Only after the word *modernism* crossed the Atlantic from Latin America to discover Europe, first Barcelona, then Paris, did it start designating certain formal strategies and thematic concerns in the visual arts that were linked to the literary project of Rubén Darío. The term *modernismo* (*modernisme* in French) or *arte modernista* (*l’art moderniste*) was used in the beginning to refer to such famous architectural projects by Antoni Gaudí as *Parque Guell* (1900–1914) and *Sagrada Família* (1883–1926), in the fin-de-siècle city where both Pablo Picasso and Diego Rivera would work in the early twentieth century. It was this cosmopolitan city in Spain, as much as Paris proper, that would help to spawn such early modernist masterworks as Picasso’s 1907 *Les Femmes d’Alger (O. J.)* (named for a street in Barcelona) and Rivera’s distinctive corpus from 1913 to 1917 of “Anáhuac Cubism,” as Justino Fernández would so aptly call it in reference to the indigenous Mexican content of Rivera’s work. In the case of Gaudí, for example, the term *modernismo* constituted both a distinct tendency within modernism proper and a point of departure for advancing other types of modernism as well, such as cubism. Indeed, almost all of the key formal tactics for every other variety of modernism were deployed in Gaudí’s singular modernist artworks, like *Parque Guell* and *Sagrada Família*: (1) a collage aesthetic featuring a mosaic of ruins or shards; (2) a multilateral sense of history based upon uneven development; (3) a multicultural *mestizaje* (hybridity) ranging from African components to pan-European elements; (4) a critique of capitalist modernization; and (5) an anti-imperialist aspiration (in this instance, one interlinked with the Catalan autonomy movement).

As for the ideologically charged use of the fragment to explain the historical import of modernism in the visual arts, we need only recall how Mexican painter Diego Rivera defined the unsettling language of cubism as “a revolutionary movement . . . [that] broke down forms as they had been seen for centuries, and was creating out of the fragments new forms, new objects, new

The Towers of Satellite City (constructed 1957), designed by Mexican architect Luis Barragan (1902–1988). Resembling abstract skyscrapers, the cement towers of this public artwork ascend over the Queretaro highway in Mexico City as a startling example of Latin American modernism. © RENE BURRI/MAGNUM PHOTOS

patterns, and—ultimately—new worlds” (trans. by March). Later, art critics would illuminate how *arte modernista*, like that of the cubist “collages” by Rivera, with their distinctive uses of modernist space, constituted a critique of the actual mechanics for pictorial logic in Western art. As Rosalind Krauss would point out in the 1980s, two of the key artistic strategies to develop out of collage space were figure/ground reversals and the restless transposition of negative space into positive form, so that no visual sign would exist without the attendant eclipse or negation of its natural referent. In this manner modernism, particularly as manifested in cubism, ended up critically exploring through a critique of artistic languages the preconditions of mainstream Western—that is, colonial—modes of representation.

As such, the modernist contestation by Latin American artists of Euro-American cultural hegemony is what permitted Diego Rivera to recruit cubism and several other artistic traditions, both modern and premodern, on behalf of the Mexican Revolution, when he (along with José Clemente Orozco, David Alfaro Siqueiros, Fernando Leal, and others) created an

“epic modernism” during the Mexican mural renaissance from 1922 to 1940. Signs of this emergent “revolutionary modernism” (Rivera called it “*la revolución de arte moderno*”) already surfaced in such cubist period paintings in 1915 as *Paisaje Zapatista: El Guerrillero and Retrato de Martín Luis Guzmán* (a Mexican novelist who served with Pancho Villa). In that sense, one could justifiably recall the observation of Mexican writer Antonio Caso that Diego Rivera was to the modernist visual art of Latin America what Rubén Darío had been to modernist poetry from Latin America.

Modernism and Postmodernism

It is worth noting that, as was true of the term *modernism*, there was a south-to-north movement for circulating the word *postmodernism* (or *postmodernismo*). The latter first emerged in the Hispanophone literary world, in 1934, when it was coined by author Federico de Onís. He did so in *Antología de la Poesía Española e Hispanoamericana (1882–1933)*, where he identified modernism as a worldwide movement in response to the “crisis of Western Civilization.” De Onís contrasted a conservative artistic tendency within modernism, which he christened “postmodernism,” in contradistinction to an “*ultra-modernismo*.” The latter, linked to writers like Jorge Luis Borges from Argentina, was then reintensifying the most radical features of modernism, in a second wave of the original movement. Revealingly, it was only in the 1950s that the centrist Spanish term *postmodernism* would resurface in the English-speaking world—after which it then was redefined as a “radical development” and became a generalized cultural phenomenon in the arts “around the world” over the next three decades.

The art critic Hal Foster pointed out in a now-famous anthology entitled *The Anti-Aesthetic: Essays on Postmodern Culture* (1983) that postmodernism emerged not just as a “new set of styles” that chronologically superseded those of modernism. Rather, some tendencies of postmodernism have often been another way of reengaging critically with the competing legacies of international modernism, thus being yet another subaltern or dissenting phase of modernism proper in the form of “resistant post-modernism.” Hence, in the period since 1900, there has been a concerted move by advanced critical theorists both to redefine modernism along postcolonial lines and to resituate the historical trajectory of modernism worldwide in response to the “new world order” (without, in either case, denying the ongoing neocolonization now being sanctioned by Western imperialism). Two noteworthy reconsiderations of modernism from “outside the West” encapsulate this hotly contested historiography of modernism and postmodernism: *La Modernidad después de la postmodernidad* (1990; *Modernity after postmodernity*) by the Argentine author Nestor García Canclini and “Postmodernity as Modernity’s Myth” (2001) by the Slovenian philosopher Slavoj Žižek.

Conclusions

In Latin America and elsewhere in the “postcolonial world,” the confining, Eurocentric position of Greenberg was then more broadly reworked through critiques by such notable thinkers as Juan Acha of Peru, Gerardo Mosquera of Cuba,

Partha Mitter of India, Rasheed Araeen of Pakistan, Olu Oguibe of Nigeria, and Kobena Mercer of the United Kingdom. In all of these cases, and others, they reminded us that a “post-colonial” redefinition of modernism (along with modernity and modernization), one that is adequate to the demands of the historical present, has only now begun to be written.

MODERNITY.

This entry includes three subentries:

Overview
Africa
East Asia

OVERVIEW

Modernity is best understood as a condition, rather than as the designation for some particular period of time. Aspects of the modern condition can arise at any time and place, but they are most generally associated with historical trends arising out of Cartesian philosophy, industrial capitalism, revolutionary politics, and the cultural changes of the turn of the nineteenth century. The main lesson to be learned from the postmodernism of the late twentieth century is that the tensions of modernity are still with us.

Of course, the term *modern* has narrower uses in particular fields of human endeavor, including especially art and architecture. The use of the term in the sense discussed here, as a syndrome of conditions associated with the modern mode of human life, is relatively recent. The French revolutionaries, for example, did not think of themselves as modern. When characterizing the more forward-thinking aspects of his time, the philosopher Immanuel Kant (1724–1804) did not call them modern or even enlightened, but described the late eighteenth century as undergoing a process of enlightenment. Classically, the term *modern* contrasts the present day as opposed to some time in the past, or more specifically, it contrasts ancient times with the modern times subsequent to them, as in Bernard of Chartres's famous twelfth-century description of moderns as dwarves sitting on the shoulders of giants. *Modern* may also apply as an adjective denoting novelty, as in the phrase "modern conveniences."

From a general point of view, however, modernity should be understood as a condition, mentality, or syndrome presenting characteristic dilemmas to human beings that remain both defining and unresolvable. Elements of the modern condition

include rejection of traditional authority, a progressive rather than cyclical notion of time, individual and collective emancipation, a broadly empiricist orientation toward understanding the world, and what John Dryzek has called a Promethean outlook that regards all difficulties as technical problems to be mastered through human endeavor. As a heuristic, contrasts with unmodern conditions may be useful, as in Jürgen Habermas's point that "before the French Revolution, before the workers' movements in Europe, before the spread of formal secondary education, before the feminist movement . . . the life of an individual woman or man had less worth—not regarded from our own point of view, of course, but from the contemporary perspective" (p. 106). The modern horrors of the twentieth century, however, should cause one to be careful to apply these distinctions to elements of human practice, rather than to specific individuals or groups. The impulse to define some people along a premodern/modern axis, itself an outgrowth of characteristically modern impulses toward rational social management, should be resisted, whether the people are described as characteristically modern, as Richard Wagner said of the Jews, or as characteristically premodern, as European colonists considered aboriginal residents of the New World. The tension in this very practice of defining modernity in people and practices, with its disparate results ranging from attempted extermination to processes of emancipation, respectively, reveals the inescapably dialectical nature of the modern condition.

Indeed, an accelerated and socially powerful process of conceptual change constitutes a key element of the modern condition. Reinhart Koselleck has argued that in modernity, "political and social concepts become the navigational instruments of the changing movement of history. They do not only indicate or record given facts. They themselves become factors in the formation of consciousness and the control of behavior" (p. 129). Koselleck illustrates this process with the quintessentially modern concept of emancipation: once the reflexive verb, to emancipate oneself, gained currency beyond its origins among philosophers and literati and began to be used widely among participants in the revolutionary politics of late-eighteenth-century France, it became linguistically impossible, as it were, to defend the institutions of the Old Regime. The linguistic turn in philosophy and social theory attests to the modern role of language as constituting experience itself. Martin Heidegger (1889–1976) argued that language illuminates specific, comprehensive modes of being in the world; Hans-Georg Gadamer (1900–2002) later refined this idea with the idea that human beings move within "horizons" of linguistic prejudgments. Philosophers as different as Habermas, Ludwig Wittgenstein, and Hannah Arendt have explored the potential for commonalities in language usage to overcome seemingly fundamental barriers among human beings.

Modern theorists do not agree about the role played by historical subjects in effecting the conceptual changes that seem to drive a constantly evolving public sphere. Whereas Georg Wilhelm Friedrich Hegel (1770–1831) spoke abstractly of the progress of *Geist* (mind, consciousness, spirit) and Michel Foucault (1926–1984) revealed the socially constructed nature of the concepts and practices that constrain human beings, Karl Marx (1818–1883) and his followers argued that false consciousness could be overcome, while Sigmund Freud

(1856–1939) and his successors sought to overcome the damage done to individual mental health by modern social pressures through psychoanalysis. Some lines of modern argument are characterized by progressive optimism regarding the power of enlightened human reason, once freed from the shackles of tradition, to remake society according to rational principles. Jeremy Bentham (1748–1832) and his fellow utilitarians, for example, supported a slate of social reform programs, including birth control and humane treatment of prisoners, based on their application of the principle of the greatest happiness for the greatest number to society at large. In another indication of the dialectical tensions inherent in modernity, Bentham's rationalist vision of prison reform, originally intended to redeem the inherent worth and social value of every individual, even those abandoned to the horrors of the premodern prisonhouse, has evolved, as Foucault has demonstrated, into a near-totalitarian vision of social control over the resisting individual. Bentham's modern design for a prison, the "panopticon," has become the blueprint for the present-day "supermax" vision not of rehabilitation, but of central control.

Alexis de Tocqueville's (1805–1859) seminal thinking about this dynamic between modern egalitarian democracy and quasi-despotic central control happened to begin with a study of the early-nineteenth-century American prison system, which in Pennsylvania and New York exemplified Benthamite reformist principles. In *Democracy in America*, Tocqueville warned his fellow Europeans that democratic equality was not a passing fad, that although it broadened opportunities for the masses, it threatened national and individual greatness, and that without a strong network of intermediate institutions, democracy was likely to resolve into centralized administrative despotism. Tocqueville's dystopian vision contrasts with Bentham's progressivist faith in reason's beneficence: modern individuals in American democracy may be free of the old tyrannies of class and king, but they are subject to new forms of despotism rooted in their very freedoms. Like John Stuart Mill (1806–1873), Tocqueville argued that modern social mobility requires individuals to devote most of their energy to economic well-being, to the exclusion of more noble pursuits. Worse, without the traditional intermediaries of the estates checking the central power of the state, democracies will tend toward ever more powerful government. As modern individuals torn by accelerating social pressures become alienated from their premodern social support systems, they are vulnerable to domination by "an immense tutelary power . . . which alone takes charge of assuring their enjoyments and watching over their fate. It is absolute, detailed, regular, far-seeing, and mild. It would resemble paternal power if, like that, it had for its object to prepare men for manhood, but on the contrary, it seeks only to keep them fixed irrevocably in childhood . . . can it not take away from them entirely the trouble of thinking and the pain of living?" (p. 693).

What Habermas calls the "enlightenment project" thus doubles back on itself. Whereas for Kant, republican government (that is, government responsible to the people) forms an essential part of the emancipation of human beings to autonomy, for Tocqueville this same institution could lead to autonomy's opposite, to the infantilization of the population under a paternal power far worse than any premodern royalist

opposed by the likes of John Locke and Thomas Jefferson. Jean-Jacques Rousseau (1712–1778) had identified this irony of modernity already in the eighteenth century. In his first *Discourse* he outlines the many sacrifices human beings have had to make to become modern, including even the possibility of authentic relations with each other. However, for Rousseau there is no going back: modern consciousness, once achieved, cannot be forgotten but must enable modern human beings to devise new institutions for achieving a modern kind of authenticity. Similarly, the English poet William Wordsworth (1770–1850) complained in an 1807 sonnet of the loss of authentic relations among newly rational modern human beings:

The world is too much with us; late and soon,
Getting and spending, we lay waste our powers:
Little we see in Nature that is ours;
We have given our hearts away, a sordid boon!
The Sea that bares her bosom to the moon;
The winds that will be howling at all hours,
And are up-gathered now like sleeping flowers;
For this, for everything, we are out of tune;
It moves us not. —Great God! I'd rather be
A Pagan suckled in a creed outworn;
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn;
Have sight of Proteus rising from the sea;
Or hear old Triton blow his wreathèd horn.
(Sonnet No. 18).

The loss of the old gods, of traditional ways and of the comforts of an unquestionable worldview worried Wordsworth, the German poet Friedrich Hölderlin (1770–1843), and many others, but presented an opportunity to those modern thinkers seeking to replace the Old Regime with rational modes of human being. Chief among these were Marx and Engels, who noted with pleasure that in modern life "all fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new-formed ones become antiquated before they can ossify. All that is solid melts into air, all that is holy is profaned, and man is at last compelled to face with sober senses, his real conditions of life, and his relations with his kind" (p. 68). Marx's optimism was undergirded by his faith in the power of reason; he expects human "sober senses" to point out the direction to progress. Nietzsche has a similar diagnosis of the origins of contemporary institutions in the interests of the few, but no accompanying expectation that the application of modern human reason can end this dynamic:

With the aid of such images and procedures [as flaying and quartering criminals], man was eventually able to retain five or six "I-don't-want-to's" in his memory, in connection with which a *promise* had been made, in order to enjoy the advantages of society—and there you are! With the aid of this sort of memory, people finally came to "reason"! —Ah, reason, solemnity, mastering of emotions, this really dismal thing called reflection, all these privileges and splendors man has: what a price had to be paid for them! how much blood and horror lies at the basis of all "good things"! (p. 42)

Faced with the failure of received ideas, and without the optimistic view that modern reason could replace previous illegitimate modes of life with authentic modes, Nietzsche calls on (at least some) modern human beings to embrace the disorientation that comes with recognition of the modern condition, and to create their own sets of values.

Such a solution has obvious shortcomings when it comes to social coordination. Most observers of the collapse of traditional values felt less exhilarated than paralyzed, waiting for the inevitable new mode of collective human being. The Irish poet Yeats, in his 1921 work "The Second Coming," an exquisitely modern poem, both formally and in its content, worries thus:

Turning and turning in the widening gyre
The falcon cannot hear the falconer;
Things fall apart; the centre cannot hold;
Mere anarchy is loosed upon the world,
The blood-dimmed tide is loosed, and everywhere
The ceremony of innocence is drowned;
The best lack all conviction, while the worst
Are full of passionate intensity.

Surely some revelation is at hand;
Surely the Second Coming is at hand.
The Second Coming! Hardly are those words out
When a vast image out of *Spiritus Mundi*
Troubles my sight: somewhere in sands of the desert
A shape with lion body and the head of a man,
A gaze blank and pitiless as the sun,
Is moving its slow thighs, while all about it
Reel shadows of the indignant desert birds.
The darkness drops again; but now I know
That twenty centuries of stony sleep
Were vexed to nightmare by a rocking cradle,
And what rough beast, its hour come round at last,
Slouches towards Bethlehem to be born?

The quintessentially modern poem depends on a fundamentally premodern concept of time: for Yeats, time is not progressive, but cyclical. Modernity as a human condition is characterized by such ironies: as democratic politics empowers the subject, social scientific research demonstrates the subject's disempowerment; as modern political thought looks to abstraction to resolve premodern injustices, that most particular institution of the national state is the main agent against them; as modern science enables increasing technical mastery of nature, it simultaneously demonstrates nature's mastery over individuals.

Small wonder, then, that antimodern movements of nearly infinite variety have sprung up around the globe in recent years. Responding to the arguments of Max Horkheimer, Theodor Adorno, and many others sympathetic to the critique of modernity, Habermas has argued that

only further enlightenment . . . has grown from the devastation of enlightenment. . . it is only through reason

that we can determine the limits of our rationality. *This* is the fundamental figure of Kantian thought that was definitive for modernity. And modernity can't just be peeled off like a dirty shirt. It's in our skin. We find ourselves in a condition of modern life: we didn't freely choose it; it is existentially unavoidable. But for the opened eyes of modernity, this condition also implies a challenge, and not just a disaster. (p. 94)

Elisabeth Ellis

AFRICA

The debates and controversies over modernity, from its origins in sixteenth- and seventeenth-century western Europe to the various sites of its deployment following the formation of colonial empires, have given rise to an abundance of literature. Non-Western societies, by and large, in the formation of their cultural, political, economic, and social identities and their reactions to it, have appropriated or not, accommodated or not, resisted or not, in many different ways, what is usually referred to as the project of modernity (or modernization). Associated at first with colonization, and then with independence, modernity involves an understanding of several issues connected with modes of

thought, action, and belief, the legitimacy and effectiveness of which are fed by absolute faith in human progress, thanks to the power of science and technology. This creative tension between a way of being (the philosophical dimension of modernity) and of acting (modernization, which involves concrete advances in the realms of social and economic, political and legal, military and health policy, with the aim of transforming agrarian peoples and non-Western communities into urban, industrial societies) is at the heart of the dispute between the partisans and opponents of an understanding of modernity as the exclusive sign of civilization, established and defined by Europe.

The philosopher Jürgen Habermas, supported by the arguments of Max Weber, established a strong internal link between modernity and Western rationalism. This led to the erosion of religious concepts and the emergence in Europe of a secular culture via both laicization and modernization. Habermas suggests that the concept of modernization proposed in the 1950s comprises a set of cumulative procedures that reinforce one another, such as the capitalization and mobilization of resources, the development of the forces of production, increasing productivity of workers, establishment of political power and formation of national identities, dissemination of the notion of the right to political participation, the growth of forms of urban life, public education, and the secularization of values and norms.

However, in the historical, anthropological, and sociological literature, the terms *modernity*, *modernization*, and, occasionally, *liberalism* are often interchangeable. Opposing the idea of modernity as a strictly European development set forth by Habermas is the approach of numerous authors who are non-European or who work on the periphery of non-European societies. They emphasize its pluralistic character and its responsiveness to local environments. Benjamin Schwartz, a scholar examining Chinese history, stresses two revealing signs of the ambiguous nature of modernity: first, the crises, shocks, and convulsions that have destabilized Western societies and have strongly influenced and redefined Western modernity, both in terms of its basic content and its having been put to the test nationally during and after World War I; and the multiple versions of modernity, in particular the Soviet Marxist version. Two other fundamental issues should be considered: Modernity is a preoccupation of intellectuals, centered on questions of tradition and development, with a focus on the description and understanding of certain practical procedures and ways of thinking and feeling; when modernity leaves the realm of the intellectuals and takes on the aspect of modernization, it involves practical problems of economic development. Modernity thus became a word connoting order and mobilization, a goal to work toward. Schwartz invites us to proceed by a double movement: first, accepting that modernity does not refer to a simple entity or to a homogeneous admixture of manifestations, practices, or modes of thought, neither in its place of origin nor in non-European cultures. And similarly, it is not any kind of complete or synthetic whole; rather, it is crossed with horizontal tensions and conflicts “among the various currents and countercurrents of the modern world” (Schwartz, p. 54). It is therefore necessary to pay close attention to the lively debates among the

intellectuals in their specific historical context. In fact, for intellectuals in developing nations, in China at the beginning of the twentieth century, or in areas under colonial domination in Asia and Africa, the essential concern is to find the resources indispensable to the preservation of a community identity in their complex relationships to the past, in their traditions, and in the “European canon.” In the case of Africa, novelists have tried to present these clashing trajectories, as exemplified by Cheikh Hamidou Kane in *L’aventure ambiguë* (English trans., *Ambiguous Adventure*) and Laye Camara in *L’enfant noir* (1954; English trans., *The Dark Child*).

Signs of Modernity

The signs of modernity are considered here together, from the historical circumstances of European nations’ global colonial expansion, and from the indigenous reading of the signs of this economic, political, and cultural hegemony that are expressed by the project of the civilizing mission. The civilizing mission rests on the promise of universal reason and emancipation that, prompted by the philosophers of the Enlightenment, is associated with modernity, progress, and the powerful capacity for destruction possessed by irrational and unreasonable practices, in the struggle between science and rationality on the one hand, and faith and religion on the other. According to P. Selinow, there are three pillars supporting this modernity: capitalism, analyzed by Karl Marx; bureaucracy, analyzed by Max Weber; and the norms, forms, and procedural regulations of modern society studied by Michel Foucault. In addition to this definition of modernity as a unique moment in the history of Western civilization, of which the principal signs are the scientific and technological progress of the industrial revolution and the economic and social transformations of capitalism, there is an approach that envisages modernity as an aesthetic concept. Though limited, this approach may help us trace the many changing ways in which non-Western societies have tried to understand, appropriate, resist, or define the efforts at modernization as they have been presented or understood. This is the case, for example, of Chinese literature, which was dominated in the first half of the twentieth century by an obsession with the notion that China was afflicted with a spiritual malady that created a break between tradition and modernity. Tradition was regarded as the source of the Chinese malady, and modernity was seen by intellectuals as a revolt against tradition and as a possible source of new solutions.

To this dichotomy of tradition/modernity one can add others, such as agrarian/industrial, authority/liberty, and prescientific thought/scientific thought. The case of China, as with Bengali intellectuals confronted with colonial domination by the British, illustrates the adoption and utilization of the language and categories available in (or proposed by) the “European canon” in order to assimilate, evaluate, select, and/or reject the new ideas from the West—that is, in establishing a correlation between the material gains and progress associated with the European presence and the moral decadence of indigenous sociability, civility, and religiosity.

Whereas Europeans view the history of modernity as a progressive triumph of Enlightenment ideas, in non-Western societies it is seen as beginning with colonial conquest, which is

now regarded as being part of the same movement in enlightened places and in regions of total darkness.

Colonial Modernities

There are two important issues in the development of colonial modernities: the interpretation of manifestations of modernity in the process of imperial expansion, on the one hand, and the place assigned to indigenous people in the colonial enterprise, on the other. Regarding the former, authors such as C. L. R. James focus on the modernity of slavery in the Atlantic economies at the beginning of the modern period; similarly, others suggest that the Indian peasant is not an anachronism in a modernized colonial world but a veritable contemporary of colonialism, an indispensable member of modernity. The complicity between colonial history and modernity is precisely the cause of the circumstances underlying the statement, “The same historical process that has taught us the value of modernity has also made us the victims of modernity” (Chatterjee, pp. 8–9). This strong correlation has its origin in numerous attempts to reinterpret the manifestations of modernity from indigenous impressions of it, by trying to jettison certain of these signs while recognizing the revisionist efforts to which it is heavily subjected in non-Western societies. Such a perspective is notably more apparent in studies on India and China than in those on Africa. One observes in the former an abundance of qualifications that result from opposing the idea of modernity as a strictly European development and affirming it as a multivalent phenomenon. Partha Chatterjee provides the best insight on this point in his definition of an Indian (or rather, Bengali) modernity as “our modernity.”

The many authors who have joined this debate after Chatterjee emphasize the ways in which non-Western societies remake modernity in their own images, revising rationality and capitalism by transforming general formulas and formulations in terms of their own interests, ideals, and enterprises—political, economic, and social. It is essential to recognize that in the case of Africa, the debate is less intense today than it has been. It does not necessarily take the same theoretical and epistemological approaches that color the writings in the social sciences on India and China, to give just two examples. It has always been presented as a double figure, each of which takes various forms, the pair tradition/modernity and the demands, expectations, and aspirations of development through the economic and social compensation by modern, industrial Europe. This figure, which does not always reflect democratic structures, secularism, or equality between the sexes, among other things, is part of a series of attempts to transform African societies by “modernizing bureaucrats” in the final phase of colonial domination. In Africa and among blacks in general, as has already been mentioned, writers and cultural critics—more than historians and social scientists—have drawn connections between Africa and Europe, whether in terms of conflict (Aimé Césaire, Camara Laye, and Cheikh Hamidou Kane) or a fruitful dialogue (Léopold Sédar Senghor and Ousmane Socé Diop). Only one author, Cheikh Anta Diop, a Senegalese philosopher, taking a brutal, ironic approach, reverses this problematic double. He has made a name for himself as a radical dissident and

has struggled to rethink and revise the genealogy of modernity to counter the notion of it as a strictly European development. On the contrary, he asserts, Europe has evolved under the aegis of Africa; it became rational by following the example and teachings of Africa, the mother of civilizations and the originator of modernity, which emerged along the banks of the Nile during the time of the Egyptian pharaohs.

This revision of the history of human rationality erases the boundary between traditional African societies and modern European societies. At the least, the idea of extreme difference between the two is interpreted as an ideological strategy for establishing the mission of civilizing native populations and the enterprises of colonization. By reintroducing Africa as a participant in the development of rationality and modernity, Cheikh Anta Diop reconfirms Africa as producer and consumer of modernity. Not many other African authors share his view, although it has been embraced by partisans of Afrocentrism, especially in the United States. On the contrary, at the heart of the debates, which intensified during the years of nationalism—after World War II to the 1970s—in the era of globalization, the crucial question is how to interpret the complex and paradoxical relationship between culture and modernization. At issue are the conflict-ridden associations between modernity and colonial cultures and violence, and the cultural and psychological renaissance that accompanied the founding of postcolonial nations and states. Two historians, J. F. A. Ajayi and Jacqueline Ki-Zerbo, have responded to this in the same way. Ajayi suggests that the colonial enterprise failed in its desire to erase the African past, having never succeeded in changing the path of African history or the strength and prevalence of African initiative. Ki-Zerbo warns against the assimilation and appropriation of the history and culture of others, which cannot provide any guarantee of success in terms of development and modernization. Among the novelists, Kane emphasizes the ambiguity of the venture. The Grande Royale, who argues for the education of the young people of the kingdom of Diallobés against his brother, the king and religious leader of the community, gives two reasons: to understand why the colonizers, even though they were in the wrong, were able to defeat them; and to enable his people to gain technological expertise. His reading considers that neither morals nor the values of authenticity can save one from domination. The experience at school and university of Samba Diallo, the book’s main character, and his delving into the Koran and texts by the philosophers of the Enlightenment do not open any doors to him other than those of solitude and death, which sanctions failure, and of assimilation and hybridization. Kane is even more explicit in his theoretical texts.

In contrast, Socé Diop, in his novel *Karim* (1935), relates with gusto the metamorphoses of the main character, Karim, who assumes multiple identities, including an accountant trained at a French school, a Senegalese Muslim from Saint-Louis (the oldest French colonial settlement in Africa) educated in the traditions of Islam and the values of the Wolof aristocracy, a dancer and charmer cognizant of urban opportunities and colonial chances. For each identity, Diop gives Karim a corresponding clothing style, dance steps, a manner of being and acting that are superimposed with close attention to French,

African, and Islamic teachings and practices on issues of aesthetics and rhythm, dress, love, and sex. Karim represents the celebration of a hybrid form of being, rejecting the draconian choice that would have lethal consequences for the “ambiguous adventure.” The approach taken by Socé Diop is shared by “the translators of colonial modernity” analyzed by Simon Gikandi.

Gikandi describes superbly the dilemma of constructing an indigenous culture that embraces the colonial political economy both internally and externally, and examines the production of colonial modernity through a never-ending negotiation between the desire to maintain the integrity and autonomy of colonized societies and the willingness to face up to the European presence and its political economy (pp. 23–41). Taking as an example the kingdom of Buganda (today the nation of Uganda), he shows how the elite adopts Christianity as a key element in developing a certain modernity, regarded as one way of participating in the colonial culture. Similar characteristics detected and analyzed by Gikandi, beginning with the account of the voyage of Ham Mukasa (*Uganda's Katikiro in England*) are found in the ethnographic and religious writings of David Boilat and in the militant intervention of Augustin Diamacoune Senghor, leader of Senegal's Casamance independence movement, who used the colonial culture to “develop”—in the photographic sense—indigenous moral values and religious beliefs. Through these different figures, people involved in such causes became interested in reorienting the ways of expressing and of satisfying the desires generated by colonial modernity toward indigenous ends. They tried in various ways to alter the very nature of the “colonial canon” by infusing it with their voices, passions, and anxieties, so that it would present them not as objects of European intervention but as the subjects of their own cultural destiny (Gikandi, in Mukasa's *Uganda's Katikiro*, p. 21).

This way of thinking led to the perception of the dual nature of tradition and the realities it conceals, involving both a constant reinvention of the colonial canon and an ever-shifting horizon due to the ceaseless work of translation, appropriation, and selection. By means of this work, the colonial experience is turned into an indigenous opportunity. The only question that troubles the carriers or translators of modernity is that of defining the colonial culture of modernity (including Christianity) in isolation from the “enlightenment” of the Christian message and colonial modernity, from the repressive, controlling mechanism of political power, and from its very authoritarian economic and cultural manifestations.

To understand the African debate on modernity is, in large measure, to identify the different ways in which the “package” (the concept and the different constructions that it has given rise to) and the numerous realities that it conceals have circulated in Africa, in various historical circumstances. The latter have been shaped by methods of appropriation, forms of opposition, and resistance, but perhaps still more fundamentally by demands and expectations regarding what is understood or proposed by the term. It still has to be made clear, as James Ferguson has suggested, that this modernity has a concrete meaning, reflecting subdivisions, pensions, and family allowances. The African modernity that he analyzes was a preoccupation for

certain groups in colonial and postcolonial African societies: political leaders, union leaders, students, specialists as well as workers in economic development. Modernity thus became synonymous with development and material progress.

This reading of the term *modernity* subscribes to the colonial objective of impeding Africa's modernity; especially after World War I, restrictions imposed by colonial authorities led to the politics of retribalization, assimilation, and the containment of the “carriers of modernity.” The colonialists tried to hold them back by claiming all the fruits—material, cultural, spiritual, economic, and political. On this question, the case of the Tsawana people, studied by Jean and John Comaroff, demonstrates the perpetual production of a modernity that is a constant source of tensions between, on the one hand, the adoption of the material elements of colonial culture (clothing, architectural styles, sanitation) and, on the other hand, their consequences under the appearance of new forms of individuation that progressively threaten the customs of the community, especially spiritual and therapeutic traditions. According to the Comaroffs, it is precisely the shock between missionary will and the processes of resistance, selection, and alteration that the Tsawana people go through, successively or simultaneously, that has created modernity. It derives in some way from what the West and the colonial enterprise call *modern*, the first manifestation of which was the mission to civilize the native peoples, and the last of which was modernization. These have linked the colonial enterprise and the nationalist struggle and its pursuit of development and achieving parity with Western economies. The emblems of the colonial enterprise are roads, commerce, and sanitation; the nationalist emblems are schools, community clinics, and electricity.

Among the best available analyses of colonial modernity are the groundbreaking studies by two experts on the French colonial empire, Louis-Hubert Lyautey (1854–1934) and Joseph-Simon Gallieni (1849–1916), the former on Morocco and Indochina, the latter on the Sudan and Madagascar. According to Paul Rabinow, the oscillation between the extremes of colonial modernization and continuing poverty within a framework of authenticity is not an exclusive characteristic of the autochthonous elite of African colonial societies. Gallieni, for example, established a definitive correspondence between pacification and modernity. In contrast to Lyautey's cultural relativism, he was a universalist. He did not by any means imagine that one might regard the lack of sanitation and the nondistinction among domestic space, work space, and livestock pen as anything other than signs of a lack of civilization. For him, “the sign of civilization was a busy road; the sign of modernity was hygiene” (Rabinow, pp. 149–150). Here, the meaning of modernity is, by colonial logic, constructed around elements such as security, communications lines, agriculture, commerce, and population growth.

It is difficult to determine where this chaotic journey will end. The paths and detours that it has taken reflect the great difficulty involved in making sense of a concept that is so prevalent in everyday conversations and in philosophical, political, moral, aesthetic, and cultural analyses, and increasingly in the economic realm as well. The questions regarding the genealogy

of the concept of modernity and its different forms, from its initial appearance to its commonplace deployment and the subsequent debates about it, have provoked numerous examinations of its heuristic value, its effects in terms of status in the narrative and scientific fields, its limits, possibility of application, and the different manipulations that it offers to those who lay claim to it, adapt it, or reject it. As much as the imaginations it recaptures, the historical traces it carries, the uses and abuses it has undergone, the possible or probable futures that one accords it partake of different modes of reference. And it is precisely for that reason that no one challenges it for having lost, during this journey, its capacities for setting in order or disorder realities, as much descriptive as figurative. For others, despite its epistemological and narrative weaknesses, reflecting a quasi-impossibility of relating other histories and conveying other circumstances, modernity is simultaneously a horizon line, a point of anchorage, a mode of being, and a means of constructing a geography of people, of cultures, of aesthetic forms. It is probably this plasticity that makes it what it is, always different, always debated, as expected, plural and unstable, between, on the one hand, European modernity and its desire to remake the world in its image or according to its dictates, and, on the other hand, the never-ending processes of rewriting, reinterpreting, and/or retreating from other societies.

EAST ASIA

Modernity (*kindaisei* in Japanese, and *xiandaixing* in Chinese) is a relatively recent term in the intellectual vocabulary of East Asia, becoming current only after World War II. Differing conceptions of "the modern" start much earlier, when terms long available in both languages acquired new connotations, as the region felt the impact of the West. The classical Chinese *jin* (close, nearby) provided the root for the Japanese *kinsei*, or "recent epoch," popularized in the sense of "modern period" by translations of European works in Meiji time. It was soon replaced by *kindai* to free Buddhist implications in *sei*. These came to China as loanwords *jinsbi* and *jindai*, but gave way to *xiandai* in the early 1920s, indicating not "recent" but "present" age. Although intellectual exchange between the two countries was intense after the Opium War (1840–1842), ideas relating to the "modern" in fact developed along distinctive trajectories.

At the same time, certain shared features have been unmistakable. The notion of the modern, coming to the region accompanied by the military violence of Western imperialism, acquired a strongly spatial, not just temporal, force. It meant learning from the West in both enlightenment and material advance, and struggling for equal position with the West in national, cultural, and intellectual terms. This implied an inevitable element of borrowing or imitation, bringing with it anxieties of collective identity. Moreover, the very process of

modernization brought unintended—or even uncontrollable—changes to social life, turning “modernity” into part of an unprecedented daily experience that demanded articulation. Consequently, hard claimed universal ideas have been constantly challenged by local experience, and the relation between universal aspiration and particular attributes is never stable. These were issues that have preoccupied thinkers in the region down to the present.

Civilization and Enlightenment: Meiji Japan (1868–1912)

The Meiji Restoration set the stage for the first major bid of modernization. The driving force behind the program was the determination to secure *fukoky kyōhei*—rich country, strong army. But Meiji culture contained other aspirations as well. The most popular catchwords of the early Meiji years—*bunmei kaika*, “civilization and enlightenment”—were significantly different. The most forceful crusader for them was the prolific writer Fukuzawa Yukichi (1835–1901), who coined the term *bunmei* itself. His books *Seiyō Jijō* (1866–1870; Conditions in the West, 3 vols.) and *Bunmeiron no gairyaku* (1876; Outline of a theory of civilization) sold numerous copies. According to Fukuzawa, “civilization can be defined as that which advances man’s knowledge and virtue” with an open future; presently, Japan was only “semideveloped” (*hankai*), compared to Europe and the United States, a condition that defined the task in hand. Contrasting East and West, he wrote that “there must be some fundamental difference in the education of the Western and Eastern peoples. In the education of the East, so often saturated with Confucian teaching, I find two points lacking: that is to say, the lack of studies in ‘number and reason’ [science] in material culture, and the lack of the idea of independence in the spiritual culture” (*The Autobiography of Fukuzawa Yukichi*).

Fukuzawa’s original teaching, influenced by John Stuart Mill (1806–1873), emphasized the values of personal independence and a disciplined but free individuality as bases for a modern society, and the need for public diversity of viewpoints. However his commitment to enlighten the “uncivilized” led him to embrace policies of Japanese imperial expansion that followed European and American examples. Coining the term *datsua nyūō* (de-Asianization and joining Europe), he said that “our country cannot afford to wait for the enlightenment of our neighbors and to co-operate in building Asia up. Rather, we should leave their ranks to join the camp of the civilized countries of the West” (“Datsua ron,” 1885, On de-Asianization). By the end of his life, Fukuzawa had abandoned his earlier support for “people’s rights” and expressed boundless enthusiasm at Japan’s military victory over China.

In 1886, the twenty-three-year-old Tokutomi Sohō (1863–1957) published his hugely successful *Shōrai no Nihon* (The future Japan). Announcing that “the democratic trend is the world trend,” the book conveyed a new and more intense sense of the pace of modernity and the ceaseless transformations it would require of his countrymen. “The future of reform is reform, but what sort of reform will it be? What sort of reform should it be? After the deluge comes the deluge. But what sort of deluge will it be? What sort of deluge should it be? Time

flies faster than electricity.” Looking forward to a more industrial and mercantile version of modernity, inspired by John Bright (1811–1889) and Herbert Spencer (1820–1903), he argued that Japan’s vocation was to emerge from “a natural commercial nation” to become “an industrial country; and as a natural consequence . . . a democratic country.”

Tokutomi had few doubts of the ability of his cohort to make the necessary changes, claiming confidently in his journal *Kokumin no tomo* (Friends of the nation) the next year: “The old men of the past are gradually making way for the young men of the New Japan. Oriental phenomena are on their way out; Occidental phenomena are beginning. The period of destruction is at an end and the age of building is soon to start.” This was the age of the utopian political novels, too, with plots set in future times as in *Shin Nippon* (1886; New Japan, by Ozaki Yukio, 1859–1954) and *Setchūbai* (1886; Plum blossoms in snow, by Suchiro Tetchō, 1849–1896) finding an enthusiastic reception. Such enthusiasm easily turned to nationalism, as it did in Tokutomi’s case, once the Sino-Japanese war started in 1894. Thereafter, he remained an ardent supporter of the ultranationalist cause.

By the end of the Meiji period, to the cancellation of liberal political stirrings, on one side, as reforming intellectuals were absorbed into the ideology of a militarized state, corresponded on the other side the distress of lonely individuals, unanchored in the new society, as a central experience in the arts. The foremost novelist of the period, Natsume Sōseki (1867–1916), gave striking expression to this theme in his fiction, rejecting naturalist conventions. Sōseki had little confidence in the results of Japanese modernization. Scornful of both Western imitation and nationalist swagger, he told himself in 1902: “People say that Japan was awakened thirty years ago, but it was awakened by a fire bell and jumped out of bed. It was not a genuine awakening but a totally confused one. Japan has tried to absorb Western culture in a hurry and as a result has not had time to digest it” (Sōseki’s diary, 16 March 1902). He feared the worst from this force-fed diet. In his essay *Gendai Nihon no kaika* (1912; The enlightenment of modern Japan), Sōseki predicted:

If by dint of physical and mental exertions, and ignoring all the difficulties and sufferings of our precipitous advance, we succeed in covering in half the time it took the more prosperous Westerners to arrive at the same stage of specialization, the consequences will indeed be serious. We will be able to boast of a fantastic acquisition of knowledge, and will inevitably suffer a nervous collapse from which there will be no recovery.

Belated Enlightenment: China (1880s–1920s)

On the East Asia mainland, ideas of modernity developed later. In Korea, most enlightenment thinkers were trained in Japan, and these became the leading spokespersons for modernizing reforms in the late nineteenth century, and, when Korea eventually fell to Japanese colonialism in 1910, for a cultural nationalism and political independence. Chinese thinking about modernity, by contrast, was shaped by a tenacious Confucian view of the world, intertwined with erratic strands of

Buddhism and Western learning, and was marked by the persistent failure of efforts to reform the late Qing state for most of the nineteenth century. The result was a development in which enlightenment discourse was overshadowed by utopian constructions.

The leading reformer of the period, Kang Youwei (1858–1927), was a generation younger than Fukuzawa, but his ideas were notably less Westernized. In the early 1880s, Kang envisaged the emergence in another hundred years of equal rights for all human beings, phasing out the Confucian hierarchy between emperor and ministers, between gentry and commoners, and between men and women. But by the 1890s, the vague notion of a “public agreement” that would “lead every living being into the paradise of supreme happiness” (*Kangzi nei wai pian*, 1884, Kangzi: Inter and outer chapters) had given way to an accommodating monarchism that promised to give present society a stage of “well being” (*shengping, xiaokang*), en route to a “grand peace” (*taiping*) of the whole world of “great harmony” (*datong*). The vision of progress in it offered utopian constructions dressed in Confucian discourse as a remedy to China’s modern crisis.

The thinker-translator Yan Fu (1853–1921) was responsible for introducing Social Darwinism into China with a translation of T. H. Huxley’s *Evolution and Ethics*, significantly rendered as *Tianyan lun* (1895; On Heavenly evolution). Convinced of the need for the Chinese to understand the implications of “the survival of the fittest,” Yan warned his countrymen: “The weak invariably become the prey to the strong, the stupid invariably become subservient to the clever” (*Yuanqiang*, 1895, On strength). In an essay entitled “*Lun shi bian zhi ji*” (1895, On the urgency of change in the world), he noted that “[t]he greatest difference in the principles of West and East, that which is most irreconcilable, is that the Chinese love the ancient and ignore the present, whereas Westerners strive for present to overcome the past.” Here what is modern in his evolutionary horizon was still more a matter of geographical contrast than of temporal advance. As time moved on, through the chaos of the early Republic, Yan became disillusioned with the idea of evolution itself.

The first to tackle problems of modernity more directly was Kang’s disciple, Liang Qichao (1873–1929), who fled to Japan after the failed attempt at state reform in the summer of 1898. With far more access to works by Meiji thinkers and Japanese translations of Western literature, he wrote that the effect of reading them was as if “suddenly seeing the sun in a dark room and drinking on an empty stomach” (“*Lun xue riben wen shi yi*,” 1899, On the benefit of learning Japanese). Here were the models for the modernization of China. Reconfiguring the crisis of the time, Liang effectively replaced “Western” with “new” as a defining adjective for the tasks of the time. In his article “*Shanonian Zhongguo shuo*” (1900, On young China), he wrote: “What has made China today a senile giant is the evil deeds of dying old men.” The task of creating a new China fell to the young, and he enumerated all the fields—from morality and laws to institutions and conventions—that required recasting by them in “an independent spirit” (*Xinmin shuo*, 1902–1906, Discourse on the new citizen). He also called for a “new history” and “new novel,” publishing a utopian fiction of his own, *Xin Zhongguo*

weilai ji (The future of new China) in 1902, while advocating a monarchical constitution under the Manchu rule.

Liang’s call for a new historiography was challenged by the classical scholar Zhang Binglin (1868–1936), who argued that Confucius should be seen as the first great Chinese historian, founding a tradition of historical studies that retained its validity to the present. “Instead of persuading people to worship Confucianism as a religion, we should encourage them to treasure the history of the Han nation” (1906). Politically a resolute revolutionary committed to the overthrow of the Manchu court, Zhang sought intellectually to tie the nationalist movement to pre-Qing traditions: “Historical events and relics can move patriotic feelings.” The ensuing debate between the two showed the persistent classical sense of the past that had to be overcome before “modern times” could be successfully conceptualized in China.

