

The so-called "cognitive revolution" that began in the mid-1950s ushered in the information-processing approach to the study of learning and memory. The main metaphor became the computer; people were seen as general-purpose processors of information capable of manipulating internal representations. As with computers, there was an emphasis on the interaction between hardware and software, usually relabeled structure and process, respectively. By the end of the 1960s, the standard view of memory was the modal model (after the statistical term *mode*) with its set of stores, registers, and buffers. Structuralist views continue to use the spatial metaphor and emphasize a memory system in which information is stored. According to these accounts, the store in which a memory resides determines the mnemonic properties.

An alternative to the structural approach is the proceduralist approach, which views memory not so much as a thing that is stored but rather as the result of a process. As David Wechsler put it, "Memories are not like filed letters stored in cabinets. . . . Rather, they are like melodies realized by striking the keys on a piano" (p. 151). The melodies are a by-product of pressing keys just as memory is a by-product of processing information. According to this account, the processing performed at encoding and retrieval determines the mnemonic properties.

Consider the essential difference between these two accounts. Within the modal model of the 1960s and early 1970s there were three memory structures: a sensory register, short-term memory (STM), and long-term memory (LTM). Information is first briefly registered in the appropriate sensory buffer, visual information in iconic memory, auditory information in echoic memory, and so on. These buffers hold raw physical information in an unanalyzed form for a very short period of time, perhaps 250 milliseconds. Additional processing is required to convert the information from its sensory form to a more durable representation that is held by short-term memory. Short-term memory serves mainly as a buffer in which information can be temporarily stored and has a limited capacity, usually given as 7 plus or minus 2 items. Items in short-term memory decay over time unless rehearsed; rehearsal is also the way in which information gets copied into long-term memory. Long-term memory is the main memory system and stores all knowledge. It has no known capacity limitations. Whereas information loss from short-term memory is thought to be permanent, it is unclear whether there is permanent loss from LTM.

Table 1 summarizes the essential points from the structuralist point of view. When an item is in STM, it will be stored using an acoustic code (how the word sounds), the capacity will be limited to 7 plus or minus 2 items, and the items will decay within about twenty seconds. In contrast, when an item is in LTM, it will be stored using a semantic code (what the word means), the capacity will be (almost) unlimited, and the item may very well never be forgotten.

A proceduralist would agree with almost everything the structuralist has proposed, except that the proceduralist would ask the following question: What does the top row in the table add to our understanding? In other words, we could delete the top row and still have a complete and accurate description of memory. When words are processed based on how they sound, there will be a very small capacity and the information will not be available for very long. When words are processed based on what they mean, however, there will be an enormous capacity, and the information will be available for a long time.

The divergence between the structuralist and proceduralist approaches has grown since the 1970s. One current debate concerns whether memory is best characterized as a set of

	STM	LTM
Format	Acoustic	Semantic
Capacity	7 ± 2	Infinite (?)
Duration	20 s	Infinite (?)

independent systems—a continuation of the spatial metaphor—or as a set of interrelated processes (see, for example, Foster and Jelicic). This more modern structuralist approach has greatly changed the modal model and generally names five different memory systems. The proceduralist approach has refined the idea of memory as a by-product of processing to focus on the relationship between the processing performed at encoding and the processing performed at retrieval.

The Structuralist Approach

Typically, structuralists are concerned not only with delineating the number of memory systems but also in locating them within the brain. Advocates of the systems approach identify five major memory systems: working memory, semantic memory, episodic memory, the perceptual representation system, and procedural memory.

Working memory is a system for the temporary maintenance and storage of internal information and can be thought of as the place where cognitive “work” is performed. It has multiple subsystems, most notably one for the processing of verbal or speech-like stimuli and another for the processing of visual-spatial information. Each features a store (the phonological store and the visual-spatial sketchpad) and a maintenance process that offsets decay (articulatory control process and the visual scribe). Unlike short-term memory, the capacity limit is based on a trade-off between the rehearsal process and decay.

Semantic memory refers to memory for general knowledge and includes facts, concepts, and vocabulary. The term is somewhat misleading, however, as it implies storage of only semantic information, which is not the case. Rather, the distinguishing feature of this system is the lack of conscious awareness of the learning episode. In contrast, episodic memory is the system that does provide this awareness of the learning episode and thus enables the individual to “travel back” mentally into his or her personal past, to use Endel Tulving’s term. As an example of the difference, consider the fact—picked hopefully for its obscurity—that Samuel Beckett is the only first-class cricket player to win a Nobel Prize (he played for Dublin University and won the 1969 Nobel Prize for Literature). Imagine that two weeks from now you happen to participate in a conversation about Nobel Prizes, and you recall the above information about Samuel Beckett. If you remember reading the information in this book, where you were, whether it was hot or cold, or anything else about the episode other than the mere facts, then the information is said to be in episodic memory. If you remember only the fact itself, then the information is said to be in semantic memory.

All three of these systems are part of declarative memory, which is contrasted with procedural memory, the fourth proposed major memory system. Declarative memory is concerned with knowing “that” rather than with knowing “how.” For example, if you know that two plus two equals four, the information is said to be in declarative memory. By contrast, if you know how to ride a bicycle, that information is said to be in procedural memory. One distinction is that you can usefully communicate declarative information but not procedural

information: simply telling someone how to ride a bicycle (explaining balance, pedaling, and steering) does not work.

Finally, the perceptual representation system is a collection of non-declarative domain-specific modules that operate on perceptual information about the form and structure of words and objects. Although currently the dominant approach, the structuralist conception of memory is not without its problems.

First, there is little agreement on what the criteria should be for a memory system, let alone agreement on the number of systems. In particular, there are no criteria that result in producing just the five systems named above. The most well-specified criteria for determining whether two systems are separate were proposed by David Sherry and Daniel Schacter in 1987: (1) functional dissociations: an independent variable that has one effect on a task thought to tap system A either has no effect or a different effect on a task thought to tap system B; (2) different neural substrates: system A must depend on different brain regions than system B; (3) stochastic independence: performance on a task that taps system A should be uncorrelated with performance on a task that taps system B; and (4) functional incompatibility: a function carried out by system A cannot be performed by system B.

Henry Roediger, Randy Buckner, and Kathleen McDermott have shown how recall and recognition meet the first three of these criteria: the variable word frequency produces functional dissociations (high-frequency words are recalled better than low, but low-frequency words are recognized more accurately than high); neuropsychological dissociations between recall and recognition are observable in amnesiac subjects; and numerous studies have found essentially no correlation between performance on the two tests. A thought experiment suggests that recall and recognition might also demonstrate functional incompatibility: memory for odors is a function that is well supported by recognition (consider the case of Marcel Proust) but not very well supported by recall.

Second, the proposed systems have not yet been anatomically isolated (although it remains an empirical question whether they will be), and even when isolation is found, the results are often equivocal. For example, many studies show that retrieval in episodic tasks involves right prefrontal activation, whereas retrieval of semantic information involves left prefrontal activation. This neuropsychological distinction, however, reverses when the two tasks are equated for difficulty: retrieval of semantic information now produces larger amounts of right frontal activation than the episodic task.

Third, this view does not account for the general pattern of decline seen when normally healthy people get older. One would expect a systematic relationship between tasks that shows a decrement in performance and the underlying system. For example, one might expect that episodic memory might deteriorate faster than semantic memory. In fact one finds no such relationship. Performance on some episodic tasks is unaffected, whereas performance on some semantic tasks is quite impaired. Rather, the pattern of performance loss is better described based on the processes, especially those at retrieval.

The Proceduralist Approach

The modern incarnation of the proceduralist approach began with the levels of processing framework of Fergus Craik and Robert Lockhart. Rather than viewing memory as something that is stored in a system, they viewed memory as the by-product of performing processing. Because the emphasis is on processing rather than on structure, Craik and Lockhart argued that the most informative research will occur when the experimenter has control over the processing and that therefore researchers should use an incidental learning procedure. The experimenter might ask the subject to judge whether two words rhyme or to judge which of two words has the most pleasant associations. The learning is “incidental” in that the subject is unaware that the material being processed will be tested later on and so is not intentionally trying to remember the information. The type of processing performed at retrieval can also be manipulated.

The basic premise of the transfer-appropriate processing account of memory is that memory will be best when the processing performed at encoding is appropriate given the processing demands required at test. For example, if you processed how an item sounds at encoding but the test emphasizes the meaning of the item, performance will be worse than if your processing focused on how the item sounds at both encoding and retrieval or than if your processing focused on the meaning of the item at both encoding and retrieval. This view offers an explanation for why intent to learn is not an important factor in subsequent tests of learning and memory: if a person uses an inappropriate process, performance will be poor regardless of the intent to learn.

This idea applies very generally. For example, context-dependent memory refers to the observation that memory can be worse when tested in a new or different context relative to performance in a condition in which the context remains the same at both encoding and retrieval. Context can refer to mood (such as happiness at both encoding and retrieval, sadness at both encoding and retrieval, or a mismatch) or to physical location (for example, underwater at both encoding and retrieval, on land at both encoding and retrieval, or a mismatch). One practical implication for divers is that if they memorize decompression tables on land, they may not remember them very well when needed, underwater. The idea is that if you are happy, you are likely to have quite different processing than if you are sad. Neither mood is inherently better (from a memory perspective); the point is that the results of processing while in a sad mood are different from the results of processing while in a happy mood.

One problem with the transfer-appropriate processing view is determining exactly which processes are being used. Larry Jacoby introduced the process dissociation technique, in which a subject is asked to perform two tasks. The experiment is set up so that on one task, two processes can contribute to memory performance, but on a second task, the processes work in opposition. Using this procedure, one can estimate the relative contribution of each process. It remains an empirical question whether this will result in a sufficiently detailed description of the various processes that can be used.

Dynamic Memory

In addition to the divergence between the structuralist and the proceduralist views, another major difference between memory research now and memory research in the 1960s and 1970s is the emphasis on the dynamic, reconstructive nature of memory. Long gone is the library metaphor in which memory was like a book in a library that just sat on a shelf. Instead, memories are seen as being dynamically constructed and changed according to the current available information. It is now well documented that people can even remember things that never happened.

Memory is now viewed as inherently reconstructive. This term emphasizes that at the first retrieval attempt, one constructs a memory from all available information. At the second retrieval attempt, the memory is constructed again. Consider what happens when an event is retrieved and then retrieved a second time. At the first retrieval attempt, you will have two sources of information: memory of the event itself and general knowledge. At the second retrieval attempt, you have three sources of information: memory of the event itself, general knowledge, and memory of your first retrieval.

This process is nicely illustrated from experiments that intentionally try to implant a memory of an event that did not happen. For example, Ira Hyman and F. James Billings asked their subjects, college students, to recall as much information as they could about events from their early childhood. Each subject was asked about two to four events that actually occurred (according to the subject’s parents) and one event that did not occur. This event supposedly happened when the subject was five years old and concerned going to a wedding and knocking over the punch bowl, spilling some punch on the bride’s parents. Originally only 3 percent recalled the wedding episode, as it had not occurred. Two days later the subjects were again asked to recall as much as they could, and this time 27 percent indicated remembering the event. Subjects were also asked to rate their confidence in the accuracy of their memory. There was no difference in the confidence ratings for real or made-up events.

This is not an isolated finding. People who read a story and were then told that the main character of a story was Helen Keller were likely to remember reading the sentence, “She was deaf, dumb, and blind,” even though that sentence was not presented. A student in one of my memory classes had a memory of a favorite pet golden retriever. After hearing my lecture on this topic, she checked with her parents: the dog had died two years before she was born. Apparently she had heard stories about the dog and had seen slides featuring the dog and was attributing memory of these as memory of real events.

Studies from the eyewitness memory literature show that eyewitnesses readily incorporate information from questions into their recollections of events. Unless there is objective evidence available, there is no way of assessing the accuracy of recollection of an eyewitness: they may be very accurate, very inaccurate, or somewhere in the middle. Among the many factors that do not predict subsequent accuracy are the duration of the event; the emotional intensity of the event; the unusualness of the event; the number of details that can be recalled;

the confidence expressed about the memory; and the delay between the event and the subsequent questioning.

Memory then is fundamentally active, dynamic, and reconstructive. Like other cognitive processes, memory processes recruit information from a variety of sources, including from memory of the event itself as well as from generic knowledge, memory of past recollections of the event, and even inferences, with the goal of constructing a sensible, coherent memory.

LEGALISM, ANCIENT CHINA. Legalism (*fa jia*) is a label applied since the second century B.C.E. to a group of Chinese thinkers of the Warring States period (453–221 B.C.E.). The label is doubly misleading: first, because the thinkers concerned did not necessarily consider themselves members of a unified intellectual current, much less a common school of

thought; and second, because the notion of law (*fa*), albeit important, is by no means central in the thought of all these thinkers. Legalism is thus not a scientific category but rather a scholarly convention.

Major sources for Legalist thought are the works attributed to the leading Legalist thinkers, Shang Yang (d. 338 B.C.E.), Shen Buhai (d. 337 B.C.E.), Shen Dao (fl. late fourth century B.C.E.), and Han Feizi (d. 233 B.C.E.), as well as portions of the Warring States collectanea, the *Guanzi* and *Lüshi chungiu*. Of these only the first has undisputed Legalist credentials, while the intellectual affiliation of the others is constantly questioned. These disputes notwithstanding, we may discern several major approaches that characterize these thinkers and texts and distinguish them from contemporary intellectual currents. First, all of them sought to strengthen the state versus society through the perfection of a centralized bureaucratic mechanism. Second, Legalists adopted a ruler-centered perspective, which held that reinforcing the ruler's authority was crucial for social stability and that this authority should be absolute and limitless. Third, the Legalists rejected the authority of the past and favored institutional and intellectual innovations to match rapid changes in the sociopolitical situation. Fourth, they rejected the priority of moral values over practical considerations advocated by most of their rivals and adopted a pragmatic and often cynical stand toward political issues. Finally, since major Legalist thinkers had rich experience as administrators, military advisers, and diplomats, their writings are often dominated by practical issues to the extent that some modern critics question their philosophical credentials altogether. Paraphrasing Marx, it may be said that while other philosophers often sought to explain the world, the Legalists did their best to change it—and indeed achieved remarkable results.

Shang Yang

Shang Yang is the major Legalist thinker and statesman. As a chancellor of Lord Xiao of Qin (r. 361–338 B.C.E.), he initiated a series of profound reforms that turned the relatively weak and peripheral state of Qin into the strongest power and the eventual conqueror and unifier of the Chinese world. Shang Yang's views are presented in the *Shang jun shu* (Book of Lord Shang); although parts of the book were composed after his death, the text reflects to a significant extent Shang Yang's legacy.

Shang Yang aimed to turn Qin into a powerful state through two parallel and interconnected processes: encouraging agricultural production and strengthening military prowess. To achieve these goals he advocated a clear system of rewards and punishments, according to which aristocratic ranks would be granted for high grain yields and for military merits, while high taxation would be applied against merchants and other "parasites," and harsh penalties would be imposed on those who fled the battlefield and on their relatives. He claimed that rational management of state funds and allocating more resources for reclaiming the wastelands would promote agricultural production, while military achievements would be attained through abandoning any pretension of moral behavior on the battlefield: "When you undertake whatever the enemy is ashamed to do, you will benefit."

Shang Yang's major concern was to assist the ruler to subdue and overcome his people. The people are inherently selfish and stupid, and they do not know how to attain prosperity and peace. Hence a uniform legal system of rewards and punishments is needed to bring order. The punishments should be severe: imposing harsh penalties for the slightest violations of the law can prevent the appearance of capital offences. Only by frightening the people, establishing a system of collective responsibility and mutual surveillance, can the ruler eliminate crimes and achieve peace for the citizens. This ultimately moral goal should be attained therefore through overtly immoral means.

Shang Yang ridiculed traditional culture, moral values, and beliefs in harmonic relations between the ruler and his subjects. All these are bygone ways, appropriate perhaps in the remote past but meaningless in the current age of constant warfare and internal struggles. The only meaningful lesson from the past is that wise rulers changed their laws and regulations to accord with changing circumstances. Shang Yang constructed an evolutionary model of social development, from a kin-based order toward a legal-based one; later Legalist thinkers adopted and further modified this model.

Shang Yang succeeded in creating a harsh and intrusive state that deeply penetrated society and eliminated or weakened previously autonomous social units, such as lineage and the agricultural commune. His success, admitted even by his rivals, explains his appeal, despite his overt attacks against the intellectuals, whom he called parasites and whose moral and intellectual credentials he constantly sought to undermine. In the long run, however, these anti-intellectual philippics backfired against Shang Yang and his followers, turning Legalism into an overtly negative label among the members of educated elite.

Shen Buhai

Shen Buhai, Shang Yang's contemporary, was a chancellor in the state of Han. Reportedly his administrative reforms restored stability in this state and made it a model of efficiency for the rest of the Chinese world. Indeed where Shang Yang is associated with the law (*fa*), Shen Buhai's hallmark was the development of technique of rule (*shu*). Shen Buhai's book was lost and partly reconstructed from remaining quotations in the nineteenth century.

Shen ridiculed the traditional emphasis on harmonious relations within the ruling apparatus and warned the ruler that his worst enemy would not "batter in barred doors and gates" but would rather be one of the ministers "who by limiting what the ruler sees and restricting what the ruler hears, seizes his government and monopolizes his commands, possesses his people and takes his state." Rather than trusting his deceitful aides, the ruler should establish a strict system of surveillance over his ministers. He should divide the tasks between the officials, inspect their performance, and prevent a horizontal flow of information between them. To maximize his power, the sovereign must strictly preserve his prerogatives as a chief decision maker but should never interfere in the everyday administrative routine that is the task of the ruled. Shen's system, perfected and modified by others, contributed greatly toward the establishment of an efficient bureaucracy on Chinese soil.

Han Feizi

Han Feizi, the last and most sophisticated of the Warring States' Legalist thinkers, is credited with synthesizing Shang Yang's and Shen Buhai's achievements. He furthermore based his philosophy of law on solid metaphysical foundations, borrowing ideas from the Daoist classic the *Laozi* (or *Dao de jing*). The monistic transcendent power of Dao ("Tao," the Way) is embodied in the ruler, whose authority is hence limitless and unquestionable. The principles (*li*) of Dao are manifested in the law, which thus becomes the constant and unshakable foundation of human society. Social hierarchy also reflects cosmic principles and so is similarly unassailable.

Philosophical sophistication notwithstanding, Han Feizi's fame derives from his astute and cynical analyses of political and social laws and practices. Politics are a battlefield in which deceit and treachery are common, and mutual trust and morality are an anomaly. The ruler should trust neither the people nor his aides, neither his kin nor his closest friends. This candor is revealing because, being a minister himself, Han Feizi actually claimed that he also cannot be trusted. This contradiction between Han Feizi's ideas and his personal aspirations ultimately led to a personal tragedy: after he arrived at the state of Qin, Han Feizi was imprisoned and executed as a potential spy for his Han homeland. Later the king of Qin reportedly admired Han Feizi's teachings and regretted his decision. Han Feizi thus did not witness the ultimate triumph of his ideology, which came shortly after his death with the imperial unification of 221 B.C.E.

Later Legalism

The triumph of Legalism in the Qin empire (221–207 B.C.E.) was to a certain extent a Pyrrhic victory. Qin's harsh treatment of independent thinkers, which culminated in the burning of privately held book collections, backfired against the Legalist ideology, which lost its popularity among the educated elite. Although Legalist methods and ideas remained influential throughout the imperial millennia, the rulers overtly rejected Legalists' cynicism and anti-intellectualism and their emphasis on constant innovation. In the twentieth century the Legalists' ideas of the powerful state strongly appealed to modern intellectuals, and the school's fame reached its peak during the pro-Legalist campaign in the People's Republic of China in the early to mid-1970s. After Mao Zedong's death in 1976, however, the tide reversed again, and the Legalist contribution to traditional China's polity was again deemphasized.

LIBERALISM. It is widely agreed that fundamental to liberalism is a concern to protect and promote individual liberty. This means that individuals can decide for themselves what to do or believe with respect to particular areas of human activity such as religion or economics. The contrast is with a society in which the society decides what the individual is to do or believe. In those areas of a society in which individual liberty prevails, social outcomes will be the result of a myriad of individual decisions taken by individuals for themselves or in voluntary cooperation with some others.

Liberalism in the political sphere cannot be a simple application of individual liberty, because decisions have to be taken collectively and are binding on all. Political liberalism means, first, that individual citizens are free to vote for representatives of their choice and to form voluntary associations to promote their ideas and interests in the realm of collective decision-making. Second, it means the adoption of constitutional procedures for limiting government power and making it accountable to the citizens.

Liberal Practice

In discussing liberalism, it is important to distinguish between liberal practices and liberal theories. Liberal practices are those institutional and customary arrangements that support individual liberty. Of prime importance are individual legal rights to engage in certain activities such as to practice the religion of one's choice, to use one's property and labor as one pleases, and to enjoy freedom of opinion, expression, association, and movement. Political rights and constitutional procedures designed to put limits on government power, such as the independence of the judiciary, the separation of legislative and executive power, freedom of the press, and electoral accountability, are liberal practices insofar as they are designed to protect or express individual liberty.

Individual nonpolitical rights are necessarily limited by the equal rights of others. A religion or other association, or a use of property, that violates the rights of others, cannot be protected. Individual rights may also be limited by consideration of the public good, such as limits on public meetings that will

produce disorder. A liberal account of such public-good constraints must limit them to whatever arrangements are necessary to protect a liberal society.

In talking about individual rights, it is essential to note, in order to understand liberalism, that the liberal individual is a human being not otherwise differentiated by status, class, race, religion, or gender. This formulation describes an ideal—implicit in liberalism and eventually standardly affirmed—rather than the actual practice of liberalism as it originally developed. With respect to the latter, many individual rights were variously restricted in different countries: universally at first to men, in America to white men. Nevertheless, the standard justifications for the exclusions were the incapacity of the excluded class of human beings to make effective use of the liberal freedoms or their existence as a threat to the established liberal order. In this way, it was still possible to say that all human beings capable of freedom and not threatening public order were entitled to rights.

As the practice of particular societies, liberal individual rights, although proclaimed as the rights of human beings, would be restricted to members of that society and to resident aliens only under the developing provisions of international law. The standard justification for such limitations was that the rights could be given practical effectiveness only through the legal and political systems of particular states. Liberal practices emerged in the states of northern Europe and North America in the course of the seventeenth and eighteenth centuries and contributed substantially to their dynamic international power through the early twenty-first century despite the life-threatening challenges to them in the twentieth century by the fascist and communist powers. The liberal societies of the West, above all the United States, have given liberalism as a practice and a theory a dominant status in the contemporary world.

While the aforementioned legal and institutional arrangements are important for the constitution of a liberal society, they are not enough. A fully liberal society requires a tolerant public opinion as well. This is one of the main points of John Stuart Mill's famous essay *On Liberty* (1859), in which he seeks to defend individuality and difference from the coercive pressure of public opinion.

Liberalism as a social practice is a matter of degree along three dimensions. First, a society may be more or less liberal according to how many aspects of its life are governed by the principle of individual liberty. A society may be very liberal in matters of belief but illiberal in the economic and/or the political sphere or conversely. It may be liberal in all these areas but illiberal with regard to sexual conduct. Second, a society may be more or less liberal with regard to each of these spheres. It may allow only a limited degree of economic freedom or a limited degree of freedom of belief. Finally, a society may be more or less inclusive of its adult population in the scope of the liberal freedoms.

Liberal Theories

Liberal theories are theories designed to show that the liberal organization of society is the best for human beings with

regard to their fundamental nature and interests. The Western intellectual tradition includes several discourses of major importance that have this aim. It is widely held that the principles of liberalism can be traced back to the seventeenth-century natural rights and social contract theorists who attach primary significance in just interaction between persons to an equal individual liberty and who derive the constraints of organized society from an agreement by individuals to submit to such constraints for the sake of the protection of their liberty and other natural rights.

A radically different type of liberal theory, which was very scornful of the idea of natural rights, was the utilitarian one. This flourished in the nineteenth century, particularly in Great Britain, and remains influential in English-speaking countries. This theory holds that the best organization of society is the one that produces the greatest amount of utility or happiness, taking equally into account every individual's utility. Such a theory is liberal only insofar as it argues, as the classic British utilitarians did, that the liberal order of society would best satisfy the utilitarian principle.

The theory that has been most influential in liberal thought on the continent of Europe and also on contemporary thought in English-speaking countries is that of Immanuel Kant (1724–1804) and German idealism. This theory seeks to provide a rational deduction of the natural rights principle of equal individual liberty from human beings' capacity for autonomy, which is understood as a capacity to govern one's conduct by laws or principles that one freely imposes on oneself.

Modern Western political theory from the seventeenth century is largely dominated by liberal ideas. Even thinkers who have been thought to be fundamentally illiberal, such as Thomas Hobbes (1588–1679), Jean-Jacques Rousseau (1712–1778), Edmund Burke (1729–1797), and Georg Wilhelm Friedrich Hegel (1770–1831) are really illiberal, if at all, only in regard to the state and not in regard to society. A liberal society may, thus, be supported on very different theoretical bases within Western thought, including religious ones. Indeed, the dominant status of liberalism in the contemporary world, together with the high importance attached to recognizing the equal worth of non-Western cultures, has led to many attempts to construct support for liberal practices from within religious systems of belief. Thus, there exist forms of liberalism that can be called Confucian, Islamic, and Buddhist.

The Historical Development of the Liberal Idea

From the discussion of liberalism above, one might assume that the term itself came into use in seventeenth-century northern Europe. In fact the term *liberal* was first used in connection with politics in Spain in the early nineteenth century to describe a political movement whose object was to establish constitutional constraints on government power. The term rapidly came to be applied to movements and ideas aimed at promoting individual liberty of choice, and it is now generally considered reasonable to use the term retrospectively to describe thinkers such as John Locke (1632–1704), Adam Smith (1723–1790), and many others whose thought exhibited this character.

Natural rights theories. As claimed earlier, liberalism was nurtured in the natural rights doctrines of the seventeenth century. The Dutch scholar Hugo Grotius (1583–1645) is widely held to be the main innovator of the modern doctrine, and his mode of theorizing, involving the idea of a prepolitical state of nature and a social contract as the ground for political society, was taken up and given major formulations by Hobbes and Locke in England and Benedictus de Spinoza (1632–1677) and Samuel von Pufendorf (1632–1694) on the European continent. The reason for holding these theories to be the ground in which liberalism grew is that they start with a presumption in favor of individual liberty and limit liberty only to protect the equal rights of others or to provide the public order considered necessary to secure everyone's liberty to the greatest extent. These theorists refer to other natural rights besides liberty, as in Locke's classic formulation of rights to life, liberty, health, and possessions. All these rights, however, are to be understood as negative in character. The rights to life and health are rights not to be deprived of one's life or health by the actions of others and are thus rights to go about one's business as one thinks fit without being killed or injured. The right to possessions is again a negative right not to be hindered in the exercise of one's liberty to acquire possessions in order to preserve and enhance one's life. Furthermore, all individuals are held to have the natural right to govern themselves in accordance with their own judgment of their entitlements under natural law.

All these theorists recognize that constraints on individual liberty are necessary if people are to enjoy the maximum of equal liberty in a peaceful society, so it is rational for them to agree to establish a political society on the basis of their natural interests in liberty. This is a new and essentially liberal mode of thinking about a just society, because the aim is to leave people as free as possible to form their own lives as they think fit compatibly with a peaceful and orderly society. The contrast is with conceptions of just order that are based on a substantive conception of the good. In the latter view, one starts with a conception of how human beings should live in order to achieve the good life, such as that of Plato, and then organizes society politically to enable its members to realize this end. Individual liberty, in such a view, is only what is left over after the structure of the good life is in place.

The natural rights theorists explicitly adopted the primacy of liberty conception because they were especially impressed by the quarrelsome nature of human beings and by the devastating consequences of the contemporary disputes over religion involving Protestants and Catholics and the skepticism about the good that could thereby be engendered. These theorists' aim, therefore, was to construct a minimal social ethics that all could agree on while leaving as much room as possible for each to decide for him- or herself what to believe and how to live. Of course, it is always possible to say that the liberal view of just interaction still involves a conception of the good life, namely one of maximum equal liberty. But this is a very thin conception of the good that leaves people as free as possible to make their own choices.

The natural rights theorists developed the central ideas of a liberal *society*. Their politics, however, was in many cases far

from being liberal. Despite the grounding of political society in a social contract and thus apparently basing it on the consent of all, Grotius, Hobbes, and Pufendorf defended absolute monarchy, while Locke and Spinoza restricted political rights to property owners. A crucial argument of the absolutists was that, although the ruler's authority was based on a contract, the contract necessarily involved the surrender by the contractors of their natural right to interpret the natural law for themselves to the sovereign whose judgment could not subsequently be questioned without undermining political society itself and returning everyone to a lawless state of nature. It is for this reason that Hobbes, and later the conservative thinker Burke, can appear to be so illiberal. Although they do not deny that human beings have natural interests in an equal liberty and that sovereigns are well advised to respect that liberty, sovereigns cannot be held to account for not respecting it. Hence, their subjects' enjoyment of their liberties can only be at the discretion of the ruler or the political traditions of the society.

The partial political liberalism of Locke is presented as an attack on the absolutists and consists of making the government responsible to the property owners who are taxed to support it and who are held to be the more rational members of society; and additionally an embryonic version of the idea of the separation of government powers in different hands. Nevertheless, absolute sovereignty still lurks in Locke's theory insofar as citizens who are aggrieved at the actions of a legitimately constituted government have to appeal to the members of political society as a whole whose decision, in principle by majority will, is presented as necessarily binding. Thus, Locke's political theory contains an unelaborated majoritarian democratic principle that could be and was seized on by more radical thinkers and movements concerned to develop the egalitarian implications of liberal rights to promote political democracy.

Rousseau can be understood as one of these radical egalitarian Lockean thinkers in some respects, and his theory was very influential in inspiring the French revolutionaries of the late eighteenth century. But Rousseau is rarely regarded as a liberal. This is largely because his theory of the general will and his belief in direct rather than representative democracy were seen, especially in the light of the actions of the French revolutionaries and through the criticism of the early-nineteenth-century French liberal thinker Benjamin Constant, as wholly antipathetic to individual liberty. He is said to identify liberty with participation in collective decision-making rather than individual choice. However, this is to misunderstand the general will. The general will is supposed to be aimed inherently at securing laws that equally protect the individual liberty of all. Insofar as it is a collective will through participation in which all persons equally impose general laws with a liberal character on themselves and others, its collective nature and positive conception of freedom is merely the necessary political element in a self-governing liberal society.

Rousseau does depart radically from the economic liberalism implicit or explicit in most natural rights theorists of the seventeenth and eighteenth centuries. For Rousseau the equality element in the doctrine of equal rights requires a rough

equality of all as property owners and an opposition to capitalist ownership and market society. Because the foundational liberal principle affirms both the equality and liberty of all, Rousseau's interpretation of it would seem to be a possible one while its egalitarian commitments have become more and more influential.

Other notable figures in the democratic development natural rights theory are Thomas Paine (1743–1809) and the Marquis of Condorcet (1743–1794). They played noteworthy parts in the political revolutions that transformed America and France at the end of the eighteenth century and produced important theoretical works justifying a liberal-democratic order.

Utility-based liberalism. Rights-based liberalism has two apparent weaknesses: It is not clear where the natural rights come from, and no principled account of conflicts involving rights is given or seems to be possible. Utilitarian-based liberalism offers a single solution to both. The principle of utility, which tells moral agents to do those acts that will produce the greatest amount of utility, is interpreted by the great liberal utilitarians to mean that one should act to bring about a society in which individuals enjoy the standard liberal rights enumerated earlier in this entry. At the same time what to do when rights conflict is to be settled by appeal to the principle of utility, which establishes a suitable hierarchy of rights in such cases.

The most important liberal utilitarians are Jeremy Bentham (1748–1832) and Mill. To get a defense of liberalism from the principle of utility, Bentham adopts a number of secondary principles reflecting the fundamental interests of individuals. One of these is that individuals are the best judges of their own interests. So, there must be a presumption on the part of government that social outcomes will be better if individuals are left as free as possible to decide for themselves what to believe and do. His other secondary principles were those of security (or liberty), subsistence, abundance, and equality. Security of person and property involves the protection of people's liberty while ensuring that both subsistence and the possibility of abundance are best accomplished by leaving people free economically. Equality, arising from the fact that in the utilitarian calculus each is to count for one and no one for more than one, might suggest redistribution from rich to poor were that not to conflict in an unacceptable way with the operation of the other secondary principles and so is outweighed by them.

Unlike most of his contemporary rights-based liberals, Bentham believed that the only way of ensuring that governments followed policies that best promoted the general utility rather than their own interest was to establish a representative democracy. He thought that the great majority would see that their interests lay in the institution of a liberal society and polity, a view repudiated by those partially political liberals who doubted that non-property owners could be trusted to support liberty because they lacked the necessary independence and rationality.

Mill introduced significant modifications to the liberal theory he inherited from Bentham. One of these is his extension of the liberty principle, which requires persons to be allowed to pursue their own good in their own way so long as they do

not harm others, to cover the coercive pressure of public opinion mentioned earlier. Furthermore, the area of conduct falling within this principle includes what Mill calls experiments in living. People should be encouraged to experiment (so long as they do not harm others) in order to promote the long-term utility of the human race. Underlying these views is a belief in the fundamental importance of individuality to a person's happiness. This is the capacity to make choices for one's life that express one's own individual nature. A liberal society will be one that promotes the development in its members of this capacity. Adult human beings and whole societies will not necessarily manifest it and can benefit up to a point from the tutelage of others.

Kant and post-Kantian liberal idealism. Kant, the deeply anti-utilitarian and still very influential German philosopher, identifies human beings' capacity for autonomy as the grounds for claiming the existence of a natural right to an equal liberty. Autonomy is the capacity to govern oneself by freely imposing rational laws on the operation of one's natural inclinations. In following one's inclinations even through rational calculation, one is bound by causal laws operating independently of one's will. One is free and self-determining only insofar as one's end is rational and self-imposed. One achieves this in willing principles that are universal and apply to everyone. In subjecting one's natural self-interested maxims of conduct to the requirement of a universal legislation for its own sake and not for any advantage, one is treating rational being in oneself and others as an end in itself and of absolute worth. The laws one wills from that perspective will be ones that could be willed by every rational human being, who is not only a rational being but also a natural one. One will then be participating as an equal legislator in willing rational laws to govern the pursuit by each of his or her natural ends.

Among the fundamental laws such beings will legislate is one bestowing the universal right to an equal liberty. Human beings as rational beings embodied in a particular natural being are ends in themselves, and this means that their will insofar as it is rational and thereby conforms to rational universal law must not be coerced but must be left free to pursue its natural ends as it chooses. To the extent that a person's will violates the equal freedom of another, however, that will itself may be coerced, and in order to ensure the precision and effectiveness of this fundamental law, human beings must rationally will their entry into political society and their formation of a public order and sovereign will.

Kant's significance lies not so much in his working out the implications of the principle of equal liberty but in his invention of a new rational ground in autonomy for it. Contemporary liberals who still seek to provide justifications for preferring liberalism to other social and political schemes are largely either Kantians or utilitarians, with Kantians for the moment predominating.

Post-Kantian idealism, most elaborately developed by Hegel in Germany but also influential in Britain in the second half of the nineteenth century through the writings of Thomas Hill Green, Francis Herbert Bradley, and Bernard Bosanquet, historicizes and socializes the Kantian scheme. The

general idea is that historical forms of society and the reflective philosophies that arise in them are the result of the struggle of human beings to grasp and actualize the free will inherent in their nature as rational beings. This struggle culminates in the development of a liberal civil society and a partially liberal state. A liberal self-organizing civil society in which all persons are responsible for their own life economically and socially is necessary to develop in all the idea and partial actualization of their autonomy. This society, however, can exist only within the framework of a system of legislation that is the ultimate locus of the self-determining free will of human beings through their participation in and identification with the general will of the state. This theory socializes the individualist character of the liberal philosophy, because although individuals are the beings within which free will is realized, this is achieved only through their development in and membership of liberal social forms.

Twentieth-century liberalism and the influence of Rawls.

A striking characteristic of twentieth-century political theory is its loss of belief in the possibility of finding rational foundations for moral and political prescriptions. Adherence to liberal or antiliberal principles became a matter of espousing an ideology.

Liberal practices were, nevertheless, deeply embedded in English-speaking societies but, as it turned out, less so in the societies of Continental Europe, above all Germany and Russia. In those nations, in the chaos of the aftermath of World War I and the economic misfortunes of the 1920s and 1930s, the powerful antiliberal political movements of fascism and communism seized power, destroyed the forms of liberal society, and threatened the very survival of liberalism in the Western world. The victory of the liberal states (together with the Soviet Union) in World War II led to their strong reaffirmation of the individualist values of liberalism. This was least marked in the economic sphere, where the apparent industrial success of Stalinist Russia encouraged many Western and developing states to adopt extensive policies of economic socialism in the form of the nationalization of major industries. The postwar liberal states also for the most part greatly expanded the provision of state welfare to their subjects. While such policies were contrary to the principles of classical liberalism, they were perfectly justifiable under the revision of liberal theory that took place in the second half of the nineteenth century.

Political and moral theory remained marooned in the swamp of ideological contestation largely between liberalism and communism until the publication of John Rawls's *A Theory of Justice* in 1971 and the collapse of the other great antiliberal power in the 1980s (that is, the Soviet Union). The former generated an extraordinary revival of political theory based on the belief that Rawls had invented a new rational justification of liberalism. Rawls supposes that persons engaged in social interaction have the need and the desire to justify their actions to those affected by them and that this justification must take the form of everyone agreeing from an initially fair position to a set of cooperative principles that will then be seen to be fair. The initially fair position is one in which the contractors are understood to be free and equal persons—free

because they have the capacity to form conceptions of the good and govern themselves by these conceptions, and equal because no one has any more power than another to secure favorable terms for him- or herself. The contractors would choose two principles. The first is a principle of equal liberty by which each is to have as much liberty as is compatible with a like liberty for all. This principle takes priority over the second principle, which is concerned with fair equality of opportunity and the distribution of income and wealth. With regard to the latter Rawls holds that the contractors would choose that distribution that maximizes the long-run position of the worst-off group in society. These principles are commonly taken to justify a liberal welfare state with a leaning toward egalitarian outcomes.

One of Rawls's main claims about liberalism is that it is a method of political cooperation that is neutral between different conceptions of the good. Rawls believes, as did the original natural rights theorists, that human beings differ and tend to quarrel disastrously about the good. Any attempt to establish a coercive state on the basis of a particular conception is bound to generate conflict and be unfair to those holding different conceptions because there is no way of conclusively establishing the truth of any one conception. Liberalism, as Rawls understands it, and as presented in this entry, is a way of achieving peaceful social cooperation on the basis of agreement on principles that leave people as free as is compatible with allowing a like freedom to others.

In *A Theory of Justice*, however, Rawls claims that the ultimate ground for accepting his liberalism is that it expresses the Kantian idea of free and equal autonomous persons cooperating together in a social order. Rawls later came to accept the criticism that to base the theory on a Kantian conception of autonomy, which some persons could reasonably reject, violated the neutrality of the scheme. So in *Political Liberalism* (1993) he holds that the burdens of judgment regarding the good are such that it is unreasonable to seek to impose one's own conception on others by making it the basis of the state's order. But this claim raises the question of whether the unreasonableness of imposing one's conception of the good is solely pragmatic or whether it is based on principle, and, if the latter, what that principle is if it is not the Kantian one. Taking the former view would force one to abandon the belief that Rawls has effectively countered the general twentieth-century skepticism regarding foundations.

Some Issues in Liberal Theory and Practice

Liberalism has deep internal tensions primarily between the claims of equality and those of liberty arising from its equal commitment to both these principles. The tensions are held by some thinkers who are not well-disposed towards liberalism to be contradictions that prevent liberalism from living up to its own principles. Some of these issues are discussed briefly below together with some important distinctions between types of liberalism.

Liberalism and cultural difference. Liberalism prides itself on its toleration of cultural and other differences. Some cultural groups, however, are internally illiberal. They do not

treat their members as free and equal autonomous individuals with rights but as having identities defined by their membership in and place within the group, and by relation to the group's values. They are communal selves rather than individual ones. People so identifying themselves cannot easily flourish in liberal society by taking advantage of its freedoms. Hence, it is said that liberalism cannot treat such minority cultures fairly in accordance with its own principles.

Liberalism can tolerate such groups provided that they do not harm others and provided that their members are free to leave without suffering unjust discrimination. The problem is whether persons formed in such groups are really free to leave unless they have had a liberal education that enables them to think of themselves as individuals with the power and right of choice. But if they do think of themselves in this way, they will no longer be the communal selves they were. The liberal education of its members would undermine the group's illiberal identity and force it to reconstitute itself in liberal terms. It is clear also that illiberal groups could not be specially represented in the political realm without turning that realm from a principled association into what would be at best a pragmatic compromise between conflicting groups. There is no reasonable compromise between liberalism and illiberalism. In the end one must seek to show the superiority of a liberal society by appealing to some foundational principle and by reiterating that there is no possible social scheme compatible with a principled order that is more tolerant of difference than liberalism.

A more modest claim for the special recognition of cultural difference would be that of cultural minorities whose values are not incompatible with liberalism but whose members are disadvantaged relative to the majority in terms of their ability to compete on fair terms to obtain the benefits of liberal society. The demand would be in part for the preferential treatment of the members of such groups so that they could enjoy fair equality of opportunity. But this would not be to give special recognition to the culture as such but to its members as disadvantaged individuals. Some cultural minorities might also reasonably claim to be given symbolic public recognition as distinct and loyal members of the polity in public ceremonies celebrating the history of the nation and the contributions of its various citizens.

Liberalism and women's difference. In the beginning, feminism was just the application of liberal principles to women. Women were conceived as having fundamentally the same nature and interests as men and thereby entitled to the same rights.

Radical feminists from the 1970s, however, opposed the liberal assimilation of women's claims on the grounds that the liberal conception of the person did not reflect women's nature. This nature had been obscured by millennia of patriarchal rule and needed liberation from patriarchal society before its true content could be revealed. But whatever it turned out to be, the radical feminists were certain that it would not be a liberal individual. They held that whereas the liberal individual was based on impersonal rationality and abstraction, women's ethical life was rooted in her body and its emotions.

Insofar as women's difference amounts to an illiberal nature opposed to liberal man, the same issues are raised as those that occur in the cultural case, although compounded by the fact that men and women would seem to have to live together in the private realm if the race is to be satisfactorily continued. Women cannot be treated as a self-reproducing cultural group. Nevertheless, illiberal women could be specially represented in the public sphere. Yet, this would turn it once again into a reasonable compromise between the representatives of conflicting values.

Women could, of course, be seen as a disadvantaged group whose members need preferential treatment in order to achieve fair equality of opportunity. But this is not incompatible with liberalism. Some contemporary women writers claim that it is incompatible on the grounds that if women are given special treatment because of their difference, for example, their maternal being, then liberalism's claim to treat all persons equally without respect for gender will be breached. Nevertheless, because the ground for special treatment is to achieve fair equality of opportunity for different individuals in regard to their different circumstances, this argument seems invalid.

The radical feminists believe in a special women's nature was subverted by the postmodernist feminists, who reject the idea of essential selves. Identities are socially produced and always subject to challenge and change. This view would seem to make it impossible to claim that women as such are oppressed in patriarchal or liberal society because there is no such thing as women as such. Nevertheless, postmodern feminists believe that it is still possible within particular discourses to resist established conventions and develop alternative discourses regarding women. But to what end is unclear.

Economic liberalism. Economic liberalism is the view that the best economic order is a free market. This view may be justified by utilitarian considerations, as in those of Bentham, or by a combination of natural rights and utilitarian consequences, as in the theory of Adam Smith.

Fundamental to Smith's view is the idea of a natural order. This is the social order that develops when individuals are allowed to pursue their interests through specialization and exchange of goods and services. It is an expression of human beings' natural right to liberty. But it is also the best way for a society to promote the accumulation of wealth and national power.

Individuals are motivated in the natural order by the desire to improve their material condition, and given a suitable economic environment competition among them will normally produce beneficial consequences. Such an environment requires the free movement of labor, capital, and goods; many buyers and sellers; sound information among buyers and sellers; security of person and property; and the abolition of monopolies, tariffs, and government regulation of production and consumption. Yet Smith acknowledges that there exists a class of public goods that it is the function of government to provide, including the administration of justice, defense, and education.

Smith is not blind to the defects of the liberal economic individual and society but thinks liberal society is still preferable to aristocratic society. In particular, he deplores the condition

of the poor but believes that their only hope lies in the accumulation of wealth. Furthermore, he distrusts the capacity and interests of the poor to make political decisions in the general interest, which he identifies with the system of liberal liberty. So, like many other early liberals, he wants a liberal polity to be restricted to property owners.

Smith is the founder of classical economics, which is committed to free markets and hence economic liberalism. Another major figure in this school is David Ricardo (1772–1823), whose *Principles of Political Economy and Taxation* dominated the subject until the end of the nineteenth century. However, in Ricardo the subject becomes more technical and abstract and less concerned with its connections with liberal values more generally.

Economic liberalism of the Smithian kind is commonly thought to have been practiced by the British government during the nineteenth century and to a lesser extent by others. But this is far from being unqualifiedly true. The British government interfered in market outcomes during this period by regulating working conditions, trade unions, and the rates of utility companies, and by imposing an income tax and maintaining a monopoly of the money supply. The general spirit of economic liberalism is better described as a strong presumption in favor of laissez faire unless it was clear that intervention was to the general benefit.

Classical and revisionist liberalism. Classical liberalism is the liberalism that prevailed mainly in northern Europe and North America up to the second half of the nineteenth century. It consisted of minimal government intervention in economy and society. But it was by no means politically democratic, especially in Europe where liberals were for the most part and for a long time strongly resistant to the inclusion of the propertyless in the benefits and burdens of a liberal polity. Its principles received notable political expression in the declarations of the rights of man and the citizen of the American and French Revolutions at the end of the eighteenth century, while the extremes of the latter revolution confirmed many middle-class liberals in their hostility to democracy. Because of its economic and political association with the middle classes, classical liberalism can easily be represented as the ideology of the capitalist class, a position taken by Karl Marx (1818–1883) and other socialists. As presented in this entry, however, the fundamental tenets of classical liberalism go far wider and deeper than that claim implies. This is shown by the way the application of its principles was revised in the course of the nineteenth century to accommodate what most liberals came to accept as inevitable, namely the arrival of democracy.

The revision in practice took the form of increasing government intervention in the economy to protect the interests and promote the welfare of workers. Government resources, obtained through general taxation, are used to provide for the basic needs of the population. The revision in liberal theory that justified the change to big government involved a shift from the belief of the classical liberals that normal adult human beings would automatically have developed the capacity to exercise their freedom in their own interests to the view that this capacity needed suitable economic, educational, and

social conditions for its development—a belief found in the works of Mill and especially the nineteenth-century idealists. If individuals cannot provide these conditions for themselves, then fellow citizens must do so through state action. In general the move is to a greater emphasis on the equality aspect of equal liberty, as exemplified in Rousseau's thought, a change requiring more protection for workers and the poor.

Rather than as an abrupt and radical break, this revision of classical liberalism should be considered a movement along a continuum of possible social forms, all based on the liberal principle of equal liberty. At one extreme of this continuum is libertarian anarchy with no government at all, which is followed by the minimal state as described above in Smith's theory, and increasing levels of government intervention all the way to the government ownership of the means of production at the other extreme. The latter can still be called liberal provided that individual freedom prevails in all but the economic realm and that economic socialism is understood as the best means of assuring an equal liberty. Classical liberalism shares with revisionist liberalism the belief that government intervention can be justified if it works out to the general advantage.

Liberalism and nationalism. Liberalism and a weak form of nationalism developed together. Liberalism was a way of organizing society for the benefit of its members in a manner that promoted, better than any alternative, the society's harmony, prosperity, and power in a world of independent states. The nation here is just the collection of people organized in a state and thereby sharing common interests in their peace, prosperity, and power.

A strong form of nationalism holds that a nation is an ethnocultural group sharing a common ancestry, history, and culture and that membership in such a group is fundamental to the identity and value of the individual. Nationalism in this sense is totally antithetical to liberalism, for which individual identity is deeper than national identity.

A form of nationalism intermediate between the two is to be found in Mill and the contemporary thinker David Miller. According to this view a democratic liberal state will work better—be more harmonious and just—if the great majority share a nationality in the ethnocultural sense.

Liberalism has also been allied with imperialism. The argument here is that the rule of a liberal state over other peoples, such as the rule of Britain over India, may be justified if it serves to develop the subject peoples' capacity to become self-governing individuals and a self-governing people—in other words to develop in them the culture of liberalism. It is held by some that cultural imperialism of this kind, if not political imperialism, has been pursued by the Western powers after World War II through the United Nations program on Human Rights. Ultimately, the only justification for pursuing a liberal program domestically or internationally is that liberalism describes a better way for human beings to live together than any alternative because it better expresses and actualizes their fundamental nature and interests.

LIBERATION THEOLOGY. The broad definition of liberation theology stresses the interrelatedness of differing structures of oppression and domination. Liberation from oppressive structures necessarily involves political, economic, social, racial, ethnic, and sexual aspects. As a paradigm, liberation theology today places explicit emphasis on assessing different forms of human oppression and suffering, and liberation from them, as layers in a complicated process.

Liberation theology is one of the most significant currents in modern theology. Because of its multidisciplinary and its emphasis on social, political, and ecclesial praxis, it has come to have importance far beyond academic theology or institutional churches. Liberation theology can be defined either narrowly or broadly. In the former sense, it is limited to Latin American liberation theology (*teología de la liberación, teologia da libertação*), born of a specifically Latin American context in the late 1960s. In the broader sense, liberation theology also includes other theological currents, most importantly black theology (mostly in the United States and South Africa), feminist theology, and variations of Asian and African liberation theologies. In the latter sense, it would be even more accurate to speak of theologies of liberation in the plural. Among different liberation theologians, this understanding of liberation theology as plural, heterogeneous, and global (with multifaceted local expressions) is common. There are also non-Christian theologies of liberation, even if the term sometimes is not fully accurate in all contexts. However, there has also been dialogue

between Christian and Jewish, Muslim, and Hindu theologians of liberation. This article will concentrate on Christian liberation theologies in the broader, global meaning.

It is often wrongly assumed that liberation theology first appeared in Latin America and then spread to other continents and contexts. Some classical works on black theology (for example, James Cone's *A Black Theology of Liberation*, 1970) and feminist liberation theology (Rosemary Ruether's *Liberation Theology*, 1972) were published at about the same time as the first major works of Latin American liberation theology, such as Gustavo Gutiérrez's *Teología de la liberación* (1972). It is more accurate to say that the term *liberation theology* arose simultaneously in different contexts. The different theologies within the liberation theology movement have had some dialogue with each other, most importantly in the context of the Ecumenical Association of Third World Theologians (EATWOT), founded in 1976. Counted among "Third World theologies" are liberation theologies inside the First World, especially the United States. Liberation theologians have learned from each other through critical dialogue: for example, the critique of the meagerness of the analysis of racism and sexism and the emphasis on economic and class issues at the cost of cultural elements in Latin American liberation theology; or for a feminist theology from industrialized countries that has been slow to admit that white, educated, and affluent women are a small minority.

Each liberation theology, whether black, feminist, or Latin American, is characterized by its distinctive viewpoint, but what they all share is a commitment to social justice. To some extent, all liberation theologies are situated in contemporary political struggles and movements (such as different human rights movements against Latin American dictatorships, the U.S. civil rights movement, and feminist movements in different countries and regions). Liberation theologians usually refer to this as praxis, not only as their aim or objective, but also as their point of departure.

Liberation theology stems from the conviction that giving priority to the poor and the oppressed in theology and in the church, and the concrete defense of their rights in different societies, is a central, if not the most central, element of the Christian faith. Christian liberation theologies aim their critical analysis not only at society but at the church and theology as well in order to judge to what extent they are accomplices in maintaining structures of domination.

Liberation theologies understand theology as critical reflection on the presence of the divine within different liberation struggles. This reflection is accomplished with the help of both sacred scriptures and tenets of the faith tradition, as well as other disciplines, in order to understand the root causes (and ways of eradication) of phenomena such as poverty and racism.

The concept *contextual theology* has been used interchangeably with liberation theology. It has been claimed that because all human activity, including the study of theology, is born in a particular context, all human activity is contextual. However, contextual theology has been used mainly to designate the changing character of Christianity as it took root outside the Western

world. In this sense, contextual theology would be a wider term than liberation theology, Latin American liberation theology, for example, being just one form of contextualized theology from a particular colonized and Christianized part of the world. In the sense that the term contextual theology refers to a local political, social, and religious context—for example, Ghana or the Philippines—it is a narrower term than liberation theology, which stresses a global struggle against different systems of domination.

No single article can do justice to the contemporary richness of different liberation theologies, such as Dalit theology (India), gay and lesbian liberation theologies, *minjung* theology (Korea), indigenous peoples' theologies and spiritualities of liberation all over the globe, and the Palestinian theology of liberation, among others. In the remainder of this essay, to the discussion will be limited to Latin American liberation theology, black theology, and feminist theology.

Latin American Liberation Theology

The Catholic Church was, for centuries, one of the pillars of Spanish power in Latin America, which was Christianized more than five hundred years ago, unlike other areas later colonized by European countries. The circumstances that made liberation theology possible have deep historical roots; however, there are some more immediate causes, both secular and ecclesial.

The generally conflictive atmosphere, and the rise of authoritarian military dictatorships all over Latin America in the 1960s and 1970s, created the conditions in which the Roman Catholic Church had to take a political stance regarding growing violations of human rights, deepening poverty, and organized, armed guerrilla struggle, culminating in some cases in a successful popular revolution (Cuba in 1959 and Nicaragua in 1979). An influential idea behind early liberation theology was the dependency theory, according to which the main reason for the poverty and underdevelopment of the Third World was its dependency on industrialized countries, which were largely developed through the use of, and profit from, dependent regions. Theologically, liberation theology was a radicalization and contextualization of the influence from European political theology and, certainly, in a tradition as long as Christianity itself, of prophetic denunciation of injustice and oppression and declaration of freedom and liberation to those suffering from them.

The Second Vatican Council (1962–1965) of the Roman Catholic Church established a global opening of the church to society and had an extremely important influence especially on Catholic churches in North America and Latin America. Ecumenically, the World Council of Churches took steps that encouraged Protestant churches to commit themselves to issues of social justice, especially the eradication of poverty. In Latin America, the Latin American Catholic Bishops' Conference (CELAM, *Consejo Episcopal Latinoamericano*) met in Medellín, Colombia, in 1968, a meeting often interpreted as a critical point in the departure of the Catholic Church (as an institution) from its five-hundred-year-old relationship to the state. The church formally made “a preferential option for the poor” and aspired to become “a church of the poor.” Some of the first important Catholic liberation theologians were Gustavo Gutiérrez, Leonardo Boff, Juan Luis Segundo, Hugo

Assmann, Jon Sobrino, and Pablo Richard; on the Protestant side were theologians such as Rubem Alves, José Míguez Bonino, and Elsa Tamez.

At the grassroots level, priests, pastors, nuns, and laypeople started to work with the rural and urban poor, forming ecclesial base communities, or *comunidades eclesiales de base* (CEBs), in which people learned to interpret their everyday realities in the light of their Christian identity and faith. In some countries, such as Nicaragua and Brazil, the local CEBs played an important sociopolitical role.

According to Gutiérrez, liberation theology is “a critical reflection on praxis in the light of the Word of God.” While there is a clear Marxist influence in liberation theologians' use of the concept of praxis, the Vatican's claim that liberation theology is camouflaged Marxism is exaggerated. Liberation theologians interpreted both Christianity and the Latin American situation from a new perspective, that of the colonized “Christian South,” in which the majority of people lived in widespread poverty under extremely repressive governments. The method of liberation theology—to give primacy to praxis over theological speculations—has influenced nearly all contemporary theology.

In the 1990s, the influence of both liberation theology and the CEBs has diminished, partly due to the growing presence of Pentecostalism and the rise in Protestant churches in Latin America. Also, the Catholic Church has become much more conservative during the papacy of John Paul II, leaving very few liberation-theological bishops, such as Helder Camara of Brazil and Oscar Romero of El Salvador in the 1970s and 1980s, in the Latin American Catholic Church. At the same time, ever-deepening poverty and the globalization of market economies, issues of sexism and racism, and ecological concerns raise both old and new questions for liberation theologians. An analysis of idolatry as well as of the common roots of Western theology and economy (for example, the sacrificial elements in both) has led to some of the new developments that have deepened the original insights of liberation theology. Capitalism as religion and the “necessary” production of victims as a basically theological belief have been theorized by Franz Hinkelammert and Hugo Assmann. Christianity should always side with the victims and defend their lives, which is why liberation theology is also called the theology of life, *teología de la vida*, reflecting on the meaning of the God of life, *el Dios de la vida*.

Liberation theology today might best be seen as forming part of the so-called globalization critique, which, along with theories and practices of alternative globalization, tend to bring together actors and theories from both the First and Third Worlds in order to create alternatives to contemporary economic policies. A lack of democratic control of economic policies, poverty, ecological disasters, the concentrated control of natural resources, and the concomitant issues of sexism and racism, remain as issues.

Black Theology

Black theology in the United States arose out of the civil rights and black power movements of the 1950s and 1960s.

However, its historical roots go back to the beginning of African slavery in the United States and the founding of black independent Baptist and Methodist churches in the late eighteenth and early nineteenth centuries. Important contributors to this literature are James H. Cone, J. Deotis Roberts, and Gayraud S. Wilmore. "In a racist society, God is not color blind," says James Cone. Also, if all humans were created in the image of God, it must not only mean that black people are created in God's image, as are whites, but also that "God is black." In a related sense, "blackness" is a category in black theology similar to that of "poverty" in Latin American liberation theology. To be black, or poor, is to be conscious both of one's oppression and of one's authentic humanity.

As in other liberation theologies, black women's voices, and their critique, have been central for the later development of black theology. In the United States, African-American feminist theologians prefer to call their work *womanist theology*, after a term borrowed from the African-American writer Alice Walker. Important Christian womanist theologians are Delores Williams, Jacquelyn Grant, and Katie G. Cannon. Most U.S. black and womanist theologians are Protestant. In a racist and sexist society, black women cannot prefer one identity at the cost of the other: they are marginalized both as women and as a racial minority.

As in the United States, the struggle against institutionalized racism, often legitimized by religious beliefs, has been the source of black theology in Africa, especially South Africa. Reformed Christianity in South Africa has been one of the ideological pillars of apartheid, the repressive political system of that country for decades, which is why black theology in the South African context has been different from that in the United States. Important black South African theologians such as Desmond Tutu, Allan Boesak, and Manas Buthelezi have often also been leaders in the churches and in movements against apartheid. A black theology of liberation, *la teología negra de la liberación*, including a feminist version, is also being developed in the Latin American and Caribbean context.

Feminist Theologies

By virtue of its large and varied racial and ethnic minorities, the United States has produced the largest variety of feminist theologies. At the same time, theologies from the United States are not only not applicable in other parts of the world but also often reflect the specific historical and cultural circumstances of that country. Thus, Latina feminist theology (exemplified by María Pilar Aquino from the Catholic tradition and Daisy Machado from the Protestant), womanist theology, *mujerista* theology (including Latina female theologians such as Ada María Isasi-Díaz and Yolanda Tarango), Native American, and Asian-American feminist theologies (for example, Kwok Pui-lan and Chung Hyun Kyung), have been influenced by feminist thinking from other contexts and countries, but also reflect the situation of women from ethnic and racial minorities in the United States. It is sometimes difficult to draw a clear line between Latin American and U.S. Latino or Asian and Asian-American theological production because individual theologians often have spent parts of their lives in both their countries of origin and in the United States.

Some important white North American feminist theologians who have done groundbreaking work are Elizabeth Schüssler Fiorenza and Rosemary Radford Ruether (Catholic), Mary Daly (post-Christian), Judith Plaskow (Jewish), and Letty M. Russell (Protestant). Schüssler Fiorenza and Ruether also explicitly define themselves as liberation theologians.

In Europe, scholars such as Catharina J. M. Halkes, Elisabeth Moltmann-Wendel, and Mary Grey identify themselves as feminist liberation theologians. The European Society for Women in Theological Research has been an important forum for the development of European feminist theologies. Both in Europe and the United States, there are also feminist theologians (after *thea*, Greek for "goddess") who depart from the Judeo-Christian tradition by reclaiming different goddess traditions. Many feminist theologians in different parts of the world include eco-feminist and ecological concerns in their work.

All feminist theologies share the importance of the analysis of sexism in different religious traditions, women's exclusion from both theology and positions of power in religious institutions, and the often explicitly religious legitimization of the subordination of women. Many burning ethical issues, such as abortion and violence against women, cannot be adequately assessed without a critical feminist theological analysis of the religious underpinnings of ethical thinking; and dialogue with feminist theories from other fields is also important.

LIBERTY. Liberty is an integral concept in Western political and social thought. Liberty as an inalienable social and political attribute of individuals emerged in the formation of the modern political discourse in the West. Since Georg Wilhelm Friedrich Hegel (1770–1831) the concept has often been categorized in a threefold manner: moral liberties (freedom of moral choice, such as freedom of conscience), civil liberties (freedom of individuals as constituting members of a civil society, such as freedom of speech) and political liberties (freedom of individuals in relation to the state, such as freedom of political association), all being attributes of individuals. Pre-modern Europe, by contrast, did not necessarily attribute liberties to individuals but to social relations and communities. Non-Western worlds did not produce an idea equivalent to liberty in their own intellectual traditions. Around the nineteenth century, however, they assimilated the Occidental idea of liberty primarily as a concept denoting the independence of the nation state rather than the liberties of individual human beings. In what follows we shall survey Western conceptions of liberty chronologically, and discuss the Islamic, Indian, Chinese, and Japanese variations of it.

Ancient Conceptions

Liberty or freedom (*eleutheria*) in ancient Greece denoted the status of the free man and woman as opposed to that of the slave. The division between free persons and slaves was deemed to be a social and natural institution. Free status was identified by a set of various rights and privileges. Hence, liberty was exclusive and could not be shared by every individual. Indeed, one of the rights of free individuals was to own other individuals as slaves. Similarly, the political freedom of a community also denoted the subjugation of other communities under its control. The preservation of an individual's liberty was not considered to be inconsistent with the deprivation of another's, and this was also the case with a political community. In addition, the Greek (especially Athenian) concept of liberty entailed equality of political rights and freedom of male political participation in the public sphere.

In his philosophical framework, Plato (c. 428–348 or 347 B.C.E.) left little room for liberty or freedom. Liberty was not a constituent element of human dignity, and freedom of thought was nothing other than the freedom to be incorrect, that is, a greater chance to deviate from the objective truths. Aristotle's (384–322 B.C.E.) definition of liberty resembles the contemporary notion; for him, the general essence of freedom is being one's own person for one's own sake rather than belonging to another. What discriminates the slave from the free man, then, is not that he is restricted in his actions and

subject to coercion but that everything he does is done to serve the interest of someone else. Whether Aristotle enshrined individual freedom in the sense of personal autonomy is a contentious issue. The place of autonomous practical rationality in his ethics becomes problematic when set against his claim of the individual's subordination to the state (*polis*). Aristotle's alleged dearth of interest in personal autonomy would be consistent with the reduction of the individual to a mere part of the state, while the recognition of personal autonomy in the Aristotelian ethical system would not.

The Roman idea of liberty (*libertas*) was a civic right acquired under positive law; namely, it was a constituent of the membership of the civic body (citizenship). Roman civil law was applicable to citizens of Rome only; noncitizens were ruled by the law of nations. Roman liberty was by definition a positive right that was guaranteed (but could also be withdrawn) by the law. Law-abiding citizens enjoyed the liberty of a Roman citizen and, before the law, all the citizens were equal. The slave was legally defined as a thing (*res*)—rather than person (*persona*)—and was subject to the mastery of another person.

In the final days of Roman republicanism, Cicero (106–43 B.C.E.) significantly related forms of government with the idea of liberty. He drew on the Polybian discourse on the change of constitutions and characterized each form of polity according to the degree of liberty attributed to it. Cicero's notion of liberty was equality of juridical rights, not equality before the law. He considered that democracy was marked by the excess of liberty granted to the ruled, and he recommended a just equality proportionate to *dignitas* (reputation or merit).

Early Christian ideas of liberty concerned interior disposition, which contrasted sharply with Greek and Roman ideas of liberty. St. Augustine of Hippo's (354–430 C.E.) discourse on freedom revolved around the idea of free will. Just as God is by definition unwilling and incapable of sin, so Adam, before the Fall, knew the distinction between good and evil and had the God-given power to choose the good alone. After the Fall, however, Adam and his descendents were motivated to choose evil. At the heart of Augustine's conception of liberty was the incapability of sin. From this perspective, individuals, who are "free" in the this-worldly sense are no more free than slaves. In terms of sinful humanity, neither "free" persons nor slaves have the right to be free in this world: the liberty of humans can only be achieved eschatologically.

Medieval Conceptions

Medieval Europe, it is often argued, is an insignificant period in the history of liberty. And yet "liberty" (*libertas* or *franchise*) is a word that can be found in a wide range of medieval documents: charters, plea rolls, theological treatises, and polemical writings. Liberty was, in medieval Europe, widely and primarily grasped as territorial immunity from seigneurial justice. The exclusion of public judges from an individual's land was the privilege attached to and exercised in the landlord's territory, and it could only be granted by a higher authority that acknowledged the capacity to act as a holder of a court or to be a judge.

The *libertas* and franchise, however, were privileges, and their recipients were often communities. They were not the rights of individual citizens. Indeed, medieval European society has been described as consisting of tightly bound corporate groups, in which individuals were absorbed, and liberty was often attributed to such groups rather than individuals. Should “liberty” be supposed to be an attribute of individuals, it might appear difficult to narrate a medieval history of liberty. But the “discovery of the individual” is now traced back to the world of intellectuals, higher clergy, and aristocracy in the twelfth century. Accordingly, recent research has denied that liberty as an attribute to individuals was not known in medieval Europe. Liberties as individual rights were also known in terms of personal freedom from, say, arbitrary imprisonment and extortion of money for release. This idea of individual liberties can be found in the record of royal justices and parliaments. Article 39 of the Magna Carta (1215) stipulated that “no free man should be captured and imprisoned or disseized or outlawed or exiled or in any way harmed except by a lawful tribunal of his peers and by the law of the land.” King John (r. 1199–1216) was compelled to concede to the requests of the rebellious barons and accepted that royal legislative and judicial authority was limited not only by the divine and natural law but also by his need to obtain counsel and consent of his subjects. In the fourteenth century, the privilege was not limited to the aristocracy as “free men” but to all: no men of whatever estate or condition he may be was to be captured and imprisoned unlawfully. Historians are divided over the significance of the charters of liberties. While the charters appear to offer new liberties, some scholars argue that they merely acknowledged freedoms that had already been enjoyed de facto by individuals as well as communities.

Similar conceptual change took place in the sphere of political and legal theory. It is well known that Henry de Bracton (d. 1268) noted the concept of liberty in Roman law as “the natural power of every man to do what he pleases, unless forbidden by law or force.” Thomas Aquinas (c. 1224–1274) maintained that by nature all human beings were both free and equal. Aquinas’s concept of liberty denotes the individual’s capacity for free choice, in which one is master of oneself, as opposed to servitude, a markedly Aristotelian conception. The English philosopher William of Ockham (c. 1285–?1347) was perhaps the greatest champion of individual liberty before the Renaissance and the Reformation. His ecclesiastical protest against the heretical doctrine of papal absolutism culminated in his assertion of the liberty of evangelical law, which may be grasped as volitional freedom of moral choice. Also Ockham’s “nominalist” outlook rejected the quintessentially medieval idea of corporation, thus attributing what he called “right and liberties granted by God and nature” to all individual humans rather than any fictitious groups. His discourse on natural rights and individual liberty has long been considered as the “semantic revolution” of the medieval language of rights. His intrinsically destructive anarchism, it was argued, anticipated the collapse of medieval Latin Christendom followed by the Reformation. Recent research, however, has shown that Ockham’s notion of right as the subjective power of an individual’s volition originates in the writings of canon lawyers in the twelfth century, such as Ugucione da Pisa (d. 1210), who

held that human rationality included a capacity for moral discernment.

Modern Conceptions

Niccolò Machiavelli (1469–1527) has often been considered as a theorist of political leadership, a founder of modern political science, or a preacher of amoral power politics. Recent scholarship, however, has increasingly paid attention to his republicanism, describing him as a theorist of political liberty. His *Discorsi sopra la prima deca di Tito Livio* (1535; trans. *Discourses on the First Ten Books of Livy*) discussed why the city of Rome attained supreme greatness, and liberty was considered as a means to such greatness. The work, filled with references to Roman writers such as Livy, Cicero, and Sallust, is interpreted as an assertion of republican liberty. Machiavelli grasped liberty as the counter-concept of slavery, which parallels his contrast between the free way of life and tyranny. According to him, the preservation of liberty is closely related to the maintenance of a particular form of polity because the enslavement of a political community will inevitably jeopardize individual freedom. The liberty of individual citizens can only be secured if the political community is maintained in a state of liberty. In this sense, coercion to a specific type of polity does not obstruct but rather warrants freedom, and coercion and the Machiavellian concept of liberty are not mutually exclusive. This maintenance of a free commonwealth in turn requires the individual citizen’s service to the common good, which can be motivated through the cultivation of civic virtues. This republican idea of liberty was influential among the English Puritan writers in the seventeenth century including James Harrington (1611–1677) and John Milton (1608–1674), and America’s Federalists in the eighteenth century.

Thomas Hobbes (1588–1679) has been regarded as no more a defender of liberty than Machiavelli, and yet his conception of liberty, in sharp contrast to Machiavelli’s, was no less important in the history of the concept. Hobbes’s notion of human freedom was characterized by the absence of external impediments: he discerned when an individual is not hindered to do whatever he has the will, desire, or inclination to do. Hobbes rejected freedom of the will; for him, to say that the will is free is nothing other than to say that a form of internal motion is not constrained from moving by something external, and this was absurd. According to him, liberty “properly called” is what he called “natural liberty,” that is, under the “natural” condition, humans have no legal obligations; they are capable of exercising powers without being physically prevented or compelled. In the Hobbesian world of nature, then, one can maximize the enjoyment of liberty when one is alone: a radical and extreme departure from the ancient conception that is embedded in a political and social context. The “artificial” condition of humans, under which people give up their natural liberties and live under human law is in sharp contrast to the natural condition. Liberty we can enjoy under the artificial condition was called the “liberty of subjects,” which is identified with the absence of legal prescriptions; hence, “artificial” liberties. Unlike Machiavelli, Hobbes dismissed the idea that the preservation of individual liberty requires the maintenance of a particular type of regime. There is no such thing as a “free” commonwealth because all the commonwealths have laws. To enter subjection to civil rule, however, did not require the complete

Liberty Leading the People (1830) by Eugène Delacroix. Oil on canvas. After the Enlightenment, many authors began to focus on the constraints that society often placed on freedom. Prior to this, freedom was viewed more as the purview of communities as a whole rather than that of individual citizens. LOUVRE, PARIS, FRANCE. © THE ART ARCHIVE/DAGLI ORTI

renunciation of natural liberty; indeed, natural liberties, for instance, to preserve oneself, were inalienable natural rights.

It has been argued that liberty as a universal God-given attribute rather than a privilege determined by political and social institutions is a distinctively “modern” notion. Indeed, the ancient concept of liberty was inconceivable apart from the political and social context, while the modern one was free from such contexts and was rather linked to metaphysical views about the nature of humans. In such modern views, liberty is prior to any political or social arrangements. However, recent research has traced its origin back into medieval Scholastic discourse; hence, the distinction between “modern” and “premodern” concepts of liberty is increasingly blurred and contentious. Seen in this light, Sir Robert Filmer’s (d. 1653) attack on the “modern” idea of natural liberty by asserting the naturalness of subjection to an absolute monarch was a radical break with the long-established tradition. Filmer derived his vision of patriarchal monarchy from Adam’s unlimited dominion over his spouse

and offspring. The traditional theory of natural liberty, for Filmer, identifies liberty with license and would allow the members of society to withdraw their obedience as it pleased them, thereby making social order unstable. John Locke (1632–1704) defended the older idea of natural liberty against Filmer’s criticism by demonstrating the rationality of liberty. Liberty was the will or power to do or not to do what was willed and it gains a moral dimension when it is exercised through identifying the will with the dictates of the reason or intellect that discovers objective good in the natural law. According to Locke, law and freedom are not mutually exclusive; unlike Hobbes, following the law constitutes the fulfillment of liberty. Locke thus restored the nexus between liberty and moral order that was severed by Hobbes. In contrast to Hobbes and Filmer, moreover, Locke attributed to the state the function of assuring the protection of its citizen’s “property” including civil and religious liberty.

In criticizing the malaise of inequality in the despotism of the *ancien régime*, Jean-Jacques Rousseau (1712–1778) was

perhaps the most eloquent proponent of the idea of liberty in modern Europe. Rousseau considered that human beings enjoyed freedom in the “natural” state where social and political customs and institutions were nonexistent. The emergence and development of society, however, created moral and political inequality and undermined human beings’ “natural” virtue, freedom and equality, which, in his view, culminated in the France of his day. Rousseau thus reclaimed human freedom by asserting popular sovereignty. In participating in the making of the law, men would obey themselves through obeying the law. The kernel of Rousseau’s idea of liberty was thus self-mastery, namely every individual’s unlimited sovereignty. This conception of liberty transformed the function of the state. In contrast to Locke, who separated religion and morality from politics, Rousseau held that the state might become the constitutive element of the intellectual and moral development of man. This doctrine of liberty influenced Immanuel Kant’s (1724–1804) idea of freedom. In their passionate celebration of liberty commentators like Benjamin Constant (1845–1902) discerned the potential danger of legitimating totalitarian tyranny or charismatic dictatorship exemplified by the experience of Jacobinism.

Before the Enlightenment the idea of liberty revolved around its relationship to the moral order on the one hand and the relationship between state and individuals or society on the other. After the time of the revolutions at the turn of eighteenth and nineteenth centuries, however, a new perspective was introduced in the discourse on liberty. The pre-Enlightenment perspective overlooked the fact that individual freedom could be constrained and even undermined by power of society, as opposed to the external constraints represented by the state. This problem, which Jeremy Bentham (1748–1832) first highlighted in his defense of homosexuality and Alexis de Tocqueville (1805–1859) discussed in his *Democracy in America* (1835, 1840), was the main subject of John Stuart Mill’s (1806–1873) incisive and extensive criticism in *On Liberty* (1859). Mill’s work was primarily written in protest against the coercive force of moralism that pervaded Victorian society. What Mill called the “tyranny of the majority” captured and criticized the coercive reality of public opinion that was intolerant of any dissidence, eccentricity, and difference. Hence, he limited the authority of society over individuals from his utilitarian perspective; interference with other individual’s activities is permitted only if they are likely to cause definite harm to some other persons, thereby violating their social rights. The flip side of this idea was the assertion of the freedom of thought. “If all mankind minus one, were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind.” This defense of freedom of thought and speech was rooted in his emphasis on individuality and self-development, which formed an antithesis to the Protestant ethic of self-restraint. Mill’s criticism of the “tyrannical” force of social custom also crystallized in his assertion that the women should be liberated from the “subjection” to the men.

Contemporary Conceptions

Modern liberalism regarded liberty as a property of each individual, thereby conceptualizing it as free from politics. Hannah

Arendt (1906–1975) criticized this “anti-political” conception of liberty and preached a return to the ancient political notion. For Arendt, freedom was something “disclosed” in the collective action of individuals toward a shared goal; freedom and the act of exercising power are synonymous, not mutually exclusive. Arendt’s celebration of political practice in the polis of ancient Greece resulted in an assertion of republican freedom.

Although Arendt’s conception increasingly received serious attention, what has determined the paradigm of the discourse on liberty since the middle of the twentieth century was Isaiah Berlin’s (1909–1997) 1958 lecture “Two Concepts of Liberty,” which was later published in *Four Essays on Liberty* (1969). Its basic framework is easy to draw: Berlin distinguished between positive and negative liberty. Positive liberty denotes rational self-determination or autonomy, while negative liberty denotes the absence of constraints imposed by others. Despite its simplicity, however, Berlin’s conceptualization was controversial and required further clarification. In 1969 he reformulated the concept by introducing two questions. Negative freedom can be determined by answering the question: “How much am I governed?” By contrast, the positive concept can be determined by the answer to the question: “By whom am I governed?” Thus Berlin offered a revised definition of negative liberty: “not simply the absence of frustration (which may be obtained by killing desires), but the absence of obstacles to possible choices and activities.” Berlin’s negative freedom concerns “opportunity for action rather than action itself,” which was labeled later by Charles Taylor (b. 1931) as an “opportunity-concept.”

Berlin acknowledged positive freedom as “a valid, universal goal,” and yet his goal was to suggest the potential danger that positive liberty could readily be turned into the principle that legitimizes oppression, thereby demonstrating why negative liberty was preferable. Positive freedom as self-mastery, according to him, generates a metaphysical fission of the self into a “higher,” “real,” or “ideal” self and a “lower,” “empirical,” or “psychological” self. When the “higher” self is identified with institutions, churches, nations, races, and so forth, the doctrine of positive freedom turns into a doctrine of authority, or at times, of oppression. Berlin’s discourse forms an intriguing parallel to Benjamin Constant’s dual concept of liberty. Constant made a distinction between ancient and modern notions of freedom. He argued that liberty for the ancients was the freedom to participate collectively in the exercise of sovereignty, while liberty for the moderns was the freedom from interference by the community. Constant criticized Rousseau’s unlimited notion of sovereignty—he read Rousseau’s texts as supporting despotism. The resemblance between Constant’s criticism of modern liberty and Berlin’s caution about “positive” freedom is striking, and yet they differed significantly. Constant grasped modern liberty as the inalienable right of individuals, while Berlin’s positive freedom is “choice among alternatives or options that is unimpeded by others” (John Gray). Constant’s modern freedom and despotism are mutually exclusive, while Berlin’s freedom and despotism can coexist.

Berlin’s negative liberty was underpinned by his commitment to pluralism. For Berlin, the absence of constraint covers

a diverse and conflicting range of values from good to evil. Berlin never tried to reconcile colliding and incommensurable values and rejected any principle that claims to resolve the conflicts. This position forms an intriguing contrast with that of Joseph Raz, who defended negative freedom, by anchoring the moral basis of freedom in autonomy. For Raz, the value of free choice-making is determined by its contribution to the positive freedom of autonomy, which is the intrinsic value. Berlin refuses to give negative freedom such an instrumental status; namely, he celebrates negative freedom as the intrinsic value.

The criticism against the negative concept of liberty highlights the notion's indifference to opportunities or choices. Charles Taylor argues that freedom is important to us because we are purposive beings; hence, we discriminate external obstacles (and, therefore, opportunities available to us as the result of the absence of the external obstacles) according to their significance. The restrictions of religious practice, for instance, may be deemed a serious obstacle and hence a significant threat to liberty, while more traffic lights may not be perceived as serious blow to our freedom. Furthermore, obstacles are not necessarily external; we may be fettered by feelings such as shame or fear or by two conflicting desires (for instance the choice between career and marriage), and we have to discriminate between our motives. Actions arising out of irrational fear or spite cannot be said to be free. Thus Taylor suggests that the negative notion as an "opportunity-concept" is seriously flawed, and abandons one of the important elements of liberalism, that is "self-realization."

Berlin's negative concept of liberty did not only attract criticisms but also found a loyal heir in John Rawls; he understood liberty as freedom from interference. Rawls did not offer an explicit general definition of liberty, but his attribution of the exalted status of liberty, which constituted one of the two principles of justice, is noteworthy. According to the first principle, "Each person is to have an equal right to most extensive scheme of equal basic liberties compatible with a similar system of liberty for others." Rawls was very specific about "basic liberties," which included "political liberty (the right to vote and to be eligible for public office) together with freedom of speech and assembly, liberty of conscience and freedom of thought, freedom of the person along with the right to hold (personal) property, and freedom from arbitrary arrest and seizure as defined by the rule of law." The priority of these liberties does not allow any of them to be sacrificed except for the sake of liberty.

In addition to the arguments surrounding Berlin's thesis, a "third" concept of liberty has emerged. Intellectual historians, including J. G. A. Pocock and Quentin Skinner, have explored the republican (or "neo-Roman") concept of liberty in early modern republican discourses, and the political philosopher Philip Pettit has theorized republicanism with a focus on the new notion of liberty as nondomination. Hannah Arendt's republican ideals were inspired by political practice in ancient Greece and the American Revolution, while this "third" concept of liberty does not originate in Arendt's vision but rather derives from sixteenth-century Italian humanism and seventeenth-century English republicanism.

Domination, according to Pettit, is exemplified by the relationship of master to slave or master to servant. The "third" concept of liberty proposed by Pettit is neither "non-interference" nor "self-mastery" but "non-domination" that requires that no one has the capacity to interfere on an arbitrary basis in the choices of the free person. Liberty as nondomination differs from the positive notion in that the former emphasizes avoiding interference rather than achieving participation. Yet, republican liberty also differs from the negative concept. Domination occurs without actual interference; and republican liberty would repudiate the presence of a master who did not actually interfere, while the negative concept of liberty would not. Republican liberty rejects arbitrary interference, and what is required for non-arbitrariness in the exercise of power is not consent to the power, as is often claimed by the contractarian theorists, but "the permanent possibility of effectively contesting it." Institutionalized contestability, Pettit argues, would promote "the absence of uncertainty, the absence of a need to defer strategically to the powerful, and the absence of a social subordination to others."

Quentin Skinner participates in the debate from an entirely different angle: he has revised the history of the concept, thereby offering a third concept of liberty that contemporary political philosophers have overlooked. Skinner's case studies of the history of the concept of republican liberty range from Machiavelli to seventeenth-century republican writers including John Milton. Skinner's notion of neo-Roman liberty underlines that it opposes dependence or slavery rather than coercion, on the one hand, and that it requires a specific institutional arrangement, namely the "free state," on the other. The former point represents an antithesis to the Rawlsian narrower notion of liberty as natural rights, and coercion as the antonym of liberty, while, as for the latter, Skinner departed from Berlin who asserted that liberty is independent of the forms of polity.

In the early 1990s Francis Fukuyama proclaimed the "end of history," in a work by the same title, marked by the victory of liberal democracy and market capitalism. Although the number of "liberal democracies" is steadily increasing worldwide, one can hardly say that the notion of liberty is universally shared. Indeed, the civilizations outside the Occidental world did not embrace liberty as a social and political concept until the encounter with Western ideas, especially in the middle of the nineteenth century. The reception of these ideas was, largely speaking, lukewarm at best and, more often, hostile. In addition, those who favored the Western idea confronted the following two problems: one was doctrinal—how to relate a foreign idea to their own intellectual traditions—and the other was semantic—how to translate the word "liberty" into their own language.

Islamic World

The Arabic word for liberty or freedom is *hurriyya*, stemming from *hurr*, meaning "free." "Free" as a legal term signified the opposite of "slave," while it denoted, as an ethical term, "noble" character and behavior. The legal concept of freedom, which was already known to the pre-Islamic world, continued to be used in Muslim jurisprudence. *Hurriyya* occupied an important

place also in metaphysics: one of the significant repercussions of Sufism on political thought was the retreat from politics. The Sufist doctrine of renunciation maintained that poverty, self-humiliation and complete surrender of personality was the highest value of life, which underpinned the apolitical character of the doctrine. Accordingly, a Sufi mystic philosopher, Ibn al-Arabi (1165–1240), defined *hurriyya* as “slavery to God,” namely freedom from everything but God. Personal freedom was valued within the religious, moral, and customary sphere determined by the *umma* (Islamic community of believers), yet it was never considered to be an absolute moral value. Thus *hurriyya* never enjoyed exalted status as a fundamental political value.

It was Ottoman Turkey in the eighteenth century that introduced the Western ideas of liberty to Islam. The treaty of Küçük Kaynarch in 1774 between Russia and Turkey established the free and independent status of the Crimean Tatars from the two countries. The Turkish term first used for liberty, however, was not *hürriyet*, derived from the Arabic *hurriyya*, but *serbestiyet*. *Serbest* is a Persian word, meaning “exempt,” “untrammelled,” and “unrestricted”; accordingly, *serbestiyet* denotes the absence of limitations or restrictions. This negative concept of liberty does not convey such meanings as citizenship or participation to government. The use of *serbestiyet* in a political context dates from the early fourteenth century and was a commonplace in political discourse by the late eighteenth century. Celebrated Ottoman ambassadors, such as Azmi Efendi and Morali Esseyid Ali Efendi, used *serbestiyet* in terms of political liberty in their memoranda.

Hurriyya entered the Islamic political lexicon in 1798 when Napoléon Bonaparte arrived in Egypt and addressed the Egyptians in Arabic on behalf of the French Republic “founded on the basis of freedom and equality,” and the term *hurriyya* was chosen for the translation of “freedom.” Again, the Ottomans made a significant contribution to the widespread political use of the term. Sadik Rifat Pasa (1807–1856) was one such writer. He observed that European prosperity derived from political conditions such as security of life and property and freedom. Rifat’s *Concerning the Condition of Europe*, which was written during his sojourn in Vienna, represents the early Ottoman reception of the Western idea of political liberty. But his understanding of liberty was limited to the security of subjects from arbitrary coercion by the government, not the right to participate in it. Rifat also introduced the new language of rights into his largely traditional framework of Islamic political thought.

The Ottoman assimilation of the concept of political liberty was accelerated by the rise of a new Turkish literary movement led by the Young Ottomans including Ibrahim Sinasi (1826–1871), Ziya Pasa (1825–1880), and Namik Kemal (1840–1888). Their popular weekly journal *Hürriyet* was launched in 1868. Perhaps Namik Kemal is the most systematic of these thinkers; he was the first to correlate the ideas of human right and parliamentary government so as to achieve a new vision of freedom and self-government. Heavily influenced by the writings of Montesquieu and Rousseau as well as the practice of the French Third Republic and the British

parliamentary system, Kemal attempted to marry the language of modern liberal-parliamentary democracy to Islamic political language. For the first time in the history of Islamic political thought, popular sovereignty was based on the liberty of the individual. However, the tyranny of Abdülhamid II (1842–1918) stifled the Ottoman pursuit of liberty.

Egypt under British rule assimilated liberal political thought quite independent of the Turkish experience. Ahmad Lutfi al-Sayyid (1872–1963) was probably the most systematic exponent of Islamic liberalism. Under the influence of Mill, Lutfi al-Sayyid squarely situated freedom at the center of this thought. For him, freedom meant absence of unnecessary control by the state: a negative concept of liberty. Freedom was “the necessary food for our life,” the human’s inalienable natural right: it was a necessary condition for humans to be human in the fullest sense. Hence, Lutfi al-Sayyid celebrated limited government: political and legal arrangements and institutions that safeguard liberty were the “natural” and “true” form of government. An opponent of pan-Islamism and Arab nationalism, Lutfi al-Sayyid was also concerned with the freedom of the nation. He argued for the liberation of Egypt from foreign rule. In this context, liberty and independence were considered almost synonymous.

India

Liberty in the sense of spiritual liberation from the cycle of birth and death was a key idea in Indian thought. The liberty of the individual in civil or political society was foreign to classical Indian political thought. The equivalent to the idea of civil rights can be found in the ancient literature of Smritis, but it differed significantly from the Western idea in that the former was considered to belong exclusively to the upper classes (especially the order of the Brahmanas).

The idea of liberty came to the fore of Indian political thinking with the encounter with the modern West, epitomized by the intellectual contributions of Mahatma Gandhi (1869–1948) and Manabendra Nath Roy (1887–1954). Gandhi’s idea of liberty was framed in the idea of *swaraj*, a multifaceted concept of the utmost importance in his thought. *Swaraj*, literally meaning “self-rule,” was also used by Gandhi to signify national independence and the political, economic and spiritual freedom of the individual. As was the case with the “modern” Islam, national independence was closely related to the idea of liberty, meaning collective freedom from alien rule. Gandhi, however, did not conceptualize it negatively. National independence, framed in the idea of *swaraj*, was not merely freedom from foreign rule but also self-government. Gandhi’s commitment to political freedom turned him into a defender of rights, and yet he refused to base the peace and security of collective life on rights. He always placed individual duty (dharma) and social and moral interdependence above rights because, for him, rights were the consequence of the fulfillment of duties. Gandhi considered his celebrated *satyagraha* (passive resistance) as the performance of his duties and hence also as a method of securing rights by personal suffering. Gandhi’s conception of liberty also entailed an economic dimension: it denoted freedom from poverty. He attacked the contemporary reality of poverty by practicing voluntary

poverty in order to demonstrate solidarity with the poor, while he criticized technology-oriented industrialization for its imperialistic exploitation of the masses. Although Gandhi located liberty in a political and economic context, his notion of liberty was also spiritual: self-rule through the practice of virtues toward self-realization. Gandhi's novelty lies in the fact that to the notion of spiritual freedom, which was derived from the classical Indian tradition, he added political, economic, and social dimensions. This perspective derived from Gandhi's internal dialogue between the Western Utopian thought represented by Henry David Thoreau (1817–1862), John Ruskin (1819–1920), Ralph Waldo Emerson (1803–1882), and Leo Tolstoy (1828–1910) and the classical Indian thought manifested in the Hindu devotional work the *Bhagavad Gita*.

Whereas Gandhi's leadership of the Hindu masses was enormously influential and successful, Manabendra Nath Roy's gained no popular appeal. Roy's political position changed over time from nationalism, then to communism, and finally to radical humanism. His colorful but unsuccessful commitment to the Indian freedom movement, however, was guided consistently by an ardent desire for individual freedom. The intellectual context of Roy's political and literary activity was, unlike that of Gandhi, distinctively Westernized, markedly severed from the Indian traditions. Roy defined freedom as the "progressive disappearance of all restrictions on the unfolding of the potentialities of individuals," and anchored the desire for freedom in biological nature. His conception of liberty was radically negative to the extent that individual freedom and social responsibility were mutually exclusive. Roy considered liberty to be dependent upon the mind of the individual rather than external conditions, and yet his belief in popular sovereignty as an inalienable right determined his preference for people's direct political participation in parliamentary democracy.

China

The Chinese language did not know a word for "liberty" before the nineteenth century. The modern translation of "liberty," *ziyou* (meaning, literally, self-determination), had to be coined in response to the reception of Western ideas. The closest classical term, *ziran* (meaning, literally, "the natural"), denoted a Taoist sense of harmony with nature. This is not to say that the idea of personal freedom was totally foreign to classical Chinese philosophy. Confucian belief in human perfectibility, however, concerned interior spiritual freedom, differing from the Western political and social concept. Likewise, freedom as a right was not conceptualized until the nineteenth century. Kang Youmai (1858–1927) was one of the first Chinese intellectuals who introduced the Protestant idea of free will. His *Complete Book of Substantial Principles and General Laws* (written between 1885 and 1887) described human beings as owners of the "right of autonomy" (*zizhu zhi quan*), thereby adopting the language of rights.

The Chinese encounter with the Western idea of liberty may well be illustrated by the translation of the works of nineteenth-century English intellectuals by Yan Fu (1854–1921). He became widely known for his translation of T. H. Huxley's *Evolution and Ethics*, which introduced evolution theory to the

Chinese intellectual world at the turn of nineteenth and twentieth centuries. Deeply inspired by Herbert Spencer's (1820–1903) concept of social organism, Yan Fu maintained that the individual's pursuit of self-interest would generate a Darwinian struggle for survival that should result in the evolution of a more harmonious society. Yan Fu claimed to have derived from Spencer his own notion of human freedom denoting the release of an individual's "energy." His Spencerian liberalism was a radical departure from the orthodox Confucian ethic that regarded the pursuit of self-interest as the source of evil, while his translations also distorted the original meaning of other writings from the West. One such case is his translation of Mill's *On Liberty*: Yan Fu bent Mill's original conception of liberty to meet his own political purposes. Mill considered liberty of the individual as an end in itself. However, Yan Fu's Spencerian outlook produced a distorted understanding of Mill's concept as a means to the advancement of the people's virtue and intellect, ultimately to achieve the freedom of the state.

One of the powerful promoters of individual liberties (*ziyou*) and rights (*quanli*) in the Late Qing China was Liang Qichao (1873–1929). He absorbed a wide range of Western philosophy and social sciences through Japanese translations, but he endeavored to anchor the ideas of liberty and rights in the Confucian intellectual heritage. It has been debated how the Chinese reception of social and political concepts and discourses from the modern West relates to classical Chinese traditions. For instance, freedom of thought is at the heart of contemporary Western liberal democracy, while "harmony and unity of thought" (*tongyi sixiang*) is celebrated in post-socialist China. This contrasting attitude toward freedom of thought has received scholarly attention in connection with the lingering Confucian tradition.

Japan

In modern Japanese, "liberty" is normally translated *jiyu*. The Japanese first encountered the idea of liberty in Dutch, *vrijheid*, and the translator could not find any proper translation, leaving it untranslated. Indeed, when Western scholarship flooded into the Japanese intellectual scene through the translation of works such as Samuel Smiles's *Self Help* (1859) and Mill's *On Liberty*, "liberty" was commonly recognized as a difficult word to translate. After a variety of translations were attempted, *jiyu* survived as the only term widely used today. Unlike the case in China, *jiyu* had already existed in the Japanese vocabulary before Japan's exposure to the Western idea of liberty; however, the first Japanese translators of "liberty" were not entirely convinced with their choice of the term. Fukuzawa Yukichi (1834–1901) is arguably responsible for the proliferation of the word, and yet he noted that *jiyu* (and any other Japanese word) failed to capture the precise meaning of liberty. According to the contemporary usage, *jiyu* signified "selfishness," "arbitrariness," and "emancipation of human desire"—in a word "license." The moral connotation of *jiyu* was rather negative. Some maintain that the notion of *jiyu* is rooted in the Taoist idea of formless but freely moving spirit, while others see its affinity to the National Learning (*kokugaku*) emphasis on human desire, as the novelist and poet Ihara Saikaku (1642–1693) once wrote: "Humans are the desires with four

limbs.” The first translators’ concern with possible misunderstanding and misconceptions soon became real: although *jiyu* became a buzz word in the 1880s when the Freedom and People’s Rights Movement (*jiyu minken undo*) reached its height, the majority of intellectuals and political leaders who supported the movement grasped *jiyu* in terms of “license.” Consequently liberalism was considered to be a licentious ideology.

The leaders of the Japanese Enlightenment often understood the concept of *jiyu* in connection with the independence of their country as a nation state. The liberty and independence of the state were the focus of debate, whereas civil liberties often escaped the attention of intellectuals. The indifference to civil liberties forms the background to the state’s oppression of free speech and academic enquiry. In 1919, Morito Tatsuo (1888–1984), of the Faculty of Economics in Tokyo Imperial University, published an article on the social thought of the anarchist Pyotr Kropotkin (1842–1921), and the authorities filed charges against him and the editor of the journal that published the paper. Morito was expelled from the university and imprisoned. Minobe Tatsukichi (1873–1948) of the Faculty of Law at Tokyo Imperial University was known for his view that the emperor was an organ of the state. In 1935, his “organ theory,” which had gained wide support in the academic community, suddenly became the object of public condemnation. Minobe was compelled to resign from the Membership of the House of Peers, and his books were banned and burned. These incidents did not merely represent the state’s oppression of intellectual freedom, but also reflected the public’s skepticism toward the mistranslated “liberty.” The widespread confusion of *jiyu* with license had prevented the Japanese from appreciating the value of civil liberties, and heavily discredited liberalism until Japan’s disastrous defeat in 1945.

LIFE. Throughout recorded history human beings have recognized the qualitative difference between the living and non-living worlds, the animate and inanimate. Placing that recognition on solid, rational footing or giving it a quantitative basis has remained a major challenge, however. What exactly makes a living being so different from one that is nonliving? Living organisms carry out oxidation, for example, but so does a candle when it burns; living organisms grow from some sort of seedlike beginning to a larger form, but so does a crystal in a supersaturated solution; some organisms move, but others, like plants, do not; organisms reproduce (that is, make copies of themselves), but so do some molecules in the chemical process known as autocatalysis; viruses, probably the most confusing of all forms of matter in this regard, can enter living

cells, reproduce themselves, break out of the cell, and infect other cells, yet they can also be crystallized and placed on a shelf for decades, only to become reactivated when placed in a solution in contact with host cells. In short, no single criterion or set of behaviors can unequivocally be said to distinguish living from nonliving matter. Yet there is also little doubt in most cases when we encounter a living organism. Life is characterized by a whole set of activities or functions, no one of which is unique but which collectively set living organisms apart from other physical entities.

In the history of Western thought, attempts to define life have been characterized by a series of alternative or dialectically opposed approaches that have reflected changing philosophical, cultural, and economic conditions. These alternative approaches will be described briefly and then applied to various aspects of the characterization of life.

Idealist versus Materialist Conceptions of Life

One of the oldest debates about the nature of life centered on whether living organisms functioned by means of a nonphysical process that lay outside material nature and therefore could not be fully understood by rational investigation or whether they could be understood in terms of everyday natural processes. The view that dominated the ancient and medieval worlds, known philosophically as idealism, claimed that living beings were qualitatively different from nonliving, representing a special set of categories whose “essence” existed only in the mind of the Creator. Associated particularly with the philosophy of Plato (c. 428–348 or 347 B.C.E.), this idealistic perspective claims that rational understanding of the essence of life is philosophically impossible, since by definition the categories of each unique species exist not in the material world but only in the nonmaterial, essentialist categories conceived by the Creator. Idealists did not deny the material reality of living organisms but only claimed that the essence of living organisms could never be understood by human investigation. Most idealists saw life as originating from a special, supernatural process of creation by a nonmaterial being.

The diversity of living organisms observed in the world was always viewed as a product of the creation of separate essences known as species, which were absolute and immutable. The biologist’s role was to try to understand the essence as much as possible by examining individual representatives of the species and determining their common or essential features. Variation among individual members of a species was recognized of course but was viewed as natural deviations from the “essence” in the same way that any given piece of pottery can be viewed as a deviation from the potter’s mold. The Platonic tradition thus became the basis for the Western idealistic view of “life” in the biological sense, informing questions not only about the functionality of organisms but also about their origin.

Idealism continued to form a backdrop to discussions of the nature and origin of species in the eighteenth and nineteenth centuries in the works of the taxonomist Carolus Linnaeus (Carl von Linné; the so-called “father” of taxonomy), the anatomist and paleontologist Georges Cuvier, and others who continued to see species as fixed entities formed by special creation. The

“scientific creation” movement in the United States in the 1970s and 1980s and “intelligent design” arguments in the early twenty-first century are yet more manifestations of idealistic thinking, because they are based on the claim that creation by supernatural (nonmaterial) processes has occurred and is as theoretically valid as theories of descent with modification by material processes, such as gene mutation, selective agents of the environment, and differential fertility. “Intelligent design” is idealistic in that it postulates a supernatural, nonmaterial “designer” to explain the structure, function (adaptation), and diversity of organisms.

A second approach to understanding life, known as materialism, denies that living organisms have any special status in the physical world, maintaining that they are material beings, more complex than other entities in the universe but not immune to rational study. To materialists, all aspects of living organisms can potentially be understood by the same processes—known at present or knowable in the future—that govern all physical systems. Materialists have generally rejected all accounts of the origin of life by supernatural processes or nonmaterial “Creators.” Historically the study of living systems has been characterized by the gradual retreat of idealistic in favor of materialistic approaches to understanding the nature of life.

Mechanistic materialism. A long-standing debate among materialists has concerned whether and to what degree it is possible to treat organisms as simply special, complex kinds of machines or whether they are qualitatively different from machines, due to characteristics such as the ability to self-replicate or repair themselves, control their internal environment by self-regulating feedback loops, and so on. Mechanists argue that the basic principles on which machines function—matter in motion, transformation of energy, chemical reactions—are also at work in living organisms and provide a way of understanding life in accordance with the same laws of physics that govern nonliving systems.

Proponents of mechanistic thinking advocate the idea that complex entities are composed of separate, dissociable parts; that each part has its own characteristics that can only be investigated separately from other parts; that the functioning of the whole organism or machine is a result of the sum of its interacting parts and nothing more; and finally, that changes in the state of a machine or organism are the result of factors impinging on it from the outside (for example, machines and organisms decline in function due to physical wear and tear over time).

With the advent of the scientific revolution in the sixteenth and seventeenth centuries, living organisms came to be seen for the first time as truly mechanical entities functioning physically like machines and chemically like alchemical retorts. The “mechanical philosophy,” as it was called, was a version of mechanistic materialism, describing organisms in terms of levers, pulleys, and chemical combustions. William Harvey (1578–1657) compared the animal heart to a pump, with valves to insure one-way flow; Giovanni Borelli (1608–1679) described flight in birds as the compression of a “wedge” of air between the wings as they moved upward; and René Descartes (1596–1650) described the contraction of muscles as due to a hydraulic flow of “nervous fluid” down the nerves

into the muscle tissue. This view persisted through the Enlightenment, which made the mechanical analogy explicit in its obsession with “automata,” models of birds, insects, and humans that moved by a series of windup gears and levers, drank from dishes of water, flapped their wings, or crowded.

In the nineteenth and twentieth centuries mechanistic views again gained considerable support with the school of Berlin medical materialists, spearheaded by the physicist Hermann von Helmholtz (1821–1894). In a famous manifesto of 1847, Helmholtz and his colleagues Ernst Brücke and Emil Du Bois-Reymond stated emphatically that living organisms have no special “vital force,” and thus research on organisms should be based only on the known laws of physics and chemistry. Life was, to the medical materialists, a manifestation of matter in motion. Their successor in the next generation, the German-born physiologist Jacques Loeb, after moving to the United States published a new version of the materialists’ manifesto as the widely read book *The Mechanistic Conception of Life* (1912). With a blatant mechanistic, materialist bias, Loeb declared that organisms moving unconsciously toward a light source were “photochemical machines enslaved to the light” and that life could ultimately be explained in terms of the physical chemistry of colloidal compounds. Though somewhat extreme, such claims emphasized that the biologist needed to probe “life” with the tools of physics and chemistry, not abstract or metaphysical conceptions.

Holistic materialism. Opposed to the mechanistic view is a philosophy known as holism. While some forms of holism, especially in the early twentieth century, had a mystical, idealistic quality about them (associated in particular with Ludwig von Bertalanffy [1901–1971] and Jakob von Uexküll [1864–1944] in Germany and Pierre Teilhard de Chardin in France), holistic views within a materialist framework have become more and more common since the 1960s. The holistic materialist view maintains that while organisms (or any complex systems, for that matter) are indeed only material entities, they acquire special properties by virtue of their multiple levels of organization (from the atomic and molecular to the organismic and population) and through the interactions of their parts.

What is missing from the mechanistic view, to holistic thinkers, is the description of each component of a system in terms not only of its isolated properties but also of its interactions with others. The characteristics derived from such interactions are known as “emergent properties” and function at a higher level of organization (including the parts and their interactions) than the individual parts alone. A cell can carry out certain functions in isolation (in a culture dish), but the many different functions it carries out as part of a tissue (a group of like cells) represent a higher level of organization. Individual nerve cells, for example, can depolarize when stimulated and release neurotransmitters at their terminal ends, thus acting like neurons; but when integrated into a nerve network, they function to stimulate a whole set of other neurons that can lead to complex outcomes, such as coordinated muscle contraction or thought, which would be emergent properties of the complex, integrated system. Holistic materialists do not admit supernatural or metaphysical explanations, only the

insistence that complex systems are more than the sum of their individual parts.

Dialectical materialism. A particular version of holistic materialism known as dialectical materialism emerged in the later nineteenth century in the work of Karl Marx (1818–1883) and Friedrich Engels (1820–1895) and was further developed in the twentieth century by Karl Kautsky (1854–1938) and Gyorgy Plekhanov (1856–1918) in the Soviet Union and J. B. S. Haldane (1892–1964) and others in Britain and subsequently by Richard Lewontin and Richard Levins (*The Dialectical Biologist*; 1985) in the United States. Dialectical materialists maintain not only that the whole is greater than the sum of its parts and that complex systems have various levels of organization, each with its own emergent properties, but also that such systems are always in flux, changing dynamically due to the interaction of opposing forces within them. Thus organisms move developmentally through their life cycle in a constant struggle between the opposing forces of anabolism (building up of molecules, tissues) and catabolism (the breaking down of molecules and tissues). Ultimately the forces of catabolism win out, and death follows. Similarly evolution can be seen as change in a species over time due to the interaction of the opposing forces of heredity (faithful replication) and variation (unfaithful replication). Constant temperature in homoeothermic organisms is maintained by the interaction of heat-generating and heat-dissipating processes. A dialectical materialist view of life particularly emphasizes the dynamic, ever-changing nature of living systems.

Holistic approaches to “life”—dialectical or otherwise—have become increasingly prominent in certain areas of the life sciences since the 1980s, for example, in physiology (especially the study of homeostatic feedback systems), in neurobiology (brain and behavior in particular), and in population biology and ecosystems work, where any useful understanding of the system must take into account numerous variables and their interactions. The advent of the computer in the study of such systems has aided greatly in providing ways of handling the immense amount of data that such investigations must utilize. Growing out of this revived holistic movement is an increasingly prominent field known as “systems science” or in some quarters as “the study of complexity.”

Methodological Debates about the Study of Life

A corollary of the philosophical contrast between mechanistic and holistic materialist conceptions of life is the distinction between reductionist and integrative methodologies. Reductionism, closely allied to mechanistic materialism, is the view that the proper way to study organisms is to take them apart and examine and characterize their individual components in isolation under strictly controlled external conditions. For example, to study the way in which the heart functions, a reductionist would remove the organ from the body and place it in a chamber where temperature, pH, and concentration of other ions could be held constant. Integrative biologists argue that the reductionist approach is a necessary if insufficient approach to understanding complex systems. The heart in the intact animal, they point out, is connected to nerves, blood vessels, and other organs and thus is subject to neural and

hormonal influences that cannot be understood from investigation of the heart in an isolated chamber. According to proponents of holism, it is necessary to devise methods for studying component parts in the living state, in the context of the whole organism of which they are a part (*in vivo*), as opposed to studying them only as isolated entities (*in vitro*).

A component of the methodological debate between reductionism and holism is the debate between the strictly observational and the experimental approach to living systems. Proponents of strictly observational studies, such as the Austrian animal behaviorist Konrad Lorenz (1903–1989) from the 1930s to the 1960s, argue that living systems must be studied in their natural context and that when experimenters bring organisms into the laboratory under highly artificial (controlled) conditions, they create an environment so foreign to the organisms that the information obtained is an artifact and of limited use. In contrast, proponents of experimentation, such as the behaviorist Daniel Lehrman, point out that restricting investigations to only what can be observed under “natural” conditions limits the kinds of questions the investigator can ask and the kinds of information that he or she can obtain. Such debates have surfaced in fields such as ecology, evolution, and animal behavior, where field investigators have often claimed that laboratory conditions are so different from those the organisms experience in the wild that the information obtained can have little relevance to how the organism functions in its natural habitat. Experimentalists argue that those who limit their work strictly to field observation have no ways to test their theories and consequently can never develop a rigorous, scientific explanation. Of course as many scientists and philosophers have pointed out, the approaches, like those of reductionism and holism, are actually complementary. Nonetheless, debates on reductionism and holism, observation and experimentation, have continued to resurface and influence the development of biology down to the twenty-first century.

Unity and Diversity in Living Organisms

Another important aspect of life is its vast diversity built on a base of underlying unity. For example, organisms as outwardly dissimilar as a bacterium, a human, and an oak tree are all composed of the same basic structural element, the cell, which in turn have many similar subcellular and molecular components. All eukaryotic cells (those cells of higher organisms that have a membrane-bound nucleus) contain mitochondria (organelles that carry out oxidation and thus provide energy), Golgi apparatus (a membrane system involved in packaging newly synthesized proteins), endoplasmic reticulum (a complex system of internal membranes), and ribosomes (small structures that form the site of protein synthesis). Simpler cells known as prokaryotes (bacteria, blue-green algae, and so forth), while lacking mitochondria and other organelles, contain ribosomes and share all the basic molecular infrastructure with eukaryotes. For example, both prokaryotes and eukaryotes have their hereditary information encoded in the molecule of deoxyribonucleic acid (DNA), transcribe that message into messenger RNA (mRNA), and translate that message into proteins in exactly the same ways. Furthermore the language in which the DNA code is written is the same in all organisms: as a triplet in which specific sequences of three out of four possible bases (adenine, thymine, guanine, and cytosine) specify

each of the twenty amino acids that make up all proteins in the living world. Thus beneath apparent diversity lies a major infrastructure of unity. How to interpret this obvious contradiction has motivated a wide variety of views of the nature of life since at least the early twentieth century.

The Molecular and Biochemical View of Life

Deriving from the reductionism-holism debate, an important issue from the 1930s onward has been the extent to which living systems are ultimately reducible to molecules and chemical reactions. Biochemical definitions of life surfaced in the late nineteenth century with the discovery of enzymes as “living ferments” and became particularly prominent during the heyday of biochemical work (in England and Germany from 1920 to 1939) on enzyme-catalyzed pathways for synthesizing or degrading the major molecules in living systems. Many biochemists, flushed with success in elucidating the multistep pathways for fermentation or oxidation, attempted to define life in terms of enzyme catalysis. They held that what differentiated living from nonliving systems was the rapidity with which enzyme-catalyzed reactions and energy conversions could take place and the precision with which they could be controlled. The cell, one biochemist argued, is nothing more than a bag of enzymes. The biochemical view of life paid little if any attention to cell structure and organization, focusing almost exclusively on metabolic pathways, their interconnections, reaction kinetics, and energetics.

In the decades following the working out of the double helical structure of DNA by James D. Watson and Francis Crick in 1953, the biochemical definition of life was replaced by, or encompassed within, what came to be called the molecular view of life. The molecular view was more comprehensive than the biochemical, including the study of the three-dimensional structure of molecules, such as hemoglobin and myoglobin, and attention to cell structure and its relation to function, using techniques such as electron microscopy, ultracentrifugation, electrophoresis, fluorescence dyeing, and later confocal microscopy. Paradigmatic along these lines were detailed investigation of the structure of hemoglobin, the oxygen-carrying molecule in animal blood, and the discovery of its allosteric changes (positional shifts) in structure as it alternately bonds to and releases oxygen. The molecular and biochemical views of life tended to be highly reductionist, seeing life as merely a manifestation of molecular structure. Nonetheless, the molecular view did emphasize the importance of understanding life in terms of molecular configurations and the ways various molecules interacted chemically in such living processes as respiration, photosynthesis, protein synthesis, cell-to-cell communication, and signal transduction (the way a cell responds internally to receiving a specific message from the outside).

A particularly prominent aspect of the biochemical and molecular views of life has been the field of abiogenesis or the origin of life. Beginning with the work of the Russian biochemist A. I. Oparin (1894–1980) in the 1930s through that of Sidney Fox (1912–2001) from the 1950s to the 1990s, Stanley Miller in the 1950s, and Cyril Ponnampertuma in the 1970s, investigations as to how living systems might have originated on the primitive earth (or other extraterrestrial bodies) have gained considerable attention. Oparin showed that simple globular

formulations that he called coacervates (formed from gum arabic and other organic substances in an aqueous medium) could perform simple functions analogous to living cells (movement, fission). Miller's experiments in the early 1950s demonstrated that basic amino acids, sugars, and other organic compounds (formic acid, urea) could be produced from components of what was hypothesized to have been the earth's early atmosphere (ammonia, carbon dioxide, water vapor, and hydrogen), thus giving credence to the view that life could indeed have originated on earth by simple biochemical processes. Later work of Fox and others on how the basic building blocks of organic matter (amino acids, simple sugars, nucleotides, and glycerides) could have become organized into macromolecules and basic cell structures showed that the origin of the next level of organization up from the molecule, the cell and its components, could be studied by experimental means. These investigations gave considerable support to the view that life is truly an expression, though an emergent one, of the basic properties of all matter, as understood through the analysis of atomic and molecular structure.

LIFE CYCLE.

This entry includes three subentries:

Overview

Adolescence

Elders/Old Age

OVERVIEW

The Sphinx, according to an ancient Greek tale, was a monster with the face of a woman, the body of a lion, and gigantic wings. Sent by the goddess Hera to punish the city of Thebes, she sat on a hilltop and stopped passersby, posing them a riddle: "What has one voice, and is four-footed, two-footed, and three-footed?" Every time the Thebans gave a wrong answer, she devoured one of them—including Haemon, the king's son. Only Oedipus, a stranger traveling through town, was able to give the correct answer: "Man."

The riddle makes allusion to the life-cycle: man travels "four-footed" (i.e., on hands and knees) as an infant, on two feet as an adult, and "three-footed" (with the aid of a cane) in old age. To solve it, it is necessary to think of a man both as a singular individual—with "one voice"—and as a being who changes form over time. Apparently the puzzle was widely known in the ancient Mediterranean, a bit of folk wisdom that gradually made its way into Oedipus's tale. (It is not to be found in written versions before 600 B.C.E., including that of Hesiod [fl. c. 700 B.C.E.]) Its depiction of a normative life course casts an oblique shadow over Oedipus's own, for by solving the puzzle and reclaiming the king's prize—his own mother as a bride—he twists the normal sequence of the generations into grotesque and tragic form.