It was not until the following decade that these parameters changed to that similar to, but almost half a century later than, Fukuzawa’s *bunmei kaika*, in both essence and scale. The two leading intellectuals of the period, Chen Duxiu (1879–1942) and Hu Shi (1891–1962), launched a sweeping campaign against Chinese traditions in the name of democracy and science in 1917, in a movement that culminated in the May Fourth Incident against the post-World War I Versailles Peace Conference in 1919. Hu Shi insisted on a “critical attitude” and the need to “revalue all values” (*Xin sichao de yiyi*, 1919, The significance of the new thought) in the light of modern reason. Chen Duxiu declared:

In support of Mr. Democracy, we must oppose Confucian teaching and rites, the value of chastity, old ethics and old politics. In support of Mr. Science, we must oppose old arts and old religions. In support of both Mr D and Mr S, we must oppose the “national essence” and old literature. . . . How many upheavals occurred and how much blood was shed in the West in support of Mr D and Mr S, before these two gentlemen gradually led Westerners out of darkness into the bright world. We firmly believe that only they can resuscitate China and bring it out of all the present darkness of its politics, morality, scholarship and thought. (*Xin qinqnian zui-an zhi dabian*, 1919, In defence of the *New Youth* against accusations)

It was in the urgency of this perspective that the semantic shift of the term for “modern” from *jindai* to the more sharply present-focused *xiandai* occurred.

It was left to China’s greatest writer of the period, Lu Xun (1881–1936), to consciously hold skepticism while fighting under the banner of Mr. D and Mr. S against conformist tendency. One of the first in China to introduce literary works from weak and colonized countries in Europe and Asia, he most valued the patriotic affection and fighting spirit expressed by the people. Similarly, he quoted Byron and Nietzsche repeatedly as the model for noncompromised struggle. He attacked those who “dream not about the future, only in the present,” and warned those optimistic about modernity that “the most painful experience in

life is to wake up from a dream and find no road to follow” (“Nala zouhou zenyang,” 1923, Now Nora is after leaving [the Doll’s House]). With a clear understanding that no ready model for imitation was available, Lu Xun envisaged life in constant struggle of paving new roads: “What is a road? It is what comes out from tramping over where there was no road, paved out from where there were brambles only.” It was also to rejuvenate “human being’s potential in longing for perfection” (“Gusiang,” 1921, Hometown) to march forward regardless of how difficult, how seemingly hopeless the future ahead might be.

Urban Cosmopolitan Modernity (1920s–1930s)

In interwar Japan a new kind of consciousness of modernity crystallized, around the scenes, rhythms, and sensations of big-city life, which spread to China some ten years later. This was the modern not of institutions or technologies but of the experience of life Charles Baudelaire (1821–1867) and Arthur Rimbaud (1854–1891) had celebrated in Europe. The 1920s saw a wave of translations of modernist literature from the West, and formal experiments by Japanese writers. Successive literary schools contended against each other, virtually all of them taking individualism as a given, with aesthetics of existential fragmentation and a mixture of fascination and repulsion for the transient surfaces of metropolitan life. The one ingredient, important in the West, that was missing from this modernism—it would be true of the Chinese variant as well—was the European anguish at loss of religious faith. The solitude of humankind in a world without God was never a major theme of East Asian modernism.

The most influential of its currents in Japan was the New Sensationalism—associated with Yokomitsu Riichi (1898–1947) and early Kawabata Yasunari (1899–1972)—which Kawabata defined as “Expressionism in epistemology and Dadaism in formal expression” (“Shinshin sakka no shin keikō kaisetsu,” 1924, An explanation on the new tendency among young writers). The New Sensationalism came to Shanghai in the late twenties and early thirties. Yokomitsu entitled his first full-length novel *Shanghai*. It was in these years that the term *xiantai* became ubiquitous in fashion magazines and avant-garde journals alike, and that—as in Japan—the idea of a specifically aesthetic modernism arrived, associated with the breaking of formal conventions and social taboos, erotic or otherwise.

In both cases, cosmopolitan influences were celebrated and even worshiped, but in general without the revolt against “philistinism” or the spirit of rebellion against the established order that marked much of Western modernism. Yokomitsu’s sense of universal cosmopolitanism ended with his “melancholy journey” to Europe in 1936, where a pilgrimage turned into disillusion, and he subsequently “returned” to the nationalist course, reaching the same end, via a different path, as Fukuzawa decades earlier. But something of the same feel for the urban landscape was also shown by the Chinese leftist writer Mao Dun (1896–1981) in his novel *Ziye* (1933; *Midnight*), which covered a wide range of lurid scenes in Shanghai in a style not dissimilar to that of the New Sensationalists. Despite China’s national crisis by the late thirties, the younger generation’s fascination with modernism continued into the war years, especially in poetry, before fading away in the 1950s.

“Overcoming Modernity” (1940s–1950s)

Intellectual reactions against modernity started early in East Asia, and were not confined to traditionalists. Alarm at the “madness” or “lost soul” of modern industrialism and militarism was soon expressed by enlightenment intellectuals in both China and Japan. Touring Europe after World War I, Liang Qichao (1873–1929) was shocked by what he found:

Countless total strangers live together, sharing the same market or factory, with absolutely no links of affection to each other, merely relations of material interest. Most people own no property, depend on wages only, and lack any roots for survival, like a withering lotus. Social complexity exceeds anyone’s capacity for orderly responses to it, over-stimulating and exhausting the nervous system. After work, there is need for play, but abruptly it is time to work again; day and night there is no rest. Desires multiply constantly, the price of goods rises uninterrupted, life becomes harder and harder, competition fiercer and fiercer. (*Ou you xin ying lu*, 1920, Impressions from my European journey)

Yet he believed China, as a latecomer to modernity, still had a chance to draw its own critical lessons from European development; he had converted to the May Fourth conviction of science and democracy as the prerequisite of entry into the modern world.

At virtually the same time, the philosopher and reformer Liang Shuming (1893–1988) set out a severe critique of contemporary Western societies in his book *Dongxi wenhua jiqi zhexue* (1921; *The cultures of East and West and their philosophies*), attacking their separation of man and nature, individual and society. After the catastrophe of World War I, the world had arrived at a point where it had to alter direction. In Liang Shuming’s view, this meant shifting from the agonistic reason, guided by intuition, of the “cultural will” of the West, to the intuition guided by reason of the Chinese cultural will—this was where the world was now heading—and eventually to the valuation of faith and devaluation of desire that was Indian cultural will. The modern society that had emerged in the West was a necessary step in this long-run development, and the spirit of democracy and science it had brought was precious. But a better civilization was possible beyond it.

The challenge to uncritical images of modernity issued by the two Liangs led to a series of controversies in China in the 1920s, in which the resources of traditional Chinese learning in a time dominated by Western configurations of human knowledge and the potential for an alternative path of modern development for China were hotly debated. Although Liang Shuming was subsequently considered a precursor of neo-Confucianism in late-twentieth-century China, at the time he was true to the May Fourth generation, becoming an active proponent and organizer of agrarian cooperatives, and like Liang Qichao in the same period advocating a variant of socialism as a remedy for China’s ills.

Japan. In Japan, probing of the dilemmas and paradoxes of modernity began already in the Meiji period, and has lasted

to this day. In the 1890s, the Christian thinker Uchimura Kanzō (1861–1930) questioned the purpose of his country's headlong drive to join the ranks of the West:

Can present-day civilization compensate for the loss of the independence of our souls through modernization? Are the steam engine, radio, champagne, torpedoes, and guns better than peace? Does civilization mean spending six billion dollars to maintain standing armies of two and a half million soldiers in Europe, producing anarchists and increasing nervous disorder? (“Kyūanroku,” 1893, A record of search for peace)

But by Taishō times, Uchimura's dissent was directed more at his fellow intellectuals than at the government:

I rejoice at the news that the government has a plan to restore Chinese studies in school. It is not the time to argue over the difference between the ideas of the West and the East. What we should do now is to destroy modern man [*kindai-jin*] and modern ideas [*kindai-shiso*]. (“Hibi no shōgai,” 1924, Daily life)

There was an echo here, however distorted, of Liang Shuming's desire to counter temporal divisions with a call for spatial unity.

Stark counterpositions of West and East nonetheless persisted—even for those who despised *kindai jin* and *kindai-shiso* no less than Uchimura—throughout the interwar and war years. For in this period the Meiji aspiration of climbing up the rungs of a hierarchical world order of “civilization” was replaced, on the one hand, by spatially stressed notions of a plurality of cultures and ethnicities, under the catchphrase of a “return to Japan.” On the other hand, Fukuzawa's vision of enlightened individuals acting with a spirit of independence gave way to fear of the modern decadence of an ill-informed individualism that was the captive of a debased mass culture. At the same time, images of socioeconomic modernity itself became much more divided. In the 1870s it was taken for granted that there was just one basic model of civilization, even though the Meiji oligarchs had borrowed selectively from the West. By the 1930s this was no longer possible. Russian Communism, Italian Fascism, American capitalism, and German Nazism offered a range of completely different models of state and society.

Against this background, a symposium that would have enormous resonance was held in Kyoto in the summer of 1942, shortly after the outbreak of the Pacific War. Modeled on League of Nations symposia chaired by Paul Valéry in the 1930s, notably on “The Future of the European Spirit,” this Japanese forum brought together philosophers from the Zen-and-new-Kantian influenced Kyoto School founded by Nishida Kitarō (1870–1945), writers from the Japan Romantic School Society, to discuss the problem of “Overcoming Modernity” (*kindai no chōkoku*). The political context of the symposium—Japanese fascism—featured prominently in the discussions, but these did not adhere to any rigid ideological

agenda, ranging over many aesthetic, philosophical, cultural, and social issues. Modernity had to be overcome, some argued, because the failures of capitalism, democracy, and liberalism had led inevitably to the war. But was modernity simply a European or American phenomenon? Others doubted it, pointing to a Japanese modernity compounded of indigenous and foreign elements alike. By the end, the chairman of the symposium concluded it had failed in its task.

Yet, after World War II, the symposium became a landmark for intellectual inquiry into Japan's modern history and its future. This outcome was primarily due to the work of Takeuchi Yoshimi (1910–1977) in the early 1950s, who extracted its quest from the compromised setting of wartime Japan, and “re-functioned” it for an anti-imperialist politics in postwar Japan. Significantly, Takeuchi was the major Japanese editor and translator of Lu Xun. Writing after the Communist victory in China, he contrasted the trajectory of the Chinese Revolution with the Japanese experience of a military-fascist regime followed by American occupation. Yet, throughout East Asia modernity had been the result of imperial violence by the West that forced it upon the East, in a continuous process in which until 1949 the West had always claimed victory. Truly to overcome that modernity in Japan required a “double resistance”—resisting both the external imposed reason and the internal denial of the defeat of which it was the outcome. Such resistance was the task of the citizens of a politically responsible nation (*minzoku*), to exercise their independent subjectivity (*shutaisei*). It was not antimodern. “If I were asked what is resistance,” he wrote, “the only answer I have is, ‘It is what you find in Lu Xun.’” (“Chūku kindai to Nihon no kindai,” 1948, China's modern and Japan's modern; in later collections the title changes to “Kindai towa nanika,” What is modernity).

In postwar Japan, subjectivity had become one of the central terms of political debates over the recent past, as intellectuals sought to understand the human agents of social change in the processes of modernization and Japan's war experience. Maruyama Masao (1914–1996), a leading thinker of the Occupation period, rejected the existential interpretation of subjectivity of the Kyoto School, which continued as a major influence in the 1950s. During the war, Maruyama had invoked Fukuzawa as a thinker who “could never conceive of national independence in the absence of individual autonomy” (“Fukuzawa ni okeru chitsujō to ningen,” 1943, The order and humane in Fukuzawa); and in his path-breaking essay *Chōkōkashugi no ronri to shinri* (1946; “The logic and psychology of ultranationalism”) he attributed the disastrous course of Showa politics to the “collective irresponsibility” of an elite drifting to war in the name of a mystified imperial rule transcending temporal or spatial boundaries, and commanding the passive obedience of its subject-citizens (*kokumin*).

A true democratic revolution in postwar Japan, Maruyama contended, required the “establishment of a modern personality,” capable of responsible decision making. His ideal here was Max Weber's (1864–1920) ethic of responsibility, as set out in *Politics as a Vocation* (1918). This was an admiration shared by his contemporary Otsuka Hisao (1907–1996), an economic historian who energetically appropriated Weber's

theory of the Protestant ethic as a model for the kind of self-discipline needed to build a robust civil society in Japan. In their different ways, Maruyama's championship of the "modern personality" and Takeuchi's call for resistance by the *minzoku* opened a new page of critical thinking in Japan. The themes of modernity or its overcoming were taken up by many others in subsequent decades and have lingered in various contexts as a persistent theme in Japanese thinking to this day.

The issue of a politically responsible citizenry, resonant in Maruyama and Takeuchi, reappeared in Korean intellectual life during the 1970s. Paik Nak-chung (b. 1938), a leading literary critic, advocated a "national literature" (*minjok munhak*), the modernity of which is defined by its opposition to Korea's North-South division, and its openness to the world at large from a Third World position. Paik has since actively promoted an independent, creative national subjectivity, in a series of debates on modernism, postmodernity, and globalization.

Modernization and Postmodernity: Ongoing Debates

If *modernity* and *modernization* were characteristically Weberian concerns, they had little place in Marxist thinking, since their generality blurs the distinction between capitalism and socialism as forms of postfeudal society that is central to Marx's theory of history. Thus the major historical controversy within the communist movement in the two countries developed quite independently of debates over modernity, and without reference to them. The Chinese Revolution might be objectively responsible for a vast modernization of the country, but for a quarter of a century the notion itself was essentially foreign to its vocabulary.

With the strong reaction against the Cultural Revolution (1966–1976) that came in the early seventies, this changed. The government adopted the slogan of the "Four Modernizations": industrial, agricultural, techno-scientific, and defense. In time the function of this semantic shift became increasingly clear—to cancel the long-held distinction between socialism and capitalism, as Mao had feared. But in doing so, it reopened the classic "wound" in the concept itself, which was first painfully exposed in Meiji times. Was modernity just a "rich country and a strong army," as the quartet of official goals implied? Dissidents did not think so. In 1978, Wei Jingsheng (b. 1950) called for a "fifth modernization"—the institution of political democracy—and was punished with a long prison sentence. Rapid economic growth and political repression have continued to date.

By the 1990s, debates on postmodernity had reached China, but in the early 2000s the principal stake in discussion remained the concept of modernity itself. The historian of theology Liu Xiaofeng (b. 1956) in his work *Xiandaixing shehui lilun xulun* (1996; A preface to social theory of modernity) believes that modernity manifests itself in the form of a social structure, whose inherent contradictions can never be put to rest by actions of "overcoming," but will regenerate themselves endlessly, and which is European in origin only through a series of historical accidents. Other countries then initiated modern processes of social change under external pressure, albeit with their own varied historical legacies. Since the late Qing

period most Chinese intellectuals, Liu argues, failed to grasp the logic of modernity because they tended to accord priority to the nation instead. In his view, the moralistic party-state that came into being after 1949 is now decaying, and to fill the vacuum it has left, a religious community needs to be rebuilt through religion at the local level, both in order to protect individual freedoms and to ensure an ethical basis for people to cope with an ever-changing society. The modern human without God must find salvation in religion again.

Approaching the issue from another perspective, the intellectual historian Wang Hui (b. 1959) worked for more than a decade on his study *Xiandai Zhongguo sixiang de xingqi* (2003; The rise of modern Chinese thought). In this work he traces the origins of ideas of modernity in China back to the eleventh century, with the aim of showing that capitalism can hardly lay claim to everything that is today associated with the modern. Himself the author of a work on Lu Xun, he champions a spirit of resistance, similar to that in Takenuch, though without emphasizing the "double," to mystifying discourses of global modernization, and the historical teleology that he argues they always entail, with an obligatory class structure and empty representative institutions at the end of the road. Alternative modernities remain necessary and possible, even if these will now require a different international order, sustaining national innovations, rather than crushing them in a neoliberal straitjacket.

In Japan, on the other hand, the success of postwar capitalist development did not put an end to questioning of modernity. Among significant debates, one centered on literature. Karatani Kōn (b. 1941), in his study *Nihon kindai bungaku no kigen* (1980; *Origins of Modern Japanese Literature*) emphasized the "nearness" of the "origins" of Japanese modernity, instead of tracing it to a genealogically distant past. Pointing to a global simultaneity of multinational modern experience, he sought to unravel the historical specificity of the Japanese case. Karatani almost immediately drew sharp disagreement from a number of Japanese scholars, including Kamei Hideo (b. 1937), who charged him with disregarding the continuities in the Japanese experience of modernity. For Kamei, exclusive attention to a uniformly identified "modernity" has suppressed the multiple possibilities latent in the flourishing creativities of Meiji Japan, which developed out of Edo culture and still require an intellectual effort to recover. The national component of modernity, projected by Takeuchi, acquired a new level of depth for inquiry.

With the consumer boom of the eighties, many intellectuals began to wonder whether Japan was not witnessing a new way of "overcoming the modern"—entrance into postmodernity. In a famous intervention, Asada Akira (b. 1957) has given the interlinked problems of subjectivity and historicity a critical postmodern twist. Drawing playful inspiration from Nishida Kitarō, he has contrasted a senile capitalism in Europe, under the sway of transcendental traditions, and an adult capitalism in America, marked by an inner-directed sense of individual responsibility, with an infantile capitalism in Japan, displaying the "nearly purely relative competition exhibited by other-directed children." Asada has described the postindustrial psyche of

Japanese society in the following way: “Children are running around, each as fast as possible, at the front lines of the history of capitalism as infantilization proceeds. They are enveloped by a ‘place’ whose age is hardly known—the ‘place’ that is trans-historical in the sense Nishida demonstrated” (1989). Debates on modernity in East Asia have plainly not yet run their course.

MODERNIZATION. The term *modernization* conjures images of social change in the direction of general improvement over the past. In contemporary social sciences, the notion has been the basis of a theoretical orientation—variously referred to as modernization theory, approach, paradigm, or framework—to the study of the development of Third World or underdeveloped societies. The conception of development as a process of modernization gained prominence in the period after World War II, but its popularity ebbed in the 1960s. There were rival definitions of modernization in the social sciences; this entry, however, will be concerned mainly with the use of the term for a general theoretical orientation—a set of linked assumptions framing analysis of and debates about the nature and challenges of development. In this regard modernization was a historically unique type of social change, which was inexorable, transformational in its effects, and progressive in its consequences. The main institutional pillars for modern society were industrialism and the nation-state.

A product primarily of American social science, the modernization approach was inspired by two important and concurrent developments of the postwar era, the disintegration of European colonial empires and the Cold War. The emergence of many new nations out of the ashes of European colonial empires generated unprecedented intellectual and policy interest in their economic, political, social, and cultural makeup and development. With the United States and the Soviet Union as the two superpowers and respective leaders of the Western and Eastern blocs, the Cold War was, among other things, a competition between two ideologies—liberal capitalism versus socialism—each claiming to be the superior path to modernity. This ideological contest framed the superpowers’ rivalry for the allegiances of developing countries. Modernization theory, directly or indirectly, was concerned with resolving the problems of underdevelopment by promoting market-based economies and pluralistic political systems. The approach thus appeared to be scholarship guided by and in support of specific Western policy objectives. The intellectual roots of modernization theory lie in pre-Socratic Western thinking about social change, and more immediately in the European Enlightenment of the seventeenth and eighteenth centuries, which gave birth to modern social sciences. The Enlightenment embodied a critique of the “Old Order,” when European societies were at the threshold of industrialization and exposed to social dislocations that would only intensify. Convinced of the inevitable demise of the old feudal

order and of absolutism, Enlightenment intellectuals propounded the “Idea of Progress,” a dogma about the immanence and desirability of change. In opposition to defenders of the Old Order, of social arrangements governed by and political authority legitimated by religion and tradition, they argued that rational knowledge of society, based on scientific investigation and freed from religious dogma and superstition, was possible and represented a superior form of knowledge. Once validated and acted on, such knowledge would advance the material and cultural emancipation of society. The founders of modern social sciences, prominent among them Karl Marx, Émile Durkheim, and Max Weber, were products of the Enlightenment and enamored of the idea of progress as a universal historical process leading to a single modernity. In Marx’s famous theory of history, for example, societies progressed through modes of production—primitive communism, slavery, feudalism, capitalism, and communism—and their corresponding political structures. In general, nineteenth-century evolutionary theories of social change were equally all-embracing, relied on dichotomous conceptions in which societies were characterized as composed of traditional and modern attributes, and saw social change as a process of structural changes resulting in the preeminence of the attributes of modernity. However conceived, emergent industrial societies and modern nation-states of the West represented the most advanced stage of societal transformation. They predicted the future of underdeveloped societies, the majority of which at the close of the nineteenth century had effectively been colonized by European states.

Modernization theory adopted the narrative of progress of nineteenth-century evolutionary theories of social change. It dispensed with the racist overtones of many, which tended to separate societies into “civilized” and “savage” and doubted the possibility of development of the latter. Adopting the nation-state as its main unit of analysis, the theory defined development as an endogenously driven process and maintained that modernization was a goal attainable by all societies. Retaining but elaborating the dichotomous conceptions of earlier evolutionary theories, the modernization approach conceived of underdeveloped societies as comprising traditional and modern sectors. The traditional sector was rural and agrarian, its sociopolitical organization defined by religion, superstition, primordial loyalties, and similar forces. In contrast, the modern sector was urban, its economy dominated by industry; social standing was determined by economic position (social class) and hence the result of personal achievement, and secularism defined the organization of social relations and public life. In effect, this equated development with the increasing Westernization of underdeveloped societies through elaboration of market-based economies and liberal, pluralistic political systems. One of the most famous articulations of the approach, W. W. Rostow’s *The Stages of Growth: A Non-Communist Manifesto*, made this explicit. Modeling his analysis on Marx’s theory of history, but blunt about his intention to present liberal capitalism as the superior path to modernity, Rostow argued that economies progressed through five historical phases: traditional, preconditions for takeoff, takeoff, drive to maturity, and the age of high mass consumption. Contrary to Marx, who saw capitalism as a way station to the ultimate modern society—stateless communism—Rostow argued that high-mass-consumption society, of which

the United States was the most fully realized incarnation, was the end of the modernization process.

In general, the two key conditions for successful modernization were economic growth through industrialization and modernizing elites with the “psychocultural attributes” to guide their societies through the process. Modernization of underdeveloped societies could be realized in a shorter period than had been the case for Western societies. In bequeathing ex-colonies with modern economic enclaves and Westernized elites, colonial rule had laid the foundations for accelerating the process. Interestingly, the narrative of progress that undergirded the approach resonated with the nationalist aspirations of Third World elites. The promise of development of their societies served as a ubiquitous trope for the legitimization of their power. Although they adopted different ideological positions, modernization for them was fundamentally about the elaboration of the two projects of economic development through industrialization and nation-state building.

The modernization approach was subjected, as the 1960s unfolded, to increasingly blistering criticism, brought on by the realities of Third World societies, which mocked its excessive optimism. The record of economic growth in developing societies was at best mixed, and what growth occurred appeared to be accompanied by increases in mass poverty and economic inequality. Whereas modernization theory presumed economic growth that expanded social groups and engendered behavioral changes that favored the emergence of pluralistic political systems, instability and authoritarian rule appeared to be the norm. Against this backdrop, criticisms centered on the theory’s ideological character, its limitations as a conceptual framework, and its contributions to the foreign policy objectives of—especially—the American government. The ethnocentrism of the approach, with its dichotomous constructs like “tradition” and “modern”—transparently, abstractions from vague and generalized images of the nature of changes in Western societies attending the rise of industrialism and the modern nation-state—drew fire. Based on such ideal types, the approach imagined the historically contingent experiences of Western societies as relevant to all societies. Moreover, in implying that “modern” and “traditional” were self-contained, it lacked definitional specificity and was of dubious analytical value, for social structures and relations in all societies were complex, shaped by the interpenetration of traditional and modern attributes, however defined. This was obviously the case in developing societies that had felt the impact of European colonization.

For conservative critics, such as the political scientist Samuel Huntington, the ethnocentrism and teleology of modernization theory made it a poor guide to public policy. The conjecture of an unproblematic causal link between economic development and the advance of pluralistic political systems encouraged a moralistic approach to policy toward the developing world, which promoted democracy even if it was not necessarily in the best interest of the United States. The social dislocations caused by economic development fed political instability; therefore, the creation of political order—the institutionalization of political authority—was a precondition for

economic development and democracy. According to this argument, the main objective of American policy toward the developing world ought to be support of regimes that are capable of maintaining order and amicably disposed toward America's economic and strategic interests.

Radical critics, on the other hand, such as dependency and world system theorists, dismissed modernization theory as well as its conservative critics as engaged in providing intellectual justification for American imperial designs. In adopting the nation-state as the primary unit of analysis and positing modernization as a primarily endogenously driven process, they were both guilty of misleading representation of underdevelopment as an "original condition." Capitalism was a hierarchically organized global system, with nations or regions belonging to the core, semicore, or periphery of the system. The pace and pattern of development of "national" economies were contingent on the manner of incorporation and position of countries or regions within the world capitalist system and its corresponding hierarchy of nation-states. The underdevelopment of peripheral Third World societies followed from their incorporation, through colonialism, as subservient members in the world capitalist system and the shaping of their economies to serve the interests of dominant core states. Their governing elites were not altruistic agents of progressive social change but groups primarily interested in advancing their class interests. This they did in part by the use of state power to create and manage beneficial alliances between themselves and foreign capitalists. For radical critics, then, modernization theory and its conservative critics were both advocating an approach to development that favored the expansion of the world capitalist system.

In the 1980s, modernization theory and its radical alternatives were queried by many influenced by the postmodernist turn in cultural and social analysis. For this new group of critics, variously labeled postmodernist, poststructuralist, or post-development theorists, modernization theorists and their radical critics had more in common than they dared to admit, for their understanding of development was rooted in the dogma of linear progress. Consequently, they were equally guilty of advocating, in the name of development, policies that fostered the repression and disempowerment of marginalized groups in Third World societies, whose right to determine their own futures they denied. The combined weight of criticisms leveled against it robbed modernization theory of its allure. But despite the changing conceptual and normative vocabularies at the twentieth century's end, modernization theory's goal of a world of receding mass poverty and disease and of social and political interactions marked by civility instead of incessant conflict remains a pivotal concern in development analysis.

MODERNIZATION THEORY. For roughly one decade until the second half of the 1960s, modernization theory was in vogue in the social sciences, especially in the United States. The word *modernization* appeared widely in titles, the concept was commonly invoked in efforts to explain long-term change, and it figured in critiques of Marxist theory and discussions of Cold War differences over how newly independent countries should develop. If much of social science analysis at the time was seen as narrow, studies dressed in the mantle of modernization theory attracted attention as meeting an academic quest for cross-disciplinary breadth and a political imperative for lessons to disseminate around the world. Over the following two decades, an entirely different atmosphere arose; modernization theory became a target of far-flung criticism. It was attacked as an ahistorical effort to impose a U.S. or Western model, disregarding obstacles resulting from the actual world order. Many rejected any theory for postmodernist reasons, while others preferred neo-Marxist or world systems theories that put the blame for underdevelopment on the United States. It became popular to dismiss modernization studies as antithetical to solid social science analysis without bothering to mention any serious efforts to apply it systematically or the fact that, even under attack, many took for granted the lingering value of the theory as a framework for understanding modern development.

As the Cold War ended, the debate over modernization theory was rejoined, only to fade gradually in the face of rising disagreements over globalization. Some argued that the fall of communism at last supported the predictions about the danger of deviating sharply from requirements specified in the theory, while others replied that the failure of "shock therapy" and other abrupt changes in Russia and beyond proved once again that the theory was incorrect. Was failure of the socialist model at last proving that the modernization theorists were correct, or was failure of economic advice a sign that a Western model could not be transferred? Later, debates about globalization revisited many of the same themes as modernization theory. A half century after the theory burst into the academic limelight, social scientists are again weighing the pros and

cons of opening to the outside world, political reform in order to improve state capacity and responsiveness, economic integration into a global division of labor, a breakdown of social barriers, and a knowledge orientation that maximizes absorption of information. At the same time, opinion is split on whether what is demanded includes a full-scale embrace of Western notions of individualism, democratic politics, and limited state management, or whether these features are not inherent in the model.

Defining Modernization Theory

Disagreements about what modernization theory is and what has been learned from comparisons bedevil discussions between users and critics. Those who applied the theory often failed to be specific or to supply supporting explanations to establish it as a powerful set of generalizations in the forefront of cross-disciplinary social science analysis, while critics usually neglected to define the theory precisely or to make an effort to balance its merits against alleged shortcomings. Although the theory exerted a huge impact on the disciplines of history, political science, and sociology, and on thinking about capitalism versus socialism, East Asia versus Western advanced capitalist countries, and more versus less developed countries, to many its legacy remains confusing, as does its connection to recent globalization theory. Even at the beginning of the twenty-first century, there is little agreement on what modernization theory is and how it has advanced social science analysis.

The theory of modernization normally consists of three parts: (1) identification of types of societies, and explanation of how those designated as modernized or relatively modernized differ from others; (2) specification of how societies become modernized, comparing factors that are more or less conducive to transformation; and (3) generalizations about how the parts of a modernized society fit together, involving comparisons of stages of modernization and types of modernized societies with clarity about prospects for further modernization. Actually, reasoning about all of these issues predated postwar theory. From the Industrial Revolution, there were recurrent arguments that a different type of society had been created, that other societies were either to be left permanently behind or to find a way to achieve a similar transformation, and that not all modernizing societies had equal success in sustaining the process due to differences in economic, political, and other institutions. In the middle of the 1950s, these themes acquired new social science and political casting with the claim of increased rigor in analysis.

In the early post–World War II era, approximately twenty societies were regarded as highly modernized and roughly another ten to twenty were depicted as having passed a threshold on the path to modernization. Definitions of *modernized* varied. Some noted structural features, such as levels of education, urbanization, use of inanimate sources of energy, and fertility. Others pointed to attitudes, such as secularization, achievement orientation, functional specificity in formal organizations, and acceptance of equality in relationships. Conscious of the ethnocentric nature of many earlier explanations for growth in national power and income, social scientists in the 1950s and 1960s generally omitted cultural traits associated closely with

Western history from definitions of modernity. Yet, given the rhetoric of the Cold War and a preoccupation with democracy in U.S. national identity, political institutions became a central factor in many definitions.

Applying Modernization Theory

It is useful to distinguish two approaches to modernization in the heyday of the theory: applications of already identified steps along a unilinear path; and comparisons of variations along a path becoming more diverse geographically, even if long-term convergence was expected in social indicators. The former approach in its extreme form assumes that the histories of latecomers to modernization (after the first-comers had all been steeped in Western culture) are irrelevant, that they can best achieve economic growth and accompanying modernization by rapid democratization and copying of Western institutions, and that notions of the self and social relationships are destined to become much as they are idealized in the United States. Even if few writers explicitly made these arguments, critics insisted that this approach was the essence of modernization theory. In contrast, the latter approach looks for diversity in societies along the path of modernization, argues that historical legacies shape divergent paths to political and other institutions, and suggests that social relations can be expected to differ as well, even as some convergence occurs.

Clashing views of the Soviet Union may have underscored the two approaches to modernization at a time when Cold War divisions were uppermost in many minds. On the one side were those who expected the Soviet system to collapse. High rates of industrial growth and the ability to project national power presumably would amount to little when the people aspiring for freedom and the economy riddled with inefficiencies reached an impasse. From this perspective on modernization there was only one model, and any seeming alternatives did not merit comparative study. The universal model assumed a high degree of individualism, an intense quest for democracy, and an economy that allowed for little state intervention. If, for a time, a mobilizing state could produce rapid economic growth, this did not signify modernization and could not be sustained.

On the other side were those who recognized efforts to reform the Soviet system as well as the rise of East Asian societies that did not fit the supposedly universal model. They argued that levels of individualism vary, states differ in their involvement in society, and social relations historically have reflected different regional traditions. While modernization in some respects is a “universal social solvent,” there is notable variation even among societies labeled the “West.” The Soviet Union had the potential to concentrate on science and technology in education and the workplace in order to advance a new elite, while providing social welfare benefits to motivate a broader mass of the population. If totalitarianism only produces temporary results, then a technocracy based on rising interest groups could lead to more balanced modernization and eventual convergence with Western societies, where social welfare benefits and central coordination were gaining ground. A comparative approach to modernization theory began with studies of socialist countries, and, after Soviet reforms

stagnated under Leonid Brezhnev (1906–1982; in power 1964–1982), shifted to East Asian countries and especially Japan.

In the 1970s and 1980s, the two orientations in comparative modernization studies contended with theories on the left and the right. The comparative study of East Asia, highlighting first Japan's model of modernization and then the Confucian development model, faced the dependency school and related arguments centered on Latin American cases. In contrast to the insistence of the Latin Americanists that societies integrated into the global system of capitalism were doomed to remain in the periphery, locked into an unfavorable division of labor that perpetuates backwardness, the East Asianists affirmed the opportunities within the world system for an industrious population led by farsighted state policies. Studies of Japanese modernization pointed to benefits from the family system that supported educational achievement, workplace dedication, and long-range planning; the school and examination system that encouraged intense learning and competition as well as loyalty in the classroom, which could be transferred to the enterprise; and the workplace system that favored lifetime employment for a large segment of the workforce, seniority wages, enterprise unions, and competition among firms under administrative guidance from state ministries. While debates proceeded over how much these unusual aspects of modernization would withstand forces of convergence as Japan reached a higher stage of modernization and openness to foreign competition, the comparisons stressed that significant differences could shape development even in countries whose per capita income ranked at the top of the world.

The dependency theorists were guilty of ahistorical analysis, arguing that the Confucian cultures in East Asia that had produced extraordinary premodern levels of literacy, urbanization, meritocratic governance, and commercial development did not matter. Yet politicians and vested interests in some East Asian countries who lauded Asian values and resisted reforms that would broaden democracy and openness to outside influences were guilty, too, of slanted analysis, ignoring the argument of modernization theory that convergence continues, and more complex societies at higher stages of modernization, with greater openness to foreign competition and influences, must give voice to younger generations espousing new values. Critics of modernization theory on the left insisted that struggle against an oppressive world system (not domestic consolidation around shared values) would be necessary, dismissing comparisons that alleged different pathways to success.

The collapse of the traditional socialist model and then the Soviet Union brought to the fore the other struggle between comparative modernization studies and established social science schools, this time of a more conservative character. The comparativists had long argued that the unbalanced nature of socialist modernization would lead to far-reaching reforms. As China experienced economic success through its reforms, these comparativists pointed to policies that work and lessons that the Chinese had drawn from their emphasis on learning from modernization theory, beginning in the late 1970s under the slogan "the four modernizations." Analysts attributed transformation under the Soviet leader Mikhail Gorbachev (b. 1931;

in power 1985–1991) less to pressure from the United States than to a domestic search to rekindle economic growth by activating Soviet society and joining the world economy. When early reforms failed and the emphasis shifted to democratization and more radical measures, social scientists diverged in their response. Many economists and political scientists who considered the Soviet system a failure prescribed universal solutions with little regard for the legacies of Russian society and the Soviet social contract. This was quite different from the thrust of comparative modernization studies that considered the Soviet record of unbalanced development and the high level of dependency on the state of various groups, suggesting reforms that built on this existing foundation. "Shock therapy" became the symbol of imposing an external model without regard for comparative study that points to different pathways based on historical circumstances.

Globalization Theory

Globalization theory is essentially modernization theory bolstered by greater emphasis on international integration and the power of external forces to induce rapid change. Again, one finds generalizations about individual modernization, adoption of attitudes in favor of personal choice for marriage, divorce, choice of work, migration, and views of authority. One also may observe organizational adaptation, with formal organizations transforming their roles in a market environment where a civil society is gaining ground and individuals are free to enter and leave. Likewise, state authority becomes subject to checks and balances, limited in creating monopolies and denying access to the outside world. If modernization theory emphasized competition among nations that would oblige, sooner or later, domestic adjustments, globalization theory stresses the powerful effects of the flow of resources, information, and people across national boundaries. The urgency of meeting the competition is accelerating, but the fundamental changes identified by modernization theory continue to occur.

Critics of globalization theory, both from the left and the right, repeat the accusations raised against modernization theory. Many on the left see it as justification for neo-imperialism or U.S. hegemonism, leading to unfair results, including one-sided gains and negative consequences for cultural diversity and the environment. On the right, there is continued fear that compromises will have to be made with others who follow different models, watering down national distinctiveness or sovereignty. Instead of comparing different approaches to globalization and accepting the need for all sides to adjust as competition proceeds in unpredictable ways, many prefer either to reject the process as inherently flawed or to insist that control by only one party must be ensured. As seen in a half century of modernization theory, politicized approaches to far-reaching questions of social change as well as narrow rejection of generalized social science analysis leave many critics unprepared to keep the focus on how to draw on empirical evidence and comparisons to keep improving existing theory. The theory of modernization may not have remained popular, but its message endures: states reorganize in an increasingly competitive environment; the quest for international power and economic growth leads to substantial changes in domestic policies; societies continuously adjust to economic growth and global

integration; and the result is growing convergence, but there may be multiple models and sharp backlashes from those fearful or unsuccessful in the process.

Contemporary Theories

As in the Cold War era, there are three prevailing theories of global evolution at the beginning of the twenty-first century. The Marxist school that equated modernization reforms with promotion of imperialism and social class exploitation has transformed into a broader left-leaning agenda, appealing to conflict against the United States and its elitist allies as a mechanism for more just economic distribution and more checks in global political development. The target of globalization more clearly pinpoints the problem of an imposed foreign model reducing cultural diversity and autonomy, raising the profile of nationalism over the old theme of class struggle.

The hegemonic globalization school may be less vocal, but it is not hard to comprehend the meaning of its warnings of threats that can only be addressed in a world mobilized under clear leadership and newly attuned to containing political development that allows security dangers to emerge. Its neoconservative message calls for imposing a single model, more than comparing alternative approaches of nations and regions while accepting the virtues of diversity.

As developed in comparative studies and by the multilateral globalization school, modernization theory accepts that convergence is a long-term process that must remain incomplete as societies seek solace in what makes them distinctive. The quickening pace of technological change will fuel accelerated integration, and there will be dangers of increased interdependence and vulnerability that will demand more security cooperation. Yet the driving forces of the global system will remain states competing to gain an advantage in boosting their economies and national power. In the context of growing world integration, states will still be in competition to capitalize on modernization and shape the global system.

MOHISM. Mohism is a school of thought named after its founder, Mozi (or Mo Di; c. 460–390 B.C.E.). Mozi was the first known thinker to challenge systematically the ideas of Confucius (Kong Fuzi; 551–479 B.C.E.) and his followers and to provide an alternative vision of the ideal society and state. One of the most prominent intellectual currents of the Zhanguo (Warring States; 453–221 B.C.E.) period, Mohism declined rapidly soon after the imperial unification of 221 B.C.E., to be rediscovered by modern scholars in the first decades of the twentieth century.

Sources

The Mohists' ideas are presented in a book that bears the name of the school's founder. The so-called core chapters (8–37) may have been produced during Mozi's lifetime or immediately thereafter, and are believed to reproduce his original thought. These chapters present ten major Mohist doctrines, each of which is discussed in three versions; the subdivisions are believed to reflect different traditions within the Mohist movement. Later portions of the *Mozi* deal with epistemological questions (chapters 40–45) and military theory (52–71) and tell anecdotes about Mozi and his disciples (46–51). These chapters were produced between the fourth and the second centuries B.C.E. by the later Mohists, reflecting major developments within the Mohist school.

The *Mozi* suffered considerably in the process of its transmission: no less than eighteen chapters were lost, others were significantly damaged, and almost ten chapters (1–7, and probably 38–39) are considered to be forged by later transmitters. The book was restored due to the meticulous efforts of scholars from the eighteenth century on, although proper arrangement of many portions is still subject to heated scholarly debate. Several Mohist treatises are included in the Warring States' collectanea, such as the *Lüshi chungiu* (c. 240 B.C.E.); valuable information about Mohist thought is also present in the writings of the Mohists' opponents, such as Zhuangzi (fl. late fourth century B.C.E.), Xunzi (c. 298–c. 230 B.C.E.), and Han Feizi (c. 280–233 B.C.E.), as well as in the Han period texts (206 B.C.E.–220 C.E.).

Mozi

Few reliable details are known of the life of Mozi. Most scholars agree that he was a person of relatively humble origin from one of the eastern Chinese states (either Song, Qi, or Lu). Like Confucius, he traveled through neighboring states in search of better appointments, but apparently to no avail. Even more than Confucius, he succeeded as an educator and organizer, turning his followers into a tight ideological group that remained active throughout the Chinese world for almost two centuries.

Mozi's sociopolitical views are a curious blend of utopian idealism and sober pragmatism. On the utopian side Mozi promulgated the egalitarian principle of "universal love" (or "concern for everyone," *jian'ai*) as a remedy to social and political fragmentation. He rejected the attachment to an individual's state and lineage, as well as to the self, suggesting instead an ideal society where all the people under Heaven would share extra labor, extra products, and proper teachings. This society would be maintained by a highly centralized state, which would implement universal surveillance to disclose deviant subjects and rectify them. The state would be ruled by a morally perfect individual, who would select his officials on the basis of their morality and then impose universal standards of benevolence (*ren*) and righteousness (*yi*) down to the lowest social levels. The unity, therefore, would be ideological and not only political.

On the more practical level, Mozi suggested a series of measures to improve the functioning of the state and the life of its populace in the immediate future. First, he proclaimed strong opposition to offensive wars, which he rejected both on moral grounds and as an inexcusable waste of public resources. The opposition was not only theoretical, as Mohists reportedly organized a kind of universal intervention force that promised military support to the weak states against their powerful and aggressive neighbors; this may explain the great interest displayed by later Mohists in questions of defensive warfare. Second, Mozi argued that improved livelihood would be attained only through reduction of needless expenses, such as those associated with lavish burials and extravagant ritual music. This rejection of mortuary rites and ritual music—the hallmark of the centuries-old aristocratic culture—reflects Mozi's staunch opposition to the pedigree-based social order. This opposition is prominent in the third of his major recommendations, namely the establishment of meritocratic instead of the aristocratic rule. A person's social rank and emoluments should be determined exclusively by his intellectual abilities and moral outlook: "If there is an able person even among peasants, artisans or merchants, he must be promoted, granted high rank, rich emoluments and an appointment . . . hence officials will not be forever noble; the people will not be forever base." "Promoting the worthy" (*Shang xian*) became the hallmark of Mozi's political recommendations.

Mozi proposed triple justification for his radical departures from the established sociopolitical patterns. First, he argued that his recommendations would benefit everyone, and hence should be adopted due to purely utilitarian considerations. Second, Mozi made painstaking efforts to prove that his views reflect the true legacy of the ancient sage kings. Third, in sharp distinction to most other thinkers from the Warring States period, Mozi sought supernatural support for his claims. He argued that the moral order he advocated is in perfect accord with the intent of the supreme deity, Heaven, which "wants justice and detests injustice." Heaven is assisted in upholding universal morality by multiple deities that act as minor guardians of Heaven's intent and also constantly intervene in human affairs to punish the vicious and reward the righteous.

Scholars in China and abroad continue to disagree over whether Mozi was a true believer or a mere manipulator of the

others' religious beliefs. Aside from emphatic statements in favor of Heaven's just intent, Mozi displays a more sober approach when he rejects the possibility of blind fate and calls upon humans to rely on themselves, disregarding possible extrahuman intervention in their lives. Moreover, Mozi's explicitly instrumental approach toward Heaven's intent, which he defines as a tool to judge world rulers, raises further doubts as to his piety.

Later Mohists

For several generations after Mozi's death his disciples maintained their effective organization and remained intellectually active. The focus of their interest, however, gradually shifted from sociopolitical issues to epistemological questions. Mozi was the first to display interest in modes of argumentation, proposing three criteria for the validity of his doctrines: their origins in the legacy of the ancient sage kings, their corroboration by people's everyday experience, and their usefulness in everyday affairs. Later Mohists further developed the art of argumentation, which led them to focus on many previously unexplored issues, such as logic, the relation of names to reality, the validation of knowledge in face of changing circumstances, and so on. Six chapters of the *Mozi* (40–45) summarize their views, remaining the richest source for the largely extinct logical approaches in ancient Chinese thought. The sophistication of Mohists' argumentation had, however, a negative impact on their school. First, the increasingly active search for abstract truth fueled ideological confrontations among the Mohists, which resulted in inevitable splits. Second, preoccupied with epistemological issues, the Mohists turned their backs on political issues, becoming partly irrelevant in contemporaneous intellectual life. As a result, although at the end of the Warring States period Mohism was still defined as "bright learning," its appeal was shrinking. From the second century B.C.E. Mohists largely disappeared from the intellectual scene, although some of their ideas, such as reducing conspicuous consumption and advancing those worthy to the top of political apparatus, had a lasting impact on Chinese thought and Chinese political culture in general.

MONARCHY.

This entry includes two subentries:

Overview

Islamic Monarchy

OVERVIEW

Monarchy derives from a Greek term that refers literally to rule by one person (as distinct from oligarchy, rule by the few, or democracy, rule by the people). Among political systems of a post-tribal nature, monarchy is certainly the most common form of human governance globally throughout human history. While the modern Western world tends to venerate non-monarchic constitutions of the past—such as the city empires of Athens and early Rome, and, to a lesser extent, Babylonia—this elides the near-ubiquity of one-man rule. And while modern authoritarian or despotic regimes are not usually considered to be monarchies, they nevertheless contain elements associated with monarchic rule. The persisting appeal of monarchic governments may stem largely from the perception that, in contrast to populist and self-governing systems, they are more stable and more successful at maintaining peace and order. (This is perhaps encapsulated in Benito Mussolini's [1883–1945] famous declaration that in fascist Italy, under his quasi-monarchic leadership, the trains run on time.) Regardless of whether such a position is empirically true, it has been central to the ideology of monarchy.

The nearly universal acceptance of monarchic rule, at least until recent times, obscures important differences in the ways in which such regimes have been classified and legitimated. Monarchies are by no means of a piece in either their theory or their practice. Important questions remain open to dispute, including: whether the king should be dynastic or elected, and if the latter, by whom; whether in dynastic systems, women should be admitted to succession or men only, or indeed whether succession may even pass through a female line; and whether (and under what circumstances) a king may be removed from power, and if so, in what way. When viewed from this perspective, monarchy ought hardly to be treated as a singular phenomenon at all. Rather, examination of the diverging conceptions of the foundation and source of monarchic power yields recognition of the highly diverse principles upon which ideas about the nature of monarchy have rested over time and across cultural and geographical divides.

Religion

Assessed from a global perspective, perhaps the most common justification given for the rule of a single person is religious. Even in this category, however, many different approaches are available. The ancient Egyptians regarded their kings to be deities, albeit lesser gods in the pantheon. By virtue of his divinity, the Egyptian monarch was qualitatively superior to and at a remove from those over whom he reigned, and his powers were “absolutely absolute,” to use Samuel Finer's phrase. Consequently, the king of Egypt was the undisputed owner of all the territories under his control and the master of his subjects, who were all equally inferior to him. The surviving cultural artifacts from three millennia of Egyptian monarchy, such

as architecture, paintings, and written treatises, all reinforce this absolutistic image of royal divinity.

The Romans also deified their emperors in the later stages of their empire, proclaiming them to be *dominus et deus* (“lord and god”). This has sometimes been considered to be a result of the influence of so-called oriental or Eastern monarchic ideas. But it is difficult to gauge how seriously this deification (and attendant absolutist language) ought to be taken, given the persistence of earlier Roman ideas of citizenship and legality. The ideological structure supporting the Chinese dynasties of antiquity, by contrast, approached the Egyptian model more closely. Confucius (c. 551–479? B.C.E.) lent philosophical credence to the long-standing doctrine that while emperors were not themselves deities, they enjoyed the “Mandate of Heaven” in their occupation of the imperial throne. Of course, this mandate did not ensure that the emperors would not be overthrown in a palace coup (any more than the divinity of Egyptian kings protected them against dynastic replacement). Rather, the mandate was an ever-shifting imprimatur that depended upon the emperor's conformity with the fundamental dictates of virtue and equity, in particular the practice of benevolence, according to Confucius.

The monotheistic Abrahamic religions all subscribed to the notion of the divine ordination of kings to some extent. Although the earliest government of the Israelites was a sort of proto-republican federated constitution, the shift to a monarchic regime described in Jewish scripture arose from God's assent to a popular plea for a king so that Israel might resemble the other nations of the region. Israelite monarchy thus emerged as a divine appointment, and kings remained subject to the judgment of God. Once Christianity reached an accommodation with the Roman Empire in the early fourth century, the emperor came to be viewed as a divine agent—free to sin, of course, but a servant of the Heavenly Lord even when he went astray. Christian authors often deployed a microcosmic argument to bolster monarchy: just as God was the king of His creation, so the monarch resembled the supreme master of the universe. Islam also involved religion in the defense of monarchy. In the early history of Islam, the caliph was held to be the agent of God insofar as his conquests facilitated the spread of the Muslim religion and he enforced adherence to the rites of the faith. During a later era, the caliphate was charged in theory, if not in practice, with the imposition of the punishments for violations of *shari'a* (the vast body of Islamic law).

Naturalism

More mundane explanations of a monarch's authority emerge out of images and analogies drawn from nature. In many cultural traditions, the ruling position of the head (or sometimes the heart) in the human body is regarded as an analogue of the monarch. Royal dominion is thus licensed by or in accordance with the observable natural world. One finds this position evinced in East and South Asian writings, such as the *Arthashastra* of Kautilya (fl. late 300s B.C.E.), as well as in Western thought from antiquity through modern times. Alternatively, the supposed dominance of a single leader in the nonhuman organic world (such as among bees or other social

creatures) has often been taken as a sign of a natural order subordinate to monarchy. Even the arrangement of the cosmos and the movements of the stars and planets are found to support the monarchic principle.

Perhaps the most widespread naturalistic justification for monarchy, however, is its supposed imitation of the organization of the family. Monarchic government is directly authorized by the presence in the typical family of a father or other male head whose responsibility is to care and provide for all the other members of the household. The rest of the family is expected in turn to submit without question to the superior authority of the father. Confucius insisted that filial piety constituted the quintessential basis of all forms of social relationships, extending as far as the people's obedience to the king. This view enjoyed considerable currency through East Asia well into modern times. Likewise, European authors such as Jean Bodin (1530?–1596) and Sir Robert Filmer (d. 1653) advanced one or another form of the patriarchal thesis.

Modes of Virtue

An alternative to a naturalistic justification of royal rule derives from the view that the monarch should be obeyed on account of the personal qualities that inhere in him, whether these characteristics are physical or psychological or both. Hence many cultures accepted the principle that, in effect, might makes right, in the sense that the warrior who demonstrates the greatest prowess and courage in battle deserves to be revered and obeyed in matters of government. The Greek concept of *aretē* (“excellence” or “virtue”), as espoused in the Homeric epics, epitomized this martial conception of rulership; those who fought gloriously were accorded the greatest deference concerning all political decisions. Similar views can be found in many societies with strong chivalric traditions, such as Japan during the era of the Shogunate or feudal Western Europe during the Middle Ages.

Monarchy might also be justified by the intellectual or moral qualities acquired and refined by a leader. The *Republic* of Plato (427?–347 B.C.E.) speaks of a “philosopher-king” whose competence to govern a city (and even over other philosophers) stems from his preeminence in the exercise of his speculative reason as well as the fully just ordering of his soul. Likewise, Aristotle (384–322 B.C.E.) believed that kingship, as that species of monarchy in which a superlatively virtuous man rules, constituted the ideally best political system, even if he was skeptical that it could be attained in practice. The Roman Marcus Tullius Cicero (106–43 B.C.E.) also believed that among “simple” constitutions, kingship was optimal, as long as the occupant of the royal office remained morally upstanding. Cicero also identified kingship as the chronologically earliest form of human government, since it involves power without a formalized system of laws. But Cicero believed (as did Aristotle) that kingship could readily degenerate into a form of arbitrary rule in the interest of the incumbent, and so he preferred a law-based republican regime.

Niccolò Machiavelli (1469–1527) combined the martial and the psychological elements of monarchy in his *Prince* (written c. 1513–1514 but not published until 1532). Machiavelli stated explicitly that he was addressing a particular sort of

monarch: one who came to power not as the result of heredity or divinity but solely on the basis of his own ability (which Machiavelli called, somewhat perversely, *virtù*). On the one hand Machiavelli claimed that military prowess constituted the salient quality of an effective prince; good “arms” must precede good laws. Yet Machiavelli also held that *virtù* had a psychological dimension, insofar as the prince who succeeds in gaining and retaining his state must shun conventional personal morality and adjust to the circumstances of his position in whatever way is required. Hence, while the “self-made” monarch should try to adhere to the precepts of everyday virtue when he can, he must be prepared to contradict the moral teachings of religion and philosophy at those times when following them would lead to political ruin.

Limited Monarchy?

Most ideas of monarchy assumed or even pronounced the absolute power of the ruler, so that despotism was readily licensed. Yet some attempts were made, especially in Western thought, to constrain the reach of royal office. Religion provided one source of limitation. A monarch who engaged in tyrannical actions could be threatened with divine judgment unless he mended his ways. In its most extreme form, as in the *Polycraticus* (completed 1159) by John of Salisbury (c. 1115/20–1180), God's hand might even reach out to an earthly source (human or otherwise) to punish the evil ruler, permitting tyrannicide as a remedy. Alternatively, thinkers looked to election or other mechanisms of consent to hold the monarch in check. During the Latin Middle Ages, scholastic authors widely debated whether monarchy should be elective or inherited, and in a later era, liberals such as John Locke (1632–1704) sought to confine the authority of monarchs by basing their powers on a preexisting social contract.

The attempt to balance constitutional and absolutist dimensions of monarchy produced some interesting, if not always entirely convincing, theories. In his *Six Books of the Commonwealth* (1576), Bodin insisted upon the unfettered power of the monarch but also claimed that the ruler was strictly limited by natural law in the extent to which he could exercise his royal office. G. W. F. Hegel (1770–1831), in the *Philosophy of Right* (1821), posited a system of constitutional government in which the king possessed a single yet still indispensable function: placing the final stamp of his unique, indivisible will on all legislation and thus rendering a bill into statutory force. Hegel believed that short of such an ultimate declaration of will, members of civil society and their legislative representatives would continue to debate the validity of laws and thus undermine the respect due to legal structures.

One might imagine that monarchy is an outmoded idea in the modern world, given the widespread ideology of democracy. In fact, however, numerous countries are still ruled by monarchic regimes, even in Europe. Allegiance to a monarch in countries such as the members of the Commonwealth, comprising former colonies of the British Empire, remains popular. In the same vein, the public and ongoing expression of grief following the death of Princess Diana of the United Kingdom suggests that royal identity, even if only by marriage, remains a very compelling reason for public attention. It seems unlikely that the monarchic principle is likely to disappear entirely any time soon.

Cary J. Nederman

ISLAMIC MONARCHY

The question of leadership in the Islamic world is a complicated one. Although until recently monarchies were the most common form of government, Muslim understandings of a ruler's role, qualifications, and relationship to religious and worldly authority have been the focus of intense discussion and have shifted radically since a very early period. Literally hours after the death of Muhammad in 632 C.E., disagreements arose about the identity, qualities, and selection of the caliph, or successor to the Prophet (Ar., *khalifah*). Although it was clear that the caliph should function as the political, military, and religious leader of the community, the method of choosing a caliph was ill-defined at first. Many felt that the caliph should possess special religious qualities, whether noteworthy piety, early conversion to Islam, or blood relation to Muhammad. But the first four caliphs—Abu Bakr (r. 632–634), 'Umar ibn al-Khattab (r. 634–644), 'Uthman ibn 'Affan (r. 644–656) and 'Ali ibn Abi Talib (r. 656–661)—all had varied reputations for piety and differing relations to Muhammad, and were chosen in four unrelated fashions.

It was only in 661 at the accession of Mu'awiya that the Umayyad caliphate (661–750) became the first Islamic dynastic and caliphal monarchy. Knowledge of the Umayyad family is difficult to extract from the generally negative portrayal of them in later historical sources, but one criticism of them did highlight the fact that they were considered by some to be temporal kings (Ar., *muluk*), not religious authorities. Although this charge is difficult to evaluate, it may be said that the Umayyads managed to restrict the caliphate to their own family, forming a dynasty of kings whose political and military authority was evident but whose religious authority may well have been in question.

Abbasids

Ultimately resistance to Umayyad rule led to the Abbasid revolution of 749–750. The Abbasid caliphs (750–1258)

traced their descent from Muhammad's uncle 'Abbas, and therefore their claims to legitimacy were considered to be stronger than those of their predecessors, since they were seen as members of the Prophet's house. The Abbasids formed a dynasty in which religious and political power were mingled. According to Muslim thinkers such as Abu Yusuf (d. 798) and al-Mawardi (d. 1058), the Abbasid caliphs needed to possess justice and comprehensive religious knowledge, with which they were to uphold Islamic law and maintain Islamic society.

Caliphs were chosen through a variety of methods, including designation by a ruling caliph, election by a selected body of religious scholars, primogeniture, or any combination of these factors. A caliph had not only to be a member of the Abbasid house but also male, sane, and free of physical restrictions—such as blindness—that might hinder the fulfillment of his duties. While the Abbasids were in power, pre-Islamic Persian ideas about a remote and awe-inspiring monarch were adopted into the Islamic tradition. Eventually the caliph was transformed from the head of the community to the Shadow of God on Earth, elevated far above ordinary people, and supported by an elaborate state bureaucracy and a complicated court protocol.

Military Rulers

The ninth and tenth centuries witnessed the Abbasids' gradual loss of control to military strongmen (emirs, sultans) who were fast becoming the *de facto* rulers in the Islamic world. This period also saw the rise of anti-caliphs, whether the Sunni Umayyads in Iberia (756–1031) or the Ismaili Shiite Fatimids (909–1171) in North Africa. Both developments led to important changes in Islamic theories about rule, for Muslim thinkers were forced to reconcile the new reality of military rule with the purely theoretical superiority of the caliph.

This was accomplished by thinkers such as the celebrated bureaucrat Nizam al-Mulk (d. 1092) and his equally famous contemporary al-Ghazali (d. 1111). Such theorists penned elaborate manuals on the proper behavior of military rulers, who had no claims to religious authority. These works drew on pre-Islamic Persian ideas about the interdependence of kingship and religion, in which neither could exist without the other because religion furnished a base for kingship and kingship protected religion. Combined with this concept was the equally ancient notion of the Circle of Justice, which espoused a belief in the importance of balance within society among four elements: the king, the army, the subjects, and justice. According to this theory, there could be no king without an army, no army without the wealth obtained from subjects, no subjects without justice in the realm, and no justice without a king to uphold it. The military rule of a sultan fit easily into the models provided by the Circle of Justice and the notion of cooperation between religion and kingship; indeed, eventually the earlier designation of the caliph as the Shadow of God on Earth was transferred to the sultan. This model also allowed scholars and statesmen to function as interpreters of Islamic norms. In this way, rule became dominated by military monarchies and regulated by religious scholars, while the caliph became a figurehead who periodically bestowed recognition on the rulers. Pre-Islamic Persian cultural and

literary traditions also contributed the notion of a king of kings (Pers., *shahanshab*), which was easily worked into Islamic ideology.

Turko-Mongol Ideals

These developments were also shaped by Turko-Mongol ideas of kingship, which arrived with nomadic tribes from the central and east Asian steppe in the eleventh century. For Turkic and Mongol nomads, a ruler (Turk., *bey*, *beg*; Turk. and Mongolian, *khan*) was a charismatic military leader who exercised a highly personal style of rule. Often merely a first among equals, he was directly responsible to his own followers and was expected to settle their disputes, lead them militarily, and reward them for their loyalty through the distribution of spoils and wealth. Although nomadic khans were often members of noble families, their positions depended not only on their lineage but also on their own merits.

The more successful khans believed that their charisma had a divine origin, which was often identified with the spirit or spirits of the Enduring Sky, or God (Mongolian, *Tenggeri*; Turk., *Tanrı*). Such divine favor was expressed through a special good fortune (Mongolian, *su*; Turk., *kut*; Pers., *bakht* or *farr*), which was bestowed on particular rulers by Divine Will and which was demonstrated through military victories. Divinely favored rulers were thought to possess special religious or shamanistic powers. An emphasis on nomadic law (Turk., *töre*, *türe*; Mongolian, *yasagh* (*yasa*); Ar. to Ottoman Turk., *kanun*) also formed part of nomadic ideals of rulership, since a nomadic khan was expected to uphold the law. These ideas first entered the Islamic world when the Sunni Muslim confederation of Seljuk Turks conquered Khorasan and the Iranian plateau under the charismatic military leader Tughril Beg (d. 1063), who reached Baghdad in 1055 and established the Great Seljuk dynasty (1055–1157) under the benevolent eye of a powerless Abbasid caliph. (Nizam al-Mulk and al-Ghazali both wrote under Seljuk rule.)

Genghis (Chinggis) Khan

The most nomadic famous recipient of divine favor was the Mongol Temüchin, or Genghis (Chinggis) Khan (d. 1227). Genghis Khan rose from a noble but impoverished background to absolute rule and was thought to possess the power bestowed by God in the form of a divine mandate, which later passed to his descendants. According to the divine mandate, God had granted universal rule to the Chinggisids, who were charged with implementing that rule on earth through territorial conquest. The divine mandate passed to all Chinggisids, male and female, although only men reigned openly; women ruled primarily as regents for their sons. The position of Great Khan was usually limited to the sons of a chief wife, but within this restriction such factors as primogeniture, ultimogeniture, the preference of the current ruler, and the approval of the Genghisid family and the Mongol nobility all could play a role. As a result of this new and powerful model of kingship, the death of the Abbasid caliph al-Musta'sim at Mongol hands in Baghdad in 1258 therefore spelled for many a sea-change in understandings of rule. Despite the hasty revival of an Abbasid caliphate in Cairo (1261–1517), not all Muslims recognized it as legitimate. At first, Muslim kings and their advisors

focused on the military defense of the Islamic world against the pagan Mongol invaders. When the religious scholar Ibn Jama'ah (d. 1333) wrote an advice work in the early thirteenth century, he elaborated in great detail on the king's responsibility for defending the community.

But soon Mongol sovereigns themselves began to convert to Islam and employ Islamic models of kingship. Among these new Muslims were the khans of the Golden Horde in southern Russia and central Asia (1241–1480) and their Ilkhanid cousins in Iran (1258–1335). Their conversions led to important changes in the development of Islamic monarchies, since Muslim Mongols ruled both as divinely chosen descendants of Genghis Khan and as Muslim sovereigns, advised by Islamic scholars. Theories of rule in this era drew not only on the well-established Persian Islamic models but also on Greek philosophical thought, which was embodied by the work of authors such as al-Razi (d. 1256), al-Tusi (d. 1274), and Kashifi (fl. 1494–1495). These ideas envisioned a society divided into four distinct classes: men of the sword, men of the pen, merchants, and cultivators. In this model the ruler functioned as an enlightened philosopher king, whose task was to maintain each class in its proper place through the just application of Islamic law.

Post-Mongol Period

After the political disintegration of Mongol rule in the fourteenth century, new Muslim Turkic monarchies arose and modeled themselves on the Muslim Mongol example. At first they struggled with the dominant Mongol ideology and styled themselves guardians of the Chinggisid heritage by marrying Chinggisid princesses, using Chinggisid puppets, and upholding Mongol law. Later, Turkic dynasties began to replace Genghis Khan with their own noble ancestors and promoted both their own tribal law codes and their own versions of Mongol-style divine favor. Simultaneously they ruled as Muslim military leaders and made use of the well-established themes of justice and order. Among these was the warlord Timur (Tamerlane, d. 1405), who began as a Genghis Khan imitator but also relied on Islamic models of kingship. Timur's own dynasty ultimately grew to rival that of Genghis Khan and reached a conclusion in the career of Babur (d. 1530), founder of the Mughal Empire in northern India (1526–1858). Babur epitomized the Muslim sovereign but also prided himself on his impeccable lineage: his paternal descent was from Timur, and his maternal descent from Genghis Khan.

A long-term problem for Muslim monarchs of nomadic origin was their tribal laws, which posed a potential challenge to Islamic law (Ar., *shari'a*). Under the longest-lived Islamic dynasty, the Ottomans (1281–1923), tribal laws coexisted uneasily with Islamic law until Muslim thinkers under Sultan Kanuni Süleyman (Süleyman "the Lawgiver," r. 1520–1566) reconciled the two into a single coherent legal system (Ar. to Ottoman Turk., *kanun*), which became identified with the Ottoman state in general and the person of Süleyman in particular. Under the Ottomans the Persian and Greek concepts of the ruler as the upholder of justice and order were also linked both to the nomadic idea of the ruler as a lawgiver and to Islamic law itself.

Safavids and Successors

In a more radical development of Turko-Mongol norms, especially the notion of divine favor, the Safavid monarchy in Iran (1501–1736) assumed that the ruler possessed a direct personal connection to God, which allowed him to implement God's will in his kingdom through law. Although the Safavids were eventually succeeded by the tribal dynasties of the Afsharids (1736–1796) under Nadir Shah (d. 1746) in the east, and the Zands (1751–1794) in the west, these successors were seen by some as monarchies of warlords, lacking legitimate claims to rule and devoid of the religious aura that had surrounded the Safavids. Indeed, Zand rulers were never addressed as *king* (Pers., *shah*), and maintained a Safavid puppet until 1773. Subsequently the Turkic tribal Qajar monarchy (1795–1925) eliminated both the Zands and the Afsharids and went on to control Iran as independent kings. Although perfunctorily religious, the Qajars lacked the religious charisma of the Safavids and ruled by drawing on their heroic Turkic history, their former support of the Safavid state, and the Iranian cultural tradition of the king of kings.

Modern Monarchies

In the nineteenth century the Ottoman sultans began to investigate European-style parliamentary monarchies, but this model was not fully established until the abolishment of the Ottoman Empire in 1923 and the creation of the modern republic of Turkey, which replaced the monarch with an elected president and a parliament. Similar in focus were the khedival dynasty of Egypt (1805–1952) and the Hashimite dynasty of Iraq (1921–1958), which also developed into parliamentary monarchies and which were likewise replaced by republican governments.

One particular challenge for twentieth-century monarchies was the concept of secularism, which in some cases removed the religious ideology used by earlier kings to legitimate their rule but left nothing in its place. A noted secular monarchy was the Pahlavi dynasty in Iran (1925–1979), which succeeded the Qajars. The Pahlavis downplayed Islamic ideas in favor of their own pre-Islamic Persian heritage, which combined with their oppressive rule to provoke their overthrow in favor of an Islamic Republic in 1978–1979.

In the early twenty-first century, monarchies in majority countries with an Islamic majority tend to rely on some evocation of religious legitimacy. The al-Saud family of Saudi Arabia and the Hashimite monarchy of Jordan, for example, practice official state versions of Islam and rule with either secular or Islamic law. However, some modern monarchies have been challenged by Islamist resistance groups, which have proposed alternate visions of society in which sovereignty belongs to God alone.

MONASTICISM. The “idea of monasticism” invites a misconception, because monasticism is not an idea but a practice. It is a discipline of life, encapsulated in a vow to obey a rule. Monasticism is not a theory about the good life, and still less an escape from practicality, but rather a commitment to live according to a rule handed down from a founder. In its classical Western form deriving from St. Benedict (c. 480–547), a rule directs a monastic to spend a lifetime in one cloister under one abbot following one routine. This secluded way of life begets institutions, some of them highly complex, and these in turn nurture the kind of inner life that in the early twenty-first century is called “spirituality.” Monastic *orthopraxy* regulates behavior through conformity to a rule, and contrasts with doctrinal *orthodoxy* that regulates belief through a magisterium or teaching office. Implausible though it may seem, a rule shields monastics from obsession with theorizing. Day in and day out, monastics live an ethos that others may merely preach. To this extent Christian monasticism resembles Rabbinic Judaism. Both pivot on obeying rules, and both tend to disregard niceties of belief. A crucial difference pertains, however. Whereas Jews affirm that the mandates of Torah come from God, Christians acknowledge that any rule comes from a human lawgiver.

History

As a mode of life that vows obedience to a rule, monasticism originated not in the Near East but in India with Siddhartha Gautama the Buddha (c. 563–c. 483 B.C.E.). His rule or *vinaya* governed conduct of life initially for the Buddha’s community or *sangha* of immediate followers. Nine months of the year they wandered, but during the three months of the monsoon they settled in a *vihara* or monastery. Eventually the Buddha delivered a separate rule for women. Parallel phenomena co-existed within Jainism and Hinduism. Christian monasticism emerged six or seven centuries later in the deserts of the Eastern Mediterranean. Although Rabbinic Judaism (together with Islam) repudiates asceticism, Jewish precedents for Christian extremism emerged in a wanderer such as John the Baptist (c. 7 B.C.E.–c. 27 C.E.) or in the Qumran community. Christian ascetics of whom little is known roved the deserts of Syria and Egypt. The lifestyle of these spiritual “athletes” crystallized in figures such as Anthony of Egypt (c. 251–356) and Pachomius (c.290–346). Experience as a soldier equipped Pachomius to write a rule for, as it were, an army-camp of ascetics. By mid-fourth century in Egypt, hermits living alone or in loose groups practiced *eremitical* monasticism, while desert fathers and mothers living in community practiced *cenobitical* monasticism. The head of a consecrated community was called an *abba* (father) or *amma* (mother). From the start monks were copying manuscripts, as they would continue to do for the next twelve centuries. Eastern desert monasticism passed to France through fourth-century intermediaries such as Martin of Tours (c. 316–400), Hilary of Poitiers (401–449), and above all John Cassian of Marseilles (360–435). Epitomized in the disputed figure of St. Patrick (c. 385–461), an Englishman who may have dwelt at Cassian’s houses near Marseilles, Irish monasticism emerged in the mid-fifth century through contact with France. In sixth- and seventh-century Ireland, an island that had never known Roman cities, an

abbot ruled as a kind of tribal chieftain who outranked bishops. No amount of asceticism could, however, prevent Celtic monasticism from collapsing in the Viking raids of the ninth century.

By 450, Eastern Christian monasticism was coalescing not just in the desert but also in cities such as Alexandria, Antioch, and Constantinople, while its Western counterpart kept spreading in self-sufficient rural communities. Monastics lived in an enclosure or cloister that fenced a church, a refectory, a library, dormitories, and subsistence farming. Monasticism produced vastly more varieties in Western Europe than anywhere else. Proliferation of types—notably during two periods, one from 1100 to 1250 and the other from 1520 to 1700—complicates the task of classifying Western monasticism. Fundamental differences separate cloistered orders who, at least until the thirteenth century, preferred to dwell in the country and Mendicant friars who, in the wake of St. Francis of Assisi (1182–1226), frequented cities and towns preaching and begging for alms. Stemming from the Black Monks, who only in the seventeenth century acquired the name of Benedictines, other rural orders were the Carthusians (founded 1084) and the Cistercians (founded 1098). Following the example of the Franciscan friars (organized 1209), thirteenth-century Mendicants came to include three other orders: the Dominicans (organized 1215), who preached against heresy; the Carmelites (organized by the pope in 1247) who originated as hermits on Mount Carmel in Palestine; and the Augustinian Friars (organized by the pope in 1256), whose most famous member was Martin Luther (1483–1546). Whereas the pre-1200 Benedictines had cultivated son-to-father obedience to an abbot, Mendicants cultivated sibling-to-sibling relations to one another. Excelling all these in martial vigor were the warrior monks of Crusader Palestine, including the Knights Templar (who emerged c. 1119 and were dissolved in 1312) and the Knights Hospitaller (who emerged c. 1080 and in 1530 took the name Knights of Malta).

A second crucial distinction differentiates *contemplative* orders founded before 1215 from post-Reformation *active* orders and congregations such as the Jesuits (founded 1540) or Oratorians (founded 1575). The latter comprise not monastics but clerks regular: priests who follow a rule while ministering in the world. Having no lay brothers, the Jesuits and Oratorians are not monastics, and neither are the numerous post-1520 female teaching or nursing congregations such as the Ursulines (founded 1535) or Sisters of Charity (founded 1633). Nevertheless, from 1298 until the early 1970s, canon law obliged women’s congregations in solemn vows to stay cloistered.

A third distinction pertains to Eastern and Western Christianity. In contrast to Western organizational fecundity, Eastern Christian monasticism functions under just one rule: that ascribed to St. Basil the Great (329–379). As a result, Eastern Christian monasticism has upheld one model through sixteen centuries, while Western monasticism has initiated reforms in nearly every generation. To be sure, monastic reform means not launching a fresh departure but rather attempting to install a better version of the past. In Western Christianity the

idea of monasticism implies constant renewal in quest of a founder's vision or "source experience."

Buddhist monasticism differs structurally from Christian or Hindu forms. When the Buddha founded his religion, he conceived it solely as a monasticism. Lay Buddhism emerged after his lifetime and in Asia still presupposes proximity to a *sangha*. In Christianity and Hinduism, by way of contrast, monasticism competes with many other embodiments of the religion. This means that at least until the late twentieth century, classification of types of Buddhist monasticism amounts to classification of the religion as a whole, whereas classification of Christian monasticism does not. Three major types of Buddhism stand out: (1) In Sri Lanka, Thailand, Burma, Laos, and Cambodia, Theravada or the "Way of the Elders" claims to descend directly from the historical Buddha. It offers to individual monastics rules for working out during this or later lifetimes gradual passage to enlightenment. (2) In India and then in China, Korea, Japan, and Vietnam, Mahayana emerged at least six to eight centuries after the historical Buddha, and the first three of those countries generated numerous schools of thought and practice, each with its own ritual, texts, and lineage of masters. Some schools promised enlightenment to laypeople and not just to monastics, while innovative "pure land" leaders in Japan such as Shinran (1173–1262) discarded monasticism. (3) Starting in the eighth century, Indo-Tibetan Buddhism or Vajrayana fostered many sects or schools in Northern India, Tibet, Nepal, and Mongolia. Under the leadership of the present Dalai Lama (1935–), leader of the Gelukpa school, Tibetan Buddhism has spread throughout the world. Many non-Buddhists in the early twenty-first century mistakenly regard Tibetan forms as synonymous with Buddhism

per se. This misperception overlooks the dozens of schools of Theravada, Mahayana, and Vajrayana that thrive throughout Asia and increasingly in the West.

Twentieth-Century Changes

Asian Buddhism enforces the *vinaya* strictly, not least because that is what the historical Buddha did. In order to promote meditation, traditional Asian Buddhism imposes a life of renunciation—including dietary restrictions, memorization of texts, and attendance at ceremonies—with a stringency that Western adepts often evade. In consequence monastic rigor is diminishing among new Buddhists in North America, Europe, and Australia. Many so-called Western Buddhists appear intent to de-monasticize their religion. As a countertrend, since the 1960s Buddhist and Christian monastics have delighted in comparing their ways of life. The Trappist monk Thomas Merton (1915–1968) and the Dalai Lama helped to initiate joint scholarly meetings and other intermonastic encounters.

In Eastern Christianity, monastics retain authority not least because most bishops come from their ranks. Moreover, liturgies remain quintessentially monastic through use of chant, an unhurried pace, and lay adherence to monastic rules for fasting. Characteristically, Eastern Christianity boasts a "monastic republic" of male monasteries on the Holy Mountain of Athos—the easternmost arm of the Chalcidice Peninsula in northeastern Greece. In order to uphold an autonomy that excludes women, the Holy Mountain enjoys exemption from laws of Greece and of the European Community. No Western monastic site—and least of all the rebuilt Monte Cassino south of Rome—so resoundingly epitomizes the idea of Western

Cloister inside monastery on Mount Athos. monasticism as Mount Athos does for the Eastern idea. As the English classicist Graham Speake explains, that idea entails a process of inner transformation known as *theosis*, whereby the image of God nurtured in each adept gradually transfigures, indeed divinizes him or her, in body, mind, and spirit.

The prestige of Western monasticism once stood equally high. The period of medieval history from 700 to 1050 is frequently labeled the “Monastic Era,” and the reforms inaugurated by monastic popes such as Gregory VII (1020–1085; ruled as pope 1073–1085) can be viewed as having imposed on all priests the practice of celibacy previously reserved to monastics. Needless to say, Roman Catholic monastics no longer command such attention. To be sure, in Europe pilgrimages to monastic centers such as Santiago de Compostela in northwestern Spain or the shrine of the Black Madonna at Czestochowa in southern Poland draw hundreds of thousands, as do celebrations for youth sponsored by the ecumenical monastery of Taizé, founded in Burgundy during the 1940s. Nevertheless, apart from pilgrimages, the *institutions* of contemplative monasticism engage only a tiny minority of Western Christians, while the *spirituality* that developed there wins ever-greater admiration.

Meanwhile, gender studies has transformed the understanding of the idea of monasticism. This scholarly revolution

can make it embarrassing to read master historians such as the Benedictines’ David Knowles (1896–1974) or Jean Leclercq (1911–1993), who too often wrote as though all monastics were male. Since the 1970s researchers have reclaimed phenomena as diverse as the Desert Mothers of fourth-century Egypt, double houses of male and female monastics in twelfth-century France and England, and the rather widespread acknowledgement before 1100 of the spiritual equality of women and men. The Benedictine Hildegard of Bingen (1098–1179) has come to be hailed widely as one of the most original Christian writers ever. Many have come to deplore the pronouncement of Pope Boniface VIII (c. 1235–1303; ruled as pope 1294–1303) in 1298 that placed under enclosure all women in solemn vows. The constraint remained in force until the early 1970s. As the American historian Jo Ann Kay McNamara and the English philosopher Grace Jantzen, among others, show, almost everywhere in the West women monastics have proven to be at least as creative as men. At first nearly every branch of Eastern Christianity fostered autonomous houses for women, but many of these communities withered under Islamic occupation. In Theravada Buddhism and in Tibetan Buddhism, by way of contrast, a millennium ago women lost permission to receive the highest ordination as nuns (*bhikkuni*), while in Mahayana countries such as China, Japan, and, above all, Korea nuns have held their own.

WHAT DO WE KNOW ABOUT ST. BENEDICT?

A scholarly controversy of utmost delicacy affects interpretation of the reputed founder of Western monasticism, the author of its major rule, St. Benedict of Nursia (c. 480–547). The words of his *Rule* have been pondered in thousands of monasteries, and episodes from his life have animated countless paintings and hagiographies. Regrettably, apart from his *Rule*, all record of St. Benedict and his life comes from a single source, Book II of the *Dialogues*, supposedly written in 593 by Pope Gregory I (c. 540–604; ruled as pope 590–604). That account interweaves miracle stories of a rural wonder-worker with tales of the saint's periods of residence at mountain locations in central Italy such as Nursia, Subiaco, and Monte Cassino. Since the sixteenth century, the authenticity of Gregory's authorship of the *Dialogues* has occasionally been questioned, but never so comprehensively as by Francis Clark in *The Pseudo-Gregorian Dialogues* (1987). Clark argues that Benedict's rule appeared only in 655 in Gaul and around 675 in Britain, being acclaimed only after 717 when Monte Cassino began to be built; and that a clerk in the papal archives ("the Dialogist") compiled the *Dialogues* (first reported to exist in the 680s) and ascribed the document falsely to Gregory I. The Dialogist's "literary patchwork" intersperses miracle legends (some originating after Gregory's death) with eighty genuine Gregorian passages presumably culled from archives in the Lateran Palace. These genuine passages comprise 25 percent of the whole, half of

them in Book IV. The Dialogist recounts prodigies of recluses in a legalistic style quite different from Gregory's own. In themes, allusions, and word frequencies, the *Dialogues* differ from every known work by Gregory. Moreover, the tales glorify many persons, including St. Benedict's sister Scholastica, whom no other text from before 690 so much as mentions. Thus Clark's argument revises the entire account of "Benedictine" monasticism down to the 730s. In his view its true creators were not, as previously believed, monastics at Monte Cassino in the 540s or at the Gregorian papal court of the 590s, but rather Italian and French monastics of the 720s who drew inspiration from the newly available *Dialogues*. As yet only a few Benedictines have accepted this revision, not least because it demolishes their order's foundational narrative. Cognitive dissonance between the 1300-year-old account and Clark's revision remains too acute, but as Clark's sequel *The "Gregorian" Dialogues and the Origins of Benedictine Monasticism* (2003) shows, the tide is beginning to turn. One can no longer affirm the traditional account of how Benedictine monasticism began. All that is known is that a rule ascribed to a certain Benedict had surfaced by the 650s and had begun to establish its preeminence by 720. The idea of Western monasticism no longer enjoys an agreed-upon foundational story. Seldom has a legend accepted for so long dissolved so abruptly. A gigantic task of rethinking looms.

Monasticism as the Institutional Matrix of Spirituality

During the last decades of the twentieth century, postmodernists began to conflate the idea of monasticism with that of *spirituality*. The latter word means a process of inner transformation in the presence of God such as Christian monastics pioneered from the fourth century onward. In the twelfth century the Latin word *spiritualitas* came into use among Cistercians to denote the presence of the Holy Spirit within a monastic. Both the adjective *spiritual* and the noun *mysticism* sprouted in seventeenth-century France to describe inner religious experience of monastics and laity alike. But only in the 1920s did Roman Catholic theologians of asceticism adopt the noun *spiritualité* to denote anyone's experience of the divine within. Although many Eastern Christian monastics hesitate

to apply this Latin-derived word to the process of inner reconditioning that they call *theosis* (i.e., divinization), no one doubts that it was monastics in East and West who propounded what has come to be called "spirituality." The years of postmodernity of the late twentieth and early twenty-first centuries in the West saw treasures from seventeen centuries of monastic interiority exit the cloister and invade the mainstream of religious publishing—for example, in the series *The Classics of Western Spirituality* published since the 1970s by the Paulist Press.

The Dutch literary scholar M. B. Pranger calls into question postmodern infatuation with spirituality by contrasting its eclecticism with the monotony of textual memory within pre-1200

monasteries. The practice of *lectio divina* invited a monastic to nestle inside a text as if it were a cloister, where the mind encountered memories of other scriptural passages. Across a lifetime of rereading the same texts, a monastic recalled previous acts of remembering, as each act of memory condensed previous ones into an eternal moment. Thus *lectio divina* called into being a community of monastic reciters of the same texts, above all of the psalms, the Gospels, and the Rule of St. Benedict. Naturally, no medieval author could have imagined the popularity that monastic writings rooted in centuries of *lectio divina* would attract at the turn of the twenty-first century. Mass marketing undermines the idea of monasticism as a life spent in a reciting community ruminating on a few texts.

Postmodernity has enlarged the community of readers of monastic texts to include nearly everyone who pursues a spiritual quest. Just as Western Buddhists are de-monasticizing the practice of Buddhism, so the “Spirituality Revolution” among Christians in Europe, North America, and Australia is de-monasticizing the legacy of Christian interiority. The very idea of monasticism as lifelong commitment to a rule is being diluted. At a time when texts of monastic origin are read more widely than ever before, consumers of these distillations of the cloistered life probably understand less of the idea of monasticism (i.e., of religious orthopraxy) than ever before. In response to the postmonastic ethos of the early twenty-first century, the idea of spirituality is being de-institutionalized, while texts by monastics are being spiritualized. Scholars such as M.B. Pranger, Marilyn Dunn, Frank Senn, and Kees Waaijman are laboring to re-insert the study of Christian spirituality into a monastic context, where obedience to a rule governs all.

MONISM. Monism is the doctrine that there is only one principle in terms of which all reality is to be explained. Doctrines differ as to the nature and activity of this principle and its relations to the appearance and experience of multiplicity. Monists explain multiplicity or plurality in the world either as derivative from the one principle or as an illusion. Monism is found in philosophical, religious, and cosmological doctrines. The concept itself is ancient, though the first appearance of the term *monism* in Western philosophy is in Christian von Wolff’s *Logic* (1728).

Religious Systems

Religious monism has two forms: atheism and pantheism. Both deny that there is a transcendent deity. Pantheism posits a deity that is immanent to the world and on which the world completely depends. Atheism states that there is no deity at all. Critics of pantheism sometimes conflate it with atheism, on the grounds that a true God must be transcendent.

Brahmanism. Among the most ancient forms of pantheism is Brahmanism. Many of its main tenets were expressed in the Upanishads and systematized by the Vedanta-sutras. Its beginning is traced to the seventh-century thinker Gaudapada, who denied individuation and plurality. Appearances, as well as individual minds, are only temporary manifestations of the all-soul. Master Sankara (c. 700–750, India), author of commentaries on the Brahma-sutra, on parts of the Upanishads, and on the *Mandukya-karika*, studied with a pupil of Gaudapada. For Sankara, only the Brahman is real, and plurality and difference are an illusion.

Gnosticism. Gnosticism is the name given to various doctrines of salvation through knowledge. The first gnostic sects

were pre-Christian. Scholars argue about Persian Mazdeism, Greek mysteries, Egyptian doctrines, or Babylonian astrology and religions as possible roots of Gnostic thought. Gnosticism came into contact with Judaism and early Christianity, borrowing some names and concepts, though refusing the main tenets. Ancient Gnosticism held that everything flows from one purely spiritual principle. The origins of matter were explained as a flaw in a long line of successive emanations from the one principle. While matter is impure, its existence is temporary: Gnostic eschatology states that ultimately the original unity and purity will be restored. Gnostic sects include the Syrian school and the Alexandrian school (early second century).

Sufism. Only rarely do Judeo-Christian forms of mysticism accept monism. John Scotus Erigena (c. 810–c. 877) in Ireland, Johannes Eckehart (Meister Eckehart; c. 1260–?1327) in Germany, and Nicholas of Cusa (1401–1464) endorsed forms of pantheism. The same is true for Islamic Sufism, which appeared as a reaction to the overly worldly tendencies of Islam in the late seventh century C.E. While most Sufi authors stressed personal discipline, asceticism, and purity as necessary elements to prepare the soul to know and unite with a transcendent God (which hardly qualify them as monist), it is interesting to mention figures that stressed a metaphysical unity of all beings in God. In the thirteenth century, the Spanish-born Ibn al-‘Arabi (1165–1240) created a theory of the “Unity of Being.” According to this theory, all existence is one, a manifestation of the underlying divine reality. Sufi currents that stressed the unity of all reality were present also in Indian Muslim communities in the late sixteenth and early seventeenth centuries. Mainstream Sufi authors reacted against monistic trends, stressing that a unity of vision (the mystical experience) did not correspond to a unity of reality.

Philosophical Systems

In philosophical systems, three forms of metaphysical monism can be identified: materialism, idealism, and neutral monism (in which the first principle is neither matter nor mind).

Neutral monists. Parmenides (b. c. 515 B.C.E.) juxtaposes *doxa* (mere belief or nonbeing) and *aletheia* (truth or being). Being is one, unchangeable, and atemporal, and the experience of change and plurality is illusion. Parmenides’s student, Zeno of Elea (c. 495–c. 430 B.C.E.), argued against the reality of plurality and motion. Plotinus (205–270 B.C.E.), the most famous and influential of the Neoplatonists, held that everything is an emanation from the One, flowing to lower and lower degrees of reality until matter is formed.

Another famous monist was Baruch Spinoza (1632–1677). In his *Ethics* (1677), Spinoza argues that there is at most and at least only one substance, God. His study of René Descartes (1596–1650) and the new science resulted in a metaphysical system where everything is a necessary manifestation (mode) of this single substance, which is conceived under the attributes of extension and thought.

Materialism. Materialists deny the existence of any nonmaterial substance. Materialists are often, but not necessarily, atheists: some, such as the Stoics, or Thomas Hobbes

(1588–1679), held that God is corporeal. Among the earliest forms of materialism was atomism. Leucippus (5th century B.C.E.) and Democritus (c. 460–c. 370 B.C.E.) believed in an infinite number of indivisible bodies (atoms) moving in a void (nonbeing). Their movements, aggregations, and interactions explain every aspect of experience, including mental life. Epicurus (Greece, 341–270 B.C.E.) developed an atomistic ethics, claiming that the pleasures of the mind and the deliverance from passions constitute human happiness. Lucretius’s (c. 100 to 90–c. 55 to 53 B.C.E.) poem *De rerum natura* (On the nature of things) had the most developed exposition of ancient atomism. Other atomist-like schools include the Indian school of Vaisesika, founded presumably by Kasyapa (c. 2nd–3rd century C.E.), which posited an infinity of atoms, of which nine kinds are identified, which constitutes all reality. The Medieval Islamic group of Asharites known as the *mutakallimun* (8th–12th century) held that God was the direct and continuous cause of all created beings (composed of atoms) and of the maintenance of each atom, from instant to instant. This doctrine of atomic time presaged Descartes and the Occasionalists, though without the commitment to a transcendent God.