The notion of the life cycle, then—that there are stages in life through which every individual must pass—is old and widespread. And, as in this tale, it is both descriptive and prescriptive: It describes inevitable physiological changes that are readily observable in humans as in all living things, but it also suggests that one ought to move through life in a certain prescribed manner. This dual meaning can be found in examples far removed in time and space from Oedipus, as for example in two of the greatest examples of early American literature: *Primeros Memoriales*, written in Nahuatl in Mexico by Bernardino de Sahagún (1499–1590) between 1558 and 1561, and *Nueva corónica y buen gobierno*, completed by Felipe Guaman Poma de Ayala (1538?–1620?) in Peru in 1615 and likewise primarily written in a Native American language, Quechua. Each of these books is an act of cultural translation that presents an imperial society of the Americas—Aztec and Inca, respectively—as their authors wish Spanish readers to see them. In each of them, we find detailed, carefully illustrated presentations of the stages of human life. Guaman Poma depicts first ten stages of a man's life, then ten stages of a woman's; curiously, he begins each with the adult in his or her prime, which he calls the "first road"; he then progresses through to old age, then lists in reverse order the four stages of youth, ending with infancy. Sahagún likewise depicts women and men in separate but equivalent sequences; and his Nahuatl informants, like Guaman Poma, emphasize productive labor more than simple physiological change. At each point except for the very beginning and the very end, women and men are shown performing the work appropriate to their time of life. For women in both empires, these stages are defined in terms of textile production, with adult women weaving at looms, while youngsters and the elderly spin. This emphasis upon work—possibly intended to show the contributions that citizens were expected to make to the state—underlines the normative quality of the

concept of the life cycle; Sahagún's artists and writers also passed judgment on leisure activities, indicating that while drunkenness and idleness were acceptable in the old, they were to be condemned in the young. In European art, the moralizing version of the life cycle can be seen in the series of engravings by William Hogarth (1697–1764), “The Harlot's Progress” (1732) and “The Rake's Progress” (1735)—humorous visions of the life sequence gone awry.

But of course, the life cycle can also be seen not as a set of expectations, but as an inevitable and even a tragic fate. This vision of the life course often emphasizes the notion of the life course as a cycle: that is, as occurring within a circular, natural form of time rather than the linear historical time invented by humans. As such, it often calls upon metaphors from nature, such as the seasons of the year; and in turn, it becomes a metaphor for the life of a society or an empire, which like the human body may be born, grow, mature, sicken, and die. Although it employs few metaphors from nature, a classic evocation of the life cycle as a circle is to be found in *As You Like It* by William Shakespeare (1564–1616), first performed in 1599 and first published in 1623. The famous soliloquy spoken by Jaques that begins “All the world's a stage” presents seven stages in the life of man, with the end marking a return to the beginning:

All the world's a stage,
 And all the men and women merely players;
 They have their exits and their entrances;
 And one man in his time plays many parts,
 His acts being seven ages. At first, the infant,
 Mewling and puking in the nurse's arms.
 And then the whining schoolboy, with his satchel
 And shining morning face, creeping like a snail
 Unwillingly to school. And then the lover,
 Sighing like a furnace, with a woeful ballad
 Made to his mistress' eyebrow. Then a soldier,
 Full of strange oaths and bearded like the pard,
 Jealous in honour, sudden and quick in quarrel,
 Seeking the bubble reputation
 Even in the cannon's mouth. And then the justice,
 In fair round belly with good capon lined,
 With eyes severe and beard of formal cut,
 Full of wise saws and modern instances;
 And so he plays his part. The sixth age shifts
 Into the lean and slipper'd pantaloon,
 With spectacles on nose and pouch on side,
 His youthful hose, well saved, a world too wide
 For his shrunk shank; and his big manly voice,
 Turning again toward childish treble, pipes
 And whistles in his sound. Last scene of all,
 That ends this strange eventful history,
 Is second childishness and mere oblivion,
 Sans teeth, sans eyes, sans taste, sans everything. (2.7.139)

In art, literature, and mythology, then, the life cycle is a powerful theme, played both for comedy and tragedy. With the modern emergence of the social sciences, this concept has continued to fascinate and trouble scholars because of its dual grounding in nature and culture. On the one hand, childhood,

maturity, and old age are physiological processes that most humans will experience; on the other hand, cultural norms and expectations about what these phases mean and how they should be lived—and even whether the stages of childhood and adolescence are distinct from adulthood—vary tremendously across time and space. Each of these periods, childhood, adolescence, and old age, has given rise to its own social science literature. Within each, debates about what, if anything, is transhistorical and what must be seen only within its own cultural context have provided lively and stimulating conversations, as exemplified by the tremendous public attention accorded to Margaret Mead's *Coming of Age in Samoa* (1928) and Philippe Ariès' *Centuries of Childhood: A Social History of Family Life* (1962), two of the best-known examples of works that challenged prevailing conceptions about our experience of the life cycle.

ADOLESCENCE

Many social historians have argued that *adolescence* emerged as a distinct life stage only with the advent of industrialization. Using case studies from regions where the historical record is plentiful, such as France, England, and the United States, scholars contend that prior to the industrial revolution, the physical processes of maturity did not necessarily signal a change in life status for the individual. Rather, adolescence as a distinctive stage in the life course emerges only in societies where certain social characteristics are present. While the processes are complex, in general the characteristics include the formation of an indeterminate period of “dependence” on parents that occurred most often in urbanizing areas where old rules about land inheritance and marriage were obsolete, child labor was unnecessary or of questionable value, and where investing in children's education became profitable. Noting that prior to the mid-nineteenth century there was no word for “adolescence,” historians point out that words such as “child” might be used to encompass children as young as eight or as old as nineteen or, in the transition stages prior to industrialization, the word *youth* often referred to semi-independent unmarried children who were often removed from their parents' homes to work on large estates. While the concept of adolescence first emerged among the middle classes (those who could afford to send children to school and not to the sweatshop), by the end of the nineteenth century, adolescence had become “democratized” (Gillis) in western societies, and teenagers of all social classes were experiencing this life stage.

Conceptualizing Adolescence

While the necessary link between industrialization and a life stage of adolescence is debatable (see Schlegel below) what is clear is that by the twentieth century the term *adolescence* and the understanding that it represents a life stage that is distinct from both childhood and adulthood was thoroughly embedded in European and North American thinking. Usually linked to the years just after puberty and before marriage, adolescence was not only seen as a unique and distinctive life stage but it was identified as one that posed particular problems and concerns. In 1904 the psychologist G. Stanley Hall published a two-volume set succinctly titled *Adolescence* that attempted to set forth current theories about this “vast and complex theme” (Hall, p. xix). While Hall’s work on adolescence was nothing if not prodigious, his most controversial claim was essentially that “ontogeny recapitulates phylogeny” or, in other words, that the psychic development of each individual mirrors and re-creates the evolutionary stages of the species. If this is true, then the behaviors associated with adolescence, which at the time were often referred to as filled with “storm and stress,” were rooted in nature and therefore were assumed to be universal. Hall’s theories on adolescence, and in particular his concern for describing it as a universal stage of human development, were inspired in part by popular theories of the age concerning both physical and social evolution. Indeed, Hall claims in the concluding chapter of his second volume that “savages” “in most respects are children, or, because of sexual maturity, more properly, adolescents of adult size” (Hall, vol. 2, p. 649).

For several decades before and after the publication of Hall’s *Adolescence*, social theorists were interested in developing ways to incorporate evolution as a conceptual tool for understanding human behavior and cultural difference. Most of their arguments centered on two interconnecting themes: how cultural and social differences could be explained through an evolutionary model; and how much of human behavior could be explained by evolutionary inheritance, or biology. Both of these themes easily qualify as “racist” by twenty-first-century standards, with their emphasis on white, Western civilization (and behaviors) as the apex of social evolution, while “primitive” societies or “races” were held to represent “earlier” stages along the evolutionary trajectory.

By the early decades of the twentieth century, evolutionary theories dominated the social sciences and influenced social policies through ideas such as eugenics. In anthropology, human societies were described as following “natural” laws and many believed that the “history of mankind is the history of nature” (Stocking, 1968, p. 116). A leading theorist of the time, E. B. Tyler, argued both for delineating how different societies could be understood as models of the different stages of a unilinear evolutionary process, and for the concept of the “psychic unity of mankind” (p. 115), which claimed that humans share an evolutionary history and therefore a uniform “nature.” Human nature, therefore, was inextricably linked to biology.

Anthropological Critique

The most important anthropological critique of the social evolutionary model came from Franz Boas, who published *The*

Mind of Primitive Man in 1911. Boas used extensive ethnographic data to make an argument for the separation of culture from biological determinism and the importance of diffusion, rather than evolution, in the formation of cultural traits. Boas became best known for the concept of “cultural relativism,” which argues against judging a culture by outside standards. As he states in the conclusion of *The Mind of Primitive Man*, “Then we shall treasure and cultivate the variety of forms that human thought and activity has taken, and abhor, as leading to complete stagnation, all attempts to impress one pattern of thought upon whole nations or even upon the whole world” (1932 ed., p. 272). Over time, Boas attracted a wide range of students who studied with him at Columbia University and by the 1920s his theory that culture is historically created, not evolutionarily structured, became the dominant paradigm in American anthropology.

By 1924 Boas had successfully argued for the importance of cultural diffusion—the sharing of ideas between cultures—as an important mechanism of culture change, but he was still looking for ethnographic data to demonstrate how culture specifically influences the psychological development of individuals and creates distinctive patterns of behavior. In particular, Boas decided that a study of adolescence would be a useful way to demonstrate how culture, not nature, patterns human behavior. He chose one of his young graduate students, twenty-three-year-old Margaret Mead, to conduct a study in Samoa; her assignment was to determine whether adolescence was filled with the same troubles in the South Seas as it was in America. Mead was trained in psychology and she knew Hall’s work well. As she explains in her book *Coming of Age in Samoa* (1928), she embarked on that research to answer the question: “Are the disturbances which vex our adolescents due to the nature of adolescence itself or to civilization?” In other words, what takes primacy? Nature or nurture?

While Mead did not overly concern herself with defining “adolescence,” it is clear from many of her conclusions that she closely associates adolescence with the years directly surrounding puberty; nevertheless, her conclusion that “there are no great differences” between girls in adolescence and those about to enter it or who have just left it, downplays its significance as a Samoan life stage. Noting the general “casual” nature of Samoan society, Mead argued that adolescence is not filled with “storm and stress” but rather this was a period of orderly maturing interests and activities (1961 ed., p. 157). Maturing girls in Samoa had few restrictions placed on their sexual encounters, few judgments passed on the behaviors, and negligent pressure to prepare for an unseen future. This, she argued, created an adolescence that was peaceful and enjoyable. Comparing the United States to Samoa, Mead noted that American youths “grow up in a world of dazzling choices” and that all choices are “the half-ripened fruit of compromise” (p. 205). Addressing educators directly, Mead used her Samoan research to call for changes in the expectations and pressures put on American adolescents.

Mead’s book, which was intentionally written for the “educated layman,” became a best-seller and positioned Mead to become one of the most important and influential voices in

American anthropology, and in American society, for the next five decades. Among Mead's most noteworthy contributions were her works on childhood (*Growing Up in New Guinea*, 1930) and gender roles (*Sex and Temperament in Three Primitive Societies*, 1935) both of which continued the argument that cultures create patterns of behaviors in consistent and holistic ways.

Mead's conclusions about the role that culture plays in shaping the experience of adolescence were never seriously challenged until 1983 when Derek Freeman, an Australian anthropologist, wrote *Margaret Mead and Samoa: The Making and Unmaking of an Anthropological Myth*. Freeman, who studied Samoa, albeit several decades after Mead, argued that Mead was a "cultural determinist," who ignored any ethnographic evidence that did not support her contention that culture (not biology) is primarily responsible for human behavior. Freeman argued that adolescence was in fact stressful in Samoa and defended an "interactionist" perspective that interpreted behavior as a result of the intersection of biology and culture. Freeman's book sparked controversy both in anthropology and outside because it directly attacked Mead's evidence but also because it attempted to reinvigorate the nature/nurture debates that had remained relatively sidelined in cultural anthropology. Mead was dead by the time Freeman's book was published so could not defend her own work. However, her reputation, which was only partially constructed from her early work, was never seriously in jeopardy.

By 2000 the dust had settled, with no one on either side effectively convincing the other of the truth of their sides' claims. Given the importance, or at the very least, the prominence of Margaret Mead in the development of American anthropology, it is paradoxical that the study of adolescence in anthropology did not flourish at all in the second half of the twentieth century. In fact, it stagnated. While the study of childhood was continued in a limited but impressive fashion (most notably at Harvard), and gender studies blossomed after the 1970s, the systematic study of adolescence all but disappeared in anthropology until the 1990s. While mention might be made of youths or adolescents in longer ethnographic studies, there were no titles in anthropology focusing exclusively on adolescents for several decades. Indeed, even Freeman's attack on Mead was directed toward her conclusions about the primacy of culture in human development, and was never intended as a serious contribution to the study of adolescence. The study of adolescents did not disappear from academia, but was continued by psychologists, child development specialists, historians, and sociologists. Two important sociological studies about teens in America that furthered Mead's general sociocultural orientation were Hollingshead's *Elmtown Youth*, which focused on teenagers in 1942 and 1943, and *Growing Up in River City*, a longitudinal study of teens in the postwar boom.

Contemporary Perspectives

While the approaches to certain questions had been significantly refined by the 1980s and 1990s when anthropologists once again began to study adolescence, these studies can still generally be separated into those that seek to find some

universals across cultures in the adolescent experience, and those studies that attempt to provide in-depth context for "youth" culture in specific places. In the first case, biology or evolution (understood broadly) is assumed to play some role in the experience of adolescence, while in the other, situating cultural contexts is of exclusive concern.

The two dominant voices for the first perspective are Alice Schlegel and Herbert Barry III. Schlegel (an anthropologist) and Barry (a psychologist) published *Adolescence: An Anthropological Inquiry* in 1991. Arguing for an ethological perspective, in their case reflecting upon observations of primate groups to inform questions and buttress conclusions, Schlegel and Barry assume that adolescent behaviors are both "antecedent," that is, linked to earlier socialization and development and "situational"—influenced by the particular conditions of adolescence. Moreover, Schlegel and Barry argue that reproduction, in particular the (often extended) gap between sexual maturity and social adulthood, is a "key issue" in understanding how adolescence is managed and understood cross-culturally. In this view, biology (in the form of sexual maturity and the necessities of reproduction) and culture (which rarely allows for the full assumption of adult roles at puberty) intersect, literally creating this life stage. In their thinking, neither biology nor culture should be given explanatory primacy.

Schlegel and Barry's methodology consists primarily of reviewing existing cross-cultural ethnographic works that discuss adolescence—if only briefly—and coding for a select number of variables. Their statistical analysis of 173 societies for boys and 175 for girls points to both regularities and differences in adolescence across cultures. For example, the authors argue for the universality of the life stage of adolescence and refute the contention that it is linked exclusively to industrialization. They also point out the ways in which adolescence differs for boys and girls within a culture, and the variable degrees of discord in the adolescent period that can exist between them.

The 1990s also saw the emergence of a number of journal articles, edited volumes, and book length ethnographies that focused on adolescence, or "youth culture." The shift in terminology from *adolescence* to *youth culture* is not arbitrary but reflects the growing emphasis on seeing adolescents as producers of culture, not just as individuals awkwardly situated between culturally sanctioned life stages. The term *youth culture* itself is not new and comes from the sociologist Talcott Parsons who argued in 1942 that middle-class American teens lived in a distinctive cultural world. In today's usage, youth culture has come to mean that teens are viewed as social agents who impact their cultures in meaningful ways (Wulff).

Studies of youth culture are diverse and cover a wide range of topics, but they reflect some of the larger concerns of late twentieth and early twenty-first century anthropology. First, they reflect the shift away from viewing culture as holistic and consistent as described by Mead and others, toward an understanding of culture as "contested" and represented by multiple perspectives and voices. Women, minorities, and even youths are fully part of cultures, yet they may have distinctive interpretations and perspectives on that culture, and act upon that culture accordingly. Second, studies of youth culture reflect a

concern for the ways power impacts social organization and cultural expression. Youth are not only influenced by larger societal power structures such as race, class, or gender; they produce, respond to, and manipulate power in different ways (Caputo; Sharp). Finally, youth culture studies are also influenced by anthropology's increasing interests in the processes of globalization and transnationalism (see Kathleen Hall). Teens are often the first to embrace media and technology, they may be the only ones in their migrant families to speak the dominant language or, because of transnational migration, they may find a stunning disjuncture between their experiences as adolescents and the experiences of their parents. "Youth culture" is now seen as responsive and dynamic and worthy of study in its own right.

The study of adolescence in anthropology has been one in which the disciplinary debates between nature and nurture have played out with intense fervor, but also one that represents the fruit of disciplinary cross-fertilization. From the outset, anthropological studies of adolescence have built upon and contributed to debates in multiple disciplines, most especially sociology, psychology, history, and more recently cultural studies. Beginning with Mead, some anthropological work has contributed to public policy debates, most especially in education. While the study of adolescence lay relatively dormant in anthropology for many decades, the resurgence of studies on adolescence such as Schlegel and Barry's signal an attempt to unite divergent perspectives while those on "youth culture" seek to bring the study of young people back to the center of anthropological theorizing.

ELDERS/OLD AGE

The study of the human life cycle is primarily a study of the aging process. The question of why humans age has long intrigued social and biological scientists. While a fountain of youth has yet to be discovered, public health and hygiene interventions have lengthened the human life expectancy greatly over the course of the past hundred years. And yet life expectancy varies greatly within and between societies, relating to their relative socioeconomic status, gender, reproductive history, and environment, among other factors. Biologists have estimated the human life span to be approximately 120 years; however, there are no well-documented lives of this length. This discrepancy between life expectancy and life span raises the important and complex relationship between biological and cultural determinants of aging. In effect, an understanding of the life cycle and human aging is predicated upon exploring these determinants of physical, cognitive, and social decline in later life.

All societies possess some mechanism by which to denote or mark stages in the life cycle—in particular, the transition from youth to adult and from adult to elder. Anthropologists have enumerated many formal age classification systems. Age classification systems such as age sets—groups of persons born within a set number of years and considered to be the same age—are more rigid and formalized among horticulturalist and pastoralist societies; industrialized societies tend to have less formalized mechanisms to denote elder status and often rely upon physical and chronological markers of aging. Gerontologists also conceptualize age in terms of age grades, cohorts, and social age. Age grades are status differences predicated on culturally defined social ages. Cohorts are generations of people who experience similar historically defining moments that shape their experience. Social age is a way of grouping elders based on particular cultural experience, such as retirement, widowhood, or grandparenthood.

Social Theories of Aging

Leo Simmons's is the first major work to explore the relationship between culture and the experience of old age. Using existing ethnographic works, Simmons evaluated the effects of selected societal traits on the social roles, treatment, and status of the aged across seventy-one globally distributed tribal groups. This work set the stage for further investigation into the sources of cross-cultural variation in the status of older people. In part drawing upon Simmons's work, Donald Cowgill and Lowell

Holmes formulated one of the first substantive theories on variation in the life cycle and aging processes. This collection drew upon ethnographic examples from both tribal- and state-level societies and theorized that modernization was the driving force behind the wide range in elder treatment. As societies become increasingly drawn toward modernization, the productive and social roles available to older adults concomitantly grow fewer and less prestigious. With modernization, the status of elders decreases, the proportion of elders within society increases, and the responsibility for elder care is transformed from a domestic to a public sphere; cross-culturally, all elders are channeled into less physically demanding roles, and all cultures place a high value on a good and long life. Critics of modernization theory point to the ethnocentric bias inherent in modernization's naturalization of Western social structure.

The differentiation between what is biological and what is cultural in the aging process continues to drive research into the experience of aging as well as social theories of the aging process. Older adults' disengagement from social and economic life was first understood as a natural process predicated upon decreasing physical and mental capacities; later theories emphasized the importance of reciprocal relationships in determining an elder's likelihood of social withdrawal. Marxist approaches postulated that elders' circumscribed relationship to the means of exchange was the underlying cause of their social alienation. Carroll Estes's groundbreaking work on the "aging enterprise" introduced and explicated the political economic production of elders' relative disadvantage. The aging enterprise is the invention of new needs for the elder population, which are provided by new technologies, services, medications, and goods. This process exploits elders' economic and political power and works to isolate them further from the rest of society.

The 1980s brought a new direction in life-cycle research, one that focused less upon macrosocial functionalism and the ways in which elders as a group function within society and instead directed attention toward the effects of lifelong experiences and social locations on the status and experience of older age. The double-jeopardy hypothesis proposes that elders are first disadvantaged by age and that this disadvantage is intensified by other layers of their identity, such as ethnicity, gender, or sexual preference. In contrast, the life-course perspective seeks to understand elders' status as a product of their lifelong interaction with systems of discrimination and privilege as well as their individual personal experiences. The experience of older age is often positively affected by elders' social support system or their social networks. Social support networks can be characterized by the amount of reciprocity among members, the intensity of exchange, the complexity or number of activities performed by members, or the level of interconnectedness among different members of the network. Elders who possess intense, complex, reciprocal, and dense social networks experience greater social integration and may have greater relative status within the elder population.

Elders' relative status in society may often be predicated upon the various roles they fulfill. Some roles, such as grandparent, provide a high status, while other roles available to elders, such as the sick role, connote low status. All societies possess some

unwritten rules for which roles are accessible to older adults. These age norms, while generally not formalized, can serve as a form of social control to discourage older adults from engaging in activities deemed unfit for their age. Another term used to describe this phenomena is "social clock," the culturally defined time of life for particular social activities to be performed. Marriage, employment, childbirth, grandparenthood, and death are just a few of the human activities governed by social clocks.

Aging as Stigma

While the status of older adults varies cross-culturally, in the United States and other industrialized nations, elders are ascribed low status. This low status may be attributed to the cultural associations of elders with disease, disability, death, and dying. In the United States, the emphasis on independence, autonomy, and bodily integrity casts persons who deviate from the norm as morally and socially suspect. The sick, disabled, dying, and elderly are often stigmatized and socially isolated. Undoubtedly elders experience these negatively valued states more often than any other age group; however, the cultural value of any one of these experiences depends upon a particular sociohistorical and cultural context. For instance, immigrant and minority subcultures in the United States may accord far greater prestige and importance to elders than is found in the dominant culture.

Many social scientists in aging studies have examined how to forestall or decrease disability and disease among older adults in order to improve their quality of life and ensure prolonged social integration. Activity theory was one of the first approaches to understanding elders' social experience. Activity theory asserts that older adults have better lives if they maintain a high level of varied activities. Somewhat commonsensical, activity theory does not address the underlying reasons for relinquishment of activities. This shortcoming may open the possibility of "blaming the victim"—if elders have a poor quality of life, it is because they chose to disengage from their social roles and activities.

Disengagement theory is a response to activity theory and seeks to remove the blame for relinquishment of activities from individual elders and instead houses responsibility within human biological change. It proposes that the biological changes accompanying the aging process naturally discline elders toward continued participation in the productive spheres. However, disengagement theory has the potential to conflate aging with senescence and works to naturalize the segregation of older adults within society. Continuity theory might be conceived as a middle-of-the-road approach. It explains the circumscribed social experience of older adults as a product of role continuity. The roles one acquires as an adult do not change, and as elders age and relinquish physically or mentally demanding spheres, the remaining roles available to them become more rigidly claimed and new roles are not sought after. Continuity theory does not explain why some elders continue to seek new experiences and skills.

Critical and Constructionist Perspectives on Aging

The work that Estes began with *The Aging Enterprise* experienced a resurgence of activity in the later 1990s and the early

twenty-first century. Critical gerontology aims to examine the sociopolitical processes and policies that conspire to disadvantage certain classes of people disproportionately. As a group, elders are often economically and socially disadvantaged, but critical theorists deepen the investigation of disadvantage by pointing to the heterogeneities within the elder population. Hence critical perspectives are often feminist ones, theories that investigate the ways in which women are systematically denied access to avenues of privilege. Critical theorists also explore the ways in which other markers of identity—race, ethnicity, native language, sexuality, disability, HIV status, educational attainment, employment history, or social class—intersect with age to exacerbate age-related disadvantage. Feminist gerontologists have been particularly vocal within critical gerontology in the study of gender bias in state-sponsored pension systems, health insurance programs, biomedical research, and paid and unpaid caregiving.

The constructionist perspective also gained steam from the late 1980s onward. Constructionists step back from an attempt to explain the totality of the aging experience and instead examine specific facets of experience in an effort to understand the roots of social problems or cultural beliefs. Constructionists differ from critical scholars (though they are in no way exclusionary of the others) in that their focus is on the cultural determinants of disadvantage rather than sociopolitical or economic systems. Many scholars within this vein turn toward narrative analysis to help explain the experiences of elders. Elders' narratives allow for an individual level of analysis as well as providing a means by which elders can be conceptualized as active agents in the creation of meaning and value in their lives rather than as products of political economic systems.

Geroanthropology: A Cross-Cultural and Holistic Inquiry

Jennie Keith characterizes geroanthropology as a tripartite endeavor consisting of the anthropology of old age, old age within anthropology, and the anthropology of age. Early and contemporary ethnographic works that did not focus on the experience of elders but rather referred to the knowledge and wisdom of elders as repositories and keepers of cultural traditions comprise "old age in anthropology." The anthropology of old age is represented by texts that seek to explore the experience of older adults across cultural or national boundaries. Works by Jay Sokolovsky and Margaret Lock represent just a few of the recent texts in this genre. The anthropology of age seeks to understand aging as a social and biological process and does not focus entirely on the end product of aging per se but looks to elders as active participants and creators of the meaning and experience of later life. All three of these endeavors have been dramatically influenced by three widespread processes: the demographic transition, globalization, and the medicalization of aging.

The world's population is aging, but demographic profiles differ widely among nations. The populations of the United States, Canada, and Western Europe are widely known to be "graying," yet the proportions of the populations that are grandparents in nations such as China, Kenya, or Mexico pose entirely different social and economic questions. Industrialized

nations view their "aging problem" to be primarily one of social services, health care, and cost containment, whereas nations within sub-Saharan Africa struggle with ways to support elders who are caring for orphans of the HIV pandemic. China, the nation with the largest population in the world, will be facing a caregiver shortage of huge proportions due to shrinking family size and because its elders are concentrated in rural areas with fewer young adults to provide, informally or formally, caregiving support. The demographic transition is often thought to be of concern only to industrialized nations that have the longest life expectancies; however, elders in many nations are suffering the effect of low status and lack of support.

Globalization is often bandied about as a ubiquitous covering term referring to the confluence of goods, labor, and information traveling across national borders, but it is not often considered particularly germane to gerontological research. In fact, however, increased economic globalization since the mid-1980s has had an enormous impact on the status and quality of life of the world's elders. Among other things, globalization has decreased job security, decreased employment-related health and retirement benefits, increased the seasonal migration of low-paid workers, upset local economies, and increased international disease transmission. These changes have forced low-income workers to remain in the workforce longer in order to provide economic support for their households, have raided the retirement funds of those middle-income families who had planned for retirement, and have often increased the cost of prescription drugs and other health care products vital to elders. Globalization is often conceived as an economic boon to national economies and a harbinger of prosperity, but it has also worked to exacerbate the existing systems of relative disadvantage for elders.

Estes was one of the first scholars to point out the trend toward the medicalization of aging. Medicalization, broadly defined, is the transformation of behaviors, bodily states, or bodily functions from a state of naturalness or idiosyncratic or cultural behavior to disease states that can be defined, diagnosed, and perhaps treated. It has been characterized as a form of social control and a tool for the expansion of cultural hegemony. Medicalization affects health insurance policies, the quality of life of those living or working in long-term care facilities, the economic security of unpaid caregivers, notions of self and identity, and access to choice of healing modality. It is an interactional process that occurs between social structures, patients, health care providers, or medical technologies. However, medicalization is steeped in the legitimacy and authority accorded biomedicine. The authority and dominance of the biomedical model in the United States limits the range of appropriate responses to disease. Once medicalized, a disease is appropriately treated as a medical, physical (or psychiatric) problem. Further, medicalization does not necessarily imply an opportunity for efficacious treatment or health improvement. Alzheimer's disease, for example, could be considered a newly medicalized interpretation of senility in older adults. Those who are diagnosed with Alzheimer's are given the stigma and gravity of the diagnosis but are then offered limited caregiver support, pharmacological treatment, or long-term care assistance.

Geroanthropology has been profoundly changed by demographic transition, globalization, and medicalization. The demographic transition forces gerontologists to examine elders' status and quality of life cross-culturally while questioning ethnocentric ideas regarding the definition of old age, retirement, caregiving, and grandparenthood. Globalization has complicated cross-cultural research as national and cultural boundaries are increasingly understood as dynamic and historically contingent products of competing international political and cultural forces. Cultural ideas and beliefs are shared via electronic media at an unprecedented rate, and the values associated with specific cultural groups become taxed under new forms of economic exploitation or pressure. Medicalization has substantively changed the scope of geroanthropology. It has also compelled social-scientific researchers to couch their projects in terms of biomedical categories, contributing to an increasing emphasis upon short-term, problem-, or crisis-oriented research rather than longitudinal or prospective studies. This may have the unintended effect of further stigmatizing diagnosed persons as being artificially divorced from society.

These processes have encouraged gerontological research to work toward problem-solving rather than theory-building and ironically may have compartmentalized the experiences of elders while working toward their increased status and social integration. Research with or of the aged or about the aging process itself must remain as holistic as possible in order to encapsulate the complexity of social and physical experience at the end of life. The status of elders varies within and across cultural groups. The current study of cross-cultural variation tends not to focus on documenting these differences but instead looks at the effects of privilege and disadvantage on particular classes of elders in specific situations or alternatively examines meanings and values elders create as active participants in society.

LINGUISTICS. *See Language and Linguistics.*

LINGUISTIC TURN. "Where word breaks off no thing may be": this is the line from a poem by Stefan George repeatedly cited by Martin Heidegger to indicate his version of the linguistic turn, which affected many philosophers in the early twentieth century—literary scholars already having made the turn, whether consciously or not (Heidegger, p. 60). The phrase "linguistic turn" is actually Gustav Bergman's, given new currency by Richard Rorty, but the phenomenon is far from unprecedented. Friedrich Nietzsche's idea of "the infinite interpretability of all things" is an analogy drawn from language, and a century earlier there was what H. G. Gadamer called "Herder's ill-fated criticism of the Kantian transcendental turn"—that is, his "metacriticism" of Immanuel Kant, which Jacques Derrida likewise recalled. Renaissance humanism, too, was in part a linguistic—a philological, a rhetorical, and a literary—protest against the excessive abstraction of Scholasticism, following the lead of the ancient Sophists and orators.

The "linguistic turn" has been made by many philosophical movements by now, even analytical and Marxist philosophy, and as usual this has been done in the search for foundations and a universal standpoint from which to pass judgments on the human condition. Linguistic criticism certainly undercuts the spiritual world of ideas; but "language," when divorced from the particularities of different linguistic traditions, can also be "reified" and made into a philosophical fetish. Martin Heidegger speaks of language but in practice regards German and Greek (rather than, say, Sanskrit or Chinese) as closer to Being than any other. His former pupil Gadamer, while regarding hermeneutics as universal, is more self-critical, speaking of "trying to draw out of one's mother tongue new ways of thinking." The implication is that there is not only no *Ding an sich* (thing in itself) but also no *Geist an sich* (spirit) and moreover that "there is no meaning where expression fails." Language is the ocean in which we all swim—and whatever our dreams of rigorous science, we are fishes before we can become oceanographers.

Literary Aspects

The linguistic turn was apparent in other connections, one the "new rhetoric" of the past generation, which draws attention to the habits and conventions of language, like Michel Foucault calling into question the control of speakers and writers over their own discourse. The arts of speaking and writing are both

based on conscious imitation, but every literate person is moving in linguistic channels carved by predecessors, deposited in the memory, and repeated in different contexts. Particular languages produce semantic fields that make possible communication and dialogue; and linguistic usage—particular topoi, copulas, and word combinations—has its own inertial force that acquires meaning apart from the intentions of users. This is one reason for being wary of the “intentional fallacy” in interpreting texts.

One of the most impressive vistas opened up by the linguistic turn is the modern philosophy of hermeneutics in the form given by Gadamer, who, following Heidegger, extended the line of thought in the direction suggested not by Friedrich Nietzsche (as did Heidegger and Derrida) but rather by Wilhelm Dilthey. Rejecting revolutionary ruptures as a condition of understanding, Gadamer preserved belief in a kind of continuity making communication and “dialogue” possible not only between speakers but also over time. There are no absolute beginnings, no understanding without prejudice, without “forestructures of understanding” provided by language and the “life-world.” Pursuing Friedrich Schleiermacher’s old quest for “the I in the Thou,” Gadamer accepts the horizon-structure of experience but doubles it to accommodate the contexts of the past as well as the inquiring present. Language is a continuum making interpretation possible, but it does not permit the sort of retrospective mind reading assumed by the “empathy” of Romantic hermeneutics. That meaning must always be constructed in the present is the hermeneutical condition of Gadamer’s kind of historicism. To understand, in short, is always to understand differently.

An important offshoot of hermeneutics is reception theory, or reception history (*Rezeptionsgeschichte*), which follows Gadamer’s line by shifting attention from writing to reading. In fact intellectual history is more concerned with the original intention of authors and meaning of their texts than with their “fortune” in later contexts. What Paul Ricoeur calls the “semantic autonomy” of texts is the condition of the interpretations and misinterpretations that accompany the reception of writings. For Ricoeur the poles of interpretation are the hermeneutics of tradition and the hermeneutics of suspicion, the first locating the position of Gadamer (and of Arthur Lovejoy), who seeks an experience of tradition, the second that of Foucault, who is devoted to the critique of ideology. For Gadamer “tradition” and continuity make possible the common ground of understanding and communication that, via ideas, connects present and past (the Western past); for Foucault they mean entrapment in or complicity with ideology and a denial of the ruptures between the successive epistemes that represent decipherable codes (critically fabricated *Weltanschauungen*) of culture and patterns of underlying power relations.

Textualism

The linguistic turn prompted another and more severe tactic, which was the textualist turn. In this literary/philosophical game of one-upmanship Derrida substituted the transcendent phenomenon of language by the visible presence of “writing,” through which—or rather through the hyper-textualist device

of “traces”—he attempts not only to operate in the “margins” of texts but also speak in the realm of the unspeakable and in effect to “get behind the back of language” (in Gadamer’s terms) and of philosophical discourse. Taking writing as the condition of knowledge is itself a traditional move, as illustrated in the Renaissance preoccupation with *littera* (*letteratura*) and *scriptura* and, more conspicuously, in the tradition of rabbinical (but also of Protestant) scholarship.

In this and other metalinguistic maneuvers of deconstruction, Derrida surpasses even Heidegger in claiming to be a “beginning thinker”—in the goal of transcending criticism or even, as in the notorious (non-)confrontation with Gadamer, dialogue. The very idea of situating Derrida’s own writing in the history of philosophical thought, declares one devotee, “would amount to defusing its alterity and explosive potential.” To be effective, it seems, cultural criticism, like philosophy, must be beyond the horizons of historical inquiry. Breaking with tradition is itself traditional in philosophical thought, as this Derridean adds, though without suggesting that the break and the “alterity” occur in the medium of rhetoric, or writing, rather than a transcendent tradition of thinking (in Derridean terms a transcendental state of “*différance, née différence*”)—or an antitradition of deconstruction—that is itself set beyond language, criticism, and perhaps even history.

Foucault, too, sought to transcend language and “the history of historians,” hoping, with the help of his episteme, to uncover the structures of society and relations of power underlying social practice and discourse, but historians have questioned the methods and especially his attitude toward historical evidence. For Foucault learning does not enjoy high priority; and whether or not he himself was, by intention or vocation, a historian, his opinion was that history was too important to leave to such. Foucault had more important things on his agenda. Criticisms of the concept of episteme (and of “practice” and “discourse”) must be of the same order as criticisms of other such collective abstractions as spirit (*Welt- or Volksgeist*), *Weltanschauung*, *mentalité*, and other shorthand devices for grouping apparent homologies in various areas of behavior within a particular cultural horizon. Like Marxism, Freudianism, and Critical Theory, including the work of Jürgen Habermas, it is another effort of getting “behind the back of language,” which had for centuries been the dream of “philosophy as a rigorous science.”

Intellectual History

This is also to some extent the noble dream of the German approach to intellectual history that succeeded old-fashioned *Geistesgeschichte* or *Ideengeschichte* (history of thought, history of ideas). Like the French *mentalités*, German “history of concepts” (*Begriffsgeschichte*) is an effort to reconstruct an intellectual field through the history of terms and families of terms like the English study of “keywords.” In fact *Begriffsgeschichte* is a species of cultural history focusing on semantic change and the social and political context of ideas, and its program depends on metahistorical considerations to determine the meanings behind the keywords being analyzed. This enterprise began in the early 1970s, before databases like Proteus and ARTFL made possible a much more extensive searching of semantic

fields, but it has nonetheless greatly enriched the practices of intellectual and social history.

The linguistic turn in women's studies allowed for the awareness of gender constructs throughout historical records as well as in the limited questions of historians. Words such as *masculinity*, *femininity*, and *androgyny* became keywords as gender studies scholars began new inquiries into the history of ideas. A last new frontier of intellectual history at the end of the twentieth century is the effort to understand cultures not only past but also alien. Philosophy has not been much concerned with alterity, what Michel de Certeau calls "heterology," which has been faced by historians, anthropologists, archaeologists, mythographers, and other outward- and backward-looking scholars. "The course of history does not show us the Becoming of things foreign to us," argued Georg Wilhelm Friedrich Hegel, "but the Becoming of ourselves and of our knowledge." But the hermeneutical philosophy of his contemporary Schleiermacher sought the *thou* as well as the *I*—the Other as well as the *We*—and this aim has been carried on and intensified by more recent followers. It is here that the methods of "anthropology," which had been found suspect by Immanuel Kant and Foucault alike, again become relevant, especially the interpretive anthropology of Clifford Geertz, which depends on a language model rather than a natural science model of understanding and that has made its way also into historical studies. Language is the "house of being," in Heidegger's famous aphorism, and the history of ideas, too, has taken up residence here.

LITERARY CRITICISM. When the definitive account of post-1960s intellectual technologies is written, the history of literary movements will constitute a key chapter. Perhaps paradigmatic of the closing decades of the twentieth century in its dramatic shifts and realignments, literary criticism at the opening of the twenty-first century shows all the earmarks of specialized knowledge, professionalization, and market maneuvering that have successfully permeated the precincts of human activity in advanced industrial society since the end of World War II. Virginia Woolf's "common reader," for all intents and purposes, has disappeared, replaced by professional practitioners trained in the efficacies of "close reading" and highly conscious of a critical landscape represented by "schools" of criticism, from mythic to Marxist, from structuralist to feminist, from psychoanalytic to poststructuralist. Deconstruction and postcolonial critiques have joined a range of cultural studies that encompass race, gender, and sexual orientation. With allied movements in linguistic, rhetorical, narrative, and semiotic theory, criticism at the turn of the twenty-first century accommodates the study of ethics regarding nonhuman species as well as conduct toward the environment. English and American literature at the university level cut across interdisciplinary formations; thus, the English department, situated in the humanities, could as easily play host to the analysis of legal documents, congressional legislation, aspects of the medical archives, and the fashion modes of hairdressers, as to the recurrence of images of senescence in William Shakespeare's sonnets, or the irreality of closure in Toni Morrison's novels, or the rhythm of repetition in William Faulkner's fiction. The field of literary criticism is a growth industry, its latest paradigm shift related to global transformations brought on by the terrorist attacks of 11 September 2001. Regarding its susceptibility to change, then, the critical field offers a good example of centrifugal movement.

Literary criticism had rather complicated beginnings, apparently unrelated to the project of literary study. Richard Ohmann argues in *English in America: A Radical View of the Profession* that the "technology of the Industrial Revolution gave *knowledge* a new and central place in the business of making a living" (p. 264; emphasis added). The modern American university is dynamically linked to the centrality of knowledge, "the regularizing of technical innovation, and the bending of knowledge to profit" (p. 266). An older technological model, with industries localized in the domestic sphere and skills transmitted from generation to generation, through hands-on experience, was displaced onto the site of the factory, which brought the worker together with the organizational talent of the manager and the stochastic innovations of the entrepreneur. As Ohmann explains, this new model required "a high concentration of special and theoretical knowledge, of the capacity to

create more knowledge as needed, and of the managerial skill to bring this about.” If these changes necessitated the systematization of knowledge, as well as its spread across “a large and diverse corps of people whose main work is generating, communicating, and developing ideas” (p. 271), then the modern university of the late nineteenth century would become fully complicit with the new social order and its growing market demands. The university would answer both the will and the imperative to knowledge and the demand for skills in an increasingly national population.

According to Ohmann, then, the humanistic project and its situation in the modern university springs from *material* grounds. Ohmann’s work is subtitled “a radical view,” playfully reinforced by the book’s original cover collage, which superimposes the facial images of Edgar Allan Poe and Karl Marx. The graphic conveys the interarticulations of the aesthetic and materialist realms, and poses the conditions by which it is possible to understand not only the role of the university and the ascent of ideas in a market economy, but also the specific performances of criticism and theory. Not at all an oppositional movement to a “business civilization,” the view usually taken by humanists, the “business” of the English department, for Ohmann, is compatible with the rationalizations of the “technostructure” and owes its prosperity to that structure’s interventions.

Terry Eagleton pursues the provenance of literary criticism and theory back to the “rise of English” and the modern sense of literature that emerged with the English Romantics of the nineteenth century. A counterweight to the alienation of workers bred by the ravages of the industrial revolution, the literature of the Romantics “appears as one of the enclaves in which the creative values expunged from the face of English society by industrial capitalism can be celebrated and affirmed” (p. 19). The Romantics’ “creative imagination” was enlisted on the side of the “intuitive, transcendental scope of the poetic mind” (p. 19) and marshaled in the interest of a “living criticism of those rationalist or empiricist ideologies enslaved to ‘fact’” (p. 19). The literary work as a “mysterious organic unity” was opposed “to the fragmented individualism of the capitalist marketplace,” and whereas the latter yields rational calculation, the former offers spontaneity. In time, the literary artifact would emerge “as an ideal model of human society itself” (p. 22).

Under the impact of scientific development and the related decline of religious sentiment, literature became in this context a decisive moral and aesthetic regimen: according to one of Eagleton’s sources, English literature would in time be solicited “to save our souls and heal the State” (p. 23). From Matthew Arnold on, “English,” in a period of religious decline, “is constructed as a subject to carry the ideological freight of social cohesion” (p. 24). The “poor man’s Classics,” English literature marked the route to a liberal, humanizing education, first institutionalized as an academic course of study in unexpected venues—not in England’s great universities, Eagleton contends, but in the “Mechanics’ Institutes, working men’s colleges and extension lecturing circuits” (p. 27). Installed in the British curriculum during the final quarter of the nineteenth

century, English literary studies commenced as a “subject fit for women, workers, [and, given England’s colonial project] those wishing to impress the natives” (p. 29).

Though Eagleton’s and Ohmann’s respective accounts of the development of English critical studies are contrastive, what they have in common is the attempt to put in perspective the relationship between manifestations of the creative and imaginative impulses as curricular objects and the material and political bases on which the former are predicated. Not some glorious abstraction, English, which will become the place of habitation of literary criticism and theory, belongs, one way or another, to the industrial phase of capital. Either as a preserve of creative values or as an elaboration of a radically transformed scene of labor, English in the twentieth century would supersede the old, time-honored trivium of the curricula of the Middle Ages—grammar, logic, and rhetoric.

The New Criticism

In 1930 Harper and Brothers published *I’ll Take My Stand: The South and the Agrarian Tradition*, by Twelve Southerners, which might be considered the central doctrinal statement of the Fugitives literary circle and advanced the names of some of the founding personalities of what became the New Criticism in the United States. John Crowe Ransom, whose *New Criticism* (1941) named the movement, the poet Allen Tate, the fiction writer Andrew Nelson Lytle, and the critic and fiction writer Robert Penn Warren, among others, contributed essays to this collection, and there is a good deal of justification to support the view that the New Criticism, running conceptually parallel to Russian formalism, did not exhaust itself for decades to come; if one concludes that “close reading,” or concentration on the text of a literary work, constitutes a minimal condition for the performance or practice of literary criticism, then its strategies would be adaptable to all the “schools” of criticism. In other words what began as a value peculiar to a certain social formulation was transformed into standard operating procedure: the practitioner is no longer focused on “close reading,” but does it automatically. Close reading is considered so “natural” a posture to the work of the critic that whatever else he or she might do with a conceptual object or “hermeneutic demand” is predicated on its facilities. Terry Eagleton argues that close reading involves both a “limiting” and a “focusing of concern”—both because it excises superfluities—considerations such as the length of Tennyson’s beard, for example—and because it enforces, among other things, “the illusion that any piece of language . . . can be adequately studied or even understood in isolation” (p. 44). In any case, for some critics, close reading is an act of reification, or the treatment of the literary work “as an object in itself” (p. 44).

M. H. Abrams describes the autonomous object as a “heterocosm,” or “second nature”: it is “an end in itself, without reference to its possible effects on the thought, feeling, or conduct of its readers” (pp. 35, 327). If, as Eagleton suggests, the poetic object for the New Critics “became a spatial figure rather than a temporal process” (p. 48), then the texts that one associates with the heterocosm, “chartered” by the Coleridgean imagination, makes the critical process itself as demanding as the thing it is interpreting: irony, ambiguity, paradox, and ambivalence

are highly valued poetic practices for the New Critics and will yield, in turn, an appreciation for textual “density” and “complexity” as the watchword of value. The idea is that the poem, in rendering disparate things to harmony, in Shelley’s formulation, achieves a dynamic stillness among competing linguistic and imagistic elements.

That a poem could be imagined to body forth such a beautifully orchestrated outcome makes it the model of a perfected world, well out of reach then and now. But *I’ll Take My Stand* sketches the social and political presuppositions against which some of the early New Critics were operating and how poetic perfection might have provided them with a strategy of retreat from the realm of realpolitik in an era of global depression. These southern intellectuals were on the cultural defensive, given the South’s defeat in the Civil War; General Robert E. Lee’s surrender at Appomattox had occurred in 1865, only sixty-five years before the appearance of the manifesto. It is not difficult to imagine that the “political unconscious” of the “twelve southerners” could engage with, up close and personal, their own historical memory: Robert Penn Warren’s contribution to the volume, “The Briar Patch,” bristles with all the energy of revelation, illuminating Penn Warren’s great anxiety—the industrial/technological transformations homing in on the South: “The chief problem for all alike [the Negro and the white] is the restoration of society at large to a balance and security which the industrial regime is far from promising to achieve” (p. 264). Although what appears to be nostalgia for the full range of social relations imagined as complementary to the “agrarian tradition” runs through the entire volume, the unsigned “statement of principles” (the introduction) could easily be read in concert with “The Briar Patch,” or even anticipatory of it. Written in opposition to the “American industrial ideal,” *I’ll Take My Stand* argues boldly in its introduction that the “capitalization of the applied sciences has now become extravagant and uncritical; it has enslaved our human energies to a degree now clearly felt to be burdensome” (p. xi). Labor relations in this new order also fall under the microscope, as do the new means of production: “The act of labor as one of the happy functions of human life has been in effect abandoned, and is practiced solely for its rewards” (p. xiii). Just so, the apologists for industrialism “have been obliged to admit that some economic evils follow in the wake of the machines,” yet the remedies that they propose “are always homeopathic,” insofar as they “expect the evils to disappear when we have bigger and better machines, and more of them” (p. xiii).

A series of consequences follow from the new relations, and a crucial number of them point toward the cultural indices: “We receive the illusion of having power over nature, and lose the sense of nature as something mysterious and contingent” (p. xiv). If the delicate balance between humans and nature has been upset by the “machine in the garden,” then it follows that for the Fugitives, art, as well as religion, is dependent on “a right attitude to nature” (p. xv). “Neither the creation nor the understanding of works of art is possible in an industrial age except by some local and unlikely suspension of the industrial drive” (p. xv). “Under the curse of a strictly-business or industrial civilization,” life’s amenities “suffer.” Furthermore, a community must find a way to extricate itself from

the toils of industrialism, the “evil dispensation,” as the failure to do so is not only the mark of pusillanimity, but the loss of political genius and the embrace of impotence (p. xx). Despite themselves, context insistently bore down on the New Critics, although, surprisingly, some of them would be keenly attuned to it: “We cannot recover our native humanism by adopting some standard of taste that is critical enough to question the contemporary arts but not critical enough to question the social and economic life which is their ground” (p. xvi).

Bill Readings argues that F. R. Leavis in England and the New Critics in the United States would have “an enormous impact on the educational system” transatlantically (p. 84). According to Readings, the radical claim “for the benefits of literary scholarship was accompanied by a massive attention to the training of secondary school teachers who went out from the University entrusted with a sense of their mission to uphold literary culture” (p. 84). The impact of the new literary scholarship was hardly limited to teacher training, but profoundly altered the exercise of reading by removing the tasks of evaluation and canon-making from the precincts of common sense; in other words, pronouncements on the modern text—the poetry of T. S. Eliot and Ezra Pound, the fiction of James Joyce, for example—would become the vocation of the professional critic, who would read literary passages not only against the context of the text in which it was embedded, but with attention to the “total context provided by the [author’s] work” (Brooks and Warren, p. 1616). Because criticism would become the province of the professionally trained, canonicity and how to determine the canonical would take on capital significance for American criticism. Readings contends that the New Criticism generated disagreement about the canon precisely because the latter was, in fact, “the surreptitious smuggling of *historical* continuity into the study of supposedly discrete and autonomous artworks” (p. 84; emphasis added). The New Criticism brought to fruition a development that quite probably began with the proliferation of “little magazines”—Harriet Monroe’s *Poetry*, which Venture launched in 1912, became a promoter of modern poetry—and the culture of literary salons on both sides of the Atlantic, flourishing as early as the 1910s. The artistic entrepreneurial spirit of Bloomsbury, the London intellectual circle dominated by Leonard and Virginia Woolf, as well as the intense collaborative energy central to some literary masterworks, such as Eliot’s *Waste Land* (1922), strongly shaped by Pound, prepared the basis of reception for the very notion of the art work as autonomous. In fact, the stirrings across the range of the “seven arts”—in literature, painting, music, modern dance, drama and the stage, photography, and the new kid on the block, cinema, all heralded the heady transformation and new persuasions at work. For poetry and literary criticism, the New Critics would give the impulse a name: modernism.

Formalism and Beyond. It might come as a matter of surprise for some readers that according to Lee Lemon and Marion J. Reis, “During the 1920s a group of Russian critics urged the separation of literature and politics [which] challenges our popular clichés about Soviet control of literary theory” (p. ix). In their succinct account of Russian formalist criticism, Lemon and Reis go on to observe that the early work of the Russian formalists and the America New Critics demonstrated certain

concepts and strategies in common, among them: (1) “an attack against traditional academic scholarship”; (2) a critical theory that drives a corridor between literature and other disciplines of the human sciences, such as history, philosophy, and sociology; and (3) a strategy of literary investigation that would advance the “analysis of structure” in the place of discourse about “background, social usefulness, or intellectual content” (p. x). Literary critical performance would later annul the breach with related disciplines, not so much by “going over” to them, but by “translating” their content, in effect, into literary values and analogues, as is the case with poststructuralism, which gained ground from the 1970s on. But the isolation of structure, beginning with the formalists and the New Critics, enables the emergence of a conceptual object that gains a precision of focus comparable to the scientific object.

The wedding of formalism and the New Criticism, never officially pronounced as such, provided a merger called “formalism” that dominated literary study on both sides of the Atlantic from the 1930s through the late 1960s. The aims of this prolific period of theorization are perhaps most poignantly captured in the titles of certain works that attempt to configure literary study as a “system”—René Wellek and Austin Warren’s *Theory of Literature* (1942) and Northrop Frye’s *Anatomy of Criticism* (1957), for example. More pointed investigations in genre theory—the meaning of poetry, the development of the novel and short story, studies in allegorical, symbolic, and mythic modes, as well as inquiries into the “grammar of motives,” the “rhetoric of motives,” and the “philosophy” of literary form—all mark this period as one of the most distinct and distinguished chapters in the history of the modern humanities, but they also help to establish the foundations of what was referred to earlier as a centrifugal movement in literary study. In other words, formalism brings about the *institutionalization* of the study of literature and language, both in the academy and in the marketplace of ideas. But it also opens onto the possibilities of a broader application of literary method across the universe of signs. The not entirely playful or lighthearted complaint from scholars outside the field that personnel in English believe that they can “read” anything is not exactly misplaced; there is an ascendant logic operative here that grants primacy to the word/words. If the Russian formalists, as early as the period of the Russian Revolution, had been influenced by the enormous impact of the science of modern linguistics—primarily by way of Roman Jakobson—then the “structuralist turn,” via Parisian intellectual circles, would integrate linguistic method and ideas into new systems of thought.

It would appear to the graduate student in English in 1968 that something quite astonishing was happening on the ground. Change was in the air and coming from a number of different directions, not the least of them political. The ramifications of those changes—the presence of larger numbers of minorities and women, on faculties and in student bodies, at American colleges and universities, as well as the commencement of “multiculturalism” as a mode of scholarly study and address—would reverberate right through the contemporary period. The year 1968 might be regarded as a time of rupture, on the one hand, brought on by the transatlantic youth movement (in the United States, the Vietnam War protest movement ran parallel to the

black nationalist movement and the continuation of the civil rights struggle, while in Europe, particularly in the big cities, students, demanding transformation in the educational system and allied with Labor, especially in the French instance, threatened political order). On the other hand, the literary object, destabilized by a reinvigorated debate on the canon, would seem to displace continuity with formalist and neoformalist persuasions onto questions that had not been asked before, such as How does one read as a woman, or a black person, or a post-colonial subject? Though it appears from the vantage of the early twenty-first century that these transformations occurred all at once, it is fair to say that they systematically unfolded over the last three decades of the twentieth century, falling out in a kind of domino pattern. As new legislation had been required to reinforce equal protection for minorities in public accommodations and at the ballot box, rights initially secured by the “citizenship” amendments (the Fourteenth, Fifteenth, and Sixteenth Amendments) to the U.S. Constitution, gender equality in access to higher education followed by legislative mandate. The entire panoply of multicultural occasions swam in its wake. While it would be appropriate to regard the 1960s protest movements in light of global development subsequent to the end of World War II, the isolation of intellectual currents in this sea of change is instructive.

Just as John Crowe Ransom’s *New Criticism* in 1941 heralded a paradigm shift that had been well under way for at least two decades, Richard Macksey and Eugenio Donato’s *The Languages of Criticism and the Sciences of Man: The Structuralist Controversy* (1971), which introduced to an English-speaking scholarly audience many of the themes that would come to dominate critical inquiry for the next few decades, pointed to a radical shift in the humanities repertoire. Macksey and Donato’s table of contents contains the names of many of the major continental thinkers whose projects would model the new scholarship, from René Girard, Georges Poulet, and Lucien Goldmann to Roland Barthes, Tzvetan Todorov, Jacques Lacan, and Jacques Derrida. Though the volume was not published, originally, until 1971, the event that engendered it had taken place during the fall of 1966 at the Humanities Center of the Johns Hopkins University. Supported by a grant from the Ford Foundation, this international symposium brought together more than one hundred humanists and social scientists from the United States and eight other nations. According to Macksey and Donato, the symposium initiated “a two-year program of seminars and colloquia which sought to explore the impact of contemporary ‘structuralist’ thought on critical methods in humanistic and social studies” (p. xv). The purpose of the symposium was not to consolidate an orthodox view on structuralist method and thinking, but, rather, “to bring into an active and not uncritical contact leading European proponents of structural studies in a variety of disciplines with a wide spectrum of American scholars” (p. xv). The 1966 convocation marked a turning point in the way that literary studies would be configured, and it also enabled the interdisciplinary extension of the latter in the direction of “cultural studies.”

Perhaps the single most radical mark of the “structuralist turn” is the “death” of the subject, which opened the way to

critical practices, deconstruction prominent among them, in the contemporary era. But the fate of the subject might be thought of as the consequences, or end results, of a series of premises that begin with the concept of “system,” which Culler describes as “behind the event, the constitutive conventions behind any individual act” (1975, p. 30). If the prestige and success of the science of linguistics had had an enormous impact on literary study, then it would find application to other cultural and material phenomena on two fundamental grounds: First, cultural phenomena are constituted of objects and events that are riddled with meaning. Such events are, therefore, signs, and signs, as Ferdinand de Saussure (one of the preeminent founders of modern linguistics) contended, are made up of *signifiers* (auditory images that match a concept) and *signifieds* (strings of signifiers that yield meaning). Because cultural phenomena behave like language in yielding meaning, one can, then, in Culler’s words, “investigate the system of relations that enables meaning to be produced” (p. 4). The science of signs, or semiology, was therefore enabled by the insights of linguistics. Second, the event in question is not only rule bound, but its rules cohere in an entire ensemble of relations: According to Culler, “Rules . . . do not regulate behavior so much as create the possibility of particular forms of behavior” (p. 5). The best example, interestingly enough, comes out of lived experience: the English speaker has unconsciously mastered a host of complex operations called language competence; but the utterances that she will speak over a lifetime do not exhaust the *possibilities* of sentence formation in the English language (or any other), nor do such utterances even use up the *potential* formations that this individual speaker could generate. Following on the distinction between *la langue* (“a system, an institution, a set of interpersonal rules and norms”) and *la parole* (“the actual manifestations of the system in speech and writing”), structuralism was able to posit *systematicity* across the universe of signs, from fashion modes and food consumption to the conduct of poems, novels, and films (Culler, 1975, p. 8). By investigating the rules behind material manifestations and events and what ensemble of relations they were configured in, the structuralist, at least in theory, could reconstruct how things come *to mean*.

When the French theorist Michel Foucault argued the “death” of “Man,” or his “end,” he was not talking about a nuclear holocaust, but, rather, the displacement of an anthropomorphic centrality onto theories of the constructed character of human and social events; in other words, the human subject, though events pass through him and have meaning for him by way of institutional and conventional practices, is not the autonomous being that Hegelian metaphysics had posited; he is instead the *outcome* of cultural forces and processes not only beyond his control, but beyond his knowledge. The radical nature of this proposition is perhaps most poignantly demonstrable in language itself: As Culler attests, “Individuals choose when to speak and what to say . . . but these acts are made possible by a series of systems which the subject does not control” (1975, p. 29). Therefore, “I” do not speak so much as “I” am “spoken,” or enter into a system of human and social relations on which the individual “I” is entirely dependent. When these influences are juxtaposed with the innovations of Sigmund Freud and psychoanalytic practice and theorization

in the wake of Freud’s *Interpretation of Dreams* (1900) and its revelation of the *symptom* in dreams and the neurosis, then we reach the Lacanian synthesis of psychoanalysis, heavily influenced by structuralist thought. In the *Four Fundamental Concepts of Psycho-analysis*, Jacques Lacan would assert that the unconscious (the privileged site of the Freudian mental theater) is “structured like a language” (p. 20). Moreover, even “before strictly human relations are established, certain relations have already been determined” (p. 20). Lacan calls these preestablished or prior relations “supports,” offered by nature and “arranged in themes of opposition.”

Deconstruction and Beyond

It would be difficult to overstate the implications of (1) the recession of the subject of the humanities, (2) the emphasis on systematicity and process, and (3) the flattening out of the literary object in a vast sea of textual properties and equalities; in the aftermath of structuralism, between the mid-1960s and the mid-1970s, “literary criticism” would become one of a number of critical foci that joined a textualized universe wholly explicable by a generous term called “theory.” Texts of philosophy, history, anthropology, and psychoanalytic practice, among other writings deemed to have powerful explanatory value, mixed and mingled in the corridors of criticism with uncustomary abandon, “guests,” as it were, of the English department and the departments of comparative literature and modern languages. Bridges between these allied disciplines were supplied by a widespread importation of the writings of continental thinkers, particularly the French contingent. Of prime importance to these developments were the philosophy and methodology of deconstruction, articulated through a critique of modern philosophy by Jacques Derrida, in his *De la Grammatologie* (1967; *Of Grammatology*), a work that was enormously influential to the development of theory in the poststructuralist period.

Deconstruction casts its gaze at the dominant trend lines of metaphysical philosophies that posit the centrality of the *logos* (the word) and the presence of speech/voice; through a “double gesture,” as Jonathan Culler explains it, the deconstructionist project seeks to *reverse* the classical oppositions of philosophical writings at the same time that it exploits or uses them. By way of such reversals, deconstruction effects a displacement of the philosophical system. Deconstruction is carried out primarily as paradoxical procedure because it undermines “the hierarchical oppositions on which it relies” (1982, p. 86). One might think of deconstruction, then, as “the story of reading” writing (1982, p. 35), insofar as it ultimately holds that writing is a “writing-in-general,” an “archi-écriture,” or a “protowriting which is the condition of both speech and writing in the narrow sense” (1982, p. 102). It seems that the key displacement executed by deconstruction is that of the “origin,” or “beginnings”; as origin recedes, “transcendence” follows in its wake. If the “origin” of the “word” is taken as leading figures of thought to be displaced in the classical schemata, then a universe of oppositions opens up, splitting off positives and negatives, truth and falsity, presence and absence, good and bad, superior and inferior. The negatives can be lined up under one rubric and the positives under another, or the degraded class of objects over and against the transcending ones. By contending that these punctualities are the

result of the manipulations of language, or the effects of the play of signification, rather than the hallmarks of truth, deconstruction posits *différance* (a French neologism) as the condition of meaning—an interminable interpretation and analysis, or in Culler's words, an "act of differing which produces differences" (p. 97). *Différance*, as a paronomastic device, contains deferral (or cancellation of closure), as well as difference, in the sense of *differing from*. From Saussurian linguistics, the deconstructionalist reinforces the notion that *meaning* works by *signification*, but the latter is driven not by the meeting of opposites, but by the annulment of the latter. In other words, we can only account for the bombardment of differing elements. For example, a "tree," the sign vehicle, is a "tree" because something else is "not-tree," and so on, ad infinitum.

Interestingly, some of the best examples of the play of difference are presented in the "Sense-Certainty" segment of Georg Wilhelm Friedrich Hegel's *Phenomenology of Mind* (1807), and in the vertiginous exceptions of Plato's *Parmenides*. The "now" that Hegel turns over, for instance, is not something under the thumb and pinpointed, since it is a continuity that "grows" into the present, ever passing into the "not-now," both the future and the has-been (p. 152). That simple "now," according to Hegel, is "therefore not something immediate, but something mediated." It might appear that this tedious activity of discrimination would sustain only esoteric appeal, but in truth, it seems convertible into a powerful heuristic tool or "speculative instrument," insofar as it also calls into question the entire repertoire of the mundane, of the domination and dogma of "common sense," "reality," "what we all know and believe," and the limitless orthodoxy of "*what is*"—"that which everywhere, that which always, that which by all." Furthermore, if truth no longer has a guarantor in an undivided origin, then we are doomed to, or liberated from, *essences*—or the gold buried beneath the dross, as the philosopher Louis Althusser would have it—to the entanglements of *existence*.

The contemporary women's movement or the critique of knowledge undertaken by the black studies project, and deconstruction, are not customarily spoken of in the same breath, but if the latter is thought of as the inscription of an *attitude* toward the symbolic enterprise, then it might be seen as the perfect context for a radically altered humanities academy. If origin is questionable, then it follows that canons will be, as well, and once canons are toppled, then an entire ensemble of hierarchical operations (one gender over another, one dominant race and its "others") might be rendered moribund, or at least brought down to size.

The curricular objects of women's studies and African American, Marxist, and postcolonial critiques are the newest epistemologies of the humanities academy, both enabled by poststructuralist methodologies and going well beyond them. The repertoire of critical inquiries on sexuality, the New Historicism, and a range of cultural studies constitute the most exciting developments in a field generally known in the opening years of the twenty-first century simply as "theory." From Chicago to China, one of the languages that speaks across the cultures is that of "theory," now a global language of scholars in the humanities.

LITERARY HISTORY. History traces the passage of men and women through time. Literary history charts their developments and experiments in writing in the hope that global discourse will be stimulated and cultures come to understand one another. It relates, compares, and categorizes the poetry, prose, drama, and reportage of authors at various periods. The process started when the artistic deployment of language (poetry, polemic, drama, and stories) began to inspire a significant following. There arose a "culture of response" or a body of people—priests, scholars, educators, and fellow writers—who extolled select works and ensured their preservation in archives and public buildings. In this manner a "canon" or corpus of writing was put together that was deemed significant in relation to the culture because it reflected nationalistic bias, religious, political, or aesthetic partiality. The "models" or frameworks of admission altered as knowledge progressed, printing became widespread, and attitudes and styles of writing changed. Around the world separate cultures evolved their own criteria, forms, and traditions, ranging from doctrinal works such as Buddhist sutras and Vedic hymns to Japanese dance-drama (the Noh plays) and Chinese operatic drama or chuanqui. Within such works were found ideas that had a lasting effect.

In the Western model, for instance, Plato (c. 428–348 or 347 B.C.E.) believed poetry was merely imitative, but Aristotle (384–322 B.C.E.) praised its imaginative truth, while Homer thought his inspiration "God given"—standpoints that were echoed and debated down the centuries. After the Greeks and Romans, many critical ideologies emerged in Europe, invoking morality, passion, and truth to life and authorial intention, but it was not until the twentieth century that the sound of theories clashing drowned the traditional debate between critic and author (a debate that did not much affect the public who continued to read books for pleasure). Ironically the shift of spotlight from creator to commentator climaxed in a critical task force that sought to detonate its own foundations or "deconstruct" the very language of its discourse. Ostensibly radical, this was no more than a revival of an ancient revolt. For language from the start had always sought to analyze or "argue" the authority of its being, just as man had always sought to challenge the authority of God. From the beginning, literary history tended to be presented as a sequential progression—a dialogue or "confrontation" between successive ages and schools of writing, one "great book" or "genius" spurring another, starting with texts concerned with man's status in the universe, specifically his mortal limitations as opposed to the immortal gods.

Early interest focused on myth, out of which emerged the hero who stood taller than the rest, loyal, brave, and fabulously

resilient. The Sumerian *Epic of Gilgamesh* tells of a swaggering young prince who defies the gods, bonds with another warrior-hero, and meets the fate that such a rebellion inevitably courts. It ends with a massively moving death lament. Gilgamesh *has* to die in order that he retain his humanity. If he did not, he would be a god and forfeit that essential *realism*, or truth to the mutable world, that is the hallmark of great literature.

The Greeks showed a similar preoccupation with gods and heroes. If their analysis went deeper, they too held by laws in which the overreacher—the man who commits an irreversible act against nature—is abandoned to the Furies (primitive avenging spirits), who demand he be sacrificed in order to maintain the status quo. This is notable in Greek tragedies, especially Sophocles' *Oedipus Rex*, whose harsh, unrelenting climax is often viewed as pitiless. With respect to such forms, Aristotle introduced an ethical dimension when he analyzed the rhetorical devices and idioms of the fourth century B.C.E. in his *Poetics*, a foundation-stone for students of literature (as well as Hollywood scriptwriters), for it launched the notion of plot or *mythos* as a device conveying unity of theme and action. Crucially, the concepts *mimesis* and *catharsis* were defined, the first positing language as imitation and the second dealing with the emotional purgation—a mix of horror and pity—arising in the spectator of a powerful tragedy. Aristotle's compatriot, Plato, denied the highest truth to literary art, seeing literature as too attractively persuasive. As for the Greek myths, with their stunning organic imagery and metamorphoses, they inspired every age of literature, perpetually updated and adapted as novels, operas, and plays.

The Religious Imperative

Equally far-reaching, in Europe, was the impact of Christianity. With its volatile mix of stories, poems, and sacred and prophetic texts, the Bible provided a moral groundwork that formed the basis for hagiographies, sermons, and devotional verses. The book of Genesis unlocked “Logos,” the divine word or sacred seal of inspiration: thus, being literally “God given,” language was able to transcend the clasp of mortality and enshrine the numinous. Literature was annexed for the promulgation of doctrine. A library was an institution that preserved sacred texts rather than a place where a commoner might go and acquire knowledge. The one great rebel was Satan, who, having been expelled from Heaven, pursued his counteroffensive among the fallen and fallible of the world.

With the spread of monotheism, the relationship of man to God dominated prose and poetry. In the early medieval period, fables, histories, and courtly tales of love and chivalry predominated. Stories were promoted as exempla, designating a suitable way to behave in order to draw down grace or, alternatively, court damnation. However, in the *Phaedrus*, Plato had placed art a rung below “truth,” being a product of materiality rather than spirit. Hence it could never be wholly trusted.

So that the Bible should hold absolute authority, this doctrine was modified by the Scholastics (c. 800–1400), whose era of crippling, devotional studiousness was shattered by the

Renaissance of the fifteenth and sixteenth centuries—an amazing upsurge in learning that held fast to classical models (Plato, Aristotle, and Cicero's rules of rhetoric) yet managed to accommodate a vast influx of new ideas—from science, natural history, philosophy, theology, botany, mechanics, anatomy, and engineering. Literary art promoted a worldview with God and his angels at the top, a spiritual cartography that found its acme in Dante's *Divine Comedy*, in which love was the redeeming force and every station of saint and sinner had their precise place and part.

Naturally a great deal of literature was the preserve of monks and scholars who tended to propagate heroes of a devotional bent. By the time of the Reformation (1517), this mold showed signs of cracking. Eventually it was superseded by a new type of psychological truth, typified in England by the dramas of an emergent laity that included men such as Shakespeare, Christopher Marlowe, and Ben Jonson, writers who portrayed characters—villains, nobles, and commoners—bursting with painful, turbulent contradictions hinting at the inadequacy of religion in engaging human dilemmas.

Enlightenment and Romanticism

The Enlightenment of the seventeenth and eighteenth centuries is often vaunted as the age of reason. But it was also an age of passion, profound thinking, and revolutionary zeal, allied to a robust practicality, Aristotelian in outlook. John Locke (1632–1704) evolved a theory of the personality and a far-sighted, liberal political philosophy. Less idealistic, Thomas Hobbes wrote *Leviathan* (1651), a masterly analysis of man's place with regard to nature and society. Religion remained institutionally entrenched (if a little shriveled by the skepticism of David Hume) and the dominant literary mode, classic in character and reformist in outlook, found its outlet in urbane, sometimes sardonic stylists like Voltaire (1694–1778) and Diderot (1713–1784) in France. Equally puncturing of pretensions were the heroic couplets of Alexander Pope and John Dryden in England and novelists like Samuel Richardson and Henry Fielding, portraying social rather than God-seeking characters engaging in intrigues and amours.

The French Revolution brought republicanism, in which commoners replaced kings, and taxes were more evenly distributed. But military aspirations rampaged across Europe and Russia until the defeat of Napoléon Bonaparte. The Romantics of the late eighteenth and early nineteenth centuries were caught up in this spirit of rebellion. *Liberty* was the shibboleth of the poets William Wordsworth, Lord Byron, and Percy Bysshe Shelley—a word hoarding spiritual and political connotations. Language no longer favored the noble above the plain, for it was thought that the artist's intention elevated the subject matter. German Romanticism followed in the wake of the English initiative and, like its forerunner, throbbed with nature, passion, and intrigue but with an added spicing of wit and sexuality.

Where the Romantics had shown a preoccupation with themes like murder, intrigue, and incest, the nineteenth century developed the skills of everyday observation. Above all, it was the age of realism in the novel, embodied in the psychological

narratives of Leo Tolstoy, Fyodor Dostoyevsky, Charles Dickens, and George Eliot: multilayered fictions set in worlds so convincingly realized that they seemed to reflect life as *experienced* rather than imagined. It was also a time of the professional man of letters who, at intervals, appraised the state of culture, typical English examples being Matthew Arnold and John Ruskin, the first a poet of distinction and the second a social critic and art historian. Victorian poetry was marked by a facile, routine romanticism that finally darkened and putrefied: hence the morbidity of content, the gothic shadow falling over some of the works of Robert Browning (1812–1889), Alfred, Lord Tennyson (1809–1892), and Edgar Allan Poe (1809–1849).

The final decade of the nineteenth century was enlivened by the walk-on of the decadents, who started in France but quickly spread over the English Channel, espousing a doctrine similar to the symbolists: that art was free to treat whatever subject it saw fit, whether pernicious or virtuous. Art for art's sake (a slogan translated from the French of the philosopher Victor Cousin) was the byword, emancipating the creator—if he or she so wished—from conscience or morality. The decadents liked to celebrate small, exquisite instants in small, exquisite poems, sipping at life as if it were a rare wine.

From Masterpiece to Text

With the advent of the twentieth century came a shift from elitism to inclusivism. Despite the elite radicalism of factions such as the modernist who sought to break with the past and incorporate in their projects the staggering breakthroughs in science, anthropology, medicine, and psychology, the citadel of high culture was opening its gates. In the same way that the people of various countries were demanding a government in which their opinions could play a central role, literature became more democratic, spawning free libraries, open scholarships, and popular editions. Eventually there spread an awareness that all facets of culture, oral or written, constitute a “text,” and the traditional fixation on a corpus of “masterpieces” was a blinkered way of evaluating culture.

A noted leveler was the psychologist Sigmund Freud (1856–1939), who showed how people tend to think and act the same—that all are dominated by hidden urges. Each man and woman has a subconscious in which sexual desires bubble and fume and are liable to spill over in erratic or outrageous behavior—ideas that opened the floodgates of creativity and literary experiment, unleashing the “stream of consciousness” technique, in which a rush of unpunctuated, sometimes loosely associated words are made to stand for dreaming or thought-play, notable exponents of the latter being James Joyce, Virginia Woolf, and William Faulkner.

As experiment brewed in artistic circles, elsewhere the dream of freedom was degenerating into tyranny and nightmare. In the Soviet Union, Joseph Stalin wrested power in 1924, followed by Adolf Hitler in Germany in 1933. Both the Communist and Nazi regimes banned free speech. In Russia, novelists were condemned as “insufficiently ideological” or as putting self before state, and in Germany the works of select writers were ritually burned as “Jewish” or “decadent.” Literature was promoted as an extension of a cause, much as it had

been during the Middle Ages. Whereas Nazism had effectively died out after World War II, the Communist dream persisted through the writings of Karl Marx (1818–1883), whose ideas pioneered an influential school of literary criticism.

Marx's thesis was that the worker, alienated from his product by contractual enslavement, had no status and was there solely to serve his master. And, of course, to him the master was equally remote, unsolid, and this notion of invisibility or “nonpresence” takes us to the core of modern literary theory: the author as anonymous ghost haunting the boundaries of his or her text.

For just as science at the turn of the century was breaking matter into tinier and tinier particles, literary criticism was separating the finer elements of language, analyzing units of sound and syntax. The theories of Ferdinand de Saussure (1857–1913) identified sequences of self-contained signs whose parts could be isolated into vocal utterances (*parole*) and the abstract structure that organized them (*langue*). Saussure was a major influence on the Russian formalist movement, which had its inception in 1914 at Saint Petersburg, headed by the critic Viktor Shklovsky (1893–1984), who fused symbolist ideas with his own manifesto, demanding autonomy for the text, discarding any social role for literature, and cultivating metaphor, mystery, and radical perception.

This propensity to focus on language, its emotional and figurative charge, was also a precept of the New Criticism that developed in England and the United States after World War I. Treating a poem or novel as a self-contained artifact, this approach took the text apart in a precise, clinical manner, paying attention to aesthetic balance, the interplay and opposition of imagery, excluding social and biographical factors that existed beyond the page. The overall unity of the work—how parts were orchestrated to harmonize or counterpoint one another—was considered as indicative of its quality in the “Western tradition,” which held by formal standards of excellence.

With emphasis on the autonomy of texts, words drifted from their anchorage in the physical. Signifiers were seen as signaling to each other rather than the reader. This reached its apotheosis in the writings of Jacques Derrida (b. 1930), who subverted the notion of a single meaning. The author was not a spider presiding over a web of words. No, he was a fly trapped in it—unaware that his work held messages at odds with the stance he thought he had taken. What critics of the past had done was “privilege” various angles and themes, taking in current thought and social mores, but their readings were more acts of faith than rational appraisals. Derrida drastically hinted that the totalitarianization of meaning—the obsession with a single clear authorial intention—found a counterpart in the inflexible rationalism of the Nazi death camps.

Such theories began to infuse the novel, which started to question its own fictive illusion, just as had the German playwright Bertolt Brecht (1898–1956) when he sought to separate the political message from the drama by exaggerating the elements of artifice and so creating a sense of “alienation.” So-called metafiction was produced that ridiculed the procedures of novel writing and, in one instance (B. S. Johnson's

1964 novel *Albert Angelo*), had the angry author breaking through the page shouting, “O fuck all this lying!” At last, Narcissus had smashed the mirror.

Guilt and Contrition

Aside from innovation, propaganda, and linguistic debate, the twentieth century was an age of guilt and contrition. The guilt was based on a dawning awareness of the elitism of Western culture. Contrition took the form of an eagerness to make good the oversight by broadening the definition of literature and including in its field hitherto silent minorities whose voices initially took the form of protest, their cultures having been so long patronized that the “imaginative” content needed longer to emerge. In 1925 the educator and critic Alain Locke (1885–1954) issued a manifesto to young black American artists, challenging them to draw upon the power of African art as avant-garde artists in Europe had done. However, many of those to whom he appealed had not even been to Africa, and to them it was as much a place of fantasy as it was to the white men. Africa was grasped in terms of distance, vastness, and a savage sensuality—qualities that writers like D. H. Lawrence (1885–1930) had strained to capture. Negritude had its origin in the Caribbean and was defined by poets like Léopold Sédar Senghor, who conveyed a sense of anger and injustice in torn, surreal images.

Another minority impacting on current thought were women writers who mobilized to form a cultural force after World War II, key texts being Simone de Beauvoir’s *The Second Sex* (1949) and Kate Millet’s *Sexual Politics* (1970). The matter had earlier been raised in Virginia Woolf’s *A Room of One’s Own* (1929), but the tone was now combative, attacking the patriarchal roots of the Western canon and drawing attention to female writers whose stature had been overlooked or denied. Such efforts stimulated a massive wave of gender-based critiques—gynocriticism—that analyzed and tried to reshape the culture that, as they saw it, was based on male bias and partiality.

With the interest in hitherto marginalized groups and communities came an increased recognition of the political and economic factors that permeate culture and leave their impress. Insights like these gave rise to the New Historicism, a mainly American school of criticism, Marxist in flavor, that used texts to pinpoint the political and social conditions, the ideologies and judgments that, inevitably, color and bias writing—in opposition to the Romantic view of the author being a wellspring of unpolluted inspiration. The critic analyzes oddments, small, previously ignored details and facts, typical yet eloquent, exposing literature as a tool of history.

Contemporary Dilemma

By the twenty-first century, the Western model of literary history had been dramatically extended, taking in Asia, Africa, Australia, South America, the South Pacific, and the Arab world. Its approach had been criticized as a series of “generalizations” working through contrasts and continuities—an “institutionalized subjectivity,” as the French critic Roland Barthes would have it. (And yet, many believed, such a summary or “distortion” is inevitable if information is to be condensed

within a certain remit.) It infers an almost kinetic impact between literary movements, whereas a scientist might argue this is not *how things happen*, merely a habit of human perception. Is the model then valid? Or is it a piece of illusionism, a series of traditionally accepted linkages? This is the type of question literary history had begun to ask of itself. Having broadened its scope to encompass the world, it was almost the history of everything (“everything” and therefore “nothing,” some critics might say).

Thus previous classifications were being reexamined and fresh approaches made, considering not just the text but, for example, the prevalent institution, the critical orthodoxy or heterodoxy, in which it was first received. Threads of movements such as classicism, romanticism, and naturalism, together with critical theory, were being redefined within a pattern that, inevitably, will grow more intricate and extensive as the field of study reaches out to the vernacular, cinematic, and oral, where previously it had focused on the canonical. The new methodology will go far beyond the aesthetic, developing an increasingly comparative methodology, moving between past and present, drawing on disciplines like sociology, economics, and politics.

This epic inclusiveness generates anxiety as well as excitement among its practitioners, who must trace vibrations from reader to society, from society to politics, from politics to the world. Keeping literary history up to date is like being both cannibal and victim, devouring past texts in the hope of completion, only to be swallowed in turn by the recorders of futurity.

Overview

African Literature

OVERVIEW

Almost all senses of the English word *literature* and its cognates in other Indo-European languages can eventually be traced back to the act of scratching (on a piece of leather or on clay, stone, wood, wax, pottery, lead, or papyrus). But this primitive act very quickly became associated with superior development: civilization.

The Appearance of Literacy

The word goes back first to the Latin *litteratura* (writing, grammar) and *litteratus*, which denote learnedness derived from writing, or literacy, and then to *littera*, or letter. (The French *littérature* has the same roots.) It is conjectured that the Greek root of the Latin *littera* is *diphthera*, meaning a leather hide prepared for inscription. In his *Institutio oratoria*, Quintilian (c. 35–c. 100 C.E.) uses the word *litteratura* as a translation of the Greek *grammatikē* (Wellek). As such, it represents the art of the letter (*gramma*), which would denote the ability to read and write and hence the rules or “grammar” governing this ability. But the Greek word for writing, *grammata*, also means “scratchings”—its Indo-European root, *gerebh-*, means “to scratch.” The English verb *to write* derives from the Germanic *writan*, also meaning “to scratch.” The English word *Scripture*, like the German *Schrift* (a *Schriftsteller* is a literary person), can be traced back to the Latin verb *scribere*, “to write,” and then to the Indo-European root *skeri-*, from which come a host of words having to do with cutting. The Indo-European *skeri-* has a variant form *krei-*, denoting separation, sifting, and discrimination, from which comes the Greek *krinein*, meaning “to judge,” and later English words such as *critic* and *criterion*. One of the meanings of *sker-* is excrement, hence something worth knowing how to avoid. One can discover in literature’s philological beginnings nascent forms of nearly the entire family of ideas that would come to be associated with the word *literature*: letters, writing, literacy, learnedness, discrimination, distinction, criticism, and judgment. Because, almost everywhere, writing and reading—unlike speech, acquired in infancy—were skills that demanded time and effort to acquire, literature, more or less by its nature, had its beginnings among groups that not only were socially empowered to make distinctions (priests, scribes, bards, chiefs) but also were socially distinguished by the very fact of being literate.

As Barry Powell observes, it has long been a puzzle why the narratives generally considered the oldest examples of Western literature, Homer’s *Iliad* and *Odyssey*, have all the structural

characteristics of advanced, literate societies yet contain no mention of writing itself. The one reference to “baneful signs”—not yet *grammata*, or writing—in the story of Bellerophon (*Iliad* 6.157–211) came to Homer from the Levantine East, as did many other elements of the Homeric epics, and it may suggest that the poet whose version of the *Iliad* was finally written down did not yet understand what writing was. Literature in any guise came late to the West: the written forms of the Homeric epics date from around the time of the invention of the Greek alphabet, c. 800 B.C.E., while reference to written documents appear regularly in much older narratives from Egypt and the Near East, c. 1800 B.C.E.

The oxymoron *oral literature* has been used to describe unwritten compositions in story, poetry, or song, transmitted with many variations over time, though the rubric remains mired in much dispute (Lord). People have most likely told stories about themselves, their gods, their heroes, and the creatures, both real and imagined, surrounding them from the beginnings of language, and such storytelling is still an integral part of what is meant by the term literature. But the process by which supposedly oral compositions like Homeric epic poetry came to be written down is unknown. Similarly, while the extant Bible is largely a mix of documents assembled piecemeal from preexisting (and now lost) documents, oral accounts must have been part of many biblical stories. Abraham may have existed as early as 2000 B.C.E., Moses around 1200 B.C.E., but no written account of them survives from before the sixth century B.C.E. Well before the Latin word *litteratura* existed, Homer’s epics and Hesiod’s *Theogony* already included what is now recognized as a wide range of genres or modes of writing, from the skillfully entertaining to the legal, philosophical, historical, and religious. If oral traditions that survived into the modern period are any guide, oral performances designed for entertainment employed a range of structural devices and tropes that helped define what came to be called “literary” language. A general consensus arose in the late twentieth century that alphabetic writing made possible whole ways of thinking not available to nonliterate societies (for different approaches, see Ong and Goody). Certainly literacy seems to have facilitated military conquest and administrative authority. But it is hard to know precisely how the psychological or cultural consequences of alphabetic writing in the West, beginning in Mesopotamia, differed from those of writing in China, which had a quite distinct history; or how much of what is called the “literariness” of novels, poems, and plays ultimately derives from preliterate oral performance or perhaps from the innate structure of human consciousness.

In Sumeria and Egypt and in China written documents and ways of talking about writing appear earlier. Writing first appears in Sumer c. 3400 B.C.E. with the inscription of shapes into clay for the purpose of counting objects, though the use of smaller objects themselves as tokens is much older. At a certain point, perhaps first via pictures (pictograms) and then via increasingly abstract symbols, phonetic units came to be linked to written ones, and writing came to be considered the legible form of speech. It can be said that the earliest (cuneiform, logographic) literary texts could not actually be “read,” since one still needed aural instruction to be able to pronounce the radically

incomplete sequence of signs. The epic story of Gilgamesh survives in several different language families (Sumerian, Semitic, and Indo-European) and scripts (cuneiform and Luwian), the longest version from the seventh century B.C.E., the earliest from perhaps the fourteenth century; the hero-king himself seems to have existed in the third millennium. Chinese script may be even older than the Sumerian and certainly dates from at least the second millennium. In Chinese, unlike the phonetic writing that developed in Sumeria and then in the Greek and Latin alphabet, one finds in the same sign a phonetic element and a nonphonetic element, or semantic “radical.”

Literature in the Early West

The Hellenistic Greeks had a robust sense of the different kinds of writing within the idea of *grammata*. In book 10 of the *Republic*, Plato distinguished sharply, for example, between philosophy (dialectic), which he championed, and poetry, which he wanted to ban because of its propensity to settle for superficial views of things and to stir the emotions unnecessarily. Aristotle’s treatises *Interpretation* (comprising grammar and logic), *Rhetoric*, and *Poetics* are some of the earliest examples of criticism. His *Poetics* is generally considered the founding text of literary interpretation in the West, though the term explicated by Aristotle is not *grammata* but *poiēsis*, which means “making” or “creating” as well as “poetry” and “poem.” Nevertheless, the treatise clearly sets out a theory of literary genres and thoroughly anatomizes one of them—tragic drama—to demonstrate its essential structure; its psychological effects on its audience; its bases in Greek culture and myth; its distinctness from history and philosophy as well as from other types of poetry, such as epic and lyric; its ability to give pleasure and to reveal truth; and its relation to fate and the gods. Aristotle’s ideas have remained touchstones throughout the history of literature in the West, and it would be fair to say that the academic study of literature would not be the same without them. They were revived in a dogmatic form by the French in the seventeenth century and are still routinely taught in the twenty-first century.

Romans such as Cicero used the term *litteratura* to mean both writing itself and learning. It was the early church fathers of the second century, such as Tertullian in *De spectaculis*, who distinguished between sacred and profane writing—*scriptura* versus *litteratura*—within the Christian tradition and who elevated the former above the latter for several centuries. During this period, the profane term *litterature* and its cognates appear to have had little currency. In the British Isles there is a small canon of Anglo-Saxon poetry beginning in the late sixth century. With the exception of *Beowulf*, a narrative poem assembled from earlier sources in the seventh or eighth century, the development of a major classical genre, such as epic, seems to have been hindered for a time by the dominance of Christianity. In France literacy and learning were revived by the court of Charlemagne (742–814), king of the Franks from 768 until his death and Holy Roman emperor (from 800), but the legend of Charlemagne is handed down in various forms before the epic *La chanson de Roland* appears in early twelfth-century medieval France. The twelfth-century *Poema del Cid*, perhaps the most important of early Spanish epics, embellishes

in courtly, Christian terms the deeds of a noble, eleventh-century Castilian soldier of fortune.

The patristic Scripture-literature hierarchy was vigorously challenged by Dante Alighieri (1265–1321) in *De vulgari eloquentia* (1304–1309), a treatise defending “eloquence in the vernacular,” albeit written in Latin and perhaps with Quintilian as a model. Dante argued, first, that profane literature could be read with the same seriousness and interpreted along the same lines as Scripture, and second, that morally serious profane literature could be written not only in Latin, which was then the language of statecraft and high culture throughout Europe, but also in the vernacular, that is, in the commonly spoken regional languages. Such regional languages were assumed at the time not to be governed by the rules of grammar and hence not to be suitable for important matters. Although Dante’s ideas had a negligible influence in his day, his vision of vernacular literature would be realized in the subsequent rise of distinct national cultures following the fragmentation of Roman Catholic hegemony in Europe. Martin Luther’s early sixteenth-century Reformation and perhaps more important, the translation of the Bible into modern languages prepared the ground for the later idea that literature, whether historical, philosophical, or imaginative, embodied distinct national spirits. Still, the study of vernacular literatures would not occur in most European academies until the nineteenth century.

In a fourteenth-century Scottish version of the lives of the saints, the word *lateratour* is used to mean essentially what its Latin root had meant for Quintilian and Cicero: familiarity with books, including the polite learning and elite cultural status associated with literacy. In 1513 Henry Bradshaw wrote in verse of “the comyn people symple and neclygent, / Whiche without lytterature and good informacyon / Ben lyke to Brute beestes” (vol. 2, p. 4). Something of Bradshaw’s “good informacyon” persists in one of the secondary modern meanings of the term literature, which allows the term to denote the totality of written material on a given subject, as when one speaks of the literature on a particular medical treatment, or the literature on child development. In the part of the sixteenth-century school curriculum called the trivium, designed to teach both spoken and written Latin, grammar was intimately related to rhetoric and logic: to have “literature” was to write both persuasively and rationally. This academic synthesis, based on the study of Latin and Greek, persisted into the nineteenth century and also governed the early study of vernacular languages. Theater, both in the Elizabethan London of Shakespeare and in the fashionable seventeenth-century Paris of Corneille and Racine, supplied early intimations of the idea of literature in its primary modern sense: imaginative writing pursued as a vocation and for profit. It is in this context that in 1635 Cardinal Richelieu founded the Académie Française, an essentially literary academy, for which Charles Perrault proposed in 1666 a section devoted to “belles lettres,” to include grammar, eloquence, and taste. By 1710 the phrase “belles lettres” is used by Jonathan Swift in an issue of the *Tatler* magazine to denote a profession on a par with history and politics. On the whole, literature bears its traditional, inclusive meaning through most of the eighteenth century, as exemplified by Voltaire’s definition of *littérature* in his

BY WAY OF COMPARISON: *LITERATURE* IN CHINESE

The word for literature in Chinese (*wenxue*) is an ancient term revived for twentieth- and twenty-first-century needs. In a Chinese schoolroom or bookstore, *wenxue* designates a familiar activity: the reading of poetry, plays, and novels augmented by criticism and the study of some historical and philosophical works for pleasure and instruction. The properties of *wenxue* map precisely onto those of European literature. This is not a coincidence or an astonishing parallel between diverse cultures but rather a case of influence, the contagion of modernity: the categories of thought that have framed the institutions of literature in the West since about 1800 also contributed toward reforming and refounding modern East Asian cultures.

Confucius (551–479 B.C.E.) described two of his students as *wenxue*. *Wen* means “writing,” “documents,” or “culture” in an extended sense, including customs and ritual; *xue* means “learning.” Hence Confucius has always been understood as saying that the strong point of these two disciples was in documentary knowledge, as opposed to others who specialized in policy or argumentation. *Wenxue* has been used as a metonym for scholars or schoolmasters as well as for the activities they engage in, primarily the preservation, interpretation, and transmission of written records. The vast and meticulously administered empire of China had a constant need for such literate men. Periodic examinations held at local, provincial, and imperial levels qualified and requalified candidates for office. The subjects covered in these examinations varied from reign to reign, but policy essays and poetic composition were prominent during most of the fifteen hundred-year history of the examination system.

It was not until the seventeenth century that *wenxue* began to be used, but only rarely, as a catchall term for polite or imaginative letters, as opposed to other kinds of writing. It seems that the impetus for the specialization of the term was given by foreign missionaries who wrote, both in

the reports they sent home and in their Chinese evangelical texts, that the Chinese Empire was unique in selecting its high officials on the basis of literary attainment. From an internal Chinese point of view, the world of letters was multifarious, including every kind of verbal artistry and application, but not divided into the subspecies of verbal art and instrumental communication. That distinction came to be canonical for external reasons.

In the late nineteenth century, as the Meiji Restoration set Japan on a course of determined centralization and westernization, new Japanese educational institutions redistributed the many fields of letters to include foreign languages but to exclude most practical or scientific subjects. The term adopted for the faculty of humanities was *bungaku*—the Japanese pronunciation of the Chinese characters for *wenxue*. Within the humanities, *bungaku* specifically referred to literary disciplines, as distinguished from philosophical or historical studies. On the Asian mainland, as the Qing dynasty gave way to the People’s Republic of China in 1911 the original Chinese term made a triumphal return—probably on the lips of Chinese revolutionaries who had studied in Japan—as an object of knowledge, a species of publication, a career path, and a division of learning. The definition and reform of this emergent field was a particular concern of the intellectuals associated with the May Fourth (1919) Movement, whose vision of a “Chinese Renaissance” implied a democratic political order, a scientific epistemology, and a national literature written in the vernacular. The imperial order of letters, in which elegance of expression was—without explicit differentiation—a resource to be wielded in the exercise of power as well as a social mark of distinction and a private amusement, had vanished. As in Europe, the new divisions of learning heralded a new society populated by a new kind of person.

Haim Saussy

BY WAY OF COMPARISON: *LITERATURE* IN ARABIC

The semantic range of the Arabic word *adab*, which in modern usage designates literature in the specialized sense of artistic writing, has shifted considerably over time. As an intellectual standard of cultivation, the notion of *adab* came into being after the emergence of poetry, the cardinal genre of Arabic literature, called “the register of the Arabs” (Allen, p. 104). The Arabic ode in the pre-Islamic era, originating in oral forms and possibly in song, followed an aesthetic that appealed primarily to the listener and had tightly codified tropes. The figure of the poet was associated with “divine inspiration”; the poet was seen as the tribal spokesperson, one who praised the tribe’s illustrious past and hurled invective at its enemies. The connection between poetry and patronage, which predates Islam, grew after the establishment of the new religion: the shift to urban life and the espousal of eulogistic poetry by rulers and the administrative aristocracy as an enhancement of their prestige and power modified without at first annulling the role of the tribal poet. This new poet was the client of a given court, and poetry began to address new themes. It is speculated that etymologically *adab* referred to standards of conduct, to customs, and to enrichment. But the word “came to mean ‘high quality of soul, good upbringing, urbanity, courtesy’ . . . corresponding to the refining of bedouin ethics and customs as a result of Islam,” as well as urbanization, the emergence of a city-bred elite and administrative class, and contact with other cultures (Gabrieli, p. 175). The term gradually acquired an additional “intellectual meaning” and “came to imply the sum of knowledge which makes a man courteous and ‘urbane’” (Gabrieli, p. 175). Such “profane culture” was “at first strictly national” and later, through contact with other cultures, developed from “Arab humanitas, into humanitas without qualification” (Gabrieli, p. 175). Although its primary significance is now homologous with the modern idea of literature in English—that is, imaginative writing—*adab* can

still also be used to denote “good manners” and “refinement.”

Derived from early prose antecedents, such as the compilations of the Prophet Muhammad’s biography and of traditions associated with the pre-modern corpus, *adab* (the tradition of belles lettres written in classical Arabic) includes poetics, biography, historical and geographical writings, travelogues, rhetoric, compilations of entertaining anecdotes, and monographs. Debate about the origin of the modern Arabic novel has hinged on whether it is an imported genre or one that draws on indigenous antecedents, especially elite ones, such as the *maqamah* (“assembly,” a form of fictional narrative in rhyming prose; also poetry and quotations from poetry). Scholarly discussions have tended to overlook popular antecedents such as *The Thousand and One Nights*, a collection of Arabian tales of unknown origin probably collected in Egypt in the fourteenth to sixteenth centuries with a Persian frame narrative that is first mentioned in the tenth century C.E. In his study of the origins of modern Arabic *narrative discourse* (a term he uses to cover the short story, novel, and drama), Sabry Hafez approaches the issue through “intertextuality” rather than “genealogy.” Tracing the “cultural revival” in modern Egypt and the Levant back to the eighteenth century, before Napoléon’s occupation of Egypt, Hafez demonstrates that these new genres emerged through a complex and dynamic process based in socioeconomic and cultural changes. These included increasing urbanization, improved means of transport, the printing press, and education as well as “the rise of national and political consciousness, journalism and the contact with European culture and thought,” largely through translation (Hafez, p. 64). The result was a new reading public with a different worldview and a demand for narrative texts. Such conditions encouraged writing that drew on a wide range of codes and literatures, writing that would eventually lead to the emergence of modern narrative forms.

Hala Halim

Dictionnaire philosophique (1764–1772)—“a knowledge of the works of taste, a smattering of history, poetry, eloquence, and criticism”—though by this time one can sense the semantic gravitation of the word toward its emerging and narrower modern meaning (Wellek). Not until the late eighteenth century, however, was the word *literature* actually used more narrowly to designate imaginative writing per se, that is, the genres of poetry, fictional narrative, and drama.

The Modern Idea of Literature

In 1777 Samuel Johnson (1709–1784) was invited to compose critical essays for an edition of English poets, beginning with Geoffrey Chaucer (c. 1342–1400), then being prepared by London booksellers. Once the anthology—which was shortened to begin with the early seventeenth-century poet Abraham Cowley—was complete, Johnson’s fifty-two introductions were published separately as *Lives of the English Poets* (1779–1781). In his portrait of John Milton, Johnson still used literature in the classical sense of learning or erudition, observing that the great poet “had probably more than common literature, as his son addresses him in one of his most elaborate Latin poems” (vol. 1, p. 85). But when introducing Cowley, Johnson gave the term a significance that would become central by the early twentieth century. Johnson described Thomas Sprat, Cowley’s biographer, as “an author whose pregnancy of imagination and elegance of language have deservedly set him high in the ranks of literature” (vol. 1, p. 1). By the early nineteenth century, a period marked by the prominence of the entrepreneurial author-publisher Sir Walter Scott (1771–1832), the idea that literature refers primarily to a particular *kind* of writing—imaginative—also meant that the word could signify a particular professional occupation. Isaac Disraeli (1766–1848), father of Benjamin Disraeli, used the word in this new, narrower sense when he wrote in 1823, “Literature, with us, exists independent of patronage or association” (vol. 2, p. 407). The primary modern meaning of literature—autonomous, professional, imaginative writing designed for a market economy—had emerged.

At almost the same time that literature was beginning to signify primarily the imaginative genres of poetry, fiction, and drama, two complementary semantic changes were occurring. The first is that the word was being used to designate the total body of writing defined by national (or at least linguistic) origin. Thus Johann Gottfried von Herder (1744–1803) published a book called *Über die neuere deutsche Litteratur* (On the more recent German literature) in 1767, and L’abbé Antoine Sabatier de Castres published a book called *Les trois siècles de notre littérature* (Three centuries of our literature) in 1772, which became *Les trois siècles de la littérature française* (Three centuries of French literature) in subsequent editions. In 1836 Robert Chambers (1802–1871) produced *A History of English Language and Literature*. Such texts both contributed and responded to a political sensibility in the eighteenth and nineteenth centuries that had begun to categorize cultural artifacts in national terms. By the late nineteenth century this way of looking at literature, and especially imaginative literature, would be normalized. The study of modern literature (as opposed to Greek and Latin) came to be used in the schools

to standardize linguistic usage; to elevate the culture of populations with little access to classical learning; to produce social integration across the divisions of economic class; and to provide a basis for a national collective consciousness (Weber).

The second semantic change in the word literature is a reflection of the idea of “aesthetics” in the eighteenth century. Since antiquity, claims had been made that the arts, including poetry and drama, were rational and rule governed, quite despite their aura of divine inspiration. Both Aristotle and Horace, in different ways, made these claims. On the whole, so did neoclassical French critics of the seventeenth century such as Nicolas Boileau. With the third earl of Shaftesbury, and especially the version of his ideas found in Francis Hutcheson’s *Inquiry into the Origin of Our Ideas of Beauty and Virtue* (1726), English moral philosophy based on the sentiments began to translate the older idea of “good taste” in terms of a specific, subjective “aesthetic intuition” present in both the “genius” of artistic creation and the perception of beauty. For Shaftesbury and Hutcheson, the sensation of the beautiful became nothing less than the path by which all the traditional antinomies of philosophy—subject versus object, innate ideas versus empirical learning, necessity versus contingency, reason versus passion—can be overcome. In Germany, with Alexander Baumgarten (1714–1762) and especially Immanuel Kant (1724–1804) and his *Critique of Judgment*, the project emerges of a specific science or philosophy of beauty that emphasizes the disinterested and universal nature of the human response to beauty (Cassirer, pp. 275–360). The Greek word *aesthēsis*, which had covered a range of meanings, including sensation, perception, feeling, knowledge, and consciousness, came to be *aesthetics*, used exclusively to refer to our response to beauty. In the 1790s Friedrich Schiller (1759–1805) wrote his *Letters on the Aesthetic Education of Man*, which outlines a project for making the education of the aesthetic sensibility the central component of a wholesale moral and political reform of humanity. Along with the other arts, literature became a part of that project, though often the term *poetry* or *poetics* (as in Aristotle’s treatise) was still used to denote the artfulness of literature. For Georg Wilhelm Friedrich Hegel (1770–1831), lecturing on aesthetics in the 1820s, art evolves in human history from more material to less material forms, from architecture to sculpture to poetry, as it approaches the ideal of reason. But this means that poetry becomes the most elevated Romantic art form only by virtue of becoming pure sound: poetry is the least burdened by matter, that is, by written *letters*. It is as if the putative oral basis of literary art had for Hegel returned to become its highest form.

Along with the nationalizing of imaginative literature in the nineteenth century—a development that was the dominant institutional form of literary studies in the twentieth-century academy—two complementary ideas arose. The first is the idea of *Weltliteratur* (world literature) used by Johann Wolfgang von Goethe (1749–1832) when commenting in 1827 on his translation of Torquato Tasso (1544–1595). It is a vague but visionary term suggested by the ideal of universal humanity promulgated during the French Revolution and embodied more ambiguously by Napoléon’s subsequent attempt to “liberate” Europe, Asia, and the Middle East by force. The second

is the notion of “comparative literature,” which began to be used in the early nineteenth century, perhaps in imitation of concurrent scholarly movements, such as “comparative anatomy,” “comparative philology,” and other comparative enterprises in history, philosophy, and anthropology. Abel-François Villemain gave a course of lectures at the Sorbonne in the 1820s in which he used the term *littérature comparée*, and two German journals appeared later. *Zeitschrift für vergleichende Literatur* (Journal of comparative literature), edited by Hugo von Meltzl de Lomnitz, was published between 1877 and 1888, and *Zeitschrift für vergleichende Literaturgeschichte* (Journal of comparative literary history), founded in 1866 by Max Koch, was published until 1910.

Contemporary Developments

In some ways, “world” literature predates the nationalizing of literary traditions, since the classical and medieval period is quite polyglot and multicultural. But world literature and comparative literature were given new life in the late twentieth century by the awareness of the historical power of European imperialism and the rise of postcolonial literatures in India, Africa, South America, Asia, and the Middle East and later by the emphasis on globalization as a cultural phenomenon. The fate of specifically *national* imaginative literatures hangs in the balance. At the same time, two other critical perspectives on literature served to challenge once again what the term means. On the one hand, the Romantic idea of literature as the vehicle of aesthetic sensibility was called into question to emphasize the political function of the literary text, especially in terms of class, gender, and race. On the other hand, the idea that imaginative literature represents a kind of writing qualitatively distinct from philosophical writing or historical writing was also radically questioned. The paradoxical result is that the word *literature* at the beginning of the twenty-first century in many ways has begun to recover some of the inclusive significance that was lost when it was narrowed to fit nationalist and aesthetic sensibilities during the Enlightenment. Literature once again refuses to be confined to national borders or to be defined by the imaginative and the aesthetic. With the arrival in the 1990s of electronic literature, produced and consumed with the help of computers, the traditional medium of literature in print or manuscript—the book—acquired a potentially powerful rival. The root idea of literature as writing, that is, the scratching (or printing or typing) of marks into an impressionable material, may well be superseded by the flash of digital impulses across video screens.

AFRICAN LITERATURE

African literature is best understood within the context of Ali Mazrui’s categorization of African historical experience as a “triple heritage”: Africa as a space produced by endogenous historical traditions, Arab/Islamic influences, and Western Judeo-Christian influences. This triple heritage has produced a literature characterized by a tripod identity, based on its relationship to each element. Africa’s indigenous heritage is of its rich oral traditions. The Arab/Islamic heritage is associated with the written literatures of North Africa and parts of East and West Africa. The Arabic and Western aspects of Africa’s triple heritage reflect the continent’s experience with the historical trauma of conquest, evidenced by such events as the Arab invasion of North Africa and West Africa, the trans-Atlantic slave trade, and colonialism. The Western/Judeo-Christian heritage has shaped the literature written in English, French, and Portuguese.

Oral Tradition

Oral tradition comprises the specialized verbal art forms—proverbs, riddles, chants, lyric poetry, tales, myths, legends, and epics—through which African societies have ensured cultural continuity. It is the repository of a community's core values, philosophies, mysteries, rituals, and, most importantly, memory. It survives by virtue of transmission from one generation to another by word of mouth. Performance is its most important distinguishing feature. It exists only in its moment of actuation, when performer and audience come together in a quasi-spiritual engagement. The performer draws his or her materials from the collective ancestral lore familiar to the audience; distinctiveness comes with innovation and inventiveness, delivery, and command of language.

Ruth Finnegan sparked the most significant controversy on the status of oral tradition when she concluded, in her influential *Oral Literature in Africa* (1970), that Africa had no epic. Isidore Okepwho's *The Epic in Africa* (1979) and *Myth in Africa* (1983) became crucial to the institutional and conceptual legitimization of those genres against the backdrop of the Finnegan controversy. Allied to the development of a robust critical apparatus on African oral tradition was the process of recording the various oral genres—folktales, proverbs, riddles, myths, praise poetry, epics, and sagas—for posterity. Birago Diop's (1906–1989) *Les contes d'Amadou Koumba* (1947; Tales of Amadou Koumba) and *Les nouveaux contes d'Amadou Koumba* (1958; New tales of Amadou Koumba) and Bernard Dadié's (b. 1916) *Le pagne noir* (1955; The black cloth) have become classics of the folktale genre. The Sundiata, Mwindo, Ibonia epics and the Ozzidi saga are also extant in significant textual versions.

Written Literature

Africa's written literature could easily span close to five thousand years, depending on the persuasion of various commentators. Thinkers in the Afrocentric tradition trace the antecedents of African written literature to such touchstones as the scribal tradition of ancient Egypt, the Arabic poetic tradition, which began roughly with the Arab conquest of Egypt in the seventh century C.E., the spread of that tradition to the Maghreb and West Africa from the ninth century C.E., which culminated in the development of Hausa Islamic/Arabic verse from the seventeenth century on.

The twentieth century witnessed the blossoming of a generation of North African writers whose craft combined centuries of Arab narratological conventions and Western influences. These writers either write in Arabic and have influential translations of their works in English and French, or they write directly in the two European languages. Of those whose works attained international recognition in English are the Egyptians Naguib Mahfouz and Nawal El Saadawi. Mahfouz's deft handling of historical realism, his inimitable depiction of quotidian life in Cairo turned his fiction into an important opus of Arab imagination and earned him the Nobel prize for literature in 1988, while Saadawi's transgressive novels have become some of the most important feminist works in the twentieth century.

The modern novel in French came much later in the Maghreb. The Algerian, Kateb Yacine's *Nedjma* (1956), is

usually considered the first significant work of the fiction from the Francophone Maghreb, even though the Moroccan, Driss Chraïbi had published a novel, *Le passé simple* (The simple past), two years earlier. North Africa fiction in French soon blossomed with internationally acclaimed writers such as Tahar Ben Jelloun, Abdelhak Serhane, Abdelkébir Khatibi, and Assia Djebar. Djebar's expansive fictional opus, which explores wide-ranging themes such as the trauma of French colonization of Algeria, the brutal war of liberation, and the condition of women in the context of religion and tradition, has become the quintessence of North African literature in French.

With regard to subsaharan Africa, discussions of written literatures tend to take the late nineteenth century as a rough starting point. Indigenous language literatures evolved as a consequence of missionary activity during this period. Missionaries established churches and schools and introduced forms of orthography into local languages to facilitate translations of religious literature. As a result, indigenous language literatures blossomed in western, central, eastern, and southern Africa in the nineteenth and the first half of the twentieth centuries. The Yoruba fiction of Nigeria's D. O. Fagunwa (1903–1963) and the Sotho fiction of Lesotho's Thomas Mofolo (1876–1948) are notable examples.

European language literature, usually referred to as modern African literature, is the dominant African literature. Although the violence of colonialism and the attendant sociopolitical ruptures it occasioned in Africa constitute the background of modern African literature, texts have evolved over several decades and across numerous genres in a manner that allows for the identification of divergent thematic and ideological clusters, all of which underscore modern African literature's investment in the representation of the African experience.

Négritude poetry was the medium through which modern African literature came to international attention in the twentieth century. The Négritude movement grew out of the encounter of young African intellectuals and their black Caribbean counterparts in Paris in the 1920s and 1930s. The Senegalese Léopold Sédar Senghor (1906–2001), the Martinican Aimé Césaire (b. 1913), and the Guyanese Léon-Gontran Damas (1912–1978) were the avant garde of the movement. Négritude philosophy involved a coming into consciousness of the condition of one's blackness in the racist European context of the time and the validation of Africa as the matrix of a proud black race after centuries of European misrepresentation. Damas's *Pigments* (1937) was the first volume of poetry to properly signal the birth of the Négritude movement, but Césaire's *Cahier d'un retour au pays natal* (1939; Notebook of a return to the native land) became its bible. Senghor's *Chants d'ombre* (1945; Shadow songs) and *Hosties noires* (1948; Black hosts) transformed the movement into a full-blown aesthetic phenomenon. However, the full dimensions of Négritude angst were not recorded until the publication of David Diop's (1927–1960) *Coups de pilon* (1956; Pounding).

Poetry comparable in stature with Négritude poetry did not come out of Anglophone and Lusophone (Portuguese-speaking) Africa until the period of the 1960s–1980s. Wole Soyinka (b. 1934), Christopher Okigbo (1932–1967), Gabriel Okara

(b. 1921), John Pepper Clark (b. 1935), Kofi Awoonor (b. 1935), Lenrie Peters (b. 1932), Taban Lo Liyong (b. 1938), Okot P'Bitek (1931–1982), Kwesi Brew (b. 1928), Dennis Brutus (b. 1924), Agostino Neto (d.1979), and Antonio Jacinto (1925–1991) were the leading lights of Anglophone and Lusophone African poetry. Okigbo's collection, *Limits* (1964), is representative of this phase of African poetry.

The African novel also developed within the ambit of historical reevaluation, cultural nationalism, political contestation, and anticolonial protest. Although modern African fiction started with the publication of the Ghanaian Joseph Casely-Hayford's (1866–1930) *Ethiopia Unbound* (1911), it was not until Amos Tutuola's (1920–1997) *The Palm Wine Drunkard* appeared in 1952 that Anglophone West African fiction attained international recognition. Francophone Africa's first novel, René Maran's (d. 1960) *Batouala*, was published to considerable acclaim in 1921 and went on to win the prestigious prix Goncourt. *Batouala* owed its fame to Maran's vivid portrayal of the effects of French colonial rule in Africa as well as his evocative and humanizing descriptions of African life and its environment.

The novel came of age in Francophone Africa from the 1950s onward when writers such as Camara Laye (1928–1980), Seydou Badian (b. 1928), Mongo Beti (1932–2001), Ferdinand Oyono (b. 1929), Sembene Ousmane (b. 1923), Cheikh Hamidou Kane (b. 1928), Ahmadou Kourouma (1927–2003), Williams Sassine (b. 1944), Sony Labou Tansi (1947–1995), Henri Lopès (b. 1937), Alioum Fantouré (b. 1938), and Tierno Monenembo (b. 1947) arrived on the scene. The thematic spectrum of these writers is broad and their range reveals the shifts that occurred in the sociopolitical dynamics of their informing contexts, particularly the tragedy of one-party states and military dictatorships that became the rule in postcolonial Francophone Africa. For instance, Laye's *L'enfant noir* (1953; *The African child*) is a powerful bildungsroman that explores the growing up of an African child who loses the values of his traditional society in a world permeated by European values. In *Le pauvre Christ de Bomba* (*The poor Christ of Bomba*) and *Une vie de boy* (*Houseboy*), both published in 1956, Beti and Oyono, respectively, deploy critical satire to expose the hypocrisies of the colonial situation. Ousmane brings class analysis to the crisis of colonialism in *Les bouts de bois de dieu* (1960; *God's bits of wood*).