Seventeenth- and eighteenth-century materialism arose with the scientific revolution’s mechanical philosophy. Most natural philosophers were not materialist monists (because they believed in a transcendent God and in incorporeal souls), yet there are exceptions. Giordano Bruno (1548–1600), who was burned as a heretic, presented a pantheistic system in which the world and its soul are one. Thomas Hobbes in *Leviathan* (1651) developed a geometrical account of natural, human, and political science, where he argued that reality is only bodies in motion and these explain perception, our human ideas and volitions, and the body politic.

During the Enlightenment materialists like Julien Offroy de La Mettrie (1709–1751) and Baron Paul-Henri-Dietrich d’Holbach (1723–1789) wrote about the material and “mechanical” nature of man and rejected any immaterial God. Some Enlightenment philosophers (Denis Diderot, Holbach) were atheists, others opted for deism, or the belief that God acted exclusively through natural laws. The borders between deism, pantheism, or downright atheism were often quite blurred (as in Anthony Ashley Cooper, third earl of Shaftesbury, or Jean Le Rond d’Alembert).

The first half of the nineteenth century saw a strong idealistic and romantic reaction to materialism, yet materialism returned with a vengeance in the second half with the successes of the theory of evolution by natural selection and of Marxism. Karl Marx (1818–1883) focused on economics, yet, in reacting against Hegelian idealism, endorsed a metaphysical materialism and atheism. In Marx, ideas (intellectual contents) are determined and explained through the material, economic processes of production and ownership, upon which rise social and political superstructures.

On the Origin of Species by Means of Natural Selection: Or, The Preservation of Favoured Races in the Struggle for Life (1859) by Charles Darwin (1809–1882) made it possible, in

Richard Dawkins's words in *The Blind Watchmaker*, "to be an intellectually fulfilled atheist." Darwin was held by many to have produced a fully naturalistic and scientifically robust explanation of the nature of life. Darwinian evolution and natural selection were taken to be a serious challenge to explanations of the creation and development of life by a designing God. While many aspects of Darwin's own theory underwent major revisions with the discoveries of molecular biology and genetics, natural selection has lost nothing of its power as an explanatory tool in contemporary evolutionary biology and is used in many fields to explain structures and functions that are seemingly designed.

Idealism. Idealism is metaphysical monism that rejects the existence of matter and founds the experience of matter on the mental. Ancient forms of idealism can be found in Buddhist schools.

The Yogacara (or Vijnanavada) school started around the fifth century C.E. in India. Its central doctrine is that only consciousness (*vijnanamatra*) is real, that thought or mind is the ultimate reality. External things do not exist; nothing exists outside the mind. Ultimately, the purified, undifferentiated state of the mind without objects or thought processes is what constitutes "Buddhahood." Among the principal figures were the brothers Asanga and Vasubandhu.

The Zen, or Chan school was founded by the Indian monk Bodhidharma, who traveled to China around 520 C.E. (according to the tradition). Zen stresses the use of meditation to experience the unity and indistinctness of reality, which cannot be understood otherwise (any form of verbalization or conceptualization falls into the trap of dualism).

In the Western tradition, idealism was reprised by George Berkeley (1685–1753), bishop of Cloyne, who held that all we can know are the ideas in our minds. All objects of perception, including matter, are only ideas produced by God. German idealism started later with Johann Gottlieb Fichte's (1762–1814) transcendental idealism, which he saw as a development of Immanuel Kant's (1724–1804) ideas. For Fichte, God is the All, and particular objects result from reflection or self-consciousness through which the infinite unity is broken up. Friedrich Wilhelm Joseph von Schelling (1775–1854) held that there is a unity between ideal and real. Absolute idealism explains the process of division of consciousness and nature, and their return to unity.

The culmination of German idealism came with Georg Wilhelm Friedrich Hegel (1770–1831), who believed that understanding *Geist* (Absolute Spirit) would overcome all (Kant's) contradictions in the realms of reason and science. *Geist* is the principle of reality that makes the universe intelligible as an eternal cyclical process whereby *Geist* comes to know itself, first through its own thinking, then through nature, and finally through finite spirits and their self-expression in history and their self-discovery in art, in religion, and in philosophy. Later in the century, Hegel's doctrines were developed by a group of English idealists, most notably Francis Bradley and John McTaggart Ellis.

In contemporary philosophy, monism is mostly materialism or physicalism. In psychology and philosophy of mind, it is held by many that the mental is reducible to the physical and may be explained in terms of physical laws. Eliminative materialism (Patricia and Paul Churchland) denies that the mental exists and claims that all "mental" talk will be ultimately eliminated as science progresses. Functionalism is a noneliminativist form of materialism claiming that descriptions of mental events and their intentional natures may be explained by systemic relations among the parts of the material brain (Hilary Putnam and William Lycan).

Anomalous monism (Donald Davidson and John Searle) holds that mental events are ultimately identical to brain states, but that there are no laws (hence *anomalous*) that connect brain states to mental states.

MORAL SENSE. Sentimentalism, of which moral sense theory was a part, initially had a short run. Until the end of the twentieth century, all the major versions of the theory were produced within a sixty-year period in eighteenth-century Britain. Anthony Ashley Cooper, third earl of Shaftesbury (1671–1713), initiated the sentimental line of thought with his theory that morality is grounded in the reflexive sentiments of the mind, but the idea that human beings possess a specific moral sense, in addition to their external senses, is due to Francis Hutcheson (1694–1746). David Hume (1711–1776) explains the moral sense in terms of more fundamental psychological principles of the mind, especially sympathy. Adam Smith (1723–1790) follows Hume in tracing the moral sentiments to sympathy while dispensing with the idea of a moral sense altogether. Joseph Butler (1692–1752) advocated a compromise between sentimentalism and rationalism, describing the deliverances of conscience as a “sentiment of the understanding.”

The sentimentalists think morality is rooted in human nature in two ways. First, what has moral value are first-order sentiments, the passions and affections that motivate people to act, and actions expressive of these sentiments. Second, what gives these motives their value is our reflective, second-order sentiments; sentiments we have about our own or other people's sentiments. We feel approval or disapproval toward ourselves or others for having and acting on certain first-order sentiments and affections. The eighteenth-century sentimentalists compare moral qualities to secondary qualities such as color that result from our visual apparatus. Because we have a propensity to project color onto objects, we come to think of color as a property of objects themselves. Similarly, we project our approval onto people's motives, which explains why we think virtue is a property of actions themselves and approval is a response to that property. For the sentimentalists, however, an action is virtuous only because we approve of it.

Both sentimentalism and its rival, rationalism, initially developed in reaction to Thomas Hobbes's (1588–1679) moral theory. The rationalists objected to Hobbes's claims that there is no right or wrong in the state of nature, that rightness or wrongness is determined by the sovereign's will, and that morality requires sanctions if it is to motivate us. The sentimentalists took a different tack, opposing what they took to be Hobbes's “selfish” conceptions of human nature and morality. They argued that we are by nature social creatures. Other-regarding affections such as benevolence, gratitude, and compassion are an original and real part of human nature. Butler's criticisms of Hobbes's selfish conception of human nature are held in high repute to this day. The sentimentalists also tried to show that morality has nothing to do with self-interest. Self-interest neither provides the motive to act morally nor explains why we morally approve or disapprove.

By the middle of the century, rationalists and sentimentalists began to argue with each other. The rationalist Samuel Clarke (1675–1729) claimed that our moral ideas spring from reason and that the rational awareness that actions are fit or unfit has the power both to obligate and to motivate us. The sentimentalists objected to both claims. One surprising advantage that the sentimentalists had over the rationalists is that they had a more fully worked-out view of what reason is and does, and they interpreted the rationalists in terms of that theory. On that view, reason is inert in two ways. First, reason's operations are limited to the examination and comparison of ideas, that is, to ascertain facts and to determine a priori relationships. Rationalists and sentimentalists agree that basic moral ideas are simple. On the sentimentalist view, however, reason alone never gives rise to simple ideas, so reason alone cannot be the source of moral ideas. Reason is inert in another way: it cannot by itself give rise to a new motive. All reason does is notice the relations between ideas; noticing a relation cannot move us. Hume infamously added that there are no normative rational standards at all that apply to action. We are no more required by reason to act prudently than we are required to act morally.

Shaftesbury characterizes the reflective moral sense as a tendency to admire and approve what is beautiful in people's motives and characters. Butler agrees that the principle of reflection—or conscience—is an essential part of human nature but argues that Shaftesbury overlooked its most important feature. Conscience, he insists, has authority—a right to rule us—that is independent of its strength or power to move us. Both Shaftesbury and Butler conceive of human nature teleologically, as a system structured to promote good ends—one's own good and the good of other human beings. The constitution that is morally approved of is one appropriately balanced between other-regarding and self-regarding affections. Moral evil results not from evil affections, but from our affections being out of balance. As these philosophers see it, human nature is on the whole good.

Starting with Hutcheson, later sentimentalists began to move toward a more modern scientific conception of human nature as morally indifferent. They thus reject the teleological picture of human nature Shaftesbury and Butler endorsed. They continue, however, to think of our nature as benign. Hutcheson, for example, denies that human beings have such evil affections as disinterested malice.

Hutcheson is famous for two claims. First, taking over Shaftesbury's idea of a reflective sense and embedding it in the empiricist view that simple ideas must come from the senses, he claims that human beings possess a unique moral sense that disposes us to immediately and noninferentially approve and disapprove of people's characters and their actions. He also argues that the only character trait of which the moral sense approves is benevolence. The four cardinal virtues—temperance, courage, prudence, and justice—are virtues, he insists, only when motivated by benevolence. Hutcheson distinguishes three types of benevolence. The morally best kind is calm universal benevolence, which aims at the good of all sentient creatures. The moral sense also approves of benevolence directed

toward smaller groups, such as love of family or country, as well as particular benevolent impulses, such as pity and gratitude, but only if they do not counteract universal benevolence. When Hutcheson turns from a discussion of why we approve or disapprove of certain actions to a discussion of what actions we should choose, he says we should always choose the action that “produces the greatest happiness for the greatest number.” He is the first to enunciate the utility principle.

Even more than Hutcheson, Hume and Smith explicitly aimed at providing a naturalistic explanation of morality, one wholly consistent with the scientific picture of the world. They criticized Hutcheson not only for positing an extra sense but also for failing to explain its origins and workings. The moral project, as they see it, is to discover the fundamental principles of the mind that account for the origin of moral concepts. Both trace the moral sentiments to the operation of sympathy, although they conceive of sympathy differently. For Hume, sympathy is a propensity to feel what other people are feeling, even those wholly unrelated to and removed from us. For Smith, sympathy is the ability to put yourself imaginatively in another’s situation and to feel what you would feel in that person’s place.

Hume’s explanation of moral approval and disapproval begins with our more ordinary loves and hatreds that are violent and vary from person to person. He then describes the process whereby we transform these feelings into a kind of calm, uniform moral love and hatred. On his view of sympathy, we sympathize more easily with people who resemble or are contiguous to us. Although our ability to enter into the feelings of others varies, Hume believes, like most other moral philosophers of this period, that our moral approvals do not. Accordingly, moral approval springs from sympathy but only when we take up a “general” or “common” point of view. There are two regulating features to the general point of view. The first is that we survey a character from the perspective of the person and his or her usual associates. We sympathize then with the person and the people with whom that person regularly interacts, and we judge character traits in terms of whether they are good or bad for these people. The second is that we regulate sympathy by relying on general rules that specify the general effects of character traits. We do sympathize not with the actual effects of a person’s character traits but with their usual tendencies for a person’s regular associates.

Hume offers as an empirical hypothesis the claim that the moral sense approves of motives that are pleasant and useful to agents themselves or to others. Smith criticizes Hume for ignoring another important way in which we judge people’s sentiments. We judge the propriety of people’s reactions—whether they are excessive or weak in relation to their object. When we blame someone for excessive anger we do so not only because of its bad effects on that person or others, but also because it is out of proportion to its object or occasion. Smith explains judgments of propriety in terms of his own distinctive conception of sympathy. We judge the propriety of someone’s reaction by seeing whether his reaction is the same as our vicarious reaction. We imaginatively put ourselves in the other’s shoes and feel what he should feel, given his situation. We then compare his reaction with our vicarious one.

If his actual feeling is excessive compared with the vicarious one we are feeling, we disapprove; if the feeling is similar, we approve. Smith’s account of judgments of propriety is one of his most distinctive contributions to sentimentalism.

Subsequent sentimentalists objected to Hutcheson’s reduction of virtue to benevolence, claiming that we approve of a wide variety of character traits and motives. Butler argued against Hutcheson that utility cannot be the basis of our approval of justice, since we disapprove of such injustices as theft and treachery even in those cases in which they are useful. Hume grants that acts of justice, taken singly, do not always promote the public good, but he argues that what is useful is the system of justice with rules and procedures that everyone is to follow. Hume also accommodated the rationalist idea that the good person does the right thing because she sees it as right. He argues that in the case of justice this is the morally best motive as well as our usual motive.

Although all the sentimentalists believe that we have the capacity to judge ourselves, Smith tries to explain how we acquire this capacity and in so doing become reflective agents. According to him, conscience, or the “man within,” comes from our social nature. We first learn to internalize the judgments others have about ourselves, viewing ourselves through their eyes. But others may misinterpret or misunderstand our motives, praising or blaming us when we do not deserve it. Smith thinks we learn to distinguish the actual praise of others from judgments about whether we are worthy of praise. The sense of moral obligation arises when we internalize the gaze of the ideal spectator—the man within—and try to meet the standards of praiseworthiness he sets for us.

Sentimentalism is enjoying a revival. New versions of the theory have been produced at the end of the twentieth century and the start of the twenty-first, the most prominent of which are the neosentimentalist theories of Simon Blackburn and Annette Baier. Both are followers of Hume, although Blackburn incorporates important elements from Smith. Their main target is Kant, whom they misread as a traditional moral rationalist along the lines of Hume’s main opponent, Samuel Clarke. Traditional moral rationalists were realists: they believed that moral truths are part of the framework of the universe. So for Blackburn the foundational issue of whether morality should be located in sentiment or reason is one that asks whether morality is grounded in the framework of the universe or in that of human nature.

Like Hume and Smith, Blackburn wants to provide a naturalistic theory that is consistent with the scientific worldview. According to his theory, to value something is to have a stable disposition in favor of that thing, a disposition we approve of having and are concerned to preserve. Blackburn believes human beings tend to share the same settled dispositions because we need to coordinate our actions with those of others and because we want to be loveable in their eyes.

Blackburn conceives of morality as a product of human nature, springing from second-order sentiments we have about our first-order sentiments. He explains this characteristically sentimental idea in terms of a “staircase of emotional ascent.”

At the bottom are preferences, simple likes and dislikes. The next step up are our primitive aversions to some kind of action or character. Following Smith and going up another step, Blackburn argues that if you are angry and I come to share your anger, we come to see the matter as a moral one. The sympathetic identification causes us to see the sentiment as legitimate. We take the final step when we are moved to urge others to share the sentiment, effectively treating it as required.

Moral obligation and motivation result from a four-step process. Following Hume, Blackburn thinks the process begins with the natural emotion of love we feel toward certain character traits. We turn that love into moral esteem by taking up what Hume calls the common point of view. We then notice whether we have the character trait or not. Blackburn relies on Smith's theory that we become agents by internalizing the moral gaze of others and on his explanation of how we come to desire not just praise but praiseworthiness. For Blackburn, the latter is the desire to do what is right, so we are motivated to act morally.

Like the earlier sentimentalists, who compare moral properties with secondary qualities, Blackburn gives a projectivist explanation of why morality appears to us as a feature of reality. We tend to project our approval onto people's motives and see it as a property of the motives themselves. This "quasi-realism," as Blackburn calls it, is the aspect of his theory for which he is best known.

Blackburn provides a naturalistic explanation of what we are doing when we use normative concepts. According to him, we are expressing or voicing our values rather than describing something. He thus defends a form of noncognitivism, the view that ethical judgments cannot be true or false, since they do not describe facts. Borrowing the term from Allan Gibbard, he calls this type of noncognitivism "expressivism." The twentieth-century noncognitivists are often thought to be following in the footsteps of the classical sentimentalists. But the eighteenth-century sentimentalists were concerned with the question of where our moral concepts come from rather than with the analysis of moral language. They did not deny that sentences in which moral concepts appear could be true or false.

Blackburn adopts the Humean view that the role of reason is limited to informing us of the facts of the case, including the likely effects of proposed actions. Awareness of these facts will move us, but only if they are tied to some desire or contingent concern of ours. Like Hume, Blackburn denies that there are rational standards governing action. Nevertheless, he argues that there is a perfectly respectable sense in which people may be said to reason about their ends or are criticized for being unreasonable. Reasonableness stands for freedom from certain traits—ignorance, lack of foresight, lack of concern for the common point of view. Those of us who value these traits may condemn someone who lacks these traits as unreasonable.

Baier provides perhaps the most sympathetic and systematic reading of Hume's *A Treatise of Human Nature* in *A Progress of Sentiments*. The progress is a turn from a reliance on pure Cartesian intellect to an attempt to employ philosophically all the capacities of the mind: memory, passion, sentiment, and "chastened intellect." On her reading, Hume's

"carefree" or liberated philosophy is an investigation of the whole mind by the whole mind, in contrast to the Kantian investigation of reason by itself.

Baier sees Hume's moral theory as friendly to women's moral experiences and the inspiration for a new approach to feminist ethics. She thinks Hume anticipated many important elements of feminist ethics. Agreeing with the classical sentimentalists that we are essentially social creatures, she believes, as she thinks Hume did, that relationships are at the heart of morality. She applauds Hume for realizing that the system of justice with its rules and rights is an offspring of family cooperativeness and love. She sees him as one of the first philosophers to emphasize intimate and involuntary relationships and relationships between unequals such as parents and children.

Baier advocates a feminist ethics in which trust underwrites both love and obligation. Her deepest debt to Hume comes from his insight into how trust can come to be progressively enlarged, a view she reconstructs from Hume's account of the artificial virtues and the conventions in which they are embedded. Unless people trust each other, they will have trouble loving each other. To recognize a set of obligations is to trust that those who have the power to impose sanctions will enforce sanctions if obligations are not met. It is to trust a group of people with coercive power. Important questions include whom we should trust as well as distrust. Baier looks at obligation from the point of view of the powerless, not the powerful.

Despite Hume's commitment to naturalism, Baier, along with the neo-Kantian Christine Korsgaard, claim to have found in Hume a general test of normativity that applies to the understanding and the moral sense. Both agree that for Hume the normative problem is not whether our beliefs and values are true in the sense that they correspond to some independent reality. The problem is whether our more unreflective beliefs and values and the faculties that give rise to them can withstand their own reflection without incoherence or self-condemnation. Both argue that, on Hume's view, when the moral sense turns on itself and its operations it survives its own survey; therefore its judgments are authoritative.

MOTHERHOOD AND MATERNITY. Motherhood the world over is commonly understood in terms of a generic terminology. Regardless of country, clime, or class, age-old mythologies in all cultures eulogize motherhood and impart to it an importance that goes well beyond the physical act of birthing. At the level of twenty-first-century popular culture, however, motherhood and maternity have been appropriated by modern-day consumerism, particularly in Western cultures where specialized stores like Mothercare sell fashionable maternity apparel, and Internet sites like The Mothersbliss Shopping Experience offer both goods and advice on mothering. While religious symbolism stresses motherhood as *creation*, modern-day marketing targets the “mother-consumer” to sell fashionable maternity clothing, lingerie, and accessories as a form of “Pregnancy Chic!”

Given all the numerous contextual underpinnings, the concept of motherhood lends itself to a variety of interpretations across culture and historical time. It therefore needs to be analyzed in terms of history, culture, myth, art, and more lately

in terms of the scientific discourses that shape new reproductive technologies and population control policies, all of which focus on women’s bodies and their biological ability to become mothers. This article touches upon all these contexts, drawing illustrations from diverse cultural, social, and geographical locations to point out that motherhood is valorized in all cultures, yet the notions, symbols, and cultural practices that constitute motherhood and maternity are neither homogenous globally nor stable chronologically.

History, Religion, and Myth

Motherhood is wrapped in many cultural meanings. Birthing and nurturing new life physically has led to a conflation of “feminine,” “maternal,” and “feminine spirituality” in many cultures and religious traditions. Motherhood has been painted as a sacred and powerful spiritual path. In literature and in nationalist discourses alike, motherhood is a recurrent theme across cultures.

Religious scriptures and myths place motherhood in an exalted realm. Christian, Judaic, and Hindu religious imagery sentimentalizes and idealizes motherhood. While Madonna images are characteristic to Christianity, conceptualizations of the Devi-Ma (Goddess-Mother) in Hindu tradition are reinforced by the many goddesses in the Hindu pantheon, each epitomizing an attribute (Durga/Kali: strength; Lakshmi: prosperity/abundance; Saraswati: knowledge; etc.). In West African, Afro-Caribbean, and Afro-Brazilian traditions, Yemaya (or Yemalla) is a creation goddess. Often depicted as a mermaid or a beautiful woman, and associated with the moon and ocean, Yemaya governs the household and rules over conception, birth, and ensures the safety of children. Local mythologies suggest that the fourteen Yoruba goddesses and gods spilled forth from Yemaya’s womb, and the breaking of her uterine waters caused a great flood that created the oceans. From her body were born the first human woman and man, who became the parents of all mortal beings on earth.

Although Buddhism does not give motherhood such overwhelming spiritual status and significance, maternal imagery and symbolism are present in the concept of the archetypal female Bodhisattvas, seen as supreme mothers. Tara is compared to a mother with compassion and forbearance; Prajnaparamita is seen as the mother of all Buddhas. Interestingly, the Bodhisattvas (transcendental ideal mothers) are also essentially androgynous—thus distinguishing the Buddhist spiritual tradition from the Christian and the Hindu.

Influenced by religious mythologies and local lore, classical literature from Europe, Africa, and Asia is filled with examples of self-sacrifice in the name of motherhood. While mothers are revered as creators, nurturers, and goddesses, they also inspire awe because they are believed to both protect and destroy. At the heart of the sprawling metropolis Mexico City stands the Monumento a la Madre, a monument commemorating motherhood. Its location and the Spanish inscription on it, “Porque su maternidad fue voluntaria” (because their maternity was voluntary), emphasize the centrality of motherhood in Mexican society. In fact, two of Mexico’s most important mythical figures are mothers, contrasting figures with

origins in Mexican history and mythology. La Malinche (also known as Malintzin), a Mexican Indian princess born around 1500, was given as a slave to Hernán Cortés, the leader of the conquistadors in Mexico. She later bore him a child. Because of this sexual transgression and for her role as mediator between the Spanish and the native Indians, popular mythologies view her as a traitor and a bad mother responsible for the quick defeat of the indigenous peoples and the downfall of the entire Aztec Empire. In contrast, the Virgin of Guadalupe, a Madonna with indigenous features, is seen as incarnating all the values associated with the good Mexican mother: meek, kind, self-sacrificing.

Indeed, in modern societies the concept of mother has commanded popular appeal as a symbol of the nation-state. Nationalist discourses in diverse global contexts deploy the nation-as-mother symbolism to mobilize patriotic sentiments. Love of mother and love of nation have been conflated. The symbolism of the enslaved mother was at the heart of the anti-colonial nationalist struggles, both in India to free Bharat-Mata (Mother India) in the 1940s and in South Africa in the 1980s and 1990s. While patriotic songs and monuments in many countries celebrate the nation-as-mother, there are exceptions. In Russia, for instance, patriotic songs often invoke sentiments of loyalty toward the land of birth (*rodina*), referring to it as *otchestvo* (fatherland).

Although maternal ideals are espoused and valorized in all cultures, in patriarchal societies that uphold a woman's central purpose to be her reproductive function, motherhood and mothering become intertwined with issues of a woman's identity. Essentializing theories that define women in terms of fertility are reinforced socially through many female archetypes (such as the Virgin, Venus, and Mother Earth) that remain bound to women's reproductive functions. Such cultural myths, perpetuated throughout the centuries, enforce the belief that motherhood is an essential part of being a woman. The Mexican writer Rosario Castellanos (1925–1974) pointed out that a Mexican woman does not consider herself to be a real woman unless she has proved herself to be fertile and the “halo of maternity” shines over her. This holds true for most women not only in Mexico but also in Iran, India, China, Korea, and many Latin American societies, where the index of motherhood is used to define “real” women. Given that motherhood becomes a prerequisite for social acceptance in such societies, many non-mothering women experience feelings of rejection and low self-esteem. In cultural practice, this means that patriarchies can deploy notions of motherhood to foster conservative traditions, through which motherhood becomes a means of female control.

Although in many cultures expectations of mothering roles are buttressed by intense social pressure to conform to them, this seems to be driven less by levels of modernity or urbanization than by the status accorded to norms of familial and community cohesiveness in a society. For instance, Japan's highly urbanized, industrialized society continues to perpetuate highly prescriptive notions of motherhood, just as in Egypt, Iran, India, or Afghanistan. Despite differences in economic status and levels of development, all these societies share widely

held beliefs about the importance of family and community linkages. Regardless of whether a particular African society displays a patrilineal or matrilineal kinship system, mothers are the essential building block of social relationships and identities in most African cultures. Because mothers symbolize familial ties and unconditional loyalty, motherhood is invoked even in extrafamilial situations that call upon these values. Women-as-mothers, then, become key players in the maintenance of linkages and acquire important community responsibilities.

Birthing. Given such assumptions about motherhood, the act of birthing is both anxiety-producing and a dramatic moment in what is perceived as the cycle of creation. In many Islamic and Hindu communities, birthing is also associated with rituals of purity and pollution: While these traditions exempt the mother from household chores and burdensome tasks, they also regard her as unclean and force her to live somewhat segregated from community spaces for several days post-childbirth. In many societies in Africa and Asia, among Muslim, Hindu, and Christian families (both urban and rural), daughters still return to their natal family homes late in pregnancy, to be properly cared for and pampered during and after birthing. Given the high maternal and infant mortality rates in most developing countries, birthing is understandably regarded as a dangerous and life-threatening process, the successful completion of which calls for prayer and celebration.

African societies also widely posit birthing with great significance. Feminists in Africa, while conceding that this may at times operate in an oppressive manner, have attempted to recuperate other conceptualizations of motherhood that are empowering for women. Within such conceptualizations, birthing bestows a certain status on women—even mystical powers. Yoruba traditions are a case in point. Among the Yoruba, motherhood confers privileges that hark back to the very foundations of society and women's presumed roles in it. Women symbolize fertility, fecundity, fruitfulness. The Yoruba say, “*Iya ni wura, baba ni jigi*” (Mother is gold, father is a mirror). Mother is gold: strong, valuable, true, central to a child's existence, wise, also self-denying. The Yoruba also believe that *ikunle abiyamo*—the kneeling position that is assumed at the moment of birth—confers spiritual privileges on a mother. Thus there are powers, privileges, and entitlements that come with motherhood—even in the act of birthing.

Stereotypes of “ideal” mothers. Even in Western societies, at least until the postwar years, women were encouraged to produce large families, to find satisfaction and pride in motherhood. However, the nobility and respect assigned to full-time motherhood was still regarded as inferior to male pursuits. Thus, motherhood was simultaneously idealized and denigrated.

The importance of these cultural and religious symbols of motherhood is borne out by the fact that they are repeatedly invoked in art and literature and form part of ongoing mythologies that create icons and idealized stereotypes pervasive in communities. Literary and artistic works through the ages valorize those attributes of motherhood associated with Virgin-identified self-sacrifice, offset by myths of the bad mother, which are just as prevalent. Depictions of self-sacrificing mothers as creators who must bear pain with patience and nurture

selflessly leave no space for mothers as women who feel pain, anger, frustration, or are simply drained by the responsibilities that accompany their mothering roles. Thus good mother stereotypes assist in sustaining a bad mother/good mother dichotomy within which patriarchy condemns the negative maternal feminine image.

Statistics, of course, prove that the universality of motherhood is a myth. Women across the globe are individual, multi-dimensional personalities who defy this super-construct. Their roles and self-perceptions as mothers are mediated by the complicated tapestry of culture, clime, and class that shape them. Feminists in the second half of the twentieth century have aimed to debunk these cultural myths.

Feminist Critiques

Debates over motherhood have been fundamental to feminist movements, whether in the United Kingdom, the United States, Japan, India, or China. In this context, the issues for feminism are numerous. Some of these are analyzed in a historical context below, with references to how literary representations use tropes of motherhood that reinforce patriarchies of race and gender. Finally, contemporary debates on issues such as abortion, the use of reproductive technologies, surrogate motherhood, and single mothers are examined.

Broadly speaking, critiques of motherhood argue that femininity is widely defined in essentialist terms that assume that women have instincts that make them selfless nurturers. Such assumptions, in turn, shape social practices that make women automatically responsible as caregivers. Feminist theorists argue that such myths, constructed by the patriarchy, undergird social practices that eventually restrict women. Although contemporary feminisms have widely vocalized these issues, it is important to recognize that the first formulations on this issue predate twenty-first-century feminism.

The French writer Simone de Beauvoir (1908–1986) argued that women are repeatedly told from infancy that they are “made” for childbearing. While the “splendors of maternity” are forever being sung to her, the drawbacks of her situation—menstruation, illnesses, and even the boredom of household drudgery—are all justified by this “marvelous privilege” she has of bringing children into the world. Beauvoir pointed out that such pervasive socialization shapes women’s desire to “choose” motherhood.

The second-wave feminist movement in the United States (after the 1960s) brought these interrogations to center stage. Feminists argued that throughout human history, maternal experience has been defined and written by patriarchal culture. Religion, art, medicine, psychoanalysis, and other bastions of male power have objectified motherhood, have disregarded female subjectivity, and have silenced the voice of the mother. Feminist activists insisted on middle-class women’s right to work and participate in public life beyond the family (working class and poor women had been working all along, while also raising their families), and, along with this, that mothering was not essential to women’s fulfillment or necessary to every woman’s life.

Feminists in the United Kingdom, North America, and Europe began to challenge the overemphasis on fertility, insisting that the link between childbearing and childrearing is socially manipulative and serves to exclude women from other productive roles. Feminist theorists debunked the social pressures of a mothering role that seeks to control women’s bodies and energy. They argued that such notions limit women’s possibilities to the domestic sphere and restrict their entry into the public domain, thus vitally feeding into patriarchal agendas.

Although the second-wave feminists vocalized the issue of fertility more aggressively than before, it is important to remember that the earliest efforts in this direction were made in the 1920s through activism of the suffragists and women like Margaret Sanger (1879–1966), who founded the American Birth Control League in 1921. Sanger’s movement made an impact in North America, Britain, and India, and forcefully argued for “planned parenthood” as essential to ensure women’s participation in the public domain. Since the work of the second-wave feminists, fertility has remained a crucial part of the feminist agenda.

Literary criticism. Since the 1970s, feminist critics have generated a prolific body of literary criticism that demands an inquiry into the nature of the maternal instinct and the psychology of the mother-child relationship. This task is common to feminism in the West and the widely different cultures of Japan and India. In the 1970s, Japanese feminist critiques began to assert that *bosei* (innate maternal instinct) was a social construct. They sought to demonstrate that modern Japanese conceptions of womanhood as motherhood, of motherhood as something natural and instinctive to women, were artifacts of contemporary society whose construction could be historically interrogated. Contemporary Japanese fiction such as *Child of Fortune* by Yuko Tsushima (1983), about a woman struggling between the reality of motherhood and the expectations of society influenced by an idealized good mother paradigm, presents a stinging critique of rigid and constraining constructions of motherhood.

Along a related trajectory, the work of Marianne Hirsch from the late 1980s captures the spirit of Western feminists’ preoccupation with the literature of matrilineage in conjunction with an ongoing feminist pursuit of retrieving maternal subjectivity. The literary representations of mother-daughter voices in contemporary matrilineal narratives open up a new chapter in the feminist project of repositioning mothers as individuals and as subjects. This repositioning sheds new light in the study of relationality in the field of feminist maternal scholarship.

Feminist scholarship from Latin America has critiqued the implications of local mythologies and motherhood discourses for Latina women. A feminist analysis of the La Malinche/Virgin of Guadalupe dichotomy reveals that the Virgin (symbolizing passivity, tenderness, and self-sacrifice) is central to the construction of femininity in Latin American cultures because she embodies virtues convenient for the patriarchal order. La Malinche—the sexualized, headstrong woman who freely chose her destiny—is dangerous to the patriarchal order and is presented as hateful. Women thus feel compelled to emulate the Virgin, a less threatening figure. In effect, the Virgin

image serves to suppress the threatening or deviant femininity embodied La Malinche—regarded as the Mexican Eve. The Virgin becomes the embodiment of Mexican motherhood, while La Malinche's depraved sexuality becomes a reason to justify the oppression of women.

Motherhood and race. Feminism and the self-reflexive questionings within the women's movement in North America also drew attention to the fact that notions of motherhood are racially specific and conditioned by prevailing social hierarchies. For instance, in North America from the Reconstruction through the Progressive Era, African-American and white women were encouraged to view motherhood as a national racial imperative. The mother-nation symbolism was anchored in a patriotic discourse. Literary representations depict a conflated mother-nation as a protector who also needs protection by her children/citizens, who must ensure the mother-nation's perpetuation by reproducing her progeny. Novels of sexual awakening by Kate Chopin (1851–1904) and Edith Wharton (1862–1937) depict motherhood as personally limiting but racially necessary. Women writers and activists responded to this imperative by using diverse strategies that reflected the broader public debates about race, reproduction, and female agency.

In the American context, it has also been argued that early-twentieth-century depictions of motherhood for African-American women sought to depict mothers as active agents rather than passive instruments of reproduction. However, the narratives also revealed that women's agency as mothers comes at a price and was continually constrained by fixed gender roles and social expectations. The brutalizing effects of slavery marred the joys of black motherhood, as did complications of biracial identity (Berg). Such fictional and nonliterary texts also reflected the early twentieth-century debates over birth control, feminism, and eugenics in the United States, using motherhood and race as key tropes for discussions of social progress and decline. These texts also established that even notions of universal motherhood that fostered cross-racial conversations reinforced social and racial hierarchies.

Feminist critiques from South Africa point out how nationalist and patriarchal causes have appropriated the African-woman-as-mother. This figure has been used to extol the ostensibly unique qualities of nurturance, protectiveness, and altruism of African women, qualities that are often believed to make them morally and culturally superior to Western women. Celebrated in much of the nationalist poetry and prose during the 1950s and 1960s, the African mother recurs in a range of present-day discourses in public and domestic life.

From another context, ethnographic research from Asia and the Pacific shows that maternal experiences vary greatly depending upon historical time and local discourses. For instance, motherhood as embodied experience for women in colonized societies was shaped by colonial policies, missionary influence, and conflicts between Western medicine and biomedical birthing methods. All these shaped the experience of modern mothering in many colonial societies (Ram).

Feminist theorists and writers challenge valorizations of motherhood fostered by conservative patriarchies. However, it

is important to emphasize that feminists do not reject maternity or devalue the woman-centered experience of birthing and mothering. Their project is to interrogate the myths and assumptions that impose oppressive role expectations and erase the reality of maternal experience. Feminist voices seek to liberate motherhood from the institution and the myth that confine it to the narrow playing field of the conventional family, leaving no space for women to choose alternative identities.

Motherhood and Development Discourses

Some of the public debates, campaigning, and policy-making that surround women's relationships to their bodies at the turn of the twenty-first century make evident the extent to which affirmations of motherhood constrain discursive frameworks of justice for women. The American feminist Patricia McFadden identifies this in relation to dominant trends within research, public debate, and policy-making around HIV/AIDS, while Jessica Horn discusses how the patriarchal emphasis on reproductive health anchors perceptions of women's sexual health firmly in stereotypical gender roles and identities (Narayan).

Along another axis, projects like the Population Council's "Save the Mothers Initiative" places attention on motherhood in development discourses. The Safe Motherhood Conference (Nairobi, 1987) of the International Federation of Gynecology and Obstetrics (FIGO) noted with alarm that almost half a million women die each year because of complications related to pregnancy and childbirth. FIGO sought global support, stressing that because 99 percent of maternal deaths occur in the developing countries and among women in the most deprived sections of the population, it was a socially unjustifiable phenomenon.

At the beginning of the twenty-first century, United Nations agencies and the World Bank supported several country projects in Asia, Africa, and Latin America to evolve cost-effective and sustainable ways to reduce maternal mortality and morbidity. Institutions like the London School of Hygiene and Tropical Medicine have maternal programs for conducting research and disseminating information on policy issues related to maternal and child health.

Critics of such population policies, however, argue that mass distribution of hormonal medicines used for population control in developing countries has serious implications for the health of millions of women who are unaware of the long-term impact of these drugs. Feminists also point out that notions of "reproduction" and "reproductive rights" have many possible interpretations, with varying degrees of social impact on gender and family. In the 1960s, the core issues around reproductive rights involved the access to family planning and to information on birth control; in the abortion debates, the right to privacy seems to encompass the right to decide whether to conceive and to carry a fetus to term. Since the 1990s and the struggle against AIDS, reproductive health has won new relevance.

Contentious Debates

In the light of the revolutionary changes that have come about since 1978—when the first test-tube baby, Louise Brown, was born—it is important to touch upon abortion, surrogacy, and

new reproductive technologies (NRTs). Such contemporary issues relating to motherhood have provoked controversies that reflect diverse social and cultural perceptions of motherhood.

Abortion. The conscious decision to medically terminate pregnancy is controversial in religious and political terms in many countries, regardless of levels of modernity. Pro-life groups in the United States and Europe staunchly campaign for the closure of abortion clinics, while for women in contemporary China or India abortion is easy and inexpensive, given the population control policies in these two countries.

Buddhism, Hinduism, Christianity, perhaps all religious and secular philosophies, focus on two central questions relating to abortion: (1) When does the embryo/fetus acquire the property that makes the termination of pregnancy “killing”? and (2) Is abortion, before or after this point, ever justifiable? Orthodox strains in Christianity, Buddhism, and classical Hindu embryology (which maintain that the transmigration of consciousness occurs at conception) believe that all abortion is sin and incurs the karmic burden of killing (in Buddhist and Hindu terms). Before modern embryology, however, in both Buddhist countries and the West, ideas about conception were scientifically inaccurate. Although the findings of modern neuro-embryology provided scientific support for subsequent arguments developed by most Western ethicists to defend abortion, such legacies continue to impede pro-choice campaigns in asserting that any society that values liberty should not control a woman’s reproductive rights by law (Luker).

Whether abortion is ever “justified” relates to whether religious ethics about motherhood are absolutist, utilitarian, or “virtuist” (i.e., seeing the good in the development of personal qualities). The absolutist would regard abortion akin to murder, whatever the justification. The utilitarian would justify it on compassionate grounds (based on the mother’s health or the population crisis or parental inability to raise a child).

Traditional Jewish law (*halakah*) takes a positive stand on procreation and is comparatively lenient regarding the NRTs. In densely populated countries like China, India, or Bangladesh, state-sponsored family planning policies have enhanced the social acceptability of abortion. Japanese society combines both utilitarian and virtue approaches. Widely accepted as a “sorrowful necessity,” abortion is openly ritualized in Buddhist temples selling rituals and statues intended to represent parents’ apologies to the aborted. Some Buddhists have adopted a moderate position: abortion is akin to killing, but women should have that choice. Since most Buddhists support laws that discourage or punish murder, implicitly this position seems to suggest that abortion is either justifiable (when it conflicts with bodily autonomy) or that fetuses are closer in status to animals.

Such reproductive accommodations, while they reduce the impact of oppressive regimes on women’s reproductive autonomy, do not necessarily emerge from debates that incorporate women’s voices. Feminists also point out that pro-life activists (women and men) are not necessarily opposed to capital punishment or killings in war, implying thereby that anti-abortion

positions are motivated by considerations of power and control over women rather than morality. Thus, feminist activists the world over stress that abortion should be viewed as an issue of autonomy, constitutionality, and economic status, rather than simply of ethics.

Surrogate motherhood. Like abortion, surrogate motherhood—which allows for a woman to carry and bear a child for childless couples, mostly as a commercial transaction—is a highly problematic issue. In pitting claims of mothering-as-biological birthing against those of mothering-as-nurturing, it poses ethical, legal, and, some would argue, moral issues. Although new reproductive technologies that enable childless women to raise genetically related offspring increase women’s motherhood options, they are pitted against religious beliefs and conservative ethical systems. By creating alternative forms of parenthood and supplanting sexual intercourse as a means of reproduction, this branch of biomedicine has also unwittingly created challenges to kinship and family law. Ethicists generally view surrogate mothering arrangements in terms of stark moral choices: between the tragedy of infertility on the one hand, and the potential for exploitation of the host mother on the other. Among the many compelling objections, the likely economic exploitation of poor, working-class women by affluent childless couples remains a key concern. There are also concerns that widespread surrogacy would lead to a commodification of infants, while reducing motherhood to paid labor and the woman’s body to an incubator that can be hired through a contract.

New reproductive technologies. Feminist theorists of different persuasions have been critical of the effects of NRTs as “potentially insidious forms of social control” over women’s bodies. Radical feminists believe that by using NRTs, and participating in these technological processes that invade the autonomy of their bodies, women unwittingly aid patriarchy in gaining more control over their bodies. Feminist theorists Jana Sawicki and Donna Haraway, however, advocate a more complex reading of these technologies. For Sawicki, radical feminists ignore the resistance already emerging within this area. Haraway suggests that rather than view this simplistically, one should complicate our theories of experience. Haraway calls for a shift away from dualistic, oppositional thinking that posits technology as solely destructive and fragmentary. In short, Haraway proposes that while it is true that technology can and has been used as a negative force against women, to write it off as unredeemably patriarchal limits feminist thinking when more nuanced perspectives are needed.

Contemporary Redefinitions: Single and Lesbian Mothers

It is evident that notions of motherhood are culturally varied and shift over time. In Japan and in South Asian societies, for instance, where traditional abortion is readily available and relatively free of social stigma, single motherhood is highly stigmatized. In fact, given rising divorce rates in Japan, the institution of single motherhood has become a particularly salient issue for contemporary Japanese feminism. Single motherhood in Japan almost inevitably involves financial and physical hardship, perhaps more consistently than in the West,

given that there is little provision for child support and that even a divorced father usually does not continue to pay child support to the mother when she has custody of the children. Only 10 to 20 percent of divorced Japanese mothers receive regular child support payments. In addition, given the mythologies surrounding the mother's role in childrearing, there tends to be social stigmatization of working mothers in Japanese society, which has historically restricted and problematized conditions of access to daycare and other facilities. Thus, in the Japanese context, there are issues of institutionalized discrimination against single mothers that are intertwined with social perceptions of what constitutes a family.

Other redefinitions of mothering and motherhood have emerged with the turn of the twenty-first century. These new definitions interrogate gender stereotypes and question social constructs of "family." Nontraditional models of mothering by lesbian mothers in North America and Europe have further destabilized received notions of motherhood. Research scholars such as Ellen Lewin have analyzed models of the lesbian mother and lesbian and gay commitment ceremonies in the United States.

Definitions of motherhood and assumptions about its intersection with womanhood have been central to feminist theory in anthropology. Often these ideas draw directly on notions of nature and culture, conflating particular components of motherhood with virtue and authenticity. Insofar as some theorists have presented motherhood as a set of practices, it might be argued that men who undertake basic childrearing and caretaking activities are in some ways "mothers" rather than "fathers." What are the implications of these social realities for enacting cultural notions of motherhood and fatherhood? If men can be mothers, then can the conventional, biologically drawn boundaries of the basic gender categories—female and male—be defended? These questions remain complex and unresolved.

Motherhood in Academia and National Policy

Although millions of women in the world become mothers, motherhood generally is not regarded in academia as a core issue relating to society and the nation-state. Some universities, such as York University in Ontario, Canada, are beginning to study motherhood as an academic discipline, yet much of the research looks at the psychological and sociological aspects. Feminists argue that if motherhood is viewed as a historical experience, it will be evident that it is shaped not just by personal experiences and desires but also by public policy in which the nation-state plays a significant role.

From the discussion above, which draws upon the heritage, traditions, literature, and art from various cultures, it may not be far-fetched to suggest that the failure of institutionalized religions to give women a visible and valid role has traditionally led many women to seek dignity and self-respect, salvation and status, in society through birthing and motherhood, a role and path unique to them. In the new millennium, however, the emerging reality, especially in the industrialized countries, is of a falling birth rate. As millions of women join the global workforce, as more and more women gain control over their lives and bodies, and as motherhood becomes one of many acceptable identities and choices, it would seem that fewer

women become mothers (and those that do raise fewer children). The birth rate in Japan has been falling steadily since the 1970s. On average, the first postwar generation had four children, and the second, two. Trends in Europe are also alarming. Such statistical projections are causing concern to government planners and national policy-makers in many countries. If women increasingly begin to feel that the challenges outweigh the "joys of motherhood," demographers may well predict for the rapidly industrializing world a future of restructured family norms, labor shortages, fewer taxpayers to support a rapidly aging society, and fewer caregivers for the elderly.

MOTIF.

This entry includes two subentries:

Motif in Literature

Motif in Music

MOTIF IN LITERATURE

George Steiner has described culture as a matrix of recurrent and interrelated elements, a motor fueled by revolving constants. Broadly speaking, cultural literacy relies on our ability to recognize these constants—in literature, music, painting, or any other form of cultural production—and to work out relationships between them, to translate and recycle the meaning we inherit from them. Thus, the single word *Roncevaux*, voiced offhandedly by one man to another in Ernest Hemingway's *The Sun Also Rises*, can echo for the reader with large themes of betrayal, ambush, rivalry, and national loss—but only if the word is recognized as an allusion to the death trap set treacherously for Charlemagne's twelve peers in the early-twelfth-century *Chanson de Roland*. The tone of Steiner's short reflection on cultural literacy is dire, his main point being that “elementary” allusions and “implicit motifs”—such as *Roncevaux*—go unrecognized even by today's most “privileged students and readers.” A small literary element like *Roncevaux*, reused over time in various languages and genres, provides a useful example of a cultural “constant,” and recognizing the rich depth afforded by such recycled bits of meaning is in fact a method of comparative literary analysis. *Motif* is one word that can be used to delimit and distinguish an element like *Roncevaux*. But our options are many, and terms prove in practice frequently interchangeable. Steiner writes generally of *topologies*, a term that lumps together and encompasses such overlapping concepts as *topos*, *archetype*, *motif*, and *genre*. Our focus here is on the motif and limits the cultural field to literature. And yet Steiner's more expansive notion of culture as a network of recurring, interrelated constants provides one of the more helpful and lucid introductions to the movement and persistence associated with literary motif, an otherwise ambiguous element in comparative analysis.

Ambiguity

Let us start with the ambiguity that has characterized *motif* since the term first appeared—used in reference to a musical rather than a literary work—in Denis Diderot's *Encyclopédie* of 1765. Even now, defining exactly what constitutes a single motif or a motif sequence in literature continues to be a thorny task for students and scholars alike, in large part because published definitions as well as general use in literary criticism offer very little agreement as to its nature (excepting a general agreement that there is no common agreement). Dictionaries,

encyclopedias, and handbooks have defined *motif* variously as myth, theme, subject, central recurring idea, image, characteristic, symbol, archetype, leitmotiv, or outstanding trait. Adding to the confusion, *theme* and *motif*—potentially incompatible terms to Horst Daemrich—tend to be used interchangeably, strings of motifs often made synonymous with legend and myth. The recurring narrative constant of the insatiable artist, for instance, analyzed as integral to and mutually dependent on the literary tradition of Faust, has been described by Stuart Atkins, without clear distinction of terms, as “motif,” “theme,” and “myth.” General character types (holy hermit, evil dwarf, seer-hag, calumniated wife, warrior king, “flower” or “candle” of knighthood), objects (hero's sword, poet's pen, lover's ring, the Holy Grail), settings (paradise, hell, deserted wasteland, the otherworld, the city), situations (spilled wine, physical blow, quest, game or test, war, marriage), psychological states (madness, hysteria, paranoia), and general attributes (red hair, black eyes, hairy mole, hunchback) can all be traced over time and across genre and discussed as recurring literary motifs. Such lists are potentially endless and not necessarily new (see the Medieval Welsh Triads as well as Stith Thompson's motif-index and Daemrich's handbook). We might even speak of instructional, didactic, or homiletic motifs, as has David F. Johnson; in a study that seeks ultimately to identify the origin of a narrative tradition, Johnson has culled medieval British manuscripts for references to the rewards and punishments of the afterlife, concluding that both the Seven Joys of Heaven motif and its reverse, the Five Horrors of Hell, are Irish (rather than English) homilies. Theorists and scholars have used *motif* to identify narrative elements such as detail, metaphor, image, symbol, idea, and subject matter. The term need not refer exclusively to content elements but can apply to formal elements as well, and motif sequences have been identified as structuring devices, integral to a text's configuration. Helen Vendler's study of “key words” in Shakespeare's sonnets, for instance, demonstrates how motifs provide structural coherence by “firmly connecting” the four units of a sonnet (three quatrains and a couplet); in Vendler's analysis, motifs prove equally essential to the form of a sonnet as to its meaning. (The semiotician A. J. Greimas, as well as two of the most significant modern indexers of literary motifs, Stith Thompson and Elisabeth Frenzel, restrict motifs to content units; Wolpers, Daemrich, and others extend the term's scope into form and structure.) A literary motif, in other words, can be—and has been—defined with great fluidity: as an element of both narrative content and structural form, as a general literary theme, or as a question of the discrete units that make up that theme.

Size

And yet, however frequently equated with larger terms, motifs are invariably “small,” autonomous units of meaning. With Werner Sollors, we might consider *theme* to be a text's “aboutness” and motifs the discrete elements that make up its “treatment.” Motifs are the “basic components” of literary texts, “small substantial content units,” or the “details out of which full-fledged narratives are composed.” *Theme* is a structured group of motifs, and “wider thematic potential” is the result of recurring motifs. Thus, the two broken, failed

STITH THOMPSON'S *MOTIF-INDEX OF FOLK-LITERATURE*

The “alphabetical” organization of Thompson’s six-volume motif-index may at first seem counterintuitive. Thompson arranges material into twenty-three index categories—A to Z (excluding I, O, and Y)—but the category headings themselves are not arranged alphabetically. There is no correspondence, in other words, between a category’s letter and its topic—category A collects Mythological Motifs; category B, Animal Motifs; category C, Motifs of Tabu; D, Magic; E, the Dead; F, Marvels; G, Ogres; H, Tests; J, the Wise and the Foolish; K, Deceptions; L, Reversals of Fortune; M, Ordaining the Future; N, Chance and Fate; P, Society; Q, Rewards and Punishments; R, Captives and Fugitives; S, Unnatural Cruelty; T, Sex; U, the Nature of Life; V, Religion; W, Traits of Character; X, Humor; and Z, Miscellaneous Groups of Motifs. Each index category is subdivided, some much more so than others. For a detailed list of the categories and their divisions, see the beginning of volume one: “General Synopsis of the Index,” 29–35.

swords of *Beowulf* can be said to add essential, thematic force to the sense of loss that pervades the poem: Hrunting and Naegling are not in and of themselves what *Beowulf* is about, but as object motifs, in failing the hero in a time of need, they function as distinct elements in the poet’s elaboration of cyclical violence and social disintegration. Likewise, character and setting motifs reverberate throughout the poetry of Charles Baudelaire in ways that build an overall sense of anxiety about mechanized modernity: the idle dawdler (*flâneur*), for one, and the contrasting “traumatophile type”—a man propelled both by irrational fear and by sudden, nervous tics of the body—are both lost in the faceless, phantom masses of Baudelaire’s big-city crowd. While not interchangeable, then, (small) motif and (larger) theme are nonetheless “mutually dependent” aspects of all literature—both integral “constants” that contribute to the intertextual matrix of literary culture.

Etymology: Dynamism

The fluidity of the term *motif*, and its conflation with other concepts, help emphasize the movement, mutability, and persistence that return us both to Steiner’s cultural “motor” and to the root of the word itself. Derived from the Latin verb *movere*, “to move,” and the Medieval Latin noun *motivum*, “cause” or “incitement,” *motif* implies movement, stimulus, and dynamism; a recurring pattern or rhythm of motifs in effect propels narrative action. Motifs move in different ways: they are “mobile sequences” that conduct narrative action within individual texts, and they are also “translingual,” “intertextual migrations” that move between texts and genres through time. Motifs moreover persist—constantly migrating and recycling, but surviving. Thus, George Steiner traces the combined motifs of poet’s death, springtime, and resurrection from Horace, via the early modern poets William Dunbar, Thomas Carew, and John Milton, to Percy Bysshe Shelley and W. H. Auden—

tracking how diverse writers inherited and adapted meaning from classical antiquity into the twentieth century.

King Motifs in the Medieval Arthurian Tradition

Kingship, along with issues of power—who wields it, and how—can be said to obsess literature in general and medieval literature in particular. Take the weak king of Arthurian tradition—discussed by Edward Peters as an example of *rex inutilis* (the useless king) and frequently defined as exemplary of the *roi fainéant* (idle king) of medieval romance. Together with his Knights of the Round Table, he is already lost in decline, sliding toward the betrayal and civil war that will annihilate the Arthurian world. The Arthur of late medieval literature is himself largely absent from narrative action and almost always silent—his court a place of contention; his knights cowardly and his champions far away; his queen physically threatened, kidnapped, and ultimately unfaithful; his servants and realm vulnerable to violence and attack (as, for instance, in the works of Chrétien de Troyes [fl. c. 1170]). Exemplifying the character motif of weak, ineffectual king, this Arthur has persisted in literature, a king who is familiar today through Alfred, Lord Tennyson (*Idylls of the King*), T. H. White (*The Once and Future King*), and John Steinbeck (*The Acts of King Arthur and his Noble Knights*), or via the cinematic creations of Robert Bresson (*Lancelot du Lac*, 1974), John Boorman (*Excalibur*, 1981), or Jerry Zucker (*First Knight*, 1995).

And yet, far from first appearing on the literary scene as weak, Arthur is initially an impressive heir to the warrior kings of early medieval epic. The earliest and most complete literary version of King Arthur, that of Geoffrey of Monmouth, proves to be almost indistinguishable from the likes of *Beowulf*’s Shield Sheafson, a king whose name defines his role as defensive armament to his people, and whose violent leadership is praised in such terms as (in Seamus Heaney’s trans-

lation) “scourge of many tribes,” “wrecker of mean-benches,” and “terror of the hall-troops.” As encapsulated by the *Beowulf* poet, Shield Sheafson “was one good king.” Arthur, too, conquers, and with similar abandon: in the early years of his reign, the fifteen-year-old king defeats all of Britain—exterminating (in Lewis Thorpe’s translation) “without mercy” and with “unparalleled severity” the Saxons, Scots, Picts, and Irish—before expanding his realm with the subjection of Iceland, Gotland, the Orkneys, Norway, Denmark, and Gaul. Moreover, this Arthur delights in close combat and general slaughter. “White hot in the fierceness of his rage,” he laughs as he singlehandedly slays the monster of Mont-Saint-Michel, “driving the whole length of the blade into his head just where his brain was protected by his skull.” Though not explicitly named his nation’s armament, as is Shield Sheafson, Geoffrey’s Arthur is nonetheless memorable both for his sword, Caliburn (the Excalibur of later tradition), and for his shield, on which “was painted a likeness of the Blessed Mary, Mother of God, which forced [Arthur] to be thinking perpetually of her.” When Arthur invokes the Virgin’s name as his battle cry, her apparent blessing enables “unheard of slaughter.” Thus, the savage violence of *Beowulf*’s kingship gains in Geoffrey’s *History* divine sanction and favor.

Interestingly, the sword and shield of Arthur—in Geoffrey’s *History* such forceful sources of the king’s warrior might—are parceled out to knights in later tradition: in Chrétien de Troyes’s *Story of the Grail*, Excalibur is wielded by Gawain rather than by Arthur, and by the end of the fourteenth century it is Gawain rather than Arthur who carries the Virgin Mary emblazoned on his shield. The literary Arthur and the objects that help define his kingship demonstrate how motifs can transform even while persisting; such character and object motifs contribute to and elaborate a changing thematic of kingship, one that moves from praise of the warrior king to general neglect, to a new emphasis on knights and their quests.

What is the point of tracking literary change in a character motif, or of conducting motif-based analysis in the first place? Motifs in and of themselves, after all, are not what literature is about; if we recall Sollors’s distinction made above, they are merely the small elements that treat what literature is about. What exactly gives motif-based analysis methodological force? Even our brief consideration of the figure of King Arthur, of his transformation from inimitable warrior king to weak and inactive ruler in need of knights, allows us to raise much larger thematic questions about the nature of royal power. We can begin, for instance, to chart a literary trend away from the king as heroic conqueror toward a focus on the exploits of champion knights—toward a kind of redistribution and redefinition of power that in fact coincides with actual, historical change. Such wider thematic potential is arguably what makes motif so integral to literary criticism—and so useful to readers, students, and scholars.

Conclusion

It is precisely the persistence through tradition of motif that made motif-based classification such a fundamental aspect of the structural criticism of the mid-twentieth century: dis-

crete, shared units of literature were collected, alphabetized, numbered, and indexed, and relationships between literary genres and periods catalogued by type. A cursory glance at Stith Thompson’s six-volume *Motif-Index of Folk-Literature*, in which Western literature is reduced to twenty-three motif categories organized alphabetically from A (“Mythological Motifs”) to Z (“Miscellaneous Groups of Motifs”), may strike any reader as a vestige of the classification impulse that marked literary methodology of the past. And yet a quick keyword search on WorldCat will yield nearly one hundred “motif-indexes” of literature, very many of them published in the 1990s. Current trends in literary criticism and analysis, even if no longer explicitly indebted to formalist or structuralist vocabulary—and even if the term *motif* is not used—continue to illuminate connections and relationships between texts in ways identifiable as motif-based. Consider Werner Sollors’s discussion of recent “thematic” studies as well as the great number of “treatment of” titles published annually in the bibliography of the Modern Language Association, or the ongoing series issued by the publisher Peter Lang, titled *Studies in Themes and Motifs in Literature*. Although it was in 1993 that Sollors called attention to “the return of thematic criticism,” motif-based analysis, inherently intertextual, interdisciplinary, and comparative, has arguably never gone out of style.

MOTIF IN MUSIC

A motif is a small but recognizable musical unit. The motif might consist merely of a series of pitches or a distinctive rhythm, or it might be harmonically conceived; quite often, pitch and rhythm are combined in a motif to create a discrete melodic fragment. No matter what its constituent elements, the motif needs to be repeated before it can be recognized as a unit. The repetition may be nearly continuous, as in the case of an ostinato—a short motif constantly repeated throughout a section of a composition—or the recurrence may be reserved for significant points in the structure of a work. (A form thus linked is often described as cyclical.) A motif needs to have clear boundaries, which might be established by immediately repeating the motif (as in the "Hallelujah" chorus in George Frideric Handel's *Messiah*, 1741), by placing a rest or pause after the motif (as in the beginning of Ludwig van Beethoven's Fifth Symphony, 1807), or by following the motif with contrasting material before repeating it. Although motifs vary in length, they are customarily only a portion of a complete melody.

Many motifs recur in note-for-note repetition, but a motif may be recognized even when modified. The modifications may involve rhythmic alterations (such as augmentation and diminution) and various sorts of melodic changes (including altered intervals or additional ornamentation) as well as retrograde (reversed) presentations or inversions, in which ascending pitches are substituted for descending pitches or vice versa. Sequential treatment, in which the motif is repeated at successively higher or lower pitch levels, is very common during transitional passages within large-scale structures, especially while the tonal focus is changing rapidly.

There is little consistency in terminology when discussing motifs. Some prefer the Anglicized *motive*, which, like *motif*, is derived from the Latin *motus*, the past participle of *movere* (to move). Other analysts use words such as *figure*, *subject*, *clause*, *pattern*, and *segment*. Both Western and non-Western cultures have terms for specialized motifs, such as leitmotifs, mottoes, head motifs, and the like.

Early History of the Motif

It is apparent in the earliest surviving music that composers were aware of the cohesive power of the motif. For example, the medieval sequence *Dies irae* (Day of wrath), a chant later incorporated into the Catholic requiem mass, opens with a descending eight-note melodic motif that unifies the entire chant by reappearing repeatedly through the course of the eighteen

Dies irae

verses. The somber associations of its intervallic patterns, coupled with an ominous text concerning the biblical Judgment Day, have ensured the chant's opening motif a lasting place in music that strives to evoke the supernatural, ranging from Hector Berlioz's *Symphonie fantastique* (1830) to Stanley Kubrick's horror film *The Shining* (1980).

An early assessment of musical motifs appeared in Denis Diderot's monumental *Encyclopédie* in 1765. The *motivo* (as it is called there) is described as the principal thought or idea of an aria and thus constitutes "musical genius most particularly" (Grimm, p. 766a). Similar and expanded descriptions continued to appear on into the twentieth century. In 1906 the music theorist Heinrich Schenker argued that the "fundamental purpose" of a cyclical form is "to represent the destiny, the real personal fate, of a motif or of several motifs simultaneously" (p. 12). He added, "At one time, [the motif's] melodic character is tested; at another time, a harmonic peculiarity must prove its valor in unaccustomed surroundings; a third time, again, the motif is subjected to rhythmic change: in other words, the motif lives through its fate, like a personage in a drama" (p. 13).

Structural Uses of a Motif

Even among those uncomfortable with such anthropomorphic analysis, there is widespread recognition of the motif's role in creating unity within large or disparate pieces. Navajo traditions include an enormous body of Yeibichai songs, representing sacred ancestral spirits. Every one of the songs includes the call of the ancestors, a motif sung to the syllables "Hi ye, hi ye, ho-ho ho ho!" The Quechan tribe, in contrast, sings songs about natural history and lore, grouped into large cycles or series. In their Bird Series, all the songs are related by ending with the same "ha ha ha haaa" motif.

Melodic motifs. Melodic motifs have functioned structurally in many genres of music. The chief architectonic technique used by Renaissance composers of multivoice masses and motets was imitative counterpoint, in which subsequent voices repeated or echoed the opening motif presented by the initial singer. Similarly, in a Baroque fugue, the work begins with a subject that is reiterated in different registers, and the same motif reenters at later points in the work to start new series of imitative entrances.

Opera composers of the seventeenth and eighteenth centuries wrote arias with "motto openings," in which the first phrase of the song was performed by the singer, followed by a contrasting instrumental passage; the vocalist repeated the

same opening phrase but then continued on with the remainder of the aria. In contrast, a single motif may serve as an introductory flourish for an entire set of pieces, such as the multiple movements of some Renaissance masses written in cyclical form, by having each movement begin with the same “head motif” or “motto.”

Another common use of mottoes, especially in instrumental music, is the repetition of a clear-cut opening motif to signal important structural points within a movement. The slow, solemn fanfare that begins the first movement of Beethoven’s “Pathétique” Sonata, Op. 13, is followed by the fast main section—the exposition—but it returns twice to underscore the start of the movement’s development (tonally unstable) and coda (concluding) sections.

Harmonic motifs. Many cultures use certain harmonic motifs to provide a sense of completion or finality. In Western art music, these motifs are often described as cadence “formulas”; one of the most familiar of these is the Plagal (or “Amen”) cadence that concludes hymns and other church music. Because cadence formulas are so ubiquitous, composers frequently embellish and prolong them in elaborate ways.

Harmonic motifs also occur in many styles of jazz music. Jazz performers often take the sequence of harmonies (or chord changes) underpinning a tune and use those borrowed chords as the basis for new melodic improvisations. The chords of George Gershwin’s Broadway show tune “I Got Rhythm” (1930) are an especially popular source; numerous jazz hits have been based on these particular chord changes.

Rhythmic motifs. The organization of rhythm into recognizable groupings is a widespread motivic device. Many music analysts borrow from the vocabulary of poetic meter to describe short patterns of strong and weak pulses in music; thus a short note followed by a longer one would be called an iamb, while a longer note preceding a shorter note is a trochee. It has been traditional in Western literature and music to regard these different rhythms as possessing different emotional qualities.

Cultural customs lead to longer rhythmic patterns in varying contexts. Dances all over the world depend on set rhythmic motifs; a minuet has a different rhythmic pattern than a gavotte or a mazurka. In classical music of India, clap-patterns can be incorporated into a performance in accordance with one of the ancient rhythmic patterns, known as a tala. The complicated layering of much African drumming consists of the simultaneous presentation of diverse rhythmic motifs by various players, often repeated in ostinato fashion.

Representational motifs. In numerous cultures, a motif may carry symbolic meaning. Much of India’s classical music, for example, is based on rāgas. Each rāga combines aspects of a mode—a certain set of pitches—with particular melodic motifs. Rāgas carry extramusical associations, sometimes linked to emotions, divinities, and even particular seasons of the year or times of day. Similarly the leitmotifs (leading motives) that Richard Wagner used in the four music dramas of his opera cycle *Der Ring des Nibelungen* (The ring of the Nibelungs;

1848–1874) are linked with a person, an object, or even an idea, and were repeated at different points in the work to bring that association back to our minds. For instance, in *Die Walküre* (the second music drama in the cycle), when Wotan refers to a “hero to come,” the orchestra sounds the motif linked with Siegfried (even though at that point Siegfried has not yet been born).

Motifs can also portray more than just characters and objects in a story; at times, motifs have represented composers themselves. Since, in German musical nomenclature, the note B-flat is transcribed as a “B” and B-natural is transcribed as an “H,” Johann Sebastian Bach was able to use a motif based on the letters of his last name as a subject for a fugue. Many other composers have embedded motivic messages into their works through this type of cryptography.

Despite its often tiny size, the motif’s diversity makes it one of the most powerful tools at the disposal of composers and performers. It is one of the few musical characteristics that can be found in virtually all world cultures as well as throughout recorded history. Perhaps most important for listeners, a motif is a device by which music gains cohesion and, often, comprehensibility.

MULTICULTURALISM, AFRICA. Multiculturalism means different things to different people. For some it is directly linked to the politics of recognition and of difference (Taylor). In this regard, it concerns an appreciation of the necessity to deal with diversity in ways that affirm the value of different cultures and to respect the various claims made by minority groups. For others, multiculturalism concerns an explicit policy of protecting particularistic local cultures in the face of hegemonic and global cultures (both Australia and Canada have such self-conscious policies) or it can refer to a loose form of cultural pluralism (Kuper). Since multiculturalism is not a homogeneous concept or practice, it is important to differentiate between multiculturalism as a practical response to diversity and as an aspect of social philosophy advocating particular values with respect to cultural differences. There is no unifying theory of multiculturalism, and its respect for difference finds expression in a variety of political, social, and cultural approaches to problems of diversity.

The concept of multiculturalism does not enjoy widespread currency in African social thought. It is certainly not a topic of debate in early-twenty-first-century intellectual discourse on the continent. There are many reasons for this neglect, but it is undoubtedly connected to the fact that African societies are intrinsically multiethnic and multicultural. Diversity is not a new thing in Africa. Multiculturalism is premised on challenges to hegemonic cultures occasioned by the large-scale migrations of people who may experience alienation, marginalization, and exclusion in the host country. Sweden, for example, was remarkably homogeneous in a cultural sense prior to the influx of migrant laborers in the 1960s. African countries, in contrast, have entirely different histories. By and large, African states were formed by colonialism, usually to serve the interests of the colonists and, therefore, with little attention paid to the precolonial ethnic allegiances and other forms of belonging. These different histories play a critical role in the extent to which the concept of multiculturalism may be relevant in the African context.

Multicultural Problems in Africa

While the concept of multiculturalism has not enjoyed a great deal of scholarly attention in Africa, there are several practices that may fall neatly under its rubric. First, in the process of nation-building following independence, there was a concerted attempt to de-ethnicize the population and to construct a unitary conception of the nation. Second, multiculturalism is used in dealing with minorities, especially indigenous minorities in Africa. Third, it may be relevant in the various efforts at coping with and managing diversity in the workplace. Finally, multiculturalism plays a major role in education.

Even though ethnicity had a profound influence in African politics, the official rhetoric was dedicated to nation-building. Due to the generalized economic and political failures of the postcolonial state in Africa, these efforts have been thoroughly discredited. In the aftermath of massive resource limitations, the way has been opened up for a more explicit assertion of ethnic differences as a basis for economic and political claims. Since these perceived differences may form the basis of violent, sometimes genocidal, clashes between people, the topic of ethnic conflict has received considerable research attention from social scientists. The main area of debate is how to make citizens of everyone under conditions of such diversity and with so many subnational forms of belonging. This relates directly to the necessity of building legitimate polities in Africa in which all people have a sense of inclusion and national loyalties do not contradict cultural pluralism.

Dealing with minorities has become a major preoccupation of the Commission on Human Rights of the United Nations (CHR), which was established by the UN Economic and Social Council soon after the United Nations was formed in 1946. After years of dormancy and lack of effective functioning, in response to demands from below the CHR started to mobilize. A series of workshops, "Multiculturalism in Africa: Peaceful and Constructive Group Accommodation in Situations Involving Minorities and Indigenous Peoples," has been held across Africa over the last three years in Tanzania, Mali, and Botswana. These have served as starting points to provide both a voice for the articulation of people's concerns and a platform for cooperation among them on the basis of their common experiences of exclusion, marginalization, and displacement. It is of concern that, while the last meeting of this group was held in Botswana, the Basarwa/San were being forcibly removed from their ancestral land in the Kalahari.

Managing workplace diversity was at the center of the oppressive methods developed in the mining compounds in South Africa. Since many migrants came from all over southern Africa to work in the mines, the companies devised brutal divide-and-rule methods in an attempt to forestall the development of a common working-class consciousness by insisting on separate ethnic allegiances. In many ways, the apartheid experiment was an example of imposed cultural packaging of people and, in a perverse sense, it could fall under the rubric of multiculturalism in its imposition of cultural difference. The overwhelming emphasis in early-twenty-first-century South Africa, as in most postcolonial African states, is undoubtedly on de-ethnicizing the population in favor of a unitary national concept. However, parallel to this emphasis runs the idea of the promotion, and even celebration, of a rainbow nation, encapsulated constitutionally in the establishment of the Commission for the Protection and Promotion of the Rights of Cultural, Linguistic, and Religious Communities. Whether this represents a retreat into relativism and whether it will have a major impact on South African politics remain to be seen.

Multiculturalism has a profound influence on education in Africa. There are as many different positions on the virtues and vices of multicultural education as there are on multicult-

turalism itself. There is an abiding ambiguity here. Multiculturalism is supposed to promote diversity and contradictory perspectives, yet the goals attendant to these different positions differ sharply from those who are merely concerned with promoting tolerance to those who actively seek social change in the name of equal opportunities for all to learn. The question of language is, of course, of vital importance since it is established beyond all doubt that children perform much better when they are taught in their native language. Whether some people should be accorded special treatment in education because of historical disadvantage and whether, indeed, they should be given special curricula to cope with educational demands remain unresolved issues.

The cultural diversity of Africa has long been recognized. Audrey Richards, for example, provided a detailed account of the linguistic, religious, and cultural differentiation of communities in East Africa in a book presciently entitled *The Multicultural States of East Africa*. One of the contested concepts in multiculturalism is assimilation. An example from Ethiopia provides a unique insight into this policy. Bahru Zewde considers the situation of the Oromo in East Africa in the following manner: “[T]he Ethiopian emperor has three options with regard to the Oromo: enslavement and expropriation, assimilation, and indirect rule.” While the first and the last mentioned are rejected for various reasons, “assimilation therefore remains the only credible and sensible option.” In short, the Oromo should become Amhara since, “two peoples who are allowed to evolve separately will end up forming two different, and perhaps antagonistic, nations” (pp. 132–133). Assimilation thus implies the eradication of difference in favor of the dominant culture. It is essentially a homogenizing project that imposes itself on others on the basis of assumed cultural superiority. It is precisely this kind of cultural chauvinism that multiculturalism seeks to oppose, usually for the sake of the oppressed.

Multiculturalism and Culture

Any discussion of multiculturalism must include a definition of *culture* since multiculturalism literally refers to a plurality or a multiplicity of cultures. In this regard, *culture* refers to the collective material and nonmaterial accomplishments of particular groups, their ways of doing things, and the manner in which these patterns of behavior are transmitted from one generation to the next. A basic truism about culture is that it is never static. In this respect, multiculturalism has to accommodate changes if it is to remain relevant. This is very difficult though because multiculturalism tends to reify culture and freeze people into cultural particularisms on the assumption that certain people need to be treated differently because of their separate cultures. This is problematic because *culture* is then defined as an immutable entity based on primordial origins, and becomes a biological given rather than learned forms of behavior and creativity. Exemplifying this conflation of race and culture, Paul Kelly insists that the movement of “white European immigrants . . . and . . . the movement of non-white [sic] populations” (p. 2) lie at the heart of the reality of pluralism. Put bluntly, it is extremely difficult to emphasize cultural difference without also essentializing culture and ethnic identities, sometimes even understood in racial terms. Once group identities are politicized it

is virtually impossible to avoid packaging people in different categories and ensuring that they remain in their designated spaces. K. Anthony Appiah and Amy Gutman distinguish between cultures and identities but lament that “ethnic identities characteristically have cultural distinctions as one of their primary marks” and “in the United States, not only ethnic but also racial boundaries are culturally marked” (p. 89).

There are many other philosophical and political criticisms of multiculturalism, both as a concept and as a practice. In the first instance, the tendency to categorize people in this manner may lead to greater stereotyping, particularly if special treatment (for example, affirmative action in employment appointments) is expected. While multiculturalism pays a great deal of attention to recognition, it does not accord the problems of redistribution equal weight. In this sense, it does not deal adequately with the ways in which class intersects with other forms of differentiation. Since differences in people almost always imply differences in power and wealth, there is a great challenge for multiculturalism to recognize these inequalities in ways that do not entrench or solidify them, but simultaneously to appreciate that these inequalities are real in their consequences for many people. In this regard, there is a powerful argument that multiculturalists have retreated from economic struggles in favor of cultural struggles for recognition (Fraser).

Probably the greatest challenge for multiculturalism is how it can encourage cultural difference without promoting cultural chauvinism and its counterpart, xenophobia. Its insistence on cultural difference and separation makes the quest for equality elusive because of the reality of cultural hierarchies. The celebration of difference that it advocates rests awkwardly next to the reality of persecution, exclusion, and stereotyping. Thus, when people are recognized, it is their individual identities that should be recognized and not some preconceived caricature of who they should be or how they should behave because of their membership in a particular group. According to Brian Barry, for example, multiculturalism tends to conflate descriptions about the reality of cultural diversity with prescriptions of commitment to the program of normative multiculturalism (p. 22). Finally, there is the problem of how individual human rights can be protected in the context of such a pervasive emphasis on group rights, which raises the fundamental questions of identity and of choice. If cultural difference is so rigorously imposed, then it leaves little room for individual choice. Thus, one of the major issues around the concept of multiculturalism is how it meshes with individual rights because it so clearly emphasizes the recognition and rights of a collectivity. If identity is socially derived from particularistic cultural experiences, then it amounts to an ascribed status that allows for growth and development within the limited purview of the community.

Insofar as *multiculturalism* refers to the value of cultural tolerance and to the celebration of diversity, it has made a positive contribution in broadening narrow horizons and exposing people to the wide range of cultural heritages. However, multiculturalism in the sense of politicized group identities is problematic from the point of view of individual human rights in democracies because treating groups equally is much more difficult than treating individuals equally.

MUSEUMS. It is often assumed that museums have been a permanent feature of society, simply because they contain some of the oldest things in the world. In fact, in their current form, museums are surprisingly recent in origin, almost entirely Western in conception, internally confused about their identity, and unsure of their future role.

Museums in the early twenty-first century claim descent from the Museum in Alexandria established in the third century B.C.E., but this is only partly true. That museum—a Latin word derived from the Greek *mouseion*, meaning seat of the muses—was an attempt to bring all the fields of human knowledge together into one place. Its library was its most famous feature, complemented with a collection of artifacts. Contemporary accounts describe a huge complex of buildings, including seminar rooms and banqueting halls. It was more like a prototype university than a museum.

The British Museum, effectively the mother of all modern museums, was established in 1753 as a direct emulation of the

museum in Alexandria, but this time as a public service, not as an educational institution open only to scholars. Its ambition also was to bring all human knowledge together into one place. Its library, again, was by far its most important feature. The idea that artifacts could be separated from books in the learning process did not emerge until well more than a century later, and then largely for reasons of administrative convenience. It was not until 1998 that the British Library was separated physically from the British Museum, which in the early 2000s is a totally different institution from the one that opened its doors 250 years ago, and yet it still proudly claims that its collection has remained "inviolable" since then. It is in this way that museums create myths about their permanence, though their role has in fact changed out of all recognition over the centuries.

Origins

Museums owe their origins to three traits in human nature: the desire to understand the universe, the wish to appreciate the artifacts museums contain, and the impetus to educate others. Each of these motivations has its own history, but none, by itself, necessitates the creation of a museum. One might, for example, have no more need for the objects used in one's research when what was being sought was found. Many archaeological remains are now replaced in the ground whence they came. If one wants to appreciate something, one will tend to look after it, but that does not mean that one will necessarily want to share it with anyone else, apart from a chosen few. This appears to have been the ethos behind the earliest art gallery in the world, the Pinakothek, established on the Acropolis in Athens in the fifth century

Egyptian exhibit in the British Museum. Founded in 1753, the world-renowned British Museum houses a collection that spans two million years of history. The original incarnation of the museum also boasted an extensive library; the two were divided physically in the late twentieth century. PETER APRAHAMIAN/CORBIS

B.C.E. As far as can be determined from cursory contemporary accounts (nothing physical remains), the museum had a religious purpose and showed paintings for the initiates—and the gods themselves—to view. Though it might have been open to the general public, it would be two millennia before galleries were specially created with that purpose in mind. It was not until there was a commitment to universal education that the modern concept of the museum took root and flourished.

Museums did not emerge at all in societies where the scientific study of the material world was not valued, for example, in ancient China and India, nor in countries dominated by religions that focused people's attention on the spiritual rather than the material world, such as Christianity during certain periods of its history and, more generally, Islam. Museums sprang from the approach to learning advocated by Aristotle: that people can only learn by studying the world around them and trusting the evidence of their own

eyes, not by listening to others or reading what they have written.

Early Development

Museums only started to develop in the form in which they are currently known at the beginning of the Age of Enlightenment in Europe, when amateur scientists began to collect the material evidence of what was still widely assumed to be God's creation. By the sixteenth century many European noblemen had "cabinets of curiosities" containing the unaccountable wonders of nature, such as fossil teeth (thought to be satanic) and flint tools (thought to be thunderbolts) and, increasingly, natural and cultural artifacts gleaned from the newly discovered far-flung corners of the world. By the seventeenth century some of these collections had begun to be systematically studied and categorized. Ole Worm (1588–1654), a Danish doctor, used his vast collection to prove that so-called unicorn horns actually came from a species of Arctic whale—much to the chagrin of Scandinavian fishermen, who plied a lucrative trade in supplying such wonders.

The approach of these early scientific collectors was, as it had been in ancient Greece, encyclopedic. The mere activity of collecting similar objects together and placing them in some sort of order—the standard way of working in museums even in the twenty-first century—was then an extremely exciting activity. Barriers of accepted thought were being broken on every front. Geological specimens proved that the earth was far older than anyone had imagined, fossils demonstrated the fact of extinction (thought, by most, to be an impossibility within divine creation), and coins revealed the existence of cultures and dynasties previously unknown to history. Without his vast collection of natural history specimens, Charles Darwin (1809–1882) might never have formulated his theory of evolution. Working in the Museum of Northern Antiquities in Copenhagen, Christian Jurgensen Thomsen (1788–1865) developed the system of classifying prehistory according to the material evidence of the ages of stone, bronze, and iron, the names by which they are still known. It is significant that the formation of the British Museum (and library) was exactly contemporaneous with the publication of Denis Diderot's great *Encyclopédie* in France.

During the eighteenth and early nineteenth centuries public museums burgeoned throughout Europe and America, and soon in other societies influenced by them, such as South America, Australia, India, and South Africa. This was in response to two considerable and growing pressures: the new urge to collect and codify all material things, and the public's desire to see all these wonders. In those days the interests of the scholar and the general public were consanguineous. Crowds gathered to see the first stuffed kangaroo or dinosaur bone or the latest archaeological discovery from Peru. The field of enquiry that was opening was so vast that collectors—and therefore museums—soon began to specialize, dividing into subject areas such as natural history and geology, archaeology, and ethnology, which continue to define their form to this day.

Growth

The main impetus behind the extraordinary growth in museums during the last two centuries—few cities around the world are now without several—has been the growing awareness of the importance of public education. The roots of this egalitarian ideal also can be traced back to the Enlightenment, when people such as Diderot believed that knowledge would enable humankind to make the world a better place. His ideas for a national museum were put into practice by the leaders of the French Revolution: in 1792, just nine days after the Bourbon monarchy collapsed, the Louvre, at that time a royal palace, was transformed into a museum with the aim of embracing "knowledge in all its manifold beauty" so that it would, "by embodying these good ideas, worthy of a free people . . . become among the most powerful illustrations of the French Republic." Napoléon Bonaparte was following a time-honored tradition when his armies plundered masterpieces of art from the territories they conquered, particularly in Egypt and Italy, and sent them to the Louvre. (Napoléon was, in this case—at least ostensibly—acting solely in the interests of the people. The Italian treasures were returned after his fall from power.)

Individuals and institutions have, since the earliest times and in almost all cultures, collected rare and precious objects as manifestations of their status. There is archaeological evidence of royal and religious treasuries from ancient civilizations as widespread as Peru, Assyria, Greece, and China. What was new, however, during the Enlightenment, was the idea that these should become public treasuries. The members of the aristocracy of Europe were beginning to allow the general public to visit their collections in the eighteenth century; revolutions merely speeded up the process. The English Civil War, however, had come a century before such ideas had taken hold, and Charles I's extraordinary art collection was simply sold—Britain had to create its own National Gallery, from scratch, in 1824. The Hermitage, though still a royal palace, was first opened to the public in 1852, many decades before the Russian Revolution; its collections had been formed as part of Catherine II the Great's (ruled 1762–1796) strategy to bring education to Russia. The Bolsheviks boosted public collections by giving them religious treasures after religious worship had been outlawed. Many icons are now being returned as the churches reopen following the collapse of the communist regime.

Increasing access to culture dovetailed neatly with the Enlightenment's drive for knowledge. This was the great age of the formation of museums. Its high point, arguably, came in 1846 when James Smithson, a self-effacing English businessman, gave the American government the then celestial sum of half a million dollars to found a museum for "the increase and diffusion of knowledge among men." The Smithsonian Institution is now the greatest museum organization in the world, with its many galleries, most of which are ranged along the Mall in Washington, D.C., devoted to interests ranging from art to aerospace and from natural history to ethnography.

During the nineteenth and early twentieth centuries, the establishment of a museum became not just a response to ed-

ucational need, but a matter of civic pride. This heady mix of political objectives accounts for the worldwide proliferation of museums at that time, from the Australian Museum in Sydney (opened 1828) to the Egyptian Museum in Cairo (1858) to the Museum of the History of China in Beijing (1915), and hundreds of thousands of smaller museums in towns and villages in between.

Museums had another advantage: they attracted tourists. Just as the churches of medieval Europe had competed with each other for relics, so museums sought out the best collections—for tourists, like pilgrims, bring income. Many museums in the late twentieth century were established as part of an economic strategy. Glasgow in Scotland was the first postindustrial city to rebuild itself on the back of an art gallery, the Burrell Collection, which opened in 1983. Gradually museum buildings, such as cathedrals, became beacons of attraction in themselves, which led to the extraordinary flowering of museum architecture in the late twentieth century. The Guggenheim Museum in Bilbao, Spain, designed by Frank O. Gehry and opened in 1997, is world-famous for its titanium-clad curves, though few could describe its collection—but then it is not really a museum so much as a temporary exhibition hall, exhibiting works on loan from its parent museum in New York.

Agencies of Influence

It wasn't long before people began to realize that museums could be used to influence people. The South Kensington Museum in London was created in 1857 specifically to encourage better industrial design in Britain. It was radical in that it combined engineering with art, and valued objects from the past purely for their capacity to inspire the present. It is difficult to quantify how effective it was—William Morris's famous wallpaper designs were directly influenced by its collections—but the museum gradually lost its motivation and in 1893 was split into the Science Museum and the Victoria and Albert Museum, thus creating new categories of museums for science and engineering and the decorative arts.

However, the proactive educational spirit sown by the South Kensington Museum became hugely influential. The push-button displays in the Science Museum were the direct inspiration for the Exploratorium in San Francisco, established in 1969 by Frank Oppenheimer, to help people understand new developments in science. The Exploratorium is not really a museum at all—it doesn't have collections—yet its approach has spawned science centers in almost every major conurbation.

The most radical recent developments in museums have sprung from the desire to educate, rather than to collect. Michael Spock put the old toys in the Boston Children's Museum into storage because he realized his young visitors weren't interested in them. He created a new type of museum in which children could explore the adult world through interactive displays. His methods, particularly his audience participatory programs, have been hugely influential on museums, and new-style children's museums have become almost as widespread as science centers.

Since the 1960s museums have been transformed by the introduction of modern media such as video and film, audio guides, and computers. It is now possible for museums to catch the imagination of a very wide public, but only a few, as yet, have begun to put their visitors first in this way. Most stick to their old, categorical presentations and assume that their visitors will want to learn about microliths, monstresances, and moths, without asking why they might be interested in such things, let alone if they would prefer to find out about something else. When he was commissioned to create what was to become the Museum of the Jewish Diaspora in Tel Aviv in 1968, Jeshajahu Weinberg, a former theater director, realized that it would not be possible to tell this story using original artifacts, because virtually none existed. He therefore created a display that used no original material at all, only reproductions. But, since it has no collections, it cannot really be categorized as a museum at all.

Weinberg's greatest museum, the United States Holocaust Memorial Museum in Washington, D.C. (opened 1993), uses all the storytelling techniques he developed in Israel together with real exhibits to mesmerizing effect, and attracts two million visitors per year. One reason for the recent proliferation of Holocaust museums (there are twelve in the United States alone in the early 2000s) is that its last living witnesses are being lost. One of the most important roles of museums in the future may be to preserve the evidence of past events, such as the Holocaust, of which it is imperative that they are not forgotten.

Future Challenges

A central issue facing museums in the early twenty-first century is to find ways to use their collections as a means of entertaining and educating a wide public, while developing their role as a resource for research. The felicitous atmosphere of the Enlightenment, when research and public interest coincided, has passed. Museum collections no longer represent, as they did then, the horizon of human understanding. The frontiers of science extend beyond the visible world collectable by museums, and it adds little to the sum of knowledge for museums to go on building up their collections, as most continue to do, according to categories laid down two centuries ago. But objects will still need to be preserved for future study and to make past experiences vividly meaningful to subsequent generations. Museums tend to go on doing what they have always done—adding another Carracci, crustacean, or car—and yet there is no museum about the history of communism (apart from a few remaining Soviet propaganda museums, which only tell one side of the story), or of marketing. Both are manifestations of ideas and practices that have vastly shaped the lives of people living in the early 2000s, and both have vivid material pasts, ideal for museum display. The challenge for museums is to decide what is important for them to collect in the present—because it is on these collections that their future will be built.

MUSIC, ANTHROPOLOGY OF. The phrase *anthropology of music* is most closely associated with Alan P. Merriam's 1964 landmark book bearing this title. In this prescriptive text, influential through the 1980s, Merriam defines ethnomusicology as the study of music in culture in relation to the mutual interactions of sound, behavior, and concepts. In consonance with many ethnomusicologists to this day, Mieczyslaw Kolinski (1967) responded that anthropological considerations should not dwarf an emphasis on the study of musical sound, per se, and he took Merriam to task for being too dogmatically anthropological. Kolinski argued that ethnomusicology is, in fact, a field at the juncture of two distinct disciplines: comparative musicology, which is the study of musical styles and systems from different societies, an integral part of general musicology; and musical anthropology, the study of the role music plays in human societies, an integral part of general anthropology. In 1987 Anthony Seeger described his book *Why Suyá Sing* as "a kind of musical anthropology as distinct from an anthropology of music—a study of society from the perspective of musical performance, rather than simply the application of anthropological methods and concerns to music" (p. xiii).

From these statements three general orientations emerge: (a) an emphasis on musical sound, styles, and performance in non-Western societies described in their cultural context; (b) an emphasis on analyzing musical sound and style in dialectic with social processes through the application of anthropological methods and concerns; and (c) an emphasis on social life and processes as studied through musical styles and performance ("musical anthropology"). Ethnomusicology emerged as an independent discipline in the 1950s, and the first two orientations characterize the majority of ethnomusicological work. The third orientation, that which uses musical data to understand social processes, might be

identified with the disciplines of ethnomusicology and/or anthropology, often depending on the disciplinary identity of the scholar.