However, it was Chinua Achebe's (b. 1930) *Things Fall Apart* (1958) that placed African fiction in the ranks of twentieth-century greats. In *Things Fall Apart*, the epic dimension of Africa's contact with the West, a preoccupation of much of modern African literature, reaches its philosophical and aesthetic peak. Much of Anglophone West African fiction explores versions of Achebe's themes either as collective sociopolitical fissures in a changing world or as individual dramas of alienation. Cyprian Ekwensi (b. 1921), T. M. Aluko (b. 1918), Elechi Amadi (b. 1934), Onuora Nzekwu (b. 1928), John Munonye (b. 1929), Wole Soyinka, Kofi Awoonor, Ayi Kwei Armah (b. 1939), Ngugi wa Thiong'o (b. 1938), Kole Omotoso (b. 1943), and Festus Iyayi (b. 1947) all became major Anglophone West African novelists in the period from the 1960s through the 1980s. While Armah adds a humanist/universal dimension to the drama of man's alienation from his

environment in *The Beautiful Ones Are Not Yet Born* (1968), Ngugi offers a Marxist exploration of the African experience of colonialism and neo-colonialism in *A Grain of Wheat* (1967) and *Petals of Blood* (1977).

Apartheid and race relations are the background of Southern African fiction. Peter Abrahams (b. 1919), Richard Rive (1931–1989), Es'kia Mphahlele (b. 1919), Lewis Nkosi (b. 1936), Alex La Guma (1925–1985), and the Afrikaner novelists, J. M. Coetzee (b. 1940) and André Brink (b. 1935), all produced novels emblematic of the South African situation. Abraham's *Mine Boy* (1946), Rive's *Emergency* (1964), Alex la Guma's *A Walk in the Night* (1962), and J. M. Coetzee's *Waiting for the Barbarians* (1980) document the scale of the human tragedy created by apartheid in South Africa.

African drama is perhaps the genre that has explored the resources of oral tradition most effectively as a result of the ontological linkages between the two: African religious ceremonies—rituals, sacrifices, festivals, funerals, christenings—are forms of drama and the roots of that modern African genre. Wole Soyinka, Wale Ogunyemi (1939–2001), Ola Rotimi (1938–2000), Femi Osofisan (b. 1946), Bode Sowande (b. 1948), and Olu Obafemi (b. 1950) have all written plays exploring the full range of human experience within the cosmic order and within the material contexts of colonialism, neo-colonialism, and the self-imposed tragedies of the African post-colonial order. Soyinka's plays, the most notable of which are *A Dance of the Forest* (1963) and *Death and the King's Horseman* (1975), explore the entire range of these thematic preoccupations. In South Africa, drama proved to be one of the most versatile cultural instruments in the antiapartheid struggle because of its immediate accessibility to a large audience. The South African dramaturgy of Athol Fugard (b. 1932) comes closest to Soyinka's in terms of artistic accomplishment and thematic range.

Women's Writing

African women arrived on the literary scene much later than their male counterparts. Cultural impediments to the education of women, coupled with the Western sexism of the colonial system, kept girls out of the earliest missionary schools. Flora Nwapa's (1931–1993) *Efuru* (1967) was Anglophone Africa's first female novel. Other Anglophone female novelists include Buchi Emecheta (b. 1944), Ama Ata Aidoo (b. 1942), Ifeoma Okoye Zaynab Alkali (b. 1955), Nadine Gordimer (b. 1923), Maryam Tlali (b. 1933), Bessie Head (1937–1986), and Grace Ogot (b. 1930). Some women also became accomplished playwrights, Efua Sutherland (b. 1924), Zulu Sofola (b. 1938), and Tess Onwueme (b. 1955) being the most famous. Thérèse Kuoh-Moukoury's (b. 1938) *Rencontres essentielles* (2002; *Essential encounters*) is the first novel to be published by a Francophone woman. But women's fiction from that part of Africa did not fully take off until the 1970s when two Senegalese women, Aminata Sow Fall (b. 1941) and Mariama Bâ (1929–1981), arrived on the scene.

Because women's writing arose out of the desire to introduce a female perspective to the sociopolitical vision of Africa portrayed by male writers and to address issues relative to

female subjectivity in order to expose the cultural impediments to female agency, African women writers have treated a wide range of themes. The position and role of women as mothers and daughters within the institution of marriage, especially polygamy, the encumbrances attendant on societal/traditional role prescriptions for women, female circumcision, and gender inequality are all themes explored in such classics as Emecheta's *The Joys of Motherhood* (1979), Aidoo's *Our Sister Killjoy* (1966), and Bâ's two novels, *Une si longue lettre* (1979; So long a letter) and *Un chant écarlate* (1981; Scarlet song).

Children of the Postcolony

A new generation of writers attained international recognition beginning in the mid-1980s. The most important factor that distinguishes them from earlier generations is that most of them, but for a few born in the late 1950s, were born after 1960, the year that African nations began to achieve independence. The political reality of these writers is that of the failed African postcolony, something that prompted the Francophone novelist, Abdourahman Waberi (b. 1965), himself a new writer, to describe them as "les enfants de la postcolonie" (children of the postcolony). Difficult socioeconomic conditions in the continent have forced most of the new writers to relocate to the West. Exile, migration, deracination, home, and diasporic identity issues are the major themes of the displaced. Female writers have been very visible in this group: Tsitsi Dangaremba (b. 1959), Yvonne Vera (b. 1964), Ammah Darko (b. 1956), and Chimamanda Adichie (b. 1977) have all achieved international recognition. Their male counterparts, Helon Habila (b. 1967), Chris Abani (b. 1967), Moses Iseigawa (b. 1963), Ike Oguine, and Okey Ndibe (b. 1960) have all published internationally acclaimed novels as well. The Cameroonian, Calixthe Beyala (b. 1961), is the most successful of the Francophone authors in this generation. Other notable Francophone writers include Sami Tchak (b. 1960), Daniel Biyaoula (b. 1957), Alain Patrice Nganang (b. 1970), Alain Mabanckou (b. 1966), and Fatou Diome (b. 1968).

Debates and Critical Engagements

A rich critical tradition developed early around modern African writing. Francophone Africa had journals such as *Présence Africaine* (African presence), *Peuples noirs, peuples africains* (Black peoples, African peoples), *Abbia*, and *L'Afrique littéraire et artistique* (Literary and artistic Africa). Anglophone Africa had a wider array of early journals: *Black Orpheus*, *The Conch*, *The Horn*, *The Muse*, *Drum*, *Okike*, *Transition*, *Ba Shiru*, and *African Literature Today*. While most of these journals no longer publish, *Notre Librairie* (Our bookstore) and *Research in African Literatures* remain the most important. Furthermore, writers became implicated in the early process of elaborating a critical tradition by engaging critics or one another in debates ranging from the question of critical standards to the role of the writer in society. Chinua Achebe's *Morning Yet on Creation Day* (1975), Wole Soyinka's *Myth, Literature, and the African World* (1976), and Ngugi wa Thiong'o's *Decolonising the Mind* (1986) are some of the most important contributions to African literary criticism.

One of the earliest debates concerned the definition of African literature. The writers and critics who gathered in

Uganda in 1963 faced the fundamental question of determining who qualified as an African writer and what qualified as African writing. The high point of the ensuing debate was the famous essay by Obi Wali, "The Dead End of African Literature" (1963), in which he declared that the literature written in European languages did not qualify as African literature. This was the beginning of the ongoing atavistic language debate. Although Achebe countered Wali's position, Ngugi embraced it, transforming the call for a return to African languages into a critical crusade that has lasted for more than three decades.

Another important debate concerned the issue of who was better qualified to critique African literature: the Western or the African critic. The high point of this debate occurred in *African Literature Today* between the American, Bernth Lindfors, and the Nigerian, Ernest Emenyonu. Lindfors had written an unflattering essay on the fiction of the Cyprian Ekwensi. Emenyonu wrote a fiery rejoinder, questioning the aptitude of Lindfors as a Western critic. The next big debate occurred in 1980, when the troika of Chinweizu, Onwucheka Jemie, and Ihechukwu Madubuike published their famous book, *Toward the Decolonisation of African Literature*, condemning the overwhelming recourse to Western literary models and forms by writers such as Soyinka and urging a return to African traditions. With the explosion of postcolonial and postmodernist theories in the West at the end of the twentieth century, African critics became engaged in debating the appropriateness of applying those theories to African literature.

Pius Adesanmi

LOGIC. Logic is the study of correct reasoning. A host of philosophical themes have clustered around this central concern: the nature of truth and validity, of possibility and necessity; the semantics of words, sentences, and arguments; and even questions about substances and accidents, free will and determinism.

Aristotle

Aristotle (384–322 B.C.E.) was the first person to formulate an explicit theory of correct reasoning, as he himself claimed in *Sophistical Refutations*. He owed a good deal to the exploration into forms of argument carried out in the course of argument contests, such as those illustrated by Plato in some of his Socratic dialogues. Book 8 of his own *Topics* reads like a handbook for contestants, and the *Topics* as a whole is designed to teach its readers how to construct “dialectical” arguments: arguments that, in keeping with the idea of a real contest, use generally accepted premises that will be granted by the interlocutor. In an argument, says Aristotle, “when certain things have been laid down, something other than what has been laid down necessarily results from them.” This definition captures the idea of logical consequence, and in his *Prior Analytics* Aristotle develops his “syllogistic,” a formal theory of logical consequence, which he applies to “demonstrations,” arguments in which the premises must not be merely accepted, but true.

Syllogisms (in the narrow sense considered in the *Prior Analytics*) consist of three assertoric sentences, two of them premises, from which the third, the conclusion, follows. In an assertoric sentence, something is “predicated” of a subject, and a predicate can stand in one of just five relations to a subject: it may be its definition, its genus (“Man is an animal”), its differentia (the element of the definition that differentiates things of one species from another: “Man is rational”), an accident (a characteristic the particular thing happens to have: “Socrates is curly-haired”), or its characteristic property (a feature that all and only things of the subject’s species have, but is not part of its definition: “Man is able to laugh”).

The two premises of a syllogism share a common (“middle”) term, and they have “quantity” (universal/particular) and “quality” (affirmative/negative). They may be, then, universal affirmative (A-sentences: “Y belongs to every X”), universal

negative (E-sentences: “Y belongs to no X”), particular affirmative (I-sentences: “Y belongs to some X”), or particular negative (O-sentences: “Y does not belong to some X”). Depending on the position of the middle term—predicate of both premises (“third figure”), subject of both premises (“second figure”), or subject of the first, predicate of the second (“first figure”)—from some combinations of two A, E, I, and O sentences as premises, there follows an A, E, I, or O sentence as a conclusion—and this conclusion follows purely in virtue of the form of the argument. (Although ancient logicians rarely used false premises as their examples, they too made their conclusions follow logically.) So, for example, in the first figure, the patterns AAA, EAE, AII, and EIO are valid arguments. First-figure syllogisms were held by Aristotle to be self-evident: for example, Mortal belongs to every man (every man is mortal); man belongs to every philosopher; thus mortal belongs to every philosopher. Aristotle also shows how second- and third-figure syllogisms can be reduced to first-figure ones, using a set of conversion rules.

Aristotle’s other logical works both fill in the discussions in the *Topics* and the *Prior Analytics* and introduce new philosophical dimensions. *On Interpretation* discusses assertoric statements and their relations (such as contradiction and contrariety). It also proposes a basic semantics, in which sentences are signs for thoughts, and thoughts for things, and it ventures into difficult questions of possibility and necessity. If it is true that there will be a sea battle tomorrow, then how can we avoid the unpalatable conclusion that it is a matter of necessity that the battle will take place tomorrow? The *Posterior Analytics* uses the theory of demonstration as a basis for a theory of scientific knowledge. The *Sophistical Refutations* explore fallacious but apparently valid arguments. The *Categories* has, in part, the aspect of a preface to the *Topics*, but it is in part a work of metaphysics—a forerunner of Aristotle’s treatise of that name.

The Stoics

The Stoics developed a logic different from Aristotle’s, and to a large extent independently from him. Their greatest logician, Chrysippus, lived from about 280 to 206 B.C.E. and, as with most of the Stoics, his thought has mostly to be reconstructed from reports and fragments in later writers. Whereas Aristotelian syllogistic is a term-logic, Stoic logic was propositional: it explored the relations between what they called “assertibles”—that is to say, sentences that can be used to make assertions. Assertibles can be simple (“It is day”) or complex (“If it is day, it is light”/ “It is day or it is not light”). The argument forms classified by the Stoics involve one complex and one simple assertible: for example, “If it is day, it is light. It is day. So, it is light.” This is the first of five “indemonstrables”—basic argument forms—distinguished by Chrysippus. The Stoics had a schematic way of representing the indemonstrables—what they called their “modes”—using ordinal numbers. The four remaining modes of the five indemonstrables are (2) If the first, then the second; not the second; so not the first; (3) Not both the first and the second; the first; so not the second; (4) Either the first or the second; the first; so not the second; (5) Either the first or the second; not the first; so the second. Since the assertibles could be either negative or positive, and the

complex assertible could itself include complex assertibles (“If both the first and the second, then the third”), there was quite a wide range of indemonstrable argument schemes. But Stoic logic was not limited to them. Nonindemonstrable forms of argument could be valid, and the Stoics had a theory of “analysis” in which, using certain basic rules (*themata*) and, if wanted, additional theorems, the nonindemonstrable arguments were shown to be made up of demonstrable ones or of conversions of them.

Stoic logicians also explored modal concepts. One of their main starting points was provided by the fourth-century B.C.E. Megaric logician Diodorus Cronus, who formulated a “Master Argument,” the subject of many attempts at reconstruction by modern historians, which attempts to show that, from the premises that true past propositions are necessary, and that an impossibility never follows from what is possible, it follows that nothing is possible except what is or will be true. The Stoic logicians rejected the argument by querying one or other of its premises, and Chrysippus developed his own understanding of possibility and necessity.

The Neoplatonists

Although Aristotle’s pupil and successor, Theophrastus (c. 372–c. 287 B.C.E.), wrote extensively on logic, and Alexander of Aphrodisias (fl. c. 200 C.E.) cultivated Aristotelian logic, the most important enthusiasts of Aristotelian logic were, surprisingly, the Neoplatonists, from Porphyry (c. 234–c. 305) onward. Porphyry wrote an introduction (*Eisagoge*) to the *Categories*, which itself became for later students a part of the Aristotelian logical corpus (known as the *Organon*), and he wrote extensive commentaries on Aristotle’s logical works. Despite his Platonic metaphysics, Porphyry believed that logic, which is concerned with the world of appearances that is the subject of normal discourse, should be studied in strictly Aristotelian terms. Although later Neoplatonic commentators, following the lead of Iamblichus, tended more to introduce their characteristic metaphysical ideas into discussions of logic, Porphyry’s approach was transmitted to the medieval Latin West by Boethius (c. 480–c. 524), who translated into Latin most of the *Organon* and wrote commentaries on some of it and logical textbooks on topical argument (the late ancient development of the *Topics*), division, and on syllogisms.

The Medieval Latin West, 790–1200

The study of logic was revived in the Latin West at the court of Charlemagne; his adviser, Alcuin, wrote the first medieval logical textbook (*On Dialectic*) in about 790. Logic was central to the intellectual life of medieval Europe in a way that it had not been in antiquity, and has not been since the Renaissance. Yet, until the 1130s, medieval logicians made do with what became known as the *logica vetus* (“old logic”): just Porphyry’s *Eisagoge*, Aristotle’s *Categories* and *On Interpretation*, and Boethius’s commentaries and textbooks. They had only the most limited access to the Stoic tradition, through mentions by Boethius and the *On Interpretation* of Apuleius (second century C.E.). Ninth-century authors, such as John Scotus Erigena, were interested especially in the *Categories*—its metaphysical aspects and the question, raised by Augustine

and by Boethius, of whether any of the ten categories distinguished by Aristotle apply to God. Anselm of Canterbury (1033 or 1034–1109) was a gifted logician who explored and questioned the Aristotelian doctrine of the *Categories* and made imaginative use of the ideas on possibility and necessity in *On Interpretation*.

In the twelfth century, the *logica vetus* was the central concern of the flourishing Paris schools. Peter Abelard (1079–1142), the greatest logician of the time, developed a nominalist metaphysics on its basis and elaborated a semantics to explain how sentences that use universal words (such as “Socrates is a man”) are meaningful although there are no universal things, only particulars. Abelard also excelled in more purely logical matters. Starting from the hints and misunderstandings he found in Boethius, he rediscovered propositional logic and, in his *Dialectica* (c. 1116), he explored in great depth the truth conditions for conditional (“if . . . then . . .”) sentences. Abelard was thus able to pioneer the analysis of sentences that are of ambiguous interpretation in terms of propositional logic, an aspect of logic that became especially popular from the 1130s onward, when *On Sophistical Refutations* and then the rest of Aristotle’s logic (the *logica nova*—“new logic”) became available. And he is one of the few logicians ever to have examined the logic of impersonal sentences, such as “It is good that he came today.”

The Medieval Latin West, 1200–1500

From the middle of the twelfth century, logicians developed various branches of their subject, known as the *logica modernorum* (“contemporary logic”), that had not been treated specially, or at all, in antiquity. Peter of Spain’s widely read *Tractatus* (often called *Summulae logicales*) illustrates how parts of the *logica modernorum* had developed up until about the 1230s. There was a lull in interest and innovation in logic for nearly a century, but in the first half of the fourteenth century writers at Oxford, such as Walter Burley (d. 1344/45), William of Ockham (d. ?1349), Thomas Bradwardine (d. 1349), and William of Heytesbury (d. 1372/23), and, in Paris, John Buridan (d. after 1358) revived the branches of the *logica modernorum* and brought them to new levels of sophistication. The *Logica magna* (Great logic) of Paul of Venice (d. 1429) is a vast record of these achievements.

Some branches of the *logica modernorum* grew directly from the mid-twelfth-century interest in fallacies. For example, *sophismata* were a sort of disputation, involving a master and his pupils, built around sentences that either are apparently false but can be interpreted so as to make them true (e.g., “The whole Socrates is less than Socrates”) or at least are open to different interpretations (e.g., “Every man is”). The ambiguities usually centered around the use of what were called “syncategorematic” words—words other than ordinary nouns, adjectives, and verbs with their own referential content: for instance, “only,” “except,” “all,” “begins,” “ceases”—and specialized treatises were devoted to studying these syncategoremata. Another type of disputation, “obligations,” involved trying to force an opponent who has agreed to defend a particular statement into a self-contradiction, while following a very strict set of rules for what statements may be accepted or must be rejected. Liar paradoxes (“What I am

now saying is false”)—“insolubles”—formed another branch of study. In the theory of the “properties of terms” a highly elaborate theory was developed about the reference of words depending on their function within a sentence. Propositional logic was elaborated in treatises on what were called “consequents” (*consequentiae*), although it remains questionable how far the approach was purely propositional.

Aristotle’s texts and methods were not, however, forgotten in the later Middle Ages. Aristotelian syllogistic, studied earlier through Boethius’s textbooks, could now be learned directly from the *Prior Analytics*. It was a basic tool for almost every medieval philosopher or theologian, and a set of mnemonics (“bArbArA,” “cElArEnt,” etc.) were devised to enable students to remember the valid patterns. *On Interpretation* continued to be central to discussions about possibility, necessity, and divine prescience, and the *Posterior Analytics* provided the criteria for organizing branches of knowledge as diverse as grammar and theology.

Medieval Islam

Logic was no less important for Islamic than for Christian philosophers and theologians. By the time of al-Farabi (c. 878–950), the first important Islamic logician, the whole of Aristotle’s logical *Organon* was available in Arabic—far more material, then, than in the Latin West at this period, especially since the Arabic logicians tended to follow the habit of late antiquity in regarding the *Rhetoric* and the *Poetics* as parts of the *Organon* and assigning to them their own characteristic modes of argument, to contrast with demonstrative argument as taught in the *Analytics* and dialectical argument in the *Topics*.

Al-Farabi, who worked in Baghdad, Damascus, and elsewhere, saw his task as a logician to represent Aristotle faithfully, although this task involved him in a number of interpretations that went beyond the letter of the text. He was also concerned to vindicate logic in face of the grammarians, who doubted the need for this additional discipline; earlier in the tenth century, there had been a famous debate between the grammarian Abu Sa’id as-Sirafi and the logician Abu Bisr Matta, in which Abu Sa’id seems to have had the upper hand.

The great Persian philosopher Avicenna (Ibn Sina; 980–1037) respected al-Farabi and was also an ardent Aristotelian, but his approach to logic differed. In semantics, he rejected al-Farabi’s theory that logic is concerned with expressions insofar as they signify meanings. Rather, he claimed, logic deals with meanings that classify meanings—so-called “second intentions.” In his approach to syllogistic, Avicenna was far more inclined than al-Farabi had been to pursue his own train of analysis and accommodate Aristotle to it. For example, in modal logic he proposed a number of different readings of modal sentences: they could be taken absolutely (as in “God exists”) or according to a condition—for example, “while something exists as a substance” (as in “man is necessarily a rational body”) or “while something is described in the way it is” (as in “all mobile things are changing”).

Logic continued to be studied in Islam because it was accepted by theologians as useful to their discipline rather than—as they often thought with regard to other areas of Aristotelian

philosophy—a dangerous rival to it. Particularly important was the endorsement of al-Ghazali (1058–1111): whereas he wrote a work specifically designed to attack other areas of Aristotelian philosophy, he was himself the author of two short logical works, based on Avicenna. In the next century, Averroës (Ibn Rushd), who worked in Muslim Spain, followed al-Farabi (and the general direction of all his own work as the commentator par excellence on Aristotle) in seeking a greater fidelity to Aristotle, but it was Avicenna who remained the dominant influence on later Islamic logic.

LOGIC AND PHILOSOPHY OF MATHEMATICS, MODERN. This article surveys many of the main positions that have been held in the logic and philosophy of mathematics from around 1800 up to recent times. Most attention

Axiomatized logics are far removed from the normal use of logic. In teaching and practice “natural deduction” has recently gained much popularity: state the “local” premises, and deduce conclusions from them using rules for introducing and eliminating connectives. The name was introduced in the 1930s by Hilbert’s follower Gerhard Gentzen.

is given to symbolic logics of some kind. No position has been definitive; indeed, especially over the last seventy years the variety has continually increased. To compensate for this article’s lack of exhaustiveness, the bibliography is wide-ranging.

The Revival of Logic from the 1820s, and Its Algebraic Flourishing

Some major philosophers gave logic a high status in the seventeenth and early eighteenth centuries; in particular, Gottfried Wilhelm von Leibniz advocated it as a *lingua characteristica*, with an attendant *calculus ratiocinator*, while John Locke took it as a case of *semeiotiké*, the theory of signs. The subject did not flourish, however; thus, while René Descartes stressed rules for correct thinking and deduction, and Immanuel Kant viewed logic as analytic knowledge (with mathematics as synthetically a priori), neither philosopher gave logic itself much attention. Most figures in all disciplines were content to appeal to Aristotelian syllogistic logic, while mathematicians normally saw the *Elements* of Euclid as the apotheosis of rigor.

The revival in logic came from an unexpected quarter: the *Elements of Logic* (1826) by the English theologian Richard Whately. Within a decade four more editions of this treatise had appeared, and various contemporaries commented at length. The strength of the reception is puzzling, for Whately did not advocate any radical new stances; nevertheless, interest in logic increased considerably and some notable advances occurred, especially the quantification of the predicate (1827) of George Bentham, in which Aristotle’s modes were greatly extended by admitting forms such as *all As are some Bs*.

These advances attracted the mathematician Augustus De Morgan, who from the 1840s symbolized in an algebraic manner the forms of syllogistic modes and the relationships between them. He also studied the logical form of the proofs in Euclid, and came away rather perplexed; for the flow of argument in Euclid involved far more than logical deductions. A more sweeping change to logic was effected by George Boole, who started out from a new algebraic principle. Take a “universe of discourse” (his phrase) I of, say, boxes, and divide it into the class x of black ones and the complementary class $(I-x)$ of nonblack ones. Then lay down the basic laws obeyed by x , including the novelty that x together with x is the same as x . Make deductions by formulating algebraically relationships between classes x, y, \dots and using the laws and attendant theorems to find as a

deduction the relationships between say, y and the other classes. Boole elaborated his method especially in *The Laws of Thought* (1854), where syllogisms occupied only the last chapter on logic. Finally, in 1860 De Morgan enriched syllogistics with a logic of (two-place) relations: at last the failure properly to handle, for example, *John is older than Jack* had been recognized.

The contributions of these two English algebraists were distinct: the American logician Charles S. Peirce conjoined them from the 1870s. One of his major insights, arrived at with his student O. H. Mitchell, was to individuate the “quantifier,” both the existential *there is an X such that . . .* and the universal *for all X . . .*, and to stress the importance of watching quantifier order. Continuing the algebraic style, Peirce and Mitchell regarded these quantifiers as generalizations of logical disjunctions and conjunctions respectively. The interpretation of quantifiers was to be an enduring theme in the philosophy of logic. Their logic was extended, especially as an algebra, by the German Ernst Schröder in his vast *Vorlesungen über die Algebra der Logik* (1890–1905).

Many others wrote upon logic, especially in Britain; I note three figures. John Stuart Mill’s *System of Logic* (1843, and many later editions), while not tied to syllogistics, relied much on it for an analysis of reasoning and deduction; mathematicization was absent, but in Mill’s account of “induction,” which we would regard as philosophy of science, he touched upon probability theory. Mill was broadly aligned to British empiricism: by great contrast, an influential “neo-Hegelianism” later became popular in academic circles. Francis H. Bradley’s *Principles of Logic* (1883), its landmark, is an idealistic meditation upon the basic laws of logic (such as that of the excluded middle), judgments, and the reconciliation of thesis and antithesis in synthesis. Finally, Lewis Carroll produced some rather dull books on logic (1886; 1896); but in his *Alice* books (1865; 1871) he had brilliantly anticipated several concerns of those logicians of the next century who were to launch a new tradition that came to eclipse the algebraic logicians.

Set Theory and the Rise of Mathematical Logic

Especially from the 1820s with the Frenchman Augustin Louis Cauchy, mathematicians had become more sensitive to the need for rigor in proofs, carefully stating assumptions and definitions and formulating theorems in conditional form. Cauchy’s approach was refined from the 1860s by the lectures at Berlin University of Karl Weierstrass. The main context was the calculus and its extension into mathematical analysis. Two consequences are of special import.

First, in the early 1870s the German Georg Cantor began to develop set theory, initially treating points and numbers but later as a general treatment of collections of things; he even claimed that sets enabled him to define the natural numbers, and by implication to reduce mathematics to sets. His theory differed from the traditional part-whole theory that dates back to the Greeks and that was used by, for example, the algebraic logicians; for Cantor distinguished membership of objects in a set from the inclusion of subsets of objects within it. More controversially, he also incorporated a mathematical theory of the “actual infinite,” showing that infinities came in different sizes.

Second, from the 1880s the Italian mathematician Giuseppe Peano began to symbolize as much as possible not only the notions of mathematical analysis (including set theory) but also the logical connectives and predicates with quantification. Thereby he launched “mathematical logic” (his name, in the sense usually adopted today). With an impressive school of followers he came to handle a wide range of mathematical theories this way, and enchanted the young Englishman Bertrand Russell, who came across him in 1900. Russell quickly added a logic of relations to mathematical logic, and converted Cantor’s claim that set theory could ground mathematics into the “logicist” thesis (a name provided later by Rudolf Carnap) that mathematical logic could ground sets and thereby (much) mathematics. Russell also found that the German Gottlob Frege had already asserted this thesis for arithmetic and some parts of mathematical analysis, though in a Platonist spirit very different from his own empiricism.

So much for the good news. The bad arrived soon afterwards, in the form of a paradox now named after Russell: a certain set was a member of itself if and only if it was not. Paradoxes are at least a nuisance in mathematical theories: when the theory in question encompasses logic itself, their presence is a disaster. Eventually Russell produced an articulation of logicism in *Principia Mathematica* (1910–1913), written with Alfred North Whitehead; but his and other paradoxes were avoided rather than solved, and by an unwieldy and epistemologically questionable “theory of types”: the ensemble of objects was divided into individuals, sets of individuals, sets of sets of individuals, . . . , ordered pairs of individuals, . . . , and so on, and membership was severely restricted.

Axiomatics and the Rise of Proof and Model Theories

Meanwhile, contentment with Euclidian rigor was dissolving. From the 1860s non-Euclidean geometries had been accepted as legitimate theories, especially due to the insights of Bernhard Riemann. In addition, various mathematicians, including Peano, had noticed that Euclidian geometry itself needed several more axioms than Euclid had stated.

These developments made mathematicians still more aware of finding and expressing the assumptions involved in a theory. Another stimulus was the rise in importance of algebras (for example, among several, Boole’s), each with its own basic laws. David Hilbert, the leading mathematician of his generation, studied geometries and algebras intensively, and was led around 1900 to seek for a mathematical means of studying axiom systems. He found it in “metamathematics” (his later name for it), in which a system was examined to establish its completeness, consistency, and independence.

One of Hilbert’s axioms for geometry was a meta-assumption that the other axioms supplied all the objects required. This soon led the young American mathematician Oswald Veblen to consider two different sets of objects satisfying an axiom system; if the members of each could be put in one-one correspondence, then the system was “categorical.” The study of (non-)categoricity enriched model theory considerably.

Set theory itself was influenced by these developments, for in 1908 Hilbert’s follower Ernst Zermelo axiomatized it. His

With the re-creation of their country after World War I, the Poles produced a remarkable cohort of logicians, with Jan Łukasiewicz and Stanisław Leśniewski as leaders, Łuan Tarski perhaps the most dominant figure. While Hitler saw to its demise, several members emigrated; for example, Tarski was a major figure later in the development of model theory.

system included his own discovery, the “axiom of choice,” a nonconstructive assumption that some colleagues found doubtful. A strong debate broke out; most participants agreed that the axiom was unavoidable. However, it was unacceptable for “constructivist” mathematicians, who admitted only procedures that built up mathematical objects in explicit stages: for them the axiom was outlawed, along with some standard proof methods such as by contradiction (to prove theorem T , assume *not*- T and get into a logical mess). The most prominent figure in this tradition was the Dutch mathematician L. E. J. Brouwer, who elaborated his alternative “intuitionistic” mathematics especially in the 1920s. At that time Hilbert’s metamathematical program was in its definitive phase; but in 1927 Brouwer derided it as “formalism,” a misleading name that Hilbert himself never used but that has regrettably become standard.

Gödel, Tarski, and the Individuation of Metatheory

More bad news for Hilbert arrived in 1931, when the young Austrian Kurt Gödel proved that his metamathematical program could not be achieved for arithmetic with quantification over integers, and thus a fortiori for almost all acclimatized mathematical theories T ; for Gödel showed that, in order to prove the consistency of T , its metamathematics had to be richer in assumptions than T itself rather than poorer, as Hilbert had hoped. This theorem was a corollary of another one, which torpedoed logicism by showing that there was a proposition M statable within T but neither provable nor disprovable; thus T , assumed to be consistent, was undecidable.

In addition, Gödel’s proof-method soon led to a focus on recursion and to computability as conceived by the Englishman Alan Turing, thus launching a link between logic and computing. Finally, for Gödel’s proofs to work the distinction between T and its metatheory had to be observed rigidly, as a central feature of both metamathematics and metalogic. The Polish logician Alfred Tarski also stressed this distinction around this time, for formal systems in general; his motive was treating as metatheoretic the (meta-)proposition that a proposition was true if it corresponded to the facts.

Logics and Pluralism from the 1940s

The consequences of Gödel’s theorems were profound. For example, logicism was replaced, especially by the American W. V. Quine, by elaborate systems of set theory and logic such as those

developed in Quine's *Mathematical Logic* (1940); however, Russellian reductions of the former to the latter were not claimed.

Quine adhered to classical logic, with its two truth-values. But nonclassical logics gained adherents from the 1930s. The American C. I. Lewis had been a pioneer already in the 1910s, when he advocated "modal logics," where necessity and possibility were adjoined in various ways to truth and falsehood, as a means of clarifying the undoubtedly messy treatment of implication in *Principia Mathematica*. But from the 1930s these logics were viewed as viable alternatives to classicism in their own right. Another notable adherent was Gödel's friend Carnap, especially with his *Meaning and Necessity* (1947).

Since then logics classical and nonclassical have proliferated enormously, with their metalogics; many connections have been forged with computer science and aspects of semantics and linguistics. Notable among many cases are deontic logic, with its focus on sentences using "ought" and applications to law; temporal logics, seeking means to formulate deductions such as *John eats; thus John will have eaten*; many-valued logics, allowing for values other than true and false; non-monotonic logic or defeasible reasoning, defined by the property (in the simplest case) of propositions A , B , and C that given $A \therefore C$, then $A \text{ and } B \therefore C$ does not hold; paraconsistent logics, where various heresies are entertained, such as paradoxical propositions being both true and false; and fuzzy logic and set theory, where the vagueness of *John is very tall* is itself studied mathematically, initially by engineers rather than professional logicians.

This last topic bears upon control theory, which became associated with the discipline of cybernetics during the 1950s; logics of some kind were used in areas such as machine learning and brain modeling. Such concerns then developed further within the field of artificial intelligence, and were involved also in topics such as the representation of knowledge, automated theorem proving, and the relationship between complexity and recursion. These and very many more topics are now also linked to theoretical computer science, where many (meta)logics are used, with further connections to programming, formal and natural languages, and linguistics.

Partly due to these connections a renaissance of interest has occurred in higher-order logic, where quantification is executed over predicates as well as individuals. This revises a practice followed freely by Frege and by Russell and Whitehead. Theories of types have also been revived, appearing in several of the above contexts.

Philosophies of Mathematics

Especially since World War II, new philosophies have emerged separate from logicism, formalism, and intuitionism. One kind is called naturalism, in which mathematical objects are said to be accessible to ordinary sense perception. Forms of Platonism are advocated, partly inspired by the enthusiasm of Gödel. Disaffection from concerns with mathematical truth has stimulated conventionalism; Henri Poincaré was an eminent early advocate. Versions of constructivist mathematics have been developed, broadly following the same prohibitions as Brouwer's but avoiding his peculiar philosophy; Erret Bishop was a notable

figure. Structuralism emphasizes the ubiquity of structures, perhaps to excess; mathematics has them rather than *is* them.

Most of this philosophy is by and for philosophers; the mathematical content is usually limited to set theory and/or arithmetic, even among empiricists who claim to attend to mathematical practice. In particular, little is said about the creation and development of mathematical theories in the first place. Here the eminent Hungarian Georg Polya was an important contributor, with books such as *Mathematics and Plausible Reasoning* (1954) discussing themes such as proofs themselves modifying old theorems and motivating new ones. A rather neglected area is the philosophy of mechanics and (classical) mathematical physics, despite the attraction of physical interpretation as well as rigor and proof.

By contrast, quantum mechanics has gained much attention, partly in connection with the philosophy of probability, which has a rather separate history. What kind of knowledge is expressed by *the probability that the next throw of the die will be 5 is 1/6*? Influential answers include the logical (it is a deduction from axioms), propensity (it is an assertion about the die and also its environment), subjective or Bayesian (it is a rational belief, drawing upon prior performance), and frequency (it is the limiting case of evidence drawn from long runs of throws).

Concluding Remark

Whately would be astonished at the current range and variety of logics. However, there is often still a considerable professional distance between logicians and both mathematicians and philosophers; in the mid-1930s an Association of Symbolic Logic was created to provide a venue and a journal for those active in the field. Now perhaps too many logical and philosophical flowers are blooming, and many may wither for want of genuine need. One area of exploration is metametalogic and metametaphilosophy of mathematics, which have been largely ignored so far.

LOVE, WESTERN NOTIONS OF. In the West, probably more has been written about love than any other topic except the nature of God. There is, however, no consensus on what the word *love* or *amor*, *agape*, *Liebe*, *eros*, or hundreds of other terms signifies. It is clear, however, that it is more than a simple animal urge to procreate. Harry Harlow, for example, demonstrated that mother love was essential to the normal development of infant monkeys, and that infants deprived of love and nurturance became disturbed, unhappy adults, unfit for monkey society. But love is much more than the feelings of a mother for a child, although mother love has usually been regarded as much more intense than that of a father. Among other things the term *love* has been used to describe the feelings of a child toward a parent, one's feelings for friends and comrades, a religious yearning for transcendence, an entirely materialistic desire for physical sexual gratification, and the list could go on.

Love in Western History

One kind of love that might best be called romantic love has been the gift or curse to the world of Western culture. This is a phenomenon that at its simplest might be described as the practice of choosing one's mate based on personal preference, rather than societal obligations. Such a concept emerged in the Middle Ages, and the true lover as described by Andreas Capellanus in his twelfth century *De Amore* is continually and without interruption obsessed by the image of his beloved. Capellanus also wrote that love was an inborn suffering that proceeded from the sight of, and excessive thought on, the form of the opposite sex.

This was a different view of love than had existed previously in Western culture, although there are hints of it in

earlier societies and cultures. In Judaism the closest approach to erotic love appears in the Song of Solomon:

I am my beloved's, and my beloved is mine. . . . (6:3)
 Many waters cannot quench love, neither can the floods
 drown it. . . . (8:7)

Greek myths include scenes of passionate sexual attraction but for the most part, after the successful sexual liaison, the male god goes on to seek other candidates. The tale of Eurydice and Orpheus emphasizes, however, that love in the Greek world was far more complex than simple sexual conquest. The deeper meanings of love appear in discussion by the eighth-century B.C.E. Greek writer Hesiod, who held *eros* or love to be the essential creative urge that brought the universe into being. A somewhat different view is put forth in the fourth century B.C.E. by Plato, who has Socrates explain in the *Symposium* that the lover is attracted to his beloved because he sees reflected there the higher realm of eternal truth. Love in this case is the bridge between the mundane and the transcendental, the wellspring from whence all meaningful human values derive. In the same dialogue, Plato has Aristophanes explain that the search for a lover is driven by a search to find part of oneself. This is because people were originally androgynes who were split apart because of their rebellion against the Olympian gods. Thus finding one's love was no less than the recovery of an original unity of souls.

The object of this original form of Platonic love could be of the same or different sex, although Plato makes a clear distinction between the love of youths and the love of women, with the former being held much higher than the latter kind. In fact Greek literature from the poets to the playwrights was essentially misogynistic with much of the erotic literature male focused.

In Roman society, where women had a higher standing than in Greece, the general conclusion of the first century B.C.E. lyric poets Catullus, Tibullus, and Propertius was that love (and women) inevitably brought misery to man. Lucretius, a contemporary of the poets, agreed that love made one miserable, and his solution was to eradicate love. He admitted that while a particular mistress might be faultless, a man could still free himself from the pangs of love by reflecting that in her physical nature his love object was no different from all other women. Ovid, another contemporary, built up the charms of sexual love in his *Ars amoris* (*Art of Love*) but in its sequel, *Remedia Amoris*, he shows how to counteract the attractions of a mistress and solve the problems of love. Both the Romans and the Greeks tended to separate love from marriage.

While Christianity emphasized love, it was love of humanity or of god (*agape*), not *eros* or sexual love. Such a love appeared in the Song of Solomon, and it is a strong theme in early Christian literature (see Bynum, 1982) and later in the surviving letters and prayers of St. Catherine of Sienna (1347?–1380), who portrayed the crucified Jesus as the supreme sign and pledge of divine love and as motive for ours. As Christianity became institutionalized, sexuality, one of the base points of love in the Greek and Roman classics, was

downplayed. It certainly was not necessarily involved in marriage, which was a pragmatic affair that united scions of two families and their possessions. As Caroline Walker Bynum notes in her *Holy Feast, Holy Fast*, medieval female saints before the twelfth century tended to be charity-giving queens who obediently married and used their influence and wealth to perform good deeds, often ending up in the cloisters. This began to change in the twelfth century with the development of what might be called romantic love, and it is this concept that came to dominate Western notions of love.

Romantic Love

Scholars have spent a good deal of time and energy in trying to trace the source of romantic love to Islamic lyric poetry, to Greek Platonism, to Ovid, to heretical Christian Cathars—apparently all contributing factors—but extremely influential in the period was the rise of the female patron of literature and arts. Literature is molded by the type of audience it has. In much of the past the audience that counted most was male. It was the men who had the money to hire poets to sing their praises and to recount the epic stories of war as well as the successful conquests of females. When prose developed it was men who were usually literate since so many obstacles were put into the path of women who wanted to be educated. During the Middle Ages, when the most literate group was the clergy, women and love had very little place in their literature. Nonetheless, women could be patrons of literature and it was this patronage that some, including the present authors, believe was a major factor in the development of romantic love.

Sidney Painter speculated in the 1940s upon a scenario in which a hungry minstrel who was wandering about the duchy of Aquitaine came to a castle where he hoped that his tales of battles and his tumbling tricks would earn him a good dinner. The lord of the castle, however, was absent, and the lady who acted as his hostess found his endless stories of battles rather tiring and boring and his tumbling unattractive. It somehow occurred to the poet that his stay in the castle would not be very long nor would his meals be particularly enjoyable unless he managed to gain her attention. Being very inventive he composed a song in praise of the lady's beauty and virtue and described their effect on him in rather glowing terms. This pleased the lady, who rewarded him with a better bed and more ample food. He and others got the message.

On this scene came William IX (1071–1127), count of Poitou and duke of Aquitaine, who thought such romantic songs might prove a pleasant accompaniment to his numerous triumphs over feminine virtue. The duke's accounts of his amorous adventures proved as interesting to his friends as his stories of battle, and with the example of a powerful prince who ruled one-third of France to spur it on, the fashion grew and expanded. One of the great patrons of chivalric love literature was Eleanor of Aquitaine (1122–1204), the granddaughter and heir of the duke and later the queen of England. Her role of patroness was continued by her daughters, Marie, countess of Champagne, and Alix, countess of Blois, as well as other women. A few women contributed to the love literature on their own, as did Heloise in her love letters to Abelard in the twelfth century. Marie de France wrote more traditional chivalric love literature

in the late twelfth century, but she did not differ significantly from her male poets in their description. The love literature penned by Christine de Pizan (c. 1365–c. 1430), on the other hand, has led to her being described as an early feminist.

Romantic love was originally associated with knighthood and chivalry, and in poems and stories love was pictured as a despairing and tragic emotion that drove the lover to accomplish great deeds of daring to perform for his beloved as well as for the Christian God. In theory true love was unattainable love, that is, it was not to be consummated by sexual intercourse; in fact, the female object of the love was usually married to a man other than her beloved, and the theory reflected the real situation of the noble ladies who acted as patrons. Adultery probably occurred in some cases, but unattainable love was the dominant theme. The medieval romantic love espoused by the French poets spread and was profoundly embraced throughout Europe in a way that reached directly into daily life. The concept erected impassable barriers between us and the classical past or the Oriental present.

As the theme of romantic love developed, modifications in the ideal took place, and sexual intercourse and ultimately marriage became an integral and sometimes necessary part of the conception of love. How often either took place in the past is debatable. Clearly until recently romantic love remained separate from marriage. Marriage was a contractual obligation while love was entirely voluntary. True love might well become adulterous but it need not end up that way. Romantic love, however, became an ideal and it became a major theme of song, poetry, and literature of Western culture.

Protestantism with its emphasis on marriage and hostility to celibacy gave companionate marriage a theological stamp of approval. Henry Smith, an English Puritan preacher, wrote in his 1591 *Preparative to Marriage*: “the mate must be fit: it is not enough to be virtuous, but to be suitable . . . So shall the man be pleased which finds a wife according to his own heart, whether he be rich or poor . . . like a pair of glove, or a pair of hose are like; so man and wife should be like, because they are a pair of friends.”

Catholicism, even though it placed renewed emphasis on abstinence and celibacy, never quite lost the idea of romantic love embedded in the literary tradition. Both Catholic and Protestant countries saw an increase of love literature, especially of references to romantic love in guides to proper manners and mores, magazines and newspapers, often accompanied by warnings to young women not to be persuaded into giving up their virtue to sweet-tongued suitors.

The eighteenth century saw the popularization of love with a steady increase of love literature in the New World and the Old. Even in an arranged marriage such as that in Oliver Goldsmith's 1773 play, *She Stoops to Conquer*, a parental choice in mates is sold to the daughter, Kate Hardcastle, in romantic terms. By the nineteenth century in England and America, romantic writers, according to Peter Gay, saw it as their historic mission to re-enchant the world with love. Love was not only a reinvigoration of ancient and medieval traditions but the triumph of impulse over pragmatism. The Romantics, such as Percy Bysshe

Shelley (1792–1822) and Lord Byron (1788–1824), lived as they wrote. By reunifying physical and spiritual love, they believed they established a harmony between the body and mind.

As arranged marriages declined, and the ability of individuals able to make their own decisions concerning a marriage partner increased, romantic love was increasingly seen as the basis for marriage. The work of English novelists such as John Galsworthy (1867–1933) and the real-life experience of George Eliot (Mary Ann Evans; 1819–1880) demonstrated that despite romantic love's strong pull, reality often intervened. Still, the ideal persisted. With the twentieth century, and the world of new inventions and institutions such as the automobile, motion pictures, and public coeducational high schools, romantic love received renewed vigor. If Clara Bow could go from being a Brooklyn waif to a Hollywood starlet, and if she could play a department store clerk who marries a millionaire in the movies, then young women everywhere wanted to emulate her. Romantic love had crossed all class barriers.

Inhibiting full-blown romantic love, however, were always the consequences, namely the fear of pregnancy. With the development of the birth control pill and the widespread dissemination of contraceptive information, romantic passion could be verified or rejected by sexual experience with few qualms. Was romantic love different from simple sexual impulse? After centuries of literary and philosophical explanations, love became a major research field for the emerging social sciences.

“Scientific” Analysis of Love

In a sense Sigmund Freud (1856–1939) had begun this investigation. He had challenged the Christian-philosophical ideal of transcendental, universal love. For him, the urge to love came from the self, born out of base instinct. Freud's id was, in many ways, a revival of the Greek idea of love as an unreasoning furor. While his ideas were soon challenged, Freud was important for placing love more or less on the dissecting table, a subject for research and discussion. Others such as Havelock Ellis had joined the efforts to reexamine love and sex. Psychologists entered the field in the 1960s through efforts to distinguish different types of love. Elaine Hatfield, one of the pioneers, argued that people themselves distinguished several types of love and might do so at different times in their life cycle. Passion, she said, is pleasurable but the strong emotion involved creates the potential for relationship instability. Lovers want stability and often desire friendship as well as passion. Romantic love in effect remained complicated by reality.

Another psychologist, R. J. Sternberg, put forth a triangular theory of love involving intimacy, passion, and commitment, but also recognized that this did not describe all cases and that a sudden burst of passion and commitment could appear at a first meeting. Others, such as John Bowlby, developed an elaborate theory of human infant attachment as the precursor of and foundation for human love.

Not surprisingly, some researchers have found that men and women differ somewhat in their descriptions of love. They note a tendency for men to describe themselves as more involved in game-playing while women describe themselves as

more friendship-oriented, practical, yet dependent. Men idealize an altruistic love more than women do, while women are more realistic. Both, however, emphasize the importance of passionate love. This phenomenon is no longer, if it ever was, confined to the Western world. According to W. R. Jankowiak and others, romantic love is everywhere.

The actual physiology of love has also been investigated. Intense love physiologically has been found to be distinct from sexual arousal, something that was often assumed in the past but is now demonstrated. Love, it now seems, evolved in tandem with two other primary neural systems: the sex drive and adult male-female attachment. The sex drive, according to this theory, evolved to motivate individuals to seek sexual union with appropriate mating partners, while the romantic attraction evolved to enable individuals to prefer and pursue a specific partner, whether male or female, since the same reaction is noted in homosexual and heterosexual individuals. In fact, as the literature of the past is reprinted without the censorship of earlier generations, homosexual love has come to play a significant role in the romantic literature of love as well. Lillian Faderman's 1981 study *Surpassing the Love of Men* broadly traces the literary history of romantic friendship and love between women from the Renaissance to the present. As the debate over gay and lesbian marriages in the first decade of the twentieth century would indicate, homosexual and heterosexual love are driven by the same forces.

Though love in popular fiction and accounts seem to belong to the young, love spans all of human life. Most studies have shown that friendship and passionate love are positive predictors of marital satisfaction across the life span. Love, in fact, has come to be regarded by most researchers as fundamentally important to humanity. It has a strong biological basis that is undoubtedly influenced by cultural developments. Love, it seems, is in a sense what makes the world go round.

LOYALTIES, DUAL. Loyalty is devotion to a cause and is marked by faithfulness, a sense of just purpose, and a willingness to serve in spite of any suffering that may result from service. Dual loyalty involves simultaneous obligations, express or implied, to two parties, with the second party typically constituting a state. Multiple loyalties can threaten the security and survival of a state. Nationality may affect political allegiance by prompting immigrants to place the interests of their country of origin over the welfare of their adopted home. Religion may influence loyalty when those people holding minority religious views feel a loyalty to their faith that is greater than the duty owed to their country. Soldiers fight and citizens pay taxes out of loyalty, a fact that has led many states to link dual loyalties with treason.

Ancient World

The question of loyalty is an age-old one. In ancient Greece, Socrates (c. 470–399 B.C.E.) remained loyal to the laws of the state even though they were unjust and resulted in his death. Plato (c. 428–348 or 347 B.C.E.), identifying internal political conflict as a far stronger test of loyalty than a foreign war, demanded the death penalty for any citizen who turned against the gods or the state. Aristotle (384–322 B.C.E.) argued that loyalty based upon usefulness or pleasure, such as that accorded a tyrant or corrupt politician, disappeared as soon as the motives vanished. None of these ancient philosophers addressed the question of dual allegiance except in the form of conflict between loyalty to the state and loyalty to family members or friends.

As long as the people of a state shared the same religion, loyalty involved allegiance to rulers or forms of government. The rise of Christianity threatened this type of loyalty by presenting a strong competing claim for allegiance. In the Bible, early Christians are recorded as asking Jesus Christ for guidance on dual loyalties. They were advised that no compromise was possible where spiritual matters were involved. Duty to God involved obedience to all of the commandments with any act of disloyalty categorized as sinful.

The Christian Era

After the ascendancy of Christianity to a position of worldly power, the issue of loyalty to God became entangled with the problems of loyalty to the church as an institution with influence in the world. The theologian Saint Augustine (354–430) believed that the church should be the supreme ruler of all Christian nations. Underpinning Saint Augustine's idea of the unity of Christendom was the notion that secular kings owed loyalty to the pope, the earthly leader of Christianity. This idea of rule by the church did not appeal to the secular world, and history records a divergence of views about the proper role of the church. Saint Thomas Aquinas (1225–1274), the most prominent of the dissenters, made a sharp distinction between a person's loyalty to God and to an earthly superior by declaring a right to resist tyranny.

The Renaissance and Reformation witnessed the emergence of dual loyalties as the hold of the Catholic Church weakened and power concentrated in the hands of European monarchs. The Italian political theorist Niccolò Machiavelli (1469–1527) did not rely upon religion to justify loyalty but instead advised rulers to use cruelty to keep subjects united and faithful. The first loyalty tests grew out of the development of a new religious-political system during this time. When in the 1530s Henry VIII split with the Catholic Church and elevated Protestantism in England, he needed to identify and intimidate his opponents to maintain power. Loyalty tests weakened domestic enemies by forcing them to publicly declare allegiance to the English monarchy. As late as the seventeenth century, they would be required of Catholics settling on English land in the New World.

Enlightenment and Revolution

The idea that the divine right of kings mandated loyalty began to die in the seventeenth century. Thomas Hobbes (1588–1679) tied loyalty to passion and self-interest by arguing that the power of a state derived from fear of disorder. He saw no personal loyalty to a monarch, only allegiance to the person providing peace and security. John Locke (1632–1704), perhaps the most widely read political philosopher of the eighteenth century, built upon Hobbes's idea of a contract. Locke stated that the right to govern derived from the consent of the governed. People gave loyalty to a government that governed justly, protected property, and ensured certain liberties. If a government violated the natural rights of the individual, it reneged on its contract and forfeited the loyalty of its subjects.

In proclaiming the Declaration of Independence in 1776, the founding fathers of the United States relied upon the ideas of Locke. The British government had violated its contract with the American people, thereby forfeiting any right to

allegiance. The American stance on loyalty would be duplicated throughout the world as newly liberated peoples used the Declaration as a model for their own definitions of loyalty. Allegiance would be not to a king or a section of land but to the purpose of protecting citizens against the exercise of abusive power by government officials.

Various political regimes, such as that of Henry VII (r. 1485–1509) and the new American state, have demanded tests for allegiance, typically during wartime. Whenever a political culture or institution is firmly established and feels no threat to itself from any quarter, the question of loyalty is pushed to the background. All kinds of doctrines that are hostile to the culture may be tolerated. However, if the culture feels its existence is threatened, there may be vigorous attempts to gain complete political conformity. Requirements and loyalty tests are instituted.

Loyalty played a primary role in structuring the American Revolution in the form of tests that became widespread throughout the many years of political upheaval. With the population evenly divided between supporters of the king, supporters of liberty, and those committed to neutrality, a means had to be devised to create unity. These loyalty tests, often just a public voicing of support for the revolutionaries, helped spur the creation of an American patriotism and accelerated the development of a decade of discontent by placing Americans in increasingly extreme stances regarding allegiance to the British crown. Such positioning finally made independence inevitable by creating an American identity. Both John Adams (1735–1826) and George Washington (1732–1799) viewed such statements of faithfulness as the cornerstone of discipline for troops and the source of national spirit for civilians.

Modern Era

Dual loyalty has formed a political threat in the modern era because difference is only acceptable between national identities and not within them. The modern state sought to instill political loyalties in order to maintain territorial concentrations of power. In doing so, it came into competition with communal centers of loyalty. These ethnic, religious, and regional ties resisted the state's declaration of power and rights as seen among the Aborigines of Australia, the Jews of the diaspora, and the Kurds of southwest Asia. Such expressions of dual loyalty threatened national unity by presenting the image of a divided community.

While many political regimes retain a fear of multiculturalism and attack dual loyalty, this concept of allegiance is becoming superseded by the idea of shared loyalties. The twentieth-century transportation and communication revolutions enabled immigrants to maintain close ties with their countries of origin and maintain multiple cultural identities. The many countries granting dual citizenship recognize the shared loyalties of these immigrants. The challenge for governments is to be able to distinguish between those immigrants who are benign and those who pose a security threat.

LYSENKOISM. *Lysenkoism* is a censorious name for a movement that demands either censure or faith in *agrobiology*, as Soviet agronomist Trofim Denisovich Lysenko (1898–1976) called his aggressive creation. He also named it *Michurinism*, in tribute to the plant breeder Ivan V. Michurin, who won fame with claims of improving fruit while scorning genetics. *Obscurantist* (*mrakobes*), the word a geneticist flung at Lysenko in 1935, recurs even when scholars bend over backward to avoid censure. Lysenkoism defies efforts to disentangle claims of scientific knowledge from assertions of practical authority and from the use of state power to achieve progress.

The Rise of Lysenkoism

The movement emerged as Joseph Stalin's "revolution from above" (1928–1932) forced peasants into collective farms, where the dream of a leap to scientific agriculture suffered practical failure. Lysenko saved the dream with a string of recipes for quick solutions of long-standing problems. He was a poorly trained agronomist with great talent for snap judgments, grand claims, and celebrity. "Vernalization," his breakthrough to fame, began as a scheme to moisten and chill seeds for protection against drought and freezing, with tests on a few plots, crude theorizing about stages in plant development and about heredity, testimonials by some agricultural officials, a rush to mass use on collective farms, journalistic hype—and telltale silence on long-term results. Yet the movement thrived until the 1950s.

Farm bosses quietly discarded Lysenko's recipes, but he had new ones, with crude theorizing pitted against standard science to justify mass campaigns for rapid triumphs that could not otherwise be won. Lysenko argued that the Soviet Union could not afford to lose time conducting preliminary small-scale testing, but had to keep moving forward, applying theories to the masses while still working out the methods in the laboratory. His view of theory and practice fit in with Stalin's "great break," a leap from reasoned arguments over planning to furious drives toward blue-sky goals, most famously summed up in Stalin's 1931 speech to business managers: "We are fifty or a hundred years behind the advanced countries. We must race through that distance in ten years. Either we do it, or they will crush us." In 1941 Nazi armies that had subdued Western Europe struck the Soviet Union, winning a victory that proved the wisdom of berserk modernization. Pragmatists who

would dispute that logic must confront tyrannical pragmatism in a context of backwardness: willful drive combined with brush-off or jail (or death) for specialists offering reasoned warning. That is how farming by fiat gained the reassurance of science in Lysenkoism, until long-term self-defeat grew obvious to political bosses, who rehabilitated standard science and its specialists, posthumously in some cases.

By 1939 Lysenkoists ruled many institutes of biological science; universal rule was decreed in 1948, at a highly publicized conference where Lysenko announced that the Communist Party's Central Committee endorsed his speech. Stalin himself had edited the speech, but Lysenko was not allowed to boast of that. Long after, when the system fell apart and archives opened, a historian found Lysenko's draft with red lines and marginal notes by Stalin. Stalin deleted, with sarcasm, a claim that science, like ideology, is divided into bourgeois and proletarian camps. In 1950 he published that rule: science is *not* divided by class conflict. He ignored his own much-publicized urging of practical men to tolerate no caution from specialists, to "smash" what is "old and dying in science." Such zigzags between willfulness and restraint are blips on a Communist trajectory through faith in swift modernization and social justice to frustration and apostasy.

Criticism

The highest leaders started to back away from Lysenkoism in the 1950s, when a recipe for tree planting failed Stalin's "Great Plan for the Transformation of Nature." Saplings in clusters did not thin themselves for the greater good of shelter belts, as Lysenko's "Soviet Darwinism" had predicted. Massive die-off occurred, a practical fiasco that was only hinted at in public, lest faith in authority be shaken. But biologists were allowed to revive their dispute with Lysenko's denial of competition within species. They could even hope for larger freedom implied by Stalin's startling decree of separation between science and ideology.

Stalin published that criticism of his own system in 1950, challenging specialists to make tests of free thought within their fields, though power remained centralized and violent. The hazards of such boldness within a despotic system kept most specialists quiet and still hinder historians' recognition that Communist bosses learned by bossing, with enormous waste and cruelty. Stalin's efforts to avert self-defeat by calling for criticism from below foreshadowed greater efforts of that sort by his successor, Nikita Khrushchev, and eventually by Mikhail Gorbachev, who pushed criticism of the old system to the limit in the 1980s. The death of Stalin in 1953 set his lieutenants into retreat from mass terror and worship of a "chief" (*vozhdl'*) as methods of rule and into easing of thought control, with growing confusion over such willful practicality as Lysenko boasted of. Khrushchev helped revive genetics, ordered farm specialists to tell him when he was wrong, and scolded those who criticized his campaign for planting maize all over the country. He had grown it at his dacha. He also rebuked ministers of agriculture for ignoring Lysenko's final recipes: training cows to increase butterfat and composting earth with fertilizer before spreading. "Harebrained scheming" was the laconic explanation that the Central Committee gave out in 1964 for the abrupt dismissal of Khrushchev. Genetics was

fully reestablished in research and education, but an exposé of its repression was stifled. A meeting of experts demolished Lysenko's butter and earth schemes, ignoring his angry reminders of past testimonials by practical bosses. He was retired to one farm. Without power, his movement melted away.

Lysenkoism and Human Evolution

Issues of human heredity entered the furor over Lysenkoism in the late 1930s, when the ideological bureaucracy condemned any interest in the topic as racism, if not Nazism. Even medical genetics fell under the ban until the 1960s, when the field revived in defiance of Lysenko's dismissal of genes. The closest Lysenko himself ever came to issues of human heredity was to brush aside the whole topic: "Man, thanks to his mind, ceased long ago to be an animal." That statement was a caricature of the rule that the emergence of *Homo sapiens* marks a transition from biological to sociocultural evolution. Major issues in biology and historical sociology are entangled in that rule, as Soviet Marxists discovered in the 1920s. In the 1930s ideological bureaucrats stifled further thought about human evolution and about ideas of progress; lifeless scholasticism served a faith that was withering away.

In any case the common tendency of Marxists, East and West, has been to separate social from biological evolution. The human breed is declared equally gifted in all its races and classes, which need only a suitable environment to show the common potential. A contrary faith ascribes social ranking to inherited experience of rule and submission. But an upper-class master-race bias can also make use of arguments denying that acquired characters are inherited; one need only assume that genes determine place in the social hierarchy. Any way one turns it, ideology shapes beliefs and reasoning about winners and losers.

Genetics actually supports apologists of no nation, race, or class. Precise science favors a vague egalitarianism: individual differences in hereditary capacities are far greater than average group differences may prove to be. Lysenkoism had nothing to say on such issues; it simply ignored them. But ideas of progress drove its claim of practicality, its support by Soviet men of power, and their disillusion and return to faith in world science as worked out by autonomous specialists. The presumptive utility of such science, a major reason for its flourishing, involves a dogma of universality, a belief that claims of knowledge which win out in developed contexts are practically useful everywhere. That dogma is weakly challenged by talk of "ethnoscience" or "indigenous knowledge" as anthropologists try to be respectful in studying, say, rain dancing and belief in its influence on weather. The challenge by Lysenkoism was strong, for proponents seized on its boast of superseding the science of advanced countries.

READER'S GUIDE

This Reader's Guide was compiled by the editors to provide a systematic outline of the contents of the New Dictionary of the History of Ideas, thereby offering teachers, scholars, and the general reader a way to organize their reading according to their preferences. The Reader's Guide is divided into four sections: Communication of Ideas, Geographical Areas, Chronological Periods, and Liberal Arts Disciplines and Professions, as indicated in the outline below.

COMMUNICATION OF IDEAS

Introduction to History of Communication of Ideas

Communication Media

GEOGRAPHICAL AREAS

Global Entries

Africa

Asia

Europe

Middle East

North America

Latin and South America

CHRONOLOGICAL PERIODS

Ancient

Dynastic (400 C.E.–1400 C.E.)

Early Modern (1400–1800 C.E.)

Modern (1800–1945)

Contemporary

LIBERAL ARTS DISCIPLINES AND PROFESSIONS

Fine Arts

Humanities

Social Sciences

Sciences

Professions

Multidisciplinary Practices

Especially Interdisciplinary Entries

COMMUNICATION OF IDEAS

This category is the newest aspect of the *New Dictionary of the History of Ideas*; cultural studies, communications studies, and cultural history are moving the disciplines in this direction.

Introduction to History of Communication of Ideas

The following entries focus on the media humans have used to communicate with one another.

Absolute Music
Aesthetics: Asia
Architecture: Overview
Architecture: Asia

Communication Media

This is a listing of the types of historical evidence the author used in writing the entry. While entries in the original Dictionary of the History of Ideas were to a great extent the history of texts, the entries in the New Dictionary of the History of Ideas are generally the cultural history of ideas, making use of the records of oral communication, visual communication, and communication through practices, as well as the history of texts, in order to show the impact of the idea on a wide variety of people.

ORAL

The selective list below contains the entries that give the most coverage to historical examples of the oral transmission and transformation of ideas.

Civil Disobedience
Civil Society: Europe and the United States
Communication of Ideas: Orality and Advent of Writing
Cosmopolitanism
Cultural Capital
Determinism
Dialogue and Dialectics: Socratic
Dialogue and Dialectics: Talmudic
Dream
Emotions
Empire and Imperialism: Europe
Equality: Overview
Etiquette

TEXTUAL

Every entry in the *New Dictionary of the History of Ideas* used texts. The following is a list of entries that focused mainly on the history of a succession of texts. Each academic discipline has a succession of major authors with whom later practitioners of the discipline build upon and respond to creatively. The historian of a discipline—such as the history of political philosophy, literary history, or the history of science—considers the responses of thinkers and practitioners of a discipline to the major earlier texts in the discipline. In tracing the origin, development, and transformation of an idea, the historian of ideas considers thinkers' responses to texts from a variety of disciplines.

CHRONOLOGICAL PERIODS

This section is divided according to five periods in world history: Ancient, Dynastic, Early Modern, Modern, and Contemporary. Use this section together with the section on Geographical Areas.

Ancient (before 400 C.E.)

ENTRIES FOCUSED ON THE PERIOD

Buddhism
Consciousness: Chinese Thought
Consciousness: Indian Thought
Democracy
Dialogue and Dialectics: Socratic
Epicureanism
Gnosticism
Greek Science
Hinduism
Justice: Justice in East Asian Thought
Language, Linguistics, and Literacy
Microcosm and Macrocosm
Orthopraxy: Asia
Orthopraxy: Western Orthopraxy
Poetry and Poetics
Sacred Places
Sacred Texts: Asia
Sophists, The
Textiles and Fiber Arts as Catalysts for Ideas
Time: China
Time: India
Yin and Yang

ENTRIES WITH EXAMPLES FROM BEFORE 400 C.E.

Generally the examples in this category are from the ancient Middle East, Europe, or Asia.

Aesthetics: Asia
Aesthetics: Europe and the Americas
Africa, Idea of
Alchemy: China
Alchemy: Europe and the Middle East
Algebras
Ambiguity
Anarchism
Anthropology

LIBERAL ARTS DISCIPLINES AND PROFESSIONS

This section is in accord with the university divisions of the Liberal Arts into Fine Arts, Humanities, Social Sciences, and Sciences and the graduate programs of the professions of Law, Medicine, and Engineering. The sample of Interdisciplinary Programs are listed under their most common university grouping. For example, Fine Arts includes Performance Arts; Social Sciences includes Women's Studies and Gender Studies, as well as Ethnic Studies; Sciences includes Ecology and Geology, as well as Computer Sciences; Humanities includes programs of Communication, Language, and Linguistics. Meanwhile, the growth of interdisciplinary programs reflects the increasing overlap between studies listed under the labels of Fine Arts, Humanities, Social Sciences, and Sciences. A discipline or interdisciplinary program only appears once, but an entry may appear under the several disciplines and interdisciplinary programs that influenced the scholarship of the article. Titles that appear in bold indicate entries that are especially suited as an introduction to the discipline.

Under the category Multidisciplinary Practices, there are entries on the many methods, techniques, theories, and approaches that have spread across the disciplines. The Multidisciplinary Practices help explain the contemporary trend of interdisciplinarity for which the history of ideas has long been known. At the end of this Reader's Guide is a listing of a number of entries that overlap three of the four divisions and a listing of entries that overlap all four divisions.

Especially Interdisciplinary Entries

The most interdisciplinary entries synthesized knowledge by using the methods and focusing on the topics of practitioners of several disciplines. Very few entries listed below are in only one division. Common pairs for the history of ideas are social sciences and humanities, social sciences and sciences, and humanities and sciences. In the early twenty-first century there is generally a recognition of the common overlap of the social sciences with the humanities; social scientists may take ethical and literary factors into consideration and humanists may incorporate societal contexts into their work. The presence of psychology in the sciences, as well as the quantitative nature of some social sciences work, creates an overlap of social sciences with sciences. Another interesting overlap is between humanities and sciences—topics that in antiquity were treated as philosophy or religion are now investigated by those following scientific methods.

SOCIAL SCIENCES, SCIENCES, AND FINE ARTS

Architecture: Africa
 Geography
 Phrenology
 Virtual Reality

SCIENCES, FINE ARTS, AND HUMANITIES

Enlightenment
 Epistemology: Early Modern
 Feminism: Third World U.S. Movement
 Field Theories

M

MACHIAVELLISM. *Machiavellism*, a word that goes back to the late sixteenth century, is a name for the theory and practice of amoral politics. In its ideal, simply abstract sense, it is not meant to coincide exactly with the views or practices of any historical individual, even Niccolò Machiavelli (1469–1527) himself. When Machiavelli praises the citizens of the ancient republic of Rome as noble and public-spirited, he is no Machiavellian. Consistent Machiavellism is unconstrained by custom, ideal, or conscience and aims only at the expedient means, lawful or not, to gain desired political ends. War is thought not only often expedient but necessary to maintain a people's vigor. The absence of moral restraint is reinforced by the fixed opinion that human beings are by nature weak, inconstant, selfish, and inclined to evil. Expositions of Machiavellism often take the form of advice for a ruler, who is regarded as indispensable to the state, and the welfare of ruler and state are considered to be identical. Aimed at practice rather than theory, the literature of Machiavellism is filled with amoral strategies to gain the ruler's ends.

Small-Scale Societies and Kingdoms

"Stateless" societies have no formal structure of government or any formal authorities. Anthropologists have made it clear that there are very few stateless societies in which violence is rare. Machiavellian deception makes its appearance wherever vengeance is taken and wars are fought. The best-known account of a violent, often deceptive people is Napoleon Chagnon's often controverted description of the Yanomamö, who live on the borderland between Brazil and Venezuela. In their chronic wars between villages, they make use of what is translated as "dastardly tricks." What was actually a raiding party once came to a village under the pretense of teaching the men of the village how to pray to a spirit that gives machetes and cooking pots. When the villagers knelt to pray to the spirit, the raiders killed them.

War, generally on Machiavellian principles, is frequent among the more organized societies called "chiefdoms." An anthropologist who studied warfare in the chiefdoms of both Oceania and North America found that it has been frequent and acute. Thus Fiji had many ruthless rulers and ruthless wars, while in North America, warfare in the form of small-scale raids seems to have been inseparable from tribal culture. In New Guinea, the surest route to leadership was by means of bold or sly killing. Some societies favored ambushing, some the destruction of property or kidnapping, and some the driving away or exterminating of the enemy. Stealthy, often treacherous raiding was usual.

In considering the Machiavellian traits of kingdoms or empires, one should at least mention those of South and Central America and Africa. The Incas justified their conquests by the claim that all other peoples had originated from them and therefore had to serve them, give them much of their wealth, and provide them—without showing any signs of grief—with children for sacrifices. The Aztecs' belief that the sun and the powers of the earth would die unless fed with human blood created a need for sacrificial victims and the wars to provide them. That Machiavellism was involved is proved by the fact that most of the victims were from other tribes, whose towns the Aztecs wrecked, whose fields they burned, and whose people they raped and murdered.

Among the African kings, the one best known for ruthlessness was Shaka (c. 1787–1828). By the conquest of many nearby peoples, he created the Zulu empire. Purposely enigmatic and frightening, and informed by a network of spies, he was as ruthless within his own country as outside it. When he gave orders to exterminate all the members of a tribe, he explained that he did so because otherwise the children would grow into possible enemies. Any relative or important person he had any reason to suspect was killed. His justification for his cruelty was that only the fear of death made it possible to hold together the many unruly clans of what would one day be a nation.

Ancient China

In Chinese tradition, Machiavellian thought and practice is associated with Legalism. Insisting on laws that apply impartially to persons of every status, Legalism provides techniques for a ruler to keep control over both officials and subjects. The first famous Legalist, Lord Shang (d. 338 B.C.E.), preached the doctrine that society could be controlled by means of penalties. When he succeeded in becoming the chief administrator of the state of Qin, he divided the population into units of five or ten persons, each responsible for the actions of all the others. Anyone failing to report an offender was to be cut in two at the waist, while someone who did report offenders was to be rewarded as if he had decapitated an enemy. Those who devoted themselves successfully to the fundamental occupations, tilling or weaving, would have their taxes remitted, but those who made socially unhelpful profits, in trade and the crafts, or were poor out of laziness would be confiscated as slaves.

A country that is strong, Shang said, can remain so only by continuing to wage war, while a country administered, as Confucians preferred, with the help of history, music, filial piety, and brotherly love, sinks into poverty or falls to its enemies.

Above all, he said, a government must promote order by means of rare but consistent rewards and frequent, consistent, severe punishments. Governed by the fear of punishment, people will obey the laws, be virtuous, and be kept happy by what they are allowed to enjoy.

The great Confucian Xunzi (c. 310–c. 215 B.C.E.) influenced the thought of the Legalists by insisting that a nation's power depends on its wealth and therefore on its inhabitants' frugality and devotion to the wealth-producing occupations, especially agriculture. He also insisted, like the Legalists, on the need for law with fixed standards of punishment and on the view, contrary to that of his Confucian predecessor Mencius, that people are by nature evil. Their nature, he says, needs to be forced into shape, so that only correct education can make them good.

Xunzi's student Han Feizi (c. 280–233 B.C.E.) argued that the ruler, out of love, should work against the natural disorderliness and self-indulgence of the people. Penalties bring order and rewards bring chaos, so penalties are the beginning of love. A state can function properly, he held, only if it has ingrained lines of command and obedience. The ruler must take many precautions to retain his rule because it is dangerous for him to trust anyone. The ruler's son, if trusted by the ruler to an incautious extreme, will be used by evil ministers to carry out their private schemes. To detect the more subtle kinds of subversion, the ruler must get the people to watch one another and be implicated in one another's crimes. To gain his own ends, the emperor should remain enigmatic and not reveal his intentions to his subordinates. Government can no longer be based on the Confucian virtues or on the model of familial relations. "The most enlightened method of governing a state is to trust measures and not men."

Li Si (c. 280–208 B.C.E.), like Han Feizi, was a student of Xunzi. Li Si was the paradigmatic Legalist because it was he who taught the king of Qin how "to swallow up the world and to rule with the title of Emperor." Appalled by his attacks on Confucian tradition, Chinese historians describe the First Emperor as a cruel, suspicious megalomaniac who by the intelligent use of force, slavery, and the conscripted labor of citizens created the great empire of China out of the motley of its many small states. In collaboration with the indefatigable First Emperor, Li Si created a unified culture, including a standardized Chinese, and a political hierarchy fully subordinate to the emperor. But Li Si is one of the greatly hated figures of Chinese history because, in order to escape criticism based on traditional standards, he tried to destroy very nearly the whole of Chinese literature and so, in effect, to destroy the tradition's moral basis and cultural continuity. To this end, in 213 B.C.E. he ordered that all books, except those on practical subjects such as medicine, divination, and agriculture, be gathered and burned. A year later, there occurred the episode—not the direct doing of Li Si—that to traditional Chinese has been the most extreme example of malignant politics: the execution of 460 scholars, who, according to Chinese tradition, were buried alive in a common grave. In the course of the later history of China, legalistic doctrines and practices were often incorporated into the ruling Confucianism.

Ancient India

Violence and treachery make a frequent appearance in the great Indian epics, the *Mahabharata* and the *Ramayana*, in which the ideal is that of a righteous king with obedient people. In the most usual Indian view, the king is related to the gods and should be revered as such. A wise man in the *Mahabharata* asks what a state without the protection of a king would be like and imagines robbers at work, women abducted, and the strong roasting the weak like fishes on a spit. The self-evident moral of such a fear is that to have no king is worse than to have to have the worst king.

The Indian science that deals explicitly with politics is Arthashastra, literally "the science that deals with *artha*, the means of subsistence." This definition turns out to be equivalent to "the science of politics." The oldest, most developed of the books dealing with the subject is the *Kautilya Arthashastra*. Its author, whose name or pseudonym, Kautilya, means "craftiness," is usually identified with Chanakya, the crafty adviser of Candragupta, who about 321 B.C.E. defeated the Nandas and created the first great Indian empire.

The *Kautilya Arthashastra* is a dryly written manual of government from the standpoint of a king's adviser. It urges the king to care for the welfare and loyalty of the farmers and of the Brahmans and priests. Religions should be respected, Kautilya says, but used for political purposes. For a successful king, he thinks, warfare is the most natural activity. Running through every subject treated in the *Arthashastra* is a concern with the safety of the king. Everyone is under suspicion, from the queen and the crown prince to the king's ministers and citizens.

To translate a pervading suspiciousness into administrative terms, Kautilya recommends an extraordinarily detailed system of domestic and foreign spying and subversion. Each agent is given a cover story, carries out the required spying, including spying on high officials, and reports back to a special station, where the report is put into code. Only a report confirmed by three spies is accepted. Spies who make mistakes are done away with quietly.

Indian literature reflects the attitudes both of Arthashastra and, more often, of those who oppose it for moral reasons. The *Arthashastra's* cynical wisdom was exported from India by the stories of the *Panchatantra* (The five books), probably compiled by about 500 C.E. and translated into some sixty languages. By means of the *Panchatantra*, Kautilya's point of view took on the imagination and humor of folktales and taught the world at large what it implicitly always knew.

Europe

The most famous European Machiavellian was, of course, Niccolò Machiavelli, and his most famous, most Machiavellian book was *Il principe* (1513; The prince). Like his other works, it was nourished by his personal experience, especially as a diplomat, and by the literature of ancient Greece and Rome. Machiavelli must have been familiar with Thucydides's ability to report on history in an objective, amoral spirit, as in the famous dialogue in which the representatives of Athens say to those of Melos that in human affairs the question of justice enters only where there is equal power to enforce it, and that

the powerful exact what they can and the weak grant what they must. Machiavelli knew Cicero's *De officiis* (On duties), which discusses the same political problems that he does, though with usually milder, more moral conclusions. Like Machiavelli, Cicero asks whether it is better for a ruler to be feared or loved—loved, Cicero concludes—and uses the image imitated by Machiavelli of the ruler as either a lion or a fox. Both Cicero and Machiavelli agree that a ruler must curb himself so as to escape hatred.

Machiavelli's Machiavellian views are that present-day human beings are incorrigibly changeable, ungrateful, and insincere; control of government therefore requires the use of force, so the ruler should be capable of leading his state in war and should be ready to abandon honesty and mercy when they interfere with effective rule. Put metaphorically, because humans act like wolves, the ruler must be the lion, and because humans do not keep their word, the ruler must also play the fox, though never openly. Knowing that humans are evil, the ruler should not be troubled by the cruelty that keeps his subjects united and loyal. But the wise ruler will keep a balance between reckless trust and the extreme distrust that unrestrained cruelty causes.

Francesco Guicciardini (1483–1540), a Florentine historian and politician and (at times) Machiavelli's friend, never became as famous as Machiavelli even though he was just as hard-headedly amoral as a political thinker, maybe even more canny, and rather more skeptical. His advice on public relations is always to deny what one does not want to be known and, regardless of even the most convincing contrary evidence, to sow doubt in people's minds by boldly stating what one wants to be believed. Mercy should be shown only when practically useful. No one who understands political life would ever show mercy when it endangers the fruit of a victory, but when it costs nothing to be merciful, mercy is politically advisable.

Guicciardini criticizes Machiavelli for reading contemporary events too often in the light of unrevealing Roman precedents. History is too mutable, he says, for us to learn much from it except not to expect any reward for good behavior or any success from the use of intelligence. The best we can do, according to him, is to maintain our dignity.

Machiavelli's *Prince* aroused interest, most of it indignant, everywhere, with the result that Machiavelli's name became a byword for evil. In Shakespeare's *Henry VI* (part 3), the future Richard III boasts that he can murder while he smiles, wet his cheeks with artificial tears, orate, deceive, conquer, change shapes, "and set the murderous Machiavel to school." As king, in *Richard III*, this self-proposed tutor of Machiavelli is finally destroyed, like Machiavelli's hero, Cesare Borgia, by failing to control his lust for power.

A few almost contemporary philosophers praised Machiavelli's ideas. Michel de Montaigne (1533–1592) refers to him in his essay "On Presumption" and says that Machiavelli is one of those writers who prefers the good of the state to his fidelity and conscience. Almost always, says Montaigne, there is some gain in a breach of faith, as in all other wicked acts. The wretchedness of the human condition is such, Montaigne goes

on, "that we are often driven to the necessity of using evil means to a good end." He sympathizes with a prince whose conscience does not allow him to do what is essential for his own preservation or the preservation of his people but doubts that such a prince will get the favor of God that he deserves ("On the Useful and the Honorable"). Though lying is to Montaigne an "accursed vice," he is ready to say that "to deprive wiliness of its rank . . . would be to misunderstand the world," and that anyone whose morals are conspicuously higher than those of his time "must either distort and blunt his rules" or "have nothing to do with us."

Francis Bacon (1561–1626), who experienced both high office and political disgrace, said that he was indebted to Machiavelli as one of those "who openly and unfeignedly declare or describe what men do, and not what they ought to do." His own aphorisms often have the disabused flavor of Machiavellism. In his essay "Of Simulation and Dissimulation," he concludes that it is best "to have openness in fame and opinion; secrecy in habit, dissimulation in seasonable use, and a power to feign if there be no remedy." Like all Machiavellians, he insists that greatness does not come to any nation that does not "directly profess arms."

Of the other philosophers close in time to Machiavelli, those most like him in their negative estimate of ordinary humans are Thomas Hobbes and Benedict de Spinoza. Hobbes (1588–1679), who does not mention Machiavelli at all, makes similar negative estimates of human behavior. But unlike Machiavelli, in *Leviathan* he belittles the idea of learning from past experience and wants his theory to be a carefully structured, syllogistic science. Spinoza (1632–1677) praises Machiavelli in his *Tractatus Politicus* (Treatise on politics) as a wise man who, because he is wise, must have had a moral purpose. He explains Machiavelli's text as probably meant to show "the folly of attempting—as many do—to remove a tyrant when the causes which make a prince a tyrant cannot be removed, but become rooted more firmly as the prince is given more reason to be afraid." Or, Spinoza says, perhaps Machiavelli wanted to show how careful a free people should be in entrusting its welfare completely to one man, who has to go in daily fear of plots and "is forced in self-defense to plot against his subjects rather than to further their interests." Rather like Machiavelli, Spinoza says that humans are by nature subject to great anger, envy, and the like and so are by nature enemies to one another. However, he adds, echoing Machiavelli's *Discourses*, it is not the inherent wickedness of the subjects of a commonwealth that leads to rebellions, wars, and contempt for the law but "the corrupt condition of the commonwealth" that has framed its laws ineptly; for "citizens are not born, but made." Spinoza also believes that a person can break his promise "by the right of nature," that is, the right of self-preservation.

Georg Wilhelm Friedrich Hegel (1770–1831) was an interestingly qualified admirer of Machiavelli. He thought that Germany, which, like Machiavelli's Italy, had difficulties in becoming a united nation, also needed Machiavelli's advice. Machiavelli, he said, had no special interest in advising a tyrant but in correcting an impossible political situation. For Machiavelli's "great and true conception produced by a genuinely

political head” expresses his understanding that, under the circumstances, the “Prince” had no choice but to secure his own power as a tyrant by all the violent means that are usually considered to be crimes. The acts are justified by the vision of the sovereignty and independence of the people, the *Volk*, which depend on the destruction of the lesser local authorities. But when the tyrant’s work is done, he automatically appears as a despot, and “then, it is the tyrant-slayers who are heroes.”

Machiavellian Rule

The assessments of Machiavelli himself are still mixed. The more favorable ones may be exemplified by that of the twentieth-century philosopher Ernst Cassirer, who wrote that Machiavelli’s accomplishment lay in not allowing his personal feelings and ideals to affect his political judgment, which was “that of a scientist and a technician of political life.” But whatever the verdict on Machiavelli the person, the Machiavellism of which he wrote pales in the face of the massive attack on conventional morality by the twentieth century’s great tyrants, Stalin, Hitler, and Mao.

Machiavellian behavior has been integral to the political and social life of every culture. One of the reasons why it is found everywhere is the universal need for a social system with an effective leader. When it is not clear what authority, if any, is to be obeyed, the result is uncertainty, social friction, wasted effort, dissatisfaction, and the willingness to follow any leader who promises to overcome the threat of chaos. In any case, morality proves to be easy to equate with conformity to the demands of leaders, however careless they may be of compassion and of truth. The individual conscience proves to be at its most elastic when leaders and followers assume that the cause they serve is of such surpassing importance that deception or cruelty in its behalf is in fact a moral virtue. Such a hope for a better society ordinarily requires that those who appear to be obstructing it should be identified and proclaimed to be its enemies.

MACHISMO. Machos are not born; they are made. For the same reason, the term *machismo* refers to a concept that has been invented and not to a primordial cultural trait of any particular group of people. In the United States, machismo was “discovered” by social scientists and feminists much as the New World was “discovered” by Europeans five centuries earlier: U.S. scholars and feminists noticed gender oppression in Mexico and the rest of Latin America and announced that it was a particular cultural trait among Spanish-speaking men.

Although some believe machismo has ancient roots common in all “Latin” cultures since Roman times, others argue that it is an ideology that originated uniquely in Andalusia, Spain, and was carried over the Atlantic Ocean during the Spanish Conquest. There is even an opposite theory positing that machismo was indigenous to the pre-Columbian Western Hemisphere. In fact, the term *machismo* has a very short word history dating back only a few decades in the twentieth century.

This does not mean that what scholars today call sexism is new to the Americas, or that inequality based on sexuality and gender difference—today recognized under rubrics like homophobia and misogyny—are of recent vintage. But like the expression sexism, the term machismo is new.

Perhaps the most complicated aspect of the idea of machismo stems from the fact that until fairly recently the term may have been more broadly used in the United States than in many parts of the Spanish-speaking world. Although elsewhere in the world *macho* always has had a negative connotation when referring to humans—it originates in a term that designates the male of an animal species (*hembra* being the female)—in Latin America the term has a somewhat different history. Only in the 1990s did the term come into vogue more broadly in Latin America; earlier it was mainly utilized to refer to culturally determined forms of masculinity by intellectuals and activists involved in examining and struggling against oppressive regimes grounded in ideas and relations of gender/sexuality systems in journalistic writing, social science studies, and feminist critique of the oppression of women and gays.

Pegging extreme sexism to one or another culture is a dead-end at best, and a racist subterfuge at worst. In the contemporary United States the machismo mystique is regularly employed to imply that somehow Spanish-speaking men, and especially Spanish-speaking heterosexual men, are more prone

than men from other cultural backgrounds to sexist language, actions, and relationships. This is in large part a result of scholarship by U.S. academics, including anthropologists and sociologists, who have gone to Mexico and other parts of Latin America to study questions of family, kinship, and gender/sexuality and through this research have developed interpretations and paradigms consistent with hegemonic notions of studying down—that is, looking at populations that have been marginalized and oppressed (as opposed to “studying up”; that is, examining the ruling classes)—and finding political, social, and cultural fault with oppressed others.

In Latin America, the term *macho* usually must be distinguished from that of *machismo*. Macho has different meanings in different social circumstances: sometimes it refers simply to the male of a species, whether animal or plant. In other cultural contexts “to be macho” can have contradictory connotations: for older generations this may refer to something positive for men to emulate, so that a macho man is one who is responsible for the financial welfare of his family, whereas for younger men to be macho can refer to culturally stigmatized behavior like beating one’s wife, and thus in order to differentiate themselves from this kind of stigmatized practice many men of these younger generations would not readily refer to themselves as macho.

The term *marianismo* was created, in almost biblical style, in machismo’s image: it was not good for the macho to be alone, so in 1973 a North American academic invented *marianismo*. *Marianismo* has done damage to our understanding of gender relations and inequalities among Latin American and U.S. Latina women similar to the damage done by machismo among Latin American and U.S. Latino men. Now discredited, *marianismo* was originally an attempt to examine women’s gender identities and relationships within the context of inequality, by developing a model based on a religious icon (María), the quintessential expression of submissiveness and spiritual authority. This notion of Latin American women is grounded in a culturalist essentialism that does far more than spread misinformed ideas: it ultimately promotes gender inequality. Both *marianismo* and machismo have created clichéd archetypes, fictitious and cartoonish representations of women and men of Latin American origin. If a Mexican man, for instance, is abusive and aggressive, he will be labeled a macho. If a Mexican woman quietly endures such an abusive relationship, her behavior is automatically examined within the *marianismo* paradigm. But if a white man and a white woman display similar behavior, they are seldom analyzed in so cavalier and simplistic a fashion.

What is more, frequently these traits of machismo and *marianismo* are pegged in particular to working class men and women, as if those from the middle and upper strata were too sophisticated for their lives to be captured by such crude academic groupings. As theoretical categories, therefore, machismo and *marianismo* are not only culturally chauvinist but elitist as well. The machismo-*marianismo* paradigm represented an expression of a widespread intellectual colonial mentality in the behavioral and social sciences that remained dominant and unchallenged for far too long.

Poster by Hernando G. Villa advertising dude ranches, 1938. Although the term *machismo* is generally specific to Latin America, the concept has also spread to the United States where the connotation suggests physical toughness, masculinity, and old-fashioned family values. © SWIM INK/CORBIS

As a contemporary idea, machismo has long since entered popular discourse, including among the Latino/a populations in Latin America, the United States, and elsewhere. Indeed in the twenty-first century, Latino/a cultures are commonly defined from within as inherently macho. As such machismo has become a critical aspect of Latino/a identity politics, even when, as in this case, the cultural characteristic in question is held to be a negative set of ideas and practices.

The etymology of the idea of machismo thus has roots in political and social concerns of the late twentieth century. The origin of the term is found in texts, especially journalistic, social science, and feminist dissections of Mexican men and Latinos in general in this period. The popularization of machismo as an epithet for Spanish-speaking males of the species coincided with the rise of second-wave feminism and, later, cultural identity politics in which supposedly immutable cultural traits were linked, as if genetically, to men with one or another geographic and/or class ancestry.

The origins of the term give an indication of its future as an idea: to the extent that hegemonic ideologies and ways of constructing knowledge about Latin America and Latinos

remain unchallenged, including with regard to gender relations and inequalities, it will be possible to continue employing machismo in a stereotypical fashion and as an expedient label for complex social interactions. If, on the other hand, the idea of machismo and that of its even more problematic would-be opposite, *marianismo*, are recognized and discarded as antiquated paradigms invented to explain and teach about gender inequality in Latin American and Latino/a societies, then the idea of machismo could be short-lived. Machismo as a shorthand for sexism may have come into journalistic, social science, feminist, and popular vogue for a variety of reasons, including the well-intentioned desire to criticize gender inequality and oppression. The continued employment of this hackneyed term can only reflect the persistence of an elitist and racist model to understand gender inequities among women and men of Latin American origin.

MAGIC. Magic is the performance of acts or rites that are intended to influence a person, object, or event. It can also be performed to counter other magic. Magical acts or rites are usually performed with the assistance of mystical power. People who engage in the different activities magic encompasses can be called magicians, shamans, healers, sorcerers, or priests/priestesses. In some societies the knowledge required and the ability to perform magic are restricted to specialists who have undergone extensive training, while in other societies they are available to the common person and are learned as part of the enculturation process. In early-twenty-first-century anthropological discourse magic is generally considered to be a dimension of religious thought and practice and to be an aspect of culturally influenced understandings about causality, while in

popular culture magic is often associated with superstition and used to refer to ideas and practices considered to be false and inferior. Divination is frequently identified with magic. It concerns the attempt to learn or discover information that is not accessible to most human beings through acts of skilled interpretation and the use of mystical power. The information discovered can be used to inform an act of magic but divination is not itself the act of influencing people, objects, or events.

Since the early twentieth century, scholars writing on magic have been interested in a variety of issues that concern its instrumental effects, social functions, psychological functions, symbolic attributes, and the forms of thought that characterize it. Their inquiries and theories have offered a range of ways to approach the study of magic, have made important contributions to the development of the disciplines of philosophy and anthropology, and continue to raise central questions about the limitations of language and culturally influenced perception in the interpretation of less familiar ideas and practices. The study of magic presents contemporary scholarship with a rich history on which to build theories of intersubjective understanding. An analysis of the intellectual and epistemological history of Western thought about magic reveals patterns of ethnocentrism. Awareness of these constructions offers the possibility of advancing methods of cross-cultural and cross-society comparison in addition to the creation of theories that more fully address the range of ideas and practices that can be considered in magic.

Vocabularies used to describe the practitioners, outcomes, and qualities of magic seem to gain popularity for certain periods of time, evolve in ways that reflect the concerns of particular disciplines, and come to be associated with specific geographic areas of the world. Witchcraft and sorcery, for example, have been used predominantly in the social sciences to refer to harmful or destructive uses of magic. Another example is the relatively limited use of the term shamanism in anthropological literature to practitioners of magic in Northern Europe and the Americas. In addition, shamanism assumes that magical acts can have both harmful and helpful consequences. Anthropological literature that concerns practitioners of magic in Africa has often relied on the term *healing* to refer to helpful magic, and *witchcraft* to refer to harmful magic. In an attempt to develop a more universal vocabulary and to avoid some of the topical and regional associations carried by the terms *witchcraft* and *sorcery*, some scholars prefer only to use the term *magic*.

Magic, Religion, and Science

Of particular interest to intellectual history is the way that the terms magic and religion have been used in a social evolutionary framework to mark differences between the Western and non-Western, the advanced and backward, civilized and primitive cultures, and to characterize Christian and non-Christian religions. Many scholarly ideas are based on a set of assumptions about the differences between magic and religion, placing greater importance on the achievements of religion and greater value on its truth claims. These ideas bear some similarity to distinctions offered in the Old Testament and in early Christian theology. Some scholarly ideas address the difference

between magic and science, where the latter is viewed in more positive terms. In the nineteenth and part of the twentieth century anthropological discussions of magic, religion, and science were heavily influenced by evolutionary theories and debates about the nature of scientific reasoning and practice. They also tended to rely on the understanding that magic involved the manipulation of mystical forces and beings, was used to achieve practical goals, and was intended to affect the natural world.

E. B. Tylor (1832–1917) and James G. Frazer (1854–1941) made some of the most important early contributions to the study of magic and religion, although both relied on ethnographic information that was limited in geographic scope and lacked extensive contextualization.

In contrast to a number of previous ideas holding that magic is an undeveloped and primitive form of thought, Tylor found that magic required a rational process of analogy based on understanding the links between cause and effect. He was also interested in its symbolic properties. He did, however, emphasize the differences between thought in magic and thought in science, for he called magic a “pseudoscience” that was incorrect and deluded. His point was that people involved in magic could not differentiate between causal relationships achieved through magic, and causal relationships that occur in nature. Although he thought that both magic and religion could exist together in any given society, he proposed that magic diminished as human institutions advanced and therefore associated scientific thought with more noteworthy human achievements.

Frazier’s understanding of the relationship between magic and religion was structured according to a linear evolutionary framework composed of three forms of thought: magical, religious, and scientific. He postulated that magical thought, the earliest stage of human development, was replaced by religious thought as people observed its failures and came to believe that they could propitiate gods in order to control nature. Religious thought was then replaced by scientific thought as human beings understood natural laws.

Frazier is also noted for his insights about the thought processes that magic involves. His ideas about causality in magical thought continue to be important to arguments about differences in forms, or systems, of thought in various cultures. He observed that magic was based on two sets of assumptions about the way magic worked, which he called laws. The first was the law of similarity (characterized by homeopathic or imitative magic) and the second was the law of contact (characterized by contagious magic). In homeopathic magic he stated that “like produced like,” where a thing with a property or quality similar to another thing was thought to be able to influence it. In contagious magic, a thing in physical contact with another thing was thought to be able to influence it later and at a physical distance. He observed that scientific reasoning involved a comparable thinking process, or “association of ideas,” and for that reason viewed magic and science as fundamentally different from religion, which involved human beings’ propitiation of superior powers.

By the turn of the century the writings of scholars with a sociological orientation increasingly became more important.

They based the distinction between magic and religion on its function and on the context of its performance. For Marcel Mauss (1872–1950), magic was private and secret, and did not contribute to group activities and organizations. Émile Durkheim (1858–1917) similarly viewed magic as an individual practice in contrast to religion, which he saw to be collective. Max Weber (1864–1920) was interested in comparing the practice of magic and religion in precapitalist and capitalist societies. He observed that magic was dominant in precapitalist societies, and was on the decline in capitalist societies along with what he called the increased “rationalization of economic life.”

The Functions and Effects of Magic in Classic Anthropological Works

The early contributions of Wilhelm Wundt (1832–1920) and R. R. Marett (1866–1943) drew attention to the psychological motivations and effects of magic. Wundt, who viewed magic as a stage in the development of religion, found that the impetus to practice magic came from human beings’ fear of nature and efforts to influence it. Marett saw magic as a way for humans to address emotions stemming from insecurity and to gain courage and confidence.

Beginning with the work of Bronislaw Malinowski (1884–1942) in the Trobriand Islands of Melanesia during World War I, the insights that anthropologists brought to the study of magic were based on long-term field observations and were undertaken by the writers themselves. Along with the work of his contemporary, Alfred Radcliffe-Brown (1881–1955), he greatly contributed to anthropology’s developing body of thought on methods and standards for fieldwork. With extensive examples from his study, Malinowski found that magic in the Trobriand Islands addressed particular kinds of problems that were specific and practical. These he distinguished from the larger concerns of human life that he identified with religion.

For Malinowski, the many functions of magic included human beings’ attempts to increase the probability of success in important activities, and increase confidence to undertake them. Magic opened up possibilities for human action. He did not view magic as a characteristic of particular kinds of societies, but thought that it could be found when human beings were confronted with a lack of knowledge or ability to control something important to their lives. Malinowski also observed that magic had social and moral functions that led to better cooperation among group members. In addition, it gave people access to what he referred to as “miracles,” events that were unexpected or unlikely, thus giving them hope.

Addressing the question of the difference between magical and natural causality, Malinowski showed that the Andamanese used magic to supplement the actions of the natural world. In their horticultural and sailing activities they both relied on their own knowledge and skills, and used magic to assist them to handle unexpected events. Malinowski did not present magic, religion, and science in an evolutionary framework, but considered them as aspects of cultural systems. His approach acknowledged that the Andamanese had empirical knowledge and did not assume that magic was apart from, or a replacement for, effective activity in the world.

The work of Radcliffe-Brown among the Andamanese also provided new standards of research for the study of magic and religion. Like Malinowski, he was able to demonstrate the many social functions of magic. One of his greatest contributions was to elaborate on the term *mana*, the word for magical knowledge and power that has the potential to be both dangerous and beneficial. Objects and substances possess mana, and human beings acquire mana through their relationship with spirits.

Radcliffe-Brown observed that the Andamanese used mana as a way of distinguishing transformations in social positions. During times of transition, the dangerous aspects of mana are dominant, requiring people to observe taboos. Radcliffe-Brown stressed that the function of these ideas and the rituals associated with them was to support group collaboration and interdependence. Compared to Malinowski, he placed even greater emphasis on the social value of ritual rather than on its instrumental effects.

E. E. Evans-Pritchard (1902–1973) extended the study of the social and political context of magic. His research among the Azande of the Sudan was published in *Witchcraft, Oracles, and Magic among the Azande* (1937), a work that continues to stimulate scholarly debate and reinterpretation. His analysis of magic and witchcraft not only acknowledged their strategic uses, but permitted a more complex understanding of the relationship of witchcraft and magic to social and political institutions. He reveals that it was only men and members of the elite in Azande society who were authorized to use certain forms of magic and oracles that could identify those responsible for witchcraft. While these issues were not his central concern, his detailed and comprehensive description of Azande life allows readers to identify the implications of magic for gender relations and to support political and economic power.

One of his greatest contributions was to present magic as part of a “ritual complex” and stress their relationship rather than to focus attention on categorical distinctions. For Evans-Pritchard, magic, witchcraft, oracles, and divination worked as an integral whole and could not be understood alone. In his account of Azande ideas and practices, he showed that magic, oracles, and divination were used to address witchcraft. Oracles and divination provided information about the source of witchcraft, and magic was employed to counter it. Because the Azande used magic primarily in response to the mystical power of other human beings, and not to change nature, Evans-Pritchard did not consider the comparison of magic with science to be relevant.

One of the results of Evans-Pritchard’s detailed ethnographic work was to convey the pervasive uses of magic and witchcraft in the everyday lives of the Azande. Including both the act of engaging in rituals and ways of apprehending their world, magic and witchcraft were presented as an integral part of Azande culture. Evans-Pritchard also provided information about the contents of magical acts that could be similarly compared to those in European magic. He described how the plant and animal substances used in magic were considered to be inert until activated by the verbal spells of the owner, and explained that the Azande called these substances medicines. He contested the established notion that magic was primarily used to change the natural world with his discovery that, for the

Azande, magic was used to counter the magic of others, and was therefore an activity that was largely identified with protection. He also pointed out that it was used to punish people who misused magic, a function that was considered moral.

Thought, Logic, and Rationality in Magic

Early-twenty-first-century discussions that attempt to characterize the forms, or modes of thought in different cultures, as well as their reliance on magic, often retrace debates around the work of Lucien Levy-Bruhl (1857–1939). His ideas have implications for a series of complex questions concerning the way culture can shape thought, providing an individual with either limitations or extended possibilities. Levi-Bruhl proposed that there was a major distinction between the thought of European and preliterate people, which he termed “primitive mentality.” He stressed that the difference was due to the content of the ideas and causal understandings in culture, and was not the product of different mental capacity. He termed the modes of thought that characterized each as scientific and prescientific (or prelogical), respectively. He proposed that “primitive” societies tended to use mystical or supernatural explanations for unexpected occurrences. He contended that this form of thought does not permit a kind of logic that challenges or tests it. The thought process has an internal consistency and rationality, but does not follow the rules of scientific thinking and does not differentiate between what Levi-Bruhl called the natural and supernatural.

Some of Evans-Pritchard’s most important contributions followed from an attempt to address Levi-Bruhl’s distinction between forms of thought. Evans-Pritchard associated Azande common sense with empirical observation and science. This allowed him to contrast what he called “empirical thought” and “mystical thought,” which included magic. A central point in his discussion of magic and witchcraft was that Azande thought is founded on rational processes and empirical knowledge of their world.

His ideas offered a radical departure from the preoccupation of previous literature with the dichotomy between magic and science, and between thought that either was or was not scientific. Following Levi-Bruhl’s observation that the body of collective representations in cultures with prescientific thought limited possibilities for the thought system’s self-critical appraisal, Evans-Pritchard used examples from his Azande material to explain how this took place. Azande responses to the failure of magic to achieve the desired result were not to question their technique or knowledge, but to question the specific acts of the magician and to assume that other magic conducted to counter theirs was stronger. These and other explanations, which Evans-Pritchard termed “secondary elaborations of belief,” did not require the Azande to confront the failure of their explanation, nor the failure of their entire system of thought. This, he said, was responsible for the continuation of the belief in magic despite evidence that it was fallacious. Evans-Pritchard characterized these systems as “closed systems of thought.” He observed that they were only able to operate in limited ways that did not extend beyond their own parameters. Certain forms of scientific reasoning therefore would be outside the paradigm.

Robin Horton elaborated on this issue by contrasting open and closed systems of thought. He offered that open systems had the ability to either prove or disprove particular causal relationships between acts and natural consequences. Closed systems did not encourage the verification of what was hypothesized, and the result was that the thought system continually supplied ways of accounting for particular successes or failures.

The Role of Analogy and Metaphor

Returning to the question of how thought can be similarly compared from one culture to another, and the notion that forms of thought that appear to display differences might have underlying similarities, the contributions of Claude Lévi-Strauss (b. 1908) and Stanley Tambiah (b. 1929) are particularly useful. Accepting Frazer's observation that in both magic and science relationships of cause and effect are based on analogies, Lévi-Strauss proposed that magic could be understood as a subcategory of analogical thought, and worked on the assumption that a metaphor follows natural laws. Like most early twenty-first-century scholars, he views magic, science, and religion to occupy aspects of thought and practice in all societies.

Tambiah has taken the study of magic and analogy much farther than any other scholar. Tambiah finds that analogical reasoning is a quality of both magic and science, but claims that they involve different kinds of analogies. Science, he argues, makes an analogy between known causal relationships and unknown causal relationships. Following Lévi-Strauss, he finds that magic relies on the use of a particular kind of analogy, but he emphasizes the importance of the transfer of meaning from the physical procedures in magic to a referent in the natural world. Magic offers human beings something that science does not: creative possibilities. He also observes that magic extends meaning into practical activity. The meanings produced through ideas and practices of magic are therefore central to an understanding of the workings of culture and society.

Lévi-Strauss made another important observation about the differences between magic and religion. Taking both to be categories of thought, rather than terms that referred to different contents, he proposed that the terms were used by Western thinkers to make distinctions between their own thought and what he called "outside" thought. This outside thought was designated as inferior to domestic thought. Emphasizing that neither have particular contents or meanings, and that Western thought arbitrarily provides its own subject matter, Lévi-Strauss advocated the dissolution of the category known as magic.

Magic and Modernity

Early-twenty-first-century scholarship has expanded its views on how to study magic and how to frame its object of analysis. Peter Pels (2003) observes that the practice of scholars to frame magic as the opposite of modernity has had effects that are just now being addressed. As modern discourses work to distinguish magic from the modern they also create what he calls "correspondences and nostalgias." He and other scholars such as Jean Comaroff and John Comaroff (1993) and Michael Taussig (1997) have been increasingly interested in elaborating on the

specific forms that magic takes in modernity. Taussig addresses the question of how state power is experienced and understood by citizens of Columbia, where he conducted research. He finds that state power relies on different forms of magic to not only inspire awe from citizenry, but to conceal its deceptions and violence.

Conclusions

A central concern in the intellectual history of magic and religion is modernity. This requires an understanding of how Western scholarship has created grand narratives that present Western societies and their political projects, notably colonialism, in a favorable light. It is clear that one of the most distinctive elements of Europe's construction or imagination of itself has been its self-designation as civilized and progressive. The simultaneous construction of other groups of people as the opposite—backward, primitive, and undeveloped—was assisted by discourses in the social sciences, philosophy, and religious studies.

The theories and assumptions about magic that scholars have used, particularly in writings prior to the work of Lévi-Strauss, demonstrate particular patterns. The ways that they chose to contrast and compare material from different cultures and societies often created an opposition between Western and non-Western, advanced and backward, and civilized and primitive cultures. When magic was contrasted with religion, it was viewed to be less comprehensive and focused on practical ends, rather than ontological or existential ones. When placed in contrast to science it was seen to be either limited or incorrect, since it did not contain a logic that could test its propositions nor question its own premises. In early-twenty-first-century analyses, magic has been compared favorably to science, and there is a general assumption that it works toward an understanding of the natural world and relies on analogical reasoning. Most scholars view magic as an aspect of religion that exists in all societies. It can be viewed as part of everyday life, guiding thought and action.

People in societies across the globe have been influenced by Western thought on magic, with its attending characterizations of culture. Magic has been present in the discourses of colonial rule, Christian conversion, educational institutions, state administrative organizations, and development policies. Whether the thought comes from popular culture or scholarly investigations, the production and reproduction of dichotomies, that according to Lévi-Strauss present what is "outside" as inferior, continue to present problems for scholarship. Despite the relative lack of theoretical reflections and ethnographic works on magic prior, early-twenty-first-century scholarship is poised to extend the terrain of what can be considered to be magical and to conceptualize the new forms that magic takes in modernity.

MANICHAEISM. Manichaeism is a now-extinct religious system characterized by dualism, asceticism, and an acute sense of worldwide mission. It originated in the teaching of Mani (216–277 C.E.), a Parthian raised in Mesopotamia in an Aramaic-speaking Jewish-Christian community known as the Elchasaites. He experienced visions in his youth that made him aware of a pantheistic presence in the world that he felt called upon to help liberate from its suffering. He broke with the Elchasaites (c. 240 C.E.), visited India, and upon his return to Mesopotamia formed his own religious community. He proselytized throughout the Persian Empire, and sent his disciples further afield to India, central Asia, and the Roman Empire. By the time of his death as a prisoner of the Persian king, Mani had succeeded in establishing a well-organized institutional structure that spread and preserved his teachings for a thousand years, despite nearly constant persecution.

Manichaeism arose in a highly cosmopolitan culture, in full awareness of antecedent west Asian religions such as Zoroastrianism, Christianity, and various pagan and Gnostic sects, as

well as the Hindu, Jain, and Buddhist traditions of South Asia. According to Manichaean teaching, Mani was the last of a series of divinely inspired prophets that included Zoroaster, the Buddha, and Jesus Christ. These divine messengers were sent periodically to particular regions of the earth to reform the true message from the corruption of time, an idea found also in Islam and the Baha'i faith. Mani brought the latest restatement of truth, and took the novel precaution of committing it to writing himself, rather than trusting his disciples to hand it down correctly. The rich Manichaean literary and artistic tradition is now reduced to fragments discovered in the twentieth century in China and Egypt, precariously supplemented for the modern researcher by polemical accounts from the religion's enemies.

Doctrine

Manichaean doctrine is premised on a material and ethical dualism. The known cosmos is a mixture of two antithetical realms of being, originally separate and eternally incompatible. The realm of light is a wholly good, harmonious universe in which God, the father of greatness, dwells with innumerable light beings, which are one with him in substance and character. The realm of darkness is a wholly evil, chaotic universe dominated by a king of darkness and his female counterpart. At the beginning of time, the realm of darkness perceives and covets the realm of light and attacks it, unaware of the harm that contact with it will bring to itself. The prescient father of greatness fends off this aggression by putting forth a series of emanations to act out a strategy of containment and ultimate reparation of light and darkness. In the primordial battle, one of these emanations enters into mixture with darkness, constraining it and forestalling a breach of the boundaries of the realm of light. This mythological background explains the evident condition of the known cosmos, in which everything is a mixture of conflicted substances and forces, engaged in a perpetual struggle for mastery. The point of Manichaean instruction is learning to identify oneself with the forces of light and goodness and striving for their ultimate reparation from entanglement with darkness and evil.

Manichaeism is closer to Zoroastrian dualism than to Gnostic or Platonic varieties in that it avoids a spirit-matter dichotomy. Both light and darkness have material as well as spiritual properties, and even the most subtle forces are usually treated in materialistic terms. Manichaeism also shares with Zoroastrianism an activist mythology and ethic, rejecting the notion of a sinful "fall" of the soul in favor of the idea of a voluntaristic "leap" of the soul in the service of God's purposes. In other details, Manichaeism has greater affinity to Indian thinking, for example in seeing souls not only in human beings, but in all living things, even in rocks and dirt. For the Manichaeans, the soul is a collective entity, a consubstantial emanation of the deity, broken up into individuals only temporarily through mixture with evil. Humans are only one small part of a universal process of struggle and liberation of the world soul. This world soul carries with it all positive properties, such as life, growth, beauty, and brightness, whereas evil contributes to the mixture only death, decay, ugliness, and gloom. Whereas for Zoroastrians the goal is to expel evil from

this world, the Manichaeans see this world as unperfectable, a temporary scene of conflict and suffering from which ultimate escape is envisioned. In this respect, Manichaeism has a common outlook with Buddhism and Jainism, as well as the more eschatological and ascetic strains of Christianity.

Based on these ideas, Manichaean practice entailed a rigorous behavioral code, designed to avoid harming the world soul in all things as much as possible, as well as ritual practices intended to aid the process of its liberation. Outbursts of anger, impatience, stupidity, greed, hatred, and violence attest to the mixture of evil with good in the human body. The evil elements must be identified for what they are, repented, resisted, and ultimately overcome by the Manichaean. Due to a number of adventitious factors, individuals have different capacities for this task, and consequently the community is divided into two grades. The first, that of the elect, was made up of those men and women willing and able to take on the most vigorous form of self-discipline, involving celibacy, poverty, and a wandering life preaching the faith. These had the ability to transmute material elements within their bodies, freeing soul fragments from the food brought to them, as well as the potential to achieve liberation at death. Those unable to adopt this life were called auditors, who remained engaged in hearth and home, but supported the elect while striving for advancement in the faith through moral growth and a better rebirth.

Later History

In the seventh century C.E., both the rise of Islam and the arrival of Manichaeism in China brought the religion into contact with new spiritual ideologies. Islam and Manichaeism had little in common doctrinally apart from minor elements of their shared west Asian heritage, which also contributed their common ritual patterns of prayer and fasting. Yet more speculative forms of Sufism and Shiism within Islam certainly drew on Manichaeism for ideas about the soul's affinity to God and transmigration. In China, Manichaean missionaries were able to draw upon, and perhaps help foster, developments within popular religion akin to Manichaean concepts. In Taoism, these included dualistic categorization of the cosmos and physiological alchemy, while in Buddhism they involved the ideas of a Pure Land (a realm of light and harmony as a goal of liberation from this world) and of Buddha Nature (an inherently pure nature in all things).

Manichaeism enjoyed a renaissance in west Asia under the tolerant Umayyad regime (661–750 C.E.), while the conversion and sponsorship of the Uygur Empire and its successor states in central Asia (c. 760–1100 C.E.) afforded secure conditions there, as well as within China, over which the Uygurs exerted strong political influence for a time. Such respites were short-lived. When public existence became untenable, Manichaeans found it convenient to take on the guise of Christians, Muslims, Buddhists, and Taoists, while maintaining their distinct doctrines and practices in secret. The suspicion of secret Manichaeans within these other religions probably far exceeded their actual number, duration, or influence. But it is possible that lingering traces of Manichaean ideas and practices in popular religion contributed to sectarian developments within Christianity, such as the Cathars of Italy and France

and the Bogomils of the Balkans, as well as within Islam, Buddhism, and Taoism. Nevertheless, the institutional structures and distinct identity of Manichaeism gradually eroded under relentless persecution, until the last remnant communities dissolved in southern China sometime in the fifteenth or sixteenth centuries.

MAOISM. *Maoism* is not a term that is easy to define. While it is common sense that Maoism refers to the vision, ideology, and political viewpoint of Mao Zedong (1893–1976), it is difficult to pinpoint the specific contents and basic features of Mao's conceptual world in the context of the evolving course of the Chinese Communist revolution. Despite Mao's adoption of Marxist-Leninist terminology, his ways of thinking had been deeply penetrated by Chinese thought and culture. In the People's Republic of China, it is "Mao Zedong Thought," instead of Maoism, that designates Mao's ideas, strategies, and policies. During the post-Mao era, the Chinese Communist Party (CCP) leadership, in an effort to legitimize the Chinese Communist state, emphasized that Mao Zedong Thought included only those of Mao's ideas and theories that had stood the test of practice, and that the "scientific system of Mao Zedong Thought" was the product of the collective wisdom of the Party leadership, rather than Mao's sole creation. Beyond China, many radical revolutionary movements and organizations have professed loyalty to a variety of self-proclaimed versions of Maoism, even long after Mao's death.