Anthropologists who focus on music represent a small minority within the discipline and, Bruno Nettl writes, “the practitioners of the types of study labeled as the ‘anthropology of music’ . . . have accounted, I reckon, for less than one-fifth of all ethnomusicologists, but among them have been many of the field’s great leaders” (p. 62). Since the 1980s, the anthropology of music approach probably represents a larger portion of ethnomusicological work, and anthropological methods and theories have provided an important basis for the discipline as a whole throughout its development.

Musical Anthropology

Ethnomusicologists have documented the fact that many societies in the world do not have a single word or concept akin to the English term *music*. Nonetheless, scholars engaged with musical anthropology and the anthropology of music typically use the Western concept to define the boundaries of their study. Anthropologists have approached music in two basic ways: first, as a type of data to further general social theories or models, and second as a basic component of social life that deserves ethnographic description along with other cultural domains. An example of the first type is the Kulturkreis, or German diffusionist school in the decades around the turn of the twentieth century. Musical instruments and measurable musical traits, especially pitch organization, proved attractive data for determining the historical development of cultures and hypothetical contact between distant regions through mapping the distribution of cultural trait and artifact clusters. Anthropologists sought out help from their musicological colleagues such as Curt Sachs in this endeavor. Melville Herskovits used musical data prominently in his work on “Africanisms” in the Americas and in his theories about cultural continuity and acculturation. His study of musical styles and linguistic patterns led him to hypothesize that cultural practices that remain low in focal awareness tend to be more stable in situations of contact.

The defensive tone at the beginning of Robert Plant Armstrong’s *The Affecting Presence: An Essay in Humanistic Anthropology* (1971) suggests that aesthetic systems and emotional experience were not well-accepted concerns in anthropology before this time, but an interest in such topics as *The Anthropology of Experience* (Victor Turner and Edward M. Bruner, eds., 1986), *The Anthropology of the Body* (John Blacking, 1977), and the anthropology of emotion has grown. These topics provide a natural point of intersection for anthropology and music scholarship. David P. McAllester, anthropologist and a founding father of American ethnomusicology, conducted groundbreaking research on Navajo social and aesthetic values through a study of music associated with the Enemy Way ceremony. Steven Feld’s *Sound and Sentiment* (1982), a study of Kaluli myth, song performance, and emotional experience (a classic in the ethnomusicological literature), was widely read by anthropologists and has been particularly influential.

Recently, in relation to globalization, musical data has again appeared as significant to anthropologists for addressing broader theoretical issues. In discussing the cultural homogeneity-heterogeneity dialectic within late-twentieth-century processes of globalization, Arjun Appadurai, for example, writes:

We have a growing series of studies of cultural production worldwide, especially in the areas of music, film, and advertising, which let us look into the sites and institutions through which global commodities are locally interpreted by producers as well as consumers. The study of “world music” by ethnomusicologists is perhaps the best developed of these subfields. In general, these studies have produced a broad consensus that cultural differentiation tends to outpace homogenization, even in this most interactive of economic epochs. (p. 6,269)

The second type of anthropological engagement with music saw music simply as one component of culture that deserved ethnographic description along with other aspects. Merriam notes that “While anthropologists in the earlier history of the discipline almost always included music in their ethnographies, the tradition has become steadily less practiced, particularly over the past decade or two” (p. 18). Bruno Nettl likewise sees a decline in the description of music in anthropology textbooks and monographs generally after the mid-twentieth century. It may be that anthropologists who did not feel technically competent to deal with music simply decided to leave the topic to their ethnomusicological colleagues once this became a viable option. The perceived decline may also be partially a matter of disciplinary definition in that, increasingly after ethnomusicology became established in the late 1950s, anthropologists and specific works that predominantly focused on music simply came to be considered ethnomusicological.

It remains unclear, however, if the generalization about a former prominence and later decline in descriptive musical anthropology really holds. Franz Boas and his followers took a holistic view of culture and often discussed or at least mentioned music, as did Bronislaw Malinowski. George Herzog was an anthropologist so deeply concerned with music that he comfortably fits within comparative musicology. Nettl also cites Melville Herskovits, Robert Lowie on the Crow (1935), and Clark Wissler on the Blackfoot, among others, for including music in their ethnographies. He specifically highlights Margaret Mead’s *Coming of Age in Samoa* (1928) as including a “short but insightful ethnography of music” (p. 63). The level of detail about music in this work, however, is easily matched and exceeded by anthropologists who published studies during the suggested period of decline—including Norman Whitten’s work on *currulao* (an African-derived music-dance tradition from the Pacific coast of Colombia and Ecuador) in *Black Frontiersmen* (1974), Hans Buechler’s study of Aymara panpipe performance in Bolivia as a window to social organization, William Mangin’s work on migrant regional associations in Lima, Bruce Mannheim’s work on Quechua songs, Jose María Arguedas’s

work on mestizo-indigenous relations in Peru, Ellen Basso's study of Kalapalo performance, Richard Price and Sally Price's work in Suriname, Fremont E. Besmer's study of the Hausa Bori cult, Colin Turnbull's discussion of Molimo music among the Mbuti, and Peter Fry's study of nationalism and spirit mediums in Zimbabwe, just to name a few examples. Morton H. Fried's general *Readings in Anthropology*, vol. 2, *Cultural Anthropology* (1968), includes two chapters on music and ethnomusicology—generous if one considers the number of facets of social life that needed to be covered. Conversely, founding father Edward Burnett Tylor's *Religion in Primitive Culture* ([1871] 1958), which considers a realm of life saturated with musical performance, barely mentions music at all. From the Boas camp, Ruth Benedict's *Patterns of Culture* (1934) does not mention music.

Comparative Musicology and Ethnomusicology

The emergence of contemporary ethnomusicology is typically traced to the 1880s. Thomas Edison invented the phonograph in 1887—ethnologist Jesse Walter Fewkes was the first to use the cylinder machine in his fieldwork (with Native Americans in 1890 and 1891). During the 1880s, British physicist and phonetician Alexander J. Ellis developed the cents system that divided the octave into 1,200 equal units and allowed for the measurement and comparison of scales from different societies. Ellis concluded that musical scales were not grounded on natural laws but “capriciously” differed from one society to the next. Thus he introduced the need for a culturally relativistic approach to musical analysis and understanding that became a fundamental cornerstone of ethnomusicological thinking, and that predated Boas's first direct statement about cultural relativism.

In 1885, Guido Adler published an article outlining the field of musicology. Adler divided the study of music into two subfields, historical and systematic musicology, and part of the latter was *Musikologie*—“comparative study [of non-Western music] for ethnographic purposes” (quoted in Nettl, p. 20)—a field that became known as comparative musicology, that grew into contemporary ethnomusicology, and that, along with historical musicology, has become one of the two main branches of musicology. As it has developed, historical musicology is devoted to the study of European and European-derived elite music repertoires and composers with an emphasis on style development as well as studies that describe European elite music in its cultural context. By default, the remainder of the world's musics, including European and American “vernacular” musics, became the defining subject of comparative musicology and later ethnomusicology (e.g., see Kunst, p. 9).

Comparative musicology is most strongly associated with the “Berlin School” (originally based at the Psychological Institute of Berlin), and Carl Stumpf, Erich M. von Hornbostel, and Otto Abraham, and their students and associates including Curt Sachs, Kolinski, George Herzog, and Klaus Wachsmann. In his synthetic discussion, “The Problems of Comparative Musicology” (1905 [1975]), Hornbostel emphasizes the need to compare scales, intervals, and rhythmic organization of the world's peoples; his primary emphasis is

on issues of musical sound, with theorizing about psychological and anthropological issues being secondary—a position maintained by Kolinski and many others.

Drawn generally from anthropological tradition, by the 1950s fieldwork became a basic prerequisite for professional standing in ethnomusicology. The early comparative musicologists, however, had little fieldwork experience and often based their research on recordings made by others—a style of work that became known as *armchair ethnomusicology*. The lack of in-depth fieldwork precluded the type of detailed social-musical analytical integration that began to emerge in the 1970s under the banner *the anthropology of music*.

The Anthropology of Music

Many musicologists maintain a Western aesthetic ideology of autonomous art. Against this backdrop, scholars with an anthropology of music orientation were faced with the challenge of finding theoretical approaches that would help them explain, or at least link, musical style with broader patterns of cultural and social processes. Ethnomusicologists frequently turned to the prominent anthropological theories and problems of any given period for this purpose. Social evolutionism, diffusionism, mapping culture areas, functionalism, problems of acculturation and culture change, structuralism, semiotics, “ethnoscience,” feminist theory, theories of social power, practice theory, and problems of nationalism and globalization, prominently form the historical strata of ideas guiding work in the anthropology of music. Some scholars explicitly combined a variety of theoretical approaches in single publications. While it sometimes appears as if the newest problem or body of theory negates earlier approaches as faulty or outmoded, it is more accurate to view each as a theoretical layer that continues to inform later thinking.

Hornbostel, Curt Sachs, and the widely dispersed scholars influenced by this group (e.g., Carlos Vega in Argentina), are often associated with a social-evolutionist anthropological orientation. This is an oversimplification in that Hornbostel and Sachs, to cite but two examples, contributed to a variety of theoretical discussions and problems, for example, cultural diffusion, music perception, approaches to musical analysis, and the classification of musical instruments, among others. It is probably fairer to say that evolutionist ideas were part of common sense for this generation of scholars. Thus as a reason to study “foreign [contemporary] music” Hornbostel states that “we would like to uncover the remotest, darkest past and unveil, in the wealth of the present, the ageless universal in music; in other words: we want to understand the evolution and common aesthetic foundation of the art of music” (p. 269). In *The Wellsprings of Music*, Sachs views contemporary tribal peoples as “archaic” and as “the surviving tribes of palaeolithic culture” that provide a window to “early music,” yet he also questions evolutionist ideas: “People do not stick to shallow secondal patterns because they stand on the lowest rung of the cultural ladder. . . . Often a person's sex appears to be the shaping power; women seem to prefer a smaller step [melodic interval], just as they do in dancing, while men proceed in larger strides and leaps” (p. 62). While

social-evolutionism and such broad generalizing became largely discredited after the first part of the twentieth century, it might be argued that the evolutionist “primitive–civilized” contrast served as the paradigmatic background for the “traditional–modern” dichotomy that remains in currency, with many of the same problems.

Several ethnomusicologists followed the American anthropological trend of grouping different societies into culture areas. Bruno Nettl created a map of Native North American musical styles following the cultural mapping of anthropologists such as A. L. Kroeber; and Alan P. Merriam created a map of African musical culture areas following Herskovits. Later Alan Lomax attempted to map the world’s musical areas. The musical areas that form the basis of Lomax’s cantometrics project, especially, have been questioned for creating an overly homogenized view of constituent musical cultures based on rather thin data. Nonetheless, in practice the culture area idea, writ large, forms a fundamental basis for organizing courses in ethnomusicology, for defining scholars’ specializations, and in the writing of textbooks and reference works—all typically organized according to geographical units.

During the 1950s and 1960s, practitioners of the anthropology of music embraced functionalism as a way to link music-making to social life. More akin to Malinowski’s approach than A. R. Radcliffe-Brown’s “structural-functionalism,” ethnomusicologists began to emphasize what certain types of music contributed to certain realms of activity—healing, labor, political structure, family life, social cohesion. In *The Anthropology of Music*, Merriam states, “The uses and functions of music represent one of the most important problems in ethnomusicology” (p. 209). In contrast to Kantian ideas that the “aesthetic” and “functional” realms preclude each other, McAllester’s Enemy Way study demonstrated that for many Navajo, the musically “good” or “beautiful” was defined according to its effectiveness for healing, that is, a performance was judged importantly in terms of how well it fulfilled its function. Although few ethnomusicologists after the 1960s would consider themselves functionalists, describing the deeper purposes that music serves remains a basic part of music ethnographies.

During this same time period and through the late twentieth century, an interest in musical change and acculturation echoed anthropological interests. One of the most widely accepted theories of musical acculturation, advocated by Merriam, Richard Waterman, and derived directly from Herskovits, held that musical cultures were more likely to blend together or influence each other if they shared a number of similar traits. Nettl and Margaret J. Kartomi created typologies for the different effects of culture contact. John Blacking published an influential article advocating the search for a unified theory of musical change emphasizing a distinction between change within a musical system and change of the system. Robert Kauffman argued that culture change or acculturation could not be read off surface forms, such as the adaptation of a foreign musical instrument, but rather, that modes of musical practice, organization, and aesthetics were the key variables for assessing culture change.

Practitioners of the anthropology of music loosely adapted Lévi-Straussian structuralism as a key approach in the 1970s and 1980s. Typically, ethnomusicologists were not concerned with Claude Lévi-Strauss’s starting point, the common structure of the human mind. Rather, working on a culture-specific basis, they assumed that there would be deep structural patterns that would shape (surface) cultural practices and forms, creating homologies across different domains of social life. Thus, Charles Keil identified patterns involving circles and angles, in roof designs, visual arts, and in music, and Adrienne Kaeppeler found homologies across different realms of Tongan art and society. Combining the earlier interest in homologies with the Peircian concept of iconicity, Judith Becker and Anton Becker found similar structures in Indonesian calendrical concepts and gamelan music; Steven Feld documented the iconicity of aesthetics, practices, and style across a number of domains of Kaluli social life; and Thomas Turino observed a series of symmetrical structures organized around a centerline in Aymara panpipe and flute ensembles, in Andean weaving, in the conceptualization of agricultural niches, and in the organization of space during festival celebrations.

During the same period, some ethnomusicologists took an interest in the premises and methods of structural linguistics for musical analysis; this represents a different trajectory than Lévi-Straussian structuralism, and the scholars involved tended to hail from the musicological rather than the anthropological side of the discipline. Other ethnomusicological approaches related (sometimes through opposition) to structuralism and linguistics involved “the ethnography of performance,” following sociolinguistics and the “ethnography of speaking,” and the “ethnoscience” approach.

Frequently, the early discussions of “culture contact” and acculturation did not take power relations between the groups into account as a primary variable. Beginning in the 1980s, younger scholars influenced by Marxian ideas, and especially the work of Antonio Gramsci, began to study the effects of asymmetrical power relations and identity politics on musical values and practices. During the 1990s, the study of music in relation to identity politics became a central topic in the anthropology of music. Since social identities are fundamental to political life, and public expressive cultural practices such as music and dance are key to formulating and representing social identities, ethnomusicologists have made major contributions to understanding the dynamics involved—often from a valuable grassroots perspective.

Jane Sugarman’s work documents the fundamental ways musical performance functions in processes of socialization shaping conceptions of gendered identities and roles, and Christopher Ballantine provides an insightful essay on gendered power dynamics in South African popular music. Many others have studied the intersection of ethnicity, race, and class in relation to popular music practices and aesthetics. State intervention in indigenous and popular music has received significant attention. Another prominent ethnomusicological topic has been the effects of political nationalism on music. Finally, the study of transnational or “global” economic processes in relation to the production and reception of

music—especially popular musics and styles within the “world music” rubric—has become a central focus in the anthropology of music.

Whereas European classical music was once deemed the primary type worthy of study, over the last three decades of the twentieth century “world music” classes and textbooks proliferated in response to several intersecting trends. The discourse of multiculturalism has certainly supported the growth of the interest in “non-Western” music. Multiculturalism itself may be seen as a liberal trend that is partially the result of anthropologists and ethnomusicologists advocating cultural relativism for over a century. It is also partially the result of the women’s and civil rights movements’ demand that artistic canons be expanded to include a variety of groups. Simultaneously, multiculturalism also functions as a new type of state strategy (e.g., in contrast to the “melting pot”) to incorporate the variety of immigrant groups into nation-states and to mitigate challenges to the image of national unity.

Commercial music trends have intersected with the work of ethnomusicologists to expand the interest in, and familiarity with, a variety of musics from around the world. A fascination with the “exotic” has long been part of American and cosmopolitan popular culture—examples include nineteenth-century minstrelsy, “Latin” dance crazes and stars like Carmen Miranda throughout the twentieth century, and hippie (and the Beatles’) interest in “Eastern” religion and sitar music. Following the international commercial success of Bob Marley and reggae, new marketing rubrics—“world beat” and “world music”—were adopted in the 1980s to sell a variety of musics from around the world. The more enterprising “world music” fans have turned to the work of ethnomusicologists to expand their knowledge of different styles, and ethnomusicologists have sometimes collaborated in commercial “world music” projects.

Finally, the contemporary discourse of globalism—which might be interpreted as ideologically supporting the expansion and control of trans-state capitalist interests and institutions in the post-Soviet era—has brought new recognition to the work of ethnomusicologists. The discipline has had a global perspective since its inception, but ethnomusicologists’ detailed studies of the wealth of human creativity as well as the profound musical and aesthetic differences among social groups do not support views of an emerging “global culture,” or its likelihood in the near future.

MUSICAL PERFORMANCE AND AUDIENCES.

Musical performance is an organized presentation of musical sounds (and, arguably, controlled silences), usually for the entertainment, edification, or enrichment of listeners. The parameters of a performance are often determined by culturally understood boundaries—symphony audiences disregard the warming up and tuning of orchestral musicians, whereas listeners to Indian classical music understand the *ālāpa* (a slow, improvisatory exploration of a rāga, or traditional melodic pattern) to be an intrinsic part of the performance, if not comprising the entire performance itself. Audiences must be conditioned, therefore, to understand the norms of performance and their own roles as listeners. An Indian audience

might quietly snap along with a tala (a traditional rhythmic pattern), whereas the symphony audience is expected to maintain a strict silence until the final section of a multimovement work has concluded. A jazz audience, on the other hand, might chatter and drink beverages during a jazz combo's club performance, but would also respond to individual artistry during the course of a piece by applauding after each improvised solo (as seen in figure 1); an otherwise quiet opera audience would cheer a well-performed aria, and might even, in exceptional cases, demand an encore.

Despite the recognition that there are expected behaviors for performers and audiences, defining "musical performance" is as difficult as the attempt to pinpoint the nature of music itself. The immense diversity of human musical activity has led to a host of attitudes regarding the nature and purpose of musical events. The lines of demarcation between composer and composition, composition and performer, and performer and audience are sometimes almost impossibly blurred. Moreover, no universal standard exists by which to measure "good" performance; this assessment, too, is dependent on variable cultural and aesthetic expectations. However, the ongoing attempts of historians, ethnomusicologists, and philosophers (as well as composers and performers) to articulate and isolate var-

ious parameters of musical activity help us to understand both the diversity and the similarities within musical performances.

Origins and Types of Performance

Without a doubt, performance is the oldest form of musical activity, but its origins are difficult to pinpoint. Steven J. Mithen posits a series of cultural “sparks” during the middle-upper Paleolithic transition, culminating in the first appearances of art objects in Europe some forty thousand years ago. Basing his theories on the work of cognitive scientists, Mithen argues that these sparks resulted from the coalescing of several human intelligences—technical, natural history, social, and linguistic—which in turn opened the door to the development of artistic and religious practices. Although archaeologists have discovered instruments made from mammoth bones in 18,000 B.C.E., the oldest known forms of written music survive on Mesopotamian clay tablets dating from at least 3,000 to 2,000 years B.C.E. Other tablets of the same era make reference to instrumentalists and singers. Ancient Egyptian hieroglyphics, c. 2400 B.C.E., comprise the earliest surviving representations of performing musicians. The ancient Greeks also depicted music-making (and listening); figure 2 portrays a young woman playing the aulos for a reclining male guest. Besides illustrating music as entertainment, Greek iconography also depicts other broad categories of musical performances, such as music for dance and music in support of religious beliefs.

Performance as background activity. The convention of an audience gathering specifically to listen to a scheduled musical event is a relatively modern phenomenon. Historically, much musical entertainment was presented at the convenience of its patrons, while many other forms of music-making were (and still are) almost entirely subordinate to some other fore-

Figure 3. A man dressed as a *komuso* (beggar priest) plays a flute-like *shakuhachi*. Photograph c. 1901–1920. © UNDERWOOD & UNDERWOOD/CORBIS

ground purpose, such as worship, dancing, military maneuvers, and other activities.

Music in religious observance. Cultures all over the world incorporate music into their sacred and ceremonial activities. Jews and early Christians both made use of chant in their devotions, regarding this as a means of uplifting the mind as well as a method of worship. In the Fuke sect of Japanese Buddhism, *komuso* (beggar priests) play the flute-like *shakuhachi* (figure 3), not as an instrument per se, but rather as a spiritual tool that assists its player in reaching enlightenment. In contrast, the West African Ewe people believe they are guided through life by ancestral spirits, so a musician often regards music-making as his destiny, thanks to the inherited spirit of an ancestor who has determined the course of his life. An Ewe funeral is a celebratory affair because its ritual drumming, singing, and dancing enable the soul to become an ancestral spirit. According to Charlotte J. Frisbee, the Navajo Indians make a semantic distinction between “performing,” which is the music-making during ceremonies, and “playing,” which describes all other forms of musical activity. Music is even more deeply imbedded in the intertribal Native American Church; its adherents view music itself as prayer. Music as a function

Figure 4. A field show presented by the marching band of the University of California, Los Angeles. ALYSON MCLAMORE

of religious observance is by no means universal; for instance, music is forbidden in the Algerian Mozabite Muslim sect.

Music and dance. Music is also almost always an essential component of dance (and, indeed, dance and religion go hand in hand in many cultures). Customarily, music is subsidiary to the movements of the dancers, even though it controls (or reflects) their actions to varying degrees. In its simplest form, music for dance maintains the beat and tempo; various other aspects of the musical performance might guide more nuanced gestures. By actions such as foot stamping, whistling, clapping, or singing, the dancers themselves might produce the accompanimental music. Filipino Bontok musicians of Sadanga, Luzon, when playing *gangsá* (flat gongs) sound the gongs with sticks and dance in circles and spirals. More commonly, dancers move while stationary musicians perform, as in a processional Renaissance dance performed at a fifteenth-century Burgundian wedding. The shawm and sackbut players stand in an elevated side gallery apart from the dancers, and their status as “background” performers is reinforced visually by their plain, matching tunics.

Music in the military. Since antiquity, as armies grew too large for vocal commands to be heard, a system of musical signals was adopted by various military groups. Some of these “calls” regulated the soldiers’ daily activities, ranging from the early-morning reveille to the bedtime tattoo; other forms of music passed along orders during battle. Military musical ensembles also supported morale among the troops, and although live musicians have seldom been used during actual warfare since the early twentieth century, many military units still use bands as a public-relations bridge feature, thereby moving their musical performances to the “foreground.” In North America, in particular, the military bands influenced the development of various school ensembles; these ensembles consist of not only stationary “concert” bands of wind players and percussionists, but also marching bands. The mobile marching ensembles perform in two main contexts: street parades, in which they perform music while passing in front of viewers (who therefore hear only a portion of a work before the band passes

out of hearing range), and field shows (see figure 4), in which the band members create elaborate designs and patterns with their bodies while playing.

Music in other contexts. Musical performance has functioned as a backdrop to many other forms of human activity, ranging from lullabies sung to infants to children’s games to banquet music to the elaborate vocal and orchestral performances that entertained strolling patrons in eighteenth-century Georgian pleasure gardens (see figure 5). The French composer Erik Satie was fascinated by the possibilities of what he called *musique d’ameublement* (furniture music), which was intended to be ignored, but found in 1920 that it was difficult to keep audiences talking and moving about while musicians were performing at a drawing exhibition. Nevertheless, modern-day shoppers seem to have little difficulty in ignoring live pianists playing in department stores, undoubtedly conditioned to this lack of response by the prevalence of recorded Muzak and other forms of “canned” environmental music.

Performance as foreground focus. Many cultures that use music for background purposes also host activities in which artistic music-making is the primary focus of the enterprise. Since the music itself commands attention, these endeavors might collectively be labeled “art music,” although the term “classical music” is often used interchangeably. (“Popular music,” in contrast, usually puts less emphasis on artistry and more focus on commercial qualities; in individual cases, of course, the level of artistic achievement in popular music may be extremely high.) In many instances, specialized venues (music rooms, concert halls, theaters) have been built to accommodate performances of art music (in figure 6, see Thomas Mace’s 1676 plans for a dedicated “Musick-Roome”). Nevertheless, within art music’s concert and theatrical presentations, the type of musical activity can vary widely; musicians might improvise freely or provide their own interpretations of traditional repertory, or, at the opposite extreme, they may be endeavoring to recreate a preexisting musical artwork as exactly as possible. Correspondingly, performers are viewed varyingly as free agents, composers’ interpreters or “ambassadors,” and even automatons.

Improvisation as performance. Various music education methodologies, such as Émile Jaques-Dalcroze’s eurythmics or the Orff-Schulwerk pioneered by Carl Orff, allow children to improvise freely on instruments or vocally, which appears to be a natural tendency of childhood exploratory development. In most cultures, however, audiences expect improvisers to be highly trained experts in their media, and thus the improvised portions of performances carry great prestige; the cadenzas in concertos, the “solos” in jazz works, and the *taqsīm* in Arabic and Turkish music are all highlights for listeners. In both Western and non-Western traditions, some performers may study with masters for many years before embarking on their first public improvisations. Performers in other cultures may adopt entirely different attitudes toward improvisation, however; through fasting and self-torture, North American Plains Indians seek visions in which new songs might appear to them, whereas Pima Indians regard improvisation as a process of “un-

raveling” the songs already present in the supernatural world. Of course, due to its spontaneous and unnotated nature, improvisation is one of the most difficult aspects of music to study historically.

Re-creative performance. In contrast to improvisation—or, sometimes, in partnership with it—much musical performance is the (re-)enactment of a piece according to predetermined specifications. In some traditions, the musical works are conveyed via oral transmission and rote mimicry, while other cultures have developed various forms of musical notation to guide performances (see figure 7 for a manuscript excerpt from a chorus of Thomas Linley’s 1777 oratorio *The Song of Moses*). For performers, however, any score—the handwritten or printed record of a composer’s intentions—is incapable of telling the “whole story.” Just as in the case of skilled improvisers, musicians performing from scores usually need substantial prior training to understand the conventions of a particular style of music before they are considered ready for public performance.

Performance Considerations

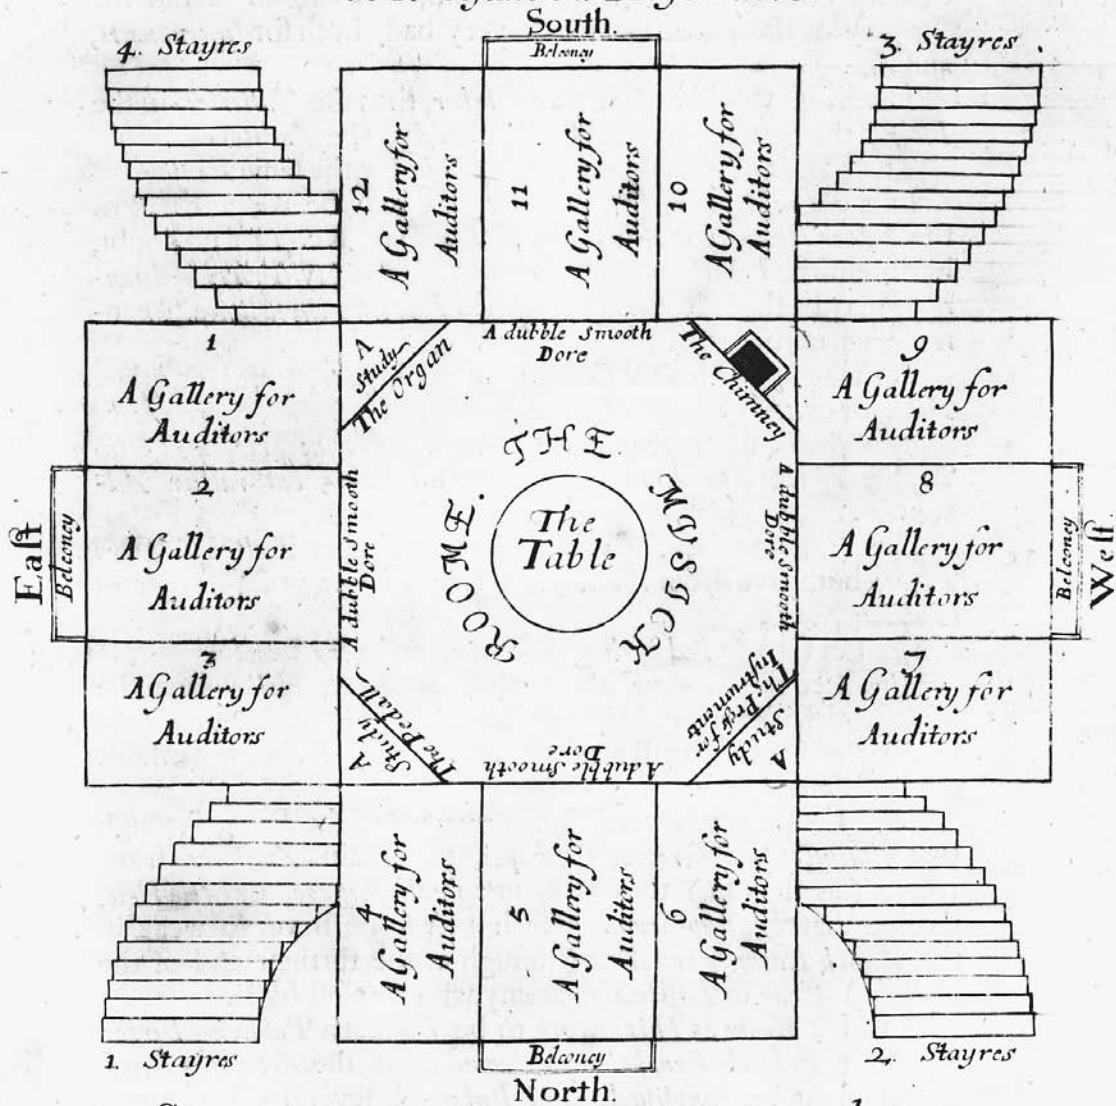

There is no universal agreement as to what constitutes a musical performance, for the nature of music-making and listening varies greatly from culture to culture. Similarly, the parameters of *good* performance are equally hard to measure.

Many philosophers, historians, and performers have turned their attention to this problem, exploring varied issues of musical aesthetics and historical performance practice.

The quest for perfection No matter what impetus—improvisation or score transmission—has produced a performance of art music, audiences attending these presentations carry with them a set of aesthetic criteria, ranging from specific personal preferences to broad awareness of cultural norms. Listeners evaluate a performance on the basis of their blended personal and collective attitudes, which allows for enormous variety in the perception of a single performance as good or bad. It is impossible for a performer to anticipate and respond to all the individual standards by which his performance might be judged; as Jerrold Levinson quipped, “For a listener who wears earplugs, a very loud performance is the best” (p. 382). Nevertheless, in most instances in which performers bring “to sound” a notated score, their faithfulness to that score is often a leading measure of their success.

Philosophers and critics disagree as to how to measure that faithfulness. The relative imprecision of much early Western notation forces performers to make many basic choices: if a surviving work contains only vocal parts, but iconography from the same time period shows instruments playing alongside singers, should a contemporary conductor choose to double

the voices with instruments, despite no written indication to do so? Is this a better—or worse—performance than a presentation limited to voices alone? There has been a growing tendency in recent years to treat the score as sacrosanct, especially in repertoires in which notation is increasingly exact. Many feel that when a musician exercises too much performance freedom, the original work's integrity is at risk of being lost. The philosopher Nelson Goodman takes this attitude to an extreme when he argues, "Since complete compliance with the score is the only requirement for a genuine instance of a work, the most miserable performance without actual mistakes does count as such an instance, while the most brilliant performance with a single wrong note does not" (p. 186). Although most listeners would disagree with Goodman's position, his view is in some ways at the heart of another controversial aspect of music: the goals of performance (or performing) practice.

Performance practice. The last half of the twentieth century witnessed an increasing desire among many musicians to reenact performances of historical works as closely as possible to the way (we think) they were first presented. No one objects to the notion that it is often pleasurable to hear Johann Sebastian Bach's preludes and fugues performed on a harpsi-

chord; the disagreements begin when we ask if it is still pleasurable (or desirable) to perform the same Bach works on a modern piano (see figure 8)—and if we should be allowed to use the pedal while doing so. Designating the attempts at exact reenactments of the past as "authentic" or "historically informed" (or "historically aware") has added heat to the debate. The problem, as Richard Taruskin and others have pointed out, is the invidious implication that a performer who does choose to play Bach on the piano is uninformed and that his performance is inauthentic or, worse, unaware. Moreover, as Paul Henry Lang recognizes, even the most exacting and thorough historical research will leave gaps that must be filled with "our own artistic beliefs and instincts"; he adds, "Unconditional conformity to authenticity in the interpretation of old music, in depending on archival fidelity, may fail in fidelity to the composer's artistic intentions" (p. 179). The conductor James DePreist argues that even living composers who are able to supervise rehearsals are inevitably surprised by the sound of their works in actual performance—"surprised," DePreist maintains, "because the gap between the musical blueprint, that is, the score, and the interpreted sound is a universe of options and potentialities" (p. 11). Looking at the issue of authenticity from another perspective, Peter Kivy discusses the challenge of creating historically aware listeners.

"Liveness" in performance. In the past, there has been an inherent two-fold assumption among Westerners that a performance entails live presentation of music before live listen-

ers. The second component of this view is not universal, as J. H. Kwabena Nketia explains in his study of African music: “A physically present audience . . . is not always necessary . . . since a performance may well be for the benefit of someone who may not actually be present, or simply for the enjoyment of the performers” (p. 33). With the advent of recorded and electronic sound, however, the traditional expectation of “liveness” in the actual presentation of music has also been challenged. Recordings usher in a new host of metaphysical questions: in the case of a multilayered, overdubbed sound creation generated privately in a studio, is there no actual “performance” at all? Or is the artist performing during the process of adding each layer and effect? Or does a performance occur when the final product is transmitted to a listener? Simon Frith argues for the latter condition when he says, “I listen to records in the full knowledge that what I hear is something that never existed, that never could exist, as a ‘performance,’ something happening in a single time and space; nevertheless, it *is now* happening, in a single time and space: it is thus a performance and I hear it as one” (p. 211).

As Philip Auslander notes, a parallel “authenticity” problem exists when a presentation purports to be a live performance, yet in actuality the performers are miming their actions to a prerecorded soundtrack. In the Milli Vanilli scandal of early 1990, the pop singing-dancing duo had won a “Best New Artist” Grammy award, yet it was eventually revealed that not only did they use prerecorded vocals in their concert appearances but they had not been the actual singers on their prize-winning recording. This discovery led not only to the rescinding of their Grammy Award but to widespread American legislation that requires performers who plan to lip-synch during concerts to indicate this fact on advertising posters and on concert tickets. For some listeners, however, this caveat begs the question whether such a performance is “genuine,” and if it is truly as good as a completely live presentation. It is frequently the case that touring productions of Broadway shows use “canned” (prerecorded) orchestral music, rather than sustaining the expense of traveling with a pit orchestra. Not only does such economy make union orchestral musicians unhappy, but it destroys the potential for flexibility during individual performances of the vocal numbers; singers must “keep up” with the recording, and so cannot indulge in nuanced interpretative variations from show to show. Perversely, however, it is precisely to enjoy those idiosyncratic moments that many listeners continue to attend and support live performance. At the same time, in some forms of art music, such as Milton Babbitt’s *Philomel* (1964), composers have created electro-acoustic works in which live musicians perform in coordination with a prerecorded tape or electronic soundtrack. Is a performance “better” when the tape and live music are combined by artistic choice rather than economic motivations? This dilemma is yet another of the many puzzles confronting the assessment of good performance.

Jonathan Dunsby offers the provocative suggestion that the same technological innovations that are complicating our current valuations of performance may also be the impetus for an enormous change in human aesthetic judgment, since they will allow us to overcome the transient nature of our short lifespans. “The past,” he observes, “is *silent*,” but “it is interest-

ing to ask whether technology, in its sound recording, then vision and sound, holography, virtual reality, and who knows what may come next, is generating a fundamental shift in this situation.” He adds,

We may be witnesses, the only direct witnesses there will ever be, to the beginning of the music of the future. Is it not easy to imagine that two thousand years or five thousand years from now people will say that Western music really only got going properly during the twentieth century from which distant time there date the earliest proper sonic and visual records, following that strange ‘mute’ early period of music history that spanned the Greeks . . . to, say, Mahler . . . ? (pp. 15–16)

Dunsby’s notion is a stimulating one, and its implications for performance have not yet been fully addressed. Certainly the ability of mass communication to shrink the globe and to link people (and their musics) has long been recognized; we are entering an age that enables us to join performances of the past to the music of the future. Any contemporary performer who has been influenced by the ideas, techniques, and artistry of long-dead twentieth-century musicians is already aware of the tremendous power of recordings; our aesthetic views now need to catch up. Mankind is not immortal, but through recorded performance we may now be able to live long beyond our time.

MUSICOLOGY. Musicology is the scholarly study of music, where music can be considered either as a fixed object of investigation or as a process whose participants are the composer, the performer, and the listener. As a field of knowledge, it encompasses every aspect of the aesthetic, physical, psychological, and cultural dimensions of the musical art. In practice, consequently, the discipline includes not just music itself—considered either as a fixed object of study or as a process—but also anything that relates to music in any way. Thus, for example, the history of music patronage during the Renaissance is considered to be a musicological topic, as is the history of the development of printing presses able to reproduce music notation. The potentially unlimited scope of the discipline has led one contemporary musicologist to define musicology as “whatever musicologists do as musicologists” (Leech-Wilkinson, p. 216).

Historically, in the Western tradition, musicology has to a great extent been identified with the study of classical music (“art music”), as opposed to popular music. Neither of the terms “classical music” or “art music” is entirely satisfactory. The former is somewhat ambiguous, as it also refers less generally to music written in the Classical style of the late eighteenth and early nineteenth centuries by composers such as Franz Joseph Haydn (1732–1809) and Wolfgang Amadeus Mozart (1756–1791). And the term “art music,” although it is widely in use, carries with it an undesirable and inaccurate connotation of elitism. Throughout this article, the phrase “classical music” is used, somewhat as the lesser of two evils, to refer generally to the notation-based music of the Western high-culture tradition.

Musicology has traditionally been differentiated from ethnomusicology, which in the most general terms is the comparative study of non-Western musics, as well as the study of popular and folk music from both Western and non-Western cultures and subcultures. However, recent developments within musicology (principally, the advent of what is referred to as the “new musicology” and the paradigm shift in musicological methodology described below under “The Critical Method”)

have tended to diminish greatly previously significant differences between the two disciplines. (For an example of traditional ethnomusicological methodology applied to the study of Gregorian chant, see Jeffery, *Re-Envisioning Past Musical Cultures*.)

Subdisciplines of Musicology

The principal subdisciplines of musicology are as follows, briefly defined in the most general terms:

Music history: the careful construction of the historical record on the basis of available data from the past and the subsequent application of a historiographical methodology to that record. Traditionally, scientific historicism, which involves the postulation of historiographical categories such as causal relationships, periodization, and musical styles, has been the preferred methodology of music historians, whose field of investigation has generally been confined to the study of Western classical music (as noted above).

Performance practice and historically informed performance: the investigation of modes of musical performance that are particular to a specific time or place within music history, including methods of interpretation, tuning of instruments, types of musical ornamentation and improvisation, instrumental techniques, and performance conventions. An important late-twentieth-century development within this subdiscipline has been the increased interest, within the Western classical music tradition, in the historically informed performance of early music—that is, music for which an appropriate style of performance must be reconstructed on the basis of historical evidence.

Textual scholarship: generally, the systematic study and description of manuscripts and printed books, and the construction of scholarly editions that, assuming the existence of a most correct or “best” text, list and reconcile variant readings between two or more versions of the text in question. The study of manuscripts involves paleography, the science or art of deciphering and dating handwritten texts; within musicology, this frequently includes the study and transcription of early music notations.

Archival research: the study, for music-historical purposes, of documents issued by governments, churches, or any administrative authority in order to establish an important part of the historical record.

History and theory of music notation: the analysis of the process of translating the acoustical phenomenon of musical sound to the written page, employing both comparative and historical methodologies. (See the sidebar on “Music Notation.”)

Music theory and analysis: the historical study of generalized descriptions of the structure of music and musical sound, both within and outside the Western classical-music tradition. Analysis, which is the de-

tailed examination of individual pieces of music for the purpose of validating existing theoretical constructs or developing new ones, differs from music theory in that its object of investigation is music that has already been composed or performed, rather than the properties of the elements of musical sound or abstract musical principles.

Aesthetics of music: the study of issues of a primarily philosophical character connected to the art of music. Of principal concern is the question of whether or not music has either affective or semantic content. At issue also, given the ephemerality of music, is the ontological status of the musical work of art: does it exist as an ideal object, perhaps the faithful realization in performance of a musical score, or is it better conceived of as a sort of process, without any assumptions of an ideal existence?

Sociology of music: the systematic investigation of the interaction of music and society. This includes not only the ways in which music functions within a particular social context, but also the influence of that social context on characteristics of the musical work (such as genre, structure, form, and harmonic organization) or of the musical process (such as modes of performance and musical values).

Psychology of music: the scientific investigation, using psychological tools, of human musical behavior and cognition, with emphasis on the perception of various properties of musical sound, musical memory, performing and creating, learning and teaching, and the affective processes stimulated by aspects of musical sound. The three principal research orientations are psychophysics, cognitive psychology, and neuropsychology.

Criticism: the evaluation, description, and interpretation of an individual work of music, or of the musical process, according to a wide range of criteria drawn principally from the study of the aesthetics, psychology, and sociology of music. Criticism differs from analysis in its emphasis on music as it is actually heard, rather than on properties of music that can be ascertained in a written score, for example, but not necessarily easily perceived by an audience during the course of a performance.

Acoustics (the physics of musical sound): the science of sound and of the phenomenon of hearing applied to the description of the physical basis of music and to the determination of the nature of musical sound.

Organology: the scientific study of the history of the design and construction of musical instruments. This subdiscipline also addresses the extramusical functions of instruments in historical contexts, technology, and general culture.

Iconography: the study of the visual representation of musical subjects—such as musical instruments and

musicians—in texts, works of art, coins, and other media as a source of historical information about musical instruments, performance practices, biography, and the social and cultural roles of music.

Principal Methodologies for Musicological Research

In the face of a disciplinary definition of virtually unlimited scope and a diverse array of related subjects, the actual practice of musicology is probably best understood in terms of the principal methodologies or investigative paradigms that have been and are currently the bases for the scholarly study of music as it is carried out within each of the major subdisciplines: the scientific historical method, the analytical method, and the critical or interpretive method.

The scientific historical method. “Scientific” historicism—rather than just “historicism,” to distinguish it from what is now commonly known as “new” historicism (see Treidler, “The Historiography of Music,” p. 362)—is the traditional historiographical methodology of music history, taken (as indicated above) to mean the history of Western classical music. It is scientific in the sense that it seeks first to establish an accurate historical record and then, on the basis of that record, to identify patterns of influence and causal relationships that form the basis of the periodization of music historical time and the construction of a diachronic narrative.

Scientific music historiography has as its object of study “the history of music” in its most common sense—that is, the events of the past that can be related in some way to music. Because the investigation begins with whatever historical data are available, the subdisciplines of textual scholarship, archival research, history of music notation, organology, and iconography (as described above) are extremely important to the accurate and efficient construction of the facts and texts (for example, transcriptions or facsimiles of archival documents, biographical information, and scholarly editions) that will comprise the historical record and will serve as the bases of subsequent causal hypotheses. This first, empirical stage of investigation is frequently referred to as “historical positivism.”

In general, once the historical record has been established, the scientific historiographer attempts to establish order among the various facts and texts by constructing plausible causal relationships and historical periodizations. In the case of music historiography, however, there exists at this point a tension between generalizations based on the entire historical record and those based on a consideration of specific pieces of music, objectified as works of musical art and considered to be semi-autonomous in the sense of existing within a continuum of musical works of art that are largely defined by their own internal processes of influence and causality, apart from those of history in general. In simplest terms, it is a question of what music history is about, traditionally a choice between two alternatives: either defining periods of musical history based on the guideposts provided by the lives of great composers (placed within their cultural context) and the schools of composition formed around them, or extrapolating periods defined by musical style from the patterns of influence, types of composi-

tions (genres), and prevalent characteristics observed through the careful formal analysis of the properties of individual works of musical art. In either case, the result remains within the historicist paradigm; and in practice, twentieth-century music historiographers have tended to base their diachronic narratives principally on musical style, a process that permits the inclusion of historical and biographical facts but encourages the conviction that music history is really about the objectified musical work—and is therefore different in essence from other types of historical narratives. An instructive case in point is the extremely popular *History of Western Music* by Donald J. Grout and Claude V. Palisca, now in its sixth edition. A sampling from the table of contents shows a pragmatic mixture of chapters defined, respectively, by stylistic period, composer, genre, and historical grab bag: “Music of the Early Baroque Period,” “Sonata, Symphony, and Opera in the Early Classic Period,” “Ludwig van Beethoven,” “The American Twentieth Century.”

One result of nineteenth-century scientific historicism was the consolidation of what is known as the “musical canon,” a collection of works that are generally regarded as having extraordinary aesthetic value and therefore able to serve as the building blocks of an historical narrative whose subject is the musical work. During the twentieth century, the wide popularity of historical accounts based on style, dealing almost exclusively with the composers and works of the musical canon, resulted in the nearly complete exclusion of minor composers and women and in an increasing emphasis on formal analysis. This emphasis led to, and was in turn nourished by, intense positivist activity in the production of new and more accurate editions of the composers and works of the canon, and answered many open questions about chronology, authenticity, and the process of composition. Thus, it encouraged an even greater focus on the inner workings of individual pieces of music and an increasing absence of any consideration of those pieces of music as historical documents produced within a specific social and political context. By the late 1970s, in fact, German musicologist Carl Dahlhaus, in the Introduction to his study of nineteenth-century music, lamented the decline of history and reasserted the task of a music historiographer as the establishment of “a relation between the aesthetic and the historical substance of works of music” (Dahlhaus, *Nineteenth-Century Music*, p. 1; see also Dahlhaus, *Foundations of Music History*). Similar ideas were expressed at about the same time by the American musicologist Leo Treitler: “Music history is possible only insofar as the historian is able to show the place of individual works in history by revealing the history contained within the works themselves, that is, by reading the historical nature of works from their internal constitution” (Treitler, *Music and the Historical Imagination*, p. 173).

Contemporaneous with these somewhat premature announcements of the triumph of formal analysis over music history was the rise of a flourishing practical application of various positivist historical projects: a branch of performance practice known variously as “the early music movement,” “authentic performance,” “period performance,” and “historically informed performance.” Beginning around 1970, performers of music written during the seventeenth and eighteenth centuries

began to use the data of the historical record—editions, information about period instruments, knowledge of the composer’s intentions, original performance conditions, and so on—to produce performances that were intended to be as historically appropriate as possible. Nourished by a thriving recording industry, the movement soon included music from every period and style, even that of the twentieth century. The movement has been widely criticized on the basis of its claims to authenticity and for what is described as its “essential modernism” (see Kivy, *Authenticities*, and Taruskin, *Text and Act*, respectively). However, it cannot be denied that the historically informed performance movement, which continues to be both vigorous and vital, has generated interest in a wide variety of repertoires and introduced a broad spectrum of possibilities for both performance and hearing. (See Butt, *Playing with History*, for a thorough discussion of issues surrounding historically informed performance.)

The analytical method. The analytical method in musicology begins with a consideration of the music itself—either in written form in a notated musical score or in sounded form in performance—and attempts to identify the structural characteristics of that piece of music in terms of broadly definable elements such as form (including motivic and harmonic analysis), musical detail (such as dynamics and tone quality), and the music’s relationship to a text. In the most straightforward sense, the musical analyst attempts to uncover what it is that makes a piece of music “work” as music. Musicological analysis differs from ethnomusicological analysis in that the latter necessarily places the investigation squarely within a particular cultural context, whereas musicologists may consider the musical work, either in score or in performance, completely removed from its context. As indicated above, musical analysis is related to music theory in that analysis provides the data that can be used to validate existing theories or to construct new ones; it is, as Nicholas Cook observed, “the practical application of theory” (*Music*, p. 93). It is also at least implicitly involved in critical musicology (see “The Critical Method,” below), since the very act of careful analysis of a work of music indicates a prior judgment as to the worth of that music.

Musical analysis, though synchronic rather than diachronic in nature, provides the data that allow the scientific historian to assess the possibility of a causal relationship between the works of two composers, given the existence of stylistic similarities: Did the two composers know each other’s work? Did they come into direct contact? Were they both influenced by a third composer rather than directly by each other? And the historian may be able to determine a chronology of composition of works of one or more composers on the basis of the stylistic information provided by analysis. Likewise, historical information can be of great use to the analyst, who must on occasion step outside of the work itself in order to decide which of several hypothetical structures best fits the music in question.

Whether the music is in musical score or in performance, the question of what is actually being analyzed, the “subject” of analysis, is difficult to answer. Music is by nature ephemeral, not subject to scientific observation and measurement. Should

one concentrate on the musical sound that the composer may have had in mind as he composed the work, or on the sound of a particular performance, or on the work as it is represented in a notated score? In the Western classical-music tradition, the notated score—the written image of a work—is generally used as the starting point for analysis, which may then go on to consider various possibilities of how it might sound. Here again, the analyst often uses the output of the scientific historian, specifically the editions of works and composers produced by textual scholarship and the study and interpretation of music notations (see the sidebar on “Music Notation”).

As mentioned above (in the discussion of scientific historicism), in recent years the popularity of historical accounts based on musical style and the accompanying emphasis on the formal analysis of the inner workings of individual pieces of music gave rise to a feeling among many historical musicologists that the analytical method had to a great extent succeeded in removing the historical component from works of music that were in fact historical documents and should not be considered entirely out of context. In short, the concern was that the two methodologies, rather than existing in peaceful symbiosis, were in danger of becoming a single approach based on formal analysis. Perhaps the most virulent denunciation of this tendency came from the musicologist Joseph Kerman, who objected strongly to the formalist preoccupation of music analysts with the internal structure of the individual work of art, considered as an autonomous entity. “The potential of analysis is formidable,” he wrote, “if it can only be taken out of the hothouse of theory and brought out into the real world” (Kerman, *Contemplating Music*, p. 18). In fact, many of Kerman’s points were well taken, although unquestionably overstated. Much of the structural analysis during the early years of the twentieth century tended to accept uncritically the works of the Western musical canon and to seek analytical methods to explain the “greatness” of these works; in other words, the truly critical dimension was missing. And in the years following World War II, music analysis became increasingly formalist, abstract, and even arcane in nature, using scientific language and symbolism, as well as drawing directly on areas of theoretical mathematics such as set theory.

In the years since 1985, the analytical method has continued in the old directions (which are ably defended in Pieter Van den Toorn, *Music, Politics, and the Academy*), while also—somewhat in response to Kerman’s charge of excessive formalism—moving in new ones that attempt to strike a balance between the consideration of the musical work out of context and an investigation of the historical and social forces evident in that music. Among these new approaches are semiotic analysis; surface rather than structural analysis; a more vigorous investigation into the history of the reception of musical works; and attempts at experimental verification, based on perception, of the importance to the listener of various abstract analytical properties. (See, in this context, the collection of essays included in Cook and Everist, *Rethinking Music*.)

The critical method. The critical method in musicology undertakes the comprehensive interpretation and evaluation of

what a musical work means within all of its contexts—historical, political, sociological, and economic, as well as aesthetic. In this, it differs from the analytical method, which generally considers the work of music to have a partially, if not completely, autonomous status with respect to any of its possible contexts. Scholarly music criticism has a long tradition, but the critical method in musicology has taken on much of its importance as a reaction and a response to Kerman’s previously mentioned attack, in the mid-1980s, on excessive analytical formalism (see “The Analytical Method,” above) and unrealistic historical positivism. With respect to the latter, Kerman and others questioned the assumption by scientific historians of the existence of a unique “best text” (ur-text) that can be reproduced in a scholarly edition, noting that for much early music the concept is anachronistic, and that even nineteenth-century composers such as Beethoven and Chopin were continually making changes to their compositions.

Deploring what he perceived as a substantial gap between academic musicology and the human experience of music, Kerman called for a methodology that would draw upon “all modes of knowledge, including the theoretical and the analytical, the historical and the intuitive, to help achieve a critical response to a piece of music” (Kerman, *Contemplating Music*, p. 154). And indeed, whether in response to Kerman specifically or simply as part of the “postmodernist” climate of the late 1980s and 1990s, the critical method in musicology has come to encompass a variety of historiographies and research methodologies, showing the influence of the literary critical theory of the 1990s as well as recent developments in disciplines such as anthropology and philosophy. This new wave of critical thinking is often included under the omnibus term “new musicology.” Among the most productive and promising are the following, not necessarily mutually exclusive, directions:

Hermeneutic historiography. In answer to criticism of the claims of “certain” knowledge put forth by scientific historians, proponents of a hermeneutic historiography in musicology advocate a synchronic rather than a diachronic historiographical model: that is, narratives based on causal relationships constructed according to the scientific historical method should be replaced by thorough contextual descriptions of a musical work of art, a goal much influenced by the work of the anthropologist Clifford Geertz. The aim of such an investigation, given the wide range of contextual information, is the well-informed interpretation, or exegesis, of all aspects of the creation in a particular time and place of a musical work or of a musical process, involving details and conditions of performance and reception. (See, for example, Small, *Musicking*, especially his Geertzian “thick analysis” of a symphonic concert of classical music.) The issue of the status of the work of music is generally unresolved. Some musicologists argue that contextual interpretation is not enough, that the musical work of art must also be considered with respect to the aesthetic experience that it produces. It must therefore retain some degree of autonomy within its historical context and should be analyzed accordingly. (See, for example, Treitler, “Historiography of Music.”) Others reject entirely the idea of a “close reading”

MUSIC NOTATION

The fundamental aim of music notation is to make a lasting visible indication of musical sound, which is invisible and ephemeral. In this respect, it is intimately related to writing in general; and, in fact, music notation is a technology found in societies that have already developed a script for language. Frequently the elements of that script are used in the music notation. And indeed, wherever they have been developed, systems of music notation fulfill two of the functions of script: conservation and communication. Moreover, just like writing in general, systems of music notation are selective in what they specify, ignoring certain aspects of performance judged to be less significant. For example, just as the written record of a speech provides little information about modes of delivery, music notations generally specify pitch or duration—which can be seen as the analogues of letters and words—but leave unfixed many elements of performance. Western notations are of two major types: instrumental tablature and phonetic or pitch notations. A tablature provides specific instructions for playing a piece of music on a stringed instrument, including proper placement of fingers and performance technique, and sometimes rhythm and the relative duration of notes. Pitch notation is a collection of signs (frequently letters of the alphabet), each representing a specific pitch, and possibly other information such as rhythm and duration.

The earliest surviving notation is from Mesopotamia; and the musical cultures of India, China, Korea, and Japan, as well as the Arabic-speaking cultures, have made extensive use of music notation of various types, principally pitch notation, tablature, and solmization (the system of using syllables to denote the pitches of a musical scale). (See the articles on notation in the *New Grove Dictionary of Music* for a discussion of Western and non-Western music notations.) Western classical music, however, has relied more on notation than any other, because notation is fundamental to the conception of Western

classical music as a collection of enduring works of art, objects that can be replicated in performance but that have a separate fixed existence independent of any specific sonic realization. This is not the case in other musical cultures, or even in non-classical Western musics, which place a higher value on performance and improvisation—on the act of making music—than on a written set of musical instructions.

The metaphor of the musical “object” came into use at some point during the nineteenth century (see Goehr, *The Imaginary Museum of Musical Works*). Prior to that time, imprecision was a generally accepted aspect of music notation, and a piece of music was generally thought of as something that existed only in specific performances made possible by the skill of performers in using a notational “sketch” to produce musical sound. But during the nineteenth century, composers increasingly sought to control performances of their works by means of more specific notation. This led to a view that performers were not “making music” but were “producing” musical works. According to this interpretation, the canon of Western music is a collection of imaginary musical objects (which are given a sense of reality by the fact that they are notated) and temporal experiences (the performances of these musical objects, made possible by the fact that they are notated). In this scenario, the responsibility of performers is to be true to the work (in German, *werktreu*)—that is, true to the intentions of the composer, true to scholarly edition, true to the authentic conditions of performance. These ideas have been challenged on many grounds, as discussed above. Most notably, the actual circumstances of composition indicate that often there is no single “correct” version of a musical work. And the degree of “authenticity” of a performance is difficult if not impossible to assess. These objections notwithstanding, Western classical music is largely conceived not in terms of performance but as a collection of notated musical objects.

of musical text, preferring to base their analysis entirely on a theoretically dialogic (two-way) conversation with the producer through the cooperation of archeological investigation and sympathetic hermeneutics. (See, for example, Tomlinson, *Music in Renaissance Magic*.) The most extreme advocates of this position interpret all musical detail—tonality, form, and so on—culturally.

Studies in gender and sexuality. Beginning in the 1970s, some music historians began to take an interest in writing the history of women in music, a subject that until then had been almost entirely ignored; the resulting studies concentrated largely on the location of sources and the recovery of biographical information. These efforts were followed in the late 1980s and 1990s by the development of serious musicological criticism based on gender. In addition to identifying gender representations in various types of music, writers have used the results of formal analysis to argue that the music itself can produce these representations. Often this type of research has resulted in the destabilization of conventional assumptions about the events of Western music history. For example, Susan McClary, in *Feminine Endings*, has examined music spanning the period from the sixteenth century to the present and has identified the ways in which historically constituted ideas of gender, sexuality, and the body have informed musical procedures. (See Solie, *Musiology and Difference*, for a diverse and fascinating collection of critical writings on gender and sexuality in music.) The emergence of gender criticism in musicology during the 1990s was accompanied by scholarship based on gay and lesbian issues, demonstrating the relevance of issues of sexuality to musical criticism. (See, for example, Brett, *Queering the Pitch*.)

Sociohistoriography. Since the late 1980s, musicologists and other scholars have increasingly studied Western classical music as a type of cultural practice. This rich methodological development includes work such as that of economist Jacques Attali, who, in a study of the political economy of music, argues that music can in fact challenge normative social orders and thus presage social development (Attali, *Noise*; see also Walser, *Running with the Devil*).

Rhetorical historiography. Recently, the very ways in which musicologists present the results of their research, rather than the research methodologies themselves, have come under critical examination. Notably, Daniel Leech-Wilkinson, employing ideas drawn from Pierre Bourdieu (especially *Homo academicus*) and others, argues that the nature of the academic workplace guarantees that the presentation of new research is necessarily influenced by the shared ideology of the group of scholars for whom that research is largely intended (see, *The Modern Invention of Medieval Music*, especially chapter 4, “Evidence, Interpretation, Power, and Persuasion”). Furthermore, paradigm shifts in musicology, like that accompanying the “new” musicology of the late 1980s and 1990s, are more a result of the importance of creativity and novelty to academic promotion than of a successively closer approximation to the “truth” that is the purported goal of musicological research. Rather than viewing this as a drawback, Leech-Wilkinson concludes that rhetorical excellence of the sort that generates interest and creativity among the scholarly

community should be the admitted goal of musicological research.

“Decentered” historiography. Since the late 1980s, many musicologists have questioned the concentration by music historians on the group of works known as the canon of Western classical music (see “The scientific historical method,” above), a concentration that has tended to marginalize or to ignore completely types of music that have in fact been extremely influential in the West and throughout the world. Advocates of the decentralization of music history argue that the very procedures by which scientific historians construct linear chains of causal relationships and ultimately propose periodizations based on elements of musical style are flawed; these historical analyses are diachronic and too narrowly focused, and the tidy narratives that they construct are misleading and should be corrected by a more synchronic and open-minded historiography. Susan McClary, for example, has written, “My history of Western music contains Bach, Mozart, and Beethoven, but it also includes Stradella and the Swan Silvertones, Bessie Smith and Eric Clapton, k. d. lang, Philip Glass, and Public Enemy” (*Conventional Wisdom*, p. 30). A fine example of decentered historiography is Robert Walser’s detailed study of the heavy metal genre of rock music (*Running with the Devil*). Walser approaches his subject in various ways, integrating methods of musical analysis and cultural criticism; in particular he devotes a chapter to what he calls the “intersection” of heavy metal and Western classical music, comparing the techniques of heavy metal musicians to those of classical musicians (chap. 3).

MYSTICISM.

This entry includes six subentries:

- Chinese Mysticism*
- Christian Mysticism*
- Islamic Mysticism*
- Islamic Mysticism in Asia*
- Kabbalah*
- Mysticism in African Thought*

CHINESE MYSTICISM

The term *mysticism* represents a modern approach to a cultural path rooted in antiquity, and given anthropological considerations it is timeless. Mysticism usually concerns any work, study, or praxis that aims at transcendence (the experiencing "self" moving beyond normal limits) or union with the divine. It was (is) often private or even secret, perhaps involving special teachers. To reflect on the experience requires placing it into everyday language and expression.

Mysticism in Chinese thought and society should neither be reified nor reduced to one cultural path or genre of thought. It resonates with some, if not all, ancient Mediterranean practices to which the Greek word *mustikos* (from the word *muo*, to be secret) was applied, as well as with mysticism found among thinkers from Jewish, Christian, and Muslim communities. Chinese society produced its own textual adepts and adherents, both within and outside of religious structures. And there are examples of guarded (in some sense hermetic) pursuits and transmittals of curricula and skills.

Three important aims of Chinese mysticism have been: (1) mantic knowledge and divination; (2) individual enlightenment and/or transcendence; and (3) union and cooperation with divinities. Social contexts range widely: individuals, village groups, and royal courts. A village scholar might employ an artisan-practitioner for mantic insight into his place in the cosmos, and priests might pursue hermetic texts and praxis of a rarefied nature.

China's "Mantic Way": Knowledge through Insight and Technics

The oldest, deepest element within Chinese mysticism is the society's diffuse mantic approach to both special knowledge and everyday life; one may call it the mantic way—enduring to the present. Archaeological work on ancient China has inspired deductions about the impact that mantic pursuits had upon politics, natural philosophy, religions, and technics. David Keightley has argued, via late-Shang royal divination records (around 1200 B.C.E.), that court decisions often were mantically "charged" in order to both detect and induce the influence of ancestors; thus, specialists, operating with divination materials, manipulated the rituals and linguistic processing of the charges not just to show how to act, but to verify that a ruler had acted correctly or had effective ancestral connections.

The mantic way infused all social levels and mundane contexts (court rites, tomb appurtenances and texts, household almanacs, manuals, and situational fortune-telling) and was a basic context for Chinese sciences. In this last regard, a trend developed from about 500 B.C.E. to 200 C.E. toward precision in the mantic arts (for example, numero-astral and calendric devices, and *Yi jing* numerate and correlative theoretics). Courts desired the best-trained and most effective practitioners with their impressive techniques. By Tang and Song times the arts were practiced widely, in urban areas and the countryside, and also became fairly regularized in state offices. Practitioners usually transmitted skills only within their own families. This alloy of intuitive, artisanal knowledge, precision

ANCIENT MYSTICISM EMERGES LATER IN DAOIST TEXTS

“[T]he five tones originate in the breath blown in and out from the mouth. . . . Spread out energy forms the six roots of the senses.” Mystical practice as described in fifth-century Daoist text “Xisheng jing.” Note the reference to ritual music, similar to the deep context of the earlier, non-religious “Wenyan” commentary to *Yi jing*.

SOURCE: *Taoist Mystical Philosophy: The Scripture of Western Ascension*, translated by Livia Kohn. Albany: State University of New York Press, 1991, p. 237.

technics, and protectiveness has cast an aura of “mystery” over arts that Westerners have found attractive, such as *fengshui*, medicine, and astrology. But it is more important to understand how arts and systems were both connected to and made sophisticated outside of the diffuse mantic way.

Self-Cultivation as a Secular Pursuit:

c. 400 B.C.E.–1600 C.E.

“Self-cultivation” shows how a certain praxis grew out of the substrate to become an important cultural artifact. At an early point it became entangled in the catch-all (and confusing) category “Daoism.” By the late 1700s European sinologists began to examine texts haphazardly denominated “Daoist.” For example, the roughly third century B.C.E. commentary to *Yi jing* (The book of changes) titled “Wenyan,” in a passage that discusses “aesthetic grace” (*mei*), reads at one point: “A man of quality: [attuned to basal] yellow [at the] center; transmitting a system-pattern. He uprightly sets [his] position; makes an abode [within his] outline-shape. With [aesthetic] grace on his inside, [he can be] at ease in [his] four limbs.” Interpreters conflated ideas like this with what little they knew of “philosophic Daoism,” which often was seen as a crypto-Legalist Confucianism. In the 1920s Richard Wilhelm translated the foregoing, in part, as “The superior man is yellow and moderate . . . makes his influence felt . . . through reason. . . . His beauty is within” (*The Yi jing*, p. 395), the assumption being that “yellow” referred to moderation and a yielding nature. This relates to late-imperial Confucian ethics and eremitism, but misses important links to an ancient context.

Scholars are now able to apply finer nuances. Since about 1975, archaeology has brought to light manuals, implements, and texts from pre- and early-Han tombs (roughly 400 to 100 B.C.E.) that evidence practices of divination, siting, sexual hygiene, demon-quelling, longevity arts, and mind-evacuation. Examples are “Recipes for Nurturing Life” and “Ten Questions,” texts from the Mawangdui cache. Donald Harper carefully explains that these may have been the practical bases from which later self-cultivation pursuits developed. Such tombs were constructed in an era when imperial courts devoted money and energy to complicated rites programs, which in

turn found parallels in local culture. Thus the commentary passage, above, apropos of the *Yi jing* phrase “yellow lower garment,” actually carries a *mustikos*—objects in closed-off tombs and the secretive, frequently agonistic, court struggles over systems of music and dress. In fact, “Yellow Bell” was the name of an elusive, theoretical pitch regulation for establishing tuning “systems.” Harmonics in turn were seen as “transmitting” cosmic beauty, which emanated from the “man of quality” at the “center”—that is, local royalty or, later, the emperor. The “Wenyan” passage thus glides on the edges of several readings: an indirect, mostly metaphorical exhortation on centering; a paean to court music and the computations of its harmonics experts; an alchemy of nurturing the homunculus emperor (or sage) within oneself; and reconciling inner and outer commitments in one’s public life. Later in the Han period, and with important revivals during Tang and Song (see below), other texts carried self-cultivation forward, with instructions in mystical practice that became more specific.

If the above interpretation of a passage of commentary to *Yi jing* is controversial, nevertheless, self-cultivation is read quite confidently from passages of famous works such as Laozi, Huainanzi, Guanzi, and Zhuangzi that discuss breathing, sitting still, and removal of all perception and emotion. Such readings are seen by Harold Roth to reflect a historical development whose very earliest period emphasized “cosmology and the inner transformation of the individual leading to the attainment of ‘mystical gnosis’” (Roth, pp. 6–9). Through the textual work of Roth, Livia Kohn, and others it is better understood that early China contained a whole culture of self-cultivation, with fairly common terminologies, texts, and aims.

Beginning around 100 C.E., scholar-officials restored and reinterpreted ancient texts. The *Yi jing*, especially its anonymous commentaries (as above), was researched anew, as was the relativistic and transcendent logic of Laozi and Zhuangzi. The second to fourth century scholar-Daoists, often referred to as “neo-Daoists” or “Mystery Adepts,” brought relativist logic and psychological inquiry into public discourse, and many practiced eremitic stances and withdrawals. Most did not identify the ancient traces of mystical praxis per se in their classics, but

FROM MEDIEVAL TANTRA TO MODERN TIMES

The following snippet of recitation (from a 600-year-old text) was performed in the 1990s in Fukien, China, for local Daoist rites: “. . . with complete obedience [to] . . . Perfected Lord Wu/ . . . Wrote talismans, let fall seal-scripts . . . that his Sacred Spell would have awesome power. . . .”

SOURCE: *Taoist Ritual*, translated by Kenneth Dean, p. 93.

their metaphysics and ontology spurred mystical speculation later on among monk-scholars and Daoist revelators.

In this same period, anonymous writings known as “weft-texts” (*wei*) and numero-calendric “charts” (*tu*) were thought to augment hermetically the “warp” of the Confucian classics. Essentially, they were revelatory texts that claimed sage-authorial voice for their political predictions and comments on sociocosmic timing and justice. Beginning about 350 C.E., revealed texts of various types influenced southern Daoist scholars and scriptural communities; and they remain in use in Daoist communities of the early twenty-first century.

Around 1000 C.E. neo-Confucian discussions reclaimed ancient approaches to self-cultivation, this time fully conscious of the mystical program, unlike earlier reclaimers. Many judged Daoist practices as undesirable and the cosmologies and belief-systems of Mahayana Buddhism as anathema; but the influential Shao Yong (1011–1077), for example, borrowed from both, sparking interest among scholar-intellectuals in psychocosmic resonance and correlation, as well as in self-cultivation. In fact, self-cultivation became prominent in the aspirations and writings of Wang Yangming (1472–1529), his disciple Wang Ji (1498–1583), and follower Li Zhi (1527–1602), to name a few. Their mysticism centered around the notion (even praxis) of “innate knowledge”—promoting instinctual mental (and moral) response over the machinations of academic learning. In fact, Wang Yangming wrote of practicing a Zen-like contemplation and the subsequent redirecting of it into political action. His ideas made a deep impact on elite-scholar life for over two hundred years.

The Buddhho-Daoist Melange: Tantra, Zen, and Mediums, 400 C.E.–Present

By about 300 C.E., northern Chinese polity had collapsed under pressure from proto-Turkic invaders. Many northern social and political elite had reestablished themselves in the south, a general area long known for expressions of ecstatic vision and song and escapist literature. When Daoism and Buddhism, as organized monastic-lay communities, flourished in the south, detailed instructions in mystical practice became more frequent, while at the same time the themes and types of practice changed. When the nation was unified under the Tang dynasty in 618, the two religions achieved widespread official sanction.

Buddhism’s Hinayana roots in China (from about 100–300 C.E.) had emphasized mind-body exercises (breathing, counting, and recitation). Mahayana Buddhism, a bit later, shared with Daoist scriptures the desire to impart protection for individuals and communities against demons and apocalyptic chaos. The resulting Buddhho-Daoist melange reflected the entrance (and frequently the forging) of Indic Tantrist technics and scriptures from Tibet and Central Asia. The Buddhist scripture titled *Book of Consecration* (c. 450s) is a collection of various spells, oracles, talismans, and even instructions for rebirth into a heaven of medicinal herbs. It is a total package of Chinese mysticism. Seemingly Indic and Tantric, it is nonetheless solidly Chinese, presenting practices in the mantic way, in self-cultivation and transcendence, and finally tutelary divinities who defend against demonic forces.

The *Book of Consecration* provides the first example of physical implements and practices as tools for transitory union with divinities. This was a new twist, since previously divinities were mainly powerful, official-like beings to whom one petitioned. “Officials to be petitioned” and “gods with whom to gain union” continue in modern Daoist communities throughout the Chinese world. Rites and festivals require chanting for divine intercession, writing of magical calligraphic documents, and direct transmission of divine will through medium-shamans.

In Tang times, “Double Mystery” (*chengxuan*) Daoist priests such as Liu Jinxi (d. c. 640), who resided at a Daoist monastery in Changan and defended Daoism at court debates in the 620s, exhibited Buddhho-Daoist blending. Liu’s *Benji jing* uses a Buddhist debate style as well as notions of the Dao as cosmic deity. Tang Daoists developed the older strains of “self-cultivation” more systematically. Instructions were set out to effect the discarding of all desires, then even the discarding of the state of no-desires, a logical ploy borrowed from Mahayana Buddhism. Chan (Zen) Buddhism matured as a sect from the 700s to 900s, transmitting texts, oral teaching, and even implements in guarded fashion, through disciple-master lineages. Chan rules for meditation were codified, for example, the “Regulations of the Chan School” (1004), and Zongze’s “Principles of Seated Meditation” (1103), which prescribe how to enter the practice room, how to sit, the placing

of the limbs, and the positioning of tongue and mouth for breathing practice.

Conclusion

Chinese mysticism was, and is, a vibrant phenomenon with ancient, secular roots that over time, and via religious enterprises, developed new forms. Not only did Chinese mysticism mix the secular and religious, but also the social range was total. To see this better, one must not think of Chinese mystical practice as simply its tools, for example, alchemically larded manuals of healing and longevity, or *fengshui* (mantic siting). Such arts often draw on China's mantic way by employing instinctive—nontextual, nonmechanistic—skills. The artisan becomes a psychopomp, a shaman leading a client to special knowledge, clarity, or health. And arts were guarded within family groups, which made them in some sense *mustikos*. But they could also be entirely mechanical. One cannot describe as mystical the act of looking up an interpretive symbol inscribed on a calibrated siting compass. Chinese mysticism is best seen in the long arc of textual guides to, and metaphysical supports for, self-cultivation. All three paths interlaced, eventually in the practices of cult communities, and eventually as techniques for establishing relations with divinities.

CHRISTIAN MYSTICISM

Since the Baroque age, the concept of mysticism (first in French, *la mystique*) has been used to describe religious phenomena that can hardly be restricted to a certain geographical space or a certain epoch. These phenomena are primarily symbolic expressions (in act, speech, literature, art, music, etc.), of persons trying to communicate knowledge that has been gained through mystical experiences.

A commonly accepted definition of "mystical experience" does not exist. St. Thomas Aquinas (1225–1274) says that beyond speculation, there is an experimental cognition (*cognitio experimentalis*) of the divine, "thereby a man experiences in himself the taste of God's sweetness, and complacency in God's will" (*Summa theologiae* II/II q.97, a.2, re2). In order to include forms of mysticism that reject the notion of a personal god, one could more generally speak of immediate experiences of divine presence. For an additional clarification of the concept it is still useful to consider the four characteristics of the "mystical state of consciousness" as provided by William James (pp. 294–296):

1. Ineffability: The paramount experiences exceed the intellect, defy verbal expression, and can therefore not be imparted or transferred to others.
2. Noetic quality: Mystical experiences are not mere feelings but also insights and participations in a nonintellectual and nondiscursive knowledge.
3. Passivity: Although the mystic may actively prepare body and mind, the actual experience is rather one of being grasped and held by a superior power.
4. Transiency: Mystical experiences are limited in time and can only imperfectly be reproduced by memory. This last characteristic, however, has been questioned by more recent scholarship, since there are sources that speak of permanent mystical states.

The symbolic expressions as well as the modes of mystical experience are, to a certain degree, predetermined by their social, religious, and intellectual environment. This observation, however, does not contradict the assumption that there is a “numinous” dimension of reality from which all mystical experiences originate. Accounts of mystical states of consciousness occur in every religion, philosophy, and doctrine of wisdom, involving a dimension of divine eternity, which on the one hand transcends the sphere of temporal beings and sense perceptions and, on the other hand, is the ground and source of all being. Besides this ontological presupposition an anthropological one is required. Mystics claim that a feature of human nature—most often identified as the “soul” or its highest parts—is divine or can assume a divine form. Therefore, it can free itself from the bodily and temporal sphere of existence in order to enter the transcendent realm of the divine.

Basic Problems of Christian Mysticism

Christian mysticism inherited most of its ontological and anthropological foundations from the Hellenistic environment from which it emerged. But it also derived a great deal of its imagery and inspiration from the Old Testament, first of all from the Song of Songs. Nevertheless, the original contributions of Christianity must be related to the revelations of the New Testament. The history of Christian mysticism begins with the oldest documents of Christianity, the letters of Paul. The Apostle writes:

I know a man in Christ who fourteen years ago was caught up to the third heaven. . . . And I know that this man . . . was caught up into Paradise and he heard things that cannot be told, which man may not utter. (2 Cor. 12:2–4)

This quotation shows the problems that scholarship on Christian mysticism confronts. Paul’s memory of his mystical ascent seems to lie at the periphery of his religious consciousness. It is his experience as a “man in Christ” and can only be understood as one of the consequences of the Damascus experience, his vision of the Resurrected. The paramount experiences that lie at the foundations of the Christian symbolic universe are not understood as the results of individualistic efforts by religious virtuosos but as the self-revelation of a merciful god. At least in Western Christianity, the paradigm of the saint is not the ascetical hero, who attained mystical states, but the converted sinner, who did not deserve the grace of his calling. The notion of a God who not only created the world but also mediates himself through sending his Son and the Holy Spirit, in other words a God who acts toward man, seems to contradict the mystical notion of an ever-transcendent God that must be approached by meditative ascent.

Moreover, if the climax of God’s self-revelation is the incarnation of his word (logos), how can there be a higher knowledge, gained in an experimental realm beyond language? The union of the soul with the ground of being, which can be regarded as the climax of mystical experiences, seems to undermine the orthodox understanding of divine union, that is

the sacramental union with the body of Christ, provided by the institution of the church. It is therefore no wonder that Christian mystics often fell under the suspicion of heresy and that even modern theologians regard the concept of Christian mysticism as a contradiction in terms. Of course, a closer look at their writings would show that almost all Christian mystics did not doubt that membership in the church, faith in Christ, and the dispensation of divine grace is the presupposition of their ascent. Nevertheless, the tension remains.

History of Christian Mysticism

The tension first became manifest in the mysticism of the Egyptian hermits who, influenced by the Platonic theology of Origen (185?–254? C.E.), felt dissatisfied with the community life of the church and were searching for a more immediate experience of God in the isolation of the desert. In their view, the *parousia*, the presence of Christ, was no longer a historical event but rather a personal encounter and a result of ascetical purification. Until the High Middle Ages, occidental mysticism was limited by the authority of St. Augustine of Hippo (354–430). Other than in his early work, which drew heavily on the mystical Neoplatonism of Plotinus and Porphyry, the church father more and more opposed the self-confident individualism of the ascetics. Rather, he insisted on the general sinfulness of man and God’s autonomous dispensation of grace. But the manifold richness of his experiential world would not allow him to completely abandon the Neoplatonic idea of mystical ascent. Augustine shows the orthodox Western attitude that mystical experience does not necessarily lead to a mystical theology. Rather the awareness of divine presence confirms earlier theological assertions and removes doubts. An account in the *Confessions* (c. 400) betrays its Neoplatonic background as it sketches the parallel ascent through the hierarchies of the ontological order of beings and the anthropological order of human capacities.

And so step by step I ascended from bodies to the soul which perceives through the body, and from there to its inward force, to which the bodily senses report external sensations, . . . From there again I ascended to the power of reasoning to which is to be attributed the power of judging the deliverances of the bodily senses. This power, which in myself I found to be mutable, raised itself to the level of its own intelligence, and led my thinking out of the ruts of habit. It withdrew itself from the contradictory swarms of imaginative fantasies, so as to discover the light by which it was flooded. . . . So in the flash of a trembling glance it attained to that which is. At that moment I saw your “invisible nature understood through the things which are made.” (*Confessions* VII, 17, 23)

Augustine’s “moderate mysticism,” which laid greater emphasis on the mutability and misery of all earthly existence and the limitedness of human knowledge, has been challenged throughout the history of Western Christianity. Influences from Eastern Christianity always provided alternative approaches to mysticism. The most important of these sources were the writings of an unknown (probably Syrian) author,

published around the year 500 under the name of Dionysius the Areopagite (cf. Acts 17, 34). Unlike Augustine, Pseudo-Dionysius provides a mystical theology in the strict sense. His negative (*apophatikē*) theology teaches the contemplative ascent through the realm of language by the successive reduction of words and negation of all positive propositions about God. Its purpose is a translanguistic meditation on and union with the superessential (*hyperousion*) "It."

. . . ascending, we say, that It is neither soul, nor mind, nor has imagination, or opinion, or reason, or conception; . . . neither is standing, nor moving; nor at rest; neither has power, nor is power, nor light; neither lives, nor is life; neither is essence nor eternity, nor time; . . . neither one, nor oneness; neither Deity, nor Goodness; nor is It Spirit according to our understanding; nor Sonship, nor Paternity; nor any other thing of those known to us, or to any other existing being. . . . (*Mystical Theology* V)

The inherent tension of Christian mysticism becomes again manifest because the mystical insights transcend everything that Christian theology teaches about God. The "It" lies in the "overbright darkness" (*hyperphōtos gnophos*) beyond the essence of the triune God.

St. Bernard of Clairvaux (1090–1153) became the most influential representative of a genuine Christian version of mysticism, the mysticism of love. In his *Sermons on the Song of Songs*, he provides a sophisticated doctrine of four types of love. The highest one is the paradoxical "self-love for God's sake," an ecstatic state in which the self is almost completely annihilated through the union with the divine. On the one hand, Bernard could more easily reconcile his mysticism with the doctrine of grace, since he could understand the mystical ascent as the loving answer of the human soul to the loving call of God. On the other hand, his doctrine implied the degradation of other forms of Christian love. According to Bernard, the love of neighbor belongs to the lowest type of love.

This view was rejected by one of the most singular personalities of medieval Christian thought, Johannes Eckehart, called Meister Eckehart (c. 1260–?1327), a German Dominican. His philosophy was a turn back to the heritage of Neoplatonism and faced vehement opposition by the church. Mystical ascent is not a movement through ever-higher stages of love but an intellectual endeavor. Its end is the contemplation of the "divinity" (*Gottheit*), a higher preexistent unity that precedes and transcends the ontological difference between God and man. Eckehart also insisted on the priority of the active life.

Nevertheless, the mysticism of love dominated female mysticism, which first began to flower in the middle of the twelfth century. Thousands of mostly wealthy married women, who were dissatisfied with their subordinate status in society and the ecclesiastical order of charismas, joined the Cistercians in order to change their "carnal marriage" into a "spiritual marriage" with Christ. In the thirteenth century, the more freely

organized but orthodox movement of the Beguines began to attract many women from all social ranks, primarily in the new urban centers of western Europe. Contemplation of and union with Christ is the typical form of female love mysticism, which ranges from loving compassion with Christ's suffering to explicit accounts of erotic encounters with the Savior. Female mysticism reached an intellectual climax in the writings of the Spanish nun St. Teresa of Ávila (1515–1582). Her symbol of the "interior castle" and its various rooms signifies the different stages of perfection the soul must pass to achieve final perfection and the union with God in the "innermost chamber." Although the exclusion of women from scholastic education was one of its motivations, female mysticism may not be regarded as a feminist protest movement. The more significant currents remained orthodox and did not oppose church authority. Moreover, many of its spiritual leaders were male. Female mysticism, however, shows that contemplative life does not necessarily lead to the renunciation of the active life. Many female mystics were extraordinarily active in charity and politics. One of the best examples is St. Catherine of Siena (1347–1380), who was sent on diplomatic missions and played a mediating role in the Great Schism.

Some other important representatives of Christian Mysticism have not been mentioned so far: St. Gregory of Nyssa (c. 335–c. 394) was one of the most brilliant and influential church fathers of the East and described mystical experience as the "fruition of God." The Flemish mystic Jan van Ruysbroeck (1293–1381), known as the "Ecstatic Teacher" and the "New Dionysius," developed a "spiritual ladder of Christian attainment," consisting of the three steps of active life, inward life, and contemplative life. St. Gregory Palamas (1296–1359) was an important theorist of the Eastern mystical movement of the "hesychasts" and taught the fusion of the soul with divine energies. Johannes Tauler (c. 1300–1361), a German mystic and Dominican monk, emphasized ethical perfection as the presupposition of mystical union. The English female mystic Julian of Norwich (1342–after 1416), insisted on the love and benevolence of God. The unknown English author of *The Cloud of Unknowing* (written around 1375) continued the negative theology of the Areopagite. St. John of the Cross (1542–1591) was the most brilliant of all mystical poets. Edith Stein (1891–1942), a student of phenomenologist Edmund Husserl (1859–1938), developed the inward mysticism of Teresa of Ávila and John of the Cross.

ISLAMIC MYSTICISM

The mystical dimension of the Islamic religious tradition has roots in the divinely revealed text of the Koran. One passage often pointed to in this regard is the “Light Verse” (24:35), in which God is described as the Light of a blessed lamp, lit by a burning oil “neither of the East nor the West.” One episode from the Koran, involving the prophet Moses, provided key evidence for the mystics’ claim that an unseen world runs parallel to our own. The story describes Moses’ meeting and deferring to one whom God had taught knowledge from His “own presence” (18:65). The understanding is that the prophets have their exoteric missions and knowledge, but that esoteric knowledge has a parallel, if not superior, position.

The earliest mystical practices seem to have been ascetic, probably based on earlier Syrian and Iraqi Christian models. The term *Sufism*, for example, probably derives from the early mystics’ practice of wearing wool (*suf*). A lost collection of biographies of ascetic women from the eighth and ninth centuries has been recovered. This work, by al-Sulami (d. 1021), presents themes such as scrupulous attention to God’s law; excessive crying and fainting in response to one’s guilt or to God’s love; sincerity and control of the material appetites. These and the many other collections of ascetic exemplars that followed could evoke the prophet Muhammad’s own spiritual retreats and supererogatory praying, as preserved in the Koran and the Tradition as precedents.

The concern with the self in this ascetic environment gave rise to theories of spiritual exercise that the aspirant would pursue in order to progress along the path to wisdom, purity, or even the presence of God. Among the most influential teachers and writers of the early period were Hasan al-Basri (d. 728), al-Muhasibi (d. 857), and the poet al-Bistami (d. 875). The tenth and eleventh centuries saw efforts at systematizing these paths, with the composition of a series of manuals describing and explaining such experiences as “extinction of the self in

God,” “trust in God,” “certainty,” “sincerity,” and “repentance.” These manuals (by al-Makki, d. 996; al-Hujwiri, d. 1071; al-Qushayri, d. 1074; and others) also present the mystical teachings of prominent Sufi masters.

Mystical thinking among the Shi’a also begins early. The sixth imam of the Twelver tradition, Ja’far al-Sadiq (d. 765) is taken by the Shi’a (and certain Sunni Sufis) to have been a master of esoteric teaching. The very concept of Shi’a leadership, or *imama*, included esoteric or mystical elements. The vibrant mystical tradition among the Twelver Shi’a, which came to be recognized as one of the religious sciences, would be known as *‘irfan* (literally, “knowledge”).

The twelfth and thirteenth centuries saw the rise of the Sufi brotherhoods, or *turuq* (singular, *tariqa*). The most prominent are probably the Qadiriyya, the Shadhiliyya, the Rifa’iyya, the Naqshbandiyya, and the Chistiyya. As an institution based on the teachings and model of a saintly founder, each *tariqa* would give rise to its own devotional practices, mystical doctrines, and literature. Central among these practices are the *dhikr*, or remembrance of God—a ritual group recitation of the name(s) of God. Along with *dhikr* goes the stylized recitation of long prayers, usually passed down from the founder of the order. Mystical doctrines vary widely. One issue that has been debated recently among scholars is that of “neo-Sufism.” This is the term given to the perceived shift in Sufi practice, from about the middle eighteenth century, which inflated the role of the prophet Muhammad as a figure of devotion. This shift also challenged the traditional structures of the established Sufi brotherhoods and saw itself as reformist.

The heyday of Islamic mystical thought, however, took place outside the brotherhood organizations. Independent thinkers such as Ruzbehan Baqli (d. 1209), Najm al-Din Kubra (d. 1221), Ibn ‘Arabi (d. 1240), Ibn al-Farid (d. 1235), and Jalal al-Din Rumi (d. 1273), provided dynamic mystical perspectives on God, creation, and existence itself. Also, the Koran could be illuminated by mystical exegesis. Ruzbehan Baqli’s writings describe dramatic visions of the divine and the intense experiences these provoke. He also defended the phenomenon of ecstatic utterances (*shatahat*), for which the early Sufi al-Hallaj (d. 922) in particular had been known. Much of this defense rests on the notion that mystical language must be recognized as a reflection of the essentially nonverbal reality that is mystical experience. Kubra’s innovative interpretation of the soul’s mystical ascent associated certain colors with the levels of experience leading to sanctity.

Ibn ‘Arabi’s thought introduces a hermeneutic based on the assumption that an interpretation based on mystical insight is as true as that from any other human perspective. His elaboration of a qualified “oneness of being,” that is, the recognition that only God’s existence stands, has had an immense influence on the mystical tradition. The concept of sanctity (*walaya*) was to undergo dramatic elaboration in his writings. Ibn al-Farid, poet and mystic, composed some of the most sophisticated verses ever in the Arabic language. His great poem, the *Ta’iyya*, reframes classical images such as love and drunkenness to point to the mystic’s experience of and devotion to the divine. The Persian poet Rumi made an even larger

impact with his epic the *Mathnawi*. This collection of fables and wisdom tales presents a sophisticated and humane perspective, which although mystical in approach has a universal appeal.