Essential Features

This essay takes Mao's own expressions of his thoughts as the basis for defining Maoism. While the contributions of Mao's CCP comrades are acknowledged, they are not regarded as an integral part of Maoism if Mao himself did not accept or adopt them. In identifying the basic features of Maoism, moreover, it is essential to test them against the development of Mao's thoughts as a historical process. Indeed, unless Mao's own

changing ideas are carefully examined, it is impossible to grasp the essence and basic features of Maoism.

Maoism as utopian vision. At its core, Maoism is first and foremost a utopian vision. Throughout Mao's political career, he fought for the ideal of universal justice and equality "all under heaven." This vision derived at one level from Mao's Sinitification of Karl Marx's concept of a communist society, yet it was also compatible with the age-old Confucian ideal of a "society of great harmony." Despite the vision's central position in Mao's conceptual realm, Mao was never able to define clearly the path and the means by which it would be turned into reality. The extraordinary ambiguity of Maoism as a utopian vision provided, on the one hand, space for Mao and his comrades to develop the CCP's ideology, strategies, and policies given the changing requirements of the Chinese revolution, and, on the other, created serious internal tensions in the Maoist system—especially when Mao's ideals proved unable to stand the test of people's lived experience.

Maoism as political ideology. Maoism is also a political ideology, representing Mao's theories and methodologies about how China and the world should be transformed in revolutionary ways. Three important features distinguished Mao's concept of revolution from other revolutionary theories in the tradition of Marxism-Leninism.

First, Mao's perception of revolution was characterized by a unique notion of permanentness in time and unlimitedness in space. In particular, Mao persistently emphasized the necessity of "continuing the revolution" after the CCP seized power in 1949. However, Mao's notion of permanent revolution was by no means a simple repetition or minor alteration of earlier formulations by Marx, Lenin, or Trotsky. While adopting such Marxist discourse as the "law of historical development" to justify his revolution, Mao often used the Chinese term *tianxia* ("all under heaven") to define the space in which the revolution should occur. The *tianxia* concept had its historical/cultural origin in the long development of Chinese civilization—implying that the Chinese way of life was the most superior in the known universe. Used in connection with *tianxia* was the Chinese word *geming*—a term that in modern times would be adopted to represent the concept "revolution." The original meaning of *geming* was that violent means must be used to deprive a ruler of heaven's mandate to rule. In employing *tianxia* to define the space in which *geming* should occur, Mao, in a China-centered manner, at once attached the qualities of permanentness and unlimitedness to his perceived revolution.

Second, Mao's perception of revolution reflected the profoundly voluntaristic belief that human consciousness, rather than the material conditions of society, would determine the orientation of historical development. For Mao, an essential condition for a revolution was the consciousness and will on the part of the "great masses" to carry out revolutionary changes. In the final analysis, whether a revolution should be judged a success or a failure depended on whether it had created a new order in the hearts and minds of the people.

Third, and closely connected with the above two features, the Maoist notion of revolution put greater emphasis on

destruction than on construction. Indeed, Maoism proved more ready to deal with tasks of destroying the "old" than to cope with missions of constructing the "new." Mao believed firmly that "no construction happens without destruction; only when destruction is under way does the process of construction begin." Not surprisingly, Mao's revolution was one of the most violent and destructive in history, not only during the stage of "seizing political power," but in the stage of "continuous revolution" as well.

Maoism as revolutionary strategies and tactics. Maoism also represents a series of strategies and tactics concerning how to make, enhance, and sustain the revolution. Mao certainly was a theorist and a man of ideas; but he also viewed himself as a practitioner and a man of action.

The central mission of Maoist revolutionary strategies concerned mass mobilization. In particular, Mao emphasized the importance of taking the peasants as the main force of the Chinese revolution. This clearly distinguished Maoism from the urban, working-class-centered mobilization strategies favored by orthodox Marxism-Leninism. Yet Mao's dependence on peasants drove him into a fundamental dilemma in furthering his "continuous revolution" after 1949. While adhering to the populist belief that the peasants' spontaneous "revolutionary initiatives" represented a natural source of the "revolution after revolution," Mao was simultaneously obsessed by the "petty bourgeois tendency" of the peasants in practical life. When the "socialist planning economy," which made industrial development the top priority, encountered resistance from the peasants, Mao argued that "a serious question is how to educate the peasants."

In Mao's own summary of his revolutionary strategies, he highlighted armed struggle, united front, and the Party's leadership role as the three keys that led the Chinese revolution toward victory. A firm believer in the idea that "political power grows out of the barrel of a gun" (*Selected Works*, vol. 2, p. 224), Mao invested great energy in developing strategies and tactics for waging revolutionary wars with both domestic and international aims. He summarized the basic principle of guerrilla war as "when the enemy advances we retreat to avoid him, when the enemy stops we harass him, when the enemy is tired we attack him, and when the enemy retreats we chase after him" (*Mao Zedong wenji*, vol. 1, p. 56). He also emphasized the importance of "making everyone a soldier" in waging a "people's war." The "united front" strategy was designed to "unite with all of those who can be united" in order to fight against the primary and most dangerous enemy. The adoption of this strategy in international affairs was often influenced by the traditional Chinese concept of "checking one barbarian by borrowing strength from another." In emphasizing the importance of the Party's leadership role, Mao originally embraced Lenin's "democratic centralism." However, with the deepening of his revolution he increasingly obscured the distinction between his own leadership role and that of the Party. Consequently, in his later years Mao openly celebrated the "correct personality cult," making enhancement of the cult of himself a crucial condition for the ongoing revolution.

In practice, Mao often interwove his ideas and plans with the discourse of revolutionary nationalism. Constantly

appealing to the Chinese people's "victim mentality"—which was unique in the sense that it reflected the sharp contrast between the Chinese people's collective memory of their nation's glorious past and their perception of its experience of humiliation in modern times—Mao found a powerful source that continuously rendered help to legitimize his programs of transforming China and the world.

The above features of Maoism, to be sure, both persisted and evolved over the course of Mao's long career. In order to achieve a genuine understanding of these features, therefore, it is essential to undertake a historical review of the shaping of Mao's worldview, as well as of the development of Mao's thought.

Shaping of Mao's Revolutionary Worldview

Mao was born into a peasant family at Shaoshan village in Hunan Province on 26 December 1893. During his childhood Mao demonstrated a rebellious and challenge-oriented character, as reflected in his frequently conflicted relationship with his father. In his early education at the village school, he read Confucian classics (which laid the foundation of his life-long habit of using Chinese classics as a reference for strategy and policy making). But he devoted his heart and soul only to the tales of rebelling peasants fighting against the exploitative and corrupt bureaucracy (as in the popular novel *Water Margin* by Shi Nai-an). At the age of seventeen, he left home to pursue further study in Changsha, Hunan's provincial capital, where he was further exposed to the rebellion-oriented cultural environment of Hunan province. All of this helped shape Mao's belief that "rebellion is by nature legitimate."

Turning to Marxism-Leninism. When Mao encountered the world beyond his home village, he saw a China that had been sinking into an ever-deepening national crisis in the face of incursions by the Western powers and Japan. Like many of his contemporaries, Mao was eager to find ways to save China and make the country strong. But he was never simply a nationalist. In search of means to save China, he not only pursued insights from China's own rich intellectual tradition, but also exposed himself to knowledge from the West, demonstrating a keen interest in such Western concepts as liberalism, democratic reformism, anarchism, and individualism. With the emergence of the iconoclastic "New Culture Movement" in the mid-1910s, Mao became increasingly critical of the Chinese past, contending that without thoroughly transforming Chinese culture no political and social reform could succeed. Yet he did not view wholesale Westernization as China's salvation. Unlike those of his contemporaries who traveled to Europe and Japan in order to "seek truth," Mao believed firmly that the key to solving the problems facing China must be sought in China itself.

In the wake of the anti-imperialist "May Fourth Movement" and under the influence of the Russian Bolshevik Revolution, Mao experienced the decisive intellectual turn toward Marxism-Leninism in 1919–1920. With only a vague understanding of such terms as "class struggle" and "proletarian dictatorship," Mao emphasized the "people's great unity" as a necessary condition for bringing about fundamental transformations "all under heaven." Taking the creation of universal justice and equality as a core mission, Mao envisioned that his

revolution would have to be carried out and completed by a "new human being" (*xinmin*), and that China would have to be transformed at the same time that the rest of the world was being transformed. With those ideas in mind, Mao became a founding member of the CCP in 1921.

Development of Mao's Thought to 1949

Until 1927, Mao did not rate as an outstanding leader of the CCP, and he made no original theoretical contribution to the Chinese revolution. In 1926–1927, Mao wrote a "Report on the Peasant Movement in Hunan," which represented a first step in his designation of peasants as the main force of the Chinese revolution. At the time, however, the report had little impact on the CCP's overall strategies.

Creating a rural-centered pattern of Communist revolution. The CCP's setbacks following Jiang Jieshi's (Chiang Kai-shek; 1887–1975) bloody counterrevolutionary coup in April 1927 released Mao from the confines of old doctrines. In order to escape the purge by the Nationalist government, Mao moved to the countryside, where he organized the Red Army and waged a violent "Land Revolution." Challenging the notion that a Communist revolution would have to be carried out by urban proletarians, Mao found the necessity and possibility—within the Chinese context—of creating a rural-centered pattern of Communist revolution. Supporting this idea lay both pragmatism and romanticism. On the one hand, Mao sensed that China's conditions precluded an urban-centered Communist revolution; on the other, he perceived that China's backwardness made it easier for a revolution carried out by the peasants—the most oppressed and, therefore, the most revolutionary group in society—to succeed.

From the beginning this Maoist pattern of revolution encountered skepticism from many CCP leaders as well as from the Comintern in Moscow. Not until the mid- and late 1930s, when the Red Army had lost its base areas in southern China and barely survived the Long March, did Mao's military genius and political wisdom come to be recognized by his comrades. Following the outbreak of the Anti-Japanese War (1937–1945), Mao, in the caves of Yan'an, found both the need and the time for theoretical elaboration.

The Yan'an years: theoretical buildup. In Maoism's development, the Yan'an years (1937–1946) represented a crucial stage. In the early Yan'an period, Mao wrote some of his most significant works, including "On Practice" and "On Contradiction." Examining the relationship between theory and practice, Mao emphasized that the former must always be tested by the latter. For Mao, this meant that Marxism should not be treated as "empty abstraction," but should be "imbued with Chinese characteristics" and "used in accordance with Chinese peculiarities." In discussing "contradiction," Mao highlighted the importance of catching the "principal contradiction" and, even more importantly, "the principal aspect of the principal contradiction." In this manner Mao virtually challenged the Marxist orthodoxy of historical materialism. He argued that, although the economic foundation generally determined the superstructure (such as politics, ideology, and culture), in specific situations—especially when the development

of the economic foundation was hindered by the superstructure—“political and cultural transformations become the principal aspect of the principal contradiction.” This voluntarism in Mao’s conceptual world cohered with his belief that a Communist revolution in China need not be restricted by the country’s backward social and economic conditions.

In the late 1930s and early 1940s, Mao developed a more comprehensive design for the Chinese revolution, contending that it would develop in two stages: first a “new democratic revolution” and second a “socialist revolution.” The mission of the first stage was to overthrow the reactionary old regime and establish a Communist-led government that would unify all patriotic social classes. The second stage of the revolution would transform state and society, resulting in China’s transition to a socialist and later communist society. Mao emphasized that, without the first stage, the second stage would be impossible; and without the second stage, the first stage would be meaningless. By introducing the concept of a “new democratic revolution,” Mao created broader maneuvering space for the CCP to adapt its strategies and policies to the practical situation in China. In the meantime, he made it clear that his revolution was already setting China on the path toward socialism and, eventually, communism.

The Yan’an years: making of the Yan’an Way. The Yan’an years also witnessed Maoism’s further development as the CCP’s dominant ideology. The “Rectification Movement” occupied a central position in this process. The movement allowed Mao to purge his opponents within the Party leadership, as well as to consolidate the CCP’s independence from Moscow’s control. As a result, the Mao cult entered the CCP’s mainstream discourse. In 1945, the Party’s constitution formally designated Mao Zedong Thought as its official ideology.

At a deeper level, the Rectification Movement offered a proving ground for Mao’s grand plans of transforming Party members into “new human beings.” Through carefully designed procedures of “criticism and self-criticism,” Party cadres were required—even forced—to expose and eliminate the “small-self” in their innermost world. These procedures, reinforced by the egalitarian environment in Yan’an during the years of war and revolution, created the myth of the “Yan’an Way”—that the “revolutionary spirit” inspired by Mao had played and would continue to play a decisive role in enabling the Party to overcome all kinds of difficulties in order to achieve its goals.

The CCP’s experience in the 1940s further solidified Maoism as the Party’s dominant ideology. China’s victory over Japan in 1945 was accompanied by the Party’s winning political influence and military strength unprecedented in its history. In the late 1940s the CCP successfully carried out a revolutionary civil war against the Nationalist government, defeating a seemingly much stronger enemy within three short years. Mao could then claim that the path toward victory had been paved by the “Yan’an Way.”

Development of Mao’s Thought after 1949

When the CCP seized power in 1949, Mao announced to the whole world that “we the Chinese people have stood up.” Yet

he also emphasized that this was merely “the completion of the first step in the long march of the Chinese revolution,” and that carrying out the “revolution after the revolution” represented an even more fundamental and challenging mission. How to prevent the revolution from losing momentum emerged as Mao’s primary concern.

Mao’s “post-revolution anxiety.” In the mid-1950s, as the nationwide “socialist transformation” (nationalizing industry and commerce and collectivizing agriculture) neared completion, Mao sensed that many of the Party’s cadres were becoming less enthusiastic about furthering the revolution. After the failure of the “Great Leap Forward” in 1958–1959, Mao realized that his revolution was losing crucial “inner support” even among the party elite. In the last decade of his life, when he pushed China into the “Great Proletarian Cultural Revolution,” Mao found that a majority of the CCP elite were unable—or unwilling—to follow the development of his thinking. Mao was preoccupied by a pivotal challenge: how could he bring about transformations “all under heaven”? Facing him was a paradox deeply rooted in the challenge itself: he had to find the means for transforming the “old” world from the very “old” world that was yet to be transformed. This profound “post-revolution anxiety” played a crucial role in shaping Maoism’s post-1949 development.

In search of a Chinese model of socialism. A major theoretical challenge facing Mao after 1949 was a question that he had previously had little time and opportunity to contemplate: What is socialism, and how could one build socialism in China? In Mao’s initial search for answers, he paid special attention to the “Stalin model”—the only existing model of building socialism from which he could learn.

With completion of land reforms and elimination of the gentry-landlord class in 1953, Mao and the CCP immediately followed the “Stalin model” for carrying out “transition to socialism.” By 1956, a highly centralized system of “planning economy” had emerged following the introduction of the First Five-Year Plan. The CCP’s Eighth Congress announced in September 1956 that, with the Communist state now possessing the major means of production, class struggle no longer figured as the principle contradiction in Chinese society. Therefore, China had entered the stage of socialist construction.

While many Party cadres were excited about this “great victory of socialism,” Mao sensed a decline in revolutionary vigor among his comrades. In order to create new momentum for the continuous revolution, as well as to pursue China’s central position in the international Communist movement, he was determined to go beyond the “Stalin model” and to push for a more aggressive and unconventional model of socialism. In the wake of the Soviet leader Nikita Khrushchev’s (1894–1971) de-Stalinization campaign and the Hungarian revolution of October 1956, Mao introduced his theory that “class struggle exists in a socialist society.” He contended that the conflict between the bourgeoisie and the proletariat continued in the sphere of the superstructure even after the economic foundation had been transformed. This formed the context in which Mao turned the “Letting One Hundred Flowers Blossom” campaign into the “Anti-Rightist” movement in the

summer of 1957, in which more than 300,000 intellectuals were branded as “class enemies.” He also brought this “ideological struggle” to the Party leadership itself and criticized Zhou Enlai (1898–1976) for his opposition to “rash advance in socialist construction.” Still with no clear definition of socialism, Mao was ready to launch in China the most radical experiments in the name of socialism and communism.

The Great Leap Forward. The year 1958, which witnessed the dramatic “Great Leap Forward,” was pivotal in Maoism’s development. Early in the year, Mao formally introduced the thesis of “one revolution after another . . . being carried out uninterrupted.” In explaining why China should and must be elevated rapidly to a higher stage of social development, Mao referred to two basic conditions: the revolutionary enthusiasm of the masses and the backwardness of the Chinese economy. Revealing again the voluntarism and romanticism at the root of his conceptual world, Mao proclaimed: “China’s 600 million people have two remarkable characteristics: poor and blank. That may seem like a bad thing, but it is really a good thing. Poor people want change, want to do things, want revolution. . . . The newest and most beautiful picture can be painted on a blank sheet with no blotches on it” (*Jianguo vilai Mao Zedong wengao*, vol. 7, pp. 177–178).

In the summer of 1958, Mao and the CCP leadership announced that “the realization of a Communist society in China is not far away.” For the purpose of rapidly increasing China’s industrial and agricultural production, Mao and the Party mobilized millions and millions of ordinary Chinese to make steel in “backyard furnaces,” and to work on miscellaneous construction and irrigation projects. What excited Mao most was that tens of thousands of “people’s communes” were founded throughout the country. In Mao’s vision, these communes, by combining “economic, cultural, political, and military affairs” into one entity, and by practicing “compensation according to need” through a public dining system, opened the door to a communist society. At one point, Mao even raised the question of abolishing the “bourgeois right,” arguing that it was time to eliminate the inequality caused by the practice of “compensation according to work.”

In order to enhance popular support for his extraordinary mass mobilization efforts, Mao ordered the Chinese Communist artillery forces to bombard the Nationalist-controlled Jinmen islands in the heyday of the Great Leap Forward. Although this caused a serious international crisis between China and the United States, Mao was unafraid, arguing that international tension had a “good side of it” as it could “bring about the awakening of many people” and was therefore beneficial to the revolution.

Mao’s utopian expectations collapsed with the failure of the Great Leap Forward, which caused one of the worst human tragedies in twentieth-century history. It is estimated that 20 to 30 million people starved to death in a nationwide famine during the 1959–1961 period. For the first time in Communist China’s history, the myth of Mao’s “eternal correctness” was called into question.

The great Sino-Soviet polemic debate. The disastrous consequences of the Great Leap Forward resulted in a major

setback in Mao’s political career. With Mao relegated to the “second line” in 1960–1962, the CCP leadership adopted more moderate and flexible policies designed for economic recovery and social stability. However, Mao never intended to abandon the theory and practice of continuous revolution. When the Chinese economy began to recover in 1962, Mao called upon the Party “never to forget class struggle.” This time, he was determined to turn the party and state that he himself had created and ruled into the target of his revolution.

Within this context the great Sino-Soviet debate erupted in the early 1960s. In the mid-1950s, Mao had already charged that Khrushchev, with his de-Stalinization efforts, risked discarding the banners of both Stalin and Lenin. Mao had further criticized Khrushchev’s strategy of “peaceful coexistence,” claiming that it obscured the fundamental distinction between revolution and counterrevolution, between communism and capitalism. Meanwhile, Mao also contended that Moscow had long carried out a policy of “great power chauvinism” toward China, characterizing Moscow as a threat to Chinese sovereignty and independence. Thus Mao effectively linked his challenge to Moscow’s leading position in international communism to the theme of safeguarding China’s national security interests. During the Sino-Soviet polemic of the 1960s, Mao further asserted that socialism in the Soviet Union had been gradually eroded by an emerging “bureaucratic capitalist class.” With such “capitalist roaders” as Khrushchev controlling the party and state, he concluded, capitalism had been restored in Soviet society. In elaborating these “lessons of the Soviet Union,” Mao emphasized that China also faced the danger of “restoration of capitalism” if its own “capitalist roaders” were not exposed and rooted out. With Mao’s push, China’s domestic politics and social life were again rapidly radicalized along with the escalation of the Sino-Soviet debate.

The Cultural Revolution. Mao’s efforts to instill a new social order in people’s hearts and minds reached new heights when the “Great Proletarian Cultural Revolution” began in the summer of 1966. Mao initiated the Cultural Revolution for two interrelated purposes. First, he hoped that it would allow him to find new means of promoting the transformation of China’s party, state, and society in accordance with his ideals. Second, he sought to use it instrumentally to enhance his much weakened authority and reputation. Both in real life and in Mao’s conceptual realm, those two purposes were interwoven—for Mao believed that his preeminent leadership would best guarantee the success of his revolution.

By carrying out the Cultural Revolution, Mao easily achieved the second goal, making his power and authority absolute during the Cultural Revolution years. But the Cultural Revolution failed to bring him any closer to achieving the first goal. Although the mass movement released by the Cultural Revolution destroyed Mao’s opponents and, for a period, the “old” party-state control system, it proved unable to create the new form of state power that Mao so much desired for creating a new society. When the mass practice of “fight self, criticize revisionism” turned into superficial “ritual procedures,” and when Mao acted to restore and enhance the state’s harsh control over society, millions of ordinary Chinese developed a

profound “crisis of faith.” Consequently, the economic stagnation and political cruelty prevailing in China made the people disillusioned with the ultimate benefits of Mao’s ideals and plans. By Mao’s own standard, the legitimacy of his continuous revolution was called into serious question as it failed the test of ordinary people’s lived experience.

In the last years of his life, it became evident that Mao’s revolutionary enterprise had lost the people’s inner support. Even Mao himself realized this. To the visiting American journalist Edgar Snow he lamented that he was “a lone monk walking the world with a leaky umbrella.”

Maoism Buried in Post-Mao China

Mao died on 9 September 1976. China has since experienced a profound derevolutionization process. The post-Mao CCP leadership discarded the Mao cult, contending that while in a general sense Mao remained a great Marxist-Leninist, he had committed mistakes throughout his career. In particular, the Party repudiated the Cultural Revolution and abandoned Mao’s theory and practice of continuous revolution. Following the pragmatic “cat theory”—“white cat, black cat, so long as it catches rats, it is a good cat”—Deng Xiaoping (1905–1997) unleashed in the late 1970s a new “age of reform and opening to the outside world.” Deng’s gradual introduction of a “market-oriented socialist economy” brought about phenomenal economic growth in China, but it also created new divisions between rich and poor within Chinese society. Maoist egalitarianism was undermined both as an ideal and a social reality. As a result, the legitimacy of the Chinese Communist regime was further called into serious question.

Against this background, the post-Mao CCP leadership has made strenuous efforts to redefine the essence of Maoism. While claiming that Mao Zedong Thought was not merely Mao’s creation but, rather, the contribution of the Party leadership’s collective wisdom, the CCP discarded Mao’s ideal of transforming China into a land of universal justice and equality, and abandoned Mao’s practice of striving for revolutionary changes “all under heaven.” In the meantime, Mao’s legacy has been represented primarily in nationalistic and patriotic terms. The greatest achievements of Mao’s revolution, according to the post-Mao CCP leadership, lay in the fact that it unified China, industrialized the country, and revived its greatness in world affairs. Maoism as a utopian vision, a revolutionary ideology, and a revolutionary way of transforming China and the world has effectively disappeared in post-Mao China’s official discourse.

Maoism beyond China

Maoism was never exclusively a Chinese phenomenon. In the late 1940s and early 1950s, when the Chinese Communist revolution achieved nationwide victory, Communist parties in such Asian regions and countries as Indochina, Malaya, and Burma claimed to take Mao Zedong Thought as the ideological guide for their own revolutions. In the 1960s, following the great Sino-Soviet debate, the international Communist movement was divided. Some parties (such as the Albanian Labor Party) and many deviating factions within the Communist parties of different nations advocated Maoism, claiming it to

be the “third milestone” in the development of Marxism-Leninism. In most cases, those parties and factions embraced the Maoist doctrines of conducting violent revolution as the only legitimate way to overthrow capitalism’s national and global dominance. They also became the CCP’s allies in the “anti-revisionist struggle” against Moscow.

This situation changed drastically with the Chinese-American rapprochement in the early 1970s and, especially, after Mao’s death in 1976. Mao’s decision to improve relations with the “U.S. imperialists” offended many “Maoist” parties and factions elsewhere, causing them (such as Albania) to denounce Mao’s China as an example of “neo-revisionism.”

The post-Mao CCP leadership’s virtual abandonment of Maoism further alienated China from the remaining Maoist parties and factions abroad. When the Khmer Rouge waged a war of survival in Cambodia’s jungle, China supported it not because of its Maoist ideology, but because it played an important role in checking Vietnam, China’s main enemy in Southeast Asia at that time. As for such Maoist revolutionary movements as the Shining Path in Peru and the Maoist guerrillas in Nepal, Beijing offered no support and paid little attention.

Does Maoism have a future? As a revolutionary ideology, Maoism has long withered in China. With the decline of such “Maoist” movements as Peru’s Shining Path, it is difficult for Maoism beyond China to attract large numbers of devotees. But it seems premature to say that Mao’s ideas have forever lost their influence. Some Maoist strategies—such as those concerning mass mobilization and armed struggle—will remain attractive to revolutionaries of generations to come. In a deeper sense, Maoism’s most lasting legacy lies, perhaps, in its utopian vision—one concerning the necessity and possibility of achieving universal justice and equality in human society. The vision’s beauty exists in its ambiguity. Because it was never clearly definable in practical political terms, the vision may have continuing appeal as long as injustice and inequality persist in human life—in China, and in other parts of the world as well.

MAPS AND THE IDEAS THEY EXPRESS. Cartography, the art and science of mapmaking, began before the invention of writing and continues to be fundamental to an understanding of the phenomena it represents graphically. Although typically associated with Earth, or parts of this body, its methods are applicable to the delineation of both the microcosm and the macrocosm. Thus, there is mapping of the human brain on the one hand, and the mapping of extraterrestrial space on the other. The unifying concept in mapping is the representation of spatial relationships and their interactions, and nowhere are these approaches more important than in geography. This entry will be concerned mainly with the map as it relates to physical and human geography, although some attention will be paid to extraterrestrial mapping. There will also be some references to GIS (geographical information systems); remote sensing of the environment through aerial and space imagery; and computer graphics (including animation). These are the twenty-first-century developments of more traditional forms of cartography. As Marshall McLuhan has expressed it, maps are one of a select group of media, “without which the world of science and technologies would hardly exist.”

Preliterate and Early Literate Maps

The so-called Bedolina petroglyph (Fig. 1) can be used as an example to illustrate preliterate mapping. This rock carving represents a known, inhabited site in northern Italy and was carved between 2000 and 1500 B.C.E. It was made in different stages in the Bronze and Iron Ages; interestingly, the more abstract symbols (tracks and field boundaries) appear to come from the earlier period, while the more realistic symbols (animals and structures) are from the later epoch. In any case, this plan attests to the basic importance of maps to humankind from early times and illustrates symbolization and other essential map features.

Other examples of preliterate cartography could be cited, but only a small number of such early maps have survived. A much larger corpus of maps of preliterate peoples of later times exists. In Russia in the early part of the twentieth century, a collection of more than one hundred so-called “native” maps was assembled, which included examples from Asia, America, Africa, Australia, and Oceania. They were employed for widely different purposes—from oceanic navigation to ceremonial uses. Likewise, the materials used were diverse, according to those commonly within the resource base of the makers: stone, wood, animal skins, either painted with locally available pigments or carved. It is known that “primitive” societies made maps for practical uses, but also for religious and nonutilitarian purposes.

Similarly, the maps of literate peoples in antiquity are varied in terms of purpose as well as materials employed. They are also more diverse in subject matter than earlier ones: a detailed plan of a garden, c.1500 B.C.E.; a zodiacal map carved in stone, c.100 B.C.E.; and other examples from ancient Egypt. Also from this culture and period are maps on the bases of coffins, which served as “passports” to the world beyond. A very different cartographic genre was the cadastral or land ownership plan, from which it is inferred geometry arose as such property maps, made originally for taxation purposes, were used to reconstruct boundaries, erased by the flooding of the Nile.

Contemporaneous with these Egyptian maps were those from Mesopotamia, mostly using cuneiform symbols on clay tablets. This cartography, however, varied widely according to subject matter and scale: city plans; maps of the rivers Tigris and Euphrates with the surrounding Armenian mountains; and a “world” map featuring a circumfluent ocean, with distant places represented by triangles—only one of these triangles is now intact (Fig. 2). The circumfluent ocean, shown by a circle, is a reminder that the sexagesimal system of dividing this figure, the usual mode employed in mapping to this day, came to the West from Babylon by way of Greece. Babylonian maps also contain written inscriptions.

Earth as a perfect sphere and map projections. In Greece the idea of Earth as a perfect sphere developed gradually. This concept was not, apparently, part of the culture of Egypt or of Mesopotamia, where a plane figure was used to represent the world. By contrast, once the Greeks accepted the idea of a spherical Earth, they attempted to divide the globe in different ways. They recognized parallel climate zones and antipodes, and measured the circumference of the entire globe. The most

Figure 1. The Bedolina petroglyph. Rock carving, c. 2000–1500 B.C.E. COURTESY OF *IMAGO MUNDI: THE INTERNATIONAL JOURNAL FOR THE HISTORY OF CARTOGRAPHY*

successful attempt of this last was by Eratosthenes (c. 276–c. 194 B.C.E.), who, it is estimated, came within two hundred miles of the correct size of the Earth, a great triumph of antiquity. These developments made possible the invention of map projections (a systematic arrangement of the meridians and parallels of the all-side curving figure of Earth) of which two are credited to Hipparchus (2nd century B.C.E.). He espoused a smaller measure of Earth than that of Eratosthenes, and his projections, the azimuthal (radial from a point) and the stereographic (in which the circles of the Earth are represented by circles on the projection) were at first used only for astronomical purposes.

It is unfortunate that only a few examples of maps of the early Greeks have survived, because their theoretical ideas on geography (expressed in contemporaneous literature) as on many subjects, are of great importance. Apart from maps on a few early Greek coins, one must await the advances of the later Greeks, and the Romans, for visual evidence of their cartographic skills. The greatest cartographer of this later period is the Greek Claudius Ptolemy (2nd century C.E.) who worked in Alexandria and was not, presumably, related to the Egyptian dynasty of that name. Ptolemy (Ptolemaios) accepted a “corrected,” shorter figure of Earth than that of Eratosthenes, which Ptolemy also used as a base for two conic-like projections he devised. It

is not certain whether Ptolemy actually made maps himself, but his list of the coordinates of some eight thousand places and his instructions for mapmaking provided the means for others to do so. In fact, the Ptolemaic corpus was transmitted via Byzantium to Renaissance Italy, where maps were compiled from this much earlier source material. Ptolemaic maps cover about a quarter of the globe, including parts of Europe, Asia, and Africa (Fig. 3). Ptolemy devised both chlamys (cloak-shaped) and simple conic-like projections for his world maps.

Some later Greeks worked under Roman masters, who generally accepted Greek ideas; but the Romans were themselves responsible for mapping some areas not part of the Greek empire, such as Gaul (France). Eminently practical, the Romans extended their rectilinear cadastral surveys (centuriation) over large areas from Britain to North Africa and made maps of their road systems. A remarkable example of the latter is the Peutinger Table (a fourth-century copy survives of this first-century C.E. itinerary map). Some of these ideas filtered down in the Middle Ages to Europeans, who were also consumed with religious iconography on their maps.

Sacred and secular maps. The most important survivor of this genre is the (East-oriented, East at the top) *Hereford*

Figure 2. Early Mesopotamian world map. Clay tablet. COPYRIGHT THE BRITISH MUSEUM

Mapa Mundi (Fig. 4). Made around 1300 C.E., this map of the world known to Europeans in the later Middle Ages combines concepts both sacred and secular and was apparently used for didactic purposes. In addition, there were maps for pilgrimage, which, like the maps of the then-known world, were products of monasteries. Contrasting with this cartography are the portolan (haven-finding) charts of the same period covering the Mediterranean and Black Seas, later extended beyond the limits of these littoral areas. Portolan charts were based on the directions of the magnetic needle, which had apparently been transmitted westward from China, via the Arabs, to the Mediterranean. There, in the later Middle Ages, it was combined with a card of the Greek system of wind directions to produce the magnetic compass. Made with the use of the magnetic compass, the portolan chart features the compass rose, emanating from which are rhumb lines to points of the compass: four, sixteen, and finally thirty-two. The North-oriented portolan charts were of great value in navigation within the Mediterranean but were of lesser use in areas where the cardinal direction of the compass varied greatly from North. The Europeans were soon to encounter such areas in their expansion to the Atlantic Ocean and beyond. Remarkably, portolan charts can be attributed to Christian, Islamic, and Jewish cartographers, sometimes working together.

China and the Arab world. From very early times there was interest in the representation of Earth in the Orient, and there are remarkable parallels between mapmaking in this region and in the Greek world and the Latin West. In the later classical period there was intermittent contact between China and Rome, and most of the then-current cartographic forms are present in both cultures, including maps of land areas and marine charts. In fact, during the European Middle Ages, China was ahead of the West (Fig. 5). Thus the most accurate map of a large geographical area was of China (c. 1100 C.E.), which utilizes a rectangular grid, and depicts the coasts and rivers of the country with great accuracy. Chinese sea charts were at least equal in quality to those of Europe at the time. In addition, map printing in China anticipates that of the West by at least three centuries. However, after 1450 C.E. when long-distance voyaging, which had taken the Chinese to the Persian Gulf and East Africa and perhaps further, was officially discouraged, Oriental mapping became extremely Sino-centric, with the rest of the world represented as peripheral to China. This influence also persisted in Korea and Japan where, however, some innovations in mapping took place especially in the delineation of urban areas and of administrative divisions.

The Arabs, especially after the rise of Islam (7th century C.E.), traveled widely from Iberia to the Orient to proselytize and trade. By sea they reached India and established settlements there and on the coasts of China; overland they controlled a large area from Spain to the Far East. They also inherited Ptolemaic cartographic (and astronomical) ideas, and improved upon them. Thus, to take one notable example, Abd-Allah Muhammad al-Sharif al-Idrisi (1100–1154) made significant contributions to cartography. Born in Morocco, Idrisi, after having traveled extensively, was invited to Sicily by its enlightened Norman king, Roger II. Under this patronage, Idrisi compiled South-oriented maps: of the world known to twelfth-century Islamic travelers, in multiple sheets; a single sheet map of Asia, Europe, and North Africa with parallels on the Greek model of “climata”; and a book of sea charts of use to sailors, “the Sons of Sindbad,” and others. By astronomical observations the Arabs determined the correct length of features such as the Mediterranean Sea, but after this great flowering of mapmaking, like the Chinese of about the same time, the Arabs made no significant progress, and even retrogressed.

Printed Maps of a More Detailed Globe

Meanwhile, Europe was awakening from the long period called the Middle Ages, between classical antiquity and the Renaissance. A map that expresses medieval ideas, while heralding the new era, is the T–O map from Isidore of Seville’s earlier manuscript *Etymologiarum*. (These letters refer to water bodies: the Mediterranean Sea and the Don and the Nile rivers forming the “T” within the “O,” or circumfluent Ocean on these largely landcovered, east-oriented world maps.) It was published in 1472 to become the first map printed in Europe (Fig. 6). Following this, the printed map gradually replaced the manuscript map for most purposes in Europe and elsewhere.

A new approach to mapmaking arose in Europe, building upon earlier cartographic models. Greek texts of Ptolemy’s

Geographia reached Italy from Byzantium c. 1410, and were translated into Latin. Soon maps were made from these instructions, and it became the business of European cartographers to improve upon this late-classical geography, as for example in the 1427 manuscript map of Scandinavia by the Dane, Claudius Clavus. Two major developments in Europe now influenced cartography, as indeed other aspects of life: the independent invention of printing in Europe, and the spread of Europeans around the globe. The (nearly) exactly repeatable representation made possible by the printing press eventually led to a wider dissemination of geographical knowledge, while the contemporaneous discovery of half of the coasts of the world and many islands, in the fifteenth and sixteenth centuries, provided new source material for European cartographers.

The first to utilize these sources and techniques were the mapmakers of the nearly land-locked states of present-day Italy and Germany: The *Bologna Ptolemy*, 1477, twenty-six sheets printed from engraved copper plates; and the *Ulm Ptolemy*, 1486, incorporating Clavus's amendments on a single woodcut print, are examples of this cartography. After a period of coexistence, copper-plate engraving prevailed over the wood-

cut method, and the Low Countries (present Netherlands, Belgium, and the lower Rhineland) became the focus of the new global cartography. The near eclipse of woodcut printing led to the virtual abandonment of color map printing in Europe for three centuries. Copper-plate engraving does not lend itself so well to color printing as does the woodblock method, of which a few examples of colored prints from the Renaissance are extant.

With their explorations along the western shores of Africa, the Portuguese from 1420 on provided a rich source of new coastal and insular information. Likewise, the Spanish provided information about the Americas, following the discoveries by Columbus, 1492–1504, and others. Although attempts were made to keep this intelligence secret, it soon became known through the dissemination of data published mostly by the other Europeans in the form of printed maps and atlases. As indicated, the cartographers of the Low Countries eventually came to dominate this lucrative trade during the sixteenth and seventeenth centuries. Although marine charts were the first products, soon other map subjects were covered: inland provinces, urban centers especially in Europe, historical topics, biblical events, and so forth.

Figure 4. *Hereford Mappa Mundi*, c. 1300 C.E. Drawing on vellum. THE DEAN AND CHAPTER OF HEREFORD AND THE HEREFORD MAPPA MUNDI TRUST

Several individuals and families were involved in this map and atlas production: Abraham Ortelius, *Theatrum orbis terrarum* (1570, and later, in several languages); Gerhard Mercator, with the map projection that bears his name (1569) and

Atlas (1595); Georg Braun (Joris Bruin) and Frans Hogenberg, *Civitates orbis terrarum* (1572, and later); Lucas Janszoon Waghenauer, *De Spiegel der Zeevaerdt* (1584), translated into English as the *Mariner's Mirrour* (1588); and others. There were

the graticule (lines of latitude and longitude) invented during this period. A few of these are still in use today, including the Mercator Projection (Fig. 7), on which any straight line is a correct compass direction and thus of great value to navigators, but which has been much misused for mapping Earth distributions, where correct size is important. The English mathematician Edward Wright provided an explication and details for construction of this projection (not given by Mercator) and it was popularized by Robert Dudley and others in the seventeenth century.

Figure 6. T-O world map from *Etymologiarum* (1472) by Isidore of Seville. BY PERMISSION OF THE BRITISH LIBRARY, IB.5438

Early modern academies and innovative methods of representation. The Italian astronomer Giovanni Domenico Cassini (1625–1712) initiated another new approach to map-making when he accepted an invitation to the then recently founded Paris Observatory. Both that institution, and the observatory at Greenwich, England, were established in the middle of the seventeenth century through the sponsorship of the also newly founded Académie Royale des Sciences in France, and of the Royal Society of London, respectively. These academies were to play an important role in the development of a more scientific cartography, which characterized the mapping of the Earth during the following three centuries.

many followers and imitators of these pioneers, and some Renaissance maps and atlases, many hand-colored prints from monotone engraved plates, became more decorative than innovative, but are prized as collector's items to this day. The greatest cartographer of the sixteenth century was Mercator, whose projection was one of a dozen new ways of expressing

In a period of over one hundred years, four generations of the Cassini family supervised the accurate topographic mapping of France in multiple sheets. The first step was to measure the length of a degree of latitude with great accuracy, which was completed in 1670. From this base, a network of triangles was eventually extended across the whole country. The work of filling in detail, covering more than 180 sheets, was not finished until 1793. One unexpected result of this work, and measurements by French surveying expeditions at the Equator, and at high northern latitudes of Europe, was confirmation of the hypothesis of Isaac Newton that the Earth is an oblate (polar-flattened) spheroid; not a prolate spheroid, or perfect sphere, as proposed earlier. Shortly, detailed topographic surveys were undertaken in other European countries and in their overseas possessions. Thus India, under the British,

Figure 8. Lunar map by Galileo from *Sidereus nuncius* (1610).

became one of the best surveyed large countries at a fairly early date.

Other directions in which cartography developed in the seventeenth and eighteenth centuries include: astronomical mapping; thematic or special-subject mapping of Earth; the development of new representational techniques; and innovative map projections. The invention of the telescope led to the mapping of the Moon; Galileo's sketch map of 1610 was the bellwether of a large number of other lunar maps (Fig. 8). Other astronomers who made contributions to this new field of mapping include: Franciscus Fontana, Johannes Hevelius, Giambattista Riccioli, and Giovanni Domenico Cassini. Through these scientists the mapping of the side of the Moon

visible from Earth was improved and features named. Thematic mapping had existed before the scientific revolution of the seventeenth century, but a new cartography developed in this period, based on instrumental surveys: maps of wind directions and of magnetism by Edmond Halley; and isobathic (depth) mapping by Nicholas Cruquius are examples of the new scientific cartography (Fig. 9). Innovative methods of representation related to these developments included the isobath and the isogonic line, two of the earliest forms of the contour method, which was so greatly expanded in the following centuries that now there are some fifty types of isoline in use. The development of new and useful map projections also mark this period. A number of mathematicians were involved in the invention of different ways of representing the Earth on a grid or graticule (lines of latitude and longitude). In this regard particularly important were the equal-area projections of the German-Swiss Johann Lambert (1728–1777), arguably the most prolific inventor of map projections of all time. These advances continued as new overseas areas were “discovered” and mapped, facilitated by improved ships, and the solution of the problem of determining longitude at sea. The resolution of this age-old enigma in the late eighteenth century was owing to the invention of the marine chronometer, one of several devices that profoundly affected navigation and cartography.

Nineteenth Century: General and Thematic Mapping

The nineteenth century was a period of consolidation and diversification. Except for the polar regions, the main coastlands and islands of the world had been explored and charted at least at the reconnaissance level by 1800. However, much remained to be delineated, especially in the continental interiors (except Europe, which was reasonably well mapped by this date). Expeditions, mostly originating in Europe, were dispatched to all parts of the world in the nineteenth century, and small-scale general mapping became a large part of the activity of geographical societies that were founded at this time. Similarly in the Americas, interior areas were explored and mapped, at first in a provisional manner, but using instrumental surveys. Thus the world's great rivers, inland seas and lakes, mountain ranges, deserts, and so forth appeared on general sheets and atlas maps, and geography became an important school, college, and university subject.

Along with this was an interest in thematic cartography, in which distributions of phenomena hitherto little known were investigated and mapped. The beginning of regular censuses in this period in many countries provided a large body of mappable data, especially on the human population. Soon demographic maps were produced, and so-called qualities of population also received attention from cartographers—disease (as in the highly informative maps of deaths by cholera in London of Dr. John Snow), crime, poverty, and so forth. Land-use maps of crops, forest cover, and urban forms soon followed, but perhaps the most remarkable development at this time was in geologic mapping.

Geologic mapping. Great scientists turned their attention to studying the strata of the earth, as mines and canal and railroad cuts revealed the earth's substrate. Those associated with the new science of geology included James Hutton (1726–1797) in

Figure 9. Section of 1729 isobathic chart of the Merwede River by Nicholas Cruquius.

Scotland, Abraham Gottlob Werner (1749–1817) in Germany, and Georges Cuvier (1769–1832) in France. But it was a contemporary of these natural philosophers, the English civil engineer William Smith (1769–1839), who is credited with successfully correlating fossils with associated strata. Smith used conventional colors and notations for rock types, based on age and lithology, and thus greatly advanced geological mapping (Fig. 10). So influential was Smith's work that when a federal, general topographical mapping agency was founded in the United States (much later, in 1879), it was named the United States Geological Survey (USGS), in contrast to the earlier, military or quasi-military topographic surveys in the Old World.

A man with vision large enough to put all of the preceding geographical knowledge into a logical framework was the Prussian Alexander von Humboldt (1769–1859) in his *Kosmos*; his fellow Prussian, Carl Ritter (1779–1859), was a great geographical educator. Both contributed original ideas to cartography: Humboldt with continental maps and profiles, and isothermal diagrams; and Ritter with the concept of altitude tints on general relief maps (this was later formalized with conventional colors for elevation in use today).

The growing United States was the beneficiary of European expertise, as when Humboldt visited Thomas Jefferson, who (like his predecessor in the U.S. presidency, George Washington) was a surveyor and cartographer. It was through Jefferson that the rectangular method of cadastral survey was applied to

the Public Domain, the most extensive example of uniform property mapping in the world. This method contrasts with irregular (metes and bounds) cadastral surveys used in the eastern United States and over most of the land area of Earth. Other Americans made signal contributions to mapping; for example, Matthew Fontaine Maury's (1806–1873) wind and current charts greatly reduced the time taken on long voyages in the period of sailing ships. Great progress was also made in land travel through the railroad, with maps used in determining the best routes and later, when the railways were built, to assist travelers in planning trips.

The traffic-flow maps of Ireland by Henry D. Harness (1804–1883) are especially innovative contributions to transportation geography. More rapid travel in an east-west or in a west-east direction necessitated the development of uniform time zones. This was accomplished in 1884 at an International Meridian Conference held in Washington D.C., when Greenwich (England) was approved as the global Prime Meridian, and the center of the first of twenty-four (one hour) time zones, which were mapped. Lithography, which eventually led to color printing of maps, was also a nineteenth-century innovation as far as cartography was concerned.

Twentieth Century: Changing Technologies

These advances continued and accelerated in the twentieth century through such developments as the airplane and

Figure 10. Section of William Smith's geological map of England (1815).

photography in the first half of the century; and space probes and more exotic imaging in the second half.

Controlled flight. Although balloons were used earlier, it was only after the development of controlled flight, through the airplane in the first decades of the twentieth century, combined with viable photography, that the new science of photogrammetry could be realized. Overlapping vertical aerial photographs could be taken at regular intervals, which, when viewed through a stereoscope, give a remarkably accurate three-dimensional view of Earth. This greatly facilitated geodetic and contour mapping, which gradually displaced other, less quantitative methods of relief representation. As photogrammetry progressed it provided a basis for mapping that was more accurate than was possible previously, and could be accomplished in much less time. It was also possible to map areas without the necessity of field work except perhaps, when feasible, for checking. Such mapping required a big capital investment, so that it became a largely national enterprise, with richer countries sometimes undertaking aerial surveys for poorer ones.

Space. In the second half of the twentieth century (partly as a result of German advances in rocketry in the first half), as well as indigenous programs in those countries, Russia and the United States became the protagonists in a “space race.” But it was the more peaceful applications that advanced cartography particularly. The first science to be improved was meteorology, as weather maps produced on a daily, or an even shorter time frame, revealed patterns that had not previously been appreciated, as well as facilitating weather forecasting on a regular basis. But soon other distributions, such as land use, were imaged and monitored. This was made possible by the Landsat program of the United States, whose low-resolution imagery was made available to all countries. Remarkable Russian contributions included the first images of the previously unobserved side of the Moon. Soon the United States landed humans on this body, from which images of the whole of planet Earth were made. A great many different parts of the electromagnetic spectrum were utilized in space imaging: color, color infrared, ultraviolet, microwave, radar, and so forth, which either singly or in combination revealed remarkable patterns on Earth, and on extraterrestrial bodies. Other countries such as France concentrated on space imaging of smaller areas of Earth with higher resolution. The new science was designated “remote sensing” of the environment.

Topographical and geological mapping. From the earliest years of the twentieth century there had been a desire to have uniform map coverage of the globe. This was proposed by Albrecht Penck (1858–1945), and it became formalized as the International Map of the World (IMW) on the scale of 1:1,000,000 (one unit of the map equals one million units on the Earth). Although supervised by the League of Nations and (partly because some countries failed to cooperate) later by the United Nations, the project was never completed. However, during World War II such coverage was compiled as the World Aeronautical Chart (WAC), and the two projects combined under the supervision of the United Nations (Fig. 11).

Along with these international efforts at mapping, the nations of the world continued their own cartographical activities including, especially, the production of topographic and

geological maps. But on a global basis that coverage is very uneven. The same is true for urban population and transportation mapping, which is largely the responsibility of local agencies, or even private bodies. For example, the automobile or road map, an extremely important cartographic form, is mainly undertaken by oil or tire companies, or by automobile associations in the United States, and other countries. Maps for classrooms and for other educational purposes, in most countries of the world, are likewise the concern of private map companies. This has made commercial cartography highly varied in quality, but also sometimes surprisingly innovative. It is unlikely that government-sponsored cartography alone would have produced such artistic products as the global-perspective renderings of Richard E. Harrison, the natural color relief maps of Hal Shelton, or the simulated three-dimensional isometric urban cartography of Herman Bollmann. Similarly, the statistical maps of László Lácó or the economic maps of W. William-Olsson are the product of freelance or university-based cartography. Likewise some of the most innovative projections of modern times are the work of non-government employed cartographers, including in the United States, R. Buckminster Fuller and J. Paul Goode, but such individuals are sometimes funded by government grants. The printing of maps was also advanced by color photolithography from high-speed presses at this time.

Exploration and mapping. In the twentieth century two large realms of Earth were systematically explored and mapped: the polar areas and the deep oceans. This was made possible by modern technology and, often, great human effort. Although the Northeast Passage (north of Asia) was navigated by the Baron Nils Adolf Nordenskiöld (1832–1901) in 1878–1879 in his ship *Vega*, the Northwest Passage (north of North America) was not traversed completely by ship until 1903–1906, by Roald Amundsen (1872–1928). The North Pole, or a close approximation to it, was attained over land and ice by Robert Peary (1856–1920) and the African-American Matthew Henson in 1909. These explorers were too rushed to engage in mapping, but they were later followed by aviators who had cameras and better views of the polar landscape, provided by the airplane. Nordenskiöld spent his later years collecting and studying old maps (an interest of many professional cartographers, and others).

Antarctica was little known until the twentieth century, when explorers from a number of countries made concerted efforts to explore and map the “Great White Continent.” Amundsen reached the South Pole in late 1911, and Robert Scott (1868–1912) and his party died in returning from his attempt early the next year. These efforts did not lead immediately to a profound understanding of Antarctica, which was greatly advanced, however, by cartography during the International Geophysical Year (IGY) in 1958. This enhanced knowledge was made possible in part by photogrammetry, as was the 1953 conquest of Mount Everest by Edmund Hillary and the Sherpa Tenzing Norkey (1914–1986) a little earlier.

Another realm, the world’s oceans, has also yielded its secrets grudgingly. Except for coastal areas, little was known of the oceans’ depths until sonic sounding (from c. 1950 on) revealed the rich variety of forms of this greater part of Earth’s lithosphere. The continuous trace, or profile, which is recorded

Figure 11. Map of Los Angeles, California, derived from the International Map of the World. U.S. GEOLOGICAL SURVEY

while a ship is in motion by sonar can be converted into map form revealing, for example, the profound deeps and continuous ridges of underwater areas. This cartography also confirmed the highly controversial, but now generally accepted, theory of continental drift or displacement. Cartography is so important that it can be said that a geographical discovery may not be accepted as valid until it has been authenticated by mapping.

Computer mapping. There is a close correspondence between progress in cartography and the general development of

science and technology. Thus, the computer has transformed cartography since the early 1980s as much as, or more than, printing, flight, and photography did at earlier times. The computer permits manipulation of large data banks and the production of maps made without benefit of hands. It also facilitates the making of animated maps for illustrating the dynamics of areal relationships. In this way a fourth dimension has been added to cartography—time. More maps are probably now viewed on screens, whether animated or not, than in any other medium.

This short survey of cartography has discussed how maps have conveyed ideas and represented phenomena of a wide variety of distributions. They have recorded important achievements of humankind from considerations of the shape of the earth to setting foot on the lunar surface. Preliterate as well as advanced societies have contributed to the art and science of mapping. In fact, cartography is a barometer of the progress of humankind and a reflection of changing technologies. Thus it has been advanced by inventions such as printing and flight, but also by geographical exploration and statistical methods. In the twenty-first century further dramatic developments in this ancient field of endeavor will continue and increase.

MARRIAGE AND FERTILITY, EUROPEAN VIEWS.

Prior to the nineteenth century, the image of the patriarchal family was a crucial component of both moral injunction (as in the Judeo-Christian fourth commandment to "honor thy father and mother") and political organization. Marriage was the keystone in the arch of social solidarities; it also signaled the creation of a new reproductive unit. For the individuals involved, marriage was at once a moment of social and personal transformation. To be married was an essential attribute of adult status. However the sexual bond at the core of these marriages was more problematic.

Judeo-Christian Tradition

Its inheritance of intertestamentary Judaism, more particularly from the radical fringes that had a fanatical devotion to self-abnegation and ritual purity, gave ancient Christianity a profoundly ambivalent attitude toward the body and sexuality. As Saint Paul wrote to the Corinthians, it was better to marry than to burn with desire (1 Cor. 7:33). Marital sexual relations were given a grudging acceptance although it was made clear that holy activity was incompatible with them: "Do not refuse each other except by mutual consent, and then only for an agreed time, to leave yourselves free for prayer" (1 Cor. 7:5). This ambivalence towards sexuality was emphasized in Saint Paul's message to fathers: "He that giveth his daughter in marriage doeth well, but he that giveth her not doeth better" (1 Cor. 7:38). The Pauline ideology of sexual austerity was later confirmed within the newly established, fourth-century Church by such powerful prince-bishops as Ambrose of Milan, who was Augustine's patron and mentor. He observed, "Marriage is honourable but celibacy is more honourable; that which is good need not be avoided, but that which is better should be chosen."

Although the continuities with its original religious milieu are striking so, too, were the changes—Christianity radically broke away from its Judaic and pagan inheritance in separating descent from reproduction. Christianity was from its beginnings a religion of revelation that believers joined by being reborn in Christ's grace. For Christians, therefore, expectations of salvation were not linked with lineage nor were the achievements of ancestors passed on to descendants. Because charisma was not transmitted, Christians were not enjoined to maintain the patriline as a religious task nor were they expected to continue the cult of the dead through physical or fictitious descendants. Its novel restrictions on the ancient practices of endogamy, adoption, and concubinage made it more difficult for the propertied classes in the Roman Empire to transfer property within the family over generations because it closed the option of creating tight, endogamous knots of restricted elementary families within which wealth could be secured in the face of demographic uncertainties.

The early modern European family system was related to the unique Christian emphasis on rebirth in Christ. This religious concept wrapped both family life and sexuality in the institutional structure of the Church. The central position of baptism in Christian society was driven by the logic of its theology that every Christian was born carnally and in sin but was then reborn spiritually in Christ's grace. Baptism was a

second birth that provided a rite of entry into the Church and full citizenship in the secular world.

This holy relationship and the accompanying incest taboos found fertile soil north of the Alps where they were grafted onto Frankish kinship systems. Papal decretals, royal capitularies, episcopal statutes, canonical collections, penitentials, and sermons continuously reiterated the point that spiritual kinsmen/women were sexually off-limits to one another. In this way, the northwest European system of family formation decisively turned its back on inherited traditions of endogamy.

Puberty and Marriage

Historical demographers have provided further evidence that the early modern, northwestern European practice of deferred marriage among women was not common in earlier periods among Mediterranean populations in which few girls seem to have delayed marriage much beyond puberty. In ancient Mesopotamia, for example, teenaged girls were married to adult men in their thirties as was the case among the Jews whose intimate lives have been chronicled in the remnants of the Cairo genizah. One gains some appreciation of the rabbinical injunction to early marriage for women from the following extract from the Mesopotamian Talmud: "Concerning the man who loves his wife as himself, who honors her more than himself, who guides his sons and daughters in the right path, and arranges for them to be married around the period of puberty, of him it is written: *Thou shalt know that thy tent is at peace.*"

Among the Romans—or at least the elite—there was a pronounced inequality in spousal marriage ages. Girls who had just reached menarche were frequently married to men in their mid-twenties. Similar findings—based on Inquisition registers, Renaissance taxation records, marriage contracts from the Toulouse area, and fourteenth-century Macedonian documents—have all described a situation in which teenaged girls were married to men ten years their senior. Early ages at first marriage for women continued to be a characteristic of eastern Europe and many parts of the Mediterranean basin as late as 1900.

Consensual Unions

The emergence of the discrete, single-family household was a landmark, which coincided with the Church's insistence on consensual unions. It separated the couple from its wider networks of clan and lineage thereby making the reproduction of families into an affair of two individuals although for most propertied peasants this was more a matter of ideology than everyday life. But because the vast majority of the peasantry was neither sufficiently well endowed with land nor likely to be subject to the same manorial controls, a treatment of the solid core of the customary tenants must be balanced with an even-handed consideration of those who were marginal, downwardly mobile, and often free.

There is little evidence to suggest that seignorial authorities arranged the peasantry's marriages or intervened in their family formations. If anything, in fact, the opposite appears closer to the mark. The peasantry may have been valued because of their ability to breed but the choice of partner seems

to have usually been their own concern. The lord's concern was to make sure that extramanorial marriages did not deplete his landed estate by draining it of present and future labor power and revenue sources. In this way, the marital horizons for the customary tenantry were limited by the political framework of feudalism, which bore down with unequal pressure on sons and daughters, and much more heavily on the first-born than on younger siblings. It was not enough to discover an attractive match; it was also necessary to find a suitable match. Marriage negotiations involved a four-sided decision-making process—two individuals and two sets of parents—in which no one player had veto-power: It was probably as difficult for a young woman to resist the imprecations of her parents as it was for a young man to sway his. If all these conditions were met, then courtship would lead to marriage; and marriage would lead to the creation of a new family unit.

Oddly the personal, sexual, and marital freedom of noninheriting younger siblings must have acted as a solvent on the restrictive powers of the older generation. Their sociability, seemingly characterized by flirtatious behavior and a casual attitude toward premarital sex and illegitimacy, was the concern of moralists and the fear of parents. The generational battle in the homes of the peasant patriarchs could not have been uninfluenced by this social milieu—sons and daughters had in their disposition over themselves a card of their own to play. Moreover this youthful card was enhanced by the Church's rules of consensual marriage, which sanctioned clandestine unions. Because a troth (promise) made a binding marriage in the eyes of the Church, the best-laid plans of a peasant patriarch could come unstuck if he was blind to the urges of his son or his daughter. This suggests that the culture of maypoles, youth guilds, dancing, festivals, games, and even the solemnities of the Church's ritual calendar all gave a measure of bargaining power to those who had reached puberty. It further suggests that parental power was not absolute, even if it was backed by the threat of disinheritance.

Having entered the marriage market and picked an appropriate partner, the courtship process slid into a familiar sequence of customary conventions.

After the hand fasting & makyng of the contracte, the church goyng & weddyng shulde not be deffered to long, lest the wicked sowe hys vngracious sede in the mene season. . . . For in some places ther is such a maner, wel worthy to be rebuked, that at the hand fastyng there is made a great feast & superfluous bancket, & even the same night are the two hand fasted persones brought & layd together, yea certayne wekes afore they go to the church. (Howard, p. 349)

In cases where property was a paramount concern, marriage contracts were drawn up and earnest money was exchanged. These details were often recorded in the full publicity of the manor court. Occasionally eager peasant patriarchs enlisted the court's services while their children were still infants. But such instances are exceptional—the Church forbade child marriage since it was considered impossible for a minor to give his/her informed consent.

Marriage Covenant

The couple's marriage covenant had several dimensions—first there was the settlement of material goods and landed property; second there was the public trothplight by which the couple announced their intentions; and third there was the wedding in the Church and the ring ceremony. In most cases, these three stages followed one another in an orderly succession. However there was no need for a settlement, a *public* trothplight, or a clerically sanctioned wedding. In terms of both the common law and the Church, a *private* agreement between the two partners was sufficient to constitute a legal, Christian marriage.

Why, then, did publicity surround each and every one of the three stages? First marriage was a rite of passage—from dependency to adulthood in the eyes of the couple's family and the wider community; second publicity sanctioned the match and was a means of granting approval to it; third publicity eliminated hidden impediments to a successful marriage, such as previous agreements and duplicitous scheming, by bringing the agreement into full view; fourth publicity and approval gave the match both legal and moral standing before the law and the Church; fifth publicity legitimated all subsequent children of their union; and sixth publicity and communal approval enabled the servile population to enlist the Church on their side in the event that seigniorial authorities tried to thwart their choice of marriage partners.

It is stretching matters to suggest that peasant marriages were characterized by "rough equality" (Power, p 75). The peasants' marital economy was a "partnership in which each person contribute[d] a specialized skill that complements the other" (Hanawalt, p. 17). These women were expected to do a double day of labor and were without independent civil rights within the peasant community. It was, for all intents and purposes, impossible for women to act in the public sphere. If this was a "partnership," then it was an unequal one. The expectation of "partnership" played a significant role in joining together men and women of roughly similar ages. And, most likely, this expectation was a crucial ingredient in making consent on the part of the prospective husband and wife something more than lip service. Bad as it was, gendered inequality in feudal society was still an improvement for women compared to the earlier situation in pre-Christian antiquity when monogamy was uncommon, adultery was frequent, and divorce was routine. Furthermore for the unfree, marital breakup was subject to the impulse of the spouses' masters, while the servile population surrendered humiliating payments for "wife-rent" to their lords.

Later Marriage

Prior to the advent of parish registers in the sixteenth century, very little is known about ages at first marriage for either men or women. Surveying the published statistical evidence from fifty-four studies, Michael Flinn describes an early modern northwestern, Europe family system in which the average age at first marriage for women fluctuated around twenty-five. Flinn does not provide measurements to assess the spread of the distribution around this midpoint, but other studies have determined the standard deviation to be about six years meaning that about two-thirds of all northwest European women married for the first time between twenty-two and twenty-eight. A few teenaged brides were counterbalanced, as it were, by a

similar number of women who married in their thirties. Perhaps one woman in ten never married. In the demographer's jargon, that tenth woman was permanently celibate. This unique marriage strategy was vitally important for two reasons: First it provided a "safety valve"—or margin for error—in the ongoing adjustment between population and resources that characterized the reproduction of generations and social formations; and second it meant that the role of women was less dependent and vulnerable insofar as they were marrying as young adults, not older children.

The Demographic Revolution of the eighteenth century produced a declining age at first marriage for women and a tremendous drop in the number who were "permanently celibate." In the preindustrial, demo-economic system of reproduction, about three-fifths of all families were likely to have had an inheriting son while another fifth would have had an inheriting daughter. Thus about one-fifth of all niches in the landed economy became vacant in each generation. In the seventeenth century, infrequent, late marriage was connected with low levels of illegitimacy whereas in the post-1750 period, frequent, early marriage was associated with skyrocketing levels of illegitimacy and bridal pregnancy. The demographic implications of cottage industrialization were as much the result of more frequent marriages, by more people, as of earlier and more fertile ones. In addition rural industrialization permitted married couples to stay together, while previously marriages were fragmented—and wives and children deserted—because the plebeian family's economic base was weak and subject to cyclical strains. Industrialization permitted cottagers, who formed the backbone of many handicraft industries, to move into new zones of economic and social freedom, which translated into stabilization of their marriages.

There were other effects that resulted from independent shifts in the mortality schedule; not the least being the changing configuration of the age-pyramid, which rapidly broadened at its base. Better chances of child survival combined with the diminishing chance of marital breakup to swell the lower age groups at the end of the eighteenth century. Generations followed one another more quickly. This factor played no small role in contributing to the maintenance of high fertility rates.

Domesticity versus Men's Work

The family production unit's reliance on its own labor power merely served to expose it, nakedly, when the terms of trade swung violently against it after the mid-nineteenth century. Simple, repetitive tasks by which women and children had contributed significantly to the domestic economy of the peasant household inexorably declined in the face of competition from, first, specialized producers and, next, factory-based manufacturing. One of the most significant additions to the domestic economy was provided by spinning—an activity of women and children; the mechanization of spinning in the last decade of the eighteenth century effectively demolished this cottage industry at the moment when population growth was creating increasing stress on the income of the semi-proletarian households. The birth pangs of industrial society sent shock waves into the very core of the cottagers' lives; the family work unit was inexorably superseded.

Women and children were doubly marginalized from the world of work. Gendered roles and age-stratified activities replaced the mutuality of the cottage. The ideology of domesticity provided the key entry-point for the new culture of bread-winning respectability.

Not only does it (i.e., agricultural labour) almost unsex a woman in dress, gait, manners, character, making her rough coarse, clumsy and masculine; but it generates a further very pregnant mischief by infitting or indisposing her for a woman's proper duties at home.

This quotation from the "Report on the Employment of Children, Young Persons and Women in Agriculture" (1867), a British document, resonates in the reader's ears. At the heart of the writers' concerns is a worry that the supposed "natural" character of rural, proletarian women was threatened by "masculine" work. Such women would not only be "unsexed" but also socially deranged since they would be indisposed to "a woman's proper duties at home." Powerful as this prescription might have been, it was essentially beside the point because such working women had never conformed to bourgeois expectations nor did they give "femininity" more importance than family subsistence needs, which were always their primary focus.

In contrast to the rough-and-ready morality of the field and street, female mentalities were reeducated to make the cozy hearth a proper home. Work was reclassified as a masculine endeavor; masculinity was tested in the labor process and judged by the harmony of domestic discipline and its respectable independence. Propriety was to be the moral property of women who were reformulated as model wives and mothers. The vice of the bad home, and the virtue of the good home, could be just as easily translated to descriptions of the good and bad wife: one was chaotic, promiscuous, unsettled, sensual, dirty, and unhealthy; the other was orderly, modest, stable, rational, clean, and well. And what was true of the wife in her home determined the family also.

In French towns of Lille, Mulhouse, Rouen, and Saint Chamond—as in the English coal-mining region of County Durham—the proliferation of proletarians disturbed social policy makers. Nineteenth-century social reformers regarded the menacing features of urban, industrial society to reside in a realm of human behavior removed from the public theaters in which working-class challenges to the status quo usually took place. Malthusian social policy has ever since been based on the understanding that the disorderly family was the problem while the ordered married family was the solution to the population question. The personal was politicized. The working-class family's profligacy—its population power—was thus the outer/public face of its inner/private lack of control.

Reduction in Family Size

The organization of national social systems of education and welfare during the last decades of the nineteenth century combined with the spread of public health measures, which radically changed children's chances of survival, to provide the historical context in which the ongoing revolution in the family was keyed by the decline in fertility. The average English woman

marrying in the 1860s had 6.16 children; her daughters, marrying in the 1890s, had an average of 4.13 children; her granddaughters, marrying in the 1920s, had on average 2.31 children. The decline of marital fertility was both an innovation and an adjustment; it not only responded to macrolevel changes in social organization but also represented one of the primary ways in which individual men and women acted to make their own history. Not only were the numbers of children dropping dramatically—and almost all of these children surviving infancy—but the period of the family cycle devoted to child-raising was likewise abridged. The very nature of married life changed in response to these demographic innovations.

Some demographers have explained this phenomenon in terms of a shift from "quantity to quality" in relation to the time, energy, and resources devoted to each individual child; but something else was at work. A Manchester woman's 1945 observation weaves together several threads into something like a whole cloth: "People wish to have a small family on account of public opinion which has now hardened into custom. It is customary—and has been so during the last twenty-five years or so—to have two children and no more if you can avoid it. A family of five or six children loses in prestige and, some think, in respectability. It is on behalf of their children that parents feel this most keenly" (Mass-Observation, pp. 74–75). She captures, first the temporality of change ("During the past twenty-five years or so"—namely, since the end of World War I); second the reconstruction of mentalities that have "now hardened into custom"; third the interpenetration of the public and the private, neatly encapsulated by the use of those notoriously elastic terms "public opinion" and "respectability"; fourth "on behalf of their children" joins the sentimentalization of childhood together with the exigencies of human-capital formation; and fifth that it is both "parents"—the respectable husband and his Malthusian wife—who decide together to control their fertility within marriage.

Fertility control was possible without the active involvement of both husbands and wives—the widespread prevalence of abortion stands in testimony to the studied indifference of many men—but the sentimentalization of the family made it more likely that methods of control would come within the parameters of conjugal agreement. Because most of the decline in marital fertility was the product of two ancient practices—coitus interruptus and abstinence—it is clearly important to pay close attention to the changing temper of communication between husbands and wives. Cultural forces, especially the "regendering" of the marital union, both narrowed the scope of the marital union and intensified its internal dynamics. The texture of the intimate relationship within marriage was not just important in its own right but also of crucial significance in reconstructing attitudes to the quality of married life, particularly in relation to the importance of parenting. In contrast to older images that emphasized the importance of work and kinship alliance, modern marriage was portrayed as the romantic union of two individuals. The modern family of "mom, dad, and the kids" was based on the idea that romance was not inimical to marriage and the experience of childhood was massively reimaged by this transition to privacy, domesticity, and, above all, child-centeredness.

New Status to Wedding

Indeed in the course of modernization—roughly coinciding with urbanization, industrialization, and the rise of the modern state, that is, from about 1750, and with increasing intensity after 1870—there was a gradual elevation in the importance of the wedding. In the earlier social formations, the wedding was the final stage in a marriage process by which two people pledged themselves to one another in the full view of family, friends, and community. The rise of mass society had the curious effect of denying publicity to the marriage while creating a need for it. In the urban world, the newly independent couple re-created the big wedding that had characterized village life. “Stag parties,” “hen parties,” and “showers” became common and, among an increasingly secular population, the church wedding became an important festivity in the course of the twentieth century. Most women were profoundly influenced by this invented custom that has had a powerful impact on popular consciousness. Mass media—magazines and, above all, movies—glorified the white wedding to make it into a social ideal, not only a right of passage but also a statement of social and individual respectability. This respectability was, of course, deeply gendered as those women who became “brides” were decked out in a glossy, flowing white satin dress and veiled in lace; their outward appearance emphasized purity and innocence upon entering the married state.

Different Family Arrangements

Yet just as the image of the white wedding was at its zenith, in the third quarter of the twentieth century, other forces were at work redefining the culture of marriage. The modern sentimental marriage is, in the early twenty-first century, widely perceived to be in crisis. Since the late-twentieth century, society seems to be in the process of making a different social system in a global world, one whose ripples can be felt in the most personal organization of private experience. In the world past, pluralism was the product of uncontrollable demography abetted by the rigidity of social hierarchies; in the world of the early-twenty-first century, by way of contrast, familial pluralism appears to be the product of centrifugal forces of individualism that castigate the traditional marriage as being both repressive and antisocial.

If, as Jean-Louis Flandrin suggests, the early modern state pivoted on the “government of families,” and if, as Jacques Donzelot relates, the modern state practices “government through the family,” then it can be argued that in the early twenty-first century the evolution is towards another configuration—government without the married family. The language of the sentimental family, as well as the invented custom of public weddings, has been borrowed indiscriminately by people whose private lives were cloaked in this time-honored disguise. Even though the majority of both males and females regard the nuclear family as the sentimental site for parenting, one in four births takes place out of wedlock. Single-parent households (usually headed by women) have become so prevalent that as many as 50 percent of children may live apart from their fathers at some time in their lives. More marriages are terminated by divorce than by death. A sociological discussion estimated that there are as many as 200 different “family”

arrangements recognized by Americans and Europeans. (Bernardes, p. 192–195). In the early twenty-first century, American religious and political leaders are also grappling with demands for same-sex marriage, yet another indication of the transformation of the institution. Indeed the debate itself, which has raised issues of inheritance, parenting, care for the sick and dying, immigration and citizenship, romance, love, and the desire for weddings as rites of passage and public events, reveals the contradictory definitions of marriage and the many purposes that this institution continues to fulfill.

At the beginning of the twenty-first century, then, the loss of prescriptive unanimity is thus a matter of fact. Those who mourn that loss cannot forget the sentimental family; yet the cost exacted by modern memory is that socially nostalgic conservatives have mistaken the image of the sentimental family for the continuity and contradictions of past realities.

OVERVIEW

Few sets of ideas are richer and more conflicted than those that have been put forward under the heading of Marxism. Marxism's founder, the German philosopher Karl Marx (1818–1883), had a wide-ranging curiosity about many aspects of humankind and a stamina matching his curiosity. But as the American philosopher Sidney Hook pointed out in his article on Marxism in the 1973 edition of the *Dictionary of the History of Ideas*, Marxism is more than simply "the ideas of Karl Marx" (vol. 3, p. 146); it also includes a vast array of thinking that took its point of departure from Marx. Indeed, Hook suggested that what Marx (and his friend, Friedrich Engels [1820–1895]) really meant is "by far not as significant as what they have been *taken* to mean" (p. 147). However, it seems clear that an understanding of both the original and the derived ideas is needed for an adequate understanding of Marxism.

The Critical Project of Karl Marx

Marx fits within a wider group of Western thinkers who, beginning in the seventeenth century, offered new, secularized answers to the old questions, What is the good life for human beings? and, How is that life to be attained? In part, Marx was a laughing heir of the eighteenth-century Enlightenment—a thinker far more optimistic about human prospects than almost all his predecessors. Yet there is also a basso profundo in his thinking, a sense of the immensity of pain and suffering that will be needed before humans can hope to become the free, autonomous, rational, loving, creative, communal beings that he hoped would eventually make their way on the earth.

Among major predecessors of Marx's social theory are Thomas Hobbes (1588–1679), John Locke (1632–1704), Jean-Jacques Rousseau (1712–1778), and Adam Smith (1723–1790). Marx was also influenced by conceptions of the self associated with the German Romantic tradition. Many intellectual tendencies found their way into his thinking through the philosopher Georg Wilhelm Friedrich Hegel (1770–1831), whose lectures (published shortly after his death) and books sought to cover the entire range of human culture. Further, although Marx's orientation was relentlessly secular, there are residues in his thinking of some religious conceptions. He continued, in a secular and universalized form, Christian conceptions of perfection. Further, as Warren Breckman has shown, his notion of humanity emerged from a theological debate concerning the personality of God.

Marx was born in Trier in the Rhineland region, which after the defeat of Napoléon in 1815 was ruled by conservative Prussia. Marx's father was obliged to convert from Judaism to Lutheranism in order to keep his position as a lawyer in the local court system. In 1835 Karl went to university—first to Bonn, the next year to Berlin. Although for career reasons his father wanted Marx to study law, Karl quickly gravitated to philosophy. He found the law too limiting, and he also believed for a time that, by pointing out inadequacies in existing institutions, philosophy could help bring about progressive change in Germany.

Hegel. From 1837 onward Marx absorbed from Hegel's writings, as well as from the generalized Newtonianism then dominant, a particular understanding of what a properly rational, scientific knowledge of the world requires (Megill, chap. 1). Such an understanding, Marx held, must be universal in form and must generate necessary rather than merely probable knowledge. Further, Hegel regarded human history as a rational process of intellectual and cultural advance, analogous to the progress of knowledge that he saw in the history of philosophy, and Marx adopted this view also. Hegel held that philosophy advances by means of rational debate (called "dialectic" in Greek). Sharpening Hegel, Marx interpreted dialectic as requiring critique of the existing order.

After finishing his doctoral dissertation, on ancient philosophy, in 1841, Marx became an oppositional journalist. In October 1843 he moved to Paris, which was the center of European radicalism and the largest city on the European continent. Here he coedited a critical journal that was to be smuggled into Germany. He also intended to complete a critique of

Hegel's political theory and to write a political history of revolutionary France. Meanwhile, in the streets, bars, cafés, and meeting rooms of Paris he discovered the revolutionary agent that he concluded would overthrow the existing order—the working class or, as he called it, the proletariat.

Estrangement (alienation). By July 1844 Marx had abandoned political theory and political history (although he never abandoned political activism, to which he devoted intense time and energy). Instead he turned to a critique of economics. In his “Economic and Philosophical Manuscripts” (May/June–August 1844; published 1932) and in related manuscripts, Marx analyzed the claims of such economists as David Ricardo (1772–1823) and James Mill (1773–1836). Notably, he criticized them for ignoring the “estrangement” (or alienation) that he saw workers as subjected to in a private-property-based economic system. Workers do not find either gratification or the possibility of self-development in their work. The products of their labor become a means for oppressing them. They become estranged from each other.

Marx borrowed the notion of estrangement from the critical theologian Ludwig Feuerbach (1804–1872). In his *Essence of Christianity* (1841), Feuerbach had argued that religion estranges human beings from their best qualities, which are attributed to God, Christ, and so on. Religion therefore needs to be superseded by a this-worldly humanism. Marx's innovation was to apply Feuerbach's critique of religion to economic theory and economic life.

Marx also contended, although elliptically, that the system of private property and exchange (buying and selling) is irrational: it is unplanned, it results in an unpredictable rise and fall of prices, and it has no intelligible historical progression.

History of production and needs. In January 1845 Marx moved to Brussels. In collaboration with the young businessman Engels, who had recently become his friend, he wrote *The German Ideology* (1845–1846; published 1932). Part 1, mostly Marx's work, sketches out a rational history of humankind, focused not on philosophy but on humans' actions to wrest a living from the material world. Using their intelligence, human beings develop their “productive forces,” which improve over time. More advanced productive forces continually come into conflict with the retrograde forms by which society and production are organized (later, Marx and Engels would call these forms “relations of production”). History up to now, Marx and Engels held, has been dominated by class conflict: famously, they declared in their revolutionary pamphlet *The Communist Manifesto* (1848) that “the history of all hitherto existing society is the history of class struggles.” In their view, these struggles are all ultimately rooted in conflict between forces and relations of production.

Marx (and Engels) also asserted that history would culminate in a socialist society that would function without a political state and without private property and exchange. However, they offered only sketchy accounts as to how this society would actually operate.

The revolutions of 1848 and an analysis of capitalism. The revolutions of 1848 disappointed Marx, for the established order proved remarkably successful in thwarting political—let

alone social—reform. Marx responded to the disappointment by turning to a serious analysis of “the capitalist mode of production.” Now living in London, he began in 1851 to study the economy systematically. After a massive effort of research, he published *Capital (Das Kapital)*, volume 1, in 1867. Although never finished, *Capital* is rightly regarded as Marx's most important work. In it, he attempted to penetrate beneath the arbitrary, merely surface phenomena of economic life to what he saw as capitalism's deep structure.

Adding to his earlier claims about estrangement, Marx in *Capital* focused to a greater degree than earlier on what he saw as the irrational and exploitative aspects of capitalism. Under capitalism, he held, workers are necessarily exploited—that is, they are deprived of the “surplus value” that their labor creates. Exploitation, he contended, is unavoidable as long as the capitalist system (oriented to private property and the market) exists.

Most subsequent economists rejected Marx's claim that labor is the sole creator of value, as well as his related assumption that the value of a commodity somehow exists objectively in the commodity. However, two of Marx's general contentions have not yet been proved false. First, he was persuaded that capitalism has a built-in dynamism, a tendency to transform its own conditions of production. Indeed, in *The Communist Manifesto* he and Engels were perhaps the first to sketch out the process of worldwide capitalist expansion and transformation that we now call “globalization.” Second, he held that exploitation under capitalism does not arise from the good or bad intentions of individuals, but is systemic. Position in the system, not greater intelligence or harder work, is the most likely explanation for why the coffee futures trader in New York makes vastly more money than the small coffee producer in Central America.

Necessity of revolution. The convinced, root-and-branch Marxist claims that capitalism must be destroyed because it necessarily brings with it estrangement, exploitation, and a disorderly irrationality (overproduction, underconsumption, boom-and-bust economic cycles). The root-and-branch Marxist holds that piecemeal reform of the system is insufficient to solve these problems. He or she also holds that capitalism will be destroyed—it is doomed to collapse.

Insistence that capitalism cannot be reformed and that the proletariat (the industrial working class) is the revolutionary class that will destroy it were the two touchstones of Marx's thinking from 1843–1844 onward. To be sure, in his later years Marx suggested that in some countries revolution might occur by electoral rather than by solely violent means, and Engels shared this view. But this was not a rejection of revolution, which in Marx's lexicon equates not to violence, but to a radical transformation of the dominant economic and social system however achieved.

A conceptual treasure-trove. Marx wrote interestingly on more topics than the ones noted above. His letters, published works, and manuscripts contain many false starts, curiosity-driven meanderings, pregnant suggestions, intelligent analyses, incipient but never fully developed theories, and journalistic

commentaries on current events, as well as reservations concerning some of his own views. He was often insistently dogmatic, and yet at other times surprisingly flexible. Toward the end of his life, he rebelled against a dogmatic tendency that he detected among some of his followers, declaring “I am not a Marxist.”

Doctrinal Marxism

During the 1880s and 1890s Marxism became doctrine in many European labor and working-class political organizations. Its scientism accorded with the spirit of the age. Its prediction that capitalism cannot escape economic crisis seemed congruent with the so-called Great Depression of 1873–1896. Marxism spread through the German Social Democratic Party after the chancellor, Otto von Bismarck, instituted the antisocialist laws (1878), and in the wake of the party’s legalization (1890) became its official ideology (1891). Although in other countries Marxism was less prominent, by around 1900 it was certainly the most influential left-wing ideology in Europe.

The main intellectual basis of doctrinal Marxism was Engels’s version of Marx. Engels embedded Marx’s analysis and critique of capitalism in a general view of history, which he in turn embedded in an ontological theory. As a theorist, Marx himself was mainly concerned with understanding the “economic law of motion of modern society” (*Capital*, 1st ed. preface), and after 1845 he rarely thought in more general terms. But in *Socialism: Utopian and Scientific* (1880) and other writings, Engels portrayed Marx as the discoverer of a general theory of history, which Engels called “the materialist conception of history” or “historical materialism” (terms never used by Marx). Engels also contended that “scientific socialism” includes a theory of reality in general, according to which reality is material and dialectical (conflict-driven). Marx himself never put forward such a theory.

In Engels’s version, Marxism claimed to be an all-embracing science. Whereas other socialisms are utopian, Marxism has the measure of the world as it is. In his 1883 “Speech at Marx’s Graveside,” Engels declared that Marx had discovered “the law of development of human history,” just as Darwin had (allegedly) discovered the law of development of organic nature. In an age enamored of natural science, such claims were the way to popularity. But the result was to downplay Marx’s early concern with human activity or praxis and his critique of estrangement. Relatedly, Engels misrepresented Marx’s relation to Hegel.

Doctrinal Marxism to 1914

Leszek Kolakowski has referred to 1889–1914, the period of the second Socialist International, as “the golden age” of Marxism. The Socialist International was an organization, founded at a congress in Paris in 1889, that aimed to encourage cooperation among the socialist parties of the different European countries. Admittedly, in this period Marxism began to acquire something of the rigid and schematic character of a catechism, but among both Marxists and people who were just interested in Marxism, serious discussion of unclear points nonetheless took place. These included such questions as the

following: If there is a law of development of human history, how does it operate? Does an explicitly normative or ethical dimension need to be added to “scientific socialism”? How is the economic “base” related to the legal, political, and cultural “superstructure”? Is socialism the inevitable outcome of capitalist development, or is it only one possibility? Is reform a worthy goal, or should Marxists focus entirely on revolution? Should socialist parties form alliances with non-socialist parties? How violent will the revolution be? Can a socialist worldview legitimately make use of non-Marxian resources?

Most (perhaps all) exponents of Marxism agreed that the goal of human history is some sort of exploitation-free society without class or other kinds of divisions, with a full development of science and technology and true freedom. The disagreements were about how this goal was to be achieved.

Revisionism and antirevisionism. Marx predicted that capitalism would collapse under the combined weight of its economic difficulties and the proletariat’s uprising against it. But by the late nineteenth century it was clear that economic upswing and actual or anticipated gains from trade unions and socialist parties were keeping revolution on the back burner. Few workers were revolutionary. In spite of its official Marxism after 1891, the actual orientation of German Social Democracy was deeply reformist. In response to this reality, the party activist and journalist Eduard Bernstein (1850–1932) argued in *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* (1899; translated as *Evolutionary Socialism* [1909]) that the collapse of capitalism is neither imminent nor inevitable, that the number of property owners is increasing, and that socialism is more likely to be achieved by gradual reform within capitalism than by revolution. Although a large minority of German Social Democrats agreed with Bernstein, such party leaders as Karl Kautsky (1854–1938) and August Bebel (1840–1913), as well as theorists outside Germany, excoriated Bernstein’s “revisionism.” Bernstein’s opponents rightly saw that revolution was central for Marx. They were anxious to maintain unity and commitment in the socialist movement. And Bernstein’s claims did not have anything like apodictic certainty. Even much later than 1899 it remained plausible to believe that capitalism was doomed, as the flourishing of Marxism during the 1930s depression shows.

Marxist theorists and party leaders, as well as other interested observers, responded to Bernstein in various ways. Kautsky repeated the increasingly hackneyed claim that the necessary development of the historical process will lead to revolution, a position that relieved Social Democrats of any need to act to bring the revolution about. The French social theorist Georges Sorel (1847–1922) scorned both Bernstein and orthodox Marxists like Kautsky and contended for a revolutionary movement committed to what Sorel called “the myth of the general strike,” that would see its goal as a total, apocalyptic transformation of the world. The Russian revolutionary V. I. Lenin (1870–1924) opted for a centralized, vanguard party that would guide the too-hesitant proletariat toward revolution. The German (also Jewish-Polish) Social Democrat Rosa Luxemburg (1870–1919) polemicized against party bureaucracy and against Leninist top-down centralism, and in

the face of massive contrary evidence put her faith in spontaneous revolt by the proletariat. The French socialist leader Jean Jaurès (1859–1914) supported Kautsky against Bernstein, and held that socialism would come about by revolution. But at the same time he was a natural conciliator and a moralist, having none of the characteristics of a revolutionary.

Kantian Marxism. Another type of Marxism in this period modified or even abandoned Marxist (actually Engelsian) historical theory. The Italian philosopher Antonio Labriola (1843–1904) anticipated a heterodox strand in post-1917 Marxism in his attempt to show that Marxism takes its point of departure from human praxis, or action, which he saw as including all aspects of human life, including intellectual activity. Other Marxist thinkers insisted (contra both Engels and Marx himself) that Marxism needs a normative dimension, the movement of history being irrelevant to what human beings *ought* to desire. The influential school of “Austro-Marxists,” involving such figures as Max Adler (1873–1937), Otto Bauer (1881–1938), and Rudolf Hilferding (1877–1941), adopted this position.

The Austro-Marxists also argued against the Leninist tendency to reduce theoretical ideas to mere weapons in the class struggle: instead, they held that Marxist theory ought to appeal to all rational minds. They likewise linked Marxism to a Kantian moral universalism. Like other Kant-inclined Marxists elsewhere, they held that socialism and the Kantian ideal of a “kingdom of ends” are congruent. Individual human beings should never be treated as mere means toward the development of some higher good. Such views were far distant from the theory and practice of Leninism.

After 1914: Leninism and Marxism-Leninism

The rise of Leninism dramatically changed the complexion of Marxism. As Neil Harding has argued, Marxism in its guise as “a theory and practice of revolutionary transformation” was virtually dead by 1914 (p. 114). Although many Marxists still made use of revolutionary rhetoric, the advance of political democracy, economic improvement, and the failure of class polarization to occur militated against revolutionary action. But in August 1914, World War I began, and all the national parties in the Socialist International supported their respective governments in the war crisis, although they had sworn not to do so. Lenin, head of the revolutionary Bolshevik wing of the Russian Social Democratic Party, was enraged at the apostasy of virtually all “orthodox” Marxists. More than this, he quickly came to see the war as marking the total bankruptcy of capitalist civilization, which in his view had forfeited its right to exist.

In response to the crisis of 1914, Lenin, living in exile in Switzerland, formulated a distinctive version of Marxism, which first took shape in his pamphlet *Imperialism, the Highest Stage of Capitalism*, written in Zurich in 1915–1916 and published in Russia in April 1917, after he had returned there in the wake of the February Revolution. By a combination of intelligence, a focus on essentials, brilliant organization, ruthlessness, and luck, Lenin and his colleagues, notably Leon Trotsky (1879–1940), seized power in the October 1917 revolution (actually, more a coup d'état than a revolution), and held onto

it. The regime that they established in the former Russian Empire (reconstituted as the Union of Soviet Socialist Republics [USSR] in 1922) promoted the Leninist interpretation of Marxism as the authoritative version. Later, under the auspices of Joseph Stalin (1879–1953), the authoritative version came to be known as “Marxism-Leninism.”

In the period of the Cold War, the world was dominated by a bipolar conflict between “the West” and “the Communist world.” Communist regimes claimed to take their inspiration from the so-called “classic writers of Marxism-Leninism.” At a minimum these included Marx himself, Engels, and Lenin. (Other figures also achieved canonical authority where they had the power to impose it, notably Stalin and Mao Zedong [1893–1976].) For much of the twentieth century it was overwhelmingly Marxism-Leninism that defined Marxism, and the fate of Marxism-Leninism was closely tied to the fate of the USSR. Even now the popular image of Marxism most often simply reproduces the Marxist-Leninist version. There are even theorists who claim that there is no “authentic Marx” apart from Lenin.

Lenin before Leninism. The central problem that faced Lenin before 1914 was the problem of how socialist revolution was to be brought about in Russia, where industry, by 1900, had barely developed and where most of the population were illiterate peasants of diverse nationalities. In the face of this problem and in response to disagreements within the Russian Social Democratic Party, Lenin, in his 1902 pamphlet *What Is to Be Done?*, laid great emphasis on party organization. Attacking Russian colleagues who celebrated a “spontaneous” awakening of the proletariat and who denigrated “theory” and “method,” he argued that workers left to their own resources cannot go beyond a “trade union consciousness.” Only with guidance from a centrally organized party of professional revolutionaries in possession of the right (Marxist) theory can the proletariat rise up to revolutionary consciousness and action.

Some commentators have seen Lenin’s position as involving a kind of conspiratorial Jacobinism or Blanquism foreign to the spirit of Marx himself. (Blanquism was so named after the French activist Louis Auguste Blanqui [1805–1881], an advocate of the forcible seizure of political power by professional revolutionaries.) But this criticism is mistaken. First, in 1902 and even much later, Lenin held that the success of revolution in Russia depended on socialist revolution also breaking out in the more advanced countries to Russia’s west. Second, Marx himself faced, in his early years, the problem of how revolution was to come to Germany, which at that time was economically backward in comparison to France, Belgium, and England. In the same essay in which he announced his “discovery” of the proletariat, he also asserted emphatically that revolution will come to Germany when philosophy (theory) allies itself with the oppressed proletariat’s practical experience. Marx did not claim that the oppressed weavers of Silesia would become conscious of their situation on their own (Marx, “Introduction” to *A Contribution to the Critique of Hegel’s “Philosophy of Right,”* published February 1844). In short, only the intelligentsia is capable of revealing to the proletariat the true meaning of its own experience.

Capitalism and imperialism. Lenin's immediate reaction to the outbreak of World War I was to engage in "a doctrinaire restatement of the fundamentals of Marxism" (Harding, p. 77). He then turned to an attempt to reconstruct the deep roots of Marxism in Hegel's thought, which led him to conclude that his fellow Marxists had failed to understand Marx's dialectical method, which always looks to find contradictions in existing reality.

Lenin also concluded that other Marxists had failed to understand the actual situation of capitalism in its contemporary guise. In Lenin's view, capitalism had now entered into the stage of state-directed violence. Its economic contradictions were such that they could only be overcome, temporarily, by an imperialist expansion enabling the extraction of super-profits from less-developed countries. Capitalism now constituted a world system, and Lenin argued that the system was destined to break at its weakest link, which was most likely to be at the periphery—for example, Russia. Thus, on returning to Russia in April 1917, Lenin felt justified in proclaiming that a socialist—and not just a bourgeois—revolution was underway.

Leninism and science. Lenin's views altered to some extent in the difficult years from 1917 to his death in 1924. The complexities must be left aside here. The central point is that notions of open discussion and mass participation quickly disappeared from the horizon of the regime. Rather, the party, and in particular its highest leaders, came to substitute for the proletariat, which itself amounted to only a small part of the population of the USSR.

The theoretical justification for this development was to be found ultimately in Marx's commitment to science. It is not for nothing that in December 1920 Lenin announced that "Communism is Soviet power plus electrification of the whole country" ("Soviet [worker-council] power" quickly faded, however). In theory, all decisions were to be made on the basis of expert, scientific knowledge, and politics was to fade from view. In practice, the attempt to impose decisions on the country—to make the country conform to the theory—was undoubtedly an important reason why the USSR under Stalin became a tyranny the likes of which had never before been seen.

In the canonical form that it acquired by the late 1930s, Marxism-Leninism claimed to offer the explanatory key to all of reality. The term associated with this monism was "dialectical materialism" (coined by the Russian Marxist G. V. Plekhanov [1857–1918] in 1890). Unimportant before 1917, in the Soviet period dialectical materialism became a widely used shorthand term for Marxism, in large measure as a result of Stalin's efforts. According to dialectical materialism, an inexorable developmental process permeates all of reality. The struggles that occur in human history are merely one manifestation of this process. We are thus in a position to know that history will lead, with utter inevitability, through the travails of the present to the sunny uplands of socialism.

It is often assumed that Marx himself was a "dialectical materialist." The theory of dialectical materialism was originated by Engels. It is not articulated in any of Marx's own writings. Both Marx and Engels claimed that Marxian socialism was

scientific, but it was Engels who intuited that many potential adherents of Marxism were looking for an all-embracing worldview. Purporting to explain everything, dialectical materialism aimed to displace all competing worldviews, notably religion. To its adherents, it offered a sense of certainty. In Stalin's calculation, this sense of certainty served the interests of the bureaucratic tyranny that he established over the USSR.

Advance and retreat of Marxism-Leninism. Marxism-Leninism prescribed a way out of backwardness through revolution, science, and rationality that many intellectuals in Asia, Africa, and Latin America found appealing. For over half a century it had a significant following in the "underdeveloped" world. However, few Marxist-Leninist regimes came into being independently of the direct application of military force by the USSR. In order to succeed, revolutionary movements needed a favorable concatenation of circumstances and an indigenous cadre of militants willing to adjust their message to suit the audience. This did happen in China. In 1926 urban workers made up only 0.5 percent of the Chinese population. As Mao Zedong saw in his prescient "Report on the Peasant Movement in Hunan" (1927), the party had to appeal to the peasantry. The People's Republic of China came into being in 1949 as a result of a successful mobilizing of a revolutionary peasantry. Meanwhile, in the wake of World War II the Soviet Union and its victorious army imposed Marxism-Leninism on Eastern Europe.

At the beginning of the twenty-first century, the fundamental fact confronting doctrinal Marxism was the all but total disappearance of Marxist-Leninist regimes and movements. Over the course of a generation and more, the Soviet Union became more and more sclerotic and then, in 1991, collapsed, having already lost its Eastern European satellites in 1989. Meanwhile, the People's Republic of China turned toward participation in the market following the "Reform and Opening" process initiated by Deng Xiaoping in the late 1970s. By 2004, only a few countries, notably Cuba and North Korea, were still claiming to be built on Marxist-Leninist principles.

As for large-scale Marxist or Marxist-Leninist political movements, by 2004 none existed. When the Leninist regime in the USSR was being consolidated, some elements of European social democracy set themselves up as the avowedly democratic wing of Marxism in opposition to Leninism. But social democracy's Marxism became attenuated over time, eventually disappearing into a generalized commitment to social welfare and to some measure of social and economic egalitarianism.

Marxism beyond Doctrinal Marxism

A large body of Marxian writing and reflection lies beyond the framework of doctrinal Marxism. Until World War II almost all of this "independent Marxism"—as we might call it—emerged within the framework of, or at least in close dialogue with, doctrinal Marxism. After World War II, this changed, for much Marxian reflection was carried out in essential independence from both official Marxism-Leninism and from whatever Marxist residues remained in the social democratic movement. In addition to independent Marxists, there were many scholars and intellectuals who deployed Marxian

perspectives without accepting Marxism as a whole and usually without even considering themselves Marxists. This is a tradition that goes back to the early twentieth century. By the end of the twentieth century it was certainly the dominant mode of serious intellectual work and reflection in a Marxist register. Of course, one encounters a difficulty here, for at this point one reaches the boundary of what can legitimately be called Marxism.

Existential Marxism. Another difficulty is that of characterizing in a general way the Marxisms that diverge from doctrinal Marxism. Beyond social-democratic and Marxist-Leninist Marxisms, Hook identified a third, post-1945 variant: existential Marxism. In doing so he inflated the significance of a relatively minor school of mainly French Marxists. Still, Hook's category does point in the direction of at least two significant developments in post-1945 Marxism. First, after about 1950, much effort went into reinterpreting Marx in the light of the "Economic and Philosophical Manuscripts," which revealed a "humanist" Marx different from the Marx of Marxism-Leninism. While Marx was no existentialist, his early interest in estrangement and in activity do reveal affinities with existentialism. Second, an important development since World War II among persons sympathetic to Marxism has been the impulse to work in the mode of "Marxism and . . ."—combining Marxism with something else, whether method, school, commitment, or discipline. In offering an existentially inflected Marxism in his *Critique of Dialectical Reason* (1960), the French philosopher Jean-Paul Sartre (1905–1980) was operating in just this sort of combinatory mode. A German-Jewish refugee to the United States, Herbert Marcuse (1898–1979), engaged in a similar effort, variously combining a Marxian perspective with Freud (*Eros and Civilization*, 1955) and with vaguely Heideggerian notions of an oppressive modernity (*One-Dimensional Man*, 1964). Other combinations involved less an attempt to combine Marxism with some other perspective than an attempt to apply Marxism to an implied object of study. It was a potentially unending intellectual game, for one could pair Marx with other partners virtually at will: a short list includes feminism, structuralism, psychoanalysis, ecology, anthropology, history, literary criticism, literary theory, film studies, and cultural studies. Although it involves much question-begging, the game still continues.

Western Marxism. Other commentators have identified a tradition of "Western Marxism." "Western Marxism" is largely a post hoc imposition. Still, the category can help us to see common features in a large body of Marxist theory that first emerged as a challenge to Engelsian and Leninist versions of Marxism. The unintended founder of Western Marxism was György Lukács (1885–1971), whose *History and Class Consciousness: Studies in Marxist Dialectics* (1923) was actually written in defense of "orthodox Marxism." But in the midst of defending orthodox Marxism, Lukács emphasized two concepts that were to be important for Western Marxism. One was estrangement (which he intuited in Marx without having read the then-unavailable "Economic and Philosophical Manuscripts"). The other was totality. The gist of this latter concept is the claim that the correct understanding of any reality requires that one first understand it as a *whole* (which among other things, involves understanding its place within the historical process),

rather than arriving at conclusions about it solely by induction from particulars. Lukács held that bourgeois empiricists, as well as some Marxists, had failed to understand this point. A second theorist often seen as a founder of Western Marxism was Karl Korsch (1886–1961), who in *Marxism and Philosophy* (1923) and other writings emphasized that Marxism is primarily concerned with human practice (praxis) and, like Lukács, criticized positivist or empiricist versions of Marxism.

Other theorists commonly associated with so-called Western Marxism include Karl Korsch (1886–1961), Antonio Gramsci (1891–1937), Ernst Bloch (1885–1977), Herbert Marcuse, Henri Lefebvre (1905–1991), Sartre, Maurice Merleau-Ponty (1908–1961), and the "Frankfurt School" theorists Walter Benjamin (1892–1940), Max Horkheimer (1895–1973), and Theodor Adorno (1903–1969). What is most striking about the "Western Marxists" is that none of them focused on Marxism's basic socioeconomic claims. They either directly assert or implicitly assume the truth of these claims, but they never see the need to show that they are true in fact. For example, Lukács emphatically saw the proletariat as the "identical subject-object" of history, but he never did the work to show how this must be so. The omission was made easier by the fact that Western Marxists focused overwhelmingly on culture, social consciousness, and ideology rather than on economics. For example, Gramsci is best known for his notion of hegemony, a kind of updated notion of ideology; Benjamin was a brilliant cultural and literary critic; and Adorno offered a cutting analysis of "the culture industry."

One historian of Western Marxism, Martin Jay, has noted that a loss of confidence in the validity and usefulness of Western Marxism occurred by the late 1970s, after a brief period in which it had attracted some young, leftist, mainly American academics. The reasons for this deflation are no doubt complex, as are the reasons for the decline of Marxism generally. One crucial consideration is that thinking persons can hardly go on begging the question as to the truth of a theory's basic claims for long before doubts need to be addressed. It is "no accident," as a Marxist might say, that such figures as Jürgen Habermas (b. 1929), scion of the Frankfurt School, and Agnes Heller (b. 1929), Lukács's most distinguished student, took issue, sooner or later, with Marxism.

By the 1970s, commitment to Marxism was not easy to maintain, for there had been too much experience contrary to Marx's hopes and predictions. Marx's claim that capitalism was doomed to collapse in a proletarian revolution had to face both the failure of any unified proletariat to appear and the fact that the institutions of capitalist society had managed to muddle through again and again. Marx's claim that socialism would be better than capitalism had to face both the experiential disconfirmation offered by actually existing communist states, and a serious argument, first articulated by Ludwig von Mises in 1920, to the effect that a complex nonmarket economy cannot operate efficiently, because markets are indispensable information-gathering mechanisms (see Steele).

Analytical Marxism. Although various claims central to Marxism no longer seem tenable, Marxism has a legitimate survival in at least two respects. First, Marxism exists as a set of suggestions for research, for Marx offered many specific

claims and suggestions concerning modern society and politics. Some of these are false, as Richard Hamilton has shown. But others, particularly when reformulated as abstract theoretical claims to be tested in specific present-day contexts, remain alive in current social science. For example, Marxism has been influential in recent thinking about international political economy—hardly surprising, in the light of Marx and Engels’s early insistence on capitalism’s global character. It has influenced thinking about state power, a theme emphasized by the Marxist political theorists Ralph Miliband (1924–1994) and Nicos Poulantzas (1936–1979) and picked up by others subsequently (see Aronowitz and Bratsis). It has influenced thinking about democratization—in particular, the thinking of those political scientists concerned with the relation between class structure and democracy. Finally, it has helped to inspire empirical research into the workings of class in modern society.

A question that arises in relation to such studies is: How Marxist are they? Clearly, they are not Marxist by the standards of revolutionary Marxism, since they are academic studies and not attempts to promote the revolution (at most, such researchers hope to encourage reform). But since in 2004 there exist virtually no active Marxian revolutionaries apart from the small circle of Nepalese Maoists, this is a high standard. By less stringent standards, such studies may well be Marxist in a looser sense—in the sense of taking Marx seriously, working within a tradition of Marxism, using Marxian language, and maintaining a normative commitment to the values of freedom, equality, and human dignity. Certainly, in the late 1970s a small but lively group of Anglo-American academics began to identify themselves as “analytical” or “rational choice” Marxists (see Roemer, Wright, and Wright et al.). However, insofar as their investigations were integrated into fields or subfields in political science, economics, sociology, and so on, these tended to become “research” rather than “Marxist research.”

Thus one meets again a boundary, where what is valid in Marxism passes over into an intellectual territory that is no longer Marxist. Some writers, notably Ernesto Laclau (b. 1935) and Chantal Mouffe (b. 1943) have called this territory “post-Marxism” (see Sim). In the eyes of such writers, post-Marxism involves a reformulation of Marxism in order to accommodate such “movements” as poststructuralism, postmodernism, and second-wave feminism. Here Marxism appears, not as a set of analyzable propositions, but, in a much more attenuated guise, as a form of critique and of hope from which almost all specifically Marxian claims have disappeared. This is the second way in which Marxism continues to have a legitimate survival in the twenty-first century.

ASIA

The writings of Karl Marx offer both a critique and a celebration of modern capitalism. On the one hand, Marx presented a devastating moral indictment of the capitalist exploitation of labor and the drowning of all human relationships in "the icy waters of egotistical calculation." On the other, Marx saw capitalism as a necessary and progressive phase of historical development, yielding the essential material and social prerequisites for socialism—modern industry and the proletariat.

The proposition that socialism presupposes capitalism was seen as universally valid. "The bourgeoisie, by the rapid improvement of all instruments of production," Marx wrote in *The Manifesto of the Communist Party* (1848), "batters down all Chinese walls. . . . It compels all nations on pain of extinction, to adopt the bourgeois mode of production. In one word, it creates a world after its own image."

In this mid-nineteenth-century anticipation of the late-twentieth-century phenomenon of "globalization," Marx assumed that the precapitalist countries of Asia were destined to follow the Western capitalist path of development. They would do so under the universalistic pressure of Western imperialism. While imperialism was morally detestable, it was historically progressive, breaking apart stagnant "Asiatic" societies

unable to move into modern history on their own. In universalizing capitalism, imperialism was laying the basis for an international socialist future.

Japan

It was entirely logical that Japan should have been the first Asian country where Marxism took root. Japan was the earliest Asian land to embark on a program of capitalist development. In the 1890s, in response to the social tensions of Meiji modernization, Japanese intellectuals imported Marxism along with a variety of other proscribed Western socialist theories. By the time of the Russo-Japanese War of 1904–1905, Marxism established itself as the dominant socialist theory. And the preeminent version of Marxism was the economically deterministic doctrine of Karl Kautsky (1854–1938).

The early Japanese Marxists often intermingled anarchist and utopian socialist ideas with their Marxian beliefs. It was not until the Russian Revolution of 1917 that Marxism found coherent political and intellectual expression. The Japanese Communist Party (JCP), founded in 1922, became the carrier of the Leninist version of Marxism while the Japanese Socialist Party largely based itself (in its various incarnations) on the more orthodox Marxist teachings of Kautsky. But Japanese Marxism in the 1920s and 1930s, partly because of severe state repression, was less influential as a political than an intellectual movement. By the late 1920s, Marxist influences were dominant in the economics departments of elite Japanese universities. The celebrated 1927–1937 debate on the nature of Japanese capitalism was a major contribution to international Marxist scholarship.

The rise of militarism and fascism in the 1930s led to the wholesale jailing of Marxists and the virtual total suppression of Marxian ideas. With the defeat of the fascist regime in 1945, Marxist intellectual and political life revived under the American occupation. Marxist theory became highly influential in economic and historical scholarship. Marxism found vigorous political expression in the small but influential Communist Party and also in the much larger Japanese Socialist Party (JSP). The JSP, which gained substantial electoral support, was hindered in its bid for power by a long-standing division between Marxist-Leninists and social democrats. A further political obstacle was the general prosperity yielded by Japan's phenomenal economic growth, which eroded Marxist influence. However, the stagnation of Japanese capitalism since 1990 perhaps augurs well for the reinvigoration of Japanese Marxism.

China

It was primarily in Japan that Chinese students and political exiles learned about Western socialism. In the first decade of the twentieth century, young Chinese intellectuals were attracted to a wide range of socialist ideologies, especially to the anarchist ideas of Pyotr Kropotkin (1842–1921) and Mikhail Bakunin (1814–1876), but also to various forms of "utopian socialism." There was some intellectual interest in Marxism, and fragments of the writings of Karl Marx and Friedrich Engels were translated into Chinese as early as 1907. But while there were many Chinese anarchists, there were no Chinese converts to Marxism prior to the Russian Revolution of 1917.

It is not difficult to understand why Marx struck few responsive chords among Chinese intellectuals who were increasingly attracted to Western socialist doctrines. Marxist theory, in its orthodox form, taught that a well-developed capitalist economy was an essential prerequisite for socialism. But China was an overwhelmingly agrarian land with little modern industry and only a tiny urban working class. What Marxism conveyed to nationalistic Chinese intellectuals, increasingly alienated from traditional culture and attracted to Western socialist visions, was the disheartening message that they could only wait patiently on the political sidelines while capitalist forces of production did their historical work.

Marxism gained its first substantial appeal in China under the twin impact of the 1917 Bolshevik Revolution and China's May Fourth Movement of 1919. The messianic appeals of the Russian Revolution did not strike the Chinese intellectual world as a "thunderbolt," as Mao Zedong later claimed, but it did arouse sympathetic interest, not least of all because Chinese intellectuals had felt a certain kinship with backward Russia since 1905. It also produced China's first Marxists, including Li Dazhao at Beijing University, soon to be a co-founder of the Chinese Communist Party.

The Bolshevik Revolution also brought to China the Leninist version of Marxism, which made the doctrine far more relevant to an economically backward land than orthodox Marxian teachings. The Leninist theory of imperialism provided a place for economically backward lands in the world revolutionary process, thus helping to satisfy nationalist and politically activist impulses. It provided an important revolutionary role for peasants in an overwhelmingly agrarian society. And the concept of the "vanguard" party, which assigned a decisive historical role to the "consciousness" of the intelligentsia, had enormous appeal.

Yet the Russian Revolution and Leninism would have had a much more limited appeal had it not been for the westernizing May Fourth Movement (c. 1915–1921), which burst into political activism shortly after World War I. The cynical betrayal of Chinese interests (in favor of Japanese imperialism) at the Versailles Peace Conference of 1919 led to widespread disillusionment with Western liberalism, opening the way for Marxian influences. Marxism received its main political expression in the Chinese Communist Party (CCP), formally established in 1921, although Marxism also significantly influenced the Nationalist Party of Sun Yat-sen and politically independent Chinese scholars.

There was little distinctive about Chinese Marxism in the early history of the CCP (1921–1927). The official ideology was Marxism-Leninism, as interpreted in Moscow and conveyed by the Comintern. In accordance with official ideology, the CCP found its main base in the urban proletariat and pursued a "two-stage" revolutionary policy, with a "bourgeois-democratic" phase preceding the socialist phase. In the first stage, the CCP was the junior partner in a Comintern-arranged tripartite alliance with the Nationalist Party of Sun Yat-sen and the Soviet Union. But the mass movement of workers and peasants proved too socially radical for the limited nationalist aims of the alliance, which were confined to national unification and

independence. The result was that the Nationalists, now led by Chiang Kai-shek, turned their Soviet-built army against their Communist allies in 1927, violently crushing the popular movement of workers and peasants. The Communists who survived the carnage fled to the more remote areas of the countryside. The suppression of Communist organizations in the cities in 1927 opened the way for the emergence of "Maoism" as a rural-based Marxian revolutionary strategy.

What came to be celebrated as "The Thought of Mao Zedong" was a doctrine that evolved over two decades of rural revolutionary warfare, culminating in the establishment of the People's Republic in 1949. Maoism, far from being "orthodox" or "hardline" Marxism as frequently characterized in the West, was marked by its departures from the premises of both original Marxism and Leninism. First, Maoism was based on the belief that the peasantry is the principal revolutionary class, even though lip service was ambiguously paid to the principle of "proletarian leadership." This was logically accompanied by a celebration of the virtues of rural life and a suspicion that cities were the breeding grounds of political conservatism and moral corruption. Maoism, thus, inverted the Marxist (and Leninist) conception of the relationship between town and countryside in the making of modern history.

Maoism not only strayed from Marxism in turning to the countryside but was also profoundly non-Leninist in celebrating the spontaneity of peasant revolt. While Mao appreciated the efficacy of Leninist principles of organization, he never accepted the intellectual basis of Lenin's "vanguard party"—the insistence that the "consciousness" of the intelligentsia had to be imposed on the "spontaneous" movement of the masses.

Mao's unique strategy of revolution was profoundly non-Marxist not only in the belief that the truly revolutionary class was the peasantry, but also in its conception that the revolution would take the form of a military struggle. Rather than the seizure of state power, the Maoist notions of "people's war" and "protracted warfare" envisioned that the expansion of the Red Army would permit the gradual building of nuclei of revolutionary political power in the rural areas. Ultimately, Maoists envisioned that the forces of revolt in the countryside would "surround and overwhelm" the conservative cities.

One of the pervasive features of Maoism was its voluntarist belief that human consciousness was the decisive factor in history. The Maoist maxim that "men are more important than machines" betrayed a striking lack of confidence in the "objective laws" of history proclaimed in Marxist theory, although the latter were ritualistically repeated in official texts. But the actual belief was that socialism was not dependent on any Marxian-defined level of economic development; rather, the historical outcome would be determined by the spiritual qualities of the people and their leaders.

The incorporation of Chinese nationalism into the Chinese version of Marxism enabled Mao to harness popular patriotic sentiments to the Communist cause during the decisive Yanan phase of the revolution, which coincided with the Japanese invasion of China (1937–1945). It made the Chinese Communist Revolution as much a war of national liberation as a social revolution.

Perhaps the most profound Maoist departure from the logic of Marxism was a pervasive populist-type belief in the advantages of backwardness. China's alleged condition of being "poor and blank," Mao believed, was a source of great moral purity and revolutionary energy that foreshadowed China's imminent leap to a socialist utopia. It was a totalistic rejection of the Marxist (and Leninist) insistence that socialism must be based on the material and cultural accomplishments of capitalism.

Such Maoist revisions of the inherited body of Marxist-Leninist theory, which were celebrated as the "Sinification of Marxism," were ideological preconditions for the peasant-based revolution that brought the Communists to power in 1949. But they left only tenuous intellectual ties between Maoism and Marxism.

In the end, Maoism sowed the seeds of its own demise. Maoist political methods and values, which continued to bear the birthmarks of its backward rural environment, became increasingly anachronistic in a rapidly industrializing society. It was thus inevitable that Mao's successors would purge Chinese Marxism of its more radical and utopian elements. They first returned to a more orthodox Marxist emphasis on the determining role of economic forces in history. What followed was the ritualization of Maoism, whose vocabulary was retained—but only in the form of nationalistic slogans severed from the actual policies that have generated a capitalist-type economy. The final chapter in the history of Maoism has seen its reduction to a nostalgic pop culture phenomenon—such as the opening of expensive Mao-themed restaurants and the sale (over the Internet) of old Mao badges and other memorabilia of the Cultural Revolution.

Yet if Maoism is exhausted, this is not necessarily the case for other forms of Marxism. The rapid development of capitalism in recent decades has yielded a massive industrial working class and an equally large *Lumpenproletariat* of migrant laborers. Many of the illegal trade unions that have attempted to speak on behalf of these highly exploited groups have done so in classic Marxist terms. It would be a grand irony of modern history if the greatest challenge to the Communist state appears in the form of a working-class movement proceeding under a Marxist banner.

Vietnam and Southeast Asia

In Southeast Asia, Marxism found its main political expression in Vietnam and, abortively, in Indonesia. Vietnamese Marxism was bound up with nationalism from the outset. In the early post-World War I years, Ho Chi Minh (1890–1969), the preeminent figure in the history of the movement who was initially attracted by the nationalist appeals of the Leninist theory of imperialism, became a founding member of the French Communist Party. Ho united several small Vietnamese Marxist-oriented parties into the Indochina Communist Party in 1930, but the party (and Marxism in general) were suppressed by the French colonial administration, forcing Ho to operate largely from abroad until World War II.

In 1941, the Vichy-controlled French colonial regime in Vietnam began active collaboration with the Japanese army.

The conditions were thus created for the ICP to emerge as the organizer of nationalist resistance to foreign domination—in the form of the Viet Minh, established in 1941 as an antifascist united front that took on an increasingly military character. While the Viet Minh was broadly based, it was Communist controlled—and its leader Ho Chi Minh became the symbol of Vietnamese nationalism. Adopting guerilla warfare tactics, Communist-led military forces successively fought the Vichy French colonial regime, the Japanese army in 1945, the post-war French colonial administration, and eventually the United States in a war that lasted more than three decades. The Communist victory in 1975 was essentially the triumph of Vietnamese nationalism. Marxism-Leninism, the official ideology, lent a social revolutionary dimension to the movement. But nationalism was always at the heart of its goals and appeals.

The Communist success in Indochina was not replicated elsewhere in Southeast Asia. Indonesia offers a particularly striking contrast. The Indonesian Communist Party, organized under the influence of Dutch Marxists in the 1920s, was among the earliest and largest Marxist parties in Asia. But the party's identification with ethnically Chinese Indonesians, its pro-Beijing sympathies, and its hostility to Islam undermined its nationalist credentials. Thus, the Communist bid for power in 1965 was crushed by the Indonesian army operating under nationalist and Islamic banners. Neither Indonesian Marxism nor Communism survived the bloodbath that took an estimated half-million lives, mostly ethnic Chinese.

Elsewhere in Southeast Asia, the main political manifestations of Marxism took the form of abortive Communist-led guerrilla insurgencies. Hostility to ethnic Chinese, as well as to China, was a major factor in the failure of Communist movements in Malaysia, Thailand, and Burma. Only in the Philippines, where Chinese migrants are socially well-integrated, does a Communist insurgency continue to simmer.

India

The diverse political implications of Marxism in Asia are suggested by comparing India with China. The two are countries of similar size and population, and both were impoverished agrarian lands in the mid-twentieth century. Yet while a Marxian-based political movement came to power in China and carried out the most massive of modern social revolutions, Marxian-oriented parties have been of marginal significance in India.

The difference cannot be attributed to a better understanding of Marxist theory by Chinese intellectuals. Propelled by the nationalist appeals of the Leninist theory of imperialism, Marxist ideas spread widely among Indian intellectuals in the wake of World War I, at the same time they did in China. Indeed, Marxism probably had a broader and deeper intellectual impact in India than in China because of the accessibility of English Marxist sources.

Although the Indian Communist Party was not formally established until 1926, radical Marxist groups flourished in the major cities from the early 1920s. However, the ICP was banned by the British colonial regime and its leaders were often jailed. Marxist and Communist influences were covertly expressed

through the Indian National Congress of Mahatma Gandhi (1869–1948) and Jawaharlal Nehru (1889–1964), which monopolized Indian nationalist resistance to British rule, winning the support of the peasantry as well as most urban social groups.

The failure of the ICP to emerge as a serious nationalist force relegated it to a relatively minor role in India's political life. Communist support of the British during World War II, demanded by the Comintern's antifascist united front policies, underscored the Indian party's lack of nationalist credentials. Nor were the ICP's prospects enhanced by the factionalism that plagued the Marxian movement in the post-independence period. The main (but not the only) division was between pro-Moscow and pro-Beijing parties following the Sino-Soviet split of 1958. The factional cleavage between "Marxist-Leninists" and "Maoists" highlighted the failure of the ICP to develop a distinctive form of Marxism suited to specifically Indian social conditions and cultural traditions. This failure, in turn, confined the various Marxian parties to a combined total of less than 10 percent of the electoral vote, although the Communists were able to win sufficient support to lead reformist coalition governments in the states of Kerala and West Bengal. In all, however, while Marxism has had a significant impact on Indian intellectual life, its political expression has been feeble.

Conclusion

It would be futile to generalize about the role of Marxism in the several dozen historically and culturally distinct countries of Asia. However, two brief observations might be ventured. First, Marxian-inspired movements in Asia have been politically successful only where they have come to express popular nationalist feelings and aspirations, as has been the case in China and Vietnam. This does not mean that Marxian Communism in Asia can be reduced to a species of nationalism, but a genuine nationalist content and appeal clearly has been an essential precondition for political success. In view of the original doctrine's internationalist message, this is one of the great ironies of the history of Marxism in the modern world.

Second, where Communists have come to power, Marxism, essentially a critique of capitalism, paradoxically has functioned as an ideology of economic development whose social outcome is a capitalist-type economy. This is clearly the case in China, and appears to be the likely fate of Vietnam.

LATIN AMERICA

Throughout the twentieth century, Latin Americans wrestled with the enduring problems of foreign domination, social inequality, and poverty. Marxist popular movements, political parties, and intellectuals were often key players in these struggles, forming an important basis for trenchant social critique, mass social movement, and revolutionary organization. Even in countries where Marxist ideas, parties, and organizations never developed a mass following or consistent electoral presence, they exercised a broad influence on social movements, politics, and culture. Latin American Marxism cannot be abstracted from this broader social, political, and intellectual ferment. Despite the insistence of many Marxist political parties and regimes on ideological unity, the history of Latin American Marxism has been characterized by creative engagement, partisan debate, and heterodoxy.

Antecedents and Origins

This ferment is reflected in how Latin American Marxists tell their own history. Although Marxist parties and popular organizations, *strictu sensu*, did not exist until the 1920s, many of the popular icons of latter-day Marxist movements have been drawn from earlier generations and other traditions of social struggle. Heterodox Marxist intellectuals have tended to echo radical currents in nineteenth-century liberalism, which suggested that village and ethnic communitarian traditions might be a foundation for radical social transformation. To some extent, these Jacobin intellectuals merely ratified a kind of organic popular liberalism, in which local and regional parties and militias sought to parlay their defense of community into broader visions of national transformation (and sometimes into effective guerrilla resistance to foreign invasions); the degree of contact and mutual influence between popular liberals and urban Jacobins is still an open question. The late nineteenth and early twentieth centuries also saw the beginnings

of a strong anarchosindicalist and socialist movements in Latin America's nascent urban working classes, which were the foundation for many early communist parties in the 1920s.

The first communist parties in Latin America were founded in the wake of the Russian Revolution of 1917, but they maintained a strong bent toward ideological heterodoxy. In Brazil, for example, former anarchists formed a communist party in 1922, although many of their delegates were vetoed at Comintern congresses. The Mexican Communist Party, the first Comintern section in Latin America (and the first communist party outside Russia), became a de facto training ground for activists in the ruling Partido Revolucionario Institucional; murals by Communist Party members David Alfaro Siqueiros and Diego Rivera still adorn government buildings. In 1928 the prominent Marxist theorist José Carlos Mariátegui founded the Partido Socialista del Perú (PSP). Mariátegui insisted that Marxist ideas needed to be adapted to the distinctive reality of Latin America, particularly its indigenous traditions, and he rejected Leninist notions of party centralism. The PSP affiliated with the Comintern only after Mariátegui's death.

One of the most original Marxist thinkers in Latin America, Mariátegui gave a distinctive Marxist cast to the broad-based political movement known as *indigenismo*, which sought to ensure the rights of contemporary Native American peoples and to vindicate Latin America's indigenous past. Mariátegui initially worked with the Alianza Popular Revolucionaria Americana (APRA) of Haya de la Torre and shared the APRA's characterization of the "Indian problem" as a social and political issue rather than a moral or racial one. But Mariátegui also insisted on working-class agency and insisted that socialism was not alien to Peru's indigenous peoples, viewing the pre-Hispanic Inca empire as a form of primitive communism. Anticipating many of Chairman Mao Tse-tung's ideas, he insisted that socialist revolution would result from a long "accumulation" of forces. Indeed, in the 1980s and 1990s the Maoist Sendero Luminoso claimed Mariátegui as a founding ancestor, although this legacy continues to be contested vigorously by other left opposition movements and intellectuals.

1929–1959: International Crises and the Search for Common Ground

Despite the independence of many Latin American Marxist thinkers, international developments also continued to shape Marxist ideas in Latin America. The global economic crash of 1929 reinforced the Comintern's turn toward ultraleftism, and in many countries communist parties broke with allies in reformist unions and organizations, established rival organizations, and vigorously contested the state. The resulting repression drove many of these parties into semiclandestine status; an attempted insurrection in El Salvador ended in catastrophe, with more than ten thousand killed. In 1935 the rise of fascism prompted the Comintern to call for a "popular front" of proletarian parties and the antifascist bourgeoisie. During World War II, Latin American communist parties also abandoned their earlier anti-imperialism in favor of a broad international alliance against fascism. They also built alliances with right-wing groups and local dictators such as Batista in Cuba and Somoza in Nicaragua. In Chile, the Popular Front of

communist, socialist, and radical parties won the presidency in 1938 and pursued a program of moderate reform. In many other countries, however, communist parties lost ground to populist regimes or other left opposition movements.

The wholesale repression of communist parties—and the aggressive intervention of the United States—encouraged Latin American communists to continue alliances with liberal and democratic parties in the postwar years. Marxist intellectuals embraced Latin American liberals' age-old enthusiasm for national "development," combining sophisticated critiques of global political economy with vague tropes of modernity. Latin American poverty, they held, stemmed from its economic dependency on the United States, whereby Latin American economies exchanged raw materials for manufactured goods at disadvantageous terms. They tended to view the development of a capitalist industrial economy and urbanized society as a prerequisite for socialist revolution. In some instances, Marxist intellectuals revived Simón Bolívar's dream of a broad alliance of Latin American nations, which would permit the development of economies of scale and the political strength to stand up to an aggressive United States.

Other Marxist intellectuals, particularly in the Caribbean, emphasized connections with anticolonial struggles in other parts of the world as well as the struggle for racial justice in the United States. This trend was exemplified by C. L. R. James, whose work remains important in both international Marxist theory and cultural studies. Born in the then-English colony of Trinidad, C. L. R. James's initial focus was on his native Caribbean, and his early work included social-realist fiction set in West Indian slums as well as his classic study of the 1793 slave revolt in Saint Domingue (Haiti), *The Black Jacobins* (1938). He also wrote two key works on Marxist theory and practice, *Notes on Dialectics* (1948) and *State Capitalism and World Revolution* (1950). His *Mariners, Renegades, and Castaways* (1953) analyzed the relations among *Moby Dick's* narrator, the ship's captain, and its expert "Third World" crew. *Mariners* anticipated James's involvement in revolutionary decolonization movements in Africa, the Caribbean, and Latin America, as well as among African Americans in the United States. It also presaged the broader internationalism of Latin-American Marxists following the Cuban Revolution.

Foquismo

Latin American communist parties tended to remain chary of insurrectionary strategies and labor radicalism in the postwar years. Indeed, the most militant opposition often came from other left dissidents. In Cuba, where the Communist Party had initially collaborated with the U.S.-backed military regime of Fulgencio Batista, the leadership of a nascent revolutionary movement emerged from the populist Ortodoxo Party (Partido del Pueblo Ortodoxo), and it was inspired as much by the romantic ideal of the revolutionary *atentat* (a spectacular act of revolutionary violence that was meant to inspire mass insurrection) as by Leninist notions of party organization. The movement's victory in 1956 was a puzzle for many Latin American Marxists as much as for U.S. cold warriors, as was the subsequent radicalization of the Cuban revolutionary regime. In the face of U.S. economic blockade and

a CIA-sponsored invasion attempt, the revolutionary government in Cuba proclaimed its Marxist-Leninist orientation and accepted the Soviet Union's political support, military protection, and economic backing. Despite the Soviet Union's increased leverage, however, the revolution's leadership continued to depart from Marxist-Leninist orthodoxy.

In the years following the revolution, the revolutionary *co-mandante* Ernesto "Ché" Guevara elaborated a new theory of revolution known as *foquismo*, in which the revolutionary *foco*, a small cell of guerrillas in the countryside, replaced the vanguard party. Ché's theory contained an implicit criticism of most Latin American communist parties, which had all but abandoned revolutionary violence. Latin American revolution was not simply a possibility, *foco* theory held, but also a moral imperative. Revolutionaries must create "subjective" conditions for revolution rather than awaiting the proper objective conditions. The rural peasantry, rather than the urban proletariat, was the seedbed of socialist revolution. Similarly, a socialist, anti-imperialist revolution was a prerequisite for national economic development, rather than the other way around. In Ché's view, the Cuban Revolution was a beachhead for a broader Latin American revolution; the Andes would become the Sierra Maestra of South America.

Ché is conventionally portrayed as a romantic counterpoint to the authoritarian turn of the Cuban Revolution and the Soviet Union. Indeed, in his final years Ché did publicly clash with the Soviet Union and—less publicly—with Fidel Castro, and *foquista* guerrillas elsewhere in Latin America often clashed with mainline communist parties. But Ché's insistence on the centrality of the revolutionary *foco* also helped underwrite the exclusion of other groups that had been instrumental in Batista's overthrow and a rigid intolerance of political heterodoxy. Inspired by Ché's writings and example, a generation of young revolutionaries sought to establish guerrilla *focos* throughout Latin America, often without any advance political work, local ties, or knowledge of the terrain. Almost all of these expeditions ended in ignominious defeat—most notoriously Ché's own expedition to Bolivia—and later rural guerrilla movements, including the *foquista* movements that had survived the repression of the late 1960s and 1970s, tended to abjure Guevara's insurrectionary strategy in favor of a "prolonged people's war" like those waged in Vietnam and China.

One of the most severe critiques of *foquismo* came from Abraham Guillén, a Spanish Civil War veteran living in Argentina and Uruguay. In his *Estrategia de la guerrilla urbana* (1966), Guillén echoed Ché's call for popular insurrection and Latin American liberation on a continental scale, but he also insisted that the movement would be led by urban proletariat rather than the rural peasantry. During the 1960s and 1970s, urban guerrilla movements emerged throughout Latin America, most famously the Argentine Montoneros and the Uruguayan Tupamaros. None of these movements were strictly Marxist in orientation, and they often drew their leadership from the left wing of national populist movements as well as communist dissidents. Indeed, like *foquista* guerrillas, they tended to clash with mainline communist parties, which often viewed voluntarist and insurrectionary strategies as little more than

dangerous adventures. After Ché's death at the hands of CIA-backed counterinsurgency forces—and under pressure from the Soviet Union—the Cuban government, too, abandoned its earlier support of revolutionary *focos* and sought a rapprochement with other Latin-American governments.

The 1970s and After: New Heterodoxies

Where possible, mainline communist parties tended to support a moderate strategy of trade unionism and broad electoral alliances. In 1970 the Chilean Marxist Salvador Allende was elected president at the head of a shaky coalition of radical, socialist, and communist parties. The Chilean Unidad Popular (UP) embarked on a modest program of social reforms within a constitutional framework. Strategic industries such as coal and steel were nationalized. With the government's sometimes reluctant backing, workers began seizing factories and transforming them into social property, including properties of U.S.-based multinationals such as Ford and ITT. The government also embarked on a far-reaching agrarian reform; by 1973, 60 percent of Chile's agricultural land had been expropriated and distributed to peasants. Nonetheless, the opposition maintained control of the Chilean congress, and the UP itself was deeply divided. United States economic sanctions and sabotage by producers, landowners, and merchants led to inflation and shortages, undermining the UP's support from an already skittish middle class. From the beginning the United States worked for Allende's overthrow, and on 11 September 1973, his government was toppled in a CIA-sponsored military coup.

One of the more novel movements of the 1970s was the marriage of older traditions of social Catholicism and popular religiosity with Marxist ideas and political organization. In what has become a foundational text of this "liberation theology," the Peruvian priest Gustavo Gutiérrez founded a new reading of biblical and church writings in Marxist dependency theory. Other religious activists—most famously the Colombian priest Camilo Torres and the Nicaraguan *padre* Ernesto Cardenal—embraced an insurrectionary strategy and participated in armed revolutionary movements. Many other priests and pastoral lay workers helped members of marginal *barrios* and villages form affinity groups known as *comunidades eclesiales de base* (CEBs), viewing popular communitarian ideals as a revindication of the primitive church. Founding their work in a process of participatory education known as *concientización* (roughly, "consciousness-raising" or "conscience-raising"), radical religious activists encouraged CEB members to apply biblical writings to their own concrete social reality.

Other communitarian traditions continued to be instrumental in Marxist ideas and movements in the final decades of the twentieth century. In Nicaragua, the Frente Sandinista de Liberación Nacional (FSLN), a broad, if shaky, coalition of Marxist guerrilla movements and liberal dissidents, overthrew the brutally repressive Somoza dictatorship in 1979. The movement's heterogeneity, its deep roots in autochthonous liberal and communitarian traditions, and the somewhat lukewarm support of Cuba and the Soviet Union meant that the Sandinista government tended to abjure Leninist party organization in favor of liberal principles of electoral democracy. It also engaged in a moderate program of land reform

(generally along cooperative rather than collectivist lines), improved education and other public services, and enacted progressive social legislation. The Sandinista government survived an eleven-year CIA-sponsored campaign of intimidation, assassination, and sabotage that cost Nicaragua more than thirty thousand lives, and in 1990 it peacefully ceded power to the liberal opposition following an internationally supervised democratic election.

The years following the disintegration of the Soviet Union were a period of retrenchment in Latin America's Marxist left. The fall of the Soviet Union, the aging of the revolutionary elite, and the coming of age of a postrevolutionary generation forced the Cuban government to adopt a program of economic flexibility and Guevarist moral incentives, opening limited spaces for private entrepreneurs and developing ties with European social democracies. In much of the rest of Latin America, the economic crises at the end of the twentieth century and beginning of the twenty-first changed the profile of the Marxist left's social bases, displacing much of the rural poor, impoverishing the urban working class, and weakening the middle class. At the same time, the transnational movement of people, information, capital, and commodities—and the negotiation of bilateral and multilateral trade agreements—spurred a new transnational focus in the Marxist left.

On 1 January 1994, the same day the so-called North American Free Trade Agreement went into effect, the Ejército Zapatista de Liberación (EZLN) captured four municipalities in the southern Mexican state of Chiapas—and captured, too, the world's imagination through its creative use of political theater, mass media, and the Internet. Founded some eleven years earlier, the EZLN's founders had adopted the classic Maoist strategy of “prolonged people's war,” forming ties with communities in the Chiapas highlands and learning the local Tzotzil language. Unlike Peru's Sendero Luminoso, however, which shared the EZLN's focus on an indigenous social base and initial Maoist strategy, the EZLN abandoned Marxist schemes of revolutionary organization, adopting a democratic decision-making process and turning leadership over to indigenous communities. Like many other Latin American popular movements in the 1980s and 1990s, the EZLN foreswore armed seizure of power in favor of “armed negotiation,” seeking a democratic opening in Mexico's political system and legal protections for its indigenous communities. In this regard it was perhaps inspired by recent Latin American guerrilla movements, which during the 1990s were able to negotiate democratic openings in their respective countries.

The EZLN shared with other contemporary Marxist-influenced popular movements and Marxist thought an outspoken opposition to the neoliberal hegemony in Latin America and around the world. These movements continued to draw from other popular traditions of community and protest as well as recent analyses of imperialism and modernity. Despite the near-disappearance of Latin American communist parties by the start of the twenty-first century, Marxist critiques of poverty, inequality, and foreign domination—and Marxist-inspired social movements—remained powerful influences in Latin American scholarly debates and political struggles.

MASKS. The Western term for an object that transforms a face, *mask*, derives from the Arabic word *maskhara*, “to transform into an animal or monster.” This term was derived from the term *msk*, used in the middle Egyptian period to denote “second skin.” In Arabic, it became *msr*, which meant “to Egyptianize,” referring to the ubiquitous practice among Egyptians of masquerading, as the Arabs noted (Nunley and McCarty, p. 15). Masks, however, were an integral component in the development of human culture and social evolution long before the term *mask* ever existed. A lion-headed human figure

carved from mammoth ivory found in France has been dated to at least 30,000 B.C.E., from the later Aurignacian (Upper Paleolithic) period. Moreover, masked images of humans have been found on Mimbres pottery (ninth to thirteenth centuries) in the American Southwest and in painted images on rock surfaces in Australia, Africa, and Siberia.

Origins

Given that masks and the performance complex of masking, known as the masquerade, are found in practically all cultures at one time or another, there must be some fundamental reasons for the emergence of such a cultural practice. The development of shamanism seems to go hand in hand with masking and masquerading. As humans began to observe nature empirically, including their own behavior, parts of the puzzle explaining reality appeared to be missing. Explanations for disease, drought, floods, lightning strikes, and aberrant human behavior were sought in the invisible world where the actions and forces of spirits, like subatomic particles, figured prominently in the phenomena of the visible world.

The development of the abstract concept of spirit may have many sources. One plausible hypothesis suggests that, as humans began to recognize themselves and other animals in temporary reflections, they concluded that such appearing and disappearing images were the counterparts of beings existing in an invisible world and that everything in the visible world had a spiritual counterpart in the invisible world. A bison, for example, had a spirit force that remained active in the invisible world after the animal was hunted down and killed. These early peoples believed that the bison's spirit had returned to this world and been reborn in the flesh. An incipient shamanic cosmology eventually mapped the perceived universe with the salient domains being the sky, earth, and water. Food, weather, fertility, and life itself depended on these realms.

Humans associated particular animals with the realms each inhabited. An eagle was associated with the sky and sun, a jaguar with the earth and darkness, and a salmon with water and life. They also observed transformations along the path of the sun, which produced day and then night as that star passed to the invisible world. The motion of the sun also produced the seasons and, by extension, the "seasons" of humans. Birth was equated with spring, maturity with summer, old age with fall, and death with winter. These transformations were believed to be controlled by invisible forces.

How did humans connect masking and the masquerade to these unseen forces? The answer is partly found in the development of human cognition during ancient times, which found a way of accounting for real-world events that continues in some traditional societies. As hunters and gatherers, humans were an integral part of the "natural environment." They carefully observed the behavior of all animals. People as well as groups of people, such as clans, assumed the attributes of these animals (totemism). Some people moved like deer, looked stocky like bears, or were mean-spirited like swans. Some were bullish (as described by Sean StandingBear, Osage oral historian and artist). Other people, however, shared the traits of many creatures and were thought to be

African costume designed by Wallace Alexander for CARIBANA Festival, Toronto, Ontario, 1986. Masks are an integral part of dress for festivals and special occasions around the world. Masquerades serve many functions, such as marking seasonal changes, celebrating rites of passage, and paying homage to ancestral ties. COURTESY OF JOHN NUNLEY

capable of shape-shifting. As people allied themselves with certain animals, their totems, they had the right to wear masks and perform as those animals. By wearing the mask of a jaguar, for example, a clan could enter the invisible underworld and communicate with the jaguar's forces in order to prepare for war. Another person might perform in a whale mask and enter the invisible world in the depths of the ocean to ask the whales to give up some of their own in order for humans to have a safe and successful whale hunt. The tensions humans felt between the invisible and visible domains could be resolved for a while in the masquerade performance and its associated rituals.

By creating different constellations of masking, communities created their own social identity. When a person or group commits to a masking identity, one is transformed; "I am not myself," as the African art historian Herbert Cole (1995) has phrased it. When everyone involved in the masquerade adopts this belief we, as humans, have reinvented who we were and are. Thus, reinvention through the masquerade became a principle vehicle for creating culture and social identity.

While other animals often seem unaware of their reflected image, for example, when they drink from a lake or pond, humans have long observed their image, particularly the face in reflective surfaces, including water and shiny hard surfaces. By manipulating their image with paint, feathers, body scarification, and tattoos, people consciously reinvent who they are in order to strengthen social bonding and group identity, both crucial to survival. Interestingly, human facial expressions, controlled by the competing voluntary and involuntary parts of the brain, also affect social bonding. The involuntary part of the brain lies in the older “primitive” portion, where it competes with the voluntary portion. This tug-of-war is often visible in the way human facial expressions suddenly change. For example, when hearing that someone secretly hated has fallen on hard times, one’s voluntary facial expression—the aspect that can be controlled—may communicate, “That’s too bad. I’m so sorry.” But, toward the end of that expression, the involuntary part of the brain takes over and an incipient smile becomes apparent.

Lying is simply a manipulation of facial expressions, voice modulation, and body language to ensure social bonding in both the long and short terms. Similarly, the use of a mask freezes the facial expression and eliminates this kind of ambivalence. Thus, a person wearing a mask while circumcising a young boy is protected by the steady gaze of the mask, which hides his true expression at an emotionally volatile time. The masks worn by executioners perform the same function.

Gender also adds to the understanding of the origins of masks and masquerades. In ancient times, men invented masks as decoys to take advantage of an animal and to become the animal in order to communicate with its spirit for cooperation in the hunt. Moreover, the entire masquerade complex includes men making masks, dancing as the masqueraders, sacrificing blood to the masks, and the symbolically violent act of drumming, which is for a man to strike with his hand or club the skin of an animal stretched over a wood cylinder. These active behaviors, so prevalent in traditional societies and in some contemporary ones, are regarded as men’s work. Women, on the other hand, are expected to perform long-term nurturing tasks, patiently and less obviously, compared to men’s actions.

The Functions of Masking

Masquerades have many functions, yet they appear to cluster into particular categories. There are masks associated with rites of passage such as adolescents’ initiations, other age-related ceremonies, and death. Masking in seasonal festivals and renewal rituals is associated with the earth’s fertility and the path of the sun as it appears to us from Earth. In other masquerades, men play women, generally as the maiden, mother, and crone. Masks also evolved into theater as, for example, in ancient Greece or the Noh drama of Japan. In some sports and in hazardous occupations, masks are worn to protective the face.

As people change physically, especially at adolescence, old age, and death, masking rituals are performed to mark the transition and make it safe. Adolescent energy, for example, can be dangerous and destabilizing to society. To insure a safe transition, groups of young boys, for example, may be gathered

and kept away from their village for long periods of time while they are taught the ways of masculine adulthood. Masquerades are performed in order to teach the adolescents and to communicate to the village that the transition has been blessed by the appropriate spirits in the invisible world and is a success. Frequently, masks that accompany the dead in burial are placed over the face or head, thus assuring their safe journey or passage through the underworld and to a place where their spirits can assist, not hinder, their people in the visible world.

Other masquerades celebrate the changes of the seasons, which are associated with renewal and fertility. The Corpus Christi masking festivals of Ecuador celebrate the fertility of Christ’s body and its positive impact on the fertility of crops and the harvest. Musical bands play as the processions of masqueraders move through the streets of Pujilí. The many plastic dolls on the mask superstructures serve as metaphors for fertility. The mirrors reflect the powerful light of the sun, which makes all life possible. Urban festivals, such as Carnival and its pre-Lenten celebrations, were all at one time associated with fertility.

In Bulgaria, masquerades are intimately associated with agriculture and human fertility, while in Basel, Switzerland, and Trinidad and Tobago there is far less emphasis on fecundity and more interest in the renewal of social and individual identities. These festivals often address local political, health, and economic issues, as well as global themes concerning war and other events reported in the popular media.

Within most masquerade festivals, only men play the roles of women, which fall into three categories: the maiden, mother, and crone. In general, men play women’s roles, first because men monopolize the masking process, and second, in order to communicate to both sexes the kinds of behavior they believe are appropriate for women. Maringuila maidens in the masquerades in Michoacán, Mexico, represent idealized beauty and how young women should conduct themselves in public.

Among the Yoruba Gelede of West Africa and in some Latin American countries, men dress as mothers and convey, through the round forms of their costumes and masks, women’s promise of fertility and ability to bring stability to society. The two-faced Gelede mask reminds participants that each person has an inner and outer self, and that it is the inner face that keeps the outer appearing cool and collected during stressful times (Nunley, 1996, p. 1782).

Men have always feared old women, most likely because the latter cannot give birth and are no longer sexually desirable. Old women might, from the men’s point of view, pose a threat to society, as they are often accused of witchcraft. Thus males play the crone to neutralize the potential destructive force they fear.

Masks are also associated with physical and spiritual dangers, in other words offense and defense. Shamans in full ritual dress, including masks, enter the invisible world on behalf of clients or even an entire community to eliminate dangers posed by disease, weather, particular people, or enemy communities. A Siberian shaman once wore such ritual dress while dancing to the rhythm

of a drum and the rattling sound of his medicines and metal objects attached to his garment. While spinning and mimicking the flight of birds, he once traveled in the invisible world and dealt effectively with both good and bad spiritual forces, thus protecting his clients. Likewise, an Oku sorcerer's ritual dress, complete with a hooded bird mask, fulfilled the same function.

In industrial societies space suits and helmets (masks) are used to protect astronauts on their flights into space. Like the shaman, who could look back on the visible world from his spiritual space, the astronauts looked back from the moon and showed the world from a new perspective. Looking back at the world from the moon, people learned how small and interconnected the world is and, as well, its vulnerability. The environmental movement was inspired by this realization.

Masks are also used in theater and in films. Greek theater masks, which evolved from the old Dionysian cults, were concerned with death, rebirth, and fecundity. They were worn by actors who played specific roles in the tragedies. In Asia, masks are frequently found in live theater in the great epics about Hindu deities, Japanese Noh theater, Chinese New Year pageants, and in Balinese street theater celebrating the exploits of the forceful crone known as Rangda. In Western films such as *Star Wars* or the popular television series *Star Trek*, masks cover the faces of beings from other galaxies as well as cyborgs, characters that are both biological and mechanical.

Masks and masquerades are inextricably linked to the development of culture and human identity. In the ludic performances of masks, social bonding occurs and roles are defined on many levels, including gender. Masks play to the spirits of the invisible world; they are the "x" commodity in the equations of the many worldviews invented by humans. Masks have existed from ancient times to space explorations. While masquerades were and are integral components of traditional societies, they have found new meanings and purposes in film, sports, and modern warfare. I am a soldier, I am a hockey goalie, I am Darth Vader, I am the spirit of the bison: in other words, "I am not myself," a conceptual tool that has led to individual and social reinvention, the essence of being human.

MATERIALISM IN EIGHTEENTH-CENTURY EUROPEAN THOUGHT. *Materialism* is the generic name of a variety of doctrines that deny the existence of non-material substances. Materialism may be either a metaphysical or a methodological concept. In its most coherent and radical form, it is a type of *monism*, the metaphysical position stating that there is only one principle—matter and its properties—in terms of which all reality is to be explained.

In the eighteenth century, materialism developed into a philosophy and gained a following that continues into the present day. Some eighteenth-century materialist philosophers were downright atheists. A few philosophers, such as the Stoics or Thomas Hobbes, while not atheists, held that God is corporeal. Others preferred some form of *deism*, the idea that a transcendent, noninterventionist God rules the world through constitutive laws of nature. For them, materialism was a methodology to follow when inquiring about the natural world, rather than a complete metaphysical commitment.

Materialism should not simply be identified with the Enlightenment, the eighteenth-century cultural movement that endorsed an understanding of the natural world, including humankind, based exclusively on reason, with no possibility of appeal to the supernatural. The Enlightenment included a secular interpretation of ethics and politics. While materialistic trends were an important part of the Enlightenment, its scope and philosophical commitments were far broader and more varied, involving an agenda that was political as well as philosophical including, in the case of several important thinkers, a straightforward belief in a God who acts in the world.

Seventeenth-Century Background

Eighteenth-century materialism in a sense is an extension of the seventeenth-century mechanical philosophy that was the hallmark of the scientific revolution. The mechanical philosophy offered a worldview in which matter and the natural laws of motions were supposed to explain all phenomena. In the seventeenth century, only Thomas Hobbes (1588–1679), in *Leviathan* (1651) and other works, and (in a much more problematic way) Baruch Spinoza (1632–1677) went so far as to argue that the mechanical philosophy could explain all the aspects of mental life. Later in the century, such monistic views, as well as trends that were inherent in the philosophy of René Descartes (1596–1650), such as the reduction of nonhuman forms of life to automata, developed the form of materialism that was characteristic of the eighteenth century.

Despite the coherence of Hobbes's materialism, the authors who were most fundamental to the passage from seventeenth-century mechanical philosophy to eighteenth-century materialism were Isaac Newton (1642–1727) and John Locke

(1632–1704). Isaac Newton was a multifaceted, iconoclastic figure. He can hardly be called a materialist in any metaphysical sense. However, the impressive results he achieved in physics gave an impulse to methodological materialism in science and well beyond. John Locke's *Essay concerning Human Understanding* (1690; 4th edition published in 1700) developed a sensationalist psychology, based on the idea that sense perception and mental mechanisms of reason, usually in the form of calculation and association, explain all mental life without the need to postulate any nonmaterial substance. Locke famously debated whether material things (such as rocks) could think. He concluded that God could have created thinking matter and was opposed by Bishop Edward Stillingfleet (1635–1699). Locke's position was later then taken up by Anthony Collins (1676–1729) against Samuel Clarke (1675–1729). A follower of Newton, Clarke is well known because of his controversy with Gottfried Wilhelm von Leibniz (1646–1716).

Another relevant source of ideas came from the French-based seventeenth-century movement of the libertines, or freethinkers (not meant as a compliment), who opposed religious oppression, and who, often in anonymous publications, defended the free use of reason against the suffocating Catholic Counter-Reformation. Libertines challenged religious authority in morals and politics, using ideas inspired mainly by the materialism of the ancient atomistic, Epicurean, and skeptical traditions. To this movement belong authors as different as Pierre Gassendi (1592–1655) and Cyrano de Bergerac (1619–1655). The anonymous *Theophrastus redivivus*, published around 1660, espoused the most radical theses of libertinism, such as atheism, materialism, and a form of ethical Epicurean hedonism.

The Eighteenth Century

The eighteenth century was an age of prodigious scientific learning. While the seventeenth century's philosophical milieu was influenced mainly by physics (mechanics and cosmology), the eighteenth century became especially fascinated with chemistry, or the constitution of matter, and by the phenomenon of life and its forms of organization. In this sense, materialist philosophers and scientists were strongly motivated to explain the complexities and diversities of life without reference to divine intervention.

The diversity of life had been unprecedentedly systematized by Carolus Linnaeus (1707–1778), whose *Systema naturae* (System of nature) was published in 1735; however, biological diversity was well known long before the eighteenth century, and the discoveries explorers made around the world drew the attention of many scientists. The ideas of evolution and adaptation had begun to gain momentum, championed in different forms by Buffon and by Diderot. Between the end of the eighteenth century and the beginning of the nineteenth, evolution of species was a concept that, though rejected by most, was part of the scientific debate with the works of Jean-Baptiste Lamarck (1744–1829) and Erasmus Darwin (1731–1802). They both struggled with an account of life and diversity based on adaptation to a changing environment and competition for resources.

Another major scientific figure was Antoine-Laurent Lavoisier (1743–1794). Known as the scientist who began the chemical

revolution by changing the concept of *chemical element* and discovering *oxygen*, which term he coined, Lavoisier developed a new physicochemical nomenclature that stressed the quantitative aspects of combining chemical elements. While Lavoisier was not particularly philosophical, his revisions of the structure of chemical knowledge, and thus of matter theory, brought about a change in the understanding of matter and the mechanisms by which it worked. In this sense, Lavoisier was like many other scientists in the eighteenth century: while maybe not metaphysical materialists themselves, they helped develop a scientific methodological materialism that could support a metaphysical alternative to religion and traditional dualism. Lavoisier, who was a tax collector for the royal government, was guillotined in 1794 during the French Revolution.

French Materialism

François Marie Arouet, better known as Voltaire (1694–1778), endorsed Locke's sensationalism and argued against Spinoza and Nicolas Malebranche (1638–1715) in his *Dictionnaire philosophique* (1764; Philosophical dictionary) and *Lettres anglaises ou philosophiques* (1734; English or philosophical letters). He also became very popular as an apologist for Newton, with his *Éléments de la philosophie de Newton* (1738; Elements of Newton's philosophy). Voltaire opposed institutionalized religion and intolerance based on superstition, and, although not an atheist, he supported the rationalistic deism. His famous *Candide* (1759) is a witty and ironic, though simplistic, lampoon of Leibniz's metaphysics of the best of all possible worlds.

His mistress and patron of the great French salon, Madame Émilie du Châtelet, who, with his aid, translated Newton's *Principia mathematica* into French, was also a prominent supporter of Newtonianism and did much to publicize these new scientific views. They were both forced to flee Paris in 1747. Once in Berlin, Voltaire entered a dispute with his old friend and protégé Pierre-Louis Moreau de Maupertuis (1698–1759), the president of the Berlin Academy and author of *Venus physique* (1745; The physical Venus) and *Système de la nature* (1751; System of nature).

Paul-Henri-Dietrich d'Holbach's (1723–1789) most famous book, *Système de la nature, ou des loix du monde physique et du monde moral* (1770; The system of nature, or the laws of the physical and moral world), was published under the name of J. B. Mirabaud. Following the tenets of Epicurean atomism, the book derided religion and espoused an atheistic, deterministic materialism: all causation was reduced to patterns of motion, man became a machine devoid of free will, and religion was excoriated as not just untrue, but dangerous. *Système social* (1773; Social system) placed morality and politics in a utilitarian framework: duty was reduced to prudent self-interest. D'Holbach used his inherited fortune to support Diderot's *Encyclopédie* project, writing many articles for these volumes himself and translating from German.

George Louis Leclerc, comte de Buffon (1707–1788) was appointed to the French Academy of Science in 1734; in 1739 he became superintendent of the Royal Botanical Garden (Jardin du Roi; present-day Jardin des Plantes). Buffon was given the task of completing a catalog of the royal collections in natural

history, which he transformed into a project to produce an account of the whole of nature. This became his great work, *Histoire naturelle, générale et particulière* (1749–1804; General and particular natural history), which was the first modern attempt to systematically present all existing knowledge in the fields of natural history, geology, and anthropology in a single publication. Buffon criticized the Swedish naturalist Linnaeus for the artificiality of his taxonomy of plants and animals. Buffon opposed metaphysics in science, denied divine intervention in nature, and was Newtonian in believing that knowledge should be derived from observations of natural phenomena. He held that what separated humans from animals was reason alone, through their use of language. He was the first to reconstruct a geological history, including a discussion of nature and a theory of the age of the earth, in a series of stages in *Histoire et théorie de la terre* (1749; History and theory of the Earth), and in *Époques de la nature* (1778; Epochs of nature), he proposed the theory that the planets had been created in a collision between the sun and a comet. His theory of the age of the Earth incensed religious opponents. Buffon divided matter into vital and nonvital, balancing an overall Newtonian physical framework with vitalistic tendencies (though rejecting nonmaterial substances). So, he opposed the idea that life was a form of organization of matter. On the other hand, life being a property of matter (of "organic molecules"), it does not require any explanatory principle external to matter. Buffon believed in spontaneous generation as resulting from aggregation of organic molecules present in the environment; his theory was criticized by Lazzaro Spallanzani (1729–1799), whose experiments confirmed Francesco Redi's (1626–1697) rejection of spontaneous generation.

The outcry following publication of Julien Offroy de La Mettrie's (1709–1751) materialistic views in *Histoire naturelle de l'âme* (1745; Natural history of the soul) forced his departure from Paris. In Holland, in 1747, he published *L'homme machine* (The man-machine), which was publicly burned, even in that notoriously liberal environment. La Mettrie then fled to Berlin to ask for the protection of Frederick II of Prussia (r. 1740–1786). La Mettrie, in opposition to Descartes, held that matter was not only extended, but also endowed with an inherent principle of motion and that it could have sensations. Humans were infinitely more complex than lower machines, yet they were still machines. La Mettrie suggested that atheism and an ethics of hedonism were the only proper paths toward human happiness.

Claude Adrien Helvétius (1715–1771) in his *De l'esprit* (1758; On the spirit) explains all of human reason as being based on sensation (like Locke and Condillac). Like La Mettrie, Helvétius placed humans on a continuum with animals. Helvétius also adumbrated a somewhat Epicurean ethical system based on self-interest, pleasure, and pain. His book provoked an outraged reaction both in the court and in the schools; both the Sorbonne and the Parlement of Paris condemned it. Despite Helvétius's public recantation, it was burned publicly (along with the works of other philosophes like Voltaire). Helvétius, like La Mettrie, was welcomed at the Prussian court in Berlin.

Étienne Bonnot de Condillac (1715–1780) maintained an empirical sensationalism based on the principle that

observations made by sense perception are the foundation for all human knowledge. The ideas of his *L'essai sur l'origine des connaissances humaines* (1746; Essay on the origins of human knowledge) are close to Locke's, though on certain points, as in rejecting what he took to be Locke's innate ideas of reflection, Condillac modified Locke's position. In his most significant work, the *Traité des sensations* (1754; Treatise on sensations), Condillac denied, for example, that the human mind makes inferences about the shapes, sizes, positions, and distances of objects. Examining each sense separately and the knowledge thereby obtained, he concluded that all human knowledge is sensation transformed by language. Modeled on algebra, language was the underlying principle used to form all higher cognition. In this work he famously analogized man to a statue who gains complex reasoning from its underlying sensations. The importance of language to thought and rational progress is one of the major themes of the Enlightenment. Despite Condillac's materialistic psychology, he believed his views about the nature of religion, especially the reality of the soul, to be consistent with his sensationalism. Condillac's own brand of sensationalism had many followers in Italy. In particular, the jurists Giandomenico Romagnosi (1761–1835), Cesare Beccaria (1738–1794), and Melchiorre Gioia (1767–1829) used his epistemology as a basis for a rationalistic study of jurisprudence and political and social theory.

In 1745 the publisher André Le Breton (1708–1779) approached Denis Diderot (1713–1784) with a proposal to produce a French translation of Ephraim Chambers's *Cyclopaedia*, (first edition, 1728). Together with the mathematician and philosopher Jean Le Rond d'Alembert, Diderot transformed the project into the great *Encyclopédie*. By adhering to strictly rationalistic and materialistic principles, Diderot and d'Alembert saw themselves as forging a weapon against the hold of religion on science and human knowledge. In 1749, Diderot published the *Lettre sur les aveugles à la usage de ceux qui voient* (An essay on the blind for those who can see), remarkable for introducing the first sketch of Diderot's "evolutionary theory" of survival by adaptation. The existence of diversity and monstrosities in nature is explained by a theory of evolution from chaos; the apparent order and adaptation is explained with a probabilistic argument, since nature has time for innumerable trials that lead to growth, increased complexity, and specialization. Only the organisms that became adapted to their environment could survive. Diderot held that our sensory organs, not ideas about essences, should determine our metaphysics. This open endorsement of radical materialism was condemned and, in 1749, led to Diderot's being incarcerated for three months.

Another ugly moment for Diderot came when Helvétius's *De l'esprit*, was condemned to be burned by the Parlement of Paris in 1758, and the *Encyclopédie* itself was formally suppressed. Diderot published the remaining volumes semiclandestinely. Among his philosophical works, special mention may be made of *L'entretien entre d'Alembert et Diderot* (written 1769, published 1830; Conversation between d'Alembert and Diderot), *Le rêve de d'Alembert* (written 1769, published 1830; D'Alembert's dream), and the *Éléments de physiologie* (1774–1780; Elements of physiology). In these works Diderot developed his materialist philosophy and concluded that

simple, reductive mechanical explanations are not sufficient to explain sentient life, without assuming that all matter is potentially sentient and that life and sentience are specialized functions that arise from a higher level of complexity. In *Jacques le fataliste* (1771; Jacques, the fatalist) Diderot gave a common sense solution of the problem of free will: while there are no rational arguments to support free will, he argued that extreme determinism is ultimately self-defeating.

Jean Le Rond d'Alembert (1717–1783) attended a prestigious Jansenist school where he developed a lifelong distaste for religion. After studying law for two years and medicine for one, he finally discovered his passion for mathematics, which he mainly taught himself. In 1739 he read his first paper to the French Academy of Sciences, of which he became a member in 1741. In 1743 he published his *Traité de dynamique* (A treatise on dynamics), containing the famous "d'Alembert's principle," stating that Newton's third law of motion (for every action there is an equal and opposite reaction) is true for both freely moving and fixed bodies. Other mathematical works followed; in particular the development of partial differential equations. In 1745, d'Alembert joined Diderot in the *Encyclopédie* project as editor of the mathematical and scientific sections. In fact, his contribution went much further, including the *Discours préliminaire* (Preliminary discourse) that introduced the first volume in 1751. The introduction endorsed a view of science as a unified and rational enterprise.

Besides the authors mentioned above, it is useful to recall that there was a clandestine literature that offered materialistic responses to Descartes and that most likely contributed to the philosophical educations of the authors listed. Of particular interest, a collection of manuscripts at the Douai library (ms. 702), on which appears the date 1723, and contains, among others, a *Dissertation sur le sentiment des bêtes, l'instinct et la raison, contre les Cartésiens* (Essay on the feelings of animals, instincts and reasons, against Cartesians); *L'essai philosophique sur l'âme des bêtes* (Amsterdam, 1732; Philosophical essay on the soul of animals); and *Principes physiques de la raison et des passions des hommes* (1709; Physical principles of reason and passions of men) by a Dr. Maubec. Most of this literature, while it circulated widely in its day, is still available only in manuscript.

A late-eighteenth-century figure, Pierre-Jean-Georges Cabanis (1757–1808), was a French philosopher, physician, and physiologist who published *Rapports du physique et du moral de l'homme* (1802; Relations of the physical and moral of man). Cabanis, opposing Condillac's sensationalism, explained all of reality, including the mind-body relations in man, in terms of a mechanistic materialism built on the organic needs of an organism and its automatic responses (the irritable properties of tissues). For Cabanis, life was merely an organization of physical forces; "secretions" in the brain, analogous to the liver's secretion of bile, produced thoughts. The concept of *soul* was superfluous, since consciousness was merely an effect of mechanistic processes, and sensibility, the source of intelligence, was a property of the nervous system. Cabanis is best known, however, as a medical reformer who brought new ways of health care and medical education to France.

English Materialism

John Toland (1670–1722) was born Catholic, though he converted to Protestantism and later endorsed Socinianism, which, like Unitarianism, denied the doctrine of the Trinity. He wrote several texts in which he supported a naturalized and historical interpretation of the holy texts and of miracles. In *Christianity not Mysterious* (1696) he claimed that reason is sufficient to explain all religious “mysteries.” In *Letters to Serena* (1704) and *Pantheisticon* (1720), he endorsed a form of pantheism in which God-soul is identical with the material universe. He defended Giordano Bruno (1548–1600), whose pantheistic and materialistic philosophy obviously influenced him. Pantheism was the doctrine that God was everywhere and was all things.

Anthony Collins (1676–1729) was a provocative author who argued, in his *Discourse of Free-thinking* (1713, published anonymously), that free and rational inquiry is the best defense for religion against atheism. In *Inquiry concerning Human Liberty and Necessity* (1715) and *Liberty and Necessity* (1729), he denied free will and defended determinism on the grounds of the necessity of a cause-and-effect relationship between events. He wrote *A Letter to Mr. Dodwell* (1707), to which Samuel Clarke, Newton’s disciple, responded. This led to a two-year correspondence (1706–1708) in which Toland defended the idea that all life and consciousness arises from emergent properties of systems of material particles.

David Hartley (1705–1757) saw himself as carrying out Newton’s scientific project for the human being and offered a physiological explanation for the association of ideas in materialistic terms in his *Observations on Man: His Frame, His Duty, and His Expectations* (1749). Hartley used Newton’s theory of vibrating corpuscular matter and forces of attraction and repulsion as a metaphysical basis for Locke’s associationist psychology. He explained mental life in terms of associations and inhibitions, which themselves were to be explained by attraction and repulsion in the nervous system and the brain. Hartley, however, was a deeply religious thinker who believed that “theopathy,” the love of God, was a natural emotion, and whose depiction of salvation bordered on mysticism.

Joseph Priestley (1733–1804) was a freethinker who formally rejected Calvinism to enter the Unitarian denomination. Priestley is known mainly for his work in physics and chemistry. He consistently pursued science as a rational enterprise based on facts and experimentation, rather than on dogmatic principles. His view of nature was informed by his belief in a benevolent God who operates through laws of nature that become accessible through careful observation. While this belief in God somehow influenced Priestley’s heuristics, his work in chemistry and physics and his political and economic theories were informed by a methodological materialism in which only matter and natural laws were relevant. Between 1772 and 1790, he published six volumes of *Experiments and Observations on Different Kinds of Air* and several papers in the *Philosophical Transactions of the Royal Society*, of which he was a member. He is well known for his contributions to the chemistry of gases, and for his development of a theory of phlogisticated air (which was opposed to Lavoisier’s, who repeated Priestley’s experiments, and rejected the phlogiston theory in favor of his new oxygen theory).

Conclusion

While it is difficult to find philosophically important individual (materialist) thinkers in other European countries, the materialistic current of the Enlightenment and its belief in the virtues of science swept through Europe, influencing, more or less directly, the political life in every country, with the endorsement of various forms of scientific progress and “enlightened” government. The application of science and the scientific method, mostly based on methodological materialist doctrines, became the hallmark of progress (itself an early-eighteenth-century notion). These beliefs brought important changes in urban development, public health, and industry throughout Europe.

The influence of European political and social thought, especially concerning tolerance and education, was also felt by American writers and had a fundamental role in the American Revolution and the writing of the U.S. Constitution. However, no movement endorsing materialism, methodological or metaphysical, can be traced.

MATHEMATICS. This article comprises a compact survey of the development of mathematics from ancient times until the early twentieth century. The treatment is broadly chronological, and most of it is concerned with Europe.

Unknown Origins

It seems unavoidable that mathematical thinking played a role in human theorizing from the start of the race, and in various ways. Arithmetic (as the later branch of mathematics became known) would have been one of them, motivated initially by forming integers in connection with counting. But other branches surely include geometry, linked to the appreciation of line, surface, and space; trigonometry, inspired by awareness of angles; mechanics, related to the motion of bodies large and small and the (in)stability of structures; part-whole theory, from consideration of collections of things; and probability, coming from judging and guessing about situations. In all cases the thinking would have started out as very intuitive, gradually becoming more explicit and less particular.

Some of the associated contexts would have been provided by study of the environment (such as days) and the heavens (such as new and full moons), which was a major concern of ancient cultures in all parts of the world; in those times mathematics and astronomy were linked closely. For example, the oldest recognized artifact is a bone from Africa, thought to be about thirty-seven thousand years old, upon which phases of the moon seem to have been recorded.

Among the various ancient cultures, the Babylonians have left the earliest extant evidence of their mathematical practice. They counted with tokens from the eighth millennium; and from the late fourth millennium they expressed numbers and properties of arithmetic in a numeral system to base 10 and handled fractions in expansions of powers of $1/60$. Many surviving artifacts seem to relate to education—for example, exercises requiring calculations of unknown quantities, which correspond to the solution of equations but are not to be so identified. They also developed geometry, largely for terrestrial purposes. The Egyptians pursued similar studies, even also finding a formula (not the same one) for the volume of the rectangular base of a pyramid of given sides. They also took up the interesting mathematical problem of representing a fraction as the sum of reciprocals.

A major mathematical question for these cultures concerned the relationship between circles and spheres and rectilinear objects such as lines and cubes. They involve the quantity that we symbolize by π , and ancient evidence survives of methods of approximating to its value. But it is not clear that these cultures knew that the same quantity occurs in all the relationships.

On Greek Mathematics

The refinement of mathematics was effected especially by the ancient Greeks, who flourished for about a millennium from the sixth century B.C.E. Pythagoras and his clan are credited with many things, starting with their later compatriots: the eternity of integers; the connection between ratios of integers and musical intervals; the theorem relating the sides of a right-angled triangle; and so on. Their contemporary Thales (c. 625–c. 547 B.C.E.) is said to have launched trigonometry with his appreciation of the angle. However, nothing survives directly from either man.

A much luckier figure concerning survival is Euclid (fl. c. 300 B.C.E.), especially with his *Elements*. While no explanatory preface survives, it appears that most of the mathematics presented was his rendition of predecessors' work, but that (some of) the systematic organization that won him so many later admirers might be his. He stated explicitly the axioms and assumptions that he noticed; one of them, the parallel axiom, lacked the intuitive clarity of the others, and so was to receive much attention in later cultures.

The *Elements* comprised thirteen Books: Books 7–9 dealt with arithmetic, and the others presented basic plane (Books 1–6) and solid (Books 11–13) geometry of rectilinear and circular figures. The extraordinary Book 10 explored properties of ratios of smaller to longer lines, akin to a theory of irrational numbers but again not to be so identified. A notable feature is that Euclid confined the role of arithmetic within geometry to multiples of lines (say, “twice this line is . . .”), to a role in stating ratios, and to using reciprocals (such as $1/5$); he was not concerned with lengths—that is, lines measured arithmetically. Thus, he said nothing about the value of π , for it relates to measurement.

The Greeks were aware of the limitations of straight line and circle. In particular, they found many properties and applications of the “conic sections”: parabola, hyperbola, and ellipse. Hippocrates of Chios (fl. c. 600 B.C.E.) is credited with three “classical problems” (a later name) that his compatriots (rightly) suspected could not be solved by ruler and compass alone: (1) construct a square equal in area to a given circle; (2) divide any angle into three equal parts; and (3) construct a cube twice the volume of a given one. The solutions that they did find enlarged their repertoire of curves.

Among later Greeks, Archimedes (c. 287–212 B.C.E.) stands out for the range and depth of his work. His work on circular and spherical geometry shows that he knew all four roles for π ; but he also wrote extensively on mechanics, including floating bodies (the “eureka!” tale) and balancing the lever, and focusing parabolic mirrors. Other figures developed astronomy, partly as applied trigonometry, both planar and spherical; in particular, Ptolemy (late second century) “compiled” much knowledge in his *Almagest*, dealing with both the orbits and the distances of the heavenly bodies from the central and stationary Earth.

Traditions Elsewhere

Mathematics developed well from antiquity also in the Far East, with distinct traditions in India, China, Japan, Korea, and Vietnam. Arithmetic, geometry, and mechanics were again

prominent; special features include a powerful Chinese method equivalent to solving a system of linear equations, a pretty theory of touching circles in Japanese “temple geometry,” and pioneering work on number theory by the Indians. They also introduced the place-value system of numerals to base 10, of which we use a descendant that developed after several changes in adopted symbols.

This system of numerals was mediated into Europe by mathematicians working in medieval Islamic civilization, often though not always writing in Arabic. They became the dominant culture in mathematics from the ninth century and continued strongly until the fourteenth. They assimilated much Greek mathematics; indeed, they are our only source for some of it.

The first major author was al-Khwarizmi (fl. c. 800–847), who laid the foundations of algebra, especially the solution of equations. He and his followers launched the theory using words rather than special symbols to mark unknowns and operations. Other interests in geometry included attempts to prove Euclid’s parallel axiom and applications to optics and trigonometry; an important case of the latter was determining the *qibla* (that is, the direction of Mecca) for any time and place at times of Muslim prayer. Their massive contributions to astronomy included theory and manufacture of astrolabes.

The Wakening Europe from the Twelfth Century

From the decline of the Roman Empire (including Greece) Euclid was quiescent mathematically, though the Carolingian kingdom inspired some work, at least in education. The revival dates from around the late twelfth century, when universities also began to be formed. The major source for mathematics was Latin translations of Greek and Arabic writings (and re-editions of Roman writers, especially Boethius). In addition, the Italian Leonardo Fibonacci (c. 1170–c. 1240) produced a lengthy *Liber Abbaci* in 1202 that reported in Latin many parts of Arabic arithmetic and algebra (including the Indian numerals); his book was influential, though perhaps less than is commonly thought. The Italian peninsula was then the most powerful region of Europe, and much commercial and “research” mathematics was produced there; the German states and the British Isles also came to boast some eminent figures. In addition, a somewhat distinct Hebrew tradition arose—for example, in probability theory.

A competition developed between two different methods of reckoning. The tradition was to represent numbers by placing pebbles (in Latin, *calculi*) in determined positions on a flat surface (in Latin, *abacus*, with one *b*), and to add and subtract by moving the pebbles according to given rules. However, with the new numerals came a rival procedure of calculating on paper, which gradually supervened; for, as well as also allowing multiplication and division, the practitioner could show and check his working, an important facility unavailable to movers of pebbles.

Mathematics rapidly profited from the invention of printing in the late fifteenth century; not only were there printed Euclids, but also many reckoning books. Trigonometry became a major branch in the fifteenth and sixteenth centuries, not only for astronomy but also, as European imperialism developed, for

cartography, and the needs of navigation and astronomy made the spherical branch more significant than the planar. Geometry was applied also to art, with careful studies of perspective; Piero della Francesca (c. 1420–1492) and Albrecht Dürer (1471–1528) were known not only as great artists but also as significant mathematicians.

Numerical calculation benefited greatly from the development of logarithms in the early seventeenth century by John Napier (1550–1617) and others, for then multiplication and division could be reduced to addition and subtraction. Logarithms superseded a clumsier method called “prosthaphairesis” that used certain trigonometrical formulas.

In algebra the use of special symbols gradually increased, until in his *Géométrie* (1637), René Descartes (1596–1650) introduced (more or less) the notations that we still use, and also analytic geometry. His compatriot Pierre de Fermat (1601–1665) also worked in these areas and contributed some theorems and conjectures to number theory. In addition, he corresponded with Blaise Pascal (1623–1662) on games of chance, thereby promoting parts of probability theory.

In mechanics a notable school at Merton College, Oxford, had formed in the twelfth century to study various kinds of terrestrial and celestial motion. The main event in celestial mechanics was Nicolaus Copernicus’s (1473–1543) *De revolutionibus* (1453; On the revolutions), where rest was transferred from the Earth to the sun (though otherwise the dynamics of circular and epicyclical motions was not greatly altered). In the early seventeenth century the next stages lay especially with Johannes Kepler’s (1571–1630) abandonment of circular orbits for the planets and Galileo Galilei’s (1564–1642) analysis of (locally) horizontal and vertical motions of bodies.

The Epoch of Newton and Leibniz

By the mid-seventeenth century, science had become professionalized enough for some national societies to be instituted, especially the Royal Society of London and the Paris Académie des Sciences. At that time two major mathematicians emerged: Isaac Newton (1642–1727) in Cambridge and Gottfried Wilhelm von Leibniz (1646–1716) in Hanover. Each man invented a version of the differential and integral calculus, Newton first in creation but Leibniz first in print. The use here of Leibniz’s adjectives recognizes the superior development of his version. During the early 1700s Newton became so furious (or envious?) that he promoted a charge of plagiarism against Leibniz, complete with impartial committee at the Royal Society. It was a disaster for Britain: Newton’s followers stuck with their master’s theory of “fluxions” and “fluents,” while the Continentals developed “differentials” and “integrals,” with greater success. The accusation was also mathematically stupid, for conceptually the two calculi were quite different: Newton’s was based upon (abstract) time and unclearly grounded upon the notion of limit, while Leibniz’s used infinitesimal increments on variables, explicitly avoiding limits. So even if Leibniz had known of Newton’s theory (of which the committee found no impartial evidence), he rethought it entirely.

Leibniz’s initial guard was largely Swiss: brothers Jakob (1654–1705) and Johann Bernoulli (1667–1748) from the

1680s, then from the 1720s Johann's son Daniel (1700–1782) and their compatriot Leonhard Euler (1707–1783), who was to be the greatest of the lot. During the eighteenth century they and other mathematicians (especially in Paris) expanded calculus into a vast territory of ordinary and then partial differential equations and studied many related series and functions. The Newtonians kept up quite well until Colin Maclaurin (1698–1746) in the 1740s, but then faded badly.

The main motivation for this vast development came from applications, especially to mechanics. Here Newton and Leibniz differed again. In his *Principia mathematica* (1687) Newton announced the laws that came to carry his name: (1) a body stays in equilibrium or in uniform motion unless disturbed by a force; (2) the ratio of the magnitude of the force and the mass of the body determines its acceleration; and (3) to any force of action there is one of reaction, equal in measure and opposite in sense. In addition, for both celestial and terrestrial mechanics, which he novelly united, the force between two objects lies along the straight line joining them, and varies as the inverse square of its length.

With these principles Newton could cover a good range of mechanical phenomena. His prediction that the Earth was flattened at the poles, corroborated by an expedition undertaken in the 1740s, was a notable success. He also had a splendid idea about why the planets did not exactly follow the elliptical orbits around the sun that the inverse square law suggested: they were “perturbed” from them by interacting with each other. The study of perturbations became a prime topic in the eighteenth century, with Euler's work being particularly significant. Euler also showed that law 2 could be applied to any direction in a mechanical situation, thus greatly increasing its utility. He and others made important contributions to the mechanics of continuous media, especially fluid mechanics and elasticity theory, where Newton had been somewhat sketchy.

Mathematics in the Eighteenth Century: The Place of Lagrange

However, Newton's theory was not alone in mechanics. Leibniz and others developed an alternative approach, partly inspired by Descartes, in which the “living forces” (roughly, kinetic energy) of bodies were related to their positions. Gradually this became a theory of living forces converted into “work” (a later term), specified as (force \times traversed distance). Engineers became keen on it for its utility in their concerns, especially when impact between bodies was involved; from the 1780s Lazare Carnot (1753–1823) urged it as a general approach for mechanics.

Carnot thereby challenged Newton's theory, but his main target was a recent new tradition partly launched by Jean d'Alembert (1718–1783) in midcentury and developed further by Joseph-Louis Lagrange (1736–1813). Suspicious of the notion of force, d'Alembert had proposed that it be defined by Newton's law 2, which he replaced by one stating how systems of bodies moved when disturbed from equilibrium. At that time Euler and others proposed a “principle of least action,” which asserted that the action (a mechanical notion defined by an integral) of a mechanical system took its optimal

value when equilibrium was achieved. Lagrange elaborated upon these principles to create *Mécanique analytique* (1788), in which he challenged the other two traditions; in particular, dynamics was reduced mathematically to statics. For him a large advantage of his principles was that they were formulated exclusively in algebraic terms; as he proclaimed in the preface of his book, there were no diagrams, and no need for them. A main achievement was a superb though inconclusive attempt to prove that the system of planets was stable; predecessors such as Newton and Euler had left that matter to God.

Lagrange formulated mechanics this way in order to make it (more) rigorous. Similarly, he algebraized the calculus by assuming that any mathematical function could be expressed in an infinite power series (the so-called Taylor series), and that the basic notions of derivative (his word) and integral could be determined solely by algebraic manipulations. He also greatly expanded the calculus of variations, a key notion in the principle of least action.

As in mechanics, Lagrange's calculus challenged the earlier ones, Newton's and Leibniz's, and as there, reaction was cautious. A good example for both contexts was Pierre-Simon Laplace (1749–1827), a major figure from 1770. While strongly influenced by Lagrange, he did not confine himself to the constraints of Lagrange's book when writing his own four-volume *Traité de mécanique céleste* (1799–1805; Treatise on celestial mechanics). His exposition of celestial and planetary mechanics used many differential equations, series, and functions.

The French Revolution and a New Professionalization

Laplace published his large book in a new professional and economic situation for science. After the Revolution of 1789 in France, higher education and its institutions there were reformed, with a special emphasis upon engineering. In particular, a new school was created, the *École Polytechnique* (1794), with leading figures as professors (such as Lagrange) and as examiners (Laplace), and with enrollment of students determined by talent, not birth. A new class of scientists and engineers emerged, with mathematics taught, learned, researched, and published on a scale hitherto unknown.

Of this mass of work only a few main cases can be summarized here. Joseph Fourier (1768–1830) is noteworthy for his mathematical analysis of heat diffusion, both the differential equation to represent it (the first important such equation found outside mechanics) and solutions by certain infinite series and by integrals that both now bear his name. From the 1820s they attracted much attention, not only for their use in heat theory but especially for the “pure” task of establishing conditions for their truth. New techniques for rigor had just become available, mainly from Augustin-Louis Cauchy (1789–1857), graduate of the *École Polytechnique* and now professor there. He taught a fourth approach to the calculus (and also function and series), based like Newton's upon limits but now fortified by a careful theory of them; although rather un-intuitive, its mathematical merits gradually led worldwide to its preference over the other three approaches.

Ironically, Cauchy's own analysis of Fourier series failed, but a beautiful treatment following his approach came in 1829 from

J. P. G. Dirichlet (1805–1859)—a French-sounding name of a young German who had studied with the masters in Paris. Dirichlet also exemplifies a novelty of that time: other countries producing major mathematicians. Another contemporary example lies in elliptic functions, which Carl Jacobi (1804–1851) and the young Norwegian Niels Henrik Abel (1802–1829) invented independently following much pioneering work on the inverse function by A. M. Legendre (1752–1833).

Jacobi and Abel drew upon a further major contribution to mathematics made by Cauchy when, by analogy with the calculus, he developed a theory of functions of the complex variable $x + \sqrt{-1}y$ (x and y real), complete with an integral. His progress was fitful, from the 1810s to the 1840s; after that, however, his theory became recognized as a major branch of mathematics, with later steps taken especially by the Germans.

Between 1810 and 1830 the French initiated other parts of mathematical physics in addition to Fourier on heat: Siméon-Denis Poisson (1781–1840) on magnetism and electrostatics; André-Marie Ampère (1775–1836) on electrodynamics; and Augustin Jean Fresnel (1788–1827) on optics with his wave theory. Mathematics played major roles: many analogies were taken from mechanics, which itself developed massively, with Carnot's energy approach elaborated by engineers such as Gaspard-Gustave Coriolis (1792–1843), and continuum mechanics extended, especially by Cauchy.

Geometry was also taught and studied widely. Gaspard Monge (1746–1818) sought to develop “descriptive geometry” into a genuine branch of mathematics and gave it prominence in the first curriculum of the *École Polytechnique*; however, this useful theory of engineering drawing could not carry such importance, and Laplace had its teaching reduced. But former student Jean Victor Poncelet (1788–1867) was partly inspired by it to develop “the projective properties of figures” (*Traité des propriétés projectives de figures*, 1822), where he studied characteristics independent of measure, such as the order of points on a line.

The main mathematician outside France at this time was C. F. Gauss (1777–1855), director of the Göttingen University Observatory. Arguably he was the greatest of all, with major work published in number theory, celestial mechanics, and aspects of analysis and probability theory. But he was not socially active, and he left many key insights in his manuscripts (for example, on elliptic functions).

Other major contributors outside France include George Green (1793–1841), who, in *An Essay on the Application of Mathematical Analysis to the Theories of Electricity and Magnetism* (1828), produced a wonderful theorem in potential (his word) theory that related the state of affairs inside an extended body to that on its surface. But he published his book very obscurely, and it became well-known only on the reprint during the 1850s initiated by William Thomson (later Lord Kelvin), who was making notable contributions of his own to the theory.

Midcentury Internationalism

By the 1840s Britain and the Italian and German states were producing quality mathematicians to complement and even

rival the French, and new posts were available in universities and engineering colleges everywhere. Among the Germans, two figures stand out.

From around 1860 Karl Weierstrass (1815–1897) gave lecture courses on many aspects of real- and complex-variable analysis and parts of mechanics at Berlin University, attended by students from many countries who then went home and taught likewise. Meanwhile at Göttingen, Bernhard Riemann (1826–1866) rethought complex-variable analysis and revolutionized the understanding of both Fourier series and the foundations of geometry. Much of this work was published only after his early death in 1866, but it soon made a great impact. The work on Fourier series led Georg Cantor (1845–1918) to develop set theory from the 1870s. On geometry Riemann showed that the Euclidean was only one of many possible geometries, and that each of them could be defined independently of any embedding space. The possibility of non-Euclidian geometries, using alternatives to the parallel axiom, had been exhibited around 1830 in little-recognized work by Janos Bolyai (1802–1860) and Nicolai Lobachevsky (1793–1856) (and, in manuscript, Gauss); Riemann, however, went much further and brought us proper understanding of the plurality of geometries.

Weierstrass emulated and indeed enhanced Cauchy-style rigor, carefully formulating definitions and distinctions and presenting proofs in great detail. By contrast, Riemann worked intuitively, offering wonderful but often proof-free insights grounded upon some “geometric fantasy,” as Weierstrass described it. A good example is their revisions of Cauchy's complex-variable analysis: Weierstrass relied solely on power series expansions of the functions, whereas Riemann invented surfaces now named after him that were slit in many remarkable ways. Among many consequences of the latter, the German Felix Klein (1849–1925) and the Frenchman Henri Poincaré (1854–1912) in the early 1880s found beautiful properties of functions defined on these surfaces, which they related to group theory as part of the rise of abstract algebras.

Another example of the gap between Riemann and Weierstrass is provided by potential theory. Riemann used a principle employed by his mentor Dirichlet (and also envisaged by Green) to solve problems in potential theory, but in 1870 Weierstrass exposed its fallibility by a counterexample, and so methods became far more complicated.

Better news for potential theory had come at midcentury with the “energetics” physics of Thomson, Hermann von Helmholtz (1821–1894), and others. The work expression of engineering mechanics was extended into the admission of potentials, which now covered all physical factors (such as heat) and not just the mechanical ones that had split Carnot from Lagrange. The latter's algebraic tradition in mechanics had been elaborated by Jacobi and by the Irishman William Rowan Hamilton (1805–1865), who also introduced his algebra of quaternions.

Among further related developments, the Scot James Clerk Maxwell (1831–1879) set out theories of electricity and magnetism (including, for him, optics) in his *Treatise on Electricity*

and *Magnetism* (1873). Starting out from the electric and magnetic potentials as disturbances of the ether rather than Newton-like forces acting at a distance through it, he presented relationships between his basic notions as differential equations (expressed in quaternion form). A critical follower was the Englishman Oliver Heaviside, who also analyzed electrical networks by means of a remarkable but mysterious operator algebra. Other “Maxwellians” preferred to replace dependence upon fields with talk about “things,” such as electrons and ions; the relationship between ether and matter (J. J. Larmor, *Aether and Matter*, 1900) was a major issue in mathematical physics at century’s end.

The Early Twentieth Century

A new leader emerged: the German David Hilbert (1862–1943). Work on abstract algebras and the foundations of geometry led him to emphasize the importance of axiomatizing mathematical theories (including the axioms of Euclidean geometry that Euclid had not noticed) and to study their foundations metamathematically. But his mathematical knowledge was vast enough for him to propose twenty-three problems for the new century; while a personal choice, it exercised considerable influence upon the community. He presented it at the International Congress of Mathematicians, held in Paris in 1900 as the second of a series that manifested the growing sense of international collaboration in mathematics that still continues.

One of Hilbert’s problems concerned the foundations of physics, which he was to study intensively. In physics Albert Einstein (1879–1955) proposed his special theory of relativity in 1905 and a general theory ten years later; according to both, the ether was not needed. Mathematically, the general theory both deployed and advanced tensor calculus, which had developed partly out of Riemann’s interpretation of geometry.

Another main topic in physics was quantum mechanics, which drew upon partial differential equations and vector and matrix theory. One of its controversies concerned Werner Heisenberg’s principle of the uncertainty of observation: should it be interpreted statistically or not? The occurrence of this debate, which started in the mid-1920s, was helped by the increasing presence of mathematical statistics. Although probability must have had an early origin in mathematical thinking, both it and mathematical statistics had developed very slowly in the nineteenth century—in strange contrast to the mania for collecting data of all kinds. Laplace and Gauss had made important contributions in the 1810s, for example, over the method of least-squares regression, and Pafnuty Chebyshev (1821–1894) was significant from the 1860s in Saint Petersburg (thus raising the status of Russian mathematics). But only from around 1900 did theorizing in statistics develop strongly, and the main figure was Karl Pearson (1857–1936) at University College, London, and his students and followers. Largely to them we owe the definition and theory of basic notions such as standard deviation and correlation coefficient, basic theorems concerning sampling and ranking, and tests of significance.

Elsewhere, Cantor’s set theory and abstract algebras were applied to many parts of mathematics and other sciences

in the new century. A major beneficiary was topology, the mathematics of location and place. A few cases had emerged in the nineteenth century, such as the “Möbius strip” with only one side and one edge, Riemann’s fantastical surfaces, and above all a remarkable classification of deformable manifolds by Poincaré; most of the main developments, however, date from the 1920s. General theories were developed of covering, connecting, orientating, and deforming manifolds and surfaces, along with many other topics. A new theory of dimensions was also proposed because Cantor had refuted the traditional understanding by mapping one-one all the points in a square onto all the points on any of its sides. German mathematicians were prominent; so were Americans in a country that had risen rapidly in mathematical importance from the 1890s.

Some Reflections

The amount of mathematical activity has usually increased steadily or even exponentially, and the growth from the mid-twentieth century has been particularly great. For example, the German reviewing journal *Zentralblatt Math* published at the beginning of the twenty-first century a six-hundred-page quarto volume every two weeks, using a classification of mathematics into sixty-three numbered sections. To suggest the rate of increase, the other reviewing journal, the U.S. periodical *Mathematical Reviews*, published 3,800 octavo pages in 1980, 7,500 pages a decade later, and 9,800 pages in 2003. It would be impossible to summarize this mountain of work, even up to 1970; instead, some main points are noted relating to the previous sections and to the companion articles on algebras and on logic.

Not only has the amount increased; the variety of theories has also greatly expanded. All the topics and branches mentioned above continue to develop (and also many more that were not noted), and new topics emerge and fresh applications are found. For example, beginning with the 1940s mathematics became widely utilized in the life sciences and medicine and has expanded greatly in economics and other social sciences relative to previous practice.

Much of that work lies in statistics, which after its very slow arrival has developed a huge community of practitioners in its own right. Often it functions rather separately from mathematics, with its own departments in universities.

Another enormous change has been the advent of computing, again particularly since World War II and indeed much stimulated by war work as on cryptography and the calculation of parameters in large technological artifacts. Mathematics plays a role both in the design, function, and programming of computers themselves and in the formulation of many mathematical theories. An important case is in numerical mathematics, where approximations are required and efficient algorithms sought to effect them. This kind of mathematics has been practiced continuously from ancient times, especially in connection with all sorts of applications. Quite often algorithms were found to be too slow or mathematically cumbersome to be practicable; but now computer power makes many of them feasible in “number crunching” (to quote a popular oversimplification of such techniques).

A feature of many mathematical theories is linearity, in which equations or expressions of the form

$(A =) ax + by + cz + \dots$ and so on finitely or even infinitely

make sense, in a very wide range of interpretations of the letters, not necessarily within an algebra itself (for example, Fourier series shows it). But a dilemma arises for many applications, for the world is not a linear place, and in recent decades nonlinear theories have gained higher status, partly again helped by computing. The much-publicized theory of fractals falls into this category.

From the Greeks onward, mathematicians have often been fascinated by major unsolved problems and by the means of solving them. In the late 1970s a proof was produced of the four-color theorem, stating that any map drawn upon a surface can be colored with four colors such that bounding regions do not share the same color. The proof was controversial, for a computer was used to check thousands of special cases, a task too large for people. Another example is “Fermat’s last theorem,” that the sum of the n th powers of two positive integers is never equal to the n th power of another integer when $n > 2$. The name is a misnomer, in that Fermat only claimed a proof but did not reveal it; the modern version (1994) uses modern techniques far beyond his ken.

This article has focused upon the main world cultures, but every society has produced mathematics. The “fringe” developments are studied using approaches collectively known as ethnomathematics. While the cultures involved developed versions of arithmetic and geometry and also some other branches, several of them also followed their own concerns; some examples, among many, are intricate African drawings made in one unbroken line, Celtic knitting patterns, and sophisticated rows of knotted strings called *quipus* used in Mexico to maintain accounts.

A thread running from antiquity in all cultures, fringe or central, is recreational mathematics. Unfortunately, the variety is far too great even for summary here. Often it consists of exercises, perhaps posed for educational use, or perhaps just for fun; an early collection is attributed to Alcuin in the ninth century, for use in the Carolingian Empire. Solutions sometimes involve intuitive probability, or combinatorics to work out all options; with games such as chess and bridge, however, the analysis is much more sophisticated. Several puzzles appear in slightly variant forms in different cultures, suggesting transmission. Some are puzzles in logic or reasoning rather than mathematics as such, and it is striking that for some games the notion of decidability was recognized (that is, is there a strategy that guarantees victory?) long before it was studied mathematically in the foundations of mainstream mathematics.

Lastly, since the early 1970s interest in the history of mathematics has increased considerably. There are now several journals in the field along with a variety of books and editions, collectively covering all main cultures and periods. One main motive for people to take up historical research was their dislike of the normal unmotivated way in which mathematics was (and is) taught and learned; thus, the links between history

and mathematics education are strong. For, despite many appearances to the contrary, mathematics is a human activity.

Matriarchy. Matriarchy is usually defined as a political system in which women are the dominant political actors, as opposed to patriarchy, in which men are the exclusive or primary heads of families, social groups, or political states. But matriarchy has always been a controversial term, since whenever it is mentioned, there are debates about whether matriarchies are imagined utopias or real societies, whether they existed at some time in the distant past or could be re-created in a possible future, and how the definitions of gendered power themselves might have shifted in relation to varying social and historical contexts. The idea of matriarchy has served to inspire a whole series of legends and myths, experiments in alternative lifestyles, feminist spirituality, and woman-centered collectives, but it has long been rejected within mainstream anthropology. In the early twenty-first century new field research in Indonesia, Melanesia, and China has raised new questions about the definition of the term itself, and reinvigorated debates about when—if ever—it can be used responsibly.

Nineteenth-Century Evolutionary Theory

J. J. Bachofen began the modern debate about matriarchy with his 1861 book on “mother right,” in which he argued that one early social formation was a family which traced descent through the mother, and in which “government of the state was also entrusted to the women” (p. 156). Bachofen developed a three-stage model: In the barbaric or hetaeristic stage (from the Greek *hetero*, meaning both), neither men nor women had control, and people engaged in indiscriminate sexual activity, worshipping Aphrodite and valuing the erotic above all else. Then women tired of this system and banded together for their own defense, creating a matriarchy in which Artemis and Athena emerged as the main deities. Agriculture was developed during this period, and so were the stories of Amazons and Furies. Bachofen argued that “matriarchal people feel the unity of all life, the harmony of the universe” (p. 79), and embraced a philosophy of “regulated naturalism” in which maternal love was the basis of all social ties. In the final stage of the development of civilization, men seized control from women, and their struggle to assert their domination was reflected in stories of Zeus triumphing over the Titans, Hades raping Persephone, Perseus slaying the Medusa, and Oedipus killing the Sphinx. Bachofen interpreted mythical accounts of sexual conflict as evidence for a historical transition from matriarchy to patriarchy.

Friedrich Engels developed a materialist version of this theme in *The Origin of the Family, Private Property and the*

State (1884), arguing that matriarchy developed from a situation of group marriage, in which paternity was uncertain so only female blood lines could be traced reliably. Early human societies were presumed to have been egalitarian, and various forms of inequality were introduced in conjunction with the emergence of private property. When property rights came to be invested in men, the development of patriarchy was tied to the birth of capitalism, in which laborers were no longer the owners of the products of their labor.

Anthropologists working on comparative evidence from a number of societies tried to develop a more rigorous definition of matriarchy. E. B. Tylor grouped matrilineal descent with postmarital residence in the wife’s household and evidence that “the wives are the masters” in the family (p. 89), and described the Minangkabau of Indonesia as one possible matriarchy. He later reconsidered this position and decided that the term maternal family would be preferable to matriarchy, since “it takes too much for granted that the women govern the family” (p. 90). Lewis Henry Morgan’s intensive studies of the Iroquois documented political institutions in which women played important roles, and his *Ancient Society* (1877) formed the basis of Engel’s speculations. But as more field studies of matrilineal societies were completed, few of them seemed to have anything approaching female rule over men, and by 1921 Robert Lowie’s *Primitive Society* concluded that there was no evidence that women had ever governed the primitive equivalent of the state.

Twentieth-Century Gender and Kinship Studies

In *Matrilineal Kinship* (1961), David Schneider reexamined several decades of scholarship on the subject and concluded that “the generalized authority of women over men, imagined by Bachofen, was never observed in known matrilineal societies, but only recorded in legends and myths. Thus the whole notion of matriarchy fell rapidly into disuse in anthropological work” (p. viii).

The possibility of matriarchy was also denied in one of the founding texts of feminist anthropology, Michelle Rosaldo and Louise Lamphere’s *Women, Culture and Society* (1974), which started with an infamous (and later retracted) assertion of the universality of male dominance: “It seems fair to say, then, that all contemporary societies are to some extent male-dominated, and although the degree and expression of female subordination vary greatly, sexual asymmetry is presently a universal fact of human and social life” (p. 3).

Twenty years after that statement was published, several contributors to the Rosaldo and Lamphere book specifically recanted this assertion, but none of them went so far as to embrace the idea of matriarchy. Sherry Ortner writes that in the early 1970s, when interest in feminist anthropology began to grow, she and many other anthropologists were asked about matriarchies: “Was it not the case, people wanted to know, that there were societies in which women had the kind of powers and authority men have in our own society? With a reasonable degree of unanimity, anthropologists said no. Well, then, continued the questioners, weren’t there matriarchies in the past? Here there was somewhat less unanimity among the anthropologists,

but by and large no professional scholar in the field was willing to make a strong claim for any past matriarchies either” (p. 139). But she noted that the anthropological consensus fell apart completely when the issue of egalitarian societies was raised. Revisiting her own argument that women’s closeness to nature was used as a universal structural principle to justify their subjugation, she later explained that gender egalitarian societies may indeed exist, but “the egalitarianism is complex, inconsistent, and—to some extent—fragile” (p. 175).

Ortner’s later position is nuanced in relation to late twentieth-century terminology, which distinguishes between cultural ideologies and cultural practices, and looks at “gender hegemonies” rather than gender dominance. A belief that men are superior to women may be posited in mythology or even institutionalized in the formal ranking of social groups, but it is never total. In many cultures, women have a great deal of power that actually counterbalances claims of male prestige, and notions of charisma and social value are always subject to individual adjustments and reevaluations. Women can in fact have significant amounts of power, authority, autonomy, and prestige in systems where men are the formal leaders, and systems that appear “hegemonically egalitarian” may also contain subtle ways to give men the edge over women in a number of informal contexts.

Joan Bamberger’s contribution to *Women, Culture, and Society* argued specifically that myths and legends about female rule were told not because they reflected a previous history of matriarchy (as Bachofen believed) but instead as “social charters” for male dominance. Looking in some detail at a series of myths about the rule of women in Amazonian societies, she found that the myths themselves justify the rule of men “through the evocation of a vision of a catastrophic alternative—a society dominated by women. The myth, in its reiteration that women did not know how to handle power when in possession of it, reaffirms dogmatically the inferiority of their present position” (p. 279). Men stole the sacred objects that gave women supernatural power, and women have since been “forever the subjects of male terrorism,” so that these “myths of matriarchy” are in fact arguments for patriarchy.

It is possible that Bamberger’s interpretation of myths of matriarchy is a more astute reading of Western mythmakers than of indigenous traditions. The myths and legends that Bachofen surveyed were indeed told in patriarchal Rome and Greece in order to justify the abandonment of matrilineal kinship and certain female-centered cults. But the idea of a simple reversal of gender roles within a similar system of domination and control may obscure other possibilities, which are not so easily reducible to a looking glass inversion of male domination and female subjugation.

Virginia Woolf echoed Bamberger’s argument when she wrote in *A Room of her Own*:

Women have served all these centuries as looking glasses possessing the magic and delicious power of reflecting the figure of men at twice its natural size. . . . Whatever may be their use in civilized societies, mirrors are essential to all violent and heroic action. That is why Napoleon and Mussolini both insisted so emphatically on the inferiority

of women, for if they were not inferior, they would cease to enlarge. That serves to explain in part the necessity that women so often are to men.” (p. 37)

Early-twenty-first-century research suggests that there is a much wider range of social alternatives than the simple binarism invoked by the terms matriarchy and patriarchy. Looking for a chimeric inversion of Western forms of male domination—which are, as Woolf notes, accentuated in the specific contexts of fascism and imperial conquest—is too limiting, since not all societies treat male/female relations in terms of colonization or domestication. Inequality can be constructed through sexual difference, but when this happens it is useful to recall Marilyn Strathern’s argument that gender appears not as an immutable construct, but as a transactable one: “The difference between men and women becomes a vehicle for the creation of value, for evaluating one set of powers by reference to another” (p. 210).

Examined from this perspective, gender as a principle of contrast for social classification does not carry a consistent positive or negative valuation as part of its conceptual baggage. As Third World women and “native anthropologists” become more involved in academic discussions of gender equality, many of them criticize what they call the “false utopias” of the search by European-American feminists for hope and inspiration from exotic others. As Shanshan Du argues: “Ironically, by projecting diverse utopian ideals into cross-cultural studies, the declaration of the non-existence of gender-egalitarian societies became a self-fulfilling prophecy. After all, there is always an unbridgeable gap between a utopian fantasy and a real society because the latter never operates on seamlessly coherent principles” (p. 4). She notes the example of the Crow Indians, who have many egalitarian institutions and ideologies, and where women are at least as prominent as men in many significant rituals. However Western anthropologists described the Crow as “male dominant” because of the existence of a menstrual taboo, although later studies have shown that menstrual taboos are complex and can also serve to empower women and grant them access to certain spiritual powers. Du calls this a “Eurocentric bias” which sets its own standards for sexual “political correctness” and is not sensitive to contextual meanings and configurations.

Alternatives to Matriarchy: Matrism, Gender Egalitarianism, and Diarchy

In order to expand the conceptual tool kit of anthropologists for understanding gender relations in other societies, several writers have proposed alternative terms designed to avoid the simplifications implied by matriarchy. Riane Eisler argues in *The Chalice and the Blade* (1987) that patriarchy and matriarchy are “two sides of the same coin,” because both of them involve “the ranking of one half of humanity over the other” (p. xvii). She prefers a partnership model that is “primarily based on the principle of linkage rather than ranking,” so that gender differences between men and women can be spoken of in ways that do not equate them with either inferiority or superiority. Instead of matriarchy and patriarchy, Eisler proposes the term *gylany* for societies where gender relations follow the partnership model, and *androcracy* for others characterized by male

dominance and ranking relations. Her title derives from symbols for these two paradigms: the chalice, symbolizing life begetting, community, and sharing; and the blade, symbolizing the power to take rather than give life—the militaristic ideal to establish and enforce domination. She represents the Neolithic as an era of peace when people worshipped the goddess, which was then destroyed by the invasion of Hebrews and “Kurgans.” The blade came to displace the chalice, and men came to displace women as the central power in the society.

These terms have not been widely adopted, and they are based on the work of Marija Gimbutas, who has excavated hundreds of female figurines from the period 7000 to 3500 B.C.E., which she interprets as mother goddesses. Several archaeologists, such as Ruth Tringham and Margaret Conkey, have argued that her interpretations are highly speculative, but they have had tremendous popular appeal, and her ideal of an early cult of a fertility deity represented as a large, possibly pregnant, woman has been widely disseminated. Gimbutas writes critically of the “indolent assumption” that ancient societies must have resembled those of the present, and presents her own theory that these figurines were produced by groups of people whose social forms she describes as “matristic”:

Indeed we do not find in Old Europe, nor in all of the old world, a system of autocratic rule by women with an equivalent suppression of men. Rather, we find a structure in which the sexes are more or less on equal footing. . . . [T]he sexes are “linked” rather than hierarchically “ranked.” I use the term matristic simply to avoid the term matriarchy, with the understanding that it incorporates matriliney. (p. 324)

Gimbutas’s work provides an archaeological argument for ideas about the importance of goddesses in early Europe that have also been developed by Robert Graves (1946), and many contemporary neopagans (Adler; Pike). Graves argued that goddess worship coincided with the time when calendars were primarily determined by the moon, and noted the correspondence of the lunar and menstrual cycles, and that the Earth Mother was associated with the Moon Goddess. He traced the changeover to patriarchy with the changeover to the solar calendar and the worship of a solar deity. His work is more a poetic vision of artistic inspiration than a work of scholarship, and has been widely discredited.

Eisler and Gimbutas consider themselves “revisionist” historians who have brought together neglected evidence of a nurturant, female-centered society, but they (like the nineteenth-century evolutionary theorists) base this universalist theory solely on evidence from Europe and the Middle East. Even within that area, their scholarship has been widely criticized as biased, selective, and unscientific, and most anthropologists consider their work to present a view of the “matrist” past as unlikely as their utopian vision of a partnership future. The phenomenon of these revisionist feminist visions is itself of great interest, however, and has proved important in inspiring the neopagan movement, Wicca, and best sellers such as *The DaVinci Code*.

Anthropologists have invoked a number of other terms that are close to matriarchy but not exact equivalents: David Hicks describes the patrilineal Tetum of Viqueque, East Timor as having “a maternal religion,” in which men dominate the affairs of the upperworld, but women play a central role in rituals of death, birth, and regeneration. Annette Weiner (1976) describes the Trobrianders of Papua New Guinea as giving value and autonomy to women through their matrilineal institutions, while men travel from island to island to seek renown and political positions of power. She has specifically argued that Bronislaw Malinowski failed to pay attention to certain crucial ways in which Trobriand women played important roles in their society because he focused too exclusively on a male-dominated politics:

The discovery that Trobriand women have power and that women enact roles which are symbolically, structurally, and functionally significant to the ordering of Trobriand society, and to the roles that men play, should give us, as anthropologists, cause for concern. . . . We have allowed ‘politics by men’ to structure our thinking about other societies; we have let ourselves believe that, if women are not dominant in the political sphere of interaction, their power remains at best peripheral.” (227–228)

Others have been more assertive in presenting case studies that directly counter ideas of pervasive inequality. Maria Lepowsky claims to have discovered on Sudest Island “a sexually egalitarian society that challenges the concept of the universality of male dominance and contests the assumption that the subjugation of women is inevitable” (p. vii). The example of the Vanatinai shows, she argues, that gender equality is possible when there is little emphasis on class, rank, age grades, or other forms of social stratification. The decentralization of political power allows for the equal treatment of all categories of individuals, allowing for a much greater sense of personal autonomy for both women and men, and little formal authority of any one person over another. Strength, wisdom, and magical power are valued as characteristics that enhance communal solidarity, and individuals who have these may become “big women” or “big men” without gender bias. Descent is matrilineal, but its influence is buttressed by gender blind institutions like a bilocal pattern of postmarital residence, in which married couples live alternately with their two natal families for many years. So this egalitarianism is defined more by a respect for idiosyncrasy and the absence of formal structure than by a positive value attached to women.

Studies of bilateral societies in Indonesia where gender receives relatively little emphasis, such as the Wana of Sulawesi (Atkinson) or the Meratus of Kalimantan (Tsing), also document a lack of any formal ideology about male supremacy, and ideas of gender crossing (male “pregnancy,” female shamans speaking in male voices) that suggest gender is not conceptualized as fixed. Ortner (1996) compares these to the example of the Andaman Islanders, who had a clear but balanced division of labor (men hunted, women gathered), and a spiritual world in which supernatural beings of both sexes played significant,

generally complementary, and sometimes reversible roles, with one deity of variable—but usually female—gender who seemed to represent fertility. All of these societies can be described as gender balanced and flexible, in which men and women were allowed to participate equally in all forms of social relations, but men nevertheless tended to emerge as leaders in some of these domains.

Feminist scholars such as Ortner, Atkinson, and Tsing stress religion and ideology in their portraits, while scholars in the Marxist tradition build on the work of Engels to argue that nonstratified societies in which both sexes have control over the means of production and their own labors are gender egalitarian. Eleanor Leacock (1978) argues that many precapitalist societies were egalitarian, and Karen Sacks (1979) suggests that, when relating to each other as siblings rather than spouses, men and women can be institutionally equal even in patrilineal, patrilocal societies.

Two early-twenty-first-century ethnographies by Chinese scholars bring together Marxist and symbolic approaches to argue that gender equality is possible and often found in the minority groups of the Chinese highlands. Shanshan Du's *Chopsticks Only Work in Pairs* (2001) stresses complementarity among the Lahu people in Yunnan and the importance of the husband-wife dyad in kinship, labor, and social leadership. She argues that mythology and religion reflect a "dyadic world view," based on cooperation between men and women, since "a single chopstick cannot pick up food" (p. 30). Lahu origin myths feature cross-sex twins who combine male and female attributes in an image of overarching power. While her account places heavy value on the marital unit, Cai Hua's *A Society without Fathers or Husbands: The Na of China* (2003) looks at another group near the Burmese border where brothers and sisters live their whole lives together, raising the sister's children, and reproduce through short term "visits" which are never socially sanctioned as marriage. This arrangement does give women greater autonomy than the traditional Confucian family, and also challenges the usual anthropological orthodoxy about the universality of male-female pair bonding. Hua argues that in this society "sexuality is not a piece of merchandise but a purely sentimental and amorous matter that implies no mutual constraints" (Hua, p. 181). The Na, like the famous Nayar of India studied by Kathleen Gough (Schneider and Gough), are matrilineal, and have resisted communist efforts to bring them into mainstream values. The sibling relationship defines the household completely, and visiting lovers have no connection with the family, have no responsibilities, and do not acknowledge their fatherhood; the children, in turn, do not know their fathers.

Another alternative to matriarchy that works with dyads and sibling symbolism is diarchy, which some scholars grouped with egalitarian structures as a form of "partnership societies." Diarchic societies are marked by a pervasive system of symbolic gender dualisms, "an ideology of balanced powers" in which the members of the male/female pair are ordered by difference and interdependence, rather than dominance and subjugation (Hoskins, 1988, p. 51). A doctrine of mutuality and shared concerns is expressed in ideas of delegation and oscillating rule.

European travelers to the Amazonian jungle and the New Guinea highlands encountered "myths of matriarchy" that presented an apparent confirmation of their own fantasies of Amazon warrior princesses and Melanesian "free love." But travelers in the Indonesian archipelago who visited the islands of Sumba, Flores, Timor, and Savu found a mixture of matrilineal and patrilineal groups who shared an ideology of dual governance often expressed as a "male ruler" and "female ruler," or—even more paradoxically—a man specifically referred to as a woman who held a position of sovereignty. This pattern had first been documented in Indian kinship, where Georges Dumezil described the idea that "sovereignty aligns itself in two planes, at once antithetical and complementary," and it is also found in Chinese and Vietnamese popular religion. The division between spiritual authority and temporal power was predicated on the conceptual opposition between female and male, in a pattern also familiar in Polynesia.

The complementarity of diarchic systems operates with the principles of male and female as abstract entities, and associates them with ideas of a proper balance of action and passivity. Women are typically associated with origins, fertility of the earth, and human reproduction, while men are associated with military and executive power, differentiation, and rank. Diarchic divisions assign to the female principle an equal role in the creation of the world, but at times the passivity of their role as Earth Mother may seem to place real women at a disadvantage, bound by the restrictions inherent to their ritual prominence. Among the Kodi of Sumba, for instance, the conceptually female priestess of the Sea Worms is secluded for several months before the rice harvest to protect the crop. In the early-twenty-first-century, a man, who is both empowered and restricted by the central symbolic role he plays, is cast as the priestess.

Gender dualism, which can be defined for comparative purposes by the formal requirement that a female and male component be included in each unifying hierarchical entity, is found throughout Eastern Indonesia. It occurs in patrilineal as well as matrilineal societies, and coexists with polygyny, occasional violence against women, and male leadership, so it is not necessarily a vision of gender equality, but it does highlight interdependence and complementarity. The importance of opposite sex couples, portrayed as parents, siblings, or ancestors, in Eastern Indonesian sexual imagery is an index of the value given to heterosexual relations, and what can only be called a vision of sexual union—the bringing together of male and female in an act of pleasure, release, and potential reproduction.

Are the Minangkabau a Modern Matriarchy?

In 2002 Peggy Sanday revived controversies about the anthropological use of the term matriarchy by titling her study of Minangkabau gender relations *Women at the Center: Life in a Modern Matriarchy*. Well aware that the term had been rejected by serious scholars for about a century, she provocatively decided to challenge this usage with an argument that matriarchy should be redefined to correspond to the usage of a Dutch-Indonesian term (*adat matriarchaal*) used by roughly 8 million Minangkabau to describe their own customs. The Minangkabau are one of the world's largest matrilineal societies, and

they are also almost all committed Muslims in the nation with the largest Islamic population in the world. While Sanday describes the term as an “indigenous category,” its early-twenty-first-century use is obviously the hybrid result of several centuries of dialogue with European traders, scholars, and administrators, who have long been intrigued by the mixture of matriliney and Muslim piety found in the Minang homeland in Sumatra, Indonesia.

Sanday argues that

the definition of matriarchy as the control of political power by women should be abandoned in favor of a definition emphasizing the role of maternal symbols in webs of cultural significance. The focus should be on the structure and content of dominant gender symbols, not just the linked relationship between the sexes as Eisler suggests. The partnership is important, but it alone does not define matriarchy because there are at least three types of symbolic structures representing gender in partnership societies: egalitarian, diarchic and matriarchic. Egalitarian structures are those in which gender differences are not symbolically marked, although sex differences may play a role in the division of labor. Diarchic societies are marked by a pervasive system of symbolic gender dualisms, Matriarchic structures, like those of the Minangkabau, are based on a maternal model. In all three, although the content of the symbols differ, male and female function as two equal halves of the larger whole and neither dominates the other. (p. 236)

The Minangkabau have been the focus of many anthropological and historical studies, but no other contemporary scholar has chosen to describe them as matriarchic. While Sanday’s claims are based on long-term ethnographic research, her colleagues have not for the most part been convinced that such a change in terminology is needed or helpful.

Sanday notes that her usage is in some ways a return to the original Greek meaning of the term. The root *matri*, from the Latin *mater*, means “mother, nurse, origin, source,” while the suffix *archy*, from the Greek *arche*, refers to “beginning, foundation, source of action, first principle,” and also the idea of “political power, rule, control of the state” (p. 237). Sanday says Minangkabau customs correspond to the first meaning, while they do not fulfill the conditions of the second. She calls for a new cross-cultural definition of matriarchy as “cultural symbols and practices associating the maternal with origin and center of the growth processes necessary for social and individual life” (p. 237). According to this definition, many of the societies studied by gender researchers—the Trobriand Islanders, the Vanatinai of Sudest Island, the Crow Indians, the Lahu and Na of southern China, and the Tetum of Viqueque, Timor—might qualify as matriarchies, since they do emphasize maternal symbols and nurturance, although in many other ways they are quite different from each other.

The use of matriarchy as an umbrella term for societies that value women’s reproductive and nurturing powers seems too broad to be of much use for comparative purposes. What

Sanday wants to call matriarchic has been described by Annette Weiner as “woman focused” (1976), by Sherry Ortner as an “egalitarian hegemony,” by Karen Sacks as a “sister-based society,” and by Eleanor Leacock as a “precapitalist form of sexual equality.” It is also close to the sacred ideals of the Okinawans of Japan (Sered), the dualistic Kodi of Sumba (Hoskins, 1993, 1998), and the highland Wana and Meratus of the Indonesian islands of Sulawesi and Kalimantan (Atkinson; Tsing). All of these examples provide evidence for diversity of gender relations that cannot be reduced to a simple stereotype of male supremacy, but which are also stubbornly idiosyncratic and unlike each other in important ways. Anthropology has long been a celebration of difference, and while it does need a comparative vocabulary, this vocabulary is only helpful if it is very rigorously defined. Expanding the notion of matriarchy beyond its largely discredited nineteenth-century significance does not seem to advance this process.

MATTER AND FORMS OF MATTER. See **Physics**.

MECHANICAL PHILOSOPHY. The mechanical philosophy was a philosophy of nature, popular in the seventeenth century, that sought to explain all natural phenomena in terms

of matter and motion without recourse to any kind of action at a distance (cause and effect without any physical contact). During the sixteenth and seventeenth centuries, many natural philosophers rejected Aristotelianism, which had provided the form of and foundations for natural philosophy at least since the thirteenth century. The mechanical philosophy, which was rooted in ancient Greek atomism, was one candidate for a new philosophy. Atomism was the theory that everything in the material world consists of imperceptible, solid, indivisible bits of matter—atoms—that move about in empty space. Not all mechanical philosophers were strict atomists, but they attempted to explain all natural phenomena in terms of the configurations, motions, and collisions of small, unobservable particles of matter. A central doctrine of the mechanical philosophy was the theory of primary and secondary qualities, according to which matter is really endowed with only a few primary qualities and all others (such as color, taste, or odor) are the result of the impact of the primary qualities on human sense organs. Nature was thus mechanized and most qualities were considered subjective.

Background

The mechanical philosophy derived from the views of the Greek philosopher Epicurus (341–271 B.C.E.), who sought the key to the good life. He considered the good life to be one that maximizes pleasure and minimizes pain. Epicurus believed that the greatest sources of human unhappiness, apart from bodily pain, are fear of the gods and anxiety about punishment after death. To eliminate these causes of distress, he sought to explain all natural phenomena in naturalistic terms—the chance collisions of material atoms in empty space (his version of atomism), thus eliminating the gods’ interference in human lives. He claimed that the human soul is material, composed of atoms that are exceedingly small and swift. The Epicurean soul did not survive death. Thus there is no reason to fear punishment in the afterlife. Epicurus believed that the atoms have always existed and that they are infinite in number. Epicureanism, while not strictly atheistic, denied that the gods play a role in the natural or human worlds, thus ruling out any kind of divine intervention in human life or providence in the world. Because of its reputation as atheistic and materialistic, Epicureanism fell into disrepute during the Christian Middle Ages. The writings of Epicurus and his Roman disciple Lucretius (c. 96–c. 55 B.C.E.) were recovered and published during the Renaissance, which began in fourteenth-century Italy.

Following the development of heliocentric astronomy in the late sixteenth and early seventeenth centuries, many natural philosophers believed that Aristotelianism, which rests on geocentric assumptions, could no longer provide adequate foundations for natural philosophy. Among the many ancient philosophies that were recovered by Renaissance humanists, Epicurean atomism seemed particularly compatible with the spirit of the new astronomy and physics. Early advocates of the mechanical philosophy included David van Goorle (1591–1612), Sebastian Basso (fl. 1550–1600), Galileo Galilei (1564–1642), and various members of the Northumberland Circle of which Walter Warner (c. 1557–c. 1642), Thomas Harriot (1560–1621), and Nicholas Hill (c. 1570–1610) were members. Although each of

these men favored some version of atomism, none of them developed a systematic philosophy. Isaac Beeckman (1588–1637), a Dutch schoolmaster, advocated a mechanical view of nature and wrote about it extensively in his private journal, which was not published until the twentieth century. Beeckman's personal influence was enormous, however, and he was instrumental in encouraging a pair of French natural philosophers, Pierre Gassendi (1592–1655) and René Descartes (1596–1650), to adopt the mechanical philosophy.

Major Advocates of the Mechanical Philosophy

Gassendi and Descartes published the first systematic and the most influential accounts of the mechanical philosophy. Their treatises spelled out the fundamental terms of the mechanical philosophy and functioned as programmatic statements, describing what such a philosophy would look like in practice. Although both men agreed that all physical phenomena should be explained in terms of matter and motion, they differed about the details.

Gassendi believed that God had created indivisible atoms and endowed them with motion. The atoms, colliding in empty space (the void), are the constituents of the physical world. In his massive *Syntagma philosophicum* (published posthumously in 1658; Philosophical treatise), Gassendi set out to explain all the qualities of matter and all the phenomena in the world in terms of atoms and the void. He argued for the existence of the void—a controversial claim at the time—on both conceptual and empirical grounds, appealing to recent barometric experiments of Evangelista Torricelli (1608–1647) and Blaise Pascal (1623–1662). The primary qualities of Gassendi's atoms were size, shape, and mass. He attempted to explain all the qualities of bodies—light, color, sound, taste, smell, heaviness, and lightness—in atomic terms. Among the qualities he included were the so-called occult qualities, which seemed to involve action at a distance and had generally resisted explanation in mechanical terms. After laying the foundations for his philosophy, Gassendi gave an account of the entire creation: the heavens, the inanimate world, the animate world, and the human soul.

Writing in the manner of a Renaissance humanist, Gassendi saw himself as the restorer of the philosophy of Epicurus. Deeply concerned with Epicurus's heterodox ideas, Gassendi, a Catholic priest, sought to modify ancient atomism so that it would be acceptable to seventeenth-century Christians. Accordingly, he insisted on God's creation of a finite number of atoms, on God's continuing providential relationship to the creation, on free will (both human and divine), and on the existence of an immaterial, immortal human soul that, he claimed, God infuses into each individual at the moment of conception.

Gassendi was not a materialist. He argued for the existence of an incorporeal, immortal soul and also believed in the existence of incorporeal angels and demons. In addition to the immaterial, immortal soul, Gassendi claimed that there exists a material, sensible soul, composed of very fine and swiftly moving particles. This material soul (which animals also possess) is responsible for vitality, perception, and the less abstract aspects of understanding. The material soul is transmitted from one generation to the next in the process of biological

reproduction. Gassendi's ideas were brought to England by Walter Charleton (1620–1707) and popularized in France by François Bernier (1620–1688).

Although Descartes also articulated a full-fledged mechanical philosophy in his *Principia philosophiae* (1644; Principles of philosophy), his ideas were quite different from Epicurean atomism. Impressed by the rigor of mathematical reasoning and Galileo's mathematization of physics, Descartes wanted to develop a mathematical approach to the mechanical philosophy. In contrast to Gassendi's atomism, Descartes was a plenist, claiming that matter fills all space. He claimed that matter is infinitely divisible, thus denying the existence of both atoms and the void. He believed that matter possesses only one primary quality, geometrical extension. This belief provided foundations for his attempted mathematization of nature. Descartes drew a sharp distinction between matter and mind, considering thinking to be the essential characteristic of the mind. Like Gassendi's doctrine of the immortal soul, Descartes's concept of mind established the boundaries of mechanization in the world.

Descartes attempted to deduce the laws of motion—the conservation of motion and the principle of inertia—from first principles. From the laws of motion, he attempted to derive mathematical laws of impact. Although these laws were inadequate, even in seventeenth-century terms, their prominent place in his system reflects their importance in a mechanical philosophy, according to which contact and impact are the only causes in the physical world. Having established the physics that he considered fundamental to his system, Descartes proceeded to give mechanical explanations of all the phenomena in the world, including cosmology, light, the qualities of material things, and even the human body.

Like Gassendi, Descartes intended his philosophy to replace Aristotelianism. He hoped that the Jesuit colleges would adopt the *Principia philosophiae* as a physics textbook in place of the Aristotelian texts still in use. His hopes were dashed posthumously, however, when the Roman Catholic Church condemned his book in 1662 and then placed it on the Index of prohibited books one year later, in response to his attempt to give a mechanical explanation of Real Presence (the doctrine holding that Christ is actually present in the Eucharist).

William Harvey (1578–1657), a medical practitioner and teacher, inspired Descartes's mechanical philosophy by his experimental proof of the circulation of the blood, published in *Exercitationes Anatomicae de Motu Cordis et Sanduinis in Animalibus* (1628). Harvey's natural philosophy was actually more Aristotelian than mechanical, a point manifest in his work on embryology, in which he adopted an Aristotelian explanation of generation—epigenesis, according to which the embryo is formed from the fluids contributed by both parents in the process of reproduction. Nevertheless, impressed by Harvey's use of mechanical analogies to describe the flow of blood, Descartes attempted to develop a complete physiology based on his own mechanical principles. Gassendi was not convinced by Harvey's evidence and rejected the circulation of the blood.

Another mechanical philosopher, Thomas Hobbes (1588–1679), was the specter haunting more orthodox natural

philosophers. Hobbes's philosophy seemed—to the seventeenth-century reader—to be materialistic, deterministic, and possibly even atheistic. In *The Elements of Philosophy* (1642–1658), Hobbes propounded a complete philosophy—of matter, of man, and of the state—according to mechanistic principles. Although the details of his mechanical philosophy were not very influential among natural philosophers, his mechanical account of the human soul and his thoroughly deterministic account of the natural world alarmed the more orthodox thinkers of his day. His claims underscored their fears that the mechanical philosophy would lead to materialism, deism, and even atheism.

Later Developments

Gassendi and Descartes set the agenda for the next generation of natural philosophers, who accepted mechanical principles in general, believing that they had to choose between Gassendi's atomism and Descartes's plenism. Robert Boyle (1627–1691), Christiaan Huygens (1629–1695), and Isaac Newton (1642–1727), among the most prominent natural philosophers of the second half of the seventeenth century, developed their philosophies of nature in this context.

Boyle is best known for his attempt to incorporate chemistry within a mechanical framework. His corpuscular philosophy—which remained noncommittal on the question of whether matter is infinitely divisible or composed of indivisible atoms—was founded on a mechanical conception of matter. His reluctance to commit himself about the ultimate nature of matter reflected his concern about the atheism still associated with Epicureanism as well as his recognition that some questions lie beyond the ability of human reason to resolve. Material bodies are, according to Boyle, composed of extremely small particles, which combine to form clusters of various sizes and configurations. The configurations, motions, and collisions of these clusters produce secondary qualities, including the chemical properties of matter. Boyle conducted many observations and experiments aiming to demonstrate that various chemical properties can be explained mechanically. He performed an extensive series of experiments with the newly fabricated air pump to prove that the properties of air—most notably its “spring”—could be explained in mechanical terms.

Huygens followed Descartes in attempting to mathematize physics and the mechanical philosophy. He applied this approach to create a wave theory of light, a mathematical analysis of centrifugal force, and an improved theory of impact. He applied mathematics to physical problems far more successfully than had Descartes.

Newton, whose reputation rests on his achievements in mathematical physics and optics, accepted the mechanical philosophy from his student days at Cambridge University. A notebook written in the mid-1660s shows him thinking about natural phenomena in mechanical terms and designing thought experiments for choosing between Cartesian and Gassendist explanations of particular phenomena. A number of phenomena—including gravitation, the reflection and refraction of light, surface tension, capillary action, and certain chemical reactions—persistently resisted explanation in purely mechanical terms. Failing in the

attempt to explain them by appeal to hypotheses about submicroscopic “aethers,” Newton was led to the view that there exist attractive and repulsive forces between the particles composing bodies. This idea came to him from his alchemical studies. Newton's most notable discovery, the principle of universal gravitation, which provided a unified foundation for both terrestrial and celestial mechanics and which marks the culmination of developments started by Nicolaus Copernicus in the mid-sixteenth century, demanded a concept of attractive force. The concept of force, which seemed to some contemporaries to be a return to older theories of action at a distance that had been banished by the mechanical philosophy, enabled Newton to accomplish his stunning mathematization of physics and thereby fulfill the primary goal of the mechanical philosophy.

In the decades after Newton's death, the worst fears of the Christian mechanical philosophers of the seventeenth century came true. John Locke (1632–1704) argued for the reasonableness of Christianity, and his environmentalist analysis of the human mind—which grew directly from the ideas of the mechanical philosophers—implied the denial of the Christian doctrine of original sin. Deism and natural religion flourished both in England and on the Continent.

Debates about theories of generation became inextricably connected to philosophical and theological implications of the mechanical philosophy. While advocates of epigenesis tended to adopt vitalistic theories of life, theories that invoked some kind of nonmechanical entity to explain the properties of living things, another theory of generation, known as preformationism, seemed to be more compatible with the mechanical philosophy. Preformationism maintained that all living things existed within their ancestors, created by God at the beginning of life with a precise moment established for each one to emerge and become alive. Although preformationism was compatible with both divine providence and the doctrine of original sin, it also raised the specter of materialism that haunted the mechanical philosophy.

Some of the French philosophes, notably Julien Offroy de La Mettrie (1709–1751) and Paul-Henri-Dietrich d'Holbach (1723–1789), espoused atheistic materialism and also adopted vigorously anticlerical and antiecclesiastical views. David Hume (1711–1776) undermined the possibility of natural religion and a providential understanding of the world by demonstrating the invalidity of the standard arguments for the existence of God, particularly the argument from design that had played such a crucial role for the seventeenth-century mechanical philosophers. Newtonian mechanics rose to great heights, having shed the theological preoccupations of its creator. These developments culminated in the work of Pierre Simon Laplace (1749–1827), who articulated a clear statement of classical determinism and was able to demonstrate that the solar system is a gravitationally stable Newtonian system. When asked by Napoléon Bonaparte what role God played in his system, Laplace is reputed to have replied, “I have no need for that hypothesis.”

MEDIA, HISTORY OF. The term *media history* is almost a tautology when the historic is distinguished from the prehistoric by the presence of recording media. History is always already mediated. A distinct domain of historiography whose object is human communication technologies will to this extent always be tempted to assimilate all human history to itself. Among late-twentieth- and early-twenty-first-century media historians, this principle has advanced to the stage at which alternative programs for understanding human activity—terms such as society, culture, economy, and power—appear as either abstractions lacking the empirical bases of media and mediation, or as derivatives of them. Media history, it can be argued, explains society, culture, and politics better than those concepts explain media.

Periodization

The most common periodization employed distinguishes at the minimum oral and literate phases, indicating that oral communication (along with gesture, dance, potlatch, and other features of orality) are to be included as media. Aristotle's definition of the human being as the *zoon politikon* clearly regards humans as properly belonging to a polis or community, but also indicates that humans are distinguished by communication since, as Claude Lévi-Strauss was at pains to demonstrate, and as the Latin etymologies suggest, there can be no conception of a community without communication, and vice versa. To this extent media history must be one of the central disciplines of the human sciences, embracing not only literary and linguistic studies, but sociology, political science, economics, and the discipline of history itself.

The story of media history is the tale of the long struggle for existence of a materialist understanding of human interaction. The central challenge has been (and remains) the task of shedding idealist conceptualizations like society and culture in favor of tracing the embodied forms in which they are constructed and lived. However, this project is hampered by the sheer scope of the enterprise. The practice of media history takes two major forms: the macroscopic address to the vast accumulation of human media artifacts on the one hand, and detailed investigations of specific conjunctures in the history of specific media on the other. The former is constantly plagued by the temptation of vast generalization, the latter constrained to merely local findings whose contribution to a general theory of media history is therefore rarely clear.

Like that of all historiography, the objective of media history is to understand historical process. The majority of media historians are explicit in adding that the reason for undertaking this task is to guide the emergence of future media or to warn against the outcomes of long- or short-term trends, a linear model with associations to teleologies of both progress and apocalypse. Umberto Eco distinguishes between apocalyptic and "integrated" scholars of the media. The former blame not individual media texts but whole media technologies for the loss or destruction of older values; the latter embrace everything new as proof of progress toward some ultimate good. In the work of the best-known among media historians, Marshall McLuhan (1911–1980), the narrative of evolution has an interestingly spiral dimension, returning in heightened form to its oral origin in the figure of the electronic "global village" (pp. 166–167). A noted Joyce scholar, McLuhan may have derived the spiral form of history from Joyce's source, Giambattista Vico (1688–1744). Be that as it may, he shares with other teleological media historians a mystical belief in eternal return or in millenarian thought that responds to a heartfelt longing for historical symmetry.

McLuhan's spiral might be seen as syncretic, even atavistic. His teacher, Harold Innis, perhaps as a result of his experience of trench warfare in Europe, had a far simpler and more immediately political teleology. Innis divided media into heavy, durable media like stone tablets, suited to carrying ideas through time, and light, ephemeral media like parchment, more suited to spatial dissemination. Though the oral tradition had a strongly conservative function before the invention of writing, afterwards its role became one of swift adaptation. Concluding his study *Empire and Communications*, Innis calls for "determined efforts to recapture the vitality of the oral tradition" (p. 170), appealing to the traditions of common law to equilibrate what, in 1950, appeared as the triumph of spatial over temporal media. Integrated critics are rarely so openly committed to utopian political projects for reform or remaking of the media. An avowed belief in the inevitability of progress is once again a widespread phenomenon, not only in the pages of hip corporate culture magazines like *Wired* but especially among respected scholars of digital media, most of all those who, like Roy Ascott, are also committed teachers and creative activists.

Technology and the “General Accident”

Even less convinced of the need for or efficacy of planning and action are the apocalyptic critics, foremost among them today Jean Baudrillard and, increasingly, Paul Virilio. Baudrillard traces media history in four phases: (1) it is the reflection of a profound reality; (2) it masks and denatures a profound reality; (3) it masks the absence of a profound reality; (4) it has no relation to any reality whatsoever: it is its own pure simulacrum (Baudrillard, 1994, p. 6 and 1983, p. 11). In later writing Baudrillard, like Debord, suggests that, far from integration, we are doomed to the disintegration of media and world alike. Since Baudrillard concentrates only on the representational functions of the media, he is blind to their communicative roles and is determinedly centered on the industrialized world. Widely read when television was still the dominant medium, his work has been eclipsed in the rise of telecommunication toward hegemony among media in the early twenty-first century. More persuasive, perhaps because less nihilistic, Paul Virilio argues that the invention of railways was also the invention of the train wreck, that of automobiles of the car crash, and that the assimilation of all our media into a unified digital circulation leads inexorably to what he calls the rapidly approaching “general accident.” Prefigured by the atom bomb and the information bomb, the genetic bomb is the latest cataclysm waiting to occur, all of them motivated by and dependent upon the mass mediation of speed and the concomitant abolition of time. The proximity of Virilio’s conclusions to those of Innis is deceptive: where Innis saw the grounds for active engagement in the reconstruction of contemporary media, Virilio sees an unavoidable Armageddon.

Innis and McLuhan are not the only figures who ground contemporary media history. Unwelcome because of his Nazi heritage, Martin Heidegger (1889–1976) is nonetheless the silent foundation of much continental media history. In his 1954 essay on “The Question Concerning Technology,” technology figures on the one hand as an ordering of materials, an instrumental relation to the world that blocks our understanding of it. On the other hand, as a collection of devices that ensure survival, technology is ultimately in the service of humankind becoming the one species in whom the coming-to-being of the world can be realized.

Technology at its best thus serves its own ultimate over-coming (a conclusion distressingly close to Heidegger’s ideological consorts in the Nazi Party). In Virilio’s terms, the data crash is the necessary precondition for the self-realization of the world. In another essay, Heidegger prefigures Virilio’s critique of the sedentarization of Western society, blaming television for “the abolition of every possible remoteness” (1971, p. 165). The industrialization of media in the form of standard delivery systems (an unchanging receiver frames all the changing content of television), unlimited replicability, and instantaneous broadcast appear to apocalypics as signals of a collapse, of reality or humanity or both, into an undifferentiated and unchanging sameness. A similar thought undergirds some theories of cultural imperialism and globalization. The apparent novelty of the position is undermined by a reading of Plato’s *Phaedrus*, where Socrates tells the story of Thamus’s indignant critique of writing when the new technology was

brought to him by Theuth: “What you have discovered is a receipt for recollection, not for memory. And as for wisdom, your pupils will have the reputation for it without the reality” (p. 184). Like Plato, Heidegger appears to believe in some form of original sin inhering in the medium he critiques. This thought is more nearly explicit in Heidegger’s pupil Hans-Georg Gadamer, who notes, for example, that “Literary art can be understood only from the ontology of the work of art, and not from the aesthetic experiences that occur in the course of the reading” (p. 161). This holds true not only of a text that retains its integrity regardless of the form in which it is read or performed, but of the written medium from the beginning.

Historical and Technological Media

A more subtle strand of media history than this blunt confrontation of integrated and apocalyptic critics arises in the work of the Frankfurt School, the most influential essay here being Walter Benjamin’s “Work of Art in the Age of Mechanical Reproduction” (1969). Benjamin’s periodization does not concern the transition from oral to literate but from the unique object to serial production, and his concern is with the consequent loss of “aura,” of sanctity and intrinsic value, which media artifacts undergo as a result. Confronting the rise of fascism and contesting the Stalinization of Popular Front cultural policy in the 1930s, Benjamin argues for both the utopian capacities of popular media and the necessity to engage with them as vanguard arenas of creative endeavor. Perhaps the most significant response appears in a letter responding to the draft manuscript written by Theodor Adorno, arguing that popular and avant-garde are “torn halves of an integral freedom to which, however, they do not add up” (1977, p. 123). In his joint work with Max Horkheimer and in other later writings, Adorno elaborates and develops this insight into media history, concluding in 1953 that under contemporary conditions, “people become welded to the unavoidable . . . television makes once again into what they already are, only more so” (1998, p. 50). This vision of industrial and technological media in the service of the status quo is more thoroughly historicized in Jürgen Habermas’s influential account of the formation and deformation of the public sphere, created at the time of the European Enlightenment through the power of the printing press, and distorted into mere opinion polling in the age of mass circulation newsprint, radio, and television. A similar thesis, inspired more specifically by the analysis of reification in Georg Lukacs, is expressed by the French situationist Guy Debord, for whom the age of commodity production had, between the Wall Street crash of 1929 and the late 1960s, given way to an age of spectacle. Where earlier media formations had served to gather people into communities, to conserve traditions, and to propagandize new ways of living, spectacular media serve to promote an endless round of imaginary desires that in turn maintain endless overconsumption through which the overproduction required for the survival of capitalism can be regulated. Unlike Baudrillard, Debord—a convinced Hegelian—believed in the necessity of a dialectical resolution to this sham culture.

Ubiquitous Media

Such macroscopic accounts of media history must be balanced against the increasing amount of scholarship devoted to

unearthing and revaluing the histories of specific moments in the history of media. Many textbooks and most popular print, online, and televisual accounts of media history share the linear model of progress (for example, color is an advance on black and white, sound an advance on silent cinema) and a focus on individual contributions. Historians engaged in revaluing the evolution of specific technologies like cinema sound (Crafton) and widescreen technologies (Belton) have made clear the nonlinear evolution of media technologies and techniques, while individual careers have been revalued in the context of publicity campaigns and the emergence of research and development as a core activity of communications industries since the late nineteenth century.

Increasingly, major corporations have been seen as agents of historical change (see, for example, Sanjek and Sanjek), and companies like the BBC and Disney have both official and unofficial historians publishing on them. The digital media have spawned a publishing industry devoted to histories of companies, sectors, software, infrastructure, components, and research institutes. The United Kingdom was the first country to produce a multivolume history of its cinema industry, begun by Rachel Low in 1948. Similar projects now exist or are in progress for many other countries, including France, Germany, and the United States, while loose groupings of researchers are advancing parallel projects on print and electronic media in a number of countries around the world.

The history of print media has been revolutionized by the work of Lucien Febvre and Henri-Jean Martin, Roger Chartier, and Elizabeth Eisenstein, among others, and the role of print in the colonizing and decolonizing processes has attracted especially significant work. Less obvious media formations such as news agencies have also attracted both company and sector histories. Much work has been done to refocus the broad-brush approach to the transition from oral to literary cultures in Europe, Latin America, Africa, and Polynesia, and major work has been undertaken on the links between media, the relations between media and transport technologies, and shared infrastructures like libraries. Such patient and passionate archival research has made it far more difficult to generalize or to repeat unexamined truisms. This has been particularly important to activists and scholars of the globalization process and the transitions from state-run to commercial models of print and broadcasting.

Current Studies in Media History

Two scholars, both of whose careers bridge Latin American politics and French academia, have made sterling progress toward bridging the gap between the macro and micro scales of media history. Régis Debray, best known perhaps for his account of guerrilla war with Che Guevara, has proposed a mediological analysis that, while repeating the linear model first outlined by McLuhan, does so in the context of a materialist philosophy that both derives from and critiques Marxism. Debray argues for a practice that concentrates on the infrastructures and materials of communication. Rather than study the literary style of a correspondence, for example, he points toward the pens, paper mills, postal delivery system, even the rearing of horses on which the delivery of mail depended,

arguing that Voltaire's letters are unthinkable outside a centralized and militarized state. In a series of books published during the 1990s, Debray draws together an eclectic if rather Eurocentric collection of detailed cases in support of a general thesis critical of both idea- and individual-centered historiography. In their place he suggests a multiply overlapping formation of different media usages associated with material practices like the organization of political parties or compulsory schooling. The practice of law and parliamentary democracy require specific media formations that guide and shape their capacities. Epochal changes, however, do not eradicate earlier forms. Like Jay David Bolter and Richard Grusin, Debray argues for the remediation of old media form and content by new technologies. Like Gadamer, he argues that mediation abides in objects, not in their relations; like Friedrich Kittler he sees particular media practices as the basis of the defining discourse networks of particular periods; and like Raymond Williams he believes that Marxism's "superstructure" of ideas is entirely material. His achievement is to have synthesized these earlier arguments into a practice with a powerful political project ahead of it.

Media history also includes critical reflection on its own past. In some ways more radical than Debray, the work of the Chilean exile Armand Mattelart has been instrumental both in accounting for the movement of thought about the media and in the materialization of such thinking in media practice and policy. Like Virilio, Mattelart is convinced of the interrelation of transport, military, and media technologies and is highly critical of the intellectual traditions that have severed media communication from the communication of goods and people. Far less exclusively bound than Debray to the history of Western media, Mattelart has made major contributions to the study of global media over thirty years and has provided radical revaluations of earlier historiography and theoretical accounts, crucially in arguing for a more integral approach to understanding the networks of interaction between transport, production, and communication. Debray and Mattelart suggest ways of rejoining the meticulous assessment of specific moments with the large-scale analysis of historical processes that in some ways echo an earlier tradition in technology and design history marked by the names of Lewis Mumford and Siegfried Giedion. Mattelart is explicit in drawing inspiration from the former. The latter, well known in industrial design circles, has much to tell contemporary scholars about historical methods appropriate to the field. Part of the challenge of media history is to recover from obscurity the work of earlier generations and to revalue the work of cultural historians like E. P. Thompson and George Rudé in the light of the new object of media history.

Popular and occasionally academic histories of the "social impacts" of media, whether of whole media technologies or of specific media artifacts and genres, suffer from the lack of any known society without media. Moreover, any new medium is always mediated by other media and is held by many historians to have older media for its initial content. Polemics blaming media have been rife since Shakespeare's time, when ballads and broadsheets were blamed for apprentice riots. Rock and roll, comic books, video, and video games have been more recent

targets in the West, and television, radio, music, fashion, and Western technological media generally have been blamed in Islam. Norbert Elias suggests a more subtly functionalist approach, writing of popular songs that “the emotional need behind them, born of the impossibility of finding in scanty leisure time the relationships which working life precludes, is absolutely genuine” (p. 34). The attribution of values to specific media is a significant element of media history. It is unclear whether prestigious media like oil painting became male preserves due to their prestige, or whether women’s media like watercolors lost prestige because of their femininity. Both processes probably occurred. Mass culture, in the sense of industrially produced media, has a history of identification with femininity. Novel reading, television, and telephony are among the domestic and private consumer forms that have been strongly feminized. On the other hand, Sadie Plant argues that network computing and mobile telephony correspond respectively to weaving and knitting, women’s media par excellence, explaining women’s high levels of participation in Internet and wireless telecoms. A key task for media history remains that of explaining why human communication, ostensibly the vehicle of democracy and evolution, has so often been restrictive, oppressive, exploitative, and exclusive.

It would appear from the oldest creation myths that keeping secrets and lying have been features of communication since the beginning. Elias proposes the rise of priestly hierarchies as a source of privileged access to key media such as writing and architecture. Jared Diamond adds the proposal that even before recorded history, possession of writing technology was a source of power for would-be conquerors, and that successful enemies adopted the technology for their own. Certainly differential access to specific media was an intrinsic element of rule in India where, as Homi Bhabha points out, the colony was governed by writing, while the United Kingdom’s Parliament ran on speech. Both print and broadcast media have been explicitly deployed in the interests of nation-building from Hitler’s Germany to Jawaharlal Nehru’s and Indira Gandhi’s India, just as standardization of dialects and eradication of minor languages had been a routine activity of nationalist revolutions throughout Europe in the eighteenth and nineteenth centuries. Since communication appears to be an inalienable quality of human societies, and given the lengthy history of intercultural communication at least in the Old World, it seems most likely that media historians must investigate the blockages, delays, and destructions of media flows as much as their origination and propagation.

Among the specific areas where this work might be undertaken are the fields of advertising, marketing, public relations, and propaganda. As an indication of the difficulty of these terms, however, it is important to recall the etymology of *propaganda*: the Vatican office devoted to the propagation of the faith. The modern term has little meaning before the age of mass literacy and broadcast media, even though José Antonio Maravall argues for its relevance to the Spanish Baroque and John Beverley to the colonial period in Latin America. But although there is archeological evidence of street signs among the ruins of Pompeii, it is misleading to understand them as advertising or public relations in any recognizable sense. Such practices evolved in step

with the emergence of mass consumption in the nineteenth century and are deeply grounded in contemporary information-gathering devices. The emergence of contemporary bureaucracies, distinguished from the Baroque clerisy precisely by their modern media (filing cabinets, adding machines, typewriters), is in turn integral to the conception of the public as a body of consumers to whom both political and commercial messages can be delivered. The radical expansion of the commodity form into leisure activities in the later nineteenth century, a process ongoing in the opening up of the People’s Republic of China in the early twenty-first century, required not only mass manufacture and mass literacy but the mass distribution of a repertoire of shared codes, conventions, and desires stemming from the managerial mode of bureaucracy emergent in such communication sectors as the railways and the department store. Certainly the industrialized media deployed techniques derived from the ancients: rhetoric, spectacle, shock, sensuality. The application of concepts of efficiency to communications, however, seems to date no earlier than the Counter-Reformation in Europe, though a case can be made for its significance in the far earlier Confucian bureaucracy in China, where the difficulty of the writing system and the exclusive nature of education were used to limit radically all access to communications systems, including the mails and navigable rivers. It is this admixture of efficiency that characterizes the contemporary industrial communications sector as, in Horkheimer’s terms, instrumental.

At the same time, when even as sophisticated a thinker as Félix Guattari can assert that “domestic life is being poisoned by the gangrene of mass-media consumption” (p. 27), it is important to consider the role of media not only in constructing concepts of domesticity, but in their subversion. Media are not single, nor exclusively industrialized and instrumental. Critics of globalized media, including Ulf Hannerz, Dayan Thussu, Arjun Appadurai, David Morley and Kevin Robins, and Annabelle Sreberny-Mohammedi and her colleagues emphasize that media not only inform contemporary audiences on issues as large as global warming and as particular as human rights abuse; they also provide vehicles, however limited, for democratic participation and creativity, and globalized industrial media are counterbalanced by diasporan cycles of music, stories, art forms, and political messages operating as informal marginalia to the corporate music business, the Internet, fashion, and the postal service. Even where instrumental media are concerned, the history of audiences indicates a complex work of attention and signification undertaken by viewers, readers, listeners, and participants perpetually ready to convert the proclamations of power into carnival, satire, and rebellion. The significant rise in both the numbers of global organizations and participation in them likewise suggests that media processes remain at least as complex as in former epochs, and therefore can be considered to continue to exist as historical processes.

In conferences during 2000, film archivist Paolo Cherchi Usai estimated that nine billion hours of moving image media were being generated annually. Add to this photographs, print, Web sites, e-mails, let alone conversation, and the information produced in any one year is beyond the reach not just of any one scholar, but of the whole community of media historians. Seen from this standpoint, “the media” as object of study

VILÉM FLUSSER

The work of Vilém Flusser, which has begun to be translated into English in the last decade, is destined to have a major impact on media history. Exiled from his native Prague in 1939, Flusser turned his exile in Brazil and later in France into the grounds of a radical philosophy of freedom. Linking information theory with phenomenology, Flusser argues that pre-history's image-based media were mythic in tone and magical in orientation. They intended to control the world by picturing it. The invention of the alphabet created a new mode of control: lineal, causal, and ultimately scientific. In the invention of photography, he sees the return of the mythic image, but this time an image not of the world but of texts. Rather than image the world, film, television, photography, and computer-generated imaging depict scientific knowledge, philosophical arguments, political beliefs, and commercial messages.

Since writing marks the beginning of history, the technical image marks its end. The

post-historical image is programmed by the texts that precede it, and in turn programs its end users. Every new image is a step toward the exhaustion of information, understood as the improbability of a given message in a particular system. Every new photograph both exhausts the stock of possible photographs still to be taken and adds to the assimilative power of the photographic apparatus. The task of photographers, and by extension all who work in the technical media, is to work at the level of information, program, code, and apparatus to increase the level of improbability. As writing loses its centrality, humanity loses the historical consciousness of linear causality. The resultant universe is entropic in information theory and absurd in phenomenological thought. The task, then, of experimentation in media and of media history alike is to create meaning in the face of randomness and freedom in the face of its necessity.

appear impossibly huge. At the same time, media history, and media theory and criticism, with honorable exceptions, have failed to address some key areas, notably amateur media, consisting of diaries, photo albums, letter writing, and Web sites, and workplace media, including bookkeeping, filing, cash registers and adding machines, cartography, and professional software. Equally, again with honorable exceptions, the focus has been largely on the developed world seen from Eurocentric positions. Acquainted as they are with the irreparable loss of much if not most early film, radio, and television, archivists are painfully aware that their inevitable sampling must respond not only to current but to future research agendas, and that in addition to content, it is increasingly necessary to archive hardware and documentation. The study of humans as the communicative species becomes both more materially feasible and more challenging, the richer and more archivable our communications become.

India

Islamic Medicine

CHINA

"Classical Chinese medicine" refers to the cumulative practices and abstract doctrines passed down by a small literate minority in China beginning in the first century B.C.E. As in any traditional society, this elite knowledge has made up only a small part of China's health care practices, which include self-therapy, family therapy, and ritual and religious curing. Since 1949, as these elements have changed and their balance has shifted, state-regulated medical practice has come gradually to be divided between biomedicine and a greatly modernized form of the classical art generally called traditional Chinese medicine, or TCM, and hybrids of the two.

Literature

More than ten thousand medical books survive from imperial China (221 B.C.E.–1911 C.E.). These include a small number of doctrinal works with a large accumulation of commentaries and scholarly studies; works on nosology and diagnosis; a great many formularies, most of which systematically set out therapeutic methods; collections of materia medica, which over the last millennium tended to incorporate compound drug formulas; collections of the medical case records of physicians; as well as more or less distinct genres for gynecology, pediatrics, and external medicine. Since the 1950s, scholars in China have edited, annotated, and reprinted many significant early works, and have translated some of the most important into the

modern vernacular. Scholars in Asia and elsewhere have used this literature to throw light on a wide range of Chinese ideas, ranging from ethics to gender.

Doctrines

In most of early medieval Europe, only a few classical medical treatises survived, primarily in the libraries of monastic institutions, and most medical practitioners had little education. The outcome was a split between theory and practice. In China there was no such split. Almost all of the literature, including works on doctrinal foundations, was written by practitioners.

Excavated writings on medical divination (from c. 316 B.C.E.) and on medicine (from c. 205 B.C.E.) show traces of a gradual separation of both from popular ritual healing, which had a strong occult component. The first collection of mature classical writings is the *Yellow Emperor's Inner Canon* (*Huangdi nei jing*, c. first century B.C.E.). It was one of a number of foundational works but the others of the same period have been lost. Although physicians through history considered the *Inner Canon* a coherent two-part treatise, David Keegan has shown that it incorporates many separate texts from different sources, some of which comment on, elaborate on, or disagree with others. The various understandings of the body, health, illness, and therapy contained in the work are inconsistent in many respects. Still, all its component text understand the body to be an ensemble of processes that, in health, remain in harmony with those of the cosmos. Reconciling the discrepancies in this most authoritative of classics in order to present a single picture was the goal of several doctrinal works over the next two centuries.

The *Inner Canon* defined what remained the chief characteristics of medicine: It was process-oriented and relational. Medicine treated a complex ensemble of life processes. Diagnosis was generally a matter of identifying abnormal states of the body as a whole (although, given the diversity of practitioners, the training of many allowed no more than proceeding from a list of symptoms to the name of a disorder). Even physicians who treated particular local symptoms did so from the viewpoint of the whole. Wounds were disorders in the same sense as fevers; they affected not only the lesion but all body processes. Body and mind, complementary aspects of a single organism, were bound to affect each other. Because a disease was a process, doctors had to determine its stage and anticipate its evolution. Medical thinkers defined concepts in relation to others; yang was never an absolute property, but implied a relationship to something else that, in the particular pair, was yin. A young woman might be yin in a discussion of gender relations that compares her with a male, but yang in comparison with an aged man who lacks her vitality.

The conviction that both the state and the body are microcosms that partake in the dynamic order of the universe emerged in political theory, moral philosophy, and medical thought over the last three centuries B.C.E. Intellectuals built these doctrines on the concept of *qi*, which was both the basic material that filled the universe and formed individual things, and the vitality that maintained body states and brought about change. The *Inner Canon* integrated this notion with that of yin and yang and the five phases (*wuxing*). It interpreted the

former as paired, opposed, but complementary aspects of *qi*, and the latter as five aspects of it, permitting a finer analysis of interaction in cyclic change. This synthesis became ubiquitous in the history of Chinese ideas. Within medicine, additional analytic categories, especially threefold and sixfold ones, made possible a sophisticated organization of knowledge.

Authors built up a model of fivefold and sixfold systems of vital function that stored and circulated *qi* throughout the body. The supply of *qi* was partly inborn and partly metabolized from air (i.e., ambient *qi*) and food. These systems were named for the main viscera. Unlike in the European understanding, organs were not considered processing stations, but rather bureaucratic offices responsible for order and control of spontaneous processes.

The main principle of health was the unimpeded circulation of *qi*; blockages and stases led to pain and dysfunction. The normal body's relation to its environment was equally important; it had to be open to air and food, but closed to pathogens, and it had to excrete what it could not assimilate without allowing leakage of the body's own *qi*. Medicine from the earliest times also incorporated the value of moderation, not only in conduct but in thought. Just as sensual indulgence could open the way to invasion by pathogens, jealousy or longing could generate medical disorders.

Therapy

Physicians largely depended on opposition therapy, but could modulate it in sophisticated ways. Once the practitioner knew the character of the disorder, he chose therapies to oppose and overcome the imbalance by strengthening the body's functions or attacking the pathogenic agent. The physician's tools included modifications of diet and exercise, massage and manipulation, and a great variety of drugs (over eighteen hundred, mineral and animal as well as botanical, in the great *Bencao gangmu* [1596; *Systematic materia medica*]), as well as acupuncture (inserting needles at certain locations on the circulation pathways to adjust the movement of *qi*) and moxibustion (burning cones of leaf pulp to stimulate these locations more intensely).

Modernization

Biomedicine had little influence on health care in China until after 1949. At that point there were too few qualified personnel to provide basic medical care for the whole population. The government of the People's Republic organized a network of schools to train doctors of traditional Chinese medicine (*Zhongyi*) and a system of modern medical schools. Both trained secondary-school graduates. The Cultural Revolution, from the mid-1960s to the mid-1970s, brought the two closer as those in power demanded that physicians in each sector be trained more than negligibly in the other. This demand also incorporated in the curricula of the TCM schools modern subjects such as anatomy and biochemistry. The government's policy of pushing for synthesis led to textbook interpretations of the old functional discourse in new frameworks close to Western anatomical, lesion-centered views.

The basic education of physicians in imperial China was a matter of memorizing, and learning to apply the methods of

reasoning and treatment in classical writings. But by 1980, few secondary-school graduates learned to read classical Chinese. The classics necessarily played a small part in their medical courses, and their confidence in the use of such traditional concepts as *qi*, yin and yang, and the five phases lessened. By 1980 symptom-based diagnosis that drew on biomedical concepts had become common among young practitioners. Therapy increasingly added to traditional remedies both standard packaged formulas and biomedical drugs. By 2000, medical-school teachers and their pupils were using many styles of synthesis involving traditional and modern medicine—recapitulating the diversity of medical reasoning and practice in previous centuries.

EUROPE AND THE UNITED STATES

Organized societies such as Babylon and ancient Egypt supported the practice of professional medicine, including surgery, but it was in Greece that European or, more cosmically, Western medicine first emerged after the fifth century B.C.E., when the classic texts began to appear.

Ancient Greece and Rome

The ancient Greeks had many ways of healing the sick. Plant gatherers and drug sellers, especially of herbal medicines, were the key people in the establishment of the vast Greek pharmacopoeia. Women healers had their own special categorization. And there were two groups making up a motley crew specializing in diagnosis and treatment calling on the gods and their evil relatives. One constant in Greek medicine was the existence of religious medicine, practiced in the sanctuaries of Asclepius, the Greco-Roman god of medicine. The heritage of Asclepius continues to survive in his professional symbol, the caduceus (one snake only). The medicine of the gods used declamation, singing, and music to speed up the healing process. Ancient Greeks, heavily invested in the "irrational,"

had more in common with Catholics who go to Lourdes for cures than with rationalist skeptics.

Hippocratic medicine. The most famous document in medical history, the Hippocratic Oath (c. 400 B.C.E.), which established a model of ethical and professional behavior for healers, invoked all the gods, beginning with Apollo. When did the epistemological rupture between mythical thinking and the sort of thinking flattered as scientific, implying a rupture between sacred and scientific healing, take place? The traditional answer is that the change occurred or at least is evident in the Hippocratic corpus, a diverse collection of sixty-odd works by different authors beginning in the sixth century B.C.E., cobbled together about 250 B.C.E. in the library at Alexandria. (A scholarly industry keeps changing the dates of composition of the works and squabbling about textual authenticity.) In the ongoing creation of the Western medical myth it is Hippocrates (the mythic father, also a real person living c. 460–370 B.C.E.) and his followers, who are given credit for establishing the rationalistic basis of scientific medicine. The text *On the Sacred Disease* (c. 410 B.C.E.) denies that epilepsy is a sacred disease, assigning it a natural etiology within the humoral paradigm based on the four body fluids: phlegm, yellow bile, black bile, and blood. (Epilepsy was caused by phlegm convulsing the body as it struggled to free itself from being blocked in the air passages.)

This Hippocratic corpus is notorious for having developed the theory of humors (*chymoi*), which provided a grid for many medical systems over the centuries. *On the Nature of Man*, an anatomical and physiological treatise, went farthest among the Hippocratic writings in the acceptance of the theory of the four humors. According to humoralism, a person's physical and mental qualities are determined by the four chief fluids of the body, thus making it possible to explain health and disease in humoral terms, with health being an overall balance of the four humors. An upset in this balance, with too much or too little of a humor or two, produces disease. The grid of the system was composed of the humors associated with four organs and the qualities or nature of their products. The heart is associated with blood, warm and moist; the brain with phlegm, cold and moist; the liver with yellow bile, warm and dry; and the spleen with black bile, cold and dry. A sick person could correct an imbalance by taking substances characterized by the opposite qualities. In this scheme both people and medicinal substances had complexions and temperaments, that is, a defining humoral composition. The qualities of the humors were thought to correspond to the qualities of the basic elements of the universe: air, water, fire, and earth. This unified theory of humanity in the universe proved so satisfactory to the Western mind that the medical part of the theory was accepted, though much mangled, up through the eighteenth century. The theory "provided the 'reasons' for techniques of evacuation . . . such as venesection [blood-letting], cupping, cathartics, emetics, sneezing, sweating, [and] urination and so on" (Ackerknecht, p. 53). In the flexible Hippocratic humoral grammar the number of humors varied from one text to another. These humors also existed in a healthy person, though invisible to the medical gaze in this case.

The Hippocratic treatise *On Regimen* gave a great deal of attention to diet in the context of an active, well-regulated life.

People absorb food and air, which become part of them and are also the main cause of internal diseases. Wine, which Louis Pasteur later classified as a food, was also an ideal item of medication, for it could be prescribed in many forms and was the best of excipients for the many herbs at the doctor's disposal. Taken pure or mixed with other ingredients, wine could be tailored to individual constitutions. The text *Affections* praised wine and honey for both sick and healthy people. Wine could be mixed with honey or even milk. Greek civilization generally required that wine be cut with two or three parts water to one part wine, but the medical canon permitted the doctor to prescribe it pure or in a variety of mixtures, according to the seasons. In winter the heat and dryness of a small amount of pure wine could counter the baleful effects of humidity and cold. Sometimes doses were quantified, sometimes not.

Galen. By the third century B.C.E., Greek civilization had spread through the Mediterranean basin, blossoming brilliantly in Alexandria, where Ptolemy I ruled from 323 to 285 B.C.E. Hellenistic or Alexandrian medicine placed much emphasis on anatomy and physiology, with Herophilus of Chalcidon (c. 330–c. 260 B.C.E.) and Erasistratus of Chios (fl. 330–250 B.C.E.) providing a mechanistic description of the organs of the human body; humoral theory played only a minor role. Dissection became an important tool in the advancement of medical knowledge, leading to the discovery of new organs such as the prostate and establishing the importance of the brain within the newly represented nervous system. Both theories and sects pullulated in Greek medicine, including groups now classified as empiricists, rationalists, and methodists. Healers became more clearly professional, though they were still trained privately rather than institutionally. By the time Rome conquered the Greek world in the second century B.C.E., Greek medicine was already leavening the simpler medical thought of the conqueror. Greek was a technical language designating diseases, remedies, and instruments for which words had not yet been invented in Latin, but sometimes with the arrival of new works in medicine and in botany Greek terms drove out Latin words in professional discourse. Many of the Roman healers were not citizens, and some were even slaves without civil rights, thus ensuring low social status for most physicians.

The most famous doctor in the history of medicine between Hippocrates and Sigmund Freud was a Greek practicing in the Roman Empire. Other names (Aretaeus of Cappadocia and Soranus and Rufus of Ephesus, for example) earn a paragraph or so in medical history books but only in the shadow of Galen (129–216 C.E.). After arriving in Rome in 161 he gained a reputation in treating upper-class patients, became physician to the imperial family, and pioneered in sports medicine as official physician to the gladiatorial school. He was one of the greatest scribblers in the history of medicine; the classical philologist Ulrich von Wilamowitz-Moellendorff (1848–1931) called him a windbag. He produced works running the gamut from *On Bones for Beginners* to his more philosophical work, *On the Therapeutic Method*. Much was just lifted wholesale from other authors. Galen believed that the physician is a philosopher as well as a healer. A good case can be made for Galen's being "the central figure in the development of the Western tradition of medicine," as Vivian Nutton points out, especially in

his transmission of a Galenized Hippocratic gospel to posterity (p. 58). The great clinician, perpetuator of the tradition of bedside medicine, at least for his wealthy clients, stands out also for his discoveries through experiments on animals and for diagnosis and surgery. Dissection of human corpses and, possibly, vivisection of living criminals had gone out of style, with animals replacing the cadavers and victims. Galen left significant errors for other great minds to correct—in clinical medicine as well as in physiology and anatomy. His legacy was eclipsed by the breakup of the empire accompanied by economic and urban decline.

The Medieval World

With the rise of Christianity in late antiquity, medicine gave a greater role to religion; miracles became more important than enemas. Earlier medieval Christianity did preserve a certain amount of learned medicine in encyclopedias, and the creation of “great texts” gave a coherence and canonic orthodoxy to an ossified Galenism that survived into the seventeenth century. Folk or popular medicine was also incorporated into medical literature, though it is doubtful that it was practiced more widely than in antiquity. In terms of remedies, there was a great deal of overlap between popular and professional medicine. The *Liber simplicis medicinae* (Book of simple medicine, c. 1150–1160) by the famous healer Hildegard von Bingen provided an encyclopedia of these traditional remedies, many herbal and some fantastic, for numerous ailments.

Arabic-Islamic medicine. During the Middle Ages the most dynamic and learned European medicine was Arabic or Arabic-Islamic, though there is little in the Koran about medicine. Arabic medicine down to the eighth century was based on popular practices using a *materia medica* of natural items, organic and inorganic, including camel urine as a general tonic. Urine (along with feces) was also an important ingredient of European *Dreckapotheke* (filth pharmacy). Greek humoral medicine, based on a secular culture, probably survived among the elite in cities of the eastern part of the Roman Empire, even after the Arab conquests. Greek medicine revived in ninth-century Baghdad, chiefly as a result of a translation of Greek texts into Arabic. The works of Galen, the medical culture hero, became the vehicle of Hippocratic medicine in the Eastern and Western caliphates, especially in Muslim Spain.

By the eleventh century, a vast body of translations with commentaries was augmented by an original medical literature in Arabic. Arab-Islamic medicine produced remarkable summaries based on a wide range of sources. As in the written history of Western medicine, historiography tends to emphasize the importance of great physicians, both for their clinical acumen and for the famous works they spawned. Among the great Persians were the philosopher-physician al-Razi (c. 865–925), a critical disciple of Galen; the prolific Avicenna, (Ibn Sina; 980–1037), author of the *Canon* or the medical code, a million-word everything-you-need-to-know for doctors; al-Zahrawi, who wrote a classic text on surgery (mostly cautery in Arab-Islamic medicine); Averroës (Ibn Rushd; 1126–1198); and Moses ben Maimon (Maimonides; 1135–1204), who ended up in Cairo as court physician to Saladin (1138–1193). Razi’s work *On Measles and Smallpox* was still useful enough

to be published in English by the Sydenham Society in 1848. Spread over a vast empire, Arab-Islamic medicine vastly expanded the healer’s pharmacological arsenal with drugs and remedies from Persian and Indian sources, created the first pharmacies, and laid the chemical (alchemical) foundations of modern pharmacy. The vocabulary of European languages was considerably enriched by this activity and by the creation of medical discourse. Medical education was still mostly a private affair, except in the hospital, an important fixture in cities. Roman hospitals had been restricted to soldiers and slaves; Islamic hospitals open to all (a pious hope) were real medical institutions. In 1365 Granada established the first European mental hospital, following the pioneering institutions in other Islamic countries. It looked as if Greek medical glories had been restored and improved.

How it all came to an end is open to debate. Erwin Ackerknecht explained the decline of Arab-Islamic medicine in Gibbonian terms: early Arab tolerance was submerged in Islamic fanaticism. Just add the triumph of the barbarians and one has a crude version of Edward Gibbon’s (1737–1794) model of the decline and fall of the Roman Empire. Christians conquered Cordova in 1236; the Mongols sacked Baghdad in 1258; the Ottoman Turks conquered the Levant—Constantinople fell in 1453—and swept into the Balkans and the Mediterranean. Arab civilization declined after the thirteenth century, but the old medical system survived, especially in the Ottoman Empire, until the nineteenth century and continues to survive in a form known as Yunani medicine (*Unani tibb*, Greek medicine) on the Indian subcontinent. What influence Arab-Islamic medicine had on the rise of the medical profession in medieval Europe is open to speculation, but it is clear that Arab medicine exercised a powerful intellectual influence on the revival of Greek medicine in the early medieval period.

Medieval physic. This revival of formal medicine in the West began in the southern Italian town of Salerno, a dynamic, multiethnic place under Norman power; the town is a hundred miles south of the great monastery of Monte Cassino, whose library held a collection of medical texts, and which stimulated an interaction with Salerno. The teachers at the medical school in Salerno developed a good curriculum, founded on their translations of the great texts of Greek (from Arabic) and on Arab medicine. Constantine the African (Constantinus Africanus; c. 1020–1087) was instrumental in transmitting a Galenized Hippocrates to the Latin world with its new concepts, couched in a new technical vocabulary, in anatomy and physiology. By the thirteenth century, an enriched Arabic-tinted medical Latin identified medicine as a separate and elite discipline—and a few centuries later provided medical discourse for Molière. The new medical canon, flattered as the *Little Art of Medicine* (Articella) in the sixteenth century, was based on a group of translated works, especially Constantine’s version of the *Liber ysagogarum* (Medical questions) or introduction of *Hunayn ibn Ishaq al ibadi* (Johannicius). This work became the basis for the medical teaching of the difficult art of diagnosis and of the gamble of therapy—Constantine’s book on drugs, the *Antidotarium*, expanded the therapeutic repertoire. This introductory book emphasized the therapeutic need to regulate

Galen's "six nonnaturals" (food and drink; sleep and waking; environment; evacuation, including sexual; exercise; and mental state) in order to preserve the natural humoral balance in the body, thus avoiding illness, or to restore balance, thus curing an illness. This emphasis on regimen or lifestyle was made famous in the popular *Regimen sanitatis salernitanum*, a book of verses perhaps concocted by Arnau de Villanova (c. 1235–1312), physician to the high and mighty (popes and kings) and professor at the University of Montpellier. Many popular works adopted this holistic framework in giving advice to the sick and those trying to stay healthy.

With the economic revival of Europe in the period 1200–1350, there appeared an age of construction in hospitals and universities as society invested in the care of the sick and the production of clergy, lawyers, teachers, and doctors. Medical education, when it was organized in places such as Bologna and Montpellier, was a long, tedious affair (about ten years) attempted by few. Padua, degree mill of the age, granted nine medical and surgical degrees in 1450; it had a large faculty of sixteen. Europe probably produced enough physicians to treat elite patients and to discourse with them in the Aristotelian lingo they both had ingested in the faculties. The rest of the population cured themselves or depended on charlatans (not necessarily a pejorative designation) or empirics of varying degrees of ignorance and skill. Neither doctor nor empiric could do much in dealing with smallpox, influenza, insanity, leprosy (a popular diagnosis in the eleventh and twelfth centuries), and the Bubonic plague (1347–1351), which killed off about a quarter of the European population. The wise doctor limited himself to dietetics, according to the Galenic gospel of the "nonnaturals," some drugs, and a bit of minor surgery. With a degree and well-heeled patients, he could become rich. There was not much competition. In 1454 Vienna, with a population of fifty thousand, had eleven M.D.s.

Medieval surgery. Surgery, often identified as a craft, has sometimes been promoted to the status of an intellectual adventure. It was certainly a dangerous though not necessarily fatal adventure to have surgery in pre-Listerian times. Roman surgery can appear "remarkably modern," meaning comparable to the surgery of the 1970s (Nutton, p. 57). Great surgeons such as John Bradmore (d. 1402), John of Arderne (c. 1307–1370), and Henri de Mondeville (c. 1260–1320) were remarkably successful in carrying out dangerous operations, some on the battlefield, often improving on ancient techniques. It is not surprising that mortality rates were high; what is surprising is the survival of a patient exposed to massive infection. The ancient technique of using wine to irrigate wounds and incisions is probably one part of the explanation. Surgeons liked to write as well as cut. The leading surgeons produced classic texts, thus following in the literary Hippocratic-Galenic tradition. Outside Italy surgery may not have been a respectable part of the curriculum, but from the twelfth century on, leading surgeons were closer to physicians than to barber-surgeons and empirics; in some towns cooperation between all groups was more striking than clashes. Even snarling Parisian surgeons and physicians could come to a limited agreement in 1210 over dissections. While the doctor envied the surgeon's skill, the surgeon lusted after the doctor's cultural capital and

academic baggage. The social status of surgery was helped by the official role of the surgeon in autopsies for investigations of homicide and in the public dissection of criminals. The growing importance of anatomy (including the dissection of human corpses) in medical education during the fourteenth century also promoted the surgeon. Medicine and surgery had become part of society in an unprecedented way as a result of the new governmental function of practitioners and the related development of institutions.

Renaissance Medicine

In the sixteenth century, Greek medicine was reborn yet again but with a difference. The upside of the fall of Constantinople was an influx of Greek scholars and manuscripts into Italy. A scholarly industry soon developed for the study of ancient Greece and for the publication of the works forming the basis of Western civilization, including medicine. In 1525 the Aldine Press in Venice published Galen's complete works in Greek. (In the sixteenth century 590 different editions of Galen were published.) The next year Aldine also published the Hippocratic corpus. New Latin translations soon appeared for the Greekless. Medical humanism was on a solid footing; what the return to a true Galenism meant for the practitioner and patient is not clear, except for a new emphasis on the etiology of disease and the tailoring of therapy to a profile of the individual patient. Clinical bedside teaching—its origins are piously traced back to Hippocrates—was integrated into medical education at Padua in 1578 by Giambattista da Monte (1498–1552), who was also keen on method as the key to knowledge and practice. Galen's *Method of Healing*, brought up to date by the professors, could put doctors on an infallible path to correct diagnosis and treatment. All they had to do was look in a *practica*, or crude physician's handbook, whose professorial prolixity often reduced its usefulness.

The new anatomy. Historians agree on the main developments in Renaissance medicine: first, the revival of a modestly revised Galenism; second, the related renewal of anatomy, which was linked to the flourishing artistic culture in Italy. Artists used the knowledge from dissection as the conceptual foundation of the new art. Anatomical texts illustrated by artists displayed a representational, natural body rather than the pedagogical schematic model of medieval texts. Michelangelo collaborated with Realdo Colombo (1516?–?1559), who in 1548 became professor of anatomy at the Papal University in Rome. A great deal of the new work in anatomy was concerned with modifying Galen, who had sometimes extrapolated from animal to human anatomy, as in the case of the five-lobed liver. The major demolition job on Galen was done by one of his most fervent disciples, Andreas Vesalius (1514–1564), who in 1537 moved to Padua, took his degree and, though an academic physician, became lecturer in anatomy and surgery. Influenced by the Bolognese model, Vesalius increased his dissecting activity—a sympathetic judge increased his supply of cadavers of executed criminals—and by lecturing while dissecting, he integrated physician, anatomist, and surgeon and gave a coherence to the subject. In 1543 Vesalius published *De humani corporis fabrica* (On the fabric of the human body), a great classic of descriptive anatomy. This book

The Anatomy Lecture of Dr. Nicolaes Tulp (1632) by Rembrandt. Oil on canvas. The study of anatomy dates back as early as 1600 B.C.E. In the fifth century B.C.E., the Greek physicians Herophilus and Erasistratus made the first substantial progress in the field by confirming many bodily functions through dissection. © FRANCIS G. MAYER/CORBIS

was “the first proper account of *human anatomy*” (Wear, p. 275); the artistic but scientifically precise illustrations were a key part of the text. By his teaching and book, Vesalius eventually changed the way doctors understood the human body, ensured the triumph of an anatomical method based on dissection and observation, and left future investigators plenty of problems to solve within the emerging physiological paradigm. Galenic views on the blood and the heart, or his cardiovascular system, came to be recognized as seriously flawed. The new model was completed *grosso modo* in 1628, when William Harvey (1578–1657) published *An Anatomical Essay Concerning the Movement of the Heart and Blood in Animals* (*De motu cordis*).

The Harveian Revolution (Seventeenth Century)

Until the seventeenth century, medicine operated within the context of the Galenic blood system, or rather, two blood systems. Using chyle (concocted in the stomach from food), the liver produced venous blood, which moved through the veins to various parts of the body to provide for nourishment and growth. The heart was the source of arterial blood, a concoction of venous blood, and *pneuma* (vital air, the stuff of life), which also moved

through the body as needed. The venous blood seeped from the right side to the left side of the heart through invisible pores in the interventricular septum. The air came from the lungs via the venal artery (today’s pulmonary vein). Blood did not return to the heart but was consumed: no circulation. This coherent, rational system, concordant with major therapies, also explained mental functions by diverting a little arterial blood for conversion into animal spirits (highly refined spirituous air) to flow through the nervous system.

Movement of the heart and blood. Harvey was a Cambridge man who took his medical degree at Padua, where he worked under Girolamo Fabrici (Fabricius ab Aquapendente; c. 1533–1619), the first anatomist to discuss the venous valves (*De venarum ostioliis*; 1603). By the time Harvey arrived in Padua, Galen’s model had been seriously damaged, though no one had thrown Galen’s works into a bonfire, as Paracelsus had supposedly done with Avicenna’s *Canon* in 1527. Vesalius had denied the origin of the vena cava in the liver and, in the second edition of *De humani corporis fabrica*, the theory of the porous septum in the heart. After some vivisectionist experiments, Columbo argued for the pulmonary transit, or

movement of blood through the lungs, and also described accurately the action of the heart in systole and diastole. Other anatomists confirmed these discoveries.

On his return to England, Harvey practiced in London, becoming one of the city's most famous doctors and after 1618 one of the royal physicians. *De motu cordis* does not introduce its great novelty, the circulation of the blood, until chapter eight, and then only apologetically in an Aristotelian, vitalistic framework. Unlike René Descartes (1596–1650), Harvey was not a mechanist. His work was based on dissection, vivisection, and a famous quantitative experiment in which he measured the amount of blood passing through the heart in a given time, thus showing that the system had to circulate the same blood or explode. Of course Harvey's argument on circulation was incomplete because he could not see the capillaries, though he inferred their existence; Marcello Malpighi (1628–1694) used a microscope to discover them in a frog's lungs (*On the Lungs*, 1661). Robert Hooke (1635–1703) as well as an Oxford group pinpointed the importance of the mixing of air and blood in the lungs. (An explanation of respiration, completing the system, was not possible before the chemical revolution of the late eighteenth century.) Galenic physiology, with the liver as a blood-making organ, became untenable, as Jean Riolan the Younger (1580–1657) recognized in a weak scientific attack on Harvey, who had little trouble in showing it to be nonobservational nonsense. Physicians were too conservative to abandon the Galenic practice of venesection, and this points to a problem of new medical science: the development of a related therapy is usually in the future, leaving doctor and patient both victims of the old science with its traditional therapeutics.

Paracelsus: Crude chemotherapy. The end of Galen's iconic status was balanced by a revival of Hippocrates, the perfect cover for an attack on orthodoxy. Paracelsus (Bombast von Hohenheim; 1493–1541) denounced learned medicine but praised Hippocrates, a curious patron for his brand of medicine based on the Christian religion, magic, astrology, observation, and personal experience. Ackerknecht called him a “medical Doctor Faustus” (p. 108). Paracelsus's cosmic “doctrine of signatures” identified the curative power of plants according to their resemblance to the organ affected; this was a pretty standard belief in popular medicine as well. In his natural philosophy, the Aristotelian-Galenic system of qualities, elements, and humors was replaced by a chemical fantasy associating substances with principles of solidity (salt), inflammability (sulfur), and spirituousness (mercury). Specific remedies of this chemical therapy cured specific diseases, whose agents might be poisons from the stars or from minerals on earth. Paradoxically, the advocate of the idea of a chemical etiology of and cure for diseases is the culture hero of alternative medicine. He was antiestablishment. Reading deeply into the book of nature, he concluded that therapy should be based on the principle of “like cures like”: applying what is suitable to the affected part, rather than following Galenic therapeutics based on the principle of opposition. Paracelsus had many followers, the most famous being Jan Baptist van Helmont (1579–1644), master of medical chemistry (iatrochemistry) and defender of the ontological concept of disease, meaning

that every disease has its own unique principle and therefore a specific treatment. The theory was useful in attacking blood-letting as a debilitating practice based on the erroneous idea that plethora causes disease. But like its Galenic enemy, Paracelsus iatrochemistry declined in the second half of the seventeenth century. The choleric Harvey, no friend of chemistry, regarded the Paracelsans as “shitt-breeches.”

Sydenham: Bedside medicine. Unlike Harvey, Thomas Sydenham (1624–1689) was on the winning side in the English Civil War. Unlike Harvey, he did not have any scientific manuscripts for soldiers to destroy. Sydenham, an Oxford man scornful of learned medicine, advocated observation and the bedside tradition. His hero was Hippocrates, reinvented as an inspiring clinical spirit at the bedside. The “English Hippocrates” believed in specific remedies for diseases; cinchona bark against the ague (benign tertian malaria), for example. Unlike Harvey, Sydenham, accepting Francis Bacon's (1561–1626) philosophy of science, was interested in classifying diseases, epidemic fevers in particular; the botanical model was useful here in his attempt to develop a clinical medicine for the London masses who suffered from the ague from March to July. In the midst of these conceptual upheavals on the functioning of the body and the nature of diseases, therapeutics changed little, except that a “new” disease like syphilis might require a “new” and horrible treatment (mercury). Herbal remedies continued in both popular and professional use. The old humoral procedures of bleeding, purging, induced vomiting, blistering, and cupping survived in the medical repertory. No wonder Sydenham admitted that without opium, medicine was a cripple. (Sydenham's laudanum contained 200 grams of opium, 100 grams of saffron, and 15 grams each of cinnamon and of cloves in 100 grams of Malaga wine.) Sydenham doubted that using the microscope or studying anatomy would advance medicine. Prophecy should be left to the prophets.

From Enlightened to Clinical Medicine

The age of Enlightenment (and revolution), even in medicine, is how historians conceive of the eighteenth century. Centers of new or innovative medicine shifted over the centuries: ancient Athens and Rome, Salerno, Montpellier, Edinburgh, Leiden, Vienna, London, Paris, New York, and so forth. After the medieval creation of universities, learned or academic medicine, often connected to a clinic or a hospital, played a major role in reorienting medicine in theory and sometimes in practice. In spite of the profession's hero worship of Hippocrates, what was going on in faculties of medicine by the late seventeenth century had little to do with classical medicine. At Leiden, then “the medical center of the world” (Ackerknecht, p. 130), teaching was organized on the basis of subjects rather than the teachings of the great doctors; bedside teaching and the dissection of corpses had also become important. Hermann Boerhaave (1668–1738) was at the center of the new dispensation. His students included the founders of the great centers of clinical medicine in Edinburgh and Vienna. Boerhaave, inspired by experimental natural philosophy, concocted a hydraulic model of the body with a corresponding mechanistic explanation of disease. His mighty text

Illustration of physician René-Théophile-Hyacinthe Laënnec (1781–1826) tending to a patient, after 1816 painting by Theobald Chartran. During the late eighteenth century, medicine began to progress into an institutionalized occupation, rather than just a societal system, and accredited doctors began to rise in prestige.

The Institutes of Medicine (1708) ran through ten editions and endured a few translations into vernacular tongues. In 1724 Boerhaave wrote up a famous case history of a male who had died of a ruptured esophagus. It can be argued that this was the first modern form of this literary genre, covering the patient’s history, a physical examination, a diagnosis, the course of disease, and an autopsy. Boerhaave developed a modern medical curriculum with a sequence of natural science, anatomy, physiology, and pathology, complemented by clinical instruction in a twelve-bed ward. This looks like the birth of that elusive entity the clinic; Michel Foucault insists that it was a protoclinic, for Boerhaave still struggled in the “old age of the clinic” (Foucault, ch. 4).

Pathological anatomy. It had become clear that death could give insight into disease, possibly even establish its cause. Though tedious to use because of its two correlating indexes, the prolix work *On the Sites and Causes of Disease* (1761), by the Paduan anatomist Giovanni Battista Morgagni (1682–1771), achieved part of its noble aim of establishing a connection between the patient’s symptoms and the lesions of the diseased organ in the corpse. Morgagni logged in some seven hundred autopsies. A new etiology of disease shifted it from a general theory to a specific organ, a site, where lesions

produced by morbid changes in the organ could be matched with symptoms of disease in the patient. The London doctor Matthew Baillie (1761–1823) carried this anatomic-pathology further in a famous work on *Morbid Anatomy . . .* (1793), which provided classic textbook descriptions of diseases, including cirrhosis of the liver and emphysema.

In Paris the hospital came to dominate medicine through surgery and teaching. At the gigantic Hôtel-Dieu, Xavier Bichat (1771–1802) did six hundred autopsies as a basis for his *Treatise on Membranes* and his book *General Anatomy applied to Physiology and Medicine* (3 vols., 1801). Bichat’s famous, complex theory of tissues, or membranes, shifted the etiology of localized disease from the organ to lesions of specific tissues. This shift allowed a lesion to be more precisely identified according to the particular tissue affected rather than the whole organ: inflammation of the heart was replaced by identification of inflammation of membranes or the muscle itself. “Life, disease and death now form[ed] a technical and conceptual trinity,” as Michel Foucault put it in consecrating “death [as] the great analyst” (p. 144). Death, formerly the domain of the priest, had become part of medicine, and, along with life and disease, integrated into the medical gaze. Or, as Roy Porter puts it in ordinary discourse, Bichat’s “work laid the foundations for nineteenth-century patho[logical] anatomy” (p. 265). Medicine could become a science enabling diagnosis to be more precise. The tool was the modern physical examination (still the doctor’s best diagnostic tool), which consecrated the techniques of inspection, palpation, percussion, and auscultation. The patient’s symptoms and the signs detected by the doctor could be related to the lesions that had been observed in diseased organs. With a galaxy of stars—Jean-Nicolas Corvisart des Marets (1755–1821), René Laënnec (1781–1826), and Pierre Louis (1787–1872) prominent among them—Parisian hospital medicine enjoyed its day in the sun as a model having considerable influence on medical thought and education.

The clinic. What was the clinic? The teaching clinic meant different things in different countries. In France clinical medicine put an emphasis on surgery, chiefly in large city hospitals. Military demand was a powerful stimulus to medical growth in the eighteenth century, and the need for army doctors rose during the French Revolutionary and Napoleonic wars. British clinical education was also mainly an affair of London institutions and provincial hospitals; Edinburgh and Glasgow resembled more the German model. In the German states small university-affiliated clinics and infirmaries provided practical education. The public hospitals of Paris had twenty thousand beds in which to stack, examine, and perhaps cure—an autopsy was more frequent—the city’s vast diseased population. Medicine in Paris distinguished itself by the accessibility of public hospitals to students wanting instruction from great men like Laënnec and experience in bedside medicine and dissection. Lots of corpses were available, for mortality at the Hôtel-Dieu was about 25 percent, two and one half times that of most English hospitals. Foreign students and doctors found Restoration Paris a profitable place in which to learn the latest French medical fashion; on returning home, they carried versions of the French model with them to many

cities, including Vienna, Boston, and even London. London, whose population reached a million and a half by 1831, developed large teaching hospitals. Paris, whose population did not reach a million until 1846, was notorious for its concentration of patients and after the 1830s the development of medical specialization. The bedside tradition foundered when dozens or even many more students crowded round the patient's bed to receive the master's instruction. More profitable instruction was to be had from private courses organized by Parisian doctors. Limits on numbers were also imposed through elite selection in intern and extern examinations. The lecture shifted to the amphitheater. In spite of the fame of Paris hospital medicine, a student got a better education in private instruction by a great man, perhaps even Laennec, who gave a private course in the small ward of a big hospital, thus providing the advantages of both pedagogical worlds.

From Clinical to Laboratory Medicine

Medicine was transformed institutionally, practically, and intellectually in the century after the 1750s. Medicine evolved from a cultural system to an occupation, as the practitioners of professional medicine grew in prestige and began to dominate their rivals, the charlatans or empirics of popular medicine.

Physiology. One of the striking intellectual developments of this period was the emergence of physiology as an autonomous experimental science, probably first in France through the work of Bichat, François Magendie (1783–1855), and Claude Bernard (1813–1878). Physiology distinguished itself by the use of operative or experimental surgery, which might be seen as a mutation of an ancient tradition running from the Alexandrian school through Galen to the Italian schools and Harvey. Much knowledge was gained; many animals were sacrificed. With the advent of Bernard, the historian passes into a different conceptualization of the development of medicine: from pathological anatomy in the hospital to medicine in the laboratory. Medicine seemed in danger of becoming obsessed with the pathological, always a danger in the doctor's world of disease. Bernard's physiological medicine showed how essential it was to understand the normal as well as the pathological, indeed, that there is only a narrow divide between them. Understanding the functions of an organ became central to understanding a disease. For example, Bernard's experimental demonstration of the role of the liver in making glycogen and in regulating glucose levels in the blood provided the basis for understanding diabetes—an alteration or disorder in a normal function produced the lesion or disease. (The new world of internal secretions later gave rise to the science of endocrinology.) Such discoveries could only occur in a controlled laboratory experiment on an animal. Bernard's view was similar to that of Rudolf Virchow (1821–1902): "Disease is nothing but life under altered circumstances." Imitating Virchow, Canguilhem (p. 100) made a brilliant diagnosis: "Diseases are new ways of life."

Medical science in Germany. In the middle of the nineteenth century the center of medical excitement and interest began to shift from Paris to German centers, where heavy investment in higher education had begun to pay large research dividends. The history of medicine at this point becomes of

necessity rather Whiggish as discovery after discovery has to be cataloged, and the practice of medicine itself seems to have improved. Some of the progress was driven by instruments, especially the microscope, which had been of no interest to Bichat but was indispensable to Virchow, pathologist and Progressive politician. The great unifier of physiology and pathology, Virchow developed the medical implications of cell theory. To understand diseases, one had to understand the cell. From Morgagni's emphasis on the organ to Bichat's concentration on tissues to Virchow's consecration of the cell (*Cellular Pathology*, 1858), medicine, like the other sciences, turned increasingly microscopic. The whole patient would soon be hard to find, but the German model of medical science became universally admired and imitated, especially in a few select American institutions (Johns Hopkins, Harvard, and the Universities of Pennsylvania and of Michigan). Of course it would be a while before the chasm between laboratory and hospital (and physician) would be bridged and the hospital would begin "to resemble a factory" (Porter, p. 347).

The immediate influence that experimental physiology had on the practicing physician is not easy to assess; the impact of sciences such as chemistry (in anesthesiology), microscopy, and bacteriology was much clearer by the end of the nineteenth century. Over the long haul no doubt physicians came to place considerable reliance on various physiological instruments to record and analyze data. Most of these instruments, like the kymograph, were invented and developed in the German states. The stethoscope replaced the urinal as the symbol of the profession. A much-improved microscope became indispensable to medical and biological research in the second half of the nineteenth century and, with the white coat, the accessory of the successful doctor. Wilhelm Conrad Roentgen discovered X-rays in 1895, and by the 1920s diagnostic medicine embraced X-rays for large masses of people. Physics was becoming an essential part of medicine, which by the early 2000s was integrated into the world of engineering and physics through CAT and PET scans and magnetic resonance imaging in order to model the structure and functioning of the body.

Women doctors. The autonomous and monopolistic organization of the medical profession under governmental protection is a late development in the history of medicine, essentially post-Revolutionary (1789). Universities assumed the primary role in medical education, though private schools or institutes and, above all, hospitals played major roles in Britain and France. Medical history teems with women healers, but they were not admitted to medical schools until the late nineteenth century, with resistance holding out until the early twentieth century in Germany. Fortunately for Russian Jewish women, Switzerland's facilities were open, beginning with the University of Zurich in 1864. The mobilization and slaughter of male doctors in both world wars helped increase the number of women doctors, though Nazi Germany dealt a blow to the movement that had made one-fifth of the German medical profession female by 1933. After World War II, female enrollments in medical schools rose and continued to rise to near equality of the sexes (in numbers only) in the profession by the early twenty-first century. Not welcome in certain specialties such as surgery, women tended to go into

[After recalling his agreements with Galen and Colombo, Harvey declares his belief in the circular movement of the blood, views so] novel . . . that in speaking of them, I . . . dread lest all men turn against me. . . . However, the die has now been cast, and my hope lies in the love of truth and the clear-sightedness of the trained mind. . . .

We have as much right to call this movement of the blood circular as Aristotle had to say that the air and rain emulate the circular movement of the heavenly bodies.

This organ [the heart] deserves to be styled the starting point of life and the sun of our microcosm just as the sun deserves to be styled the heart of the world. For it is by the heart's vigorous beat that the blood is moved, perfected, activated, and protected from injury and coagulation. The heart is the tutelary deity of the body, the basis of life, the source of all things, carrying out its function of nourishing, warming, and activating the body as a whole.

SOURCE: William Harvey, *The Circulation of the Blood and Other Writings*, trans. Kenneth J. Franklin, with an introduction by Andrew Wear (London: J. M. Dent and Sons, 1963), pp. 46–47.

general practice and areas of specialization such as bacteriology, anaesthesia, pediatrics, neuropsychiatry, dermatology, and nonsurgical gynecology.

The rise of psychiatry. An enormous number of drugs were available to healers from Hippocrates to Magendie, whose *Formulary* of 1821 introduced the notion of chemical purity into the pharmacopoeia. In the *materia medica* in use before the 1950s there is a striking absence of psychotropic drugs; the first, lithium, used to treat manic depression, dates from 1949. (Phenobarbital had been found effective against epileptic seizures in 1912.) So how did doctors treat mental disease? The answer is that they did nothing for most of medical history. “Madness” was generally not the province of the doctor, but of the churches and the family. “Madhouses” were generally charitable or religious institutions with medical connections until the nineteenth century, when the treatment of the insane evolved into a specialized branch of medicine. The development of psychiatry was accompanied by the rise of the “new” asylum—new because of its practice of a humane treatment of the mentally ill. Politicians in the late-eighteenth-century French state, converted to the scientific gospel, became convinced that madness could be cured, with the hospital functioning as a healing machine. Ideologue doctors such as Pierre-Jean-Georges Cabanis (1757–1808) provided epistemological (that is, scientific) respectability for medicine by emphasizing its roots in classification and a content related to sensationalist psychology.

The moral treatment, made famous by Philippe Pinel (1745–1826) at Bicêtre, the Salpêtrière, and Charenton,

indulged in sympathetic but firm handling and even theatrical performances by the actor-inmates. “A historic transformation . . . in Paris” (Weiner, p. 275): the mentally ill were recognized as human beings with natural rights, and mental illness was classified as a curable disease. Doctors soon invented new categories of disease out of the old simple divisions of insanity; perhaps the most notorious new disease was Jean-Etienne Esquirol's (1772–1840) concoction of monomania. Esquirol's work *Mental Illnesses*, a classic text, was published in 1838, the year the government voted to create a national asylum system. The treatment of the insane became a matter of a scientific management of the mind and emotions rather than the traditional bleeding and purging of the body. Psychiatry arrived in the faculty of medicine in Paris in 1882, when the neurologist Jean-Martin Charcot (1825–1893) was appointed professor of diseases of the nervous system. There is no evidence that all this science and institutional growth contributed to a higher cure rate for patients suffering from the old mental diseases or even the new ones such as neurasthenia and hysteria, which some doctors attributed to industrial civilization. A desperate Western psychiatry indulged in thousands of lobotomies between 1935 and 1950.

As with clinical medicine, psychiatry in Germany (and Austria) differed from psychiatry in France and Britain in being connected directly with research-related university medicine, particularly neurology. Wilhelm Griesinger (1817–1868), professor of psychiatry and neurology in Berlin, developed a department for the study of mental disorders and founded the *Archiv für Psychiatrie und Nervenkrankheiten* (1868). Sigmund Freud (1856–1939) specialized in clinical neurology, but he

A physiological laboratory, therefore, should now be the culminating goal of any scientific physicians' studies. . . . Hospitals, or rather hospital wards, are not physicians' laboratories, as is often believed; . . . these are only fields for observation; there must be what we call clinics, since they determine and define the object of medicine, i.e., the medical problem; but while they are the physician's first study, clinics are not the foundation of scientific medicine; physiology is the foundation of scientific medicine because it must yield the explanation of morbid phenomena by showing their relations to the normal state. We shall never have a science of medicine as long as we separate the explanation of pathological from the explanation of normal, vital phenomena.

. . . In leaving the hospital, a physician . . . must go into his laboratory; and there by experiments on animals, he will seek to account for what he has observed in his patients, whether about the action of drugs or about the origin of morbid lesions in organs or tissues. There . . . he will achieve true medical science. Every scientific physician should, therefore, have a physiological laboratory. . . . The principles of experimental medicine . . . [are] simply the principles of experimental analysis applied to the phenomena of life in its healthy and its morbid states.

recognized the bankruptcy of the old organic psychiatry, which attributed mental disorders to structural disease in the brain. Pinel had similarly become disillusioned with the hope of finding lesions in the brains of the mentally diseased. Freud's new dynamic psychiatry with its radical views of the human personality is probably the most influential and most controversial medical paradigm in the history of Western civilization and its discontents. The success of the "talking cure," or psychoanalysis, in treating mental disorders provided the basis for modern psychotherapy, but much of psychiatry has since followed the biochemical path to Prozac and other psychotropic drugs. The ideology of most German (and French) psychiatrists was scientific materialism, with their medical science being basically neurological and neuropathological. Medicine loves classification: German psychiatry was obsessed by it. The twenty-first century's bible of the profession, the *Diagnostic and Statistical Manual of Mental Disorders* (DSM-IV; 4th edition, 1994) has its origin in the classification of mental disorders done by Emil Kraepelin (1856–1926), who drew on the work of several other men of method. To venture beyond the current DSM paradigm and DSM-IV framework, the powers in mental health issued *A Research Agenda for DSM-V* in 2002.

Did science matter? Concluding his book on nineteenth-century scientific medicine, W. F. Bynum asked "Did science matter?" The answer is yes. Consider surgery. No branch of

medicine changed more radically than surgery during the second half of the nineteenth century. Surgery itself had been socially and cognitively (through the study of anatomy) transformed by 1790. Surgery joined medicine as a liberal profession, that is, a group in possession of scientific or esoteric knowledge, transmitted through institutions; recognized by the state, the profession also controlled admission to its ranks and tried to control the practice of medicine within certain areas. The French doctorate in surgery, introduced in 1749, required a thesis in Latin, which nicely hid professional secrets from the *polloi*. Reform of French medical education in 1794 integrated surgery into the regular training of doctors.

With the growing importance of the hospital and the increasing prestige of pathological anatomy, the professional status of surgeons soon equaled that of physicians. Whether chloroform did "a lot of mischief" by enabling "every fool to become a surgeon" (Sir Patrick Cullen, in Bernard Shaw's *Doctor's Dilemma*, 1906) is open to question. But it is certain that the cult of the surgeon could not have emerged at the end of the nineteenth century without anesthesiology. In 1846 the first amputation with a patient under ether was done in Boston; the next year James Y. Simpson (1811–1870), professor of obstetrics, first administered chloroform at the Infirmary in Edinburgh. The incorporation of bacteriology into surgical practice was equally important to the cult.

The wish-fulfillment can be detected . . . easily in . . . dreams. . . . A friend of mine . . . said to me one day: “My wife has asked me to tell you that she had a dream yesterday that she was having her period. You can guess what that means.” The fact that this young married woman dreamt that she was having her period meant that she had missed her period. I could well believe that she would have been glad to go on enjoying her freedom a bit longer before shouldering the burden of motherhood. It was a neat way of announcing her pregnancy.

SOURCE: Sigmund Freud, *The Interpretation of Dreams*, trans. James Strachey (New York: Avon Books, 1965), p. 159.

Germ theory. The medical acceptance of germ theory is a complex story. Since disease killed more soldiers than bullets, army doctors, desperate for an etiology and a therapy, were among the first to embrace the gospel of germs. The antiseptic, then aseptic practices of Joseph Lister (1827–1912)—Lister’s system—was inspired by his reading a paper on fermentation by Louis Pasteur (1822–1895). Listerism was accepted most enthusiastically in German-speaking areas, where there was also a striking development of surgery of the abdominal, thoracic, and cranial cavities, and, more controversial, the female reproductive system. Pasteur, accepting the idea that fermentation, putrefaction, and infection are related, developed a germ theory of infection. What distinguished his theory was a set of brilliant if controversial experiments on wine diseases, chicken cholera, anthrax, and rabies. Without understanding the immune system—researchers are still investigating how it works—Pasteur and his colleagues developed vaccines to prevent disease. Development of immunization against rabies (such as Creutzfeldt-Jacob disease, a frightening but minor killer) made it possible for Pasteur to collect enough funds to establish the Institut Pasteur (1888).

Bacteriology was largely a German creation. Robert Koch (1843–1910) identified major killers such as the tuberculosis and cholera bacilli and codified a method for investigating the etiology of infections. His students went on to identify the microorganisms causing a large number of diseases (diphtheria, typhoid, gonorrhea, and syphilis, among others) Koch spent the period from 1896 to 1907 in Africa studying its diseases; partly as a result of European invasions that displaced populations, millions of Africans suffered from helminth (intestinal worm) infections, in addition to germ and viral diseases. Many other medical researchers of the imperial powers also spent time in areas where tropical diseases presented a challenge not to be found in Europe. The germ-theory model of disease with its simple etiology did not work for diseases such as yellow fever and malaria; the parasitological model required the concept of a vector such as the mosquito. If the prion, which has no nucleic acids (DNA and RNA), causes bovine spongiform encephalopathy (BSE, popularly known as “mad cow disease”) and its human form, the “new” Creutzfeldt-Jacob disease, then a new model of infection will appear in medicine.

With four institutes named after him, the imperious Koch went on to glory, though not so great as that of Pasteur, with whom he squabbled over the great germs of the day. Supported by well-developed chemical and pharmaceutical industries, German scientists were able to pioneer in serum therapy (antitoxins) and chemotherapy, whose most famous product might have been the arsenical compound salvarsan (not a magic bullet) for treating syphilis. More useful drugs to come out of Germany included chloral hydrate, aspirin, and phenobarbital. But no drug has ever been more useful or cheaper than quinine, the extract of the bark of the cinchona tree, used in fighting malaria, still one of the great killer diseases.

Public health. So what was the effect of all this progress in medical science on public health? Mortality did decline in the second half of the nineteenth century, particularly deaths from tuberculosis, scarlet fever, diphtheria, typhus, typhoid, cholera, and smallpox (mostly before 1850 in this case). The decline started before effective medical means could combat these diseases. Nonmedical factors seem to explain why people lived longer: first, improved nutrition, which made people more resistant to diseases such as tuberculosis; second, the attenuated virulence of some microbes, such as the diphtheria bacillus; third, effective public health measures such as supplying towns and cities with safe water, installing sewage systems, and clearing slums. The effect of the Malthusian check of infectious disease on population growth was severely reduced if not eliminated. The introduction of antibiotics lowered mortality even further. Sulfa drugs, the first effective step toward the control of bacterial diseases, became widely available only in the early 1940s and penicillin shortly after.

The Twentieth Century: Science, State, and Business Whiggish authors justifiably rave about the “stupendous progress” of medicine in the twentieth century; it was also the century that witnessed the greatest medical crimes in history.

Medical murder and human experimentation. Enthusiastically serving scientifically deluded politicians and bureaucrats, a large number of doctors turned medical research into a large-scale immoral and deadly science in the Japanese empire,

KOCH'S POSTULATES (FORMALIZED IN 1882)

That the organism could be discoverable in every instance of the disease;

That, extracted from the body, the germ could be produced in a pure culture, maintainable over several microbial generations;

That the disease could be reproduced in experimental animals through a pure culture removed by numerous generations from the organisms initially isolated;

That the organism could be retrieved from the inoculated animal and cultured anew.

the United States, and, above all, in Nazi Germany. Adopting eugenic policies, Nazi doctors and their collaborators sterilized hundreds of thousands of mentally handicapped and sick persons, epileptics, and alcoholics. Other countries—Sweden and the United States, for example—also pursued sterilization policies. Patients in mental hospitals were starved and, during World War II, gassed. A racial agenda supported cost-effective medicine. Human experimentation carried out by doctors flourished in certain death camps. Beginning with the postwar Nuremberg Code, international declarations have outlawed such medical horrors. A nonethical medicine has a murderous potential; so it is back to Hippocrates, the phoenix of Western medicine, who was also Heinrich Himmler's medical hero.

Medical progress. By the end of the twentieth century, European medicine was remarkably similar to but not identical with American medicine in terms of clinical science, medical research, and surgery; it was different in its relations with the market economy, in the state's provision of universal primary medical care as a basic service, and in its cultural values. For considerably less cost, Europeans were just as healthy and, in many groups, enjoyed greater longevity than Americans. "Big medicine," which includes giant hospitals, often including extensive imaging and laboratory facilities, enormous bureaucracies, global drug companies, and large medical schools, was of course just as much a feature of the European as the American scene. Nowhere is this clearer than in the "war on cancer," the most useful of diseases in the promotion of the modernization of medicine; cancerology became the growth model of big medicine. The conceptual basis of medicine has changed radically since the eighteenth century. The changes can all be blamed on discoveries in genetics, immunology, neurology, endocrinology, pharmacology, and, the stepchild of medical education, nutritional science.

Still, science cannot escape being part of culture. Even in the new surgical fields that have opened up in organ transplantation and in cardiology, certain cultural differences

distinguish medical practice in different countries. German doctors, loving the heart above all other organs, are much more inclined to use drugs than surgery in treating cardiovascular diseases. The number of coronary bypass operations per 100,000 people in 1998 was 202 for the United States, 90 for Germany, and 35 for the United Kingdom; the last figure probably reflected a generally bad state of cardiovascular care. French doctors seem much more concerned with the functioning of the liver than doctors in other cultures; they are also much more conservative in recommending hysterectomies. French doctors are too generous with the use of ionizing radiation—825 procedures per 1,000 inhabitants—nearly twice as many procedures as in Britain. Wherever one looks, health is a major European growth industry. There is no shortage of disease, including hypochondria. Every age seems to have its "epidemic"—in the early twenty-first century, it is HIV-AIDS. And with the doctor accepting the modern idea that a well person is only an insufficiently diagnosed patient, and genetic medicine aiming to define genetically determined disease susceptibility in individual patients, the normal may become, as in Jules Roman's famous play *Knock*, the profitable pathological.

INDIA

The historical record for Indian civilization begins in the third millennium B.C.E., with the Indus Valley culture, but beyond

evidence of a good knowledge of the plant and animal environment, little information can be recovered concerning the healing traditions of this time. Simple ideas related to disease and healing can be found in greater abundance in the corpus of religious hymns called the Vedas, composed originally in an old form of Sanskrit during the early to mid-second millennium B.C.E. These ideas have much in common with religious materials worldwide: a concern with hostile demons, curses, and poisoning, and a detailed awareness of the plant world as a source of healing herbs. Outside the metropolis in India today, such ideas continue to form a prominent part of health-related beliefs and activities. Considering health as, in Georges Canguilhem's words, "a margin of tolerance for the inconsistencies of the environment," such practices and ideas can be seen as a perfectly reasonable and indeed rational extension of the use of a continuum of efforts—from prayer to warfare—as means for creating an acceptable environment in which to live.

Systematic Medicine

Structured systematic thought about medicine in India can first clearly be detected in sayings of the Buddha. In the *Samyuttanikaya* (4.230–231), part of the Buddhist canon (c. 250 B.C.E.), the Buddha is represented as contradicting the view that suffering is caused only by the effects of bad karma. He says that it is caused by eight factors: bile, phlegm, wind, and their pathological combination, changes of the seasons, the stress of unusual activities, external agency, as well as the ripening bad karma. This is the first moment in documented Indian history that these medical categories and explanations are combined in a clearly systematic manner, and it is these very factors that later became the cornerstone of classical Indian medical theory, or ayurveda (Sanskrit, "the knowledge for long life"). Great encyclopedias of medicine were composed in India during the centuries before and after the time of Christ, and these works brought together not only treatises on anatomy, including embryology, diagnosis, surgery, epidemics, pharmacology, and so forth, but many reflective philosophical passages discussing, for example, the origin of the human being, the rules of medical debate, methods for the interpretation of technical terminology and scientific expression, and so forth.

The two best-known compendia to survive from this era go under the names of their editors, Sushruta and Caraka. All this work was synthesized in the early seventh century C.E. into the great work *The Heart of Medicine* by the Sindhi author Vagbhata. This work became the textbook par excellence for ayurveda, the Sanskrit equivalent of Avicenna's *Canon*, and every bit as influential as that work. The later history of Sanskrit medical literature is a mixture of further works of grand synthesis and the proliferation of works on specialized topics and manuals for the working physician. Innovation took place both in the content and the form of the medical literature. By the nineteenth century, when European medical education and practice began to have a decisive impact in South Asia, Indian students who chose to specialize in medical studies were being exposed to a tradition of sophisticated medical reasoning and theory almost two thousand years old. This tradition was embodied in its practitioners and the literature they preserved through energetic and wide-ranging manuscript copying,

which included multilingual dictionaries of *materia medica*, allegorical medical dramas, toxicological manuals, and veterinary texts, in addition to more predictable reference and teaching works. Hindu and Muslim physicians sometimes worked side by side, though their practices remained distinct.

Medical Concepts and Therapies

The systematic doctrines of ayurvedic medicine included a humoral theory somewhat akin to that of Hippocrates and Galen. Indian medicine admitted three humoral substances, namely, wind, bile, and phlegm. However, a certain indecision is visible within the tradition as to the status of blood, which shared with the humors the critical feature of being able to cause illness through becoming corrupt, and blood is sometimes implicitly included as a fourth humor. Disease was classified in several interesting and useful ways, and a system of triage was developed that guided the physician to focus on treatable and curable cases, while discouraging involvement with patients who were clearly in the grip of terminal conditions. Several thousand plants were known for their medicinal values, and described in terms of a pharmacological typology based on flavors (six types), potency (usually two: hot and cold), postdigestive flavorings (usually three), and pragmatic efficacy (used when the effect of a medicine is not adequately defined by the earlier categories). This typology formed a system of interlocking correspondences and antipathies with the system of humors and other physiological categories as expressed through the vocabulary of pathology.

Sanskrit medical treatises recommended a wide range of therapeutic techniques, including herbal drugs, massage, sauna, exercise, diet (including the use of meat broths and other nonvegetarian tonics), bloodletting (including leeching), simple psychotherapy, and surgery. One important group of five specific therapies became established early. According to Caraka, these were: emetics, purgation, two types of enema, and nasal catharsis. Sushruta replaced one of the enema treatments with bloodletting. Other authors added sweating and massage, as well as other therapies, into what became historically an increasingly important and elaborate complex of treatments. This “five therapies” treatment is still popular and important today. The theories and techniques described in this tradition were widely known and practiced by learned physicians and their staffs and students all over India. Of course, as in all parts of the world, there were many quacks and charlatans, a problem explicitly discussed in the very earliest Sanskrit medical writings.

Surgery

Surgery had a different history from the other parts of traditional medicine. The compendium of Sushruta includes many chapters on the training and practice of surgeons. The early date of this treatise and the great accuracy, insight, and detail of the surgical descriptions are most impressive. One can infer that the surgical profession had developed over several generations at least and had arrived at an advanced stage. Surgeons were thought of as a separate group of practitioners from the more normative herbal healers, yet for some unknown reason, their tradition was recorded in the Sanskrit language and integrated into the medical corpus. This legacy was then passed

down the centuries as part of ayurveda. However, the actual practice of surgery did not survive in the same way. The early and medieval historical sources of India gives us almost no evidence of advanced surgery being practiced. By the time foreign observers from China, and later Afghanistan and Europe, begin to describe India, Sushruta’s surgery had all but vanished. A few barber-surgeon practitioners preserved limited skills in couching for cataract and bone-setting, and even in types of plastic surgery, but these were no longer integrated into the learned practice of classical Indian medicine. Early European surgeons were in much demand in India from their arrival in the sixteenth century onward, although by contrast European physicians were not sought after, and the flow of knowledge about simples and drugs was from East to West.

Modernization and Globalization

Under first the Moghul and then the British colonial powers, indigenous Indian medicine survived as it always had, mainly through support from patients and the community, but with occasional patronage from the state, with education and practice being devolved and decentralized, often taking place at the family level. During the twentieth century, ayurveda assumed an important role as an icon of national identity during the independence struggle. After independence, the government of India adopted the traditional systems of Indian medicine, including ayurveda, Islamic Unani medicine, yoga, and the South Indian Siddha tradition and provided a state-sponsored structure of education and practice on the model of Western medicine. To these indigenous traditions were also added homeopathy and naturopathy, both adopted and tightly integrated as part of “Indian” health care and administered by the same department within the Ministry of Health and Family Welfare. At the start of the third millennium, a process of globalization—similar to that which took place earlier with yoga—has begun to occur also with ayurveda. In diaspora ayurveda is changing and adapting, as it moves from its premodern role in India to a new position as one part of a portfolio of alternative and complementary therapies offered alongside modern biomedicine.

ISLAMIC MEDICINE

Islamic medicine refers to the range of health-promoting beliefs common to and actions taken in Muslim societies, whether by Muslims or others. As with other traditional medical systems, Muslim medicine was composed of several subsystems, each involving a unique etiology and practice and each enjoying a different legitimacy. These subsystems were not independent of each other and none enjoyed complete hegemony. In the Muslim context this means that humoralism, folklore, and prophetic medicines were all present in the medical therapeutic scene.

Theories Composing Muslim Medicine

Popular medicine was sanctioned by custom, a wide consensus from below, not by any religious, judicial, or scientific authority. This medical folklore in itself took many forms and was the outcome of diverse pre-Muslim cultural traditions (such as those of Arabs, Greeks, Persians, and Berbers) and differing ecological environments with their distinctive medical problems as well as flora and fauna from which medication was prepared.

By contrast, what Muslims call prophetic medicine (*al-Tibb al-Nabawi*) does not rely on custom. Instead it originated from (and therefore is sanctioned by) the sayings of the Prophet Muhammad. These sayings, in which Muhammad gave his opinions on medical practices, constituted the basis for a distinctive medical system from the ninth century onward. The Shiites entrust the imams, the descendants of Muhammad's family and therefore the spiritual leaders of the community, with extraordinary healing abilities as part of their supernatural attributes; thus in Shiism the role of Muhammad as healer is downplayed. But in general the field of prophetic medicine engaged many of the most renowned scholars of their time (for example, the Egyptian Jalal al-Din al-Suyuti, d. 1505). Among the population at large, medical rites and practices were connected with live and dead saints. Certain individuals were (and still are) believed to possess extraordinary healing powers, so that visiting them or their graves was believed to be medically beneficial.

Mechanical medicine, based on the humoralism inherited from Greek antiquity, constitutes the third tradition. This

medicine is based on the well-known idea of four elements: a physical and philosophical metatheory according to which everything in nature is a mixture of fire, earth, air, and water. Each element embodies two of the four qualities of hot, cold, dry, and moist. The human body was understood to correspond with this model, because it is a microcosmos of nature. The body consists therefore of four humors, or fluids, the physiological blocks of the body: blood (air), phlegm (water), black bile (earth), and yellow bile (fire). In case of illness, which is a state of imbalance in the body, it was up to the humoralist physician to diagnose which of the four humors was in excess or deficient. The physician then proceeded to recommend a course of treatment, usually by diet, to correct or counterbalance the offending humor. Excess in black bile, for example, known to be cold and dry, necessitated adding warmth and moisture artificially. This tradition asserted its legitimacy by drawing on scientific treatises of the sages of antiquity, as mediated through the intellectual and literary discourses of famous Muslim medical figures.

Hospitals

One of the unique features of Muslim medicine was the use and development of hospitals (*bimarsitans* or *dar al-shifas*). Hospitals were founded in most major Muslim cities, starting in Baghdad, the capital of the Muslim empire, in the ninth century, and reached an especially high standard during Mamluk and Ottoman periods (from the thirteenth century). Muslim hospitals were urban charitable institutions funded by endowments (*waqfs*) that offered free treatment to the sick by an expert medical staff. In contrast to their European counterparts, Muslim hospitals were “true” hospitals in that they were designed to offer the sick expert medical treatment by professionals, whereas many premodern European hospitals (mainly in the medieval Latin West) usually restricted themselves to spiritual aid and substance to exhausted and convalescent people.

Ages of Translations

Muslim medicine has always been in contact with other medical systems through translations of medical treatises. The translation movement has worked in both directions; that is, both to and from Muslim languages. Muslim Galenic medicine owed much of its origin to a massive move to translate from Greek to Arabic in the ninth century. This was part of the general introduction of Hellenic culture and science into the Muslim world. Most of the translations were done via mediator languages, mostly Syriac and to some extent Persian. Translators, many of whom were Christians (such as the famous Husayn ibn Ishaq), enjoyed caliphal patronage. Al-Ma'mun (reigned 813–833) should be given special mention for sponsoring the great library of Baghdad, *Bayt al-Hikma* (literally, “House of Wisdom”), which was the center of intellectual activity at the time. Although we associate the Age of Translation with Hellenic medicine, during the ninth century traditional Indian medicine (Ayurveda) was translated into Arabic as well, either directly from Sanskrit or by way of Persian. In the long run, however, it was Hellenic medicine that became dominant in the caliphal court.

Muslim doctors were the custodians of Hellenic medicine, which they expanded, corrected, systemized, and summarized

(for example, in the fields of pharmacology, ophthalmology, pathology, and many others). In anatomy, for example, Ibn al-Nafis (d. 1288) is credited with describing the circulation of blood in the lungs for the first time. He formulated this description through logical deduction rather than clinical observation. Many Muslim medical texts were translated into European languages during the later Middle Ages. Thus many Muslim physicians became known to Europe, as well as otherwise “lost” texts from antiquity. Figures like Abu Bakr Muhammad ibn Zakariya al-Razi (d. 925), Abu Qasim al-Zahrawi (d. 1013), and Ibn Sina (d. 1037) were famous in Europe by the Latinized form of their names (Rhazes, Albucasis, and Avicenna, respectively), and their treatises became standard medical texts well into the eighteenth century.

In the early modern period another move to translate medical texts occurred, again from European to Muslim languages. This time nonhumoral concepts were introduced to Muslim medicine. A prime example of a physician who applied the concepts of European medicine is Salih ibn Sallum, from Aleppo (d. 1670), the head physician of the Ottoman Empire, who was influenced by Paracelsus (d. 1541), the German-speaking physician who was the first to treat patients with chemical rather than botanic or natural medications. Ibn Sallum’s work in Arabic was soon translated into Ottoman Turkish. Translation of European texts accelerated in the following centuries, especially during the nineteenth century, when many European texts were translated into Muslim languages as part of the move from traditional medicine to Western biomedicine.

Changes from the Nineteenth Century Onward

Beginning with the late eighteenth century, major political and socioeconomic transformations have occurred in the Muslim world that profoundly changed medicine and public health. European medicine was introduced on a much larger scale in various ways. Students were sent to universities in Europe to learn medicine. In addition, medical schools were shaped according to the Western model, at which European professors taught European medicine in French, were founded in all major capitals of the Middle East during the first half of the nineteenth century. The first was established in 1827 near Cairo, followed shortly by a military medical school in Istanbul. The third, another military medical school, was included in a polytechnic school founded in Tehran in 1850–1851.

Despite the profound Westernization of medical theory and the medical establishment in the Muslim world, traditional Muslim medicine is still being practiced. It is not found in the state-run hospitals or in universities, but it is present at the popular level. Religious circles promote prophetic medicine, and in recent years many traditional texts have been reprinted and Internet websites devoted to this subject have been set up.

MEDITATION, EASTERN. Many religious traditions have practices that could possibly be labeled *meditation*. In Judaism, Christianity, and Islam, these practices are usually associated with prayer, contemplation, or recitation of sacred texts. In the religious traditions of the Native Americans, Australian aboriginals, Siberian peoples, and many others, what could be identified as meditation techniques are incorporated within the larger rubric of shamanism. It is, however, in the religions of Asia that meditation has been most developed as a religious method. Meditation has played an important role in the ancient yogic traditions of Hinduism and also in more recent Hindu-based new religious movements such as Maharishi Mahesh Yogi’s Transcendental Meditation program. But it is most especially in the monastic or “elite” forms of the various traditions of Buddhism (Theravada, Tibetan/Vajrayana, and Ch’an/Zen) that meditation techniques have taken center stage and have been developed to the highest degree of sophistication and complexity.

Meditation can be loosely defined as a mental regimen or discipline designed to promote concentration and the capacity for what is called “one-pointedness” (*ekagrata*) of mind. There are many different meditation methods and many different recommended objects on which to meditate. Some traditions emphasize breathing exercises that focus the mind on inhalation and exhalation; others instruct the practitioner to meditate on the subtle workings of his or her own mind. Still others emphasize concentration on certain symbols (such as cosmic representations known as *mandalas* or *yantras*) or on sacred sounds called mantras. In some traditions it is God or one of the gods (or one of the Buddhas or bodhisattvas) upon which one meditates, while in others it is a problem or puzzle (the *Zen koan*)

or a topic of an analysis such as death or attachment to the physical body. In yet other meditations it is a virtuous emotion or quality such as renunciation, compassion, or loving-kindness upon which one meditates, and in still others it is simple mindfulness or awareness (the constant watchfulness entailing “being here, now”) that is emphasized.

But fundamentally all forms of meditation have as their goal the ability to concentrate for long periods of time single-pointedly and intensely on the object of meditation. The mind is sometimes likened to a pool of water that is muddy and turbulent; the goal of meditation is to calm the mind so as to be able to see its true nature clearly. Alternatively, the goal of meditation is said to be the suspension of ordinary discursive thought and the attainment of a state whereby all dualities are transcended—especially the distinction between the perceiving and thinking subject and the object of perception or thought. In any event, Hindu and Buddhist texts alike claim that the perfection of the ability to meditate well and for long periods of time will help produce in the practitioner high spiritual states of awareness, supernatural powers, wisdom and insight into the true nature of reality, and finally, salvation itself (*moksha* or nirvana, both of which entail liberation from ignorance, suffering, and rebirth).

The practice of meditation in India goes back to at least the middle of the first millennium B.C.E. and probably much earlier. The ancient Hindu mystical and philosophical texts called the Upanishads refer to meditation, and the early texts of Buddhism assume its existence as a technique taught by a wide variety of religious teachers. By the time of the turn of the Common Era, if not centuries before, meditation had become highly systematized in both Hindu and Buddhist traditions.

In all the meditation traditions originating in ancient India, emphasis is placed on finding a quiet, solitary place (the wilderness, a monastery, or an ashram or retreat) and assuming a sitting posture that will be conducive to meditation. The most famous of these postures, or *asanas*, is the “lotus position,” whereby the meditator sits with legs folded and feet resting on the thigh or knees. The hands are kept folded in the lap or in a special gesture called a *mudra*, and the eyes are kept closed or slightly open in an unfocused, downward-looking gaze. The back is kept straight to enhance alertness and to help the “inner channels” of the mystical body open up and run smoothly.

In Hinduism, meditation is most frequently encountered as part of a more general practice of yoga. In the *Yoga Sutras* of Patanjali, the classical source on ancient Indian yoga dating to around 200 or 300 C.E. and perhaps earlier, meditation techniques are basically indistinguishable from the practice of yoga. For Patanjali, one might say, yoga *is* meditation. Yoga is defined as the “cessation of the turnings of thought” (*Yoga Sutras* 1.2), implying the ability to control even the subtlest example of the mind’s activity.

Patanjali organizes the practice of yoga into eight “limbs” or parts (*ashtanga*). The first two limbs of yoga entail living a life guided by moral principles and personal observances. The third limb of yoga encompasses the physical postures, which have as their purpose to prepare the body for the meditation

techniques that follow. The fourth limb is control of the breath, which “makes the mind fit for concentration” (*Yoga Sutras* 2.53). The regulation of the breath is followed by “withdrawal of the senses,” the disengagement of the sense organs with their objects and the turning inward of thought. This allows the yogin to develop the final three limbs or stages: concentration (“binding thought in one place”), meditation (unwavering attention on an object), and pure contemplation or *samadhi*, defined as “meditation that illumines the object alone, as if the subject were devoid of intrinsic form” (*Yoga Sutras* 3.1–3). These last and culminating stages of the yogic practice are “internal” (as opposed to the “external” limbs that came before) and when they are “focused on a single object constitute perfect discipline” (*Yoga Sutras* 3.4, 7).

Various techniques for “fixing” the attention (*trataka*) were developed in later esoteric Hindu traditions, all of which were meant to induce the trance state called *samadhi*. In some cases the practitioner was instructed to fix his or her attention on certain places in the body—the crown of the head, the spot between the eyebrows, the tip of the nose, the navel, and so on—in order to gather one’s mental energy at a single point. In other instances, the practitioner was instructed to focus on a small object such as a speck on the wall or a mustard seed, or to stare at a distant object to the exclusion of all others in one’s purview, or to focus on one or another of the Sanskrit letters or some other image. Meditation on those powerful, sacred sounds known as *mantras* (the most famous of which is “*om*”) was especially common. In the theistic sects, the object of meditation was often the deity. In the Bhagavad Gita, for example, the practitioner is advised to sit quietly, fix one’s sight on the tip of the nose, and meditate on Krishna.

But it is especially in the Buddhist traditions that stem from India (and were then spread throughout Asia) that meditation becomes absolutely central. Gautama Buddha was said to have achieved his enlightenment through the method of meditation, and ever since, meditative concentration, together with ethics and wisdom or insight, has been the pivot of Buddhist practice. Early Buddhist texts list a set of forty possible topics of meditation (in Pali, *kammatthana*). Some are labeled “devices” (meditation on the elements, or on shapes or colors) that help the meditator fix his or her concentration on a particular image. Another topic is designated “recollections,” whereby the meditator recalls the virtues of the Buddha, the dharma (the teachings of the Buddha), or the *sangha* (the Buddhist community) or is reminded of his or her own mortality through a meditation on death’s inevitability.

Yet another set of meditation topics is designed to wean the meditator from attachment to the physical body. He or she is encouraged to concentrate on the repulsive and impermanent characteristics of the body or of food (and what happens to it as it is digested), or is urged to focus on various aspects of a decomposing corpse. Still another kind of meditation recommended in the early texts of Buddhism concerns what are known as the “four stations of Brahma” or the “four immeasurables”: friendliness or loving-kindness, compassion, empathetic joy, and equanimity or even-mindedness. These meditation topics are sometimes recommended to meditators of different personalities

or proclivities. For a devotional type of person, for example, meditation on the Buddha or the Sangha might be most appropriate, whereas for a sensual type of mediator the most effective topic might be the disgusting nature of the human body.

Buddhist traditions analyze the results of meditation into eight stages of increasingly subtle states of consciousness called the “absorptions” or “trance” states of higher consciousness (in Pali, *jhana*; in Sanskrit, *dhyana*). These are, it is said, the states of mind the Buddha passed through in deep meditation on his way to enlightenment. The first is described as a mental state of detachment from sensual pleasures and craving, in which, however, the discursive intellect is still active. In the second state, the mind grows more still, concentration increases, discursive thought ends, and great joy and peace arise. The third stage is characterized by the transcendence of sensual joy itself and the attainment of equanimity, which brings about a higher form of bliss, and by the diminishing of the sense of self as the subject of this experience. The fourth trance state is where consciousness of all duality abates and one achieves the “utter purity of mindfulness,” which lies beyond all words. The second set of four even subtler states of mind are called the “formless” *jhanas* because they are based on contemplation of formless subjects: the infinity of space, the infinity of consciousness, nothingness, and “neither perception nor nonperception.” The last of these is where subject and object are nearly indistinguishable and all pairs of opposites are totally transcended.

Such deep states of concentration are to be linked, however, with “insight” (in Pali, *vipassana*; in Sanskrit, *vipashyana*) into the true nature of reality in order to produce the state of liberation the Buddhist meditator seeks. When combined with the ability to focus deeply on the object of meditation, the analysis of reality reveals it to be impermanent, without essence or “self,” and thoroughly bound up in suffering. It is these deep insights into the true nature of reality, gained through the ability to concentrate in meditation, that will lead the seeker to “release,” or the “extinguishing” of ignorance and suffering (nirvana), just as such techniques brought the Buddha to his enlightenment.

The Mahayana traditions equally emphasize the importance of meditation and most especially the combination of the ability to focus the mind one-pointedly (what is sometimes here called “calm abiding” or *shamatha*) and the penetration or insight into the true nature of reality termed *vipashyana*. Such a potent synthesis is said to lead the meditator to a realization of the “emptiness” (*shunyata*) of intrinsic existence of all things. Nothing, according to this view, has existence independently or has a self-nature; everything exists only dependently or nominally. Such a realization of emptiness in deep meditation becomes the impetus for the meditator’s own enlightenment.

In the various Mahayana traditions, meditations designed to attain the realization of emptiness range from attempts to empty the mind completely of all conceptual thought, to the stripping away of all conceptual imputations of reality and then analyzing what is left, to even more radical techniques to shock the discursive mind out of its complacency so as to recognize its true, innate, and intuitive “Buddha nature.” Among the most famous of these latter meditative tools is the *koan* used

in the Ch’an/Zen schools of Buddhism. The *koan* is a kind of a riddle or puzzle designed to break down ordinary ways of thinking and jolt the meditator into the wholly different mindset of “enlightenment” (Japanese *satori*).

Other Mahayana traditions are more devotional in their emphasis. Here, meditation takes the form of fixing the mind on the Buddha or bodhisattva to whom one is devoted and whom one asks for help. In these traditions, prayers or *mantras* become the centerpiece of meditation practice, or the name of one of the Buddhas or bodhisattvas is invoked repeatedly. The recitation of the phrase *namu amida butsu* (“Homage to Amida Buddha”) in the Japanese Pure Land sects is an example of this kind of meditation. In some of these devotional Buddhist traditions, certain Sutras or sacred texts are thought to have such salvific power that the mere repetition of the text or even just chanting the condensed verbal essence or title of the Sutra will produce efficacious results in the meditator. In the Pure Land sects of Buddhism, meditation sometimes revolves around complex visualizations of one or another of the “paradises” or “pure lands” of the Buddhas and bodhisattvas in the hopes of attaining a rebirth there.

Meditation, a feature of many traditional religions, is becoming part of secular life in the modern world. Meditation techniques seem to produce states of mind that Western scientists are beginning to think may very well have measurable effects on the mental and physical health of the meditator. Sports trainers, coaches, and psychologists utilize visualization techniques to help professional athletes perform better. The reduction of anxiety that comes from the ability to focus and calm the mind in meditation is now generally recognized, and meditation is sometimes integrated into the workplace to help workers deal with stress. Neuroscientists and doctors are finding not only that accomplished meditators can achieve states of focused attention and concentration far beyond what scientists previously thought was possible but also that meditation seems to have a positive effect on the nervous, immune, and endocrine systems. Meditation, for centuries practiced primarily by monks and ascetics in Asia, is increasingly being mainstreamed in the West as a technique that promotes relaxation, better attention and concentration, the reduction of stress, and general good health.

MEME. *Meme* is indeed an interesting and apt subject to include in a dictionary of the history of ideas, for it is nothing less than a meta-concept for describing the transmission of knowledge among persons and cultures. Memetics—the study of memes—is, briefly stated, evolutionary theory applied to ideas. The word itself was coined by the British biologist Richard Dawkins in his 1976 book *The Selfish Gene* as a neologism derived from *mimeme* (that which is imitated) and *gene*. However, Dawkins's insight was presaged by William S. Burroughs's observation that "language is a virus from outer space" and by the work of thinkers ranging from the dadaists to Jacques Derrida, who, in seeking to transcend language and textuality, recognized the role that language and ideas play in controlling human behavior. In the late twentieth century and early twenty-first century, however, memetics has drawn its strongest supporters from the rather more literally minded camp of computer scientists and devotees of Internet culture—not only because the memetic model of human intelligence is similar to the programming of a computer but because memes are a useful metaphor for describing certain phenomena that occur in the online world.

Cultures, Dawkins observed, evolve much as organisms do, and he conceptualized memes as ideas that guide human behavior just as a snippet of genetic code can guide instinctual mating or dominance behaviors. Much like genes, memes arise in response to a new stressor in the environment and evolve in response to changing conditions:

all life evolves by the differential survival of replicating entities. . . . I think that a new kind of replicator has recently emerged. . . . It is still in its infancy, still drifting clumsily about in its primeval soup, but already it is achieving evolutionary change at a rate that leaves the old gene panting far behind. The new soup is the soup of human culture. (Dawkins, pp. 191–192)

A meme can be a concrete technology, such as a technique for making a stone spearhead, or an entirely abstract idea, such as "kingship" or "jihad." Examples of memes range from methods of making pottery and building arches to songs and stories, to tastes in clothing and fashion, to even more sophisticated behaviors, such as manufacturing hydrogen bombs,

which require a "meme complex" or group of mutually reinforcing memes—in this case, the concepts of metalworking, atomic theory, and explosives.

As the result of natural selection, some memes become rare or are altogether eliminated from the "meme pool," the collective sum of a society's knowledge; they can also be overwritten by an invading group's memes. For instance, few twenty-first-century Native Americans know techniques that were indispensable to their pre-Columbian ancestors, such as flint-knapping or making a fire with the bow-and-drill method. Some memes (such as "cooking") survive because they are generally useful; others (such as "sports cars") trigger hard-wired evolutionary imperatives, such as "food" or "sex" or "danger"; still others use more insidious means to ensure their own survival. For instance, chain letters, though intrinsically useless, have managed to be successfully passed on for decades because they contain instructions for their own reproduction and because they successfully exploit the human desire to get something for nothing, while evangelical religions (to give another example of a self-perpetuating meme) emphasize the virtues of proselytizing.

These latter cases serve to illustrate an important point of Dawkins's conceptualization, namely, the parasitic quality of memes. Lacking any physical way of reproducing themselves, memes survive and grow by imitation or by transmission from mind to mind. The transmission may occur through the observation and copying of a certain behavior or technique; it may occur as a craft is taught to an apprentice or as a farmer shows his or her son how to shear sheep; or it may be verbal, as by a professor's lecturing or assigning reading to her or his students. The participants need not speak the same language, as was the case with American GIs learning judo in occupied Japan. The transmission may be by force, such as the spread of the meme complexes of Islam and Christianity by conquest; or it can be by trade and indirect influence, such as the spread of classical Greek and Chinese ideas and motifs through the ancient Mediterranean and East Asia, respectively. Certain ideas are more easily imitated, or more contagious, than others; these are the memes that tend to be selected for survival, irrespective of the benefits to the individual they infect; in fact certain memes (such as celibacy or kamikaze missions) may be detrimental to the host's genetic survival but are nonetheless highly successful at reproducing themselves. Thus a viral contagion is a more apt metaphor to describe the meme than is sexual reproduction—a comparison Dawkins also used to describe the genetic code itself. To extend the metaphor, one is "infected" by an idea as a cell is by a pathogen, and one is compelled to carry the idea to others so that it may reproduce itself. Much like a computer virus, information begets information.

The Selfish Meme

Even memes like "celibacy" and "kamikaze mission," while detrimental for their individual hosts, may nonetheless be beneficial for the meme pool at large. As Matt Ridley so eloquently explains in his 1996 book *The Origins of Virtue*, magnanimous social behavior is nonetheless often guided by the self-interest of all involved. Like ants, human beings seem to have evolved

to be genetically hardwired to cooperate. Successful memes can build on this tendency. For instance, few animals, including humans, are munificent to those outside their immediate group or tribe, but the “patriotism” meme, by giving us a way to conceptualize an entire nation as an extended tribe, is one way of explaining the phenomenon of the growth of nation-states—or “imagined communities,” as Benedict Anderson put it in his 1983 book of the same title. Thus even memes that are detrimental to the individual can confer an evolutionary advantage; to build on the example of patriotism, groups with memes that promote extensive cooperation (such as Caesar’s Roman legions) will tend to outcompete groups who do not (such as the tribes of Gaul). *Dulce et decorum est pro patria mori* (It is sweet and proper to die for one’s country).

One of the most philosophically depressing implications of memetic theory is that it is our memes, not human genius and creativity, that are the guiding force in history. Just as Dawkins reduced biological organisms to a vehicle for the self-perpetuation of genetic material, so it is with memes. Our various behaviors, from building cathedrals to writing novels, can be viewed as nothing more than our memes attempting to survive and grow. “Memes might come to be viewed explicitly as the primary actors in the drama of human history, exerting an ironfisted control precisely analogous to that of Richard Dawkins’s ‘selfish genes’ in the pageant of biological evolution,” as James Gardner put it in his article “Memetic Engineering” in the May 1996 issue of *Wired* magazine. Such an idea is tremendously troubling for notions of free will. Gardner continued:

A meme-focused vision of culture and consciousness acknowledges forthrightly that memes are not mere random effluvia of the human experience but powerful control mechanisms that impose a largely invisible deep structure on a wide range of complex phenomena—language, scientific thinking, political behavior, productive work, religion, philosophical discourse, even history itself.

Memetic Engineering

To add to the confusion, the modern world has seen an unprecedented multiplication and proliferation of memes, with mass media being the preeminent transmission vector. Some of these memes are devised with rational ends, such as advertising consumer products; others are devised solely as play; others are “junk” memes. Hula hoops, the Burma Shave billboards of the 1950s, the slogan “There’s always room for Jell-O,” the synthesizer intro to the 1984 song “Jump” by Van Halen, or the three-note “by Men-nen” jingle, while of no use to those they infect, are excellent examples. The Internet in particular is a virtual memetic petri dish, with examples such as the nonsensical phrase “all your base are belong to us” (from a badly translated 1988 Japanese video game called *Zero Wing*) spontaneously arising on message boards in 2000, spreading from mind to mind via the ether and then dissipating, not unlike a particularly virulent disease burning its way through the population.

Thus the idea of memetic engineering consists not only in choosing which memes to be influenced by but also in

counterpropaganda and countersloganeering designed to purge from the meme pool those ideas deemed deleterious to society at large. The essential component in memetic engineering is faith in human reason to discern the most advantageous memes. Dawkins himself expressed a secular humanist optimism when he wrote, “We, alone on Earth, can rebel against the tyranny of the selfish replicators” (p. 201). (Of course, from another perspective, this could be seen as just another Darwinian struggle, with the meme for “secular humanism” trying to crush its competitor for mindshare, the meme for “theocracy.”)

One example of the deployment of this idea is the activist Andrew Boyd’s Billionaires for Bush (or Gore) campaign, which used the ironic, parodical image of the superwealthy taking to the streets in support of their candidates in order to “piggyback” on mainstream media coverage of the 2000 U.S. presidential election and thus call attention to social issues neglected by the candidates. The idea of memetic engineering was both popularized and taken to its logical end by the 1992 science fiction novel *Snow Crash* by Neal Stephenson. Though the actual word *meme* never occurs in the book, the plot makes clear reference to Dawkins’s work. The title, for instance, refers to a key element in the book’s plot, a literal “mind virus” modeled after a computer virus that is capable of destroying a user’s mind through merely being seen on a computer screen. The resolution involves a clay tablet from ancient Mesopotamia, on which are recorded syllables in an ancestral ur-language (reminiscent of ideas of the “deep structure” of language popularized by Noam Chomsky and others) that can program human beings, like robots, into performing tasks for those who know how to wield the power. *Snow Crash* is frequently cited in meme circles as an example of the power of memes taken to the nth degree.

Criticism of Memetic Theory

Despite the cult popularity of the idea, memetic theory is hardly discussed in recent texts on evolutionary psychology and linguistics. The prevailing consensus seems to be that the meme is a nice metaphor but one that has perhaps been taken too far. Memes, after all, are hard to define, quantify, and measure; their very existence is somewhat nebulous, inferable but not scientifically verifiable.

Some have also assailed memes not only as bad science but as reactionary politics. The complexity of human development is overly reduced into nonmaterialist, quasi-mystical, pseudo-scientific terms, which in turn are only a new Kabbalah, a recasting of age-old ideas of angels and demons and magic words that can control reality. Many also question the memetics community’s frequent, almost reflexive, assaults on religion, which they characterize as nothing more than preprogrammed, irrational memetic replication. Moreover the idea of human behavior as nothing but the programming of snippets of information is troubling to many—and not only those who still maintain a belief in free will. To hold with a radical memetic view of human behavior is to ignore the factors of economics, environment, and politics in history. As such, memetics is a fascinating and promising protoscience but further research and experimentation is needed before it can become a full-fledged discipline in its own right.

MEMORY. The history of the idea of memory is associated with the cultural uses of two kinds of memory, episodic and semantic. Episodic memory concerns the conscious recall of particular events. Interest in its nature dates from antiquity, and mnemonic techniques for strengthening memory's resources, known as the "art of memory," were developed as rhetorical skills. Semantic memory deals in tacit understandings—habits of mind and implicit knowledge on the boundary between the conscious and the unconscious. In modern times, scholars have treated it as a realm apart from episodic memory in light of a newly discovered awareness of the significance of the social contexts of collective memory.

The Ancient Art of Memory

In ancient Greek mythology, Mnemosyne, the goddess of memory, was revered as mother of the Muses of the arts and sciences. Ever since, students of memory have acknowledged memory's creative power to evoke the imaginative forms through which humankind represents the reality of its experience. The ancient idea of memory was grounded in the concept of mimesis, according to which memory and imagination are reverse sides of the creative act of "imitating nature." In the primarily oral culture of ancient Greece, the rhapsodes were renowned for their prodigious powers of memory, which allowed them to sing the Homeric epics, the repositories of the Greek heritage and the foundation of Greek cultural identity. But the use of memory in oral tradition was uncritical, and scholars have made much of the differences between the intuitive poetic storytelling of rhapsodes and the studied analytical use of memory among the literate rhetoricians of an incipient manuscript culture.

A changing conception of memory, therefore, is coeval with the passage from primary orality to manuscript literacy (beginning about the seventh century B.C.E.), which permitted a newfound critical perspective on memory's nature. By late antiquity, the idea of memory as remembered episode had

come to be closely associated with the art of memory, a rhetorical technique of displacement for accurately recalling facts and stories worthy of remembrance. The art located data difficult to remember within easily remembered imaginary structures of places and images. The discovery of this method for associating the unfamiliar with the familiar is attributed to the Greek poet Simonides of Ceos (556–468 B.C.E.) and was developed especially by Roman rhetoricians. The *Rhetorica ad Herennium* (82 B.C.E.), attributed by some to Cicero, is the oldest such manual to have survived from antiquity. Throughout the Middle Ages and Renaissance, the art found expression in ever more complex mnemonic schemes, until it was marginalized by new encyclopedic reference books for storing knowledge in the emerging print culture of the Enlightenment.

The English historian Frances A. Yates (1899–1981) was the first modern scholar to analyze the history of the intellectual uses of mnemonic technique. She grounds this critical perspective in two seminal conceptions of memory derived from ancient Greek philosophy, one formulated by Plato (c. 428–348 or 347 B.C.E.), the other by Aristotle (384–322 B.C.E.). Plato emphasized the power of memory to open pathways to the archetypes of transcendental knowledge. Aristotle presented a down-to-earth analysis of memory's powers of recognition and recall and described mnemonics as a guarantor of the capacity of a well-ordered mind to hold fast to its learning. Yates was especially interested in the ambition the Neoplatonist rhetoricians of the Renaissance had to construct imaginary memory palaces whose architectural structures were purported to mirror those of an ideal universe and so to provide hermetic keys to correspondences between earthly and transcendental realities. But the rise of empirical science in the seventeenth century undercut the art of memory's idealist presuppositions, and while the art remained an elegant technique for the rhetorical display of erudition, it was soon acknowledged that its methods led only to a philosophical dead end.

Modern Memory and Personal Identity

The spread of print literacy by the eighteenth century transformed the cultural understanding of episodic memory. In print culture, collective knowledge could be easily preserved in readily accessible, alphabetically indexed reference books, rendering obsolete the practical applications of the art of memory in information retrieval. The psychological effect was to free memory for personal reflection on formative life experience, particularly that of childhood. The idea of memory thenceforth came to be closely allied with autobiographical soul-searching. The prototypes for this genre of self-analysis were the *Confessions* (1762) by the French philosopher Jean-Jacques Rousseau (1712–1778) and the *Prelude* (1805) by the English poet William Wordsworth (1770–1850). But for early twentieth-century readers, the most poignant introspective evocation of the past was that of the French writer Marcel Proust (1871–1922), who, in his multivolume novel *In Search of Lost Time* (1913–1927), marveled at the way an impromptu experience of sensory recall could spontaneously awaken the brilliant immediacy of an entirely forgotten cultural world. For the literati of the modern age, recovered memory was perceived to be the surest route to the discovery of the deep sources of personal identity.

Memory reconceived as the search for self was given a scientific foundation by the Austrian physician Sigmund Freud (1856–1939). Just as Plato had recourse to memory as a means for lifting the soul to an awareness of an ideal world, so Freud aspired to employ memory to open passageways leading to truths hidden in the unconscious. He invented psychoanalysis as a therapeutic technique for helping his patients cope with their neuroses, which he attributed to repressed memories of trauma earlier in their lives. Freud thought of the unconscious psyche as a subterranean archive where forgotten memories of unresolved issues pressed their unanswered claims on the conscious mind in ways that impaired its capacity to deal with present realities. In recovering repressed memories, patients would come to recognize the sources of their inner conflicts and so gain self-knowledge that would enable them to act more effectively in their present endeavors. Like the art of memory, Freud's psychoanalytic technique used the principle of displacement. Seemingly innocuous dreams, "screen memories," and slips of the tongue were often place markers for trauma in an individual's life history, providing clues to more troubling memories buried in the unconscious. The skilled psychoanalyst could help patients recover them.

The Social Frameworks of Collective Memory

In the early twentieth century, near the time when Freud's findings were being popularized, sociologists began to inquire into the nature of semantic memory as a realm of remembrance of a different order—socially conditioned memory, often tacitly understood. Here the memory was considered in its social context, as subject to social and cultural influences. The French philosopher Henri Bergson (1859–1941) prepared the way at the turn of the twentieth century by pointing out the difference between the memory of specific events and the memory of enduring attitudes, a distinction he correlated with that between the moment and duration. The French sociologist Maurice Halbwachs (1877–1945) elaborated a more complete theory of collective memory during the 1920s. For him, collective memory is a function of social power, and its expression varies with the social settings in which we find ourselves. We localize images of the past within imaginary frameworks that conform to our social understanding. For that reason, collective memory is provisional until it is evoked within specific social contexts, and its form and strength is relative to the social forces that impinge on our present circumstances. Without such social props, collective memory cannot survive. Halbwachs was especially insightful about how commemorative practices assimilate specific images of episodic memory into the idealized structures of semantic memory. As for its place in the history of ideas, Halbwachs's theory draws on the method of the art of memory to demonstrate how the strategic mobilization of commemorative monuments in mnemonic landscapes reinforces officially sanctioned collective memory.

The Fragility of Memory in a Postmodern Age

In the twenty-first century, we know more about memory than ever before, but trust its resources less. The idea of memory, conceived as the keystone of identity for the nineteenth century, has been reconceived as the debris of lost identities, the freestones of aging memory palaces that have fallen into ruins. Since the last quarter of the twentieth century, the topic has inspired

intense interest among historians, literary critics, folklorists, sociologists, anthropologists, psychologists, and neurobiologists. Across the curriculum, scholars are as one in noting that memory is easily and often remodeled, almost always distorted, and hence unreliable as a guide to the realities of the past. The idea of memory, therefore, is noteworthy for its fragility, vulnerable as it is not only to the vagaries of the mind but also to social, political, and cultural forces that would alter or obliterate it.

On the edge of fragile memory lies nostalgia, the most elusive of memory's protean forms and one beginning to receive critical attention. An admixture of sweetness and sorrow, it expresses a longing for a vanishing past often more imaginary than real in its idealized remembrance. Nostalgia exercised a powerful appeal in the Romantic sentiments of the nineteenth century, tied as it was to regret over the passing of ways of life eroded by economic and social change, a generalized popular enthusiasm for innovation, and rising expectations about what the future might hold. Nostalgia was the shadow side of progress. Chastened by the disappointments of the twentieth century, however, the idea of progress has fallen on hard times, and nostalgia presents itself as an even more diffuse longing for a fantasy world that never existed (for example, the classless society in Communist propaganda). So reconceived, nostalgia has come to be criticized as a dangerous surrender to anarchistic illusion that contributes to memory's vulnerability to exploitation and misuse.

Situated at an interdisciplinary crossroads, the idea of memory has yet to promote an exchange between humanists and scientists, though they make their way along converging avenues of research. Scientists have moved away from Freud's claim about the integrity of memory's images. Steady research in psychology over the course of the twentieth century exposed the intricacies of the mental process of remembering, which involves complex transactions among various regions of the brain. For psychologists, remembering is conceived as a dynamic act of remodeling the brachial pathways along which neurons travel as they respond to sensory stimuli. The images of memory are encoded in neural networks, some in short-term and some in long-term configurations, and so are mobilized as conscious memories in multifold and continually changing ways. Memory resides in these ephemeral expressions, and its images are constantly subject to revision in the interplay of well-established patterns and chance circumstances that governs recall.

Some neuroscientists propose that memory is an adaptive strategy in the biological life process. Drawing on Charles Darwin's theory of natural selection, the American neuroscientist Gerald Edelman (1929–) argues that there is a selective process by which memory cells cluster in the neuronal groups that map neural pathways. He identifies two repertoires of such clusters in the gestation of the brain, one, primarily genetic, in embryo, and the other, primarily adaptive, after birth. They establish the categories of recognition through which the brain thenceforth processes external stimuli, though these categories are continually modified as the brain adapts to new life experience. In this sense, each act of recollection is a creative process that entails a reconfiguration of synaptic connections. There is an intriguing analogy between Edelman's two stages of memory cell formation

and the mnemonist's two-step reinforcement of memory in repertoires of places and images. There is a resonance as well between Edelman's notion of the brain's mapping of neural pathways and Halbwachs's conception of the topographical localization of social memory. Both affirm the constructive nature of the act of memory in the interplay of recognition and context.

Cultural Contexts of Memory in the Twenty-First Century

Among contexts contributing to the idea of memory's fragility in the twenty-first century, one might highlight the following:

The one-way transit to amnesia in the pathologies of dementia. The degree to which the workings of memory elude research in the biological sciences is dramatized by the difficulties of understanding the perplexing diseases that lead to the deterioration of memory in old age. Freud's faith in the prospect of memory retrieval is difficult to reconcile with the insurmountable barriers erected by the ravages of dementia. An unfortunate by-product of longevity in the affluent Western world has been an increasing susceptibility to the maladies of memory impairment with advancing years. Alzheimer's disease is the most dreaded among an array of forms of dementia that rob victims of their memories and by consequence of their identities. Here there can be no recall of the past from the oblivion imposed by neurological degeneration. Alzheimer's disease has come to serve as a cultural metaphor for twenty-first century fears of trends that promote not only personal but also social amnesia.

Media and the eclipse of tradition in mass culture. The twenty-first century is characterized by its present-mindedness, but ironically has little regard for the presence of the past. We live in a consumer society whose interest lies in using and then discarding the resources of the present, not conserving them for future generations. Tradition, once valued as the bequest of the wisdom of past generations to the present one, is dismissed as trivial to the manufactured pursuit of immediate gratification in which the hallmarks of tradition are redeployed as the kitsch of consumerism, divested of the social and cultural frameworks that once defined social identity.

The media work their pervasive influence thanks to a revolution in the technologies of communication in the late twentieth century. The invention of new forms of electronic communication—notably the personal computer, linked by the Internet to a worldwide web of memory banks in cyberspace—so vastly expanded the capacity and facilitated the ease of information retrieval that it reshaped both perception and learning in ways analogous to those that accompanied the transition from orality to literacy (during which the art of memory was invented), and then from manuscript to print culture (when the interconnection of memory and personal identity was established). In this respect, the organization of knowledge on computer screens and Internet Web pages departs from its linear organization in print culture, to be reconfigured spatially on Web sites and in icons reminiscent of the places and images of the art of memory. Temporal models (timelines) are replaced by spatial ones (hyperlinks among Web sites).

The revolution in media communication accelerated the fraying of older forms of social and cultural identity. The media mold

images in pervasive and homogeneous ways by virtue of their expanded control of the networks of communication, and favor tendentious publicity over deliberation. The media deepen present-mindedness, since their imperative is to publicize images of recent events as quickly as possible before moving on to others even more recent and enticing in their prurient interest. They evoke a sense of immediacy in which the past is glossed over and the future reduced to idle speculation. The mnemonic power of forms of publicity to incite interest prevails over the force of ideas, undermining the value of cultural traditions that once provided sure reference points of collective identity.

A reluctance to mourn. In the late twentieth century, historians too turned avidly to research on memory, more specifically to the relationship between memory and the dissolving cultural identities of the postmodern age. Whereas scholars of the nineteenth century had looked to formative beginnings, those of the late twentieth century were more interested in irresolute endings. During the 1970s, social historians such as Philippe Ariès, Pierre Chaunu, and Michel Vovelle launched studies of changing attitudes toward death and mourning across several centuries, in some sense as a response to the denial of death and the difficulties of mourning common in the late twentieth century. For comparison, Ariès portrayed the nineteenth century as a golden age of mourning. He noted newly intense expressions of personal mourning, made manifest in lavish funeral rituals and ornate commemorative monuments in cemeteries reconceived as gardens for meditation. Mourning in the nineteenth century confirmed personal identity by integrating the rituals of private mourning into well-established public traditions. The twentieth century, he claimed, was conspicuous for its reluctance to face death's realities and its diminished capacity to devote time and intensity to the process of coming to terms with the loss of loved ones.

The politics of memory. Historians soon extended their inquiry to encompass public commemoration—what the U.S. psychologist Peter Homans has characterized as the mourning of symbolic loss. During the 1980s, historical scholarship addressed the politics of memory, especially as it was displayed in the nineteenth-century commemorative practices that solemnized the building of nation-states in their use of icons of sacred moments (for example, national holidays) and avatars of patriotism (such as “founding fathers”). Given the challenges facing the nation-state in an age more acutely aware of the need for global perspectives on humankind, the historians' perspective on the making of national memory tended to dwell on its present-minded politics and geographical parochialism. Such research drew heavily on Halbwachs's theory of collective memory, as historians sought to rein in memory's claims on the past. In parallel with the efforts of philosophers and literary critics to deconstruct the forms of cultural discourse, historians sought to expose the building blocks from which practices of public commemoration had been constructed. They juxtaposed and to some degree reduced the reverential task of commemoration to its efficacious use in consolidating political allegiances.

Eric Hobsbawm and Terence Ranger's *The Invention of Tradition* (1983) and Pierre Nora's *Les lieux de mémoire* (1984–1992) stand out as pioneering studies in this field. Both seek

to expose memory's role in the making of political identities that have become suspect in their biases and whose appeal at the turn of the twenty-first century began to wane. Nora's book on the making of the French national memory provided a method for digging through the accumulating layers of memories that contributed to the making of political identity over long periods of time. It inspired a host of studies dealing with like political uses of memory in countries around the world.

Traumatic memories of atrocities. The twentieth century witnessed episodes of genocide and mass destruction on a scale that traumatized entire populations into collective repression. Reckoning with these unhappy memories demanded a new approach. Concerned that the worst atrocities might be glossed over and forgotten, historians undertook an inquiry into a relationship of a different order between memory and history. These investigations reiterated Freud's thesis about the necessity of "working through" the trauma of repressed memory to uncover harsh and painful truths about crimes against humanity. They concluded that some memories cannot be easily tamed by history, and that they maintain their singularity at the limits of history's powers of representation. Memories of the Holocaust of European Jewry are the most studied among them.

The problems involved in historicizing the memory of the Holocaust was the subject of the much-publicized "historians' controversy" in Germany during the 1980s. One group of historians contended that it was time to place the Holocaust in historical context. Another countered that no extant conceptual framework is adequate for doing so. It argued for the importance of the preliminary task of gathering testimony from Holocaust survivors still struggling to come to terms with their painful memories. Meditating on the differences between memory and history, the Israeli historian Saul Friedländer (b. 1932) wondered whether history could ever do justice to the existential meaning the Holocaust held for its victims. His question is whether the immediacy of memory can ever be reduced to the selective perspectives and conceptual abstractions of historical interpretation. He suggests that traumatic memory may be a realm of human understanding whose meaning is to some degree incommensurable with historical explanation. The conversation among historians about the limits of history's claims on traumatic memory lingered into the 1990s, and the European Holocaust served as a point of departure for studies of other instances of genocide in the late twentieth century, the memory of which presented obstacles to adequate historical interpretation.

History's Claims on Memory: A Remedy or a Poison?

The dispute about the relationship between memory and history was put in philosophical perspective by the French phenomenologist Paul Ricoeur (b. 1913). After reviewing the many routes of scholarly inquiry into the idea of memory at the turn of the twenty-first century, he closes his analysis with a meditation on the concerns of the historians of the Holocaust about history's premature claims on memory. In considering why history must first beg pardon of memory, he guides our attention to Plato's philosophical dialogue *Phaedrus*, an evocation of the debate among the ancients about differences between the remembered and the written word that provides an analogy with the current debate about memory's relationship to history. In this dialogue,

Plato's teacher Socrates ruminates on whether efforts to tame memory to the critical perspectives of writing have merit. He poses the question: Is writing as an aid to memory a remedy or a poison? The written word can be a remedy in the sense that it secures knowledge in an enduring form. But it does so by setting limits on the depiction of the past and so discards with a certain finality alternate ways of evoking its presence. Memory, by contrast, may at any moment rescue the past from oblivion. Its uses reside not only in its resources for preservation but also in those for creation. Its virtue lies in its ontological claim to body forth the imaginative forms that make conscious knowledge of human experience possible. History at its best deepens human understanding in its accurate reporting and intelligent interpretation of the past, and it strives to be conclusive. But memory's fidelity to the experience of the past is the basis of its openness toward the future, and it resists closure. Memory stands "as a little miracle" in its distinctive capacity to trigger the creative imagination in a way no other faculty of mind can.

The U.S. intellectual historian David Gross (b. 1940) adapts that insight to consider the status of memory in the twenty-first century. He notes the readiness of society to consign to oblivion all that stands in the way of present-minded expectations. He sorts out the intellectuals of late modernity into those who would discard and those who would value the past remembered. He highlights modern "rememberers" who have argued persuasively for the importance of the past to their present concerns—among them Proust and Freud, but also the nineteenth-century German philosopher Friedrich Nietzsche (1844–1900) and the twentieth-century German literary critic Walter Benjamin (1892–1940).

Benjamin in particular fascinated scholars because of his aphoristic insight into memory's remedy for the deficiencies of the timeworn claims of the modern vision of history on the contemporary age. Especially provocative is his interpretation of the painting *Angelus Novus* (1920) by the surrealist artist Paul Klee, a tableau of the angel of history looking back sadly on the events of the modern age, not as milestones of civilization's advance but rather as remnants of its failed projects and endless disappointments. A disillusioned socialist nostalgic for the heroics of the nineteenth-century revolutionary tradition, Benjamin longed for memory's spark to jump-start an alternative future. Neglected memories, he maintained, respond to our imaginative gaze like heliotropes opening to the sun.

Although assailed by all the pressures of present-minded perspectives that deny the importance of recollecting the past, the rememberers appeal to the present age by calling to mind the striking diversity and rich complexity of past human experience, and so deepen understanding of the timefulness of the human condition in its manifold meanings. Memory's claim on the past, they argue, lies in its creative capacity to resurrect lost worlds worthy of our consideration. Their insight recalls the ancients' reverence for the goddess Mnemosyne, who out of the eons of humankind's lost primordial past brought into consciousness the imaginative forms from which all the arts and sciences would spring.

MEN AND MASCULINITY. Most human cultures, perhaps all, have accounts of gender relations, explaining and illustrating what it is to be a woman or a man, and how women and men are interrelated. The forms taken by these accounts vary greatly—ancestor myths, moral exhortation, exemplary narratives, drama, social science, philosophical speculation, and visual imagery. In many, there is a specific account of the domain of men, the characteristic activities of men, and the psychological traits of manhood.

Stories of Men

The earliest surviving text of classical Greek civilization centers on the deeds of ruling-class men, informed by a conflict over men's rights to women. Homer's *Iliad* presents a vivid picture of a military encampment and a besieged city, with warrior-heroes roaming the countryside, carrying off women and occasionally massacring the population of a captured town. War is undoubtedly men's affair, and both courage and military skill

are tests of manhood. The business of men in these stories is to rule, cultivate land, found cities, and fight. Greek legend includes warrior women, but they are exotic figures. The central women in Homer's tales are Helen, the wandering queen who was fought over by the men, and Andromache and Penelope, archetypes of domestic faithfulness.

Yet Homer is no admirer of pure brawn. The mighty but slow-witted Ajax is of limited interest in the *Iliad* and becomes almost a comic figure in later Greek literature. The hero Achilles is an invincible fighter but is at the center of the story precisely because he is also highly emotional, takes offense, and refuses to fight. The hero of the *Odyssey* is perfectly capable of slaughter—Penelope's suitors ultimately get the same treatment as Helen's. But Odysseus is far more famous for his quick wit and his ability to talk his way out of trouble.

Attic drama of the fifth century B.C.E. tells a string of stories about men, power, and violence. They include the conscience-stricken Oedipus, the proud and rigid Creon, the vengeful Orestes, the prying Pentheus, and the faithless Jason. Classical Hellenic literature thus presents a spectrum of images of men. The texts complicate, and often call into question, the central image of the warrior-prince, which nevertheless remains an ideal, a point of reference.

It was the uncomplicated image of the warrior-prince that passed down into modern European tradition as an ideal of masculinity, reshaped by feudalism. In Sir Thomas Malory's fifteenth-century reworking of the Arthurian legends, for instance, the presumed context is always one of fighting or preparation for fighting. Although Malory's *Morte D'Arthur* presents variations in the style of warriorhood—some of the knights are cool and others are hot-blooded, some are painfully honest and others treacherous—skill in battle is always the vital test of the “worshipful” knight. Yeomen and villeins are another question to Malory, but among his elite, there is only one male character who is not part of the armed competition for “worship”—the unaccountable prophet/witch Merlin. Arthur himself, it is easily forgotten, was a bastard even in the mainstream legend, and pulling a sword from an anvil was hardly an established form of royal election. He had to establish his claim to kingship by mass killings—“passynge grete slaughtir,” in Malory's phrase—in a protracted civil war.

Historic images of warrior-heroes were handed down, and reworked as somewhat more widely available ideals, in European modernity. The point is made in a British popular song of the eighteenth or nineteenth century:

Some talk of Alexander, and some of Hercules,
Of Hector and Lysander, and such great names as these,
But of all the world's brave heroes, there's none that can compare,
With a tow row row, with a tow row row, to the British Grenadier.

So it had already been in Shakespeare, with his archetype-soldier,

Full of strange oaths, and bearded like the pard,
Jealous in honour, sudden and quick in quarrel,

Seeking the bubble reputation
Even in the cannon's mouth. (*As You Like It*, 2.7.150–153)

Questioning Masculinity

The word *masculine* (as a synonym for *male*) is a very old word in English. It was used by Chaucer in the fourteenth century. However, the terms *masculinity*, *masculinize*, and *masculinism* came into common use in English only in the late nineteenth century. This change in language signaled a rather different way of looking at men and their position in the world.

This change was part of the cultural response made, in the bourgeois society of the industrialized countries, to the women's suffrage movement, and to the broad challenge by first-wave feminism to Victorian-era patriarchy. The bourgeois society of imperial Europe (and its offshoots in colonies, notably in the United States) had taken the separation of men's and women's spheres to an extreme. It defined not only war as men's business but also property, knowledge, government, and, in many contexts, even waged work as such. In this context the concept of masculinity had a slightly conservative flavor, suggesting that social inequalities were rooted in permanent differences of the character of men and women. Many thinkers of the time assumed that these were based in the imperatives of biological evolution.

The term *masculinity* not only had antifeminist overtones, it had a clinical flavor as well. Femininity in men was seen as a source of sexual crime, especially (though not exclusively) homosexuality. Masculinity in women was also seen as a kind of pathology, especially threatening to their capacity to bear children.

From the start, however, this idea was contested. Not only women of the suffrage movement, but also men like John Stuart Mill (1806–1873) and Lester Ward (1841–1913) supported equality between women and men, convinced that social progress would iron out most of the differences between men's and women's lives (see the documentary history by Kimmel and Mosmiller).

Vaerting

In the next generation, the pioneering German educator Mathilde Vaerting (1884–1977) produced in *The Dominant Sex* (1923) perhaps the most revolutionary theory of gender ever written. She argued that masculinity and femininity were not fixed characteristics but reflected the fact that we lived in a male-dominated society—a *Männerstaat* (men's state). In societies where women held power, she argued, men showed the very characteristics that Western bourgeois society saw as quintessentially feminine. Masculinity or masculine characteristics, to Vaerting, were thus not expressions of the male body, and had nothing whatever to do with evolutionary forces. They were the consequences of social power structure and of this alone.

Vaerting based her arguments on a social learning theory, common among progressive educators at the time. She traced gender patterns in institutions such as the legal system (anticipating a later generation of sociological research on gender). Among other consequences of her perspective was a remarkable

prediction of the men's liberation movement, which appeared fifty years later.

Vaerting's ideas did attract some attention in the 1920s. But first-wave feminism was in decline, Vaerting lost her academic position when fascism came to power in Germany, and it was in other currents of thought that the questioning of masculinity was carried forward.

Freud

It was the work of the Austrian physician Sigmund Freud (1856–1939), more than anything else, that disrupted the apparently natural object "masculinity" and made an enquiry into the process of its construction possible.

Freud's ideas about masculinity developed in three steps. The first came in his initial statements of psychoanalytic principles: the idea of continuity between normal and neurotic mental life, the concepts of repression and the unconscious, and the method that allowed unconscious mental processes to be read through dreams, jokes, slips of the tongue, and symptoms. Freud understood that adult sexuality and gender were not fixed by nature but were constructed through a long and conflict-ridden process. The Oedipus complex, an emotional tangle of middle childhood involving desire for one parent and hatred for the other, was the key moment in this development. What precipitated the oedipal crisis, for boys, was rivalry with the father and terror of castration. Here Freud identified a formative moment in masculinity and pictured the dynamics of a formative relationship.

In his theoretical writing, Freud complicated this picture. Homosexuality, he argued, is not a simple gender switch, and "a large proportion of male inverts retain the mental quality of masculinity." Freud suggested that masculine and feminine currents coexist in everyone. Adult masculinity was a complex, and in some ways precarious, construction. In his longest case history, the "Wolf Man," Freud pushed behind the Oedipus complex to find a pre-oedipal, narcissistic masculinity that underpinned castration anxiety.

In a final stage, Freud developed his account of the structure of personality, in particular the concept of the superego, the unconscious agency that judges, censors, and presents ideals. The superego is formed, in the aftermath of the Oedipus complex, by internalized prohibitions from the parents. Freud gradually came to see it as having a gendered character, being crucially a product of the child's relationship with the father, and more distinct in the case of boys than of girls. This provided the germ of a theory of the patriarchal organization of culture, transmitted from one generation to the next through the construction of masculinity.

Adler

The potential in Freud's work for a radical critique of masculinity was apparent very early. It was taken up by Alfred Adler (1870–1937), a socialist psychiatrist convinced of the importance of social factors in disease. He was one of Freud's first and most important professional supporters but broke with him in 1911, partly over the analysis of masculinity.

Adler's argument started from the familiar polarity between masculinity and femininity but immediately emphasized the feminist point that one side of the polarity is devalued in culture and

associated with weakness. Children of both sexes, being weak vis-à-vis adults, are thus forced to inhabit the feminine position. Submission and striving for independence occur together in a child's life, setting up an internal contradiction between masculinity and femininity. In normal development, some kind of balance is struck. But if there is weakness, there will be anxiety that motivates an exaggerated emphasis on the masculine side of things. This "masculine protest," in Adler's famous phrase, is central to neurosis, resulting in overcompensation in the direction of aggression and a restless striving for triumphs.

Adler considered the masculine protest to be active in both normal and neurotic mental life. The masculine protest was a feature of women's psychology as well as men's but was overdetermined by women's social subordination. In men it could become a public menace. Adler took a highly critical view of dominating masculinities, commenting on "the arch evil of our culture, the excessive pre-eminence of manliness."

World War I left Adler in no doubt about the connections between masculinity, power, and public violence. His 1927 book, *Understanding Human Nature*, made a clearer statement of a psychoanalytic case for gender equality than was found anywhere else until the 1970s.

Other Psychoanalysts

Other psychoanalysts contributed to the argument about femininity and masculinity, though none gave the issue so central a place. Karen Horney (1885–1952) pointed to the importance of "the dread of woman," originating in fear of the mother, in the depth psychology of men. Carl Jung (1875–1961) speculated in *The Relations Between the Ego and the Unconscious* that masculinity and femininity functioned as opposites within personality, in a kind of balance: "The repression of feminine traits and inclinations causes these contrasexual demands to accumulate in the unconscious" (p. 187). This idea, filtered through Jung's later theory of archetypes, resurfaced in the 1980s and became the key theme of a popular therapeutic movement in the United States.

After the 1920s, psychoanalysis moved far to the right on most issues, and discussion of the theory of gender was no exception. When psychoanalysts became popular writers on gender issues in the 1950s, their message identified mental health with gender orthodoxy. The course toward adult heterosexuality, which Freud had seen as a complex and fragile construction, was increasingly presented as a nonproblematic, natural path of development. Anything else was seen as a sign of pathology, especially homosexuality, which was declared inherently pathological, the product of disturbed parent-child relationships. Psychoanalysis as a practice became increasingly a technique of normalization and attempted to adjust its patients to the existing gender order—as is shown in Kenneth Lewes's excellent history of psychoanalytic ideas about male homosexuality. It was only after the impact of feminism in the 1970s that the critical potential in psychoanalytic ideas about gender was rediscovered.

Sex Differences and Ethnography

The first important attempt to create a social science of masculinity centered on the idea of a male sex role. Its origins go back to late-nineteenth-century debates about sex difference,

when resistance to women's emancipation was bolstered by a scientific doctrine of innate sex difference. The first generation of women who entered U.S. research universities not only violated the doctrine of female mental inferiority, they also questioned its presuppositions by researching the differences in mental capacities between men and women. They found very few.

This scandalous result triggered an enormous volume of follow-up research, which has flowed from the 1890s to the present and covered not only mental abilities but also emotions, attitudes, personality traits, interests—indeed, everything that psychologists thought they could measure. The main results have not changed. Sex differences, on almost every psychological trait measured, are either nonexistent or fairly small. When groups of studies are aggregated by the statistical technique of meta-analysis, it is more likely to be concluded that some sex differences in psychological characteristics do exist. These, however, are often influenced by social circumstances.

The idea of a social interpretation of sex differences came principally from anthropology. This new discipline was, after psychoanalysis, the main intellectual force that relativized Western concepts of masculinity and femininity. Ethnographers such as Bronislaw Malinowski (1884–1942) and Margaret Mead (1901–1978) published detailed accounts of non-Western societies that were very widely read in the 1920s and 1930s. In these cultures, men and women were seen to behave in ways that were intelligible and consistent, yet very different from the patterns familiar in metropolitan bourgeois society. Mead's *Sex and Temperament in Three Primitive Societies* (1935), in particular, showed men following radically different ideals of conduct in different cultural contexts. The models of heroic masculinity familiar in Western literature were, it seemed, specific to the West.

From anthropology, also, came the idea of the functional interrelatedness of a society and the idea of a social role within it. In the 1940s and 1950s these ideas were applied to sex difference research and gave birth to the term "sex role," which in time passed into everyday speech.

The Male Sex Role

The usual conception of "sex role" is that a man or a woman enacts a general set of expectations attached to their sex. There are always two sex roles in any cultural context, one male and the other female. Masculinity and femininity are quite easily interpreted as internalized sex roles, the products of socialization. The reason why this socialization occurs, according to structural-functionalist sociology and anthropology, is that it is necessary for the stability or reproduction of the society as a whole. Sex differences in behavior (which are persistently exaggerated in the sex role literature) are thus explained on the small scale by social learning, on the large scale by the functioning of society.

Most often, sex roles are seen as the cultural elaboration of underlying biological sex differences. But the idea of a biological base can be dispensed with. The most sophisticated statement of sex role theory was made in the mid-1950s by Talcott Parsons, the leading sociological theorist of the time. In Parsons's argument, the distinction between male and female sex roles is treated as a distinction between "instrumental" and "expressive" roles in the family (when considered as a small group).

The idea that masculinity is the internalized male sex role allows for social change. Change was a central theme in the first detailed discussions of the male sex role that appeared in U.S. social science journals in the 1950s. The most notable was a paper by Helen Hacker called “The New Burdens of Masculinity,” which suggested that expressive functions were now being added to instrumental functions. Men were thus expected to show interpersonal skills as well as being “sturdy oaks.” For the most part, however, the first generation of sex role theorists assumed that the roles were well-defined, that socialization went ahead harmoniously, and that sex role learning was a thoroughly good thing. Successful internalization of sex role norms contributed to social stability, mental health, and the performance of necessary social functions.

Men’s Liberation and the Critique of Sex Roles

The new feminism in the 1970s did not abandon the concept of sex roles, but it reevaluated their meaning. It was argued that the female sex role was inherently oppressive and that role internalization was a means of fixing girls and women in a subordinate position. Almost immediately, a parallel analysis of the male sex role appeared. By the mid-1970s there was a small but much-discussed men’s liberation movement in the United States, and a small network of men’s consciousness-raising groups in other developed countries as well. A minor publishing boom developed in books about the “problem” of men and also in papers in counseling and social science journals. Their flavor is indicated by one title: “Warning: The Male Sex Role May Be Dangerous to Your Health.”

The picture of the male sex role in most of this literature was conventional and typically middle class, emphasizing traits such as inexpressiveness, orientation to careers, and competitiveness. Authors pointed to the role of commercial sports, such as football, in creating popular images of competitive, aggressive masculinity. They pointed to highly stereotyped representations of men in film and television genres such as the western, the war movie, the gangster movie, and the cop serial, not to mention advertisements such as the famous “Marlboro Man” campaign.

There was some attempt to outline a process of change. The American psychologist Joseph Pleck, one of the most prolific writers in this field, contrasted a traditional with a modern male role. Much of the writing in the United States in the 1970s encouraged men toward the modern version, recommending therapy, consciousness-raising groups, political discussion, role-sharing in marriage, or self-help.

By the 1980s, intellectual weaknesses in the sex role concept were acknowledged, and political divisions in the men’s movement had become wide. The antisexist and profeminist tendency of the early men’s liberation groups were contested by men’s rights groups who were antagonistic to feminism and by a therapeutic movement that took a very different view of masculinity, partly based on a late revival of Jung. Political ambivalence was inherent in the framework of sex roles. There is a basic tendency in sex role theory to understand men’s and women’s positions as consensual and complementary—a point made explicit by Parsons’s theory of instrumental (masculine)

Billboard advertising Marlboro cigarettes, 1988. In the United States during the 1970s, a small movement sprang up to protest stereotypical male role models in society. Marlboro’s advertising campaign, which featured masculine, rugged cowboys was singled out as an offender. © CARL & ANN PURCELL/CORBIS

and expressive (feminine) orientations. Attempts by Pleck and others to create a nonnormative sex role theory proved unsuccessful in the long run.

Gay Liberation and Queer Theory

The most effective political mobilization among men around gender and sexual politics was the gay liberation movement that took shape around 1968–1970 in the United States and eventually became worldwide. Gay men mobilizing for civil rights, personal safety, and cultural space have acted on the basis of a long experience of oppression by heterosexual men. The term *homophobia* was coined around 1970 to describe this experience. A central insight of gay liberation is the depth and pervasiveness of homophobia, closely connected with dominant forms of masculinity.

Straight men’s homophobia involves real social practices, ranging from job discrimination to media vilification to

imprisonment, and sometimes to murder. These practices draw social boundaries, defining approved masculinity by its difference from the rejected. Theorists such as Dennis Altman in *Homosexual: Oppression and Liberation* (1972) regarded the oppression of homosexuals as part of a larger enterprise of maintaining an authoritarian social order and often saw it as connected to the oppression of women. Yet gay men have also noticed a certain fascination with homosexuality on the part of straight men. This knowledge was behind the slogan “Every straight man is a target for gay liberation!”

Gay liberation coincided with the emergence of visible gay communities in many cities of the developed world. From the 1970s on, these communities have been the sites of public manifestations of gay identity, ranging from the election of gay politicians to street parties and gay pride marches. For example, by the 1990s the annual lesbian and gay Mardi Gras parade had become the most popular street event in the social life of Sydney, attracting a huge straight audience. Styles of self-presentation in gay communities have shifted with time, from traditional “camp” behavior to the parodic butch masculinity of the late-1970s “clones,” changing again with the impact of the HIV/AIDS epidemic in the 1980s, the diversification of sexual subcultures, and the rise of “queer” sensibility in the 1990s.

Gay liberation, both in theory and practice, made a crucial difference to contemporary thought about masculinity. Gay culture makes visible alternative ways of being a man. Gay politics responds to, and thus makes visible, oppressive gender relations between groups of men. Gay men’s collective knowledge includes gender ambiguity, tension between bodies and identities, and contradictions in and around masculinity.

Many of these themes were picked up in queer theory, a new style of lesbian and gay theorizing that emerged under the influence of poststructuralism in the 1990s. In a diverse trend of thought rather than a formal body of doctrines, queer theorists have challenged the notion of fixed gender or sexual identities, thus challenging the basis of gay community politics. They have identified homoerotic subtexts throughout Western culture and have criticized feminist gender theory as being based on an unexamined heterosexism. Applied to men and masculinity, in texts such as David Buchbinder’s *Performance Anxieties* (1998), queer theory questions the naturalness of the category “men” and sees masculine identity not as the settled foundation of behavior but as something always insecure, constantly being created in performance.

Social Construction

The contemporary field of masculinity research, alternatively known as men’s studies or critical studies of men, was created when several impulses in the 1980s moved discussions decisively beyond the sex role framework. One was the continuing development of theories of gender, both structuralist and poststructuralist, which provided more sophisticated models of the gender relations in which men are located and masculinity is constituted.

A second impulse was provided when the coexistence of multiple masculinities was recognized—a move strongly influenced by gay thought. A third impulse was a new wave of empirical research in sociology, history, and cultural studies. This research

has been very diverse in subject matter but has generally had a local character. Its main focus has been the construction of masculinity in a particular milieu or moment: a printing shop in Great Britain, a professional sports career in the United States, a group of colonial schools in South Africa, drinking groups in Australian bars, a working-class suburb in Brazil, or the marriage plans of young middle-class men in urban Japan. Its characteristic research style has been ethnographic, making use of participant observation, open-ended interviewing, or discursive analysis of texts in popular culture. The primary research task has been to give close descriptions of processes and outcomes in the local site. This body of research was systematized in the mid-1990s in R. W. Connell’s *Masculinities*.

This “ethnographic moment” in masculinity research developed first in the English-speaking world, mainly in Australia, the United States, and Great Britain. In central and northern Europe, where feminist and gay research had also taken an early interest in the gender practices of men, there was more emphasis on survey research, such as the well-known “Brigitte study,” based on a national survey in Germany in 1984–1985, sponsored by a women’s magazine and conducted by feminist sociologists Sigrid Metz-Göckel and Ursula Mueller. There was also a focus on the ways men are positioned in relation to gender equity policies, a concern that has continued in Scandinavia to the present. The results of this great social experiment have recently been drawn together by the Norwegian sociologist Oeystein Holter, emphasizing that in favorable circumstances men can and do change their gender practices. In the same region, an interest developed in using masculinity research to uncover the roots of violence, which in recent years has become one of the most important fields of application of masculinity research internationally.

The picture that emerged from this research differed significantly from older ideas of the male sex role and even more from conceptions of “natural” masculinity. One of the key achievements of this research was to document the diversity of masculinities. There is not just one pattern of masculinity, good in all times and places. Different cultures vary, some being much more peaceable than others. Within a single society—even within a single community or institution—there will be different patterns of masculinity, different recognizable ways of “being a man.” Just as we now recognize the diversity of family forms, so we also now recognize that there are likely to be different constructions of masculinity in different social class settings, different ethnic communities, and different regions.

Hegemonic Masculinity

But different masculinities do not sit side by side as alternative lifestyles that men can freely choose. There are definite relationships between different masculinities. Most importantly, there are relationships of hierarchy and exclusion. In most communities there is a specific pattern of masculinity that is more respected than others. The hegemonic pattern of masculinity is often associated with national identity, celebrated in popular films and sports, presented as an ideal to the young, and constantly used as a basis of advertising. Other patterns of masculinity exist but do not attract the same respect—indeed, some forms of masculinity are actively stigmatized.

A good deal of debate has surrounded the concept of “hegemonic” masculinity. In some usages, it has turned into the concept of a fixed identity or stereotype, not very different from the old model of the male sex role. In others, however, it is recognized that only a minority of men actually embody a hegemonic model. Yet the hierarchy around this version of masculinity can be an important source of conflict and violence among men.

Recent social research also stresses that masculinity exists not only as a pattern of personal life, but also impersonally in communities, institutions, and cultures. Collective definitions of manhood are generated in community life, and are likely to be contested—and change—as the situation of a community changes, for instance with the decline of industrial employment or changing definitions of marriage, such as attempts in the early years of the twenty-first century to include same-sex domestic partnerships or gay marriage within the legal systems of some of the developed countries. Organizations such as armies and corporations embed particular hegemonic patterns in their organizational cultures, and mass media circulate particular icons of masculinity while discrediting others.

Historical and sociological research has produced convincing evidence that masculinities change over time. Men’s patterns of conduct, and beliefs about gender issues, do not change with dramatic speed. But research has shown significant generational shifts, for instance in sexual behavior, and in beliefs about men’s and women’s roles in society.

Change is to be expected because of the contradictions and tensions in gender relations. These give rise to a complex field of masculinity politics—mobilizations among different groups of men, some of them challenging for the hegemonic position in the local gender order, some defending more limited agendas. This conception is crystallized by Michael Messner in *The Politics of Masculinities* (1997).

Global Perspectives

Until recently, most of the research on, and debate about, masculinity has been about men in First World countries. We need to think beyond this context; and even within it, we need to consider the situation of local masculinities in a global context. Global history and contemporary globalization must be part of our understanding of masculinities. Individual lives are powerfully influenced by geopolitical struggles, imperialism and colonialism, global markets, multinational corporations, labor migration, and transnational media. Not only ethnographic but postcolonial studies are important for understanding the cultural dynamics of contemporary masculinities.

There has been some research on immigrant men in First World contexts. However, up to the 1980s little research was carried out on masculinities in Third World and/or postcolonial countries, and what was done was affected by Eurocentrism. In his excellent ethnographic study of men in Mexico City, *The Meanings of Macho* (1996), Matthew Gutmann criticizes the tendency of Anglo researchers to characterize Latino men as “macho.” More recent studies have acknowledged the great variety of masculinities throughout the Latin American world. For example, a remarkable series of studies coordinated

by José Olavarría, focused in Chile but involving researchers in other countries, has documented diversity in relation to identity, fatherhood, violence, and sexuality. Olavarría’s exploration of the dilemmas of Chilean youth as they attempt to construct a path toward fatherhood in a country undergoing globalization is particularly important.

More work is now being done in other regions outside the metropole—for example, by Japanese and Middle Eastern scholars. The importance of race and class in shaping gender patterns is strikingly shown in southern Africa. By the late 1990s, South Africa had the highest rates of violent death and rape in the world, the second highest number of gun-related homicides, and one of the world’s highest rates of HIV infection. These are connected with a turbulent gender politics in which different patriarchies contest, and different agendas for reform are found. South African masculinities, as shown by Robert Morrell’s collection, *Changing Men in Southern Africa* (2001), are both diverse and contested.

In the contexts of the developing world, as Morrell points out, gender work on men and masculinities must focus on very different issues from those in the developed world. For this reason, researchers in postcolonial contexts do not necessarily adopt theories of hegemonic masculinity or of new masculinities on the Western model. The idea of the “new man” popular in First World media has little relevance beyond the lives of such white, middle-class, urban men. How to make use of the new research is still uncertain. A controversy has developed about how men ought to be included in research and policy about gender and development. As Sarah White shows in a recent review of the argument, complex political issues arise here in a field that has sought, with some recent success, to place women’s interests on the agenda of development agencies.

Attention is now being turned to the patterns of masculinity in transnational agencies and institutions. There is some reason to think that older models of bourgeois masculinity, embedded in local ruling classes and conservative cultures, are being replaced by a transnational business masculinity. Compared with older hegemonic masculinities, the new model is more individualist, liberal in relation to sexuality and social attitudes, and oriented to power through markets rather than through bureaucratic domination. This model has been criticized, and plainly the interplay of masculinity with globalization needs much more investigation.

At the same time, as the return to military intervention abroad by the U.S. government suggests, there is cultural and political space for a reassertion of “hard” masculinities. The unevenness and relentlessness of change on a world scale are well captured in the 2001 volume *A Man’s World? Changing Men’s Practices in a Globalized World*, edited by Bob Pease and Keith Pringle. The issues reviewed in this article are currently the subject of active debate and research, with global issues an important focus.

MESTIZAJE. The concept of *mestizaje* expresses the tensions, contradictions, and ambiguities of its birth in the New World. More important, it is a concept that continues to have spiritual and aesthetic dimensions. *Mestizaje* refers to racial and/or

cultural mixing of Amerindians with Europeans, but the literal connotation of the word does not illuminate its theoretical applications and its more recent transformations. Since its inception in the New World and during those moments when race was a significant factor in social standing, *mestizaje* has been invoked to remedy social inequality and the misfiring of democracy.

Origins

In 1925 José Vasconcelos, the Mexican philosopher and educator, wrote *La raza cósmica* both to challenge Western theories of racial superiority and purity and to offer a new view about the mixing of African, European, and indigenous peoples in Mexico and throughout Latin America. The essay was an effort to undercut the maligned position of indigenous people and their material domination since the conquest, but it was unable to break completely from the civilizing motives of New Spain. *Mestizaje* was the political ideology of modern national identity, unity, and social progress. Yet Vasconcelos's vision pointed to Iberian culture, particularly Christianity, as the source for modernization and progress. Mexican nationalism has continued to construct its citizens as mestizos.

The material and ideological weight of the conquest was also difficult to shake in earlier formations of *mestizaje*. Even while under Spanish rule, criollos exalted the Aztec or Inca past and condemned the conquest, but their celebration of *mestizaje* did not include the elimination of economic domination, political disempowerment, and cultural genocide of indigenous populations. Throughout New Spain, claims of *mestizaje* were meant to indicate a bond against the *peninsulares*, the Spanish settlers with exclusive rights to high political office, and to legitimate creole equality with *peninsulares* at home and in Europe. Other classifications of mixture in the caste system were not exalted, and the status of mulattos and others was not reconsidered. Historians agree that during the colonial, independence, and revolutionary periods, *mestizaje* functioned to reduce cultural, linguistic, and political diversity in Mexico and to authorize the privileged status of ruling elites. In short, the original concept emphasized the assimilation and appropriation of indigenous cultures and the promise of progress and justice through Europe. As such, hybridity was cloaked under the banner of national unity. For the Mexican philosopher Octavio Paz (1914–1998), however, the trauma of *mestizaje* serves as a symbol of illegitimacy, a concept he develops in *Labyrinth of Solitude* (1961) and a foundation of his argument on Mexican national character.

Chicanos and Mestizaje

In contrast, contemporary expressions of *mestizaje* emphasize hybrid cultural experiences and the relations of power. The social position of contemporary thinkers somewhat explains the late-twentieth-century formulations of *mestizaje*. Whereas Mexican philosophers were members of the dominant sectors of society, Chicana and Chicano social critics, artists, and creative writers who reformulated *mestizaje* beginning in the late 1960s did not enjoy such a place in the United States or Latin America. In multiple genres, the earliest Chicano articulations of *mestizaje* were a strategy of affirmation, liberation, and identity.

Mexican Americans join three historical moments and expand the original concept of *mestizaje*. The first event occurred in 1521

with the Spanish conquest of the Aztec Empire; *el segundo mestizaje* (the second cultural mixing) occurred at the end of the Mexican-American War (1846–1848), in which the United States annexed over half of Mexico's territory; and the third event is the contemporary cultural interchange among Chicanos and European Americans. All three moments originate in disempowerment and suggest a rebirth. Particularly since the second historical moment, Chicanos and Chicanas have positioned *mestizaje* as an alternative to the social contract of assimilation. In making parallel the historical legacies of the seventeenth and nineteenth centuries, *mestizaje* no longer serves a pluralist agenda. In the United States, it functions as an antidote to modern anti-Indian and anti-Mexican sentiments, and although alliances with Native American populations in the American Southwest have been formed, they do not continue to anchor Chicano thought in the same way that Mexico's indigenous and pre-Columbian civilizations inform Chicano and Chicana *mestizaje*.

Chicano *mestizaje* enacts a void and a congested condition. For example, the poem "I Am Joaquín" (1967) by Rodolfo "Corky" Gonzales expresses a fusion of two opposites, Mexico and the United States, which are blended to form a third cultural experience: Chicano. The hybrid Chicano is neither Mexican nor American. Artists such as Amado Peña (with "Mestizo," silkscreen, 1974) and Emanuel Martínez (with "Mestizo Banner," silkscreen on canvas, 1967) produced the fusion in graphic form with a mestizo tripartite head in which two profiles faced left and right and were united in the third face in frontal position. Other artistic and scholarly proposals overdetermined a gendered *mestizaje*, emphasizing select indigenous characteristics and a masculine repertoire.

Critique and Reformulation

While social analysts agree that *mestizaje* has recuperative properties for Mexican Americans and that it successfully challenges Paz's diagnosis of a mixed nation as pathological, the neoindigenous emphasis can be ironically similar to Western distortions of native peoples, as both rely on a timeless, primordial culture. Chicano/a social critics such as Norma Alarcón and Chon A. Noriega point out that this use of *mestizaje* constructs a "pure" origin and relies on a static and unchanging past. The essentialist disposition of *mestizaje*, particularly the romantic neoindigenous perspective, clashes with the reality of Native American experiences as well as indigenous social and political struggles throughout the Americas. Furthermore, as Chicana feminists point out, an essentialist view of Mexican-origin people in the United States also distorts differences and inequalities within said communities. Chicana feminist challenges to patriarchy and homophobia helped to develop the critique of essentialism, and this had a lasting effect on the contemporary notion of *mestizaje*.

In her foundational book, *Borderlands/La Frontera: The New Mestiza* (1987), Gloria Anzaldúa fleshes out and complicates *mestizaje*. Performing a postmodern style that mixes autobiography, poetry, mythology, historical document, and documentation into theoretical proclamation, she problematizes conventions of race, nation, sexuality, and gender, drawing attention to fluidity within identity rather than a singular subject position. According to Anzaldúa, *mestizaje* is the demystification of social boundaries

and territorial borders. Thus conceived, the spaces between cultures and nations are porous and flexible. However, it is not just her acknowledgment of internal complexities that makes a *mestiza* consciousness significant. Anzaldúa does not imagine distinctions in opposition to each other but acknowledges concurrent identities, shifting strategies, and capacities for change.

The reformulated concept is more successful at challenging the premise of white racial superiority, purity, and essentialism. *Mestizaje* is a source of creativity, survival, and triumph. Unlike Mexican and Chicano cultural-nationalist formulations of *mestizaje*, Anzaldúa acknowledges all combinations and the places of contradiction that can result. Always synthesizing, *mestizaje* is a force of movement, combination, and transformation. Her own thinking about *mestizaje* fuses with the Nahuatl concept of *nepantla* (middle place or place of passage), thereby adding the potential for agency within the concept.

Spread and Influence

Nonlinear thought and unfixed identities have intellectual and political appeal for numerous fields, especially those also influenced by poststructural and postmodern schools of thought. Because of the liberatory dimensions of the concept of *mestizaje*, it is widely used in postcolonial, ethnic, and feminist studies and Latino theology. Most credit Anzaldúa with creating the aperture for understanding and theorizing about the ability to have multiple social perspectives and positions with concrete material forms of oppression or privilege.

The scholars Chela Sandoval and Emma Pérez, as well as the Latino theologian Virgilio Elizondo, explore the implications of *mestiza* consciousness for U.S. Third World feminists, including Chicana feminists and Latino Catholic congregations, respectively. For Elizondo, *mestizaje* is divine grace, which elevates the spiritual qualities of *mestizaje* as articulated by Vasconcelos but without the Eurocentric imperative. *Mestizaje* becomes the existence that resurrects humanity, and all have the potential for salvation since Elizondo ultimately describes all cross-cultural contacts as *mestizaje*. Expansions of the concept by Elizondo and others have been met by intense criticism. Most Latino theologians, such as María Pilar Aquino and Gloria Inés Loya, present its historical specificity as an important term of its experience and path to salvation. The recuperative properties of *mestizaje* are significant for postcolonial scholars. Both Chicana feminists Pérez and Sandoval reveal how the new *mestizaje* offers a political method or compass for mobilizing oppositional forms of consciousness that will produce equity. It is a method that develops and exceeds the modes of assimilation, revolution, supremacy, and separatism, each of which is a strategy unable to reconcile or allow for the multiple social positions and perspectives as delineated by Anzaldúa.

By the early twenty-first century, the concept of hybridity and cross-cultural contact had permeated social science and humanities scholarship. It also continued to travel North, and French-Canadian scholars relate it to *métissage* (French; "mixed blood"). Whether universal or not, the contemporary reconfiguration explores sites of convergence and disjuncture with attention to the pressure of power, and its meaning can be used to assess the distance between *mestizaje* and *métissage*. Nevertheless, reformulations of *mestizaje* have recuperative

power for those maligned by nation and empire, sexism and homophobia, material and political displacement. If the analysis of intercultural exchange includes attention to ambiguity and contradiction, *mestizaje* can continue to offer a strategy of resistance and liberation in the twenty-first century.

METAPHOR. Metaphor, traditionally defined as the transference of meaning from one word to another, is perhaps the most intensely and variously studied instance of figurative language. This is so because metaphor enjoys two distinct primary aspects, presenting itself as (1) a form (a discrete, replicable linguistic structure, conceivable as extrinsic to thought) and (2) a power (a cognitive operation issuing from an intrinsic and inherently creative mental faculty). Aristotle (384–322 B.C.E.), who begins the Western tradition's systematic investigation of metaphor, is the first to address the trope's double nature. On the one hand, he treats metaphor in the context

of style (implicitly rendering it secondary to invention, the first of the five parts of rhetoric), as deviation from the ostensible clarity of everyday language that is subject to rules of propriety. On the other, he calls metaphor "a kind of enigma" and claims that for the verbal artist "the greatest thing by far is to have a command of metaphor" because "this alone cannot be imparted by another; it is the mark of genius, for to make good metaphors implies an eye for resemblances" (1961, p. 104).

The dominant Aristotelian idea of metaphor is not, however, either a balanced opposition or mixture of metaphor's two primary aspects. Of the two, Aristotle chooses to emphasize the formal view—perhaps because it confirms the primacy of reason and cooperates with his systematic and pedagogical motives. The philosophical and cultural consequences of Aristotle's formal emphasis are substantial and lasting: along with cultural and intellectual traditionalism, this emphasis holds that the office of language is mimetic, that of representing the world. From such a notion of language follows the implication that the truth and value of verbal art is measured by its fidelity to an unchanging, external, and therefore communally explicable reality.

The Classical System

The Aristotelian privileging of metaphor's formal aspect and its attendant assumptions, emphases, and procedures are together amplified and reified by his classical inheritors. In this tradition, metaphor's creative aspect tends to be viewed with suspicion. For instance, in *De oratore* (55 B.C.E.; On oratory), through a fabular comparison between metaphor and clothing, Cicero (106–43 B.C.E.) articulates a view of language as a form of ethical conduct that must not stoop to don the potentially corruptive finery of metaphor: "For just as clothes were first invented to protect us against cold and afterwards began to be used for the sake of adornment and dignity as well, so the metaphorical employment of words was begun because of poverty, but was brought into common use for the sake of entertainment." Cicero uses his comparison to caution us against "borrowing" fancy metaphors because they suggest "poverty" of thought and expression (p. 121–123). But it is largely through Cicero's precise, nuanced discussion of the proper and improper forms and uses of intentionally shaped language that his motive to civilize the power of metaphor is transmitted, inspiring the anonymous author of the *Rhetorica ad Herennium* (first century B.C.E., Rhetoric to Herennius) and Quintilian (c. 35–95/6 C.E.), author of *Institutio oratoria* (first century C.E.; Institutes of oratory).

Quintilian's terminological and conceptual precision expands the formal context within which metaphor may be understood. Because his primary interest is pedagogically useful classification, Quintilian chooses to treat metaphor as a member of the tropes, which involve "the artistic alteration of a word or phrase from its proper meaning to another" (p. 301). Treating metaphor as a member of a class of similar forms allows Quintilian to note metaphor's uniqueness without committing himself to an equal exploration of both its aspects. For example, while he allows that metaphor is the "commonest and by far the most beautiful of tropes," and praises it for "accomplishing the supremely difficult task of providing a name for anything" (p. 303), he restricts an attribution of cognitive agency to the tropes as a class: "The changes involved [in the use of

tropes] concern not merely individual words, but also our thoughts and the structure of our sentences” (p. 301–303). It is noteworthy that here, in the midst of explicating a system whose formal emphasis diminishes metaphor’s creative aspect, Quintilian states that tropes *in themselves* can play a serious role in thinking. Though muted, this connection between figured language and cognition anticipates the ground from which springs the Middle Age’s most important contribution to ideas about metaphor: the notion that, when interpreted correctly, the ambiguities and excesses of figured language involve human understanding with a superior order of knowledge and being.

The Middle Ages

The institutionalization of Christianity required the preservation of classical learning, including Greco-Roman ideas of metaphor. However as Erich Auerbach points out in *Mimesis: The Representation of Reality in Western Literature* (1968), the passage from classical to Christian civilization involved a radical change in the context within which figured language was understood. Because the classical system depended upon a precise delineation and separation of elements, Auerbach sums up its emphasis as “aesthetico-stylistic.” In contrast, the Christian “ethico-theological” emphasis assumes the merging of hitherto distinct styles and foregrounds a decidedly un-Roman urgency concerning interpretation. To the early Christian fathers, figured language represented a formidable theological problem. The scriptures contain many figures and ambiguities, and Christ often chooses to teach through metaphor and parables—but the classical technology of eloquence (particularly how it defines and achieves the high style, language that moves the audience to action) is pagan and elite, neither holy nor humble.

In line with the classical tradition, which he resourcefully defends throughout *De doctrina christiana* (396–426; On Christian doctrine) as being essential for proper scriptural interpretation, Augustine (354–430) discusses metaphor as a trope. It is, however, how he defines a sign that clearly indicates the Christian break from the past: “A sign is a thing which, over and above the impression it makes on the senses, causes something else to come into the mind as a consequence of itself” (p. 535). For Augustine, words (the most important human signs) have an intrinsic power that may exceed the limits erected by the classical doctrine of mimetic fidelity and enforced by the Greco-Roman insistence on decorum. Augustine’s view of words as signs helps him to renew and meld the two aspects of metaphor that Aristotle delineated and his classical inheritors further isolated from each other.

The Renaissance

In step with sweeping material and social changes, including the Reformation and a gathering intellectual consensus that the universe and the mind similarly follow the laws of logic, a new context for understanding the relationship between thought and language was developing. Peter Ramus’s (1515–1572) challenge to the Scholastic status quo represented this new context and prepared the way for the Enlightenment’s cult of reason and pursuit of a language free from the excesses and ambiguities of figured language. Ramus replaces the transcendent Augustinian sign with stark syllogism and calls for a thorough

reorganization of the rhetorical system. As pertains to metaphor, Ramism’s most consequential features are the tightly related assumptions that (1) thought follows the rules of logic and (2) language, because of its vital role in thinking, must be plain and clear. From the Ramist perspective, metaphor has no place in serious discourse and, thus, the nature and tension between its two aspects is rendered moot. However, despite its antimetaphorical outlook, Ramism did not stifle either the flowering of Renaissance rhetoric or subsequent investigations of metaphor. Because the culture of early modern Europe was, in many respects, as medieval (traditional and collectively minded) as it was modern, oratory and poetry were highly respected and widely practiced. Thus Elizabethan and metaphysical metaphors, such as those invented by Shakespeare and Donne, tend to strike an organic balance among three elements: tradition, the age’s increasing emphasis on logic as a basis for artistic invention, and its discovery of a new model of subjectivity distinguished by a personal struggle for self-knowledge and self-determination.

Similar to Ramus, Francis Bacon (1561–1626) was an enemy of Scholasticism and a champion of reason and an unadorned language capable of serving it. In contrast to Ramus, however, Bacon was skeptical of the syllogistic process because, as he writes in *The New Organon* (1620), “the syllogism consists of propositions, propositions consist of words, words are symbols of notions.” “Our only hope” of knowing nature, the truth of things and ourselves, Bacon asserts, “lies in . . . true induction” (p. 41). The foundations of his method—which inspired the British Royal Society’s call for a scientific plain style in language and influenced a range of later philosophers, including Giambattista Vico (1688–1744)—is rooted in the principle that true knowledge comes of what one has “observed in fact or in thought of the course of nature. Beyond this he neither knows anything nor can do anything” (Bacon, p. 39). To Bacon, then, the knowledge that comes of metaphor and other figures of speech number among the “Idols” that confuse human kind, leading us into error. It is Bacon’s dream of a scientific language, one enabling the direct perception and undistorted discussion of reality through the control and exclusion of tropes and figures, that predicts and helps lay the ground for the Enlightenment’s general perspective of metaphor.

The Enlightenment

John Locke (1632–1704), one of the Enlightenment’s most representative thinkers, born into a culture increasingly defined by a belief in the verity of empirical science and its procedures, solves the problem of metaphor by rejecting both of its aspects. In *An Essay Concerning Human Understanding* (1690), Locke holds that the foundations of thought are simple ideas, which are obtained through direct sense impressions. From this perspective, words should refer to things and the most that may be expected of language is that it further discursive “Order and Clearness.” As for metaphor and “all the [other] artificial and figurative application of Words Eloquence hath invented, [these] are for nothing else but to insinuate wrong *Ideas*, move the Passions, and thereby mislead the Judgment” (Locke, p. 508). In order to get at the “true ideas upon which the inference depends,” Locke advises that from language one should

“strip” the “superfluous ideas” evoked by tropes and figures, and then “lay the naked *Ideas* on which the force of the argumentation depends, in their due order.” Thus confronted with “true ideas” in their natural order, the mind easily perceives the truth of things and their relations (Locke, p. 676).

To Locke, metaphor’s enigmatic power to create images and ideas is so corrupting of thought that he entirely exiles it from his model of consciousness and (correct) philosophical process. Of course, neoclassical thinkers, such as Voltaire (1694–1778) and Samuel Johnson (1709–1784), continued to use and productively discuss figured language—but in a context whose emphases denied relativism and forestalled the exploration of categories such as the primitive and the irrational.

Giambattista Vico’s (1668–1744) views are a notable exception to the late-Enlightenment outlook and its limited and generally dismissive idea of metaphor. Although not influential in his lifetime, Vico’s ideas clearly anticipate aspects of the Romantics’ intense interest in and philosophical linking of poetic language, primitivism, and psychological and historical relativism. Vico’s thought thus demonstrates both the continuities and differences between Enlightenment and Romantic thinking about metaphor.

Romanticism

As reflected in *La scienza nuova* (1725; *The new science*), Vico sees language as a social construction intimately involved with cognitive development and epistemology. Because society has changed—moving from an original theological stage, through a heroic epoch, to a present-day civilized, humanistic order—so, too, have language and human nature altered. Articulating ideas similar to those espoused by later, Romantic philosophers, such as Jean Jacques Rousseau (1712–1778) and Johann Gottfried von Herder (1744–1803), Vico postulates that, during the theological epoch (which has its analog in individual cognitive development), humans shared a primitive, metaphorically rich language, which was later complicated and variegated through cultural pressures and the advance of rational thinking. Rather than the opposite or absence of thought, figurative language demonstrates an elemental mode of thinking that Vico calls “poetic logic.”

Samuel Taylor Coleridge (1772–1834) serves as a particularly influential specimen of Romantic thinking about metaphor. Neoplatonic in inclination and influenced by Vico, Rousseau, and the German Romantics, Coleridge famously distinguishes between imagination and what to him is the inferior mode of fancy, thereby clarifying his age’s impatience with the limits of empirical knowledge. To Coleridge, imagination is a creative, connective power that unites nature and the poet, whose genius is realized through “organic,” original form rather than “mechanic,” derivative form. Coleridge defines poetry—and thus the exercise of its modes, such as metaphor—as a self-expressive activity whose object (pleasure) is opposed to that of science (truth).

Although Coleridge maintains that poetry enables a view of nature superior to that obtained through scientific inquiry, his system effectively treats poetry and science as complementary opposites: each (paradoxically) capable of discovering, through its

specific symbolic activity, aspects of the reality that simultaneously undergirds and lies beyond symbols. Coleridge’s Neoplatonic view of nature and its potential accessibility through human inquiry were not, however, shared by all Romantic thinkers. In particular, Friedrich Nietzsche (1844–1900) unequivocally states that human beings are “indifferent” and even hostile to “pure knowledge,” to the “thing in itself.” More important, Nietzsche denies that language—and by way of extension, any symbolic activity—is capable of revealing any meaning beyond that which it constructs. From this anti-essentialist perspective, the truths obtained through language are “illusions,” members of a “worn out” “army of metaphors.” Nietzsche is not, however, recycling a Ramist or Baconian position: To him a metaphor-free language is as impossible as a value-free science. In Nietzsche’s opinion, metaphor and reality are so entwined as to be synonymous.

The Twentieth Century

With few exceptions, the twentieth century’s consequential ideas of metaphor may be classified as Romantic because: (1) the trope is held to be cognitively and linguistically essential; and (2) its form and power are treated as an organically related unit. One crucial distinction between Romantic and twentieth-century ideas of metaphor, however, is that the latter summarily rejects transcendence, the notion that symbolic activity gives human beings access to supernatural knowledge and being. The origins of this rejection are manifold, but its primary engine and context is modern, disciplinary science. In this particular context, metaphor strongly tends to be viewed as an embedded phenomenon, as functioning within a cognitive, linguistic, or social system of such complexity that its elements and operations are generally accessible only to specialists—thus the contentious variety and intellectual weight of most contemporary ideas of metaphor.

Sigmund Freud (1856–1939) and Roman Jakobson (1896–1982) helped found and define structuralism, which, despite challenges mounted by poststructuralist thinkers beginning in the 1960s, continues to dominate contemporary theories of metaphor. Freud, best known as the founder of psychoanalysis, sees metaphor as a verbal elaboration and symptom of the elemental psychological process of condensation. Jakobson, drawing upon the theories of Ferdinand de Saussure (1857–1913) and through his work with persons suffering from aphasic disorders, proposes a functional synonymy between metaphor and the associative process, in his view one of the two basic operations used by the mind to construct language.

The structuralist approach to metaphor is not, however, exclusive to Freud, Jakobson, and their direct inheritors, thinkers as diverse in outlook as Jacques Lacan (1901–1981), Claude Lévi-Strauss (b. 1908), and Julia Kristeva (b. 1941). An alternative current of structural attention to metaphor is represented by the work of Stephen C. Pepper (1891–1972) and a set of like-minded scholars who constitute what may be called the “Vicoian school.” Rather than embedding metaphor in a psycholinguistic system, in *World Hypotheses: A Study in Evidence* (1942), Pepper projects metaphor onto the history of thought, which he views as a series of distinct “world hypothesis,” each “determined by its root metaphor” (p. 96). The philosopher and historiographer Hayden White (b. 1928)

similarly embeds metaphor in the social fabric, considering the metaphorical process as the ground for one of four modes of historical understanding. A related understanding of metaphor is offered by Thomas Kuhn (1922–1996), who proposes the concepts of the “paradigm” and the “paradigm shift” as instruments for illuminating the relationship between changes in worldview and the process of scientific discovery.

Because structuralist argumentation, like that of traditional philosophy and science, generally presupposes a separation between the object of study and the dyad of investigator and method, it tends toward universalizing claims. Thus structuralism has helped stimulate the growth of a sophisticated alternative context for thinking about metaphor, one directly inspired by Nietzsche’s militant rejection of objectivity, consistency, and unexamined systematic thinking. Jacques Derrida (b. 1930), the architect of deconstruction and a primary disseminator of poststructuralism, cautions against the abstractions produced by and upon which metaphysical systems are built. In the essay “White Mythology” (1972), Derrida holds that metaphor is a “metaphysical concept” created when “primitive” meanings are renamed and “circulated” in philosophical discourse. Hence his claims that “philosophy . . . is a . . . process of metaphorization” whose verity depends upon effacing its metaphorical roots (p. 210–211).

The formulation and widespread dissemination of post-structuralist ideas signals a broad and definite movement away from the traditional view of language as mimetic and the consequent treatment of intentional figuration as supplementary to thought and expression. For instance, through an interdisciplinary blend of philosophy, linguistics, cognitive science, and intercultural comparison, George Lakoff and Mark Johnson have moved the metaphorical function beyond language and, thus, beyond questions of representation. To these thinkers, “our ordinary conceptual system . . . is fundamentally metaphorical in nature” (p. 3), grounded in the universal and yet particular facts of the body.

Working within (and beyond) the discipline of anthropology, James W. Fernandez offers an approach to metaphor that, similar to Lakoff and Johnson’s, assumes the trope’s embedment and the intellectual obligation to foreground principles of cultural relativism. To Fernandez, metaphor is a “strategic predication” of identity that “leads to performance.” Rather than identifying metaphor as either a cognitive, linguistic, or structural abstraction (classifications that similarly encourage metaphor’s division into two aspects), Fernandez understands metaphor in much the same way that Henry Louis Gates Jr. (b. 1950) conceives the practice of “signifyin(g)” in African-American culture. Like “signifyin(g),” metaphor is a lived strategy, one that plays a key, mediating role in the mutual construction of identity, emotions, and the immediate social matrix. While it is impossible to predict the larger consequences of the ongoing shift in ideas of metaphor, the work of comparativists like Earl Miner (1927–2004) suggests that future understandings of metaphor will be all the richer because they will spring from and advance dialogue between heretofore intellectually separated traditions and cultures.

METAPHYSICS.

This entry includes two subentries:

*Ancient and Medieval
Renaissance to the Present*

ANCIENT AND MEDIEVAL

In the early twenty-first century *metaphysics* is a term used fairly loosely to describe philosophical investigation of the fundamental constituents of reality. But, in the Middle Ages, there was great debate about what was the subject of metaphysics, and that controversy had ancient roots.

What Is Metaphysics?

The word *metaphysics* is taken from the title, given by an editor in antiquity, to a treatise (or, rather, a set of material, not all of which belongs together) by Aristotle (384–322 B.C.E.): the word may have been chosen just because the work was placed after (*meta*) the physics, or it may have meant that the work deals with things beyond the physical. Aristotle does, in most of the *Metaphysics*, seem to believe that he is engaged in a single, distinctive enterprise of “first philosophy”—but he characterizes its aim in a number of different, and arguably incompatible, ways: it is the study of first principles, or of being qua being, or the investigation of substance, or its main concern is with immovable substances, that is to say, with the gods. This final, theological aspect led many later ancient philosophers to envisage the *Metaphysics* as an investigation, not of being in general, but of the highest sort of supra-sensible being—an approach that fitted the overwhelming concern of late antique philosophers with the intelligible world and the general wish to syncretize Aristotle and Plato.

In the Middle Ages, the question of the subject-matter of metaphysics became more problematic. The two greatest medieval Islamic philosophers, Avicenna (Ibn Sina; 980–1037) and Averroës (Ibn Rushd; 1126–1198), knew Aristotle’s *Metaphysics* well. Avicenna held that God could not be the subject of metaphysics, because it is in metaphysics that the existence of God is demonstrated, and no science can demonstrate the existence of its own subject. Metaphysics, therefore, has as its subject being qua being. Averroës disagreed. He held that the existence of God is demonstrated in physics, and so metaphysics can be regarded as the study of the first being, the separate substance that, as final cause, is the mover of all things.

Avicenna’s view predominated among the Christian Scholastics, who saw metaphysics primarily as the study of being in general (*ens commune*) rather than of a particular, special being. But Duns Scotus (c. 1266–1308), at least, was willing to say that God is a sort of being, and so is considered in metaphysics along with all other beings. Thomas Aquinas’s (c. 1224–1274) position had been, perhaps, more nuanced. God is not, he thought, contained under the notion of being in general, but he is included within metaphysics in that he is the cause of being in general, which the subject studies.

Form in Metaphysics

One central notion in metaphysics (understood in a broad sense, and going back to before the word was invented) is that

of form. Plato (c. 428–348/7 B.C.E.) reasoned that there could be no knowledge of the objects of everyday experience, but merely opinion about them, because they are constantly changing and cannot be said to be, but merely to become. The objects of knowledge, he thought, must be unchanging things—what he called “Forms” or “Ideas.” Although Platonic Forms can be grasped only through the powers of the intellect, not by the senses, they are by no means merely mental entities, but independently existing realities, as a result of participation in which the objects of sense perception have the characteristics they do—so, for example, beautiful things are beautiful by virtue of participating in the Form of Beauty (or, as Plato sometimes says, in Beauty Itself). Beyond this, Plato gives rather different accounts of the Forms from dialogue to dialogue, and even within the same dialogue. In perhaps his most famous discussion of them, in the central books of the *Republic*, he presents a supreme Form, the Form of the Good, which is understood only after years of intellectual training. The other Forms, Plato says, depend on the Form of the Good and are grasped properly only once the Form of the Good is grasped. In the *Timaeus*, Plato shows the universe being constructed as an ensouled living thing, according to the pattern of the Ideas.

Aristotle’s account in his *Metaphysics* of how things are constituted also uses the notion of Form, but it is treated very differently. The Forms Aristotle discusses are those of types of natural things, divided according to natural kinds. For instance, one natural kind is Man, another is Horse. According to this hylomorphic account, each man is a man by virtue of the Form of humanity, and each horse a horse by virtue of the Form of equinity. These Aristotelian Forms are not, like Plato’s Forms, independent single entities in which many particular sensible things participate. Rather, a particular member of a natural kind—this man, for instance—is a concrete whole composed of matter and Form. Yet the Form that makes him a man is the same as the Form by which any other man is a man. By grasping this Form with our intellects, we have a universal notion of Man, which we are able to use in formulating scientific truths, not about this or that man, but about Man in general.

In the Middle Ages, Plato’s Theory of Forms in its pure state had very few adherents. But an adapted version of it, which goes back to Philo (c. 13 B.C.E.–45/50 C.E.), the Hellenistic Jewish thinker, was extremely popular: the Forms are said to be in the mind of God. Thinkers as diverse as Augustine, Eriugena, Abelard, and Aquinas used this idea as one of the ways of describing God’s relation to created things. It was not until William of Ockham (c. 1285–?1349), in the early fourteenth century, that this picture was seriously questioned. Adoption of this version of Platonic Ideas still left Aristotelian hylomorphism as the main way of explaining the constitution of concrete things, and there was a vigorous debate in the twelfth century about whether (on the basis of the version of Aristotle’s theory proposed in his *Categories*) Forms in reality are really universal, or are universal merely in the way they are used in human thought and language. In the thirteenth and fourteenth centuries, hylomorphism was the basis (following Aristotle’s *On the Soul*) for the theory of intellectual cognition. The Form that makes, for example, a horse a horse informs the

matter-like potential intellect of the person who intellectually grasps the notion of horse.

Two Main Questions of Medieval Metaphysics

Another important debate in later medieval metaphysics was about whether essence—the sort of thing something is—and existence (*esse*)—the fact of the thing’s actually existing—are really distinct. Aquinas held that they are, and that in everything except God there is a real composition between them. This theory allows Aquinas, who does not believe that every creature is a composite of matter and form, to identify one sense in which nevertheless God alone is noncomposite. Not many of his successors followed him, however, in this insistence that the distinction between essence and existence is real. Some, such as Duns Scotus, held the distinction to be more than mental, but less than real, while Ockham argues that “essence” and *esse* mean the same thing.

The same thinkers also considered whether “being” in a general sense is a notion under which fall both God and his creatures. Aquinas insisted that the notion applies only analogically (and so equivocally) to God, on the one hand, and created things on the other. Scotus (followed by many fourteenth-century thinkers) argued for a subtle form of univocal predication of “being,” although he fully acknowledged that God’s infinite way of being is unlike that of any creature.

RENAISSANCE TO THE PRESENT

Metaphysics, in its most basic sense, is an account of what exists. It may include accounts of what sorts of things exist; of what really exists as opposed to what merely appears to exist; of what exists necessarily rather than by accident; of what it is that underlies everything else; or of the most general laws governing existing things. This article will describe some of the most important metaphysical positions that have appeared since the Renaissance and, where space permits, some of the reasons that have motivated the philosophers who hold them. The dates given for different eras are particular to this discussion. They name the year of birth of the earliest philosopher covered in each section and the year of death of the latest.

The Renaissance (1433–1617)

Better and more widely available texts of the writings of Plato mark the Renaissance. The new, widespread distribution of Platonic and Neoplatonic works, due in large part to the work of Marsilio Ficino (1433–1499) led to a major revival of those views. One of Ficino’s most influential views is his account of a hierarchy of perfection among existing things in which the highest thing, God, possesses the most perfection and the lowest thing, the body, the least.

The philosophy of the Renaissance remained, however, generally Scholastic. That is, it was dominated by Aristotelian views as codified by medieval commentators. Among Scholastics, Francisco Suárez (1548–1617) is notable for offering a definition of metaphysics as the science of being qua being, which distinguishes metaphysics from less lofty accounts of accidental features of existing things and focuses inquiry on the nature of being itself. Suárez’s seminal work, *Disputationes metaphysicae* (1597), also offered an original account of the metaphysical status of universals, in which it is true that only individual things exist but contrary to nominalism—the view that universal terms are merely labels for arbitrary collections of individuals—it is also true that universals are abstractions from nonconventional similarities among individuals.

The Early Modern Period (1561–1753)

Early modern metaphysics is in large part a response to the challenges that dramatic advances in physics and astronomy presented for theology and Aristotelian philosophy. Francis Bacon (1561–1626) is the figure who perhaps best marks the transition between Renaissance and early modern philosophy. Bacon’s major work, *The New Organon*, as its title suggests, was an attempt to supplant Aristotle’s authority. Two doctrines of that work form the basis of many of the period’s debates. First, Bacon asserted that a traditional part of metaphysics, the inquiry into the final causes, or purposes, of nature, is barren, thereby divesting natural science of an important theological element. Second, Bacon denied that forms,

FINAL CAUSES

[The mind] falls back on things that are more familiar, namely final causes, which are plainly derived from the nature of man rather than of the universe, and from this origin have wonderfully corrupted philosophy. (Bacon, 1620, p. 44)

When dealing with natural things we will, then, never derive any explanations from the purposes which God or nature may have had in view when creating them and we shall entirely banish from our philosophy the search for final causes. (Descartes, 1647, vol. 1, p. 202)

Nature has no end set before it, and . . . all final causes are nothing but human fictions. (Spinoza, 1660s? *Ethics* I Appendix)

Whatever Descartes may have said, not only efficient causes, but also final causes, are to be treated in physics, just as a house would be badly explained if we were to describe only the arrangement of its parts, but not its use. (Leibniz, 1702, pp. 254–255)

May I regard purpose-like orderings as intentions. . . ? Yes, but . . . it must not matter at all whether you say, “God has wisely willed it so” or “Nature has wisely so ordered it.” (Kant, 1781, p. 620)

[Spirit] is in itself the movement which is cognition—the transforming of the in-itself in that which is for-itself, of substance into subject. (Hegel, 1807, p. 488)

understood as abstract natural kinds, are principally what exists. Metaphysics, on Bacon’s view, is the study of first and formal causes in nature. It is, in short, the study of the most general laws or reasons by which natural events may be understood.

René Descartes (1596–1650) followed Bacon in denying that explanations in terms of final causes are appropriate in the sciences. He defended the existence and perfection of God but focused his metaphysics, as Bacon did, on providing an account of the natural world. In his most important philosophical works, *Meditations on First Philosophy* (1641) and *Principles of Philosophy* (1644), he argued that there are two basic kinds of substances or things with independent existence: minds and bodies. Any substance is characterized by a property necessary for its existence, which Descartes called in different places its nature, essence, or attribute. The nature of mind is thought; of body, extension. Substances have, in addition, properties that are not essential to them and that they can gain or lose without themselves going out of existence. Such properties are called modes or affections.

Descartes’s metaphysics is best known for one argument and a problem that the argument generates. He argued that

the existence of the self can be known for certain just because, at the very time one doubts the proposition “I exist,” one is at the same time thinking and therefore existing (Descartes, vol. 1, pp. 194–195). From this argument, often referred to as “the cogito,” Descartes eventually concluded that the essence of mind—and so perhaps of the person—is thought. However, it is clear that people have and are intimately aware of their own bodies. The mind-body problem arises from an attempt to give an account of human nature. Are people essentially, minds, bodies, or both? Moreover, if people are both, the relationship between mind and body needs to be explained. For Descartes, this latter problem was especially difficult. He endorsed a view of perfection in the world much like that of Ficino, in which minds are much more perfect than bodies, so he had to explain in his theory of perception how something less perfect apparently causes changes in something more perfect.

Benedictus, or Baruch, de Spinoza (1632–1677) published during his lifetime a well-received commentary on Cartesian philosophy. Many of his best-known metaphysical positions, which are found in their most mature form in his posthumously published *Ethics*, can be understood as reactions to Cartesianism. Spinoza identified God with Nature and

defended against Cartesian dualism a substance monism in which God is the only substance (EIp14) and possesses all attributes (Spinoza, EId6), including both extension and thought. Spinoza rejected any purpose in nature. (Spinoza is cited here in the customary fashion. For example, EIIp7 means *Ethics*, Part II, proposition 7.) He defended, largely against Descartes, necessitarianism (EIp33), the view that things could not have been any other way than the way they are, and universal determinism (EIp28–Ip29), in which every existing mode is the effect of some efficient cause. Spinoza addressed the mind-body problem by means of the doctrine known as parallelism, in which mind and body do not interact (EIIp7). Instead, the chain of causes and effects may be understood equally well as a chain of exclusively mental or exclusively physical events.

John Locke (1632–1704), whose philosophy is, much like Bacon's, an attempt to vindicate mechanistic science, adopted a slightly different notion of substance. For Locke, substances are much the same things as Cartesian substances—persons, God, angels, and ordinary material objects. Substances are so designated, however, not because of their independent existence but because they form a substratum for clusters of properties in which those properties inhere and which can survive change in those properties. Although Locke, like his predecessors, described modes at length, he considered them properly ideas rather than properties of substance. The important, knowable properties of substance, in his view, are qualities. In his *Essay concerning Human Understanding*, Locke famously (or notoriously) defended Robert Boyle's (1627–1691) distinction between primary qualities, such as extension, which really are in substances, and secondary qualities, such as white, which are mere powers to produce certain sensations in people (Locke, 2.8.12–13). This doctrine may be a result of Locke's attempt to ground corpuscularian physical theories, in which extension and other primary qualities were supposed to explain color perceptions and other secondary qualities.

Gottfried Leibniz (1646–1716) was perhaps the most sophisticated metaphysician of the early modern period. He read his predecessors and contemporaries widely and engaged with their views in a variety of contexts. Leibniz was by temperament conciliatory, and his sympathy toward Scholasticism emerges most clearly in his attempt to reintegrate final causes into metaphysics, both at the level of scientific explanation and at the very general level (pp. 52–55). Leibniz's fundamental metaphysical principle, the Principle of Sufficient Reason, is the doctrine that there is reason for every state of affairs. At the most general level, this reason must be in terms of God's purposes: God chooses that the world be this world rather than other possible worlds because this one is the best of all possible worlds (pp. 96–97). The Principle of Sufficient Reason formed the basis for some powerful criticisms of Newtonian physics. It is also the principal target of Voltaire's satire, *Candide*.

From at least the 1680s, Leibniz understood substances in grammatical terms, as subjects of predication that cannot themselves be predicated of something else. For example, "a king" can be either the subject or predicate of a proposition, so it is not substance; "Alexander," however, can only be a subject, so Alexander is a genuine substance (pp. 41–42). Because Leibniz

KANT'S "COPERNICAN REVOLUTION" IN METAPHYSICS

Up to now it has been assumed that all our cognition must conform to the objects; but all attempts to find out something about them a priori through concepts that would extend our cognition have, on this presupposition, come to nothing. Hence let us once try whether we do not get farther with the problems of metaphysics by assuming that objects must conform to our cognition, which would agree better with the requested possibility of an a priori cognition of them, which is to establish something about objects before they are given to us. (B xvi, p. 110)

conceived of each substance as a complete concept or a subject with a comprehensive list of true predications of it, he denied that substances change. So he denied, at the strictly metaphysical level, causal interaction among substances (p. 47). His grammatical conception of substance caused him to endorse a version of idealism, the view that substances cannot be material (p. 79) and in 1714 the theory of monads, his mature metaphysics in which all things either are or are composed of simple, indivisible, inalterable, indestructible, perceiving things.

George Berkeley (1685–1753) formulated an influential version of idealism. He was influenced by Leibniz's views on material objects and also by the Cartesian Nicolas Malebranche's (1638–1715) criticisms of accounts of causal influence among bodies. His most explicit target, however, was Locke's version of the distinction between primary and secondary qualities. Berkeley argued that Locke was right to think that sensations such as pain and white that are caused in people do not resemble their objects but that Locke had no reason for thinking that the perception of extension and other purported primary qualities is different. In either sort of case, one has access only to one's sensations, and these are certainly ideas. Berkeley identified ordinary objects and the physics of ordinary objects, then, as concerning ideas rather than their cause, which can only be God.

David Hume (1711–1776) followed Berkeley in construing ordinary objects as ideas (1.2.6). He was, however, skeptical about the causes of ideas and indeed is best known for his skepticism about causality generally. Hume denied that any sort of necessary connection could be known through experience and so denied all causal connections of the sort asserted by many of his predecessors. He redescribed causal relations as laws concerning the causal conjunction of events of one sort with events of the other. Hume has traditionally been understood as moving from causal language in the description of nature, in which

THE REJECTION OF METAPHYSICS

[Pragmatism] will serve to show that almost every proposition of ontological metaphysics is either meaningless gibberish,—one word being defined by other words, and they by still others, without any real conception ever being reached,—or else is downright absurd. (Peirce, “What Pragmatism Is”)

The fundamental faith of the metaphysicians is the faith in opposite values. . . . one may doubt, first, whether there are any opposites at all, and secondly whether these . . . opposite values . . . are not perhaps merely foreground estimates, only provisional perspectives, perhaps even from some nook, perhaps from below. (Nietzsche, section 2)

The non-theoretical character of metaphysics would not be in itself a defect. . . . the danger lies in the deceptive character of metaphysics; it gives the illusion of knowledge without actually giving any knowledge. This is why we reject it. (Carnap, “The Rejection of Metaphysics,” from *Philosophy and Logical Syntax*, 1934, section 5)

events of one sort are said to cause events of another sort, to the language of laws, in which, more modestly, events of one sort are said to follow events of another sort with lawlike regularity.

German Idealism (1724–1831)

German idealists attempted to preserve causal laws and other necessary truths about objects by emphasizing the role of the self in understanding objects. As the movement developed, figures such as Gottlieb Fichte (1762–1814) went further, arguing that, in a sense, the self creates objects.

Immanuel Kant (1724–1804), in his *Critique of Pure Reason*, defended the view, largely against Hume, that there are basic a priori laws, including causal laws, governing all objects of experience. Kant’s “Copernican Revolution” in metaphysics changed the focus of metaphysical inquiry from nature exclusively to the thinking self as it understands nature. He argued that there are concepts—Categories—and space and time—Forms of Sensible Intuition—by which one understands and experiences things. Because one cannot but think things under these Categories and Forms, they are a priori conditions of different kinds of thought and therefore form the basis for judgments of necessity. Kant described his view as “transcendental idealism” because, although the Categories and Forms make possible objectively valid and necessary laws governing objects of experience, they cannot be ascribed to objects except insofar as those objects are experienced.

In experience, Kant rescued the traditional metaphysical distinction between form and matter: form is the a priori aspect of experience that mind imposes on matter in cognition. The inquiry into the nature of objects independent of experience by means of concepts, however, which Kant understood as the

project of traditional metaphysics, cannot produce knowledge. However, Kant allowed that such inquiry, which he called “dialectic,” is founded upon important human interests, such as the quest to understand practical freedom or to find purposiveness or systematic unity in nature.

Georg Hegel (1770–1831) held that ultimately only spirit is real. Hegel argued that history, in particular the history of human society, is a history of dialectical thought. Hegel, then, moved mind out of the individual altogether and eventually into an account of stages of human consciousness that are at once a kind of progression of reasoning, steps of psychological development, and social structures. *Dialectic* had a very different meaning for Hegel from that which Kant gave it. Hegel retained a focus on the process of reasoning that characterized Kant’s dialectic and continued to consider the question of the invalidity of particular applications of a concept. The invalidity of a particular kind of reasoning is, however, of interest principally not because it makes a category mistake in applying concepts inappropriately but as itself a flawed way of being or experiencing objects in the world, which, because of its flaws, leads also to a particular new way of being.

The End of Metaphysics (1839–1980)

Kant himself rejected metaphysics, considered as an attempt to know objects outside experience. Forms of that position characterized three major recent philosophical movements that drew on his emphasis on the thinking self and his devotion to empiricism.

American Pragmatism. This movement emphasized, following Kant and in some cases Hegel, the role of concepts in experience. John Dewey (1859–1952) argued that concepts distort our understanding of the unity of nature. Charles Peirce

(1839–1914) similarly took conceptual analysis to demonstrate that the propositions of traditional metaphysics are nonsensical. William James (1842–1910) defended the use of concepts and took metaphysics to be the task of understanding why people organize experience the way they do. Some traditional metaphysical notions remained in American Pragmatism. Peirce, for example, defended an account of generals, a theory of natural kinds. However, the movement was generally critical of traditional, a priori metaphysics.

Phenomenology and existentialism. These movements, which started perhaps with the works of Nietzsche, emphasized the importance of perspective for undermining or perhaps reassessing metaphysics.

Phenomenology is the study of things as one experiences them. In *Ideas*, Edmund Husserl (1859–1938) argued that this project requires setting aside questions of existence, which amounts to making questions of metaphysics secondary to questions of experience. Martin Heidegger (1889–1976), slightly differently, made questions of existence, or being, just questions of experience. The study of being is not, for Heidegger, then, the study of the being of fundamental things in the universe that are independent of experience but instead the study of the being of things as they are experienced and, perhaps more important, formed and conceived by the thinker. Existentialism, perhaps best known from the works of Jean-Paul Sartre (1905–1980), in the most general terms is the conclusion, from either of these positions, that there are no metaphysical facts about the world, with the result that if one really needs such facts, as Kant suggested, one must either create them or insist upon what one has no claim to know.

Logical positivism. Ludwig Wittgenstein (1889–1951) and Rudolf Carnap (1891–1970) derived, largely from Kant, the view that knowledge is only of objects of experience. Logical positivists held, furthermore, that as terms apply meaningfully only to objects of experience, metaphysical claims are not merely false or mistaken but nonsensical. The movement was largely responsible for making language and its meaning the focus of a great deal of recent philosophical inquiry in metaphysics and also in epistemology and ethics.

Twenty-First-Century Developments

It is difficult to predict the debates and positions for which the early twenty-first century era will be remembered. A result of the focus on language and meaning produced by logical positivism is perhaps that many important metaphysical debates at the beginning of the twenty-first century have centered not on the question of what existence is or is like generally but on the question of whether particular sorts of things exist. A response to the positivist challenge to ethics, for example, has been to claim that terms in ethics are meaningful in the sense that they refer to real, existing things in the world, good and evil. In modal metaphysics, questions about the meaningfulness of possibility have produced debates over the metaphysical status of possible worlds: are possibilities real, and if so, how are they different from actual existents? Finally, the mind-body problem, now recast as the question of the relationship between the mind and the brain, and the existence

of general or natural kinds, often a problem for set theory, have remained hotly debated matters.

The tradition of phenomenology and existentialism has given way to the movements of structuralism and deconstructionism. Proponents of these methods might, like many phenomenologists, deny that they study anything like traditional metaphysics. Structuralists abstract from the genesis and subject of a particular kind of world or experience and analyze it as a product of thought, or text, without a thinker, who, it is argued, is irrelevant to meaning. Deconstructionism is the view that largely as a result of the fact that texts are created by thinkers, the relevant structures are binary and can be understood in terms of opposition within the structure. The aim of deconstruction is to show how, like the self and the world for Fichte, the opposed units in the structures depend upon one another.

MICROCOSM AND MACROCOSM. Microcosm and macrocosm are two aspects of a theory developed by ancient Greek philosophers to describe human beings and their place in the universe. These early thinkers viewed the individual human being as a little world (*mikros kosmos*) whose

composition and structure correspond to that of the universe, or great world (*makros kosmos*, or *megas kosmos*). *Kosmos* at this time meant “order” in a general sense and implied a harmonious, and therefore beautiful, arrangement of parts in any organic system; hence it also referred to order in human societies, reflected in good government. Comparisons between society and the human being, as well as society and the universe, were varieties of microcosmic theory. These analogies enjoyed a long life, first in the Mediterranean region during antiquity and later throughout Europe during the Middle Ages. The ideas were commonplace during the Renaissance and early modern times but lost their plausibility when a mechanistic model of the universe became dominant in the seventeenth and eighteenth centuries.

Origins

The most fully developed version of the idea in antiquity was made by Plato (427?–347 B.C.E.), but fragmentary evidence indicates that philosophers before him articulated some version of it. The idea may have begun as an archetypal theme of mythology that the pre-Socratic philosophers reworked into a more systematic form. Unfortunately, it is impossible to reconstruct their thinking in much detail, and clear references attributing the doctrine to Democritus (c. 460–c. 370 B.C.E.) and Pythagoras (c. 582–c. 507 B.C.E.) are quite late, dating to the fifth and ninth centuries C.E., respectively. Some form of the idea seems to have been common among most ancient cultures. Since comparisons of human beings and the universe were made in India and China, the concept may ultimately be of Asian origin; but the available sources do not indicate that the theory in Greece was the result of cultural diffusion. Among extant Greek texts, the term first appears in the *Physics* of Aristotle (384–322 B.C.E.), where it occurs in an incidental remark (*Physics* 8.2, 252b). Plato did not use the terminology when he developed the idea.

Plato

In the *Philebus* (28d–30d), Plato argued that human beings and the universe are both composed of an elemental body and a rational soul, and that just as the human body derives from the universe’s body, the human soul must derive from the universe’s soul. The universe is, therefore, not only an orderly system but an intelligent organism as well. Plato expounded this theme at greater length in the *Timaeus* (29d–47e), where he explained how the structure of the human being parallels that of the universe through certain correspondences in body and soul. Just as the body of the universe is spherical, and its soul is composed of orbits along which the planets wander, so too the soul of the human being is composed of orbits along which its emotions rove, and it inhabits the head, which is spherical. The rest of the human body exists merely to serve the head.

Unlike the macrocosm, which contains all things and is immortal, and hence has no need of sensory or digestive organs or limbs for locomotion, the microcosm is only a part of the whole, and its existence is threatened by the surrounding elements, so that it needs such additional parts to perceive and avoid danger and to replenish the nutrients it loses. Furthermore, the external disturbances that threaten the microcosm cause the orbits of its soul to be disrupted, throwing its

emotions into disarray. Yet when the disordered microcosm observes the heavens, it sees there the orderly motions of the planets following the orbits of the macrocosmic soul. With the aid of philosophical study, it becomes aware of the correspondence between itself and its great counterpart. Having attained this insight, the microcosm realizes that just as the universe employs reason to govern the planets, it too should employ reason to govern its emotions. In this way the microcosm overcomes its inner discord and prepares its soul for a return to the heavens from which it came.

The Body Politic

In the *Republic* (Book 4), Plato united the microcosmic theme with the pre-Socratic tendency to view cosmology in political terms when he discussed his model of an ideal city-state in order to explore the nature of the human soul. The structure of each is tripartite and hierarchical. The class of philosopher-kings corresponds to reason (located in the head), the warrior class corresponds to irascibility (located in the breast), and the worker class corresponds to appetite (located in the belly). If the city or the soul is to function in harmony, the lower parts must obey the higher, and the higher must guide prudently. This organic notion of the body politic exerted an extraordinary appeal. St. Paul of Tarsus used it to describe the church as the mystical body of Christ (1 Corinthians 12, et al.), and medieval thinkers such as John of Salisbury (c. 1110–1180), in the *Polycraticus*, and Marsilius of Padua (c. 1270–c. 1342), in the *Defensor pacis*, presented their political ideas within its framework. Theories of the body politic remained strong in early modern times, even inspiring the *Leviathan* of Thomas Hobbes (1588–1679).

The common contemporary use of organic analogies to describe the nation or the country is, therefore, an inheritance from earlier macrocosmic metaphors. This way of thinking was not confined to the West. It was, for example, reflected in the Indian Vedas, which explained the caste system by way of an anatomical analogy according to which each level of the social order sprang from a bodily part of Brahma, the Hindu creator-god.

Hellenism and Late Antiquity

Among the Hellenistic philosophers, the Stoics preserved the idea of the universe as a living organism, but the human being as a miniature image of it did not, apparently, interest them as much. The Middle Platonists also accepted the existence of a world-soul and, like the Stoics, considered it divine. The Neoplatonist Plotinus (205–270 C.E.) refined this idea and called the human being “an intelligible world” (*Enneads* 3.4.3) who, like the universe, is an intellect that governs a soul that animates a material body. Later Neoplatonists, believing that the correspondences between microcosm and macrocosm, if properly invoked, would allow them to draw upon hidden reserves of psychic energy immanent in the living universe, employed a form of ritual magic called “theurgy” to assist them in their spiritual aspirations. Others less spiritually inclined, however, hoped to use these cosmic sympathies to manipulate the world for material benefit or to predict the course of future events. Astrologers employed the theory of melothesia—that each sign

of the Zodiac corresponds to a specific part of the human body—in the practice of medicine.

The broad appeal of the microcosm is reflected in its adoption by Jews, Christians, Gnostics, Manichaeans, and the authors of the Hermetic corpus (attributed to Hermes Trismegistus). The Jewish philosopher Philo of Alexandria (c. 20 B.C.E.–c. 50 C.E.) somewhat anticipated Plotinus by calling man “a miniature heaven” (*On the Creation* 27.82). He preferred, however, to compare the human being with God, since Scripture taught that man and woman were made in God’s image and likeness (Genesis 1:26–27); he reasoned, therefore, that human souls govern their bodies in much the way that God governs the physical world (*On the Creation* 23.69). Philo employed unusual terminology, substituting for *mikros kosmos* the expression *brachys kosmos*, or “short world,” which appeared later as *brevis mundus* in the Latin works of Calcidius (*Commentary on Plato’s Timaeus*, 202; third or fourth century C.E.) and Macrobius (*Commentary on Cicero’s Dream of Scipio*, 2.12; fl. c. 430 C.E.).

Jewish and Muslim Theories in the Middle Ages

Medieval theories of the microcosm developed separately in the three religious traditions, but there were some points of contact between Jews and Muslims. The Talmud and the Midrash included a few microcosmic references, and the theory was very prominent in the mystical tradition known as the Kabbalah. The earliest kabbalistic text, the *Book of Creation* (*Sefer Yetzirah*); perhaps composed between the third and sixth centuries C.E.), observed correspondences between the letters of the Hebrew alphabet, features of the physical world, and the human body. The thirteenth-century *Book of Splendor* (*Zohar*) taught that the first emanation in the creative process is the cosmic man (Adam Kadmon), through whom the rest of creation emanates, so that terrestrial human beings are modeled on an ideal form that provides the pattern for all of creation.

Arabic influence may have inspired two Jewish philosophers, Ibn Gabirol (Avicbron, c. 1021–c. 1058) in his *Fountain of Life*, and Ibn Sadiq (1075–1149) in his *Microcosm*, to combine microcosmic speculation with the Delphic maxim, “Know thyself”; both demonstrated how self-knowledge leads to knowledge about the universe. Although Maimonides (1135–1204) found fault with certain aspects of microcosmic theory in his *Guide for the Perplexed* (1.72), he nevertheless accepted much of it.

The most remarkable development of the microcosm among the Muslims appeared in the encyclopedia known as the *Epistles* (*Rasa’il*) of the Brethren of Purity (*Ikhwan-al-Safa*) in the city of Basra during the tenth and eleventh centuries. While two of its fifty-two treatises are devoted to microcosm and macrocosm, correspondences between the two worlds are noted throughout the work as it traces the procession of creatures from God and their mystical return to God through human understanding. Al-Biruni (973–c. 1051) accepted the microcosmic model, while Ibn Sina (Avicenna, 980–1037) made it the foundation of his theory of medicine.

Greek Christian Theories

Although the ancient idea of the microcosm appealed to many Christian thinkers, their view of the macrocosm as an

inanimate structure created by God *ex nihilo* at the beginning of time led to major alterations of the ancient theory. Most conspicuously, the world-soul was omitted or interpreted allegorically as a reference to God’s providential care for the created world. Although Greek Christians, unlike the Latins, had direct access to the ancient sources, they were ambivalent about the pagan philosophical heritage.

Gregory of Nyssa (c. 335–c. 394) criticized the comparison of humanity with the universe (*De hominis opificio*, 17), stressing, like Philo, that it was more appropriate to compare humanity with God; but he nevertheless retained a modified version of the theory. Cosmas Indicopleustes, a sixth-century Greek from Alexandria in Egypt, rejected the idea of a spherical world in his *Christian Topography*, since he considered Moses’ tabernacle a symbolic representation of the universe. He nevertheless accepted the idea that humanity contains the universe within itself and therefore thought the pagans were right to have called man a microcosm (Book 7).

Greek theologians tended to view humanity as a mediator who united the material and spiritual worlds by virtue of being the only creature to possess both a body and a rational soul; at this critical juncture in the chain of being, humanity shared some characteristic with every kind of creature and thus represented the entire universe. The Greek fathers influenced the anthropology of the Irish Neoplatonist, John Scot Eriugena (c. 800–c. 877), but the idea of the microcosm in the Latin West was received mainly through Calcidius and Macrobius, and disseminated by the encyclopedist Isidore of Seville (c. 560–636; *De natura rerum*, 9.2) and the Venerable Bede (673?–735; *De temporum ratione*, 35).

Latin Christian Theories

Latin terminology generally assumed comparative forms—“lesser world” (*minor mundus*) and “greater world” (*maior mundus*)—although it also adopted the Greek loanwords *microcosmus* and *macrocosmus* (or more commonly *megacosmus*). Latin treatments of the microcosm were generally superficial until the twelfth century, but certain distinctive features did appear before then. Although Augustine of Hippo (354–430) preferred the comparison of humanity to God, he developed a theory of the seven ages of man and the world, which was a projection of the seven days of creation and the seven stages of the human life cycle onto history (*De Genesi contra Manichaeos*, 1.22.33–1.23.41). Pope Gregory the Great (c. 540–604) offered a concise and oft-repeated formula that combined the microcosm with the concept of the Chain of Being, whereby humanity was thought to contain all of creation because it shares simple existence with stones, life with plants, sensation with beasts, and reason with angels (*Homiliae in Evangelium*, 29).

Under Gregory’s influence, Jesus’ injunction to preach to “all creation” (Mark 16:15) was commonly interpreted as a reference to the human race in its status as an epitome of the created world. Robert Grosseteste (c. 1175–1253) later suggested in several works that the Incarnation not only fulfilled a redemptive role but also reconciled the creator to all creatures, since God became the creature who embodies all

creation. This cosmological role of the Incarnation was restated by Nicholas of Cusa (1401–1464) in *Learned Ignorance* (*De docta ignorantia*, 3.3).

The microcosm received special attention in the Latin West during the twelfth century, when a revival of Platonism coincided with a keen interest in the natural world and new confidence in the power of human reason. The most extraordinary product of this fusion was the *Cosmographia* of Bernardus Silvestris, written about 1147 in two books entitled *Megacosmus* and *Microcosmus*, which depict the creation of the two worlds by Neoplatonic emanations, personified as characters in a mythological drama. The intellectual atmosphere that fostered such creative approaches to old ideas also influenced spiritual meditation, which is evident in Hildegard of Bingen's (1098–1179) *Book of Divine Works* and in the allegorical commentary on Genesis by Godfrey of Saint-Victor (c. 1125–1194). Microcosmic thinking had always been implicit in monastic studies of Genesis that compared the human soul to the physical world by viewing God's work during the six days of creation figuratively, as stages of spiritual progress that the monk should pursue. Godfrey noted the similarity between the ancient theory and the medieval hermeneutical method and made the connection explicit by entitling his book *Microcosmus*.

Early Modern Theories and Aftermath

The scholasticism of the thirteenth and fourteenth centuries had little use for highly malleable metaphors, and it was not until the Platonic revival of the Renaissance that the microcosm again received substantial attention. Although Ernst Cassirer argued that Renaissance thinkers significantly redefined the microcosm (*The Individual and the Cosmos in Renaissance Philosophy*, trans. 1964), one must acknowledge that the fifteenth-century philosophers actually owed more of a debt to medieval conceptions than Cassirer supposed, as observed by Bernard McGinn (*The Golden Chain*, 1972). For instance, Nicholas of Cusa's christological use of the microcosm had already been outlined by Robert Grosseteste (as noted above), and although Giovanni Pico della Mirandola (1463–1494) offered a sustained discussion of the microcosm in his *Heptaplus* (a commentary on the creation-account in Genesis), much of his contribution in that work consisted of bringing together different currents of microcosmic theory (a testament to his wide reading and powers of synthesis). Although a new application of the ancient theory was made by Paracelsus (1493?–1541), his innovation promoted an alchemical theory of medicine rather than philosophical conceptions of the self.

Despite a surge of interest in the microcosm during the early modern period, reflected in a wide range of disciplines, the theory did not lead to new discoveries and it was gradually relegated to the margins of science and philosophy along with the "occult" disciplines that maintained an affinity to it. One of the last major statements of the theory on the verge of its abandonment by most philosophers and scientists was Robert Fludd's (1574–1637) impressively illustrated *History of the Macrocosm and Microcosm* (*Utriusque cosmī, maioris scilicet et minoris ... historia*, 1617–1621); it is significant that Fludd's grand synthesis was regarded as a bible of Rosicrucianism, a mysterious movement associated with occultism.

The microcosm continued to inspire esoteric thinkers and opponents of modern materialism, such as the theosophist H. P. Blavatsky (1831–1891), who combined the microcosm with evolution in *The Secret Doctrine* (1888), and the anthroposophist Rudolf Steiner (1861–1925), whose lectures on the two worlds, delivered in 1910, were later published as *Makrokosmos und Mikrokosmos* (1933). Although the idea of the microcosm as a synonym for humanity became untenable among mainstream thinkers by the eighteenth century, the word itself was retained as a reference to any subsystem, in which sense it is commonly used today.

MIGRATION.

This entry includes three subentries:

Africa

Migration in World History

United States

AFRICA

Historically, migration has been a way of life in Africa. Over the generations African people have migrated in response to demographic, economic, political, and other factors, including environmental disasters and conflicts. The histories of many African communities record their migratory movements from one area to another or the incursions of more powerful migrant groups who conquered and reorganized their societies. These large movements across the continent have accounted for the rapidity of the spread of new ideas and changes in culture.

Migration in Africa has been of three types: intra- and inter-country (internal) movements of people *within* the continent; movement from outside *into* the continent; and movement *from* the continent outward.

Internal Migration

Although the most prominent movement within the continent in historic times probably was that of the Bantu-speaking peoples, there have been many different movements of peoples from one region of the continent to another and over many centuries. Because of a population explosion that is yet to be fully understood, Bantu-speaking peoples have spread over most of the continent south of the equator. Bantu migrations were reflected in the expansion of Bantu languages in several parts of East, Central, and Southern Africa. Other examples of major intracontinental migration include that of the nomadic Bedouin Arab peoples, the Banu Hilal and the Banu Sulaym, into the Maghreb beginning from the second half of the eleventh century. They initiated a massive movement, infiltrating the cultivated lands while spreading westward from Tunisia to Morocco. The arrival of the Bedouin Arabs provoked a rapid Arabization of the Maghreb region. A high proportion of the Berbers were assimilated to the Arabs through intermarriage, and Arabic became the lingua franca for most of the population. In the mountainous areas, including the Atlas range in Morocco and the Kabylie mountains of Algeria, however, the Berbers maintained their language and culture, together with a fierce spirit of independence.

Intraregional migration also took place in West Africa. Hausaland, for example, was a major recipient of large-scale

migration, with peoples and groups coming from different directions and at different times for different purposes. Sources of migration into the Hausa country were the Sahel in the north, Bornu in the east, and the regions of the late Mali and Songhay empires in the west. The Fulani, who reached Hausaland from the west, were the most prominent immigrants into the region. The vast majority of Fulani immigrants were nomadic pastoralists in search of new and better grazing for their cattle, although there were also some Muslim clerics among them. Other migrant groups included the Tuareg, who were mostly pastoralists and who showed little interest in territorial occupation and settlement. Migrants from Bornu included refugees, aristocrats, merchants, and scholars who settled in all parts of Hausaland. Other immigrants were the Wangara/Dioula; the Songhay fishermen, who settled in the Lower Rima River Valley; and the Arab and Berber merchants and scholars who came from North Africa and the Timbuktu area and began entering the region in the second half of the fifteenth century, about the same time as the Fulani. The influx into the region was connected with the growing prosperity of the Hausa states and the adoption of Islam by further groups and strata of the urban population.

The dominant trend in internal migration in more recent times has been the movement from rural to urban areas. Contact with Western Europe facilitated the emergence of new towns and other urban centers that served as colonial administrative centers or as economic or industrial centers. Many capital cities of West African countries developed as artificial ports built on vacant or sparsely populated sites. These administrative, industrial, and commercial centers all experienced rapid growth during the years of colonial rule, with implications for migration. The new towns developed certain characteristics that contrasted sharply with the traditional culture. An improved physical environment—sanitary facilities, roads, street lighting, health services—combined with other rudiments of urbanism to provide the background to the rural-to-urban migration that was a hallmark of the colonial period. This prompted the "bright lights" theory of migration (that is, that rural-to-urban migrants tended to be attracted by the new facilities in the towns). However, empirical studies—such as the one on Tukulor migration to Dakar (Diop)—confirm that rural-to-urban migration was neither the outcome of an attraction to the city nor youthful rejection of traditional values. Rather, it resulted from serious and persistent underdevelopment in the communities of origin of the migrants. In the case of Tukulor migration from the Senegal River Valley, money sent back to the village by the new city dwellers was crucial to maintaining a minimum standard of living in the valley.

But regional economic disparities were not the only factors that prompted internal migration, particularly in the colonial times and after. The transformation of agriculture during this period that resulted from the creation of large plantations by the colonizers in certain regions of the continent was a major factor. The new plantations required a substantial labor force that was not always available locally. The required movement of population was often achieved by force. Colonial intervention in the mining sector prompted similar forceful movement of the people, achieved through policies designed to drive

peasants from their land and attract them to the mining areas. Moreover, colonial fiscal measures, particularly the introduction of the head tax payable in cash, also gave rise to migration. It was impossible for most rural families to raise the necessary sums from the village, and this necessitated the migration of one or more members of a household to the city. In other instances, villagers fled the tax by migrating to neighboring territories.

Intra- and intercountry migrations remain a prominent feature of African life. The persistence is partly the outcome of the fact that migrants have always considered the various subregions as single economic units within which trade in goods and services flowed. But more important, intraregional migration has been sustained by the persistence and intensification of widespread poverty, the deteriorating economic situation, and the consequences of the various macroeconomic adjustment measures. In addition, conflicts and environmental degradation, particularly in the Sahel regions, desertification, and cyclical famines have further aggravated the pressure for migration from poorer to relatively prosperous regions of the continent. The deteriorating economic situation and pressures have also affected in recent times the traditional labor-importing countries, including Gabon, Côte d'Ivoire, Zimbabwe, and Nigeria. The inability of their economies to continue accommodating clandestine labor migrants was at the root of the various expulsion measures directed at foreign nationals at different times. On the other hand, the violent conflicts that have plagued the political landscape of many African countries—Burundi, Rwanda, Liberia, Sierra Leone, and recently, Côte d'Ivoire—as well as the Horn of Africa have produced massive waves of refugees who sought sanctuary in neighboring African countries. Many have chosen to remain as migrants in the countries of their sanctuary even after conflicts have ceased in their homelands.

Immigration into Africa

In modern times, the major movements into the continent have been of European settlers into northern Africa and of European and Asian settlers in Southern and East Africa. The Dutch migrations into Southern Africa began in 1652, when a European settlement was established by the Dutch East India Company at the Cape of Good Hope. The colony was intended to serve merely as a refreshment station for the company's ships on their way to India and was originally peopled by the company's servants. But with the decision to allow some of these people to settle as free citizens owning their own farmlands, the Dutch (Boer) population in the region began to swell, and soon a deliberate policy of increasing the settler population was instituted to strengthen it against possible attacks. More Dutchmen arrived as well as a party of French Protestant Huguenots fleeing religious persecution in France. The French refugees lost their language and became absorbed into the predominantly Dutch population. As most were farmers, this meant that more land was needed as the population increased. From the coast, the settlers later moved inland to the Highveld region, where, in the nineteenth century, a series of military conflicts occurred between them and the Bantu speakers. The Dutch—and the absorbed French refugees—constituted about one-third of the

European population and were the ancestors of many modern white South African families. Other major European settlements took place in the nineteenth century: the British were dominant in modern-day KwaZulu/Natal Province of South Africa as well as in Zambia, Zimbabwe, and the East African highlands; the Germans were predominant in modern Namibia; and the Portuguese were in Angola and Mozambique.

When the European colonies were first founded, there was no conscious policy of introducing racial discrimination and settler rule. However, the presence of large settler populations later affected the pace of political developments in these territories, and the achievement of self-government and independence by the African peoples of South Africa, Namibia, Zimbabwe, Angola, and Mozambique was delayed. The struggles for independence and majority rule became the source of much bitterness and violence between races in Southern Africa. On the other hand, the growth of Arab nationalism and the emergence of Morocco, Algeria, and Tunisia—North African countries with vast European settler populations—as independent states led to the return of between one and two million colonists to their European homelands in the late 1950s and early 1960s.

Emigration from Africa

Probably the greatest outward regional movement of people in human history was that of Africans to the Americas and the Caribbean during the period of the slave trade from the sixteenth to the nineteenth century. Estimated figures of Africans forcibly uprooted from their homelands, largely from West Africa and to a lesser extent from Angola, range from fifteen to twenty million. Substantial numbers of these died in the appalling conditions of the trans-Atlantic passage. The slave trade was also active on the east coast of Africa, particularly on the island of Zanzibar. Although the composite effect of the loss of this considerable size of manpower is yet to be fully quantified and appreciated, there is no doubt that it retarded the African continent's development. At the same time, these forced migrants made substantial contributions to the development of the New World.

In recent years a combination of factors, including the worsening economic situation of most African countries, perennial conflicts, and environmental degradation, have provoked a new outward movement of Africans from the continent. The stressful socioeconomic environment created by the retrenchment of public sector workers in states across the continent implementing diverse programs of structural adjustment, the decline in real incomes, and the hostile political environment occasioned by the consolidation of autocratic regimes in several states have combined to generate and sustain pressures that trigger the outflow of professional and skilled persons on a scale hitherto not experienced. This migration has been to Europe, North America (United States and Canada), and the Gulf states. Some Africans have also found their way to Asian and Pacific countries. This phenomenon has come to be described in the literature and general discourse as the *brain drain*. Thousands of highly skilled migrants, including doctors, nurses, lecturers, teachers, engineers, scientists, technologists, and other

professionals, have moved from a number of African countries to the destination states attracted by relatively higher salaries and better working and living conditions. This is in addition to movements from poorer to relatively richer regions of the continent. Also, many students in various disciplines failed to return to their home countries from these richer countries at the end of their training.

The stressful socioeconomic environment has produced other survival strategies that affect contemporary migration patterns and gender roles in the continent. Clandestine migration, an age-old phenomenon, has reached new proportions as young migrants are adopting more sophisticated, daring, and evasive methods to enter the countries of the North—even as these destination states continue to tighten their border controls. Many clandestine migrants enter the host states as tourists or students and later work and live there without officially changing their status. Others travel via intermediary countries, where they obtain false documentation for a fee. Another phenomenon is autonomous female migration, which is equally a response to deepening poverty in the subregion. With several families forced to adopt migration as a coping mechanism of the last resort, the traditional male-dominated, long-term, and long-distance migratory streams are becoming increasingly feminized. A significant proportion of females now migrate independently to fulfill their own economic needs rather than simply joining a husband or other family members. Higher educational attainment among females has also enhanced their mobility and their propensity to migrate both locally and internationally.

Explaining African Migration

Although the most common explanations are those focusing on the economic dimensions, a general survey of the literature on demographic mobility reveals numerous economic, sociological, and demographic attempts to explain the initiation of internal and international migration. Migration is seen as a response to both endogenous and exogenous variables. These variables are, in sum, the overall effects of sociocultural, economic, political, and psychological conditions on the migrant. The decision to migrate is thus a response to one or many of the variables and the location of such variables. The sociologist describes migration in relation to the nature and magnitude of its social and cultural dimensions, the destination, and the sending area. The economist, on the other hand, reflects on the occupational and employment status, pressure of demand and supply, and relationships among wage, income, and price levels. Demographic explanations relate all the variables to the prospect of measurement and control of migration and its effect on growth and development.

Given Africa's cultural, linguistic, and economic variations, and its vast country-to-country differences, a systematic analysis of any aspect of its social behavior can be a difficult enterprise. Analysis of its migration behavior is no less challenging. When applied to the African situation, accepted theories of migration reveal the need for the development of models that distinguish between developed and developing countries. Indeed, a number of explanatory models have been developed in the literature seeking to explain internal and

international migration of labor in undeveloped countries. Three of these are especially suited to the African situation. These are the Todaro's, Mabogunje's, and Byerlee's models.

Todaro's model is a modification of the neoclassical economic (human capital) theory of migration. The theory posits that migration is the consequence of individual cost-benefit calculation. Todaro proceeds by affirming that migration is based on rational economic calculations and argues that the decision of the individual to migrate is usually a response to rural-urban differentials in expected rather than actual income earnings. This model assumes that the potential migrant selects a location that maximizes expected gains from migration. This was the first explanatory attempt emphasizing that potential migrants should base the decision to move on rational calculation of differences in expected earnings.

Mabogunje's model constitutes the second approach at explaining migration in Africa. The model is a creative adaptation of the world systems model in which Mabogunje asserts that rural-urban migration in Africa is controlled by systematic interrelationships of rural-urban control systems, rural-urban adjustment mechanisms, and the positive or negative flow of information about migration. The model identifies the *push* and the *pull* sides of migration. Local economic conditions that affect the pool of migrants constitute the push side. The size of this pool is affected by social practices, customs, community organization, and inheritance laws in the sending community. Wage rates and job opportunities emanating from the urban system constitute the pull side of migration, and these determine whether individuals in the pool of potential migrants would migrate.

In a modification of the human capital approach, Byerlee adopts a cost-benefit economic model in which he considers migration as the outcome of a cost-return calculation. Byerlee posits that the decision to migrate will be made when the perceived returns of migration exceed the perceived costs. The model goes beyond the conventional cost-return analysis of the human capital approach as it includes elements of the social system. It also explicitly identifies determinants of rural and urban incomes and introduces risks and other psychic costs into the migration decision-making process.

All three approaches have made significant contributions to a conceptual understanding of the migration process in Africa. Todaro's model provides a good explanation for labor migration in Africa, as it recognizes the unequal and uneven distribution of economic and social development between regions of the same country and among countries as a primary determinant of migration. The strength of Mabogunje's approach lies in its macrosystem emphasis, given its recognition of the economic, cultural, and social relationships between rural and urban areas. Mabogunje's model is particularly helpful in understanding the impact of family and community organization on migration. Byerlee's conceptualization of the motivation for migration in Africa has also contributed significantly to a conceptual understanding of migration in the region.

Despite their theoretical contributions, all three models fail to deal adequately with several elements of migration,

including forced migration. With regard to historically more recent migration patterns, the models fail to deal with non-wage urban income, which accounts for an increasing proportion of urban employment.

One element of migration that has assumed increasing importance in recent years is the large-scale international migration of skilled persons from Africa to relatively more developed regions of the world. Attempts to provide explanatory models for understanding the motivation for this phenomenon confirm that the behavior of the so-called highly trained migrants, including scientists, engineers, artists, and intellectuals, is fundamentally determined by the same kind of motivations and market forces as those of less highly trained migrants. However, interpretations of the effect of the migration of highly skilled workers on the developing sending countries differ. Most economists are agreed that although some degree of mobility is necessary if developing countries are to integrate into the global economy, large-scale losses of skilled workers are detrimental to developing countries and pose the threat of a brain drain.

Neoclassical models of economic development hold that brain drain has adverse effects on the development of the sending country, slowing down the GDP growth rates and adversely affecting those who remain. Consequently, poverty and inequality are likely to increase. More recent economic theory—the endogenous growth theory—also predicts that emigration of highly skilled workers reduces economic growth rates. In contradistinction, another theoretical variant holds that at some optimal level of emigration (greater than none but not too much), sending countries actually benefit. It is argued that the possibility of emigrating to higher-wage countries may stimulate individuals to pursue higher education in anticipation of migrating to secure, better-paid work abroad. The consequence is the development of a large pool of better-trained human capital in the sending country. The implication is that there may be an “optimal level of emigration” or a “beneficial brain drain.” Empirical analysis offers some support for the various theoretical expectations.

Conclusion

Human migrations in historic times have transformed the entire aspects of lands and continents and the racial, ethnic, and linguistic composition of their populations. Migration in Africa has had similar consequences. The peopling of the continent and the consolidation of its racial, ethnic, and linguistic landscape certainly cannot be totally separated from the consequences of the various migratory movements.

MIGRATION IN WORLD HISTORY

Migration is a central aspect of human existence. This is evident from the debate about the origins of the human species, which spread, according to the evidence, from Africa across all continents. On the level of ideas and prejudices, this has resulted

in racialized debates about white distinctiveness and Afrocentrism. In prehistoric times, some thirty to forty thousand years ago, human beings migrated from the tricontinental Eurasia-Africa across a land bridge into the Americas and across the seas to Australia. Migration meant diversification of cultures and physical features. Whole peoples, but also clans and groups, continued to migrate throughout the millennia. While Asia's population was settled some sixty-five hundred years ago, in Europe whole peoples continued to migrate until some twelve hundred years ago, often moving from east to west. In Africa, the southward spread of sub-Saharan Bantu-speaking peoples continued to even more recent times.

Once the movement of whole peoples came to an end, migration of members of ethnocultural groups and individuals led to genetic and cultural mixing: Manchu moved southward into China; Norsemen (and -women) moved from Scandinavia eastward along the rivers to the Moskva region where they formed the society of the Rus, and westward along the coasts where they settled in Normandy, in parts of the isles later called "British," and, further southward, in Sicily and Palestine; Slavic and Germanic peoples interacted in central Europe; in the Americas the southward movement of First Peoples resulted in a differentiation into major cultural regions and language groups; in the southeast Asian islands, exchanges of population involved sophisticated sea voyaging; and in Africa pastoralists moved into areas of agriculturalists. In customary male-centered thought, such movements have often been interpreted as the expansion of warrior males and subjugation of "lesser"—more correctly, less armed—peoples. Recent genetic scholarship has revised this imagery: Arriving men, dominant as oppressors, had children with local women, and both genetically and culturally women became dominant. In the case of the Anglo-Saxon conquest of the Celtic-settled (British) islands, the Celtic women's genetic heritage and cultural practices have had a stronger impact than the lore of strong Anglo-Saxon men, as later British historians had believed.

Patterns of Migration

Until recently, no worldwide periodization of migration since Mediterranean antiquity had been attempted, though specific movements were well-studied. The composition and character of migration was influenced by cultural practices in the society and religious creed of origin. Greek migration in the Mediterranean world was one of artisans, traders, and cultural elites resulting in a process of Hellenization. The Roman Empire's expansion was one of soldiers and the imposition of rule; it brought South European and North African men to northern Europe. One of its military officers, a man from sub-Saharan Africa, became Christian Europe's Saint Mauritius (also called Saint Maurice, d. c. 286). The spread of Islam occurred through traveling merchants and, to some degree, through military action. These migrant Arabs and their religious culture equalized social relations among Hindu Indians because they knew no castes, but they hierarchized gender relations because women's status was lower in Islamic societies than in Hindu societies. In China migrating agriculturalists, as if forming a distinct ethnocultural group, were designated as "Han." Their regions of settlement were interspersed with

those of long-settled cultural groups. In Africa, major east-west movements of people in the Sahel zone resulted in the formation of states, empires, and urban cultures. In Australia, multiple societies, later generically termed *Aboriginal*, emerged by separation rather than overlay or penetration. In the Americas some societies developed agricultural practices and became geographically stable, while others pursued hunting and remained mobile. All were connected through long-distance trading and some, seemingly, through exchange of spiritual concepts and scientific observation of celestial phenomena.

In the Eurasian-African world, patterns of migration changed in the period from the mid-fifteenth to mid-sixteenth century. By the 1440s populations had recovered from the demographic shrinkage imposed by the great plagues of the latter 1340s. In imperial China, the bureaucracy decreed an end to overseas contacts. To 1435, fleets of ships, vastly superior to European vessels, had carried expeditions of up to about thirty thousand men (and women) along the coasts of the South Asian subcontinent and to the East African ports. In the social hierarchy of Chinese society, merchants ranked low, and those who, from the southern provinces distant from the court, continued to trade overseas developed a Southeast Asian diaspora that lacked state support. In contrast, the Iberian Portuguese court provided financial and military backing to sailors and merchants who sent trading expeditions to the northwest African coast. They and, later, other Europeans developed fortified trading posts, "forts," wherever they gained a bridgehead. By the 1440s, the first enslaved Africans were brought to Portugal. Underemployed seafarers of the declining Italian port cities, Cristoforo Colombo (Christopher Columbus) and Giovanni Caboto (John Cabot) among them, migrated to the Atlantic coast. Relying on lore and knowledge of Breton, Basque, Bristol, and Icelandic sailors, and encouraged by the changing view of the earth as a globe rather than a disk, they explored westward routes aiming to reach the riches of Asia, whether China or India. Thus, a barrier on this route, the Americas, became part of the European's mental maps. In North European annals the existence of a Vinland had been chronicled since the time of the Norse voyages. Only Australia was still absent from this view of the world.

From 1550, the wealth of some of the Asian and Central and South American societies, the political-military power of the somewhat economically marginal European societies, and the transfer of germs from Eurasia to the Americas resulted in vast demographic changes: (1) the near genocide of many peoples of the Americas and the resettling of that region with immigrants from many European societies; (2) the usage of men and women from many cultures of sub-Saharan Africa as enslaved labor by European-origin investors in the process of establishing the subtropical plantation belt; and (3) the European military-commercial exploitation of the peoples of the Indian Ocean region and, subsequently, those of East Asia. As a result, several hemispheric and near-global migration systems emerged. From Europe, merchants and military as well as administrative personnel migrated outward. Their arms and purchasing power induced migration of producers and common laborers. Where they established mines or plantations—also called "factories in the fields" (Wolf)—they needed large

numbers of workers but were not willing to pay wages or provide working conditions acceptable to local populations. In densely populated Asia, they forced men and women to work the fields. In Latin America they immobilized surviving earlier populations as agricultural worker families under the *encomienda* labor distribution system or forced them to migrate hundreds of miles to labor in the silver mines under the *mita* system.

Through the postcontact epidemics and wars of annihilation, however, the peoples of the Americas had been decimated, and thus traders from most European coastal states initiated a mass importation of enslaved laborers from Africa with the help of slave-catching coastal societies in West and, to a lesser degree, East Africa. Through investment and superior armament the European colonizer migrants established the South Atlantic African-American forced slave migration system. To fill the demand for tropical produce they transported some 9.8 million men and women to the Americas from about 1500 to the 1870s. This is a downward revision from earlier estimates of fifteen million. Another two million died during the so-called transatlantic middle passage. Additional millions perished during capture and on the routes to the African coast. This trafficking in human beings depleted the population base in West and Central Africa. In addition to the chattel slavery in the Atlantic world, societies of the Indian Ocean also used slaves for services and in commerce. Figures are difficult to ascertain.

The mixing between European colonizer men and Asian, Latin American, and Afro-American women, frequently through rape but more often through hierarchical consensual unions, led to the emergence of new peoples in the Americas and of smaller groups in Africa and Asia (in a process known as ethnogenesis). Conceptualizing these new peoples was difficult. In European thought of the times, those born in the colonies were “creoles” and inferior to “pure” European-born people. In the minds of European colonials, however, those born of European-origin parents considered themselves European and preferred to apply the term *creole* to people born of culturally mixed backgrounds and with shades of skin construed as “dark” or “black”—similar to the use of such terms as *mestizo* or *mulatto*. Whereas religion and craft had served to define identities before the beginning of colonization, the ideologues of Christianity and of exploitation increasingly made color of skin (race) and genetically defined ethnic groups the marker of belonging. “Race,” however, was lived differently in Anglo and Latin colonial societies: strict racial separation ruled in the former, intermixing and hierarchization of shades of skin color in the latter.

In the nineteenth century, when the Afro-Atlantic forced migration system came to an end, the demand for labor was filled by an Asian contract labor system and by a transatlantic proletarian mass migration from Europe. Mainly Indians and Chinese were brought to plantations and mines under five-year contracts, in a system that has been called “a second slavery” (Tinker). This system lasted until the early twentieth century. Simultaneously, free Chinese and other Asian migrants developed a transpacific migration system from the late 1840s on. The largest of these systems, the European–Atlantic one, at first encompassed two routes, from southern Europe to Latin America and from western, northern, and, later, eastern Europe to

North America. Italian labor migrants integrated the routes in the 1880s. From 1815 to the 1930s some fifty-five million men and women moved westward, some seven million returning to their cultures of origin. In addition, the agricultural migration from European Russia to the southern belt of Siberia and the labor migration within European Russia coalesced into a Russo-Siberian migration system, in which some ten million men and women moved eastward and even larger numbers moved to the industrializing cities. While the nineteenth century is considered the century of proletarian mass migrations, the rate of migration per thousand people was higher in seventeenth-century industrializing societies such as the Netherlands and Sweden. Contrary to widespread ideas, even peasant societies have never been sedentary; in each generation, sons and daughters who could no longer be fed on the parental land had to move elsewhere to eke out a living in marginal agriculture or in urban wage labor. The farmers of the nineteenth-century migrations cultivated new fertile plains in North America, southern Russia, Argentina, and Australia, and their mass production of grain led to a collapse of world market prices and, consequently, to a worldwide agricultural crisis that forced millions more to leave the land for urban jobs.

In the twentieth century, wars and the depression after 1929 reduced labor migrations. Warfare and fascism in Europe generated huge numbers of refugees. From the 1950s on, the politically decolonizing but economically dependent societies of the southern hemisphere became refugee-generating states. Exclusion and border controls in the advanced industrial (and white) societies of the northern hemisphere as well as discriminatory terms of trade led to “global apartheid” (Richmond). Labor needs of the northern economies were filled by south–north migrations from both the Mediterranean and Caribbean basins. The search for more options and better lives led nonwhite people to migrate toward the industrial and social security states of the north, if necessary without documents or, from the point of view of the receiving societies, as “illegals.” To such migrations the North American societies have responded more openly, proving more willing to grant amnesties than European societies (derided in some circles as “fortress Europe”). In other parts of the world, regional systems of migration emerged: internally in China, to the oil-producing states of the Persian Gulf, in West Africa, and elsewhere. By the beginning of the twenty-first century, migration systems had become even more multifocal than in the past.

Throughout history women’s options to migrate were restrained by male-imposed concepts of gender roles. With permanent settlement, however, communities of migrants demanded and continue to demand the presence of women for family formation and the building of networks. Women have always been part of migrations; from the 1930s on they even formed a slight majority of those heading for North American societies. Both refugee migration and the demand for service labor led to a feminization of migration in the last decades of the twentieth century.

Governmental Policies

Governmental policies on migration have evolved in stages. Before the coming of colonialism, merchants, small producers,

dockworkers, and sailors were free to migrate between the ports of the trade emporia of the Indian Ocean, and cultural communities of migrants were often granted self-administration. In European societies, the shift from dynastic systems to nation-states resulted in a massive deterioration of migrants' status. In dynastic systems, incoming migrants negotiated their status with the ruler and were usually free to practice distinct customs and use their own language, provided they promised loyalty. The Protestant French Huguenots of the sixteenth and seventeenth centuries are the best example. Nation-states, however, postulated unity or even uniformity of culture and demanded that incoming migrants renounce their own culture, religion, and language—or, in short, assimilate. The elevated position of the “nationals” over resident “minorities” and immigrant “ethnics” stood juxtaposed to the republican ideal of equality before the law. Passports, a late-nineteenth-century invention of nation-states, along with border controls and immigration legislation, excluded ever-larger categories of potential migrants from entering a society. Racial thought contributed to exclusion, and fear of class struggles led to increased control over labor migrations. Through the early twenty-first century, nation-states have still not overcome this “otherizing” of newcomers. Rather than being admitted to citizenship, newcomers are labeled “aliens,” “foreigners,” temporary laborers, or, euphemistically, guest workers. The common notion of “guests” does not imply using them as cheap workers, to be sent home whenever an economic downswing results in a diminished need for labor. Such practices have also been adopted by West African societies, especially Ghana and Nigeria, as well as by the oil-producing states of the Middle East.

Public opinion has classified newcomers according to religion, power, economic pursuit, and, only recently, color of skin. In many-cultured societies—the Ottoman Empire being the best example—cultural groups of peoples governed themselves through their religious rulers, and newcomers, such as the Jews, who were expelled from the Iberian societies after 1492, were incorporated under these principles. In China, imperial officials from afar provided but a thin overlay of resident populations, and people lived according to their own customs. In the nineteenth-century Habsburg “monarchy of many peoples,” nationalizing tendencies and investment strategies reduced such self-determination of cultural groups. While conflicts have always occurred, the marginalization and otherizing practices of the late nineteenth and twentieth centuries paralleled the nation-states' cultural homogenization policies.

Global versus Nationalist Perspectives

Research has only recently achieved a global perspective on migration. Into the 1970s, nationalist historians assumed that *emigrants* depart from a nation-state and arrive as *immigrants* in ethnic enclaves of the receiving nation-state. Since then, this dichotomous perspective and terminology has been replaced by the neutral term *migrant*: People may move over short distances, for example, from rural to urban environments; or seasonally, as harvest laborers, from infertile hilly regions to farms in fertile valleys and plains; or to urban positions as female domestics, apprentices, or day laborers. People migrate over medium distances to specific segments of labor markets or to

available agricultural lands within a state (internal migration), in borderlands (intercultural migration, for example, from China to Mongolia), or across international borders. Because nation-states counted migrants only at such borders, international migration caught the attention of nation-state socialized scholars much more so than the less documented internal migration. The latter, however, included the whole process of urbanization, marriage migration, and industrialization and has been far more voluminous. Population registers of cities, parish records, and marriage lists provide the evidence.

The emigration–immigration dichotomy also assumed one-directional, one-time moves. Migrants, however, may move seasonally, for several years or for their working life. They may return regularly or occasionally. They may repeat the process of migration several times. Some migrations, such as those of early modern European artisans, Chinese transport laborers, and women earning money for a dowry, are circular: the migrants traverse short or long distances but finally return to their community of origin. Some migrations occur in stages, with a part of the intended trajectory undertaken at a time, for example, first to a nearby market city, then, with new wage earnings, to a port city, and finally to an overseas destination. Given that migration is costly, not only because of the cost of transport but also because during the voyage no income can be earned, many families decide to send one member with high earning capacity first. Then, in sequential or chain migration, other family members or friends follow whenever the “first-comer” is able to send money for travel or, at least, provide temporary shelter and access to a job. Such “free” migrations occur within economic and social constraints in the society of origin. Migrants pursue better options in their selected receiving society; for women this often involves less restrained gender roles.

Forced migrations, which encompass slavery, contract labor, and forced labor on the one hand and refugee migration on the other, have been studied separately. The distinction is both justified and misleading. Forced migrants have few opportunities to acculturate according to their own interests, whether within the slavery system in the Americas or in twentieth-century German, Russian, and Japanese labor camps. But in order to survive forced labor regimes, they have to develop strategies to make conditions physically and spiritually bearable. Refugees are “unwilling” migrants and often look back to the expelling society in hopes that changes will occur permitting their return. Because they are often not welcome in receiving societies and frequently receive no material support, they—like voluntary migrants—have to insert themselves into the receiving economy.

A further fallacy of the nationalist approach to migration has been the assumption that people are essentially monocultural. Such scholars have considered migrants to be uprooted, in limbo between cultures, and incapable of adjusting to their new sociocultural environment. Since the 1980s, however, sociological and historic research has shown that while involuntary migrants may be uprooted, voluntary ones develop individual and social capital and act in supportive networks that permit continuity as well as change. They live transculturally

rather than ensconced in ethnic ghettos; they need the ability to function in more than one society.

Thus, many societies across the ages have sought migrants as innovators, connectors, or simply additional human capital. Many migrants, in turn, have sought independence from parents, constraining social norms, and dire economic circumstances by moving between one state or society to another.

UNITED STATES

Amerindians, Pilgrim fathers, immigrants, slaves, Asian-Americans, Hispanics—all denote historical population groups in the United States and in the Americas, but each group is placed in a different frame of reference. All of them arrived as migrants with norms, values, and belief systems of their ancestors and premigration society as a whole. Before immigrating they also had experienced culture-specific material ways of life. They arrived at particular historic conjunctions and developed lifeways specific to the region or city in which they settled.

First Americans

Some thirty to fifty thousand years ago, peoples from Asia migrated across a land bridge, today's Bering Strait, into North America and beyond. Distinct linguistic groups and several complex cultures emerged, such as Hohokam farming and Pueblo culture in the southwestern mesas and a mound-building culture in the Ohio Valley. After 1492 the native populations of the Americas were gradually decimated by a combination of Eurasian germs and Old World arms. By the 1830s Amerindians had been forced to vacate all lands east of the Mississippi, and the U.S. Supreme Court had designated them as *domestic dependent* nations without sovereignty. By the 1870s white Americans had begun to speak of a "vanishing race," imagining Amerindians as the generic horse-mounted Plains "Indian." Though Helen Hunt Jackson's *A Century of Dishonor* (1881) initiated a public debate about the denigration of native peoples' cultures, the Dawes General Allotment Act (1887) dissolved tribes—a term for cultural groups that suggests a primitive stage of development—based on the notion (implemented in 1924) that citizenship could only be conferred on individuals. Native Americans were confined to reservations, denied self-government, and deprived of their cultural practices. European-Americans developed the idea that "Indians" were dependent on government handouts. Over the next century, however, migration to the cities by native people and resistance by the American Indian Movement led to a slow reversal of government policies by the 1970s. Armed struggle, legal action, and self-organization by and on behalf of Native Americans forced U.S. governmental institutions and public opinion to revise their notions of "Indians" and to accept varying degrees of Native American self-determination.

Old World Migrants

Europeans from Scandinavia reached North America around 1000, and transpacific contacts probably also occurred early. Lasting European contact seems to have begun with the establishment of Basque, English, and Portuguese fisheries off the Newfoundland shores. In the mid-sixteenth century invasion forces as well as settlers from New Spain had reached present-day New Mexico. The territories of the north, known for their fur economies, were targeted by numerous large European mercantile companies and dynasties. The gentlemen adventurers in Virginia and the religious colonizers in New England would eventually provide a profitable return on the investments of such companies that financed their voyages. Since demand for male and female laborers exceeded the available migrants, several European states established a system of indentured servitude by which poor men and women sold their labor for a number of years in return for passage to North

American or Caribbean colonies. Such redemptioners were free after serving for a period of between three and seven years. This system of bound white labor ended in the 1820s, although “free” departure under severe economic constraints lasted.

Racial and Religious Hierarchy

To increase the labor supply in the southern colonies of North America and in the Caribbean colonies, men and women from Africa were transported to the Americas and sold as slaves. To the 1830s more Africans than Europeans arrived in the Americas. The forced migration of African people occurred in stages, thus preventing them from reestablishing their lives in terms of ethnocultural groups. African Americans were relegated to a status as *domestic dependents*. The American concept of *e pluribus unum* applied only to freeborn white Europeans, who were the model of Michel Crèvecoeur’s new American man (*Letters from an American Farmer*, 1782). Twentieth-century scholarship reconceptualized the process of the (re)peopling of the Americas, examining not just the history of free migration but that of involuntary (economically induced) migration, forced migration, and destruction of the Amerindians.

Migration to the United States during the nineteenth century, from the end of the Napoleonic Wars in 1815 to the beginning of World War I in 1914, has traditionally been divided into two stages that involved two different regions of origin and thus two different “racial” groups: an early agrarian “old” immigration from west-central and northern Europe and an urban “new” immigration from eastern and southern Europe starting in the mid-1880s. The distinction dates from the late nineteenth century, when the darker-complected “new immigrants” were considered racially inferior. The Eurocentric perspective covers the vast majority of newcomers, but importation of enslaved Africans, outlawed in 1808, continued illegally. Chinese of several cultural groups from the empire’s southern provinces and other migrants from Asia arrived from the mid-1840s in Pacific Coast cities as merchants, prospectors, and credit-ticket laborers. The racial hierarchy of white America was extended to Mexican-Americans following territorial gains of the Treaty of Guadeloupe Hidalgo. The process of hierarchization included religion along with race, placing non-Christian Africans, “heathen” Chinese, and Roman Catholic “papists” in categories below that of white Anglo Protestants.

Only one-third of the migrants to the United States in the 1840s were agriculturalists. Eastern European farming families first arrived in the 1840s, while the northern European industrial laborers came after the 1880s. On average the male-female ratio stood at 60 to 40. The new states in the West sought to increase their economic potential and revenues, and the fast-growing industries in the East actively recruited newcomers from Europe. Railroad construction companies did the same in Asia. An anti-immigrant or nativist movement emerged in the 1850s; exclusion of “the Chinese”—a summary term for people from different cultures and dialects from the empire’s southern provinces—which was first attempted in 1879, became law in 1882. The designation *immigrant*, once reserved for newcomers from Europe and contrasted to *sojourners* from Asia, reveals a dichotomy, with *emigrants* as the complementary term used in Europe. Agrarian settler families, who sold their possessions before

departing for America, could hardly return to their native lands, but labor migrants often came as temporary workers. Return migrants, estimated at 7 million from the 1820s to the 1930s, were not counted by the U.S. Bureau of Statistics before 1907: The image of “immigration country” captured statisticians’ minds and prevented them from even looking for returnees. The emigrant–immigrant dichotomy also hides internal migrants: Europe’s societies of origin experienced far more internal migration than emigration; like the North American societies, most were labor-importing ones. U.S. internal migration, rather than being merely a westward colonization and mining movement, involved west-east rural-to-urban migration, the so-called Great Migration of African-Americans from southern agriculture to northern industries, as well as numerous other smaller moves.

Twentieth Century

Similarly problematic is the cultural classification of European migrants into “ethnic groups,” a differentiation denied “Asians,” “Indians,” or “Negroes.” European migrants were regionally diverse, nation-states having only come into being in the nineteenth century. Thus the nation-to-ethnic-enclave paradigm constituted an ahistoric simplification. At the end of the century biological-racist classifications (scientific racism) were increasingly applied to European newcomers from eastern Europe (“dark”), from Italy (“olive”), or of Jewish faith and excluded nonwhite populations from other continents altogether. While U.S. gatekeeper elites demanded Anglo conformity or assimilation, newcomers suggested a “melting pot” concept, a term that became popular after Israel Zangwill’s play of that title of 1908. The prescription for Anglo conformity excluded by definition peoples from Europe’s peripheries. Conceptual exclusion was paralleled by legal exclusion. Congress enacted restrictions on the open-door policy of admission to the United States starting in the 1880s. Further restrictions were legislated in 1917 and 1924. To access other labor reserves, men from Mexico were admitted under specific provisions covering temporary labor. With the closing of the front door facing the Atlantic, a back door on the Rio Grande was opened. The Pacific door was left ajar for merchants and students, in the interest of trade and cultural expansion. When scientific racism subsided, the paradigm of uprootedness emerged as a new hierarchization. While immigrants were recognized as “making the American people” (Handlin), immigrants in general and the Irish in particular were considered as suspended between cultures and thus in need of help with assimilation. Many European immigrants of the late 1940s and 1950s had in fact been uprooted but by war and forced labor camps—earning status as displaced persons—rather than by migration.

The 1965 Immigration and Nationality (Hart-Celler) Act intended to end discrimination of migrants based on skin color or cultural origin. A merit-based point system favored skilled, professional, and highly educated men and women in order to boost U.S. economic performance. The underlying assumption that Europeans could meet the new immigration criteria was wrong, and the composition of migration to the United States changed totally. Transatlantic migration subsided after Europe’s recovery from the devastations of World War II with the exception of departures from southern European societies

and refugees from the socialist countries. In contrast, transpacific migration from developed societies in Asia with high educational performance increased and surpassed transatlantic migration by the 1970s. Wage differentials—sometimes offset by cost-of-living levels—attracted men and women from low-wage societies in Asia. A humanitarian aspect of the point system and the citizenship legislation permitted highly qualified migrants to bring relatives regardless of their levels of qualification and English-language skills. U.S. soldiers stationed in Southeast Asia during the Vietnam War led to the first “war bride” migration, and in the aftermath of Vietnam large numbers of refugees arrived in the United States in the mid-1970s. A further, but temporary, incentive for Chinese to migrate to the United States was the return of Hong Kong to the People’s Republic of China in 1997.

Intracontinental northbound migration from Mexico and the Caribbean as well as from other Latin American states surpassed transpacific migration in the 1980s. Mexican laborers and laboring families continued to be recruited seasonally or without legal work documents. Puerto Rican (internal) and other Caribbean (external) migrants arrived in large numbers; Cuban exiles were hosted, while Haitian refugees were rejected. U.S. governmental support for right-wing regimes in several Latin American states resulted in an exodus of political refugees. While Asian-Americans, Mexican-Americans, and Hispanics in general created civil rights movements, advocates of “whiteness” initiated another racial debate about “the browning” of the United States and generated new calls for conformity. Undocumented migrants, upon whom certain economic sectors relied, were offered legitimization, that is, were given legal status. From the mid-1960s on scholarship on the subject of migration departed from the ethnic-group and migrant-dislocation paradigms. Scholars observed the ability of migrants to function and negotiate in two cultures, to create relations between cultural groups, to fuse multiple elements into multicultural lives and hybrid forms of expression. The perspective of women’s studies brought inclusion of migrant women—since the 1930s about one-half of all migrants to the United States—into the historical narrative (Gabaccia). However, race and culture continued to be reflected in scholarship. The experiences of African-Americans were studied separately under the heading of slavery, while research on Asian or Hispanic migrants utilized the model of European experience. Migrant origins, once nationalized, both as regards communities of origin and destinations, were regionalized as well as integrated into continental, hemispheric, or global migration systems (Gilroy; Hoerder; Ruíz; Takaki). Nation- or multicultural-state superstructures lost centrality of position in the analysis but remain important in establishing legal and institutional frames for admission (or rejection) and inclusion (or exclusion). Emphasis on exchange between cultural groups and on negotiating identities is reflected in concepts of diasporic belongings and societal embeddedness as well as in transnational or transcultural capabilities to chart life projects and develop ways of everyday life under conditions of high mobility (Portes; Rumbaut; Foner).

MILLENARIANISM.

This entry includes three subentries:

Overview

Islamic

Latin America and Native North America

OVERVIEW

Millenarianism refers to religious beliefs about a thousand-year period at the end of the world. This period, the millennium (from two Latin words, *mille*, thousand, and *annum*, year), is described in the Bible's Book of Revelation (20:1–6). Millenarians, while believing that Christ's Second Coming will usher in this earthly kingdom for the faithful, differ on the timing of the millennium. Some (premillennialists) believe Christ will return before the perfect age, while others (postmillennialists) expect that Christ will return after the elect have established the millennium either by preaching the gospel or by fire and sword. Millenarianism is synonymous with millennialism. A closely related term, *chiliasm*, (based on the Greek word for a thousand) is similar in meaning but sometimes has the association of the violence needed to bring about this thousand-year period. While individuals may quietly embrace millenarian beliefs, characteristically it has been through larger movements that millenarian hopes get expressed most dramatically.

Origins of Millenarianism

The roots of millenarianism are in apocalyptic literature. Ancient Near Eastern myths depict a great battle between good and evil, but explicit apocalyptic literature first appears in both the Jewish and Christian Scriptures of the Hellenistic period, from approximately 200 B.C.E. to approximately 100 C.E. The Book of Revelation (its Greek name, Apocalypse, means unveiling or revelation and provides the generic term for consolation literature and supplies much of the imagery of millenarianism) was written in 92–96 C.E. Apocalyptic writings, such as Second Isaiah (chapters 40–55), Isaiah (24–27), and Daniel (2:13–45, chapters 7–12), sought to comfort believers in times of difficulty and to put contemporary suffering in perspective. God would enable his suffering faithful, his elect ones, to triumph and have dominion over their enemies.

The earliest Christian communities arose amid Jewish apocalyptic thinking and Jewish renewal movements such as the Maccabees and Zealots. The earliest Christian literature reflects this eschatological expectation. St. Paul repeatedly refers to the Parousia, the Lord's Second Coming (1 Thess. 2:19, 3:13, 4:15, 5:23). The synoptic Gospels (Matthew, Mark, and Luke) similarly reflect the concerns of the first generation of Christians, for example, recalling how Jesus began his ministry with an urgent proclamation of the imminence of the end times and the coming of the Kingdom: "The time is fulfilled, and the kingdom of God is at hand" (Mark 1:15). Early Christians were convinced the Second Coming would occur in their lifetime.

The Book of Revelation, written in response to the unexpected persecution of Christians as well as the nonappearance of the Parousia, uses mysterious symbols, striking images, and visions to provide for suffering believers assurance of the Lord's imminent return, restoration of order in the cosmos, and a final victory with a new creation. Satan would be bound and the saints would reign with Christ for a thousand years (20:1–6).

Millenarian Movements

The first major millenarian movement after the early Christian communities was Montanism. Montanus, its founder,

sought to restore the enthusiasm of the early period of the church. Montanus's movement began about 172 C.E. He expected the Lord to return to Pepuza and Tymion, two small towns in Asia Minor. The New Jerusalem would soon descend to earth and the thousand-year reign of Christ would begin. Montanus encouraged his followers to live in strict asceticism to prepare for this Second Coming. The church turned against Montanus because millenarianism was not central in Christian doctrine and because ecstatic prophecy and private interpretation undermined church discipline.

St. Augustine of Hippo (354–430) effectively closed the door on millenarian speculation for centuries by writing against the kind of literal interpretation of Scriptures that promised a physical paradise on earth. But early in the Middle Ages Joachim of Fiore (1130 or 1135–1201 or 1202) reopened the door for many apocalyptic and renewal movements, such as the Spiritual Franciscans and the Fraticelli. Joachim believed his own age was in crisis and preached that human agency would contribute to bringing the church through to the final stage of history, the age of the Holy Spirit.

In many instances millenarian hopes and expectations became intertwined with political and social aspirations and resulted in a violent mix—especially when reform efforts, blocked by rigid church and secular authorities, became radical and extreme. Such a situation occurred, for instance, in the fifteenth century in Bohemia and Moravia, when the Hussite reform movement, blended with inchoate nationalistic feelings and social tensions, became the Hussite Revolution, which in turn spawned the radical millenarian movement of the Taborites. Using religious images and millenarian beliefs, Taborites created a short-lived millenarian society that fought violently against the forces sent to crush it.

In sixteenth-century Germany Lutheran reforms triggered a sense of liberation as well as disorientation amid social and religious changes. Just as Martin Luther used apocalyptic imagery to portray the pope as the Antichrist, Thomas Müntzer portrayed Luther as the Beast of the Apocalypse because Luther was countering Müntzer's reformist efforts. Müntzer committed himself to social and religious revolution, believing any who opposed this process of the last days must be violently annihilated. Anabaptist groups channeled reform hopes into efforts to establish a new golden age. Some groups preached a nonviolent awaiting for the end times, while other segments developed a fanatical millenarianism as authorities opposed them. In Münster the Anabaptists set up the new Kingdom of Zion, which came to a violent and bloody end in 1535.

At the end of the sixteenth century and early in the seventeenth, the political and religious conditions in England prompted a wave of millenarian interest and excitement. English Puritans increasingly interpreted biblical prophecies about calamities and the Second Coming as referring to contemporary situations. Learned men tried to decipher from Scripture the date when the end of the world might arrive. The most radical of English millenarians were known as the Fifth Monarchy Men (from the vision recounted in the Book of Daniel, chapter 7). In the early eighteenth century France's Camisards or "French Prophets" sought from the Catholic king some

tolerance for their Protestant culture and practices. The Camisards believed their sufferings were part of God's plan for the coming of the millennium. Lay prophets, including many children, amid physical manifestations of shaking and convulsions, revealed that the Judgment Day was soon approaching, that the reign of the Beast of the Apocalypse would soon end.

Millenarianism in North America

North America was especially fertile soil for the growth of millenarian movements and ideas. English Puritans brought millenarianism with them to American shores with the apocalyptic vision of being God's instruments in establishing the New Kingdom. John Winthrop, the governor of Massachusetts Bay Colony, expressed the Puritan aspiration of building a revolutionary city, a New Jerusalem, "coming down out of heaven from God" (Rev. 21:10). Early Puritan divines such as Joseph Cotton and Increase Mather continued the tradition of learned speculation about the date the millennium would begin and how the conversion of the Jews must precede the Second Advent of Christ. A not-inconsiderable part of American optimism and expansionism rested on beliefs about being God's elect and about the qualities of the earthly paradise.

William Miller, born in 1782 in Massachusetts, scrutinized the Scriptures and reconfigured biblical chronology. If the world began in 4004 B.C.E. and lasted 6,000 years, Miller concluded that "sometime" between 1843 and 1844 would be the end of the world. His pamphlet about the Second Coming of Christ and his reign convinced upwards of fifty thousand Americans that time would run out in 1844.

Of course, the world did not end, and the Great Disappointment of 1844 fragmented the Millerite movement. The diversity of responses to the nonappearance of the end included efforts to recalculate and "adjust" the prophetic dates of Jesus's Second Coming. Seventh Day Adventists and Jehovah's Witnesses evolved from the discouragement and divisions of Millerism. They, along with the Mormons, another fast-growing American religion, have explicit millenarian expectations, implying the lasting appeal of millenarian hopes.

Although most millenarian terms, images, and ideas originated within ancient Judaism and early Christianity, millenarianism has echoes in other religions and in cults. At its core, millenarianism offers the idea of history as progressing toward a transformed world. This nourishes the ever green yearning for an end of suffering and oppression and hardship. It is not surprising, then, that anxious and "deprived" people continue to look for signs that a new age is dawning. This human aspiration for a transformed world can then be discerned not only behind a variety of utopias and ideas about society, including those of Karl Marx or Hitler's Thousand Year Reich, but also in such contemporary millenarian cults as the People's Temple, the Branch Davidians, Heaven's Gate, and AUM Shinrikyo.

ISLAMIC

Millenarianism in Islam is a major theme that runs through the entire gamut of classical Islamic civilization. Although the Koran itself does not propose a millenarianism, as its major theme is eschatological and otherworldly, starting from the end of the seventh century C.E., the tradition literature (*hadith*) contains visions of a messiah and of a messianic age. The earliest messianic figure in Islam was probably Jesus, who was taken up to heaven by God—rather than crucified (Koran 3:55) as in Christianity—with the understanding that he would return at the end of the world; the more prevalent figure, however, was that of the Mahdi, the rightly guided one. This title began to appear attached to prominent political and religious figures by the middle of the seventh century, but the predictions concerning him received their present form during the period of the Abbasid revolution (740–749): the Mahdi will arise in the east, in the region of Khorasan (today eastern Iran and Afghanistan), raise an army, march through the Iranian plateau to Iraq and establish his messianic kingdom there after purifying the Muslim world of evil. This scenario mirrored the Abbasid rise to power closely and served to legitimize their revolution. By contrast, the figure of Jesus remained in Muslim apocalyptic beliefs primarily to fight and slay the Dajjal (the Antichrist), who will appear prior to the messianic kingdom and test the Muslims. Jesus will return from heaven at the advent of the messianic age, slay the Dajjal near Jerusalem, and then pray behind the Mahdi.

By contrast, the Shiite messianic vision was based upon the return of the Twelfth Imam (descended from the Prophet Muhammad), who went into occultation in 874. The Twelfth Imam will arise either in the east, as in the Sunni version, or in Mecca in some other versions and will similarly purify the Muslim world and take vengeance upon those who have oppressed the Shiites. However, in both the Sunni and the Shiite versions, the messianic age is not an extensive one; Sunnis believe that it will last between five and nine years, while Shiites allow for the possibility of twenty to forty years and, in some versions, up to

three hundred years. For the most part, this period is characterized by the messianic tradition, “He will fill the earth with righteousness and justice just as it has been filled with unrighteousness and injustice” (Cook, 2003, p. 137). The specifics of this tradition are not fleshed out, however, and its powerful message remains available for any movement to use.

Starting with the Abbasids (747–1258), a wide range of both Sunni and Shiite Muslim dynasties and rulers have used messianic or millenarian slogans or visions to justify their rule. The first seven Abbasid rulers all took messianic titles for their regnal names and spread the idea that their rule was the promised messianic kingdom. As the Abbasid dynasty lost power through the ninth century, other rulers appropriated or manipulated these beliefs. Many rulers gained legitimacy through the tradition that “at the turn of every one hundred years God sends a renewer to renew His religion.” This renewer, the *mujaddid*, was for the most part a religious figure, but the renewal movements spawned by his activities often had political ramifications as well.

In 899 the sevens Shiites (those who accepted seven imams descended from the Prophet Muhammad), also known as the Ismailis, proclaimed their messianic kingdom in North Africa. The dynasty they produced, the Fatimids, eventually moved to Egypt, where they founded Cairo in 969 and for a time provided serious competition with the Abbasids for primacy in the Muslim world. Like most Muslim dynasties founded on messianic claims, there was a transition after the first couple of rulers to a nonmessianic form of legitimacy. After the fall of the Abbasids in 1258 at the hand of the Mongols, Muslim dynasties all over the Middle East used messianic legitimacy to found their rule. This took several forms, the first of which was the traditional messianic religious form, conforming closely (or at least as closely as possible) to the traditions. A good example of this is the Safavid dynasty of Persia (1499–1736), which converted the Persian people (for the most part) to Shiism. This dynasty reached its peak in a wave of expectation keyed to the Muslim year 1000 (1591–1592 C.E.). Immediately after the passing of this date, the Safavids brutally suppressed their extremist followers, the Kizilbash, and thereafter ruled without recourse to messianic themes.

Another paradigm employed more secular messianic themes, such as universal justice (also present in Islam) and stability. The best example of this trend was the Ottoman dynasty (c. 1300–1918), especially under Sulayman the Magnificent (1520–1566), who was known as Sulayman the Law-Giver (Fleischer, 1992). Yet other rulers more marginally Muslim, such as Timur (Tamerlane; c. 1336–1405), employed millenarian themes taken from the world of astrological calculations and called themselves *Sahib-i Qiran* (the Lord of the Auspicious Conjunction). This term and its cognates implied that the world of the stars (governed, of course, by God) had conferred special favor upon Tamerlane and other Turkish and Persian rulers who used it and thereby had the “mandate of heaven” for their rule.

Not all millenarians were successful, and some of the more prominent failures left very conspicuous marks on Muslim history. The messianic revolt of Muhammad al-Nafs al-Zakiyya,

a descendent of the Prophet Muhammad, in Medina in 762, for example had a profound influence upon the shaping of the tradition of the appearance of the Mahdi despite the fact that the revolt itself was a failure. Many other movements were characterized by outlandish or exaggerated predictions or, while occasionally serving to vent popular frustrations, fizzled politically. A good example of this type of movement was the Syrian belief in the Sufyani, a descendent of the early caliph Mu’awiya bin Abi Sufyan (602–680), who was supposed to appear and liberate the Syrians. No less than fourteen different appearances of people claiming to be the Sufyani can be documented from history, all of them ending tragically.

Millenarianism in Islam is far from dead. The messianic ideals surrounding the Mahdi, the religious renewal of the *mujaddid* and the fear engendered by the Dajjal are quite common in contemporary Muslim apocalyptic literature. A great deal of apocalyptic speculation was attached to the year 1400 (1978–1979 C.E.), when major upheavals occurred around the Muslim world, including the messianic revolt of Muhammad al-Qahtani and Juhayman al-Utaybi at the Holy Mosque in Mecca and the Islamic Revolution in Iran. According to the authoritative treatise of Jalal al-Din al-Suyuti (d. 1505), *al-Kashf ‘an mujawizat hadhibi al-umma al-alf* (Revelation of this Community’s Passing of the Thousand-Year Mark), the end of the world should be expected around the year 1500 (2076 C.E.). Most early twenty-first-century apocalyptic tracts feature scenarios and dates that are built around his prediction. Mahdi figures continue to appear with regularity, and contemporary radical Islam includes messianic expectations for a proposed revival of the caliphate and a united Muslim state.

Scholarship on the subject of Islamic millenarianism has been primarily confined to Shiite movements. One important work is Abdelaziz Sachedina’s *Islamic Messianism*, which examines early Shiite ideals and beliefs. Wilferd Madelung has published a number of studies on the subject of Sunni and Shiite apocalyptic and messianic traditions, primarily building upon the early work of Nu’aym bin Hammad al-Marwazi (d. 844). Messianic themes among dynasties are usually to be found in historical works and have yet to be studied as a whole. David Cook’s *Studies in Muslim Apocalyptic* covers many of the basic themes of Muslim apocalyptic and messianic belief; his 2003 work, *Contemporary Muslim Apocalyptic Literature*, presents the literature current at the turn of the twenty-first century.

David Cook

LATIN AMERICA AND NATIVE NORTH AMERICA

The history of humankind is replete with the desire for better times, a more just order, and leaders who can bring their people into a better world, often having to defeat or destroy a world that is viewed as unjust and inequitable. These desires have frequently been fueled by faith or have taken specifically religious forms; and in addition have often been organized around or contained elements of ethnicity, identity, and race.

Old World Origins

In the area stretching from Asia Minor through Europe and into regions colonized by political and religious powers emanating from these areas—such as the New World—these desires have often been linked to the Judeo-Christian tradition. These beliefs and desires and the movements they have generated have become popularly known as millenarianism or chiliasm (a word of Greek origin). However, as one of the most noted scholars of the subject, Norman Cohn, has pointed out, "These movements have varied in tone from the most violent aggressiveness to the mildest pacifism and in aim from the most ethereal spirituality to the most earthbound materialism; there is no counting the possible ways of imagining the Millennium and the route to it" (p. xiv).

The term *millenarianism* comes from the belief by some Christians that Christ will return to earth and establish a kingdom in which he will reign over a society that is blessed spiritually and materially and in which the enemies of this Christian fold will be defeated. This rule, it is believed, will last for a thousand years—a millennium—before the faithful or Saints will ascend to heaven while those who are seen as evildoers will suffer eternal damnation. Hence the belief in the coming millennial earthly paradise of Christ became known as millenarianism. The actual concept of millenarianism, however, predates Christ. Long before Christians separated from Jews, the idea of a prophet or Messiah—a powerful, wise, and just ruler of the faith—was a part of Jewish belief in the coming of a world where the longed-for order was restored.

While a belief in the coming of the Messiah alone is not necessarily millenarian, when it is attached to persecution or the desire to attain a proper and just order, it can become millenarian. Hence during the centuries and decades before and after the birth of Christ, when Jews were suffering persecutions, were not self-governing, or were divided by class and other interests, numerous millenarian movements and leaders emerged. For instance, in the second century B.C.E., a time of crisis for Jews, the Book of Daniel was written in which Daniel dreams that the enemies of the Jews are destroyed and an everlasting kingdom is established with dominion over all.

While millenarian movements enjoyed some popularity within the early Christian Church in the first three or four centuries C.E., these movements, in both the Greek and Western churches, were eventually considered heretical. This was especially true after the official church became more tied to the state. In the early Christian world, many people led difficult lives and were strongly influenced by accounts such as those in the New Testament Book of Revelation, in which an angel descends to earth, seizes the Devil, and binds him for a thousand years: "Also I saw the souls of those who had been beheaded for their testimony to Jesus and for the word of God, and who had not worshiped the beast or its image. . . . They came to life again, and reigned with Christ a thousand years" (Rev. 20:4).

From the late eleventh century to the sixteenth century, millenarianism became a more common phenomenon in certain regions of Europe that were experiencing change in the traditional order. Norman Cohn argues, "The areas in which the age-old prophecies about the Last Days took on a new, revolutionary meaning and a new, explosive force were the areas of rapid social change—and not simply change but expansion: areas where trade and industry were developing and where the population was rapidly increasing" (p. 22). In this world of growing disorder, complexity, and insecurity, millenarian ideas were often blended with antagonisms of class, religion, and identity that imbued these movements with a revolutionary character that could appear threatening or hopeful, depending on one's position in society and relationship to the movement.

Movements such as the People's Crusade and the Shepherd's Crusade witnessed the rising of poor and marginalized people against elites and Jews. The Calabrian abbot Joachim de Fiore used biblical study, especially of the Book of Revelation, to develop a model for understanding history and for creating a vision of the final period of life on earth. These Judgment Days, or Last Days, involved a world where social classes had been leveled, governing structures and church did not exist, and people led a "spiritual" existence that freed them from work because in this spiritual form they did not require food. Surprisingly, the church did not repress this movement even though Christ was not at the center of this new interpretation. Hence from at least the thirteenth century on, even in the Christian tradition, millennial views existed without Christ.

It is in this tradition that scholars in the modern period have increasingly used millenarianism as a tool to study and explain movements that seek to redeem societies and rescue them from rapid social change, colonial incursions, and loss of traditional meaning; this tool also helps in understanding millenarian movements such as the Anabaptists, the Ranters, and others in Europe. While in the modern period Norman Cohn saw certain medieval and early modern millennial movements in Europe as the deep roots of modern communism and Nazism through movements such as that of Thomas Müntzer and the Shepherd's Crusade, studies of the New World have focused on millenarian movements of the poor and oppressed seeking a measure of control, hope, and dignity in their lives and cultures.

Importance in Latin America and Native North America

These movements and interpretations of them are especially prominent among the native peoples of the Americas and those who study them. In the late-eighteenth- and early-nineteenth-century United States, Tecumseh, a leader of the Shawnee nation, and his brother Tenskwatawa, known as “The Prophet,” organized Shawnee and other tribes of the Midwest in a movement to reject European ways, return to their old traditions, and end warfare between native peoples. This was part of their effort to drive out nonindigenous peoples and restore a new indigenous order based on the old ways. Tecumseh, who had studied the Bible, even injected European religion into the fray when he asked how white people could be trusted when they had nailed Jesus Christ to a cross.

The Ghost Dances of the U.S. West in the late nineteenth century represented another form of millenarianism. Indigenous peoples of the western plains, who had been severely battered by waves of settlers, the Indian wars fought by the U.S. government, and the destruction of the buffalo herds, called upon their gods to restore power to them. Often overcome with a spirit, these peoples felt imbued with the power to defeat their enemies and redeem their world.

Latin America has also been the source of important millennial movements, including those in which native peoples challenged the European-dominated order. In Peru, in the wake of massive deaths due to European diseases and the encounter with European colonialism, the Taki Onqoy (Dancing Sickness) movement of the 1560s saw the reemergence of old regional gods such as those that lived in mountains, rocks, and in water, but not the gods or leaders of Inca imperialism. These older regional leaders and gods promised salvation to those who were taken by the spirit, but the name Taki Onqoy, or Dancing Sickness, was given to the movement by those who observed its impact on the behavior of those imbued with the spirit who wished to renounce everything that was European and drive out the Europeans as well as other people and things not native to the Andes.

In Chiapas, Mexico, in the early 1700s a millenarian movement arose among the Tzeltal people in response to a vision of the Virgin, who appeared and told them to drive out all nonnative peoples. Some of these highland Maya even proclaimed themselves to be the true Christians while referring to the Europeans as Jews, thus putting the Europeans outside the realm of those protected by the Christian God.

Perhaps the greatest of New World millenarian movements, and one which may still be ongoing, is that of Inkarrí. According to this belief, which was important in validating the revolutionary upheaval of Túpac Amaru in the 1780s, the Inca was to be reborn from the buried but regenerating head (symbolic or real) of an earlier Inca. When the time is right, the Inca will reemerge to lead the indigenous people of the Andes (who are sometimes also referred to as Incas) in the restoration of a more just and equitable social order. The Inkarrí movement is still culturally alive and people are still waiting.

MIND. The science of mind is the empirical and theoretical search for the foundations of our mental lives. Unlike other subjects of scientific investigation, such as stars or rocks, human mental lives defy easy definition. Yet few would dispute that such a definition would have to encompass consciousness, emotions, reasoning, language, memory, and perception. As far back as ancient Greece, one can find accounts of how these faculties are produced by the body or the soul. But it was only in the seventeenth century that they became subjects of modern scientific investigation. In the subsequent centuries, scientists have sought to dissect the mind into its components, and to assign those components to different structures of the brain. While a full history of the science of mind would demand thousands of pages, a survey of a few key topics can give a sense of its development.

The Mind Before Neurology

To many readers, the relationship between the brain and mind may be obvious, but that has not always been the case. In 1652, for example, the philosopher Henry More (1614–1687) declared that the brain “is no more capable of thought than a cake of suet or a bowl of curds” (Zimmer, p. 5).

Medieval and Renaissance physicians sought to understand the mind with a mix of Christian theology and Greek philosophy. They believed the body, for example, was divided into three anatomical regions, each designed for its own soul. The vegetative soul in the liver was responsible for desires and appetites. The heart housed the vital soul, which produced passions and action.

The rational soul, not surprisingly, was a more complicated matter. Since it was immaterial and immortal, it could not reside in one specific place in the body. But its faculties—such

as reason, memory, and imagination—were believed to be carried out by “animal spirits” that supposedly swirled within three hollow chambers in the head known as the ventricles.

Anatomy, then, was the study of the houses of the souls. But anatomy alone was not enough to account for the life of the mind. Physicians also had to understand the fluids that coursed through the body. Known as the four humors (black bile, yellow bile, blood, and phlegm), these humors needed to be balanced for good health; if they fell out of equilibrium, they brought disease. Humors also gave each individual his or her temperament, be it the sad detachment of melancholy or the swift rage of cholera. As the humors became corrupted or moved to the wrong place in the body, they could cause epilepsy or alter the temperament, even leading to madness. Physicians sought to cure many psychological disorders by bringing the humors back in balance, typically with bleeding and purging, or by applying herbs.

During the Renaissance, these theories of souls and humors were vigorously debated. And yet in all these arguments, the brain was strangely absent. The substance of the brain—now recognized as consisting of billions of neurons trading complex signals—was seen as nothing more than phlegm. This is understandable when one considers how delicate the brain is. Without preservatives or refrigeration, a brain quickly decays after death, while muscles and bones remain available for further study.

Descartes’s Ambiguous Legacy

This “pre-cerebral” view of the mind disappeared in the 1600s, in the wake of advances in physics, anatomy, and chemistry. Galileo Galilei (1564–1642) and other natural philosophers challenged the physics of Aristotle (384–322 B.C.E.), replacing it with a new “mechanical philosophy” in which mechanical forces acting on atoms or other small particles produced all physical change. In the 1630s the French philosopher René Descartes (1596–1650) used the new mechanical philosophy to offer a novel description of the body. He no longer relied on vegetative or vital souls to produce the body’s functions. Instead, he proposed that the body was made of particles that obeyed the laws of physics. A body was no different from a mechanical doll: neither needed a soul to drive its movements. Instead, Descartes envisioned nerves as a system of cords and inflating tubes that mechanically produced involuntary movements.

Descartes managed to take a crucial step towards a science of the nervous system, despite the fact that he was woefully confused about the brain. He accepted the medieval notion of spirits flowing through the ventricles. He even used it to determine where the rational soul was located. For Descartes, it was obvious that the pineal gland, which was believed to dangle over the ventricles, had to be where the rational soul influenced the spirits, steering them toward different nerves in order to produce voluntary movements.

This scenario, as strange as it may seem to the modern reader, accorded with Descartes’s overall philosophy. He believed that nature, including the human body, was composed solely of passive matter. The human mind, on the other hand,

was completely immaterial and not subject to the laws of nature. Thus Descartes required a site where the immaterial and material could intersect. The pineal gland fit all of these requirements. It would take a separate revolution in anatomy before the brain could be appreciated as more than a bowl of curds.

Thomas Willis and the Birth of Neurology

The modern study of the body’s functions began with the work of the English physician William Harvey (1578–1657). Harvey trained at the University of Padua, where he learned Aristotle’s methods of comparative zoology and functional anatomy. He returned to England and eventually became a royal physician to James I and Charles I, during which time he discovered the circulation of the blood.

As important as this discovery was, however, Harvey’s methods were even more significant. He did not rely solely on Galen (129–c. 199 C.E.) or some other ancient source. Rather, he searched for confirmation of his hypothesis in comparative studies on animals and through experiments. By the 1650s, young natural philosophers were emulating Harvey, not Aristotle, as they studied the liver, lungs, and other organs of the body. And in the early 1660s, a group of Harvey’s disciples applied his methods to the brain.

These natural philosophers were led by an Oxford physician named Thomas Willis (1621–1675). A royalist soldier during the English Civil War, Willis had been rewarded at the Restoration with an appointment as professor of natural philosophy at Oxford. He used the new position to embark on a bold project—to seek out the hiding place of the mind. Based on a decade of previous research, including dissections, chemical experiments, and medical observations, Willis decided that the most promising way to study the mind was to make a careful study of the brain.

Willis enlisted a number of colleagues, including his junior medical partner Richard Lower (1631–1691) and his young friend Christopher Wren (1632–1723). They dissected brains of humans, dogs, sheep, and other animals, and Willis recorded their work in his 1664 book *The Anatomy of the Brain*, the first major work on the brain ever written. Over the next eight years he would rely on both his anatomical discoveries and his careful bedside observations to write *Pathologiae Cerebri* (Cerebral pathology), a book on convulsive disorders, and *Two Discourses Concerning the Soul of Brutes*, on neurological and psychological disorders.

Together, this trilogy stands as a defining moment in neuroscience. (Indeed, Willis even coined the word *neurology*.) Willis dismissed Descartes’s notions of the pineal gland and ventricles, demonstrating that these chambers could not possibly house the spirits. The brain itself was the site of mental functions, Willis argued, and he carried out experiments to show that different functions were localized in different regions. Instead of Descartes’s speculative sketch of involuntary movements, he offered a far more accurate account of reflexes.

Willis also added chemistry to Descartes’s mechanical nervous system. As a young physician, Willis had been strongly

influenced by the work of alchemist-physicians such as Paracelsus (1493–1541) and Jan Baptista Van Helmont; he also worked with the Irish chemist Robert Boyle (1627–1691) in 1650s Oxford. Willis envisioned the brain as an alembic (an apparatus alchemists used to distill substances), and he conceived of the brain's disorders as disorders of chemistry. He saw epilepsy, for example, not as demonic possession, but as uncontrolled explosive reactions in the brain and nerves.

In the decades around the turn of the twenty-first century, neuroscientists looked back at Willis's work with growing admiration. He has even been called the Harvey of the nervous system. Not only did Willis create a masterful theory of the brain, but in his writings scientists can see the first clinical descriptions of a wide range of neurological conditions, ranging from myasthenia gravis to narcolepsy. By the late seventeenth century, the work of Willis and continental anatomists such as Nicolaus Steno (1638–1686) and Franciscus de Bo Sylvius (1614–1672) had led most physicians to accept the basic tenets of neurology.

Nineteenth Century Investigation: Broca and Donders

Neurology advanced during the 1700s and early 1800s, as researchers discovered electricity's role in the nervous system and mapped out reflex pathways between the spine and limbs. But Willis's most ambitious project—to work out the foundations of the mind—did not see major advances until the mid-1800s. The huge technical challenge of studying many aspects of human cognition certainly was responsible for some of the delay. But the Cartesian dualism that lingered into the nineteenth century also acted as a brake on progress. Many researchers continued to believe that the mind was a unitary, immaterial entity. It was therefore impossible to discover its components, as had been done with the heart or the lungs. According to one prominent French neurologist in the 1800s, to divide the soul was to deny it.

A growing number of scientists rejected this claim during the nineteenth century. The concept that humans were the product of evolution—first broached in the 1700s and brought to fruition by Charles Darwin (1809–1882) in the following century—implied that the faculties of the mind were the product of evolution as well. Scientists began to divide the soul, as it were, and in the process they established the foundations of cognitive neuroscience. The work of two researchers in particular, Pierre-Paul Broca (1824–1880) and Frans Cornelius Donders (1818–1889), illuminate the scientific shift that occurred in the mid-1800s.

In 1861, the French physician Broca treated a man who suffered a stroke. The patient could understand language but could not speak, except for one sound, “tan.” (The patient became known as Tan.) After Tan's death, Broca followed Willis's example and autopsied his patient's brain. Tan's brain was damaged in the left frontal lobe. Other patients with the same difficulty in speaking exhibited damage in the same place. Broca demonstrated that a restricted part of the brain was responsible for a restricted aspect of human mental life—specifically, the ability to produce speech.

At the same time that Broca was doing this work, the German ophthalmologist Donders was dissecting the mind in

a radically different—yet complementary—way. In the early 1800s, physiologists and physicists began to study the performance of people in simple tasks, such as recognizing colors and shapes. These tests, the researchers hoped, would reveal the inner workings of the mind without any recourse to anatomical details. In the 1860s Donders performed one of the most elegant of these tests. He first measured how long it took for people to react to seeing a light come on. In his second experiment, one of two differently colored lights could turn on, and his subjects had to indicate which color had come on. He found that it consistently took 50 milliseconds longer to discriminate colors than to perceive the presence of a light. Essentially, Donders was doing in time what Broca was doing in space: He was isolating and studying a specific mental function.

In the twenty-first century, cognitive neuroscientists continue to employ the methods of Broca and Donders, albeit with more sophisticated technology.

Cognitive Neuroscience

Cognitive neuroscience, which focuses on how the mind emerges from the brain, first developed as a discipline in the 1960s. Unlike Willis or Broca, contemporary cognitive neuroscientists can build on the extraordinary advances in the understanding of the brain that took place in the late nineteenth and twentieth centuries. For example, it is now accepted that the brain is composed of several billion neurons, which project a trillion branches to contact other neurons. Neurons carry information as electrical impulses, and communicate with other neurons by releasing a variety of chemicals known as neurotransmitters.

Cognitive neuroscience has also gained great strength from new technologies that provide high-resolution information about brain activity. Consider one technology known as functional magnetic resonance imaging (fMRI). fMRI represents a modern twist on the investigative methods of Willis, Broca, and Donders. A human subject lies with head surrounded by a large, doughnut-shaped magnet. The magnet's powerful field causes some molecules in the subject's brain to release radio waves. Detectors pick up these signals, which a computer uses to reconstruct the structure of the brain. Additional analysis of this data can reveal movements of blood in the brain, which reliably indicate highly active regions of the brain.

A complex cognitive task, such as reading or recalling a person's face, involves many regions of the brain. In order to isolate components specific to these tasks, scientists borrow Donders's subtraction method. They scan the brains of their subjects as they perform one task, and then have them perform second task that is almost—but not quite—identical to the first. The scientists then study the fMRI scans for brain activity produced by the second task that are not produced by the first task as well.

Consider, for example, the ability to understand other people's thoughts and intentions (known as *mentalizing*). Psychologists and neuroscientists are fascinated by this ability because it appears to be unique to humans and may therefore represent a crucial innovation in the social evolution of the

human species. Psychologists have also demonstrated that autistic people do a poor job of mentalizing. Yet despite this deficit, they can still develop other skills such as mathematics and music. This pattern suggests that mentalizing is not the result of a general-purpose intelligence, but is instead a distinct, modular function of the brain that can be selectively disabled.

In 2001, British researchers found support for this hypothesis with the help of fMRI. They designed an experiment based on the game of “rock, scissors, paper.” In each round, two players simultaneously choose one object. Rock beats scissors, scissors beat paper, and paper beats rock. The subjects lay in a brain scanner and played the game on a computer screen. In some cases, they were told they were playing against a computer; in other cases, they thought their opponent was a person. In fact, the researchers generated a random sequence of choices. The only difference lay in the attitude of the subjects. As the researchers confirmed in interviews after the study, when subjects thought they were playing against a person, they tried to figure out their opponent’s strategy.

Scans revealed some regions that became active in both versions of the game. But the researchers also found a handful of small regions in the brain that were only active when the subjects thought they were playing against a person. One region has been shown in other studies to integrate information from face and hand movements. Another region is active during emotional experiences, and a third distinguishes self from non-self.

These results illuminate a general lesson of cognitive neuroscience: Most complex functions of the mind, such as mentalizing, are not carried out in a single region of the brain. Instead, a network of regions works together, integrating their activities. This realization has immediate practical implications. The deficit in mentalizing found in autistic people, for example, may not be the result of a lesion to a particular region of the brain. Instead, it may result from damage to the connections between the components of the mentalizing network.

Aspects of Mind

Contemporary cognitive neuroscience has made important strides in analyzing the mind. Three areas of particularly intense research are perception, emotion, and consciousness.

Perception. Contemporary cognitive neuroscience focuses on aspects of mind that are both important and scientifically tractable. A vast amount of research has been carried out on perception, and in particular, on vision. Researchers have repeatedly demonstrated that the mind does not simply perceive a photograph-like representation of the world. That would demand far more information than the brain can handle. Even if the mind could cope with such a torrent of data, it would probably miss the most important aspects of what is seen—for example, a carelessly driven car lurching onto the road.

Instead, the visual perception system searches for certain patterns. If one sees a few fragmentary lines aligned together, the lines are automatically perceived as a single edge. Different parts of the visual system are tuned to different patterns; some neurons are most sensitive to movement, for example, while

others are sensitive to contrasts. These regions are arranged in a pathway, with the first regions along the pathway handling simple processing and then passing on information to regions that can recognize more abstract information, such as faces.

Emotion. Among the investigations of the mind, emotions have posed a particularly difficult challenge. Medieval European thinkers ascribed many of the states called emotions to souls residing in the heart and liver, or to the four humors. Descartes helped to render these explanations obsolete, but his dualism posed problems of its own. Having divided the human being into two distinct substances—body and mind—he had to struggle to find an explanation for emotions. Emotions clearly affect the body, raising heart rate, causing one to blush, and so on. And yet humans also generally used their powers of reason to reach goals, which can be motivated by emotions. Fear of a fire, for example, might spur someone to figure out the fastest way out of a burning building. So somehow emotions must be able to influence the soul, despite the soul being made of a separate substance than the body.

Descartes envisioned passions as purely physical phenomena that could influence the mind by acting on the pineal gland, the soul’s intersection with the body. The function of the passions, Descartes argued, was to dispose the soul to want the things that are useful, and to dispose the body to make the movements that would help to acquire those things. But he also argued that passions can cause suffering and thus need to be mastered by the soul. Descartes defined this mastery as wisdom.

Contemporary neuroscientists are weaning themselves from Descartes’s dualism in their studies of emotions. They recognize human emotions as having a long evolutionary history. Emotions originated hundreds of millions of years ago as adaptive responses that simpler animals produced in response to a changing environment. Signs of danger, for example, triggered releases of hormones that prepared animals to fight or flee. Signs of potential reward (such as food or a mate) triggered release of neurotransmitters that caused feelings of anticipation and heightened attention.

While human emotions share a common ancestry with reactions in other animals, they are modified for the peculiarities of the human species. Fear is a case in point. Humans and other vertebrates rely on a region of the brain known as the amygdala to produce a sense of fear and vigilance. Rats learn to fear a flash of light if it reliably precedes an electric shock; remove their amygdala, and they never make the association. Humans with lesions in the amygdala also fail this test. But brain imaging shows that the human amygdala is also extremely sensitive to facial expressions. It takes only a few hundredths of a second for the amygdala to respond to an angry face, long before one becomes consciously aware of perceiving it. This is not surprising, given that humans are an intensely social species.

Emotions are also intimately involved in the most abstract thinking of which humans are capable. For example, Antonio Damasio (b. 1944) of the University of Iowa has shown that lesions to an emotion-associated region called the orbitofrontal cortex can lead to poor decision making. Damasio hypothesizes

that normally people are guided by emotional reactions to memories of relevant experiences in the past.

Consciousness. While cognitive neuroscientists have made great strides in identifying the components of the mind, they have much left to learn about their integration. Perhaps the most powerful example of this challenge is consciousness. Neuroscientists long shied away from the question of consciousness, feeling that it was impossible to formulate a scientific program to study it. At the close of the twentieth century, though, they began to overcome their reticence and began making serious attempts to solve this mystery.

Consciousness refers to people's awareness of themselves and of their own experiences. At the same time, philosophers also see in consciousness a feature known as qualia: the subjective experience generated in each person's brain. To appreciate the difficulty of studying qualia, imagine a neuroscientist who lacks color vision, seeing the world only in black and white. Imagine that she succeeds in learning everything there is to know about how the retina transfers information about different frequencies of light to the brain, and how the brain processes that information. But she does not know what it is like to experience the sight of red, or any other color. These qualia remain beyond her reach.

Despite these conceptual obstacles, neuroscientists are beginning to study consciousness. Some are using fMRI to compare the human brain in different states of consciousness. For example, scientists can measure the differences in the brain before it is aware of seeing an object and afterwards. They can also compare unconscious processing of sensory information versus conscious processing. In another line of research, scientists place electrodes on a subject's scalp in order to take high-resolution recordings of brain waves, looking for changes in frequencies that might represent signatures of consciousness.

Such studies do not pinpoint a "consciousness organ" in the brain. Rather, they offer an increasingly detailed picture of neural activity that correlate with conscious experiences. In one model that has emerged from this work, brain waves produced in different parts of the brain become synchronized during consciousness, producing a "global workspace" in which the processes going on in different parts of the brain are united.

There are a number of other models that are being explored, however, and none has emerged as a clear favorite over the others. Some researchers have suggested that the study of consciousness in the twenty-first century is like the study of hurricanes in the 1800s. Nineteenth-century meteorologists could collect very little data in order to understand and predict hurricanes. They could take readings of air pressure, winds, and rainfall at a few weather stations, and then try to extrapolate those results. Only when weather satellites were launched into orbit were meteorologists able to see an entire hurricane and track it across the Atlantic. In order to produce a satisfying theory of consciousness, scientists may have to wait for the arrival of satellites for the mind.

MINORITY. The term *minority group* and its opposite, *majority group*, have been widely used both among social scientists and the general public in recent decades. In social scientific (and often popular) use of these terms, they do not usually refer per se to a numerical minority or majority. Rather, the social-scientific meaning of a minority group is a group that is assigned an inferior status in society, one that enjoys less than its proportionate share of scarce resources. Frequently, minority group members are discriminated against, and in some cases they are severely and systematically exploited for economic gain by the majority group, as illustrated in U.S. history by enslavement of African-Americans and by the taking of land from American Indians and from Mexicans who settled in what became the U.S. Southwest.

Usually, a minority group is defined on the basis of a relatively permanent and unchanging status and on the basis of being different—often visibly—from the majority group. This

definition includes minorities based on ascribed statuses such as race, ethnicity, and gender and other statuses that are difficult or impossible to change, such as sexual orientation and disability. It also includes groups with common identities that are deeply held and relatively unlikely to change, most commonly religious or linguistic groups. When minority status is assigned on the basis of race or ethnicity, it often involves groups that have been conquered or colonized in the past, as is the case, in the United States, of African-Americans, Mexican-Americans and Puerto Ricans, and American Indians. In these instances, the degree of subordination experienced by the groups tends to be particularly intense. It is notable, for example, that the present and historic status of the four aforementioned groups is significantly more disadvantaged than that of most immigrant groups in the United States. For all types of minority groups, it is typically true that (1) the group is different in some way that is regarded as socially significant from those who hold the dominant influence in society, and (2) on the basis of that difference the group is assigned to a subordinate or disadvantaged status.

Widening the Definition

The concept of minorities has existed for over a century, and until the 1960s and 1970s the term generally referred to national or ethnic minorities in heterogeneous nation-states. In the 1960s and 1970s, the range of characteristics used to identify minority groups widened (e.g., gender, disability, sexual orientation), and the practice of defining minority groups primarily on the basis of power and status disadvantages became common. The focus on disadvantages is evident in the writings of Schermerhorn (1970), who argued that minority groups should be defined on the basis of relative size and power. A group disadvantaged with respect to both size and power, in Schermerhorn's definition, was a minority group, while a group advantaged in both regards was a majority group. A large group without power was referred to as *mass subjects*, while a small group with power was called an *elite*. In common usage, however, the term *mass subjects* is rarely used in the early twenty-first century. While *elite* is more widely used, it is usually employed in an economic and political sense without a direct tie to race, ethnicity, religion, language, or other characteristics commonly associated with minority and majority groups. It is, however, usually true that elites, as referred to in this sense, are members of dominant or advantaged racial, ethnic, religious, and linguistic groups.

While it is usually true that minority groups are numerical minorities, this is not always the case, as is illustrated by the subordinate status of women in the United States and, until recently, blacks in South Africa. Although Schermerhorn's term *mass subjects* might be a more appropriate label for such groups, they are more commonly referred to as having a minority status, referring to their subordinated position with regard to power, status, and economic opportunities. Although over 80 percent of the South African population is black, the political system was, until the mid-1990s, completely under the control of a small white numerical minority (but a majority group in the social-scientific sense) since the country was created in 1949. Racial separation and discrimination were written into the laws

at that time, and these laws remained in effect for forty years. In the early twenty-first century South Africa is a representative democracy, and the black numerical majority is in political control. Yet, in another sense, blacks still remain a minority group in South Africa, since the economic wealth of the country remains largely controlled by whites.

Another instance of a numerical majority that is a sociological minority group is women in the United States. Women make up slightly over half of the U.S. population but relatively few hold offices in the nation's higher political governing bodies (such as the U.S. Congress). Even at the start of the twenty-first century, full-time working women are paid only about 76 percent of the wages of similarly educated working men (U.S. Census Bureau, 2003). Thus, even though they are a numerical majority, women have in many ways been relegated to a subordinate role in American society. Accordingly, they can be regarded as a minority group in the social-scientific sense.

A helpful way to think about minority and majority groups, suggested by Norman Yetman (1991, p. 11), is to consider minority as a synonym for *subordinate*, and majority as a synonym for *dominant*.

Minority Status and the Individual

Discussion thus far has focused on groups because minority or majority status is defined on the basis of belonging to an identifiable group in society. An individual may be black, or Muslim, or female, or gay, or a non-English speaker, or have a disability. In each case, such an identity or social characteristic will identify that individual as belonging to a group with a collective disadvantage or a group that is the object of collective discrimination, exploitation, or stigma. However, although minorities are defined on the basis of groups, the consequences are very real for individuals (Goldman, 2001). It is individual human beings who are denied employment, schooling, or housing because of their race, disability, or sexual orientation, persecuted because of their religious beliefs, ridiculed because of their language, or underpaid because of their sex.

In the early twenty-first century, there has been some criticism of the term *minority* (Wilkinson, 2002). A number of objections have been raised, including the following: (1) since such status is not defined on the basis of numbers, *minority* is not a correct term; (2) the term *minority* can be a negative label and defines the groups so labeled from the standpoint of the dominant group; (3) groups with little in common, such as African-Americans and white women, are lumped together under one rather meaningless label; (4) the criteria used to define minorities are ambiguous and inconsistent; (5) the statuses that form the basis of defining minority groups include both true ascribed statuses and statuses that involve an element of choice (e.g., religious belief); and (6) the term *minority* obscures the very real impacts of racial, gender, and other forms of discrimination, using an ill-defined term to focus on groups rather than on systemic discrimination. Despite these genuine difficulties with the term, it continues to be used widely, both in social science and in popular terminology. A search of the EBSCO Academic Search Elite database in May 2003 yielded 11,822 hits on the

term *minorities*. One reason for this common use (though also a point of objection from critics of its scientific validity) is that it has been reified through governmental protections for a wide range of groups labeled as “minorities.” In addition—at least in the social sciences—there is general agreement on the experiences that lead a group to be considered a minority group. These experiences include victimization, discrimination, exploitation, and political and economic disadvantage. While each group considered a minority experiences these processes in a unique way, all such groups experience them to a greater or lesser degree. Moreover, possible alternative terms also pose problems: it is not clear, for example, that *subordinate* conveys a more positive image than *minority*. The purpose, if not always the consequence, in using such terms in social science is not to convey negative connotations, but rather to describe a similar situation—minority or subordinate status—that is experienced by a number of different groups.

MIRACLES. Miracles, miracle workers, and their stories are found in the life and literature of all ancient societies and are not limited to religious texts. In ancient Greece figures like Epimenides, Pythagoras, and Apollonius of Tyana were all renowned for working miracles. To this day, healing remains the form that most claimed miracles take, and many of these miracles are associated with visitations to the shrines of saints. In Africa, India, parts of Asia, and Latin America, miracles remain an important and powerful dimension of “primal” religions and cults. Indeed, miraculous healings and exorcisms are the characteristic features of the world’s fastest-growing form of

Christianity: Pentecostalism. Contrary to secularization theorists, belief in God—and in miracles—have not disappeared with the advance of science and the rationalization of Western societies. For example, opinion polls at the close of the second millennium showed that nearly 90 percent of Americans believed in God, 84 percent believed in miracles, and nearly half (48 percent) said they had experienced a miracle in their own lives or in the life of someone else (*Newsweek*, 1 May 2000, p. 57).

Viewed historically, miracles and their stories were recognized and accepted long before systematic efforts to define what a miracle is. This is not surprising since the cultures that produced the scriptures sacred to the world’s major religions—in this entry, Hinduism, Buddhism, Judaism, Christianity, and Islam—did not regard nature as a closed system operating according to its own laws and therefore impervious to the action of God or the gods. Nonetheless, they recognized miracles as extraordinary occurrences. Thus, one classic definition, from Thomas Aquinas in the thirteenth century, holds that “those things are properly called miracles which are done by divine agency beyond the order commonly observed in nature.” The medieval Jewish scholar Moses Maimonides (1135–1204) thought that miracles—especially those in the Bible—were designed by the creator for very specific purposes and, though contrary to the observable laws of nature, were instituted at the beginning of creation as part of God’s divine plan. For Deists and other Enlightenment thinkers of the eighteenth century, nature was considered to be subject to immutable laws that even God cannot abrogate. As Voltaire famously put it: “It is impossible that the infinitely wise Being has made laws in order to violate them. He has made this machine [the universe] as good as he could.” Still influential is David Hume’s argument that not only are miracles impossible, but also that “No testimony is sufficient to establish” that a miracle has occurred.

Miracles as Narrative Constructions

But “nature” and its “laws” are notoriously loose, historically conditioned concepts, and the constructs of contemporary sciences correspond to no one’s sense of “the order commonly observed in nature.” Far more useful and descriptive in any cultural context is the biblical understanding of miracles as “signs and wonders” (Hebrew, *otot u-mofetim*). Viewed this way, a miracle (from the Latin *miraculum*) is an event that astonishes beholders (wonder) and at the same time conveys meaning (sign). Absent the sign factor, it is impossible to distinguish miracle from mere coincidence. Since signs are always signs of something, we can say that a miracle is an unusual event that discloses the meaning and power of the transcendent within the world of time and space.

From this definition it follows that miracles are always narratively constructed. To take a common example: if a terminally ill patient is suddenly cured and attendant physicians can find no cause in medicine or science to explain the cure, the patient or others may claim that the patient’s sudden restoration to health is the result of prayer to God for a miracle. That is, they explain the otherwise inexplicable by fashioning a story. This is precisely what happens within the Vatican’s Congregation for the Causes of Saints, the most rigorously methodological source of contemporary miracles and their stories. Once church

officials are satisfied that a candidate for sainthood exhibited extraordinary virtue, they require two posthumous miracles attributed to the intercession of the candidate as a sign from God that the deceased candidate truly is now with God in the afterlife. Only after a board of physicians concludes that an unexpected healing has no known scientific cause does a board of theologians consider whether the healing is also a “divine sign.”

Miracles in Sacred Scriptures

The best-known miracles are those found in the scriptures of the major world religions, and in the sacred biographies of the saints, sages, and spiritual masters who embody and extend scriptural precedents. When experienced as events embedded in religious traditions, miracles tend to define themselves as stories that in some way repeat or echo previous miracles within the same tradition. For example, the Hebrew Scriptures (for Christians, the Old Testament) contains so many and various kinds of miracles—divine rescues, healings, feedings, punishments and blessings, even raisings of the dead and one ascension (of Elijah) into heaven—that it can fairly be regarded as the repository of most of the forms that miracles take in the later Jewish, Christian, and Muslim traditions.

Within the Hebrew Scriptures themselves, later books deliberately recall earlier miracle stories. For example, there are 120 repetitions and allusions to the ancient Israelites’ divinely provided crossing of the sea of reeds, the great deliverance miracle in the Book of Exodus. When the prophet Elisha picks up the mantle of his predecessor, Elijah, the power to produce similar miracles passes with it. When Jesus heals the sick and raises the dead, these miracle stories echo the miracles of Elijah and Elisha, though Jesus does them on his own authority. Likewise in the Book of Acts, the apostles Peter and Paul work the same kind of miracles that Jesus did, but they do so in his name and through the power of the Holy Spirit. Although in the Koran the prophet Muhammad notably refuses to work miracles, the story of his ascension (*mi’raj*) into heaven, a narrative developed out of a Koranic verse (Q. 17:1), replicates and surpasses the ascensions of Elijah and Jesus. This same story also provides the model of the mystical path followed by later Muslim mystics who are the chief miracle-workers in Muslim tradition.

In Buddhism, miracle stories are tied directly to Buddhist teachings as manifestations of their power to liberate. Thus the Buddha’s first disciples collectively repeat the miracles of the master as they progress along the path to perfect enlightenment. In the Puranas (“ancient tales”), a vast and very popular collection of sectarian scriptures composed and edited between the second and seventeenth centuries C.E., the miracles of Lord Krishna not only echo previous stories of earlier Vedic gods but also have the power to establish in his devotees the ability to replicate the experiences of Krishna, in some cases by becoming Krishna himself.

From this it can be seen that miracles achieve their meaning as signs through specific narrative traditions. Conversely, narrative traditions—to a large extent—determine which kinds of extraordinary events are recognized as miracles and which are not. Thus, in order to understand the significance of many scriptural

miracles, one must know what previous miracles are being replicated, echoed, or superceded. But there are important exceptions in Islam. In the Koran, Muhammad says “the signs [*aya*, meaning miracles] are with God alone;” the greatest sign is the Koran itself, every Arabic verse (*sura*) of which Muslims regard as the actual words of Allah. But the miracles attributed to Muhammad (*mu’jizat*) are all found elsewhere, chiefly in the hadith (roughly, “the traditions”) of the Prophet, considered second only to the Koran in importance. However, in the various authoritative collections of the hadith, Muhammad’s miracles tend to be merely listed apart from any interpretive narrative context. This arrangement suggests that miracles were incidental to the life and importance of the Prophet and may have been included in the hadith for the apologetic purpose of demonstrating that Muhammad, like Jesus, Moses, and other prophets of Allah before him, possessed the power to work miracles. Thus, among the three monotheistic traditions, Islam makes a formal and linguistic distinction between the miracles produced as signs by God and the miracles attributed to the prophets, whereas in Judaism and Christianity the distinction is informal: in the Bible, the power to work miracles belongs to God as the creator and sustainer of the world, but beginning with Moses that power passes to the prophets. In the New Testament, Jesus not only heals and raises the dead, like earlier Jewish prophets, but also exercises power over nature (as in calming storms and walking on water), a sign of his divinity since the power to control nature belongs to God alone.

In the various religious and philosophical traditions collectively known as Hinduism, miracles are usually understood as manifestations of innate divine power. Here we must distinguish between the miracles of God or gods, principally Shiva, Vishnu, and the latter’s many avatars (especially Krishna and Rama) and the miracles of the saints or renunciates in a long line of ascetics reaching back to the fabled sages (*rishi*) of the Vedic period (1500–500 B.C.E.). Stories of the gods and their avatars belong to the great and complex tapestry of Hindu mythology and need not concern us here. Far more relevant to the Hindu understanding of miracles are the stories told of the saints.

Just as the Hindu deities can descend in human forms (avatars), so the Hindu saints can, through the practice of asceticism (*tapas*), rise to godlike status. Thus the saint is often understood to be a “god-man” or a “goddess woman” by virtue of having “realized” the divinity innate in all human beings. In this context, a miracle is a manifestation of supernormal powers (*siddhi*) acquired as a function of attaining ever purer forms of consciousness (*samadhi*) through meditation and physical austerities. A classic treatment of the *siddhi* is the Yoga Sutra of Pantanjali, where the list of supernormal powers includes knowledge of previous lives; clairvoyance; knowledge of the moment when one will die; control over and thus freedom from one’s bodily systems; the ability to levitate and transverse great distances in a moment’s time; the power to expand or shrink one’s body; and so forth.

Although the Buddha rejected the traditional practices of Indian ascetics, Buddhism incorporates the same understanding of miracles as supernormal powers that Pantanjali outlined.

The main difference is that there is no “self” to be realized in Buddhist teachings—it is the last and greatest of illusions—which is why the Buddha taught his disciples not to display their acquired powers before the laity: to do so would manifest pride and so trap them in yet another form of attachment to self. Yet after his own enlightenment the Buddha did perform many miracles, some of them more fantastic than any attributed to Hindu god-men. But he did so for evangelistic purposes, secure in the knowledge that he had liberated himself from all attachments.

Although miracles are found in all religions, in none of them are they considered a substitute for faith or commitment to a spiritual path. As signs, they point to different meanings according to traditions, and so may be seen as boundary stories separating one religious tradition from another. As wonders, miracles continue to elicit curiosity, if not always belief. An old Hasidic saying nicely captures the ambivalence that has always attended miracles and their stories: “He who believes all these tales is a fool, but anyone who cannot believe them is a heretic.”

MODERNISM.

This entry includes two subentries:

Overview

Latin America

OVERVIEW

A movement of indeterminate origin and span, modernism nevertheless retains the distinctiveness of a major episode in the history of culture. Its most renowned manifestations

performed a radical break with the dominant arts of the nineteenth century. They were direct provocations to prevailing norms: norms of beauty, of the representational integrity of the human body, of the continuity of forms, of the consolations of progress, of secure reception by an audience. Despite striking differences, these artifacts were quickly recognized as part of a broad cultural transformation. They incited popular outrage, putting the category of “art” into question and forcing the issue of “difficulty.” The emergence of modernism is inseparable from the active controversy that was an inescapable aspect of its development.

Distinctions among modernization, modernity, and modernism remain indispensable: modernization as the condition of social, economic, and technological change; modernity as the lived social experience of these transforming conditions; and modernism as the cultural activity situated within and alongside these other dimensions. That no secure origin of modernism can be offered is a reflection of its complex relations. The process of modernization—uneven industrialization, the widening of empire, the spread of technologies, the emergence of class society, the struggle for the rights of women—has no fixed starting point, nor does the experience of modernity, the sensation of being unmoored from a continuous past or uprooted from an organic community.

Despite the indeterminacy at its limits, the period known as high modernism, roughly bound by the years 1890 through 1930, achieves historical definition. It does so through the magnitude and extremity of artistic experiment, the proliferation of public gestures (such as exhibitions and manifestos), the attentions of the press, the growing international circulation of experimental texts and ideas, and the widening consciousness of cultural and social change. Any single characteristic of modernism can be traced far back in cultural history. What distinguishes the movement is the convergence of multiple tendencies, including the exploration of such negative states as violence, irrationality, and nihilism alongside the affirmation of art as a redemptive possibility.

Immediate antecedents of high modernism are many and diverse. Charles Baudelaire (1821–1867), in the poems of *Les Fleurs du mal* (1857) as well as in his essays, introduced preoccupations taken up repeatedly over subsequent decades: a fascination with and revulsion from the modern city, an encounter with transgressive eroticism, an acceptance of evil, a delight in artifice (especially through the figure of the dandy), and a commitment to the craft of lyric poetry and the power of the Symbol. Whereas Baudelaire enacted his encounter with modernity in compact poetic forms, Richard Wagner (1813–1883) promoted radical transformation on the grand scale. He aimed for a complete reconstruction of nineteenth-century opera, based on his vision of the *Gesamtkunstwerk*, the “total work of art” that combines drama, music, dance, and stage-setting. Wagner’s demand for spectacular dramatic gesture, his investment in large mythic narrative, and his creation of the Bayreuth festival represent efforts to renovate culture through the public force of art.

The symbolic and mythic projects of Baudelaire and Wagner developed in parallel to a newly austere realism that

often looked to experimental science as a model. The paintings of Gustave Courbet (1819–1877), including *The Stone Breakers* (1849) and *The Burial at Ornans* (1850), refused pictorial idealism, representing workers and common citizens in ordinary dress and everyday poses. Gustave Flaubert (1821–1880), whose *Madame Bovary* (1857) epitomized the new realism, wrote that art “must rise above personal emotions and nervous susceptibilities. It is time to endow it with pitiless method, with the exactness of the physical sciences” (p. 195). Beginning in the 1870s, Henrik Ibsen (1828–1906) composed a series of plays—*A Doll’s House*, *Ghosts*, *The Pillars of Society*—that insisted on a “realist” analysis of middle-class ideals and that generated uproar throughout Europe. In their methods as their subjects, Courbet, Flaubert, and Ibsen pursued the unmasking of illusion and the hard-won claims of truthful fiction.

Although these figures differed in their work and their legacies, each prepared for the advent of high modernism. The decisive event was the emergence of an oppositional culture. It was only when singular provocations became related to one another, sometimes loosely, sometimes closely, that modernity recognized modernism and modernists became conscious of their historical possibility. There was no modernism without individually audacious artifacts, but equally no modernism without exchanges among artists and relationships among their works.

Impressionism, Symbolism, Oppositional Culture

Impressionism became a visible and contentious movement in the 1870s when a group of young French painters, including Claude Monet, Camille Pissarro, Berthe Morisot, Alfred Sisley, and Jean Renoir, gave several controversial exhibitions in Paris. Their break with academic painting and their commitment to everyday life followed Courbet, but they went further in the attempt to render the visible world as they experienced it subjectively: unstable, evanescent, and elusive. As significant as the new pictorial style was the collective aspect of Impressionism. Like the short-lived Pre-Raphaelite Brotherhood that had appeared in London in the 1850s, Impressionism generated hostility in part because the alliance among artists suggested a viable alternative to cultural orthodoxy.

A second French movement, more significant and sustained, was symbolism, which emerged in the 1880s. Stéphane Mallarmé (1842–1898) and Paul Verlaine (1844–1896) were presiding figures, and Arthur Rimbaud (1854–1891) was the legendary seer who had disappeared from France. The symbolists looked back to Baudelaire and resisted the dominance of realism, especially in its more extreme manifestation in the naturalist novels of Émile Zola (1844–1896) and the Goncourts (Edmond [1822–1896] and Jules [1830–1870]). Symbolism offered the rituals of the poetic enigma: evocative music, not descriptive reference. “To *name* the object,” wrote Mallarmé, “is to destroy three-quarters of the enjoyment of the poem” (p. 869). The poetic Symbol could be a sound, a scent, or a memory incarnating the invisible meanings of the world or intimating a mystery beyond the senses. Much symbolist polemic was a refusal of modernization (science, urbanism, mass politics, and the dislocations of individual experience). Apart from the success of individual poems, such as Mallarmé’s *L’Après-midi d’un faune* or Rimbaud’s *Le Bateau*

ivre, the importance of symbolism was that it offered an aesthetic counterworld. It was at once an artistic program and a social formation.

In Britain a critical lineage stretching from John Ruskin and Matthew Arnold to Walter Pater brought the idea of “culture” close to the symbolist vision of an alternative universe of value. A disciple of Pater, Arthur Symons (1865–1945) helped to introduce symbolism to the English-speaking world, presenting it as a fulfillment of literature’s highest responsibilities: “for in speaking to us so intimately, so solemnly, as only religion had hitherto spoken to us, it becomes itself a kind of religion, with all the duties and responsibilities of the sacred ritual” (p. 9). He introduced Mallarmé to W. B. Yeats (1865–1939), who also imagined a literature imbued with the force of religion and resistant to a mechanized social world and materialist philosophy. Yeats looked to magic and the occult, as well to the folklore and fairy tales of Ireland. His responsiveness to such a range of countertraditions suggests the extent of the division between the new literary movements and the modernizing social world around them.

Nineteenth-century cultural movements emerged within the broader context of modernity: in particular, the recognition of class conflict in postrevolutionary Europe. The European-wide revolutions of 1848 established modern society as a struggle between competing groups. It is often noted that the term *avant-garde* began with political and military meanings and only transferred its reference to the arts in the nineteenth century. Many artists had joined the revolutionary struggles, not only in 1848 but also in the Paris Commune of 1871. The turn away from politics is a striking feature of much late-century culture, with symbolism as a defining example; yet the political struggle generated possibilities for historical change that affected even those artists who refused the call of politics.

The Assertion of Modernism, 1890–1914

The reaction against symbolism began early, and even as its influence was passing to other national cultures, it attracted stringent critique. In the 1890s symbolism often became identified with decadence, in which the austere experiments of Mallarmé gave way to easier rhythms of yearning and escape. The tableau of the weary poet cultivating the sensations of dream became a European-wide image, vulnerable to caricature and dismissal. J. K. Huysmans’s *À Rebours* (1884) helped to inspire Oscar Wilde’s *The Picture of Dorian Gray* (1891), which dramatized but also ironized the languid life of decadence, the vocation of the senses. Wilde is a decisive figure, one who in his life and work carried Decadence into the public world and who detached himself from it through wit, irony, and paradox. When Wilde went to trial in 1895, the encounter between oppositional culture and the canons of respectability became vivid and painful. His conviction, imprisonment, and early death revealed the entanglements of modernism within the social world it refused.

The turn of the century brought a perceptible change in artistic and literary movements. The symbolist poet, committed to ritual incantations of the suggestive word, gave way to the young, assertive artist, eager to contend with aesthetic

convention and social orthodoxy. When Pablo Picasso (1881–1973) painted a brothel tableau in *Les Femmes d'Alger* (1907), with its harsh forms, its sexual brazenness, its direct encounter with the eyes of the viewer, he enacted the turn from weariness to confrontation. In *A Portrait of the Artist as a Young Man*, James Joyce's Stephen Dedalus sets himself as the antagonist of a sluggish culture, daring to echo Satan's "Non Serviam." Arnold Schoenberg's *Pierrot Lunaire* (1912) conveyed the shock of atonality to Western music, attracting tones of outrage to match its experiment in dissonance. In his first Futurist manifesto (1909) Filippo Tommaso Marinetti asserted, "No work without an aggressive character can be a masterpiece" (p. 41). He toured Europe, celebrating an escape from the exhausted past into the speed and violence of modern technology.

There had been precursors of this emphatic confrontationalism too. Rimbaud had made scorn for mediocrity a founding principle of his verse. Vincent Van Gogh (1853–1890) released the intensity of color to create intensities of affective assault. But the context that prepared for high modernism was wider than literature and the arts. The unsettled life at the end of the nineteenth century was not simply the background of high modernism; it became an ongoing concern for an intellectually self-conscious movement intent to reengage the world. Major influences included the revolutionary theory of Karl Marx transmitted through post-Marxist theorists in Europe; Friedrich Nietzsche's critique of Christianity in favor of the "overman" and the will to power; Sigmund Freud's psychoanalytic exposition of the unconscious, dreams, bisexuality, and neurosis; James George Frazer's comparison of pagan rituals and modern life in *The Golden Bough*; and Henri Bergson's arguments for an experience of pure duration available only to the deep self. These ambitious theories conflicted on many points: Marx's social vision against Freud's pessimistic view of instinctual conflict and Bergson's strictly philosophic approach, Frazer's scholarly assimilation of primitive and modern attitudes in contrast to Nietzsche's tense demand for a transvaluation of all values. What they shared was a sense of radical transformation. High modernism participated in this active theoretical milieu, in which it seemed that every basis for human self-understanding was under reconsideration. Intellectual life was often an essential element in the art, and the centrality of manifestos in high modernism is another register of the intellectual character of the movement. New artifacts did not appear as isolated provocations; they arrived within a dense context of essays, reviews, and manifestos that connected the making of modernist artifacts to the unfolding of modern theory.

Outside the realm of theoretical writing stood the power of social events. The development of a large reading public and mass democracy incited a modernist anxiety over popular culture recurrent through the period. The conflict between the sexes, including the image of the New Woman and the militant demand for female suffrage, challenged the representation of sexuality in the visual arts, the structure of the marriage plot, and poetic lyricism. This was also the new age of European imperialism, and whether empire became part of the focal subject matter, as with Joseph Conrad and E. M. Forster, or remained unacknowledged, it formed an inescapable cultural context. The political environment sometimes inspired arts to

social engagement, as in the feminist writings of Virginia Woolf or in the political theater of Vsevolod Meyerhold and Bertolt Brecht; just as often it created styles of resistance or right-wing reaction, as in the later works of T. S. Eliot, Ezra Pound, or Wyndham Lewis. In either case, the success of left-wing parties, the threat of revolution in Germany, and its success in Russia meant that experimental artists worked within a milieu of political hopes and fears.

High Modernism and the Avant-Garde, 1914–1930

The devastations of World War I created a social trauma that lasted a generation and intensified the ambitions of the arts. Beginning shortly before the war and continuing through the following decade, an astonishing variety of technically audacious works appeared. A community of artists, readers, viewers, editors, and curators created a receptive context encouraging ever more experimental work, including the move to abstraction in the fine arts (Wassily Kandinsky in painting, Henri Gaudier-Brzeska and Vladimir Tatlin in sculpture); the development of new cinematic styles (Sergei Eisenstein, Fritz Lang, Dziga Vertov); the architectural revolution of Le Corbusier (modern materials in abstract forms); the theatrical extravagance of the *Ballets Russes* accompanied by the music of Igor Stravinsky; the twelve-tone technique of Schoenberg; and the experiments in narrative consciousness of Marcel Proust, James Joyce, Virginia Woolf, and William Faulkner. This profusion has been called the "the last *literary season* of Western culture" (Moretti, p. 209). A claim of modernism to historical distinctiveness rests first of all on the sheer abundance of formally provocative art and the wide attentiveness to it.

A frequently noted aspect of modernist form is its fragmentation: the dissolution of continuity in speech, wholeness in the body, consecutiveness in narrative. The one- or two-lined lyrics of imagism, the abrupt focal shifts in the work of Gertrude Stein, the disintegration of the face in analytic cubism, the rapid editing in the cinema of Sergei Eisenstein and Dziga Vertov, all present decomposing forms shorn of the usual contexts of meaning. "Image," "vortex," "moment," "epiphany" were some of the names given to these radiant fragments. A prominent concern then became the passage from these shorter forms, however resonant, toward more encompassing structures: longer poems, more capacious novels, larger paintings, more ambitious films and music. The later phase of modernism, which contains some of its most striking artifacts (Eliot's *The Waste Land*, Picasso's *Three Musicians*, Joyce's *Ulysses*, Eisenstein's *October*, Schoenberg's unfinished *Moses und Aron*), turns toward synthetic forms that might arrange fragments into broader patterns. The use of myth was a dominant resource for Joyce, Eliot, and Stravinsky; in Eliot's formulation, the mythic method gave a form of order that made "the modern world possible for art." Eisenstein's development of cinematic montage, the conceptual and metaphoric linking of separate images, was another manifestation of synthesis.

Was high modernism then a new aesthetic order or a new antiorder? This question circulated among artists and their critics. Despite the theoretical justifications brought forward to explain the difficult art, it is clear that modernist masterworks contained much that was contingent and resistant to

explanation. The sheer eruptive energies, the sense of play, the pleasure in accident, and the linguistic and visual anarchy cannot be safely ordered as examples of a new “method.” The implications of this disruptive aesthetics were most fully drawn by the avant-garde groups that developed during and after the war, especially expressionism, dadaism, and surrealism. These groups differed significantly, but they shared a commitment to aesthetic radicalism and direct public challenge. In Germany a group of poets, painters, and filmmakers began to work under the heading *expressionism*, aiming not to receive the world’s impressions but to express irrational and intuitive states of mind. They opened the visual world to exaggeration, heightened gesture and emotion, and deformed space and time in their refusal of a corrupt social order. Beginning in Switzerland and spreading quickly to France and Germany, dadaism saw the war as marking the failure of civilization and developed the practice of antiart as a gesture of defiance. In 1916 Hugo Ball opened the Cabaret Voltaire in Zurich, where performances included cacophonous music, nonsense poetry, comic recitation, and costumed theatricality. Dada put in question the most central assumptions of Western art: its seriousness, its coherence as an artifact, its separation from the everyday social world. The dissolution of dada in the early 1920s led some of its members to join André Breton’s surrealism, which emphasized the recovery of repressed sources of the imagination and their release into arational art. Rimbaud’s call for a derangement of the senses was one major influence; Freud’s theory of the unconscious was another. Automatic writing, hallucination, and dreams were seen as instruments of liberation from a constrained and destructive reality. Many of the surrealists, like many of the Dadaists, understood their place within the avant-garde as part of a more general program of political and cultural revolution.

Useful distinctions have often been made between the high modernism of Yeats, Eliot, Rilke, Joyce, Proust, and Mann, deeply committed to the integrity of the artifact, and the “historical avant-garde” constituted by these socially active movements that questioned the coherence of art and its withdrawal from social life. Historically attentive scholarship has shown, however, that these are not rival camps or opposing sides of a cultural dyad. Within high modernism one finds both signs of radical indeterminacy in form and strong statements of social engagement. Ezra Pound’s assertion that “the artists were the antennae of the race” (p. 67) represents a characteristic modernist demand, sometimes from the political right and sometimes from the left, for social change founded on the basis of revolutionary art. Similarly, within the avant-garde, one finds scenes of consolidation, where the discord resolves into determinate artifacts. The “avant-garde” and “high modernism” are best seen as moments within the conditions of cultural modernity: an ongoing dialectic between openness and indecidability, on the one hand, and formal integrity, on the other.

Modernism after High Modernism

The later history of the movement involved its circulation into new cultural settings around the world, where it met other forms of modernity and became at once an influence and an object of resistance. The Harlem Renaissance, an efflorescence of

African-American literature after World War I, emerged out of local and national contexts—specifically, the consolidation of cultural possibility in New York after the Great Migration northward. It generated experimental forms (for instance, in Jean Toomer’s *Cane*), but it also accommodated traditional styles, as in sonnets of Claude McKay. The Harlem Renaissance was not a product of high modernism; rather, it was a parallel movement, intersecting and diverging, that obliges us to recognize a wider, more differentiated history of cultural modernity.

Late-twentieth- and early-twenty-first-century scholarship has shown how modernism played a double-sided role in the national independence movements before and after World War II. The European provenance of celebrated masterworks could make them appear distant and oppressive, tainted by the imperial past. But within the context of the traditional curriculum of the colonial schools, Modernism was also taken as a force of resistance to a canon still derived from nineteenth-century achievement. In the work of Chinua Achebe in Nigeria or Ngugi wa Thiong’o in Kenya complicated double inheritance appears: modernism is at once acknowledged and appropriated, but it has no special privilege alongside other literary aims. It combines with storytelling traditions and national aspirations (Gikandi, 1987). Other studies have shown that in the Caribbean the formal techniques refined by modernism converged with styles of experiment associated with the hybrid history of the islands (Gikandi, 1992). The “creolization” of everyday speech created regional contexts for modernist art, and the conditions of social conflict brought resistance to the elite prestige of European high modernism.

Modernism came to no definite end. The call to “make it new,” the use of formal discontinuity, the willingness to compose and present difficult works of art, all continued through the end of the twentieth century. But in the last half of that century, the assimilative power of culture diminished the challenge of such work. A movement that had offered an oppositional principle and a call for transformation found itself part of the routine of shock, celebrity, and fashion.

LATIN AMERICA

Modernism (sometimes referred to as *modern art* or, even less precisely, as *modernity* in the arts) is a term for various experimental languages in the arts with multiple meanings and conflicting aims, and was ascendant from the 1880s to the 1960s (although certain artistic techniques and tactics of early modernist art, such as collage and photomontage, have enjoyed a potent afterlife since the 1960s, especially in Latin America at moments of social insurgency).

According to one of the most famous versions of the history of modernism, associated especially with the writings of critic Clement Greenberg from the 1930s through the 1980s, modernism is an essentially Euro-American phenomenon; but this was never an accurate story about modernism and has been decisively overturned by the debate around postmodernism since the late 1980s. Greenberg has been a very prominent voice about modernism in the United States, with a certain following among Latin American critics like Marta Traba. In perhaps his most well-known definition, “Modernist Painting” (1965), he tried to limit modernism to little more than an engagement with the “essential” material properties of the medium by linking it to Western positivism. (Revealingly, positivism was the prerevolutionary ideology of the dictatorship of Porfirio Díaz in Mexico, even as this school of thought enjoyed considerable hegemony in the West long after the “post-colonial” Revolution of 1910.)

The unduly reductionist view of modernist painting championed by Greenberg was then qualified by a whole series of noteworthy scholars, including Dore Ashton, Thomas Crow, Rosalind Krauss, and Charles Harrison in the West. They respectively demonstrated how modernism from the beginning had carried on a dialogue at once both positive and negative with mass culture as well as popular culture, how modernism was less about a literal focus on the brute materials of a given medium and more about a self-critical look at the inherited languages with which modernist artists had to work, and, finally, that modernist art’s activation of the spectator’s faculties is meant “to confront the occasions of fantasy and distraction with the requirements of imagination and critical self-awareness” (Harrison, p. 154).

The historical coordinates for the advent of international modernism between 1880 and 1940 have been incisively plotted in a paper by Perry Anderson entitled “Modernity and Revolution.” In it he noted that “modernism . . . flowered in the space between a still usable classical past [of official academicism], a still indeterminate technical present [when the ‘machine age’ was still replete with radical possibilities], and a still unpredictable political future [when the prospect of revolution was more proximate than it had ever been]” (p. 105). Indeed, this triangulated field of forces—a contested academic art representing the old regime; the possibility of technological innovation, not necessarily along capitalist lines; and an insurgent political movement that called for revolutionary change—is precisely what spawned the “epic modernism” of the Mexican Mural Movement from 1922 to 1940 and thus inaugurated modernism as a potent force in the visual arts throughout the Americas.

In contrast to Greenberg’s assertion, modernism does not emerge in a linear artistic progression along national lines; instead there are several different multinational conceptions of modernism (and with them, divergent views of its relation to postmodernism) that have arisen within several geographic regions (including not only Latin America, but also Asia and Africa). Modernism’s trajectory is more accurately described as a delta with numerous destinations around the globe, rather than as a one-lane highway with only one stop terminating in the West.

At once international in character and yet also unavoidably regional by nature, metropolitan modernism has been paradoxically linked through the arts either to cultural forms of marginalized groups in the West (such as those of Eastern European émigrés, Latinos, African-Americans, and Native Americans) or to so-called peripheral nations in the Third World, as in Latin America. For Raymond Williams in *The Politics of Modernism* (1989), it was in “a generation of ‘provincial’ immigrants to the great imperial capitals that avant-garde formations and their distanced, ‘estranged’ forms have their matrix” (p. 14).

An adequate description of Latin American modernism, then, must begin by considering the various definitions of modernism that have arisen within specific contexts, as well as by distinguishing modernism as a cluster of renovative and self-reflexive languages in the arts from modernity. The latter is instead a social experience that has been generated by

modernization, which is a globalizing economic program centered in the West. All three of these historic phenomena have existed in complicated, asymmetrical relation to each other.

The Origin of “Modernism” in Latin America

Far from originating solely with intellectuals from metropolitan Western Europe, the term “modernism” first surfaced in print in the writings of a major author from a small “underdeveloped” country in Central America. It was in the late 1880s that the celebrated Nicaraguan poet Rubén Darío (1867–1916) first published the term *modernism* (or *modernismo* in Spanish). The earliest known appearance in print worldwide of this term was in 1888 in Darío’s essay “La literatura en Centroamérica” (*Revista de arte y cultural*, Santiago, Chile), when he discussed how author Ricardo Contreras was then using “*el absoluto modernismo en la expresión . . . [de] su estilo compuesto*” (“absolute modernism in expression . . . through his synthetic style”). Subsequently, Darío published the word *modernismo* a second time in an article entitled “Ricardo Palma (Perú, 1833–1919),” which appeared twice in 1890: first, in the Peruvian journal *El Perú Ilustrado* (Lima), on 8 November 1890, and second, in the Guatemalan publication *Diario de Centro-América* (Guatemala City). Thus, by 1899, the *Real Academia Española* had incorporated the word *modernismo* into the latest edition of the *Diccionario de la Lengua* (Madrid, 1899)—although the proliferation of meanings triggered by Darío’s usage of the term defied any lexicographical effort at a fixed definition.

This beginning was a prophetic one, for modernism in the arts, both here and elsewhere, has generally occurred at the historic intersection between competing cultures uneasily linked by colonial lineaments, yet starkly divided by the uneven nature of capitalist modernization. Often modernism has thus responded “nationally” to a set of unsettled transnational relationships, but it has generally done so in a cosmopolitan spirit of internationalism that moves beyond national boundaries. Such was the case not only in Nicaragua during the time of Rubén Darío, but also in India during “the age” of Rabindranath Tagore and Mahatma Gandhi or Nigeria in the period of painter Aina Onabolu (1882–1962). It was also true in turn-of-the-century Paris, during *la belle époque*, that obviously existed in tense relation to France’s contemporary colonial empire in Central Africa.

Although it hardly enjoyed common usage in either the English- or French- or German-speaking artworlds before the mid-1950s (when a group of critics, including Clement Greenberg, began defining it in English), the term *modernism* was invoked, defined, and debated in the Spanish-speaking world beginning in the 1890s on both sides of the Atlantic. In many countries, though, whether in the Americas or in Europe, the most common term for modernism in the teens or twenties was simply *the new art* (*el arte nuevo*, or *die neue Kunst*), while in the 1930s and 1940s, the most common designation of modernist art was “modern art” (*arte moderno*, *l’art moderne*, and *moderne Kunst*). In Spanish discourses, the term *modernismo* was, quite confusingly, used both to refer the Modernist movement and as the generic name for various modernist movements. This explains the recourse to *modernidad*—which in English would literally be translated as “modernity,” although

in fact *modernidad* would be better translated more broadly in English as “modernism.” An early example of the latter usage would be in a well-known 1926 essay by muralist Diego Rivera about the photographs of Edward Weston and Tina Modotti, which artistically demonstrated the “*modernidad extrema de la plástica [del arte]*,” that is, an “extreme modernism”—not “extreme modernity” in the arts—in English.

A similar imprecision in terminology occurred in routine usage from the late nineteenth century until the 1960s, both in the Americas and in Europe, of the term *avant-garde* or *arte de la vanguardia*—which was then assumed to be a mere synonym for those attributes of painting and the other visual arts articulating *modernism* (or *modernidad*). This was clearly the case in the very first modernist manifesto by the Mexican muralists, when David Alfaro Siqueiros in May 1921 made “*3 llamamientos de orientación actual a los pintores y escultores de la nueva generación americana*” (“Three appeals for orientation right now among the painters and sculptors of the new American generation”) in the journal *Vida-Americana: Revista Norte, Centro y Sud-Americana de Vanguardia*. In the public appeal, Siqueiros wrote of how: “*VIVAMOS NUESTRA MARAVILLOSA EPOCA DINAMICA! amemos la mecanica moderna que nos pone en contacto de emociones plasticas inesperadas . . . Abandonemos los motivos literarios. HAGAMOS PLASTICA PURA*” (“We are living in our marvelously dynamic epoch! We love the modern technology that we are placing in contact with unexpected artistic emotions . . . We are abandoning literary motives. Let us make pure visual art”). Revealingly, this two-page manifesto that equated “pure painting”—that is, painting freed of literary references and based on an evocation of “*la vie moderne*” in the machine age—with the “*arte del futuro*” of “*la vanguardia*” was accompanied by a frontispiece that featured a cubist painting from 1914 by Diego Rivera, the first major, internationally recognized modernist painter produced by Latin America.

Thus Siqueiros clearly assumes that these formalist concerns of the modernist movements featuring post-literary painting are entirely synonymous with *avant-garde* art. In three much later essays by the art critic Clement Greenberg, comparable assumptions prevail, yet to more conservative political ends, and far more restrictive aesthetic aims: “*Avant-garde and Kitsch*” (1939), “*Towards a Newer Laocoon*” (1940), and the aforementioned “*Modernist Painting*” (1965).

As Latin America’s earliest *avant-garde* movement, *modernismo* was first limited largely to literature: essays, poetry, and short stories. Such was the case with Rubén Darío’s now legendary *Azul . . .* (1888; *Azure . . .*), which conjoined the innovative self-critical splintering of poetic language (based on enjambment and mid-line caesura) with broader critical reflections on the process of modernization. At issue was a heterogeneous new cultural force that linked self-consciously French-influenced vanguard language with period tropes from an agrarian-based Central America and unlikely recollections of little-known pre-Columbian cultural traditions. This tightly intertwined dynamic of formal disjunction and thematic displacement was summed up by Darío in *Prosas Profanas* (1896; *Lay hymns*). In this controversial text, he both called for an inward-looking revivification of poetic language in the most

modern terms and insisted on an outward-looking reengagement with the precolonial past, since “If there is a [new] poetry in nuestra America, it is to be found in the old things.”

Following the lead of Cuban author José Martí (1852–1895), another modernist poet (who also led the movement for national liberation in Cuba against Western colonialism), Darío interwove modernist texts with thematic references to anti-imperialism and to a racial harmony only possible in a postcolonial future. An exemplary and still well-known poem in that vein is found in Darío’s *Cantos de vida y esperanza* (1905), in a piece entitled “To Roosevelt.” In it, he challenged the United States, as “*el futuro invasor de la América ingénuca que tiene sangre indígena*” (“the future invader of the ingenuous America that has indigenous blood”). As such, the colossus of the North, with its cynical fusion of the cult of Hercules and the worship of money, was critically contrasted with the other Americas, “*la América nuestra, que tenía poetas / desde los viejos tiempos de Netzabualcoyotol*.” In this text, the modernism of Darío, and others, responded to the critique of Euro-American-centrism first voiced in the celebrated anti-positivist *Kulturkritik* by Uruguayan author José Enrique Rodó (1872–1917), namely, *Ariel* (1900).