These thinkers introduced and elaborated a set of concepts that constitute the touchstones of Islamic mysticism. One of these is an extension of the idea of the Light of the prophet Muhammad. This is the Muhammadan Reality, which gave the Prophet a cosmic and existential role to play—quite a leap from the earliest understanding of the man in Islamic tradition. The Muhammadan Reality stands between God and creation, an intermediary similar to the Universal Intellect of the Neoplatonists. The “oneness of being” concept has remained debated, but a fruitful subject for speculation up to the present. The concept of sanctity, and in particular the theory of the identity and nature of the “seal of saints” has provoked much thought among later mystics.

ISLAMIC MYSTICISM IN ASIA

There are a number of mystical movements within Islam, but by far the dominant tradition is that of Sufism, one of the most dynamic and interesting dimensions of Islamic religious and cultural expression. *Sufism* is an umbrella term for a variety of philosophical, social, and literary phenomena occurring within the Islamic world. In its narrowest sense, the term refers to a number of schools of Islamic mystical philosophy and theology, to the phenomenon of religious orders and guilds (*tariqat*) that have exerted considerable influence over the development of Islamic politics and society, and to the varied expressions of popular piety and devotion to shrines found throughout the Islamic world. In a wider sense, Sufism is often seen as the spiritual muse behind much of premodern verse in the Islamic world, the idiom of much of popular Islamic piety, the primary social arena open to women's religious participation, and a major force in the conversion of people to Islam in Africa and Asia. The Sufi orders served as educational institutions that fostered not only the religious sciences but also music and decorative arts. Their leaders sometimes functioned as a challenge to the power of the juridic and theological establishment. In modern times (as at other periods in history), the Sufi orders have been praised for their capacity to serve as instruments of religious reform at the same time as they have been vilified for a lack of respect for Islamic law and

for fostering ignorance and superstition in order to maintain control over the community.

The term *Sufism*—or *tasawwuf*, as the tradition is called in Arabic—may derive from the practice of wearing wool (*suf* in Arabic), or possibly from the Arabic word for purity (*safa*). The earliest Sufis spent almost all their waking hours in prayer, and frequently engaged in acts of self-mortification, such as starving themselves or staying up the entire night, as a form of prayer exercise. They renounced their connections to the world and possessed little other than the clothes on their backs. A large percentage of these early Sufis were women, several of whom, such as Rabi'a al-Adawiyya (d. 801), are revered to this day.

History: Early Period

In Muslim understanding the origins of Islamic mysticism in the form of Sufism lie in the life of Muhammad. His earliest biographies emphasize his habit of meditating in a cave and living a life of material simplicity bordering on asceticism, both of which are seen as prototypes of mystical belief and practice in Islam. As an organized movement, Sufism too owes its official origins to Muhammad and his cousin and son-in-law, 'Ali, who is viewed by the majority of Sufis as the first of their kind. Ali was the first male convert to Islam and the man closest to Muhammad in his private life. As such, he is said to have received levels of spiritual guidance from Muhammad that were not available to anyone else. Part of this was a body of mystical knowledge that was passed down through Ali to future generations. The concept of esoteric or mystical knowledge (*'ilm al-batin*, *al-'ilm al-batini*, or simply *al-batin*) became central to the theology of Shiism, one of the two main sectarian divisions in Islam. It also remains at the center of Sufi understanding.

The historically traceable origins of Sufism begin approximately a century after Ali's death. Very little biographical information is available on some of the earliest Muslim ascetic and mystical figures, but they are important for their impact on the development of Sufism. By the late eighth century, members of the school of a famous mystical ascetic named Hasan al-Bari (d. 728) had established a convent (*ribat*) at Abadan, and others had composed important treatises on Sufi etiquette. Important mystical figures of this period include Dhu'l-Nun Misri (d. c. 859), an Egyptian figure who is of importance to the development of Sufism in western Asia because later Sufis quote him frequently, seeing him as a Muslim exponent of the Hellenistic tradition. An Iranian Sufi named Bayazid Bistami (d. 874) became famous for ecstatic utterances (*shathiyat*), which he was the first to use consistently as an expression of Sufi mystical experience. These somewhat scandalous declarations were dramatic statements made to demonstrate the merging of Bistami's individuality with the divine identity. This sense of union with God was the result of a life-long process of self-purification at both a physical and a spiritual level. In his practice of prayer and meditation Bayazid showed strong ascetic tendencies while at the same time ridiculing traditional asceticism because he felt that trying to renounce the physical world was to afford the physical realm an existence that it did not actually possess. The theme of asceticism appears frequently in Iranian Sufism in the

ninth century even though many Sufis, like Bistami, rejected the outward trappings of an ascetic life.

The end of the tenth century marks a transition in the development of Sufism from the early formative period that was characterized by a high degree of individualism in practice and a central focus on asceticism to a classical age wherein there is greater emphasis on organization and systematization. This is also a time when Sufism in western Asia appears somewhat divided between two schools, the first being the Iraqi one (which was transplanted to Nishapur in Iran) and the second being the Khurasani one, centered in northeastern Iran and Afghanistan. The differences between these two schools are not altogether clear and at times appear to have more to do with the theological and legal affiliations of Khurasani Sufis than with any major differences over mystical theory and practice.

The transitional phase of the tenth and eleventh century also witnessed an increased emphasis on the formalization of Sufi doctrine, the canonization of earlier Sufi figures, and an apologetic attempt to show potential Sufis and the society at large that Sufism was in complete harmony with orthodox Islam. Two of the most important figures in this regard are Abu Bakr Kalabadhi (d. between 990 and 995) and Abu 'Abd al-Rahman Sulami (d. 1021).

Kalabadhi is most famous as the author of the *Kitab al-ta'arruf li-madhab ahl al-tasawwuf*, a widely circulated book that attempts to explain Sufi terminology and beliefs and to show the essential orthodoxy of Sufism. Among Sulami's many works his *Tabaqat al-sufiyya* served as a model for many later Sufi biographical works. He also wrote treatises on Sufi ethics, particularly on the concept of Sufi chivalry (*futuwwa*) and on antinomian trends in Islamic mysticism.

Two of the most important mystical figures of the formative period of Sufism in Asia are Khwaja 'Abd Allah Ansari (d. 1089) and Abu Sa'id ibn Abu al-Khayr (d. 1049). They are both central to the development of organized Sufism but represent two distinct models of leadership. Abu Sa'id is perhaps the most colorful of the famous Iranian Sufis of this period. He studied law, theology, and other religious sciences before adopting a contemplative life, which he pursued under the guidance of a master for fifteen years. Following his teacher's death, Abu Sa'id entered into a flamboyant, public phase of his life during which he ran two Sufi centers, one in his home town of Mehana and the other in Nishapur, the biggest city in Iran at the time. Abu Sa'id was accused by his critics of accepting too much money from devotees, living too luxurious a lifestyle, and having attractive young men dance and sing in public. Abu Sa'id is one of the key figures in the earliest evolution of successful Sufi orders and centers.

Khwaja 'Abd Allah Ansari is a Sufi of a very different kind, though comparable in importance to Abu Sa'id. Ansari was a committed polemicist belonging to an important school of Sunni Muslim legal thought. His personal and professional fortunes changed as the religious pendulum swung in different directions. It was toward the end of his life, after he had gone blind and at the urging of his disciples, that Ansari dictated his

main works, including the very popular *Kitab manazil al-sa'irin*, a brief didactic text providing an itinerary for the soul's journey to God. His other important works include a mystical treatise emphasizing the importance of love in the journey toward God.

The period immediately before and after the Mongol invasion of Iran in the early thirteenth century was perhaps the single most vibrant phase in the history of Iranian Sufism. The social and political instability of the era combined with a high degree of intellectual vitality to produce major thinkers and teachers. Undoubtedly the most famous of these is the Andalusian emigré Muhyi al-din Ibn al-'Arabi (d. 1240). Ibn al-'Arabi's mystical and philosophical ideas reshaped much of Sufi thought and, to a large extent, fashioned the language if not always the content of Sufi discussions since his time. His central philosophical idea was that the universe is the physical manifestation of God; as such, it is not entirely distinct from him but represents one of his aspects, the other being his uniqueness. This doctrine came to be known as "Oneness of Being" (*wahdat al-wujud*). The doctrine that God is utterly separate from creation is a central belief of many Muslims for whom Ibn al-'Arabi's teachings represent an unorthodox position. Over the two centuries after his death a modified version of the theory of "Oneness of Being" emerged; named "Oneness of Witnessing," it attempted to reconcile the philosophical aspects of Ibn al-'Arabi's philosophy with common Muslim theological beliefs.

It was in the fourteenth and fifteenth centuries that Islamic mystical ideas and institutions consolidated their positions in South and Central Asia, although mystical thought and Sufi individuals had been common in these regions since the eleventh century. The Naqshbandi Sufi order started in present-day Uzbekistan. Its eponymous founder, Baha' al-din Naqshband (d. 1389), had a tremendous impact on the development of Islam all across Central and inner Asia, as well as in South Asia and the Ottoman Empire. It remains one of the most influential Sufi orders in modern times and is involved in global Muslim debates over the place of religion in modern society.

Of similar importance is the Chishti order, which derives from Mu'in al-din Sijzi (d. 1235), a Sufi master from Afghanistan who settled in the Indian town of Ajmer. The Chishti order had tremendous importance in popularizing Islam among non-Muslim or nominally Muslim Indians, at the same time as Chishti Sufi masters maintained closed relationships with the ruling elite of South Asia. To this day the Chishti order remains notable for its openness to outsiders, in terms of both its warm welcome into its gatherings and its widespread use of music.

Doctrine and Practices

Sufis are motivated by the desire to have a direct, personal experience of God while they are still alive, rather than waiting until after resurrection when, according to Muslim belief, all human beings will share this experience. The direct experience of God is considered so overwhelming as to be indescribable and can only be spoken about in metaphors, the most commonly used ones being those of falling in love and of being intoxicated with wine. These images are frequently encountered in Sufi literature, particularly in poetry, which tries to

express the indescribable joy that Sufis experience through their relationship with God, combined with the heartache of being separated from Him.

The Sufi concept of union with God is expressed in many different ways. The main problem in Sufi philosophical circles is how a mortal human being can unite with the omnipotent, omniscient deity who is unlike us in every way. The union with God is normally called *fana'*, which literally means "destruction" or "annihilation." Sufis believe that in the final stage of an individual's spiritual development, she loses any consciousness of her individual identity and is only aware of the identity of God. In effect, God's identity then replaces the identity of the Sufi.

There is disagreement among Sufis over whether the final spiritual goal of Sufism is to lose one's identity completely in the identity of God or to reach a stage where one's own concerns no longer prevent us from seeing the world in its true nature. A common metaphor for the first approach is to describe the Sufi's individuality as a drop that vanishes into the ocean. It ceases to exist as an identifiable entity but does not actually cease to exist, since it is now part of the vastness of the sea. The latter view, that one sees things more clearly, depicts the human heart (which was the seat of the intellect in medieval Islamic thought) as a mirror that is normally dirty, tarnished by our everyday concerns and petty desires. Through engaging in mystical exercises we effectively polish the mirrors of our hearts and cleanse them to the point that they can accurately reflect the light of God.

The Sufi Path

Sufis believe that average human beings are unable to understand the true nature of spirituality because of their petty concerns. The quest for spiritual understanding in Sufism is seen as a path that each Sufi must travel under the guidance of a teacher or master. This path has many stages, the number and names of which vary according to the school of Sufi thought.

The Sufi path relies on the use of meditation to accomplish its goals. The various Sufi forms of mediation are called *zikr* (or *dhikr*). *Zikr* literally means "repetition," "remembrance," "utterance," or "mentioning" and is a term that appears several times in the Koran. At its most basic level, Sufi *zikr* consists of repeating one of God's names over and over. In Islam, God is believed to have many names that describe some aspect of his nature. Of these, ninety-nine are considered special and are called the "Most Beautiful Names." The purpose of reciting these names is to concentrate wholly on what one is to lose all self-awareness by repeating the *zikr* formula enough times that it permeates one's entire being so that even if the person ceases to actively engage in *zikr*, it continues to be repeated in his heart.

Impact on Literature and the Arts

Islamic mysticism has had a tremendous impact on shaping literature and the arts in Islamic society. This impact has been felt particularly in poetry and music. Mystical poetry has been composed in all languages spoken by Muslims. In Persian in

particular, as well as Turkish, Urdu, and other languages that borrow much of their poetics from Persian, mystical poetry has traditionally represented one of the most important literary genres. Its influence has been so pervasive that almost all premodern love poetry in these languages borrows mystical metaphors, with the result that romantic poetry is ambiguous as to whether it refers to God or an earthly beloved. Complementing mystical poetry is a large literature of allegorical romances.

Among the many excellent mystical poets, the most famous is Mawlana Jalal al-din Rumi (d. 1273), whose three-volume didactic poem *The Masnavi* has been translated into all major Western languages. The Mevlevi Sufi order, which derives from him, is distinctive for the importance it gives to music and dance in its *zikr* practices. The Chishti order also makes extensive use of music in its religious exercises. Called *qawwali*, they involve a group of musicians singing religious songs in Persian or one of the languages of South Asia set to a very rhythmic beat. *Qawwali* music has attained global popularity over the past three decades.

KABBALAH

Kabbalah is a Hebrew term that has many meanings. Its basic meaning is derived from the root *QBL*, which means to receive, and thus the term means "reception." In rabbinic literature it stands mainly for a tradition that is received orally. However, beginning in the tenth century, testimonies appeared

for a more specific form of Kabbalah: an esoteric tradition dealing basically with details related to divine names. In the beginning of the thirteenth century this esoteric tradition became more common in written sources, and ultimately imposed itself as the main meaning of the noun. This widespread use of the term *Kabbalah* as secret knowledge reflects the emergence of a huge, primarily Hebrew literature that claimed to reflect the secret meanings of Judaism. Numerous authors were designated as *Mequbbalim*, kabbalists, and in their books they resorted to the term *Kabbalah*, which became a technical term.

During the thirteenth century, kabbalistic writings were composed primarily in Southern France, Spain, and Italy. However, kabbalistic thought radiated immediately to North Africa, Germany, and the land of Israel. In the late decades of the thirteenth century and the early decades of the fourteenth century the classic of kabbalistic literature, the book of the *Zohar*, was composed in Castile. It is only after the end of the fifteenth century, with the expulsion of the Jews from the Iberian Peninsula, that full-fledged centers of Kabbalah were established also in North Africa, Poland, Iraq, and especially the land of Israel. In the Galilean town of Safed, kabbalistic literature was represented by the different systems of Moses ben Jacob Cordovero (1522–1570) and Isaac ben Solomon Luria (1534–1572) and their followers. A second peak of kabbalistic creativity developed in the mid-sixteenth century.

Kabbalistic ideas were connected with messianic aspirations from the very beginning, especially in Abraham ben Samuel Abulafia's (c. 1240–after 1291) ecstatic Kabbalah and in some parts of the *Zohar*, as well as in Safedian Kabbalah. In the second half of the seventeenth century these ideas produced certain expectations in some Jewish elite figures, which led to a widespread messianic mass-movement around the figure of Shabbetai Tzevi (Sabbatai Zebi; 1626–1676). Drawing antinomian conclusions from some earlier sources, Tzevi and his prophets and theologians Nathan of Gaza and Abraham Michael Cardozo resorted to a variety of kabbalistic themes in order to foster their messianic beliefs, creating a moment of exhilaration at the beginning of the movement. An ensuing disappointment followed Tzevi's forced conversion to Islam.

Though understood to be an esoteric tradition of Judaism that should not be disclosed to an ordinary Jew and even less to a gentile, at the end of the fifteenth century a gradually expanding Christian Kabbalah became visible. It started in Florence with the succinct theses of Giovanni Pico della Mirandola (1463–1494), and then in the more systematic writings of Johannes Reuchlin (1455–1522) and Heinrich Cornelius Agrippa of Nettesheim (1486–1535), based on various elements from kabbalistic texts, often read in Latin translations made by converts to Christianity. Characteristic of Christian Kabbalah is the integration of the kabbalistic elements—mostly the theosophical, the hermeneutical, and the magical ones, which were separated from their ritualistic background—within structures of thought found in translations of Greek and Hellenistic material prepared and printed during the Renaissance, especially by Marsilio Ficino (1433–1499).

European occultism, like various forms of European theosophy and Freemasonry, had been substantially influenced by kabbalistic thought, as seems to be the case in early Mormonism. The most viable mystical mass-movement created by the popularization of Kabbalah is late Polish Hasidism. This eastern European mystical phenomenon remained the most lasting form of the penetration of Kabbalah in the lives of many nonelitist Jews. Under the combined influence of Kabbalah and Hasidism, concepts like *dibbuk* (possession) and *golem*, or *qelippah* (demonic shell), became part of the beliefs of larger segments of Jewish population in the late eighteenth century.

Types of Kabbalah

The vast literature assumed to belong to Kabbalah, composed in many countries and continents over the span of more than eight centuries, is hardly a unified literary corpus. Many capital divergences may be discerned in the thousands of texts and manuscripts, and it is difficult to offer a definition to cover those corpora. Differing speculative models informed the thought, the praxis, and subsequently also the writings of kabbalists and Hasidic masters. Far from representing a unified or monochromatic line of thought that allegedly has changed throughout history, the diverse kabbalistic literature focused around at least three major models: the theosophical-theurgical, the ecstatic, and the magical-talismanic model. The interplay and interactions between these three models characterize many important aspects of kabbalists' concerns and of kabbalistic creativity.

The three models of kabbalistic thought interpreted the earlier Jewish corpora, the Bible and rabbinic literatures, in novel ways. However, these new interpretations were only rarely totally new impositions of medieval intellectual constructs on older material. The kabbalists claimed that their writings constituted the ancient, hidden Jewish tradition, which contains the essence of Judaism. This contention notwithstanding, the conceptual divergences between the various kabbalistic schools render such an assertion difficult to support. The impact of ancient and medieval material from non-Jewish sources—for example, Hellenistic sources of Neoplatonic, hermetical, and Neopythagorean extraction—is significant and discernible in all the brands of Kabbalah. Most of those sources had been mediated, changed, and sometimes enriched by Muslim authors. In addition to the contribution of those speculative types of materials, medieval kabbalists also developed some modes of thought found in earlier kinds of Jewish written literature, like the rabbinical and the magical ones, and had access to some forms of earlier mythological themes, which have parallels in ancient times and which might have reached them orally.

Theosophical-theurgical model. The most widespread among the kabbalistic models is the theosophical-theurgical. It deals with the different and complex maps of the divine realm—this area of speculation is described by scholars as theosophy—and with the manner in which human religious deeds impact on it—what may be called theurgy. The belief in the impact of the performance of the commandments, or of transgressions, on supernal realms is crucial for the understanding of theosophical-theurgical Kabbalah.

Cardinal for this kabbalistic model is the widespread vision of the realm of the divine as constituted of a series of ten divine powers, designated as *sefirot*, originally a term standing for mystical numbers, and sometimes of a higher power, designated as infinity, *‘Ein Sof*. This is a dynamic system, in which processes of interaction between those powers and themselves, and between human religious activities and some of those divine powers are quintessential for both the divine and human realms.

‘Ein Sof—Infinity

Keter—Crown

Binah—Understanding

Hokhmah—Wisdom

Gevurah—Judgment

Gedulah—Mercy

Tiferet—Splendor

Hod—Majesty

Netzah—Eternity

Yesod—Foundation

Malkhut—Kingship

Some kabbalists assume that the ten *sefirot* constitute the divine essence and that the divine realm is a complex system, while other kabbalists assume that those powers are instruments of the divine activity—creation, revelation, and providence—or vessels mediating the presence of the divine in the extra-divine realms. Fewer kabbalists assume that those *sefirot* constitute the divine presence in the world, while some others assume the presence of those powers within the human soul. The emergence of the system of ten *sefirot* from the higher realm is described in terms of emanation, in Hebrew *‘Atzilut*, or expansion, *hitpashetut*, processes that create some form of chain, *shalshelet*, between the highest divine realm and the lower worlds that are produced by the *sefirot*. In the sixteenth-century Lurianic Kabbalah the divine configurations have even more pronounced anthropomorphic natures, called five *partzufim*, which constitute the main structure of the divine realm.

There are three main ways to explain this affinity between the higher and the lower realms: the isomorphic model, the augmentation model, and the ritualistic reconstitution of the shattered divine world—*tiqqun*. The isomorphic model assumes a structural similarity between the lower and the higher realms, as evident in many texts, and a sympathetic affinity between them, which allows the impact of the lower structure on the higher one. The Torah as a symbol is conceived of as a faithful representation of the divine form. By knowing the correspondences between the two structures, the Kabbalist is able to activate the supernal realm by performing religious rites.

The theosophical-theurgical model informed many of the discussions in Spanish Kabbalah and flourished afterward in an even more vigorous manner in sixteenth-century Safed. This

model assumes that language reflects the inner structure of the divine realm, the *sefirotic* system of divine powers. Language was conceived also as influencing this structure, by means of theurgical activities that aim to restore the harmony within the divine realm. Either in its cognitive-symbolic role or in its theurgical-operational function, language has been conceived by this type of Kabbalah as hypersemantic. This means that not only is the ordinary sense of language maintained by the kabbalists, but its basic function as part of the kabbalistic enterprise is due to a surplus of meaning, which adds semantic fields to that or those designated by the ordinary meaning. The two aspects, the symbolic, or referential, and the theurgical, or performative, should not be conceived as totally independent: the symbolic role of language, namely the concept that it reflects the structure of the divine powers, is often only one face of the coin, whose other face is the use of the symbolic knowledge in order to amend processes taking place within the divine realm.

The scroll of the Torah is conceived of as a graphic symbol of the divine form, and this is the reason why the Kabbalist assumes that it is not only the semantic message involved in it that is religiously important but also the very contemplation of the manner in which the text has been written. This comprehensive symbol constitutes a faithful representation of the entire divine realm within the lower reality—a sort of icon of God, which incorporates all the details of the divine form.

Another widespread symbol is Jerusalem. This city was conceived of in both Biblical and rabbinic sources as the unifying place between the mundane and the divine realms, an omphalic locus. However, because of its geographical distance from most early kabbalists, Jerusalem was the starting point for the transition to guessing the higher divine reality. Still, even in such a case—when the symbolizing reality existed but was distant and essentially unapproachable—the function of the symbol was essentially the same. Jerusalem was still a functioning city during most of the Middle Ages, but was practically unknown, at least in a direct manner, by those Spanish kabbalists who viewed it primarily as a symbol. Jerusalem as a symbol functions on two levels: as a present, available literary symbol it works because of the special nature of the biblical text understood by the kabbalists as reflecting the divine sphere of existence; and on an ontological level, as a *symbolum in factis*, the temporally absent and geographically remote city represents a spiritual and thus cognitively remote divine power. These two separated symbolic channels were supposed to lead to one and the same divine entity, in most of the cases the last *sefirah*, *Malkhut*.

However, in order to understand how two so different entities—a name (a linguistic unit), and a city designated by the name—may help someone to reach the invisible divine power, the Kabbalist would assume that there is a profound affinity between a name and the entity it designates, a phenomenon that can be described as a linguistic immanence. Jerusalem is not merely a conventional name for the city—it summarizes by the structure of the word the very essence of the earthly city and at the same time, points to her supernal, divine counterpart. The triad of a name, a geographical entity, and a superessential, divine attribute that governs both the name and the geographical entity, is therefore a rather com-

Dov-Der Haskelevich, a Jewish rabbi who makes predictions based on the Kabbalah, New York City, 2000. Prophecies and other paranormal experiences are characteristic of the ecstatic model of kabbalah, which began to appear in the writings of some authors as early as the late thirteenth century. © COONEY REBECCA/CORBIS SYGMA

mon triad that informs many symbolical processes in Kabbalah. However, given the fact that the starting point of the vast majority of kabbalistic symbols is the biblical texts and their intricacies, whose counterparts on the historical or geographical realms were either no longer existent or geographically very remote and beyond the scope of the more ordinary medieval Kabbalist living in Europe, kabbalistic symbolism should be defined as predominantly inspired by authoritative texts and their religious values and as functioning by means of the linguistic units that constitute these texts. Kabbalistic symbolism is fundamentally a code to interpret the canonical texts, while ignoring forms of realia that are divorced from the contents of the sacred scriptures. Rhetoric about the absorbing nature of the Torah is found in the theosophical Kabbalah, and it provides the nexus between claims of symbolizing everything via the absorbing characteristic of the Torah.

The ecstatic model. Ecstasy is a constant of human religious experience, as the wide dissemination of this type of experience in so many cultures demonstrates. Ecstatic experiences became more and more evident in the written documents of Jewish mysticism in the mid-thirteenth century. It seems that a process of adoption and accommodation of paranormal experiences was characteristic of medieval and early modern

Jewish thought, which addressed with a growing seriousness paranormal experiences as legitimate events. The concomitant spread of the Maggidic experiences in the late fifteenth and sixteenth centuries—particularly in the diary of Joseph ben Ephraim Karo (1488–1575), Isaac Luria’s claims of paranormal revelations, and the discussions of cases of possession in the sixteenth century—may bear testimony to the legitimation of their discussion in public rather than to the emergence of new forms of experiences. No movement in Judaism emphasized the importance of the pneumatic experiences, in their most intensive and extreme forms, as did Polish Hasidism.

The ecstatic model is concerned with inner processes taking place between the powers of imagination, the human intellect and the cosmic one, called the agent intellect. This sort of Kabbalah gravitates around the ideal of *devequt*, understood as pointing to moderate or extreme types of union with the Godhead. The other vital parts of this model are devices, or techniques, to ensure the attainment of this ideal. *Hitbodedut*, both as solitude and as mental concentration, *hishtawwut* or equanimity, and linguistic techniques of combining Hebrew letters or contemplating divine names are integral constituents. Paranormal experiences, like revelations and prophecies are congenial to this type of mystical model, and more consonant with it

than to the theosophical-theurgical Kabbalah. The coherence between these concepts and practices rests in an organic continuum between strong mystical techniques and extreme mystical experiences, which include experiences of self-transformation.

The ecstatic model was visible at the end of the thirteenth century and the beginning of the fourteenth century in the writings of some kabbalists, like Isaac ben Shemuel of Acre, Nathan ben Sa'adyah, the author of *Sha'arei Tzedeq, Ner Elohim*, and *Sefer ha-Tzeruf*, and in the sixteenth century in the writings of Yehudah Albotini, Moshe Cordovero (1522–1570), and Hayyim ben Joseph Vital (1542 or 1543–1620). Many of the concepts were disseminated by means of the widespread writings of Cordovero's disciples, though some folios of Abraham Abulafia's Kabbalah were in print as early as 1556. Some of Abulafia's manuscripts were known in the eighteenth century in eastern Europe by both Hasidim and Mitnagedim.

This model, though formulated in a systematic way by a Spanish Kabbalist, was not accepted by the Spanish kabbalists in the Iberian Peninsula. In Safed, however, Cordovero and his students were positively predisposed toward this type of mysticism. He described the major revelation concerning the messianic mission of Tzevi as the result of a path reminiscent of ecstatic Kabbalah. Abulafia's influence may also be discerned in Hasidism.

The ecstatic approach assumes that the Kabbalist can use language and the canonical texts in order to induce a mystical experience by means of manipulations of elements of language together with other components of the various mystical techniques. This approach is much less concerned with divine inner structures, focusing as it does on the restructuring of the human psyche in order to prepare it for the encounter with the divine. The ecstatic theory of language is less mimetic, and thus less symbolic and theurgic, than the view espoused by the theosophical Kabbalah. While the theosophical-theurgical approach to language assumes the paramount importance of information that is either absorbed by the human mind or transmitted by the soul to the divine, in many cases the ecstatic view of language encourages the effacement of knowledge as part of the opening toward the divine. According to ecstatic Kabbalah, language helps cleanse someone's consciousness by breaking, using a mystical technique, the words of the sacred scripture into nonsemantic units. While the theosophical Kabbalah emphasizes the given, structured aspects of language as manifested in the canonical writings, in ecstatic Kabbalah the deconstruction of the canonical texts, and of ordinary language as well, is an important mystical tool for restructuring the human psyche.

Significant for this model is the antinomian feature of the techniques, which means that according to the various descriptions of his paths the rabbinic rites are not essential for achieving the supreme religious experience. Prophecy is the main purpose of Abulafia's entire kabbalistic project, and he conceived himself to be a prophet. The recurrence, at least in principle, of this topic is visible in a Kabbalist who was also well acquainted with the theosophical-theurgical Kabbalah. Isaac Luria, like his teacher Rabbi Nathan, did not have

prophetic claims; his vision of prophecy is quite similar to Abulafia's. The linguistic components of these techniques are of paramount importance. Also conspicuous are the strong individualistic proclivities of this kind of mysticism and the deep influence of philosophy, especially Aristotelianism in the case of Abulafia, and Neoplatonism in the case of his followers. The existence of various elements of the ecstatic model is easily detectable in Neoplatonic philosophy and in Spanish Kabbalah.

The magical-talismanic model. While the two models of Kabbalah surveyed above are represented in distinct kabbalistic literatures, the magical-talismanic model is found in a variety of writings belonging to those models, and only rarely constitutes a literature of its own. Jewish magic is an old lore, having a variety of forms already in late antiquity. Some parts of it survived in Hebrew and Aramaic texts, some had an impact on Hellenistic magic. No doubt early kabbalists were acquainted with Jewish magical texts and appropriated some of its elements, while others criticized them. From the beginning of the fourteenth century, a distinction between two types of Kabbalah gradually came to the fore: Speculative Kabbalah (*Qabbalah 'Iyyunit*) and Practical Kabbalah (*Qabbalah Ma'asit*). In the fifteenth century this distinction appeared several times and in the sixteenth century it became a standard tool for differentiating various types of Kabbalah. The emergence of this distinction may have something to do with the distinction between speculative and practical philosophy, as formulated by Moses ben Maimon (1135–1204).

The greater interest in magical Kabbalah became evident toward the end of the fifteenth century in the writings of both the Spanish and the Italian kabbalists. The extent of the magical influence on Jewish mysticism is an issue that still waits for detailed treatment. There can be no doubt as to the importance of various forms of magic within some of the important forms of Jewish mysticism, starting with the *Heikhalot* literature. The magical view of the Hebrew language is crucial for most of the forms of magic in Judaism and remained influential in numerous texts, especially in Kabbalah. In the Middle Ages under the influence of philosophical views found among the Arabs, an additional explanation appeared, contending that by cleaving to the spiritual celestial source that rules this world—the universal soul—the mystic, or the philosopher, is able to channel the events in the sublunar world. The operation is a spiritual one and takes place in the supernal world. This understanding of magic uses Neoplatonic elements.

In ancient Hellenistic magic, and in Arabic and Jewish medieval magic, the dominant view asserted is that it is possible to attract downward the spiritual forces of the celestial bodies. These spiritual forces—named *pneumata* in Greek, *Ruhaniyyat* in Arabic, and *Ruhaniyyut* in Hebrew—were conceived as being able to be attracted and captured by special types of objects and rituals, whose natures are consonant to features of corresponding celestial bodies.

In fifteenth-century Kabbalah the use of the Hebrew language as a technique to draw down the spiritual force became explicit, and it was increasingly assumed that each and every

sefirah had a spiritual force of its own. Thus, the astrological structure of this model was projected onto the “higher” theosophical structure, thereby diminishing the potential critiques that a strong astrological stand could provoke. While not totally obliterating the astral meaning of the term *ruhaniyyut*, kabbalists attributed to the *sefirotic* realm a structure, which they adopted from astrological thought: on high, a distinction should be made between the more material and the spiritual aspects of reality. It is possible to detect some translations of features of the astral bodies to the corresponding divine powers, the *sefirot*.

While the Arab astrologists differentiated between *haikhalat* and *ruhaniyyat*, the kabbalists introduced this distinction in the realm of the intradivine: the *sefirot* have an external aspect, the vessels named *kelim* and the more inner component, the spirituality of each *sefirah*. Though this division also served other theological goals, the terms used by Yohanan Alemanno (1433–c. 1504) and Moses Cordovero in this context betray their sources. Especially important is the emergence of the term *ruhaniyyot ha-Sefirot*, the spiritual forces of the *sefirot*. This phrase still maintains the concept of a multiplicity in the spiritual world: each *sefirah* possesses a distinct inner power that reflects the specific quality of the respective divine power. This “elevation” of the term *ruhaniyyut* to the rank of divine realm did not supercede the magical use of the term in the writings of those kabbalists who adopted this projection.

While accepted by some kabbalists, the magical-talismanic model was changed in two major points: the theological, actually the theosophical plane, supplanted the celestial-astrological one, whereas the magical practices were substituted, to a great degree, by the Jewish rites and especially by the ritualistic use of the Hebrew language in prayer and in study. This pivotal change took place in a conspicuous way in the writings of Alemanno, S. Alqabetz, and Cordovero. It was part of an attempt to offer an explanation of the efficacy of the commandments in addition to, or different from, the more common theurgical rationales recurrent in the kabbalistic literature.

In adopting the Jewish ritual for the sake of magical attainments, or by interpreting these rites as magically effective, the more difficult philosophical aspects of magic, as an operation performed by acts that are not part of regular behavior, were attenuated to a great extent. The material and spiritual attainments are drawn down by fulfilling the divine will, and not by an attempt to short-circuit the order of nature, or by forcing the divine will. In many cases the term *ruhaniyyut* preserves overtones from its magical sources, while in many other instances, both in Cordoverian Kabbalah and Hasidism, this term designates the ideal, spiritual realm, without maintaining any of the astral-magical meanings.

The essence of Kabbalah involves both the theosophical core, the nature of the *sefirot* and their luminous manifestations (the theoretical Kabbalah), and the experimental factor, the visualization of the colors, which is the essential component of the mystical intention during prayer. As in descriptions stemming from Nahmanides’s (1194–c. 1270) school,

where the supernal realm and the commandments are mentioned altogether, Kabbalah is presented as a synthesis between theosophical and theurgical elements. The culmination of the kabbalistic lore and practice, as envisioned in one of the most influential treatises in its history, assumes that a mystical element is essential, in addition to the knowledge of the map of the divine world.

The magical brand of Kabbalah remained part and parcel of this lore. Nevertheless there are important cases in which kabbalists rejected, or minimized, the importance of the magical aspects of their lore. Astral magic is paramount in the writings of Alemanno and of Cordovero. The astral spiritualities were projected in the intradivine realm and were presented using magical categories. The basic technique in this type of magic is the drawing down of divine powers, or the overflow of the *sefirot*, in accordance with the needs of the magician.

Cordovero was aware of the affinity of his conception to that of astral magic and considered the knowledge of the preparation of amulets or talismans as a revealed gnosis, which serves as an introduction to the knowledge of the Kabbalah. His reluctance to acknowledge the conspicuous affinity of his Kabbalah with a certain type of magic is understandable but it does not detract from the profound similarity and the historical filiation of his Kabbalah to magic. Like Alemanno, Cordovero did not intend to disrupt the natural order by appealing to demonic forces, which could destroy the natural order. Instead he proposed a type of activity that complemented natural activity by adding a dimension of praxis based on laws already in existence but hidden from the eyes of the uninformed. The kabbalistic activity was supernatural not because it intruded into the regular course of events but because its orderliness was superior.

According to other texts, inducing the supernal influx upon the righteous by the combination of letters of the divine names is similar to causing the descent of the overflow of the *sefirot* by employing the color technique. Whereas the names can be conceived as static talismans, there are instances in which there is a dynamic process that induces the spiritual force from above, and it is a dynamic descent that is incited by a combination of letters. The talismanic implications of Abulafia’s techniques were enhanced by some of his disciples, who vigorously introduced the talismanic view of language. Thereby, the human body was conceived as the locus where the divine influx is received and becomes a vessel of the descending influx. It is the mystical-magical technique that may induce an experience of the divine, present in and working through the human body.

A certain shift from the theurgical ideal toward a more magical view, represented by the ideal of drawing upon someone the divine efflux, is evident. As in the case of the acculturation of the hermetic type of magic into the Jewish ritual, the Kabbalist performing the practice of concentration and pronunciation of the combinations of letters is presented as a righteous—that is, as an ideal—religious type. Though not part of the regular ritual, the above technique is nevertheless considered to be a licit practice as it is attributed to an ancient source, and the practitioner is described as a righteous man.

An important development taking place in Cordovero's thought that had deep repercussions later is the vision of the human righteous, the *Tzaddiq*, as functioning in a manner reminiscent of the ninth *sefirah*, *Yesod*, transmitting the influx it receives from the higher to the lower parts of the *sefirotic* realms. The influx is received from the *sefirotic* realm, to which the righteous cleaves, and is transmitted then to others.

In the magical model the world depends upon the higher powers, the spiritual force attracted on the low by the very body of the *Tzaddiqim* and their religious acts as well as the secrets of the Torah. It is a magical universe that is described by Cordovero: the *Tzaddiq* is not only able to change the earthly realm but is also conceived as governing the celestial world. By the dint of the divine soul that dwells in man, the righteous rules over the world because of his cleaving to the world of emanation. This expansion of divine influx depends on the religious behavior, which is instrumental in attracting the "light of the world of emanation" onto all the worlds. Cordovero distinguishes between this type of influence on the world—for him a type of natural magic similar to the view of his Renaissance contemporaries in Italy—which is drastically different from a more radical form of Jewish magic that operates by the virtue of the divine names, and which should be avoided as much as possible.

The drawing down consists of two stages: the intradivine, from the peak to the last *sefirah*, *Malkhut*, a stage that can be designated as a theurgical act, and drawing the influx from the last *sefirah* toward the lower entities, which can be called magic. What is significant is the fact that a ritualistic term and its performance as a ritual act are involved in the process of attracting spirituality downward. The use of the term *hamshakhab* reflects a magical aspect, which may be a return to a more ancient layer of thought. Cordovero inherited a tradition from a long series of kabbalists who connected two topics: the concept and practice of blessing, *berakhab*, and the drawing down, *hamshakhab*.

Differences and Overlaps

The three models differ insofar as their objectives: the ecstatic one is concerned with the changes a certain mystical technique may induce in humans; the talismanic model emphasizes the effects someone's ritualistic linguistic acts may have on the external world, while the theosophical-theurgical model is concerned with inducing harmony within the divine realm. These models have been only rarely exposed as completely separate approaches. The ecstatic model was sometimes combined with the talismanic. The theurgical operation, which ensures the continuing pulsation of energy within the divine realm, has sometimes been combined with the magical or talismanic approaches, and drawing the emanation from the higher *sefirot* to the lower ones was followed by causing the descent of this emanation into the extra-divine world. A strongly anthropocentric attitude, the talismanic model envisages the enhancing of the spiritual and material well-being of an individual, and often of the whole religious group, as an important core of religion.

The theosophical-theurgical and the talismanic models assume that, in addition to the semantic aspect of the sacred

text, and of Hebrew language in general, there is an energetic aspect that is also effective, either by affecting the supernal world or, respectively, by attracting it downward. In ecstatic Kabbalah these two aspects are sometimes present but play a relatively marginal role. It recognizes the magical powers of language, though it conceives them as exercising an influence on a lower, inferior level of existence, when compared to the cathartic role language plays in purifying the soul, or the intellect, in order to prepare them for the reception of the supernal effluvia. The talismanic model as exemplified by linguistic magic is a synthesis between the particularistic tendency, characteristic of the theurgical model and the more universalistic tendency of the hermetic sources. Focused on Hebrew words as major tools, the linguistic talismanics and sometimes the ecstatic kabbalists assume that not only Hebrew words, but also Hebrew letters, and especially, what can be called according to them "Hebrew" sounds or phonemes, may serve as talismans. The three models had an impact on the particular understanding of many central issues like the nature of the Messiah, metempsychosis, and cosmic cycles, which have been reinterpreted in accordance to each of these models' logic.

Impact of Kabbalah

Due to the dissemination of Christian Kabbalah, and the impact of modern scholarship of Kabbalah represented in the seminal studies of Gershom Scholem (1897–1982), elements of kabbalistic thought have been integrated in a variety of modern intellectual and literary realms. Well-known figures in European thought had been attracted to Kabbalah, like the seventeenth-century Cambridge Neoplatonists, Gottfried Wilhelm Leibniz (1646–1716), Emanuel Swedenborg (1688–1772), Friedrich Wilhelm Joseph von Schelling (1775–1854), and Salomon Maimon (1753–1800).

In literature Kabbalah influenced writers like William Blake (1757–1827), Franz Kafka (1883–1924), Ivan Gol, Paul Celan (Paul Antschel; 1920–1991), Jorge Luis Borges (1899–1986), Isaac Bashevis Singer (1904–1991), Umberto Eco (b. 1932), and, on the Israeli scene, Shmuel Yosef Agnon (1888–1970), David Shahar (1926–1997), and Uri Tzvi Greenberg, as well as some literary criticism and philosophy of text by Maurice Blanchot (1907–2003), Harold Bloom (b. 1930), Jacques Derrida (b. 1930), George Steiner (b. 1929), and Eco. In modern philosophy kabbalistic elements are conspicuous in the speculative systems of Franz Rosenzweig (1886–1929), Abraham Isaac Kook (1865–1935), Joseph Baer Soloveitchik, Abraham Joshua Heschel (1907–1972), and Emmanuel Levinas (1906–1995).

A revival of interest in Kabbalah was visible at the turn of the twenty-first century in a return of role of kabbalists in some segments of Israeli society, and the resort to kabbalistic ways of thought used by some New Age thinkers in the United States, like Rabbi Zalman Schechter. Even orthodox kabbalists, active basically only in Israel, are inclined now to allow a previously unthinkable large-scale dissemination of this lore in large audiences, by a new politics of printing and teaching.

MYSTICISM IN AFRICAN THOUGHT

The term *mysticism* typically denotes a complex of beliefs and practices related to the personal experience of the di-

Mysticism in indigenous African thought is:

distinct from conceptions of mysticism in Judaism, Christianity, and Islam;

characterized by a social, worldly orientation;

united with indigenous religious practices;

primarily focused on interaction with spirits, rather than the supreme God;

preserved in and transmitted through oral traditions; and

not aimed at unification with the divine through eradication of or purification of the self.

vine. Much, although not all, mystical thought and practice derives from or draws upon formal religious doctrines, emphasizing reflective, introspective, and meditative practices as the keys to cultivating perception and awareness that will ultimately lead to knowledge of and communion with the divine.

When one turns to mysticism in African thought, and specifically to the mystical tenets extant in indigenous religious beliefs and practices, the common Western definition is necessarily altered. *Mysticism* continues to describe the realm of interaction between humanity and the divine or supernatural, but owing to the prevailing nature of indigenous African belief systems, the orientation and manifestations of mystical practices are of a different character. The orientation is social and utilitarian, and the manifestations occur within the structure of indigenous rites; mystical practices aim to fulfill needs in society, and they do not exist as a separate body of practices. This reflects the general African cosmology and understanding of arenas of interaction between humanity and the divine or supernatural.

Cosmology and Interaction

African cosmology, in general, posits three categories of agents: God, spirits, and man. A supreme God, who is the creator of the universe and all that is in it, is acknowledged and revered in indigenous practices, through libations, praises, and proverbs. Although knowledge of his existence is present, the majority of indigenous beliefs and rites do not focus on God, nor do they aim to bring the individual closer to him. God is an acknowledged reality, but a distant, somewhat nebulous one.

In addition to God, there exist other agents, typically referred to as spirits. These spirits are part of the creation, as are humans, but they possess certain powers and abilities. They interact with human beings and have agency in the world.

Man, the third category, is created by God and coexists with the spirits in the world. Human orientation in the world is social, and action to uphold social ties and foster social cohesion is held in high regard and even seen as the primary goal of life. Humans can, through reciprocal affiliation with and worship of spirits, gain access to their power and channel that power for positive or negative ends.

Man does not, in mystical and spiritual endeavors, aim solely to gain knowledge of the supreme creator God through contemplation and negation of worldly existence and self; rather, being socially oriented, a person seeks to obtain utilitarian agency that will foster change in the world. Mystical and spiritual practices in indigenous African traditions do not, therefore, center on the individual in isolation; they maintain social orientation and purpose. The goal of the mystical endeavor is not to obliterate individual consciousness or physicality; it is rather to garner knowledge and power that can be used in the human world.

Individuals and spirits interact with each other. Laypeople may have encounters with spirits, and they may also seek guidance and physical assistance from them. Individuals who are initiated in specific indigenous traditions may mediate the latter form of interaction; individuals can experience the divine or supernatural to only a certain extent without an intermediary. Furthermore, the role of the intermediary is of central importance because that experience alone is not the end; the goal is to acquire and use knowledge to bring about change in human society. In many cases, these practitioners, commonly referred to as priests, are “chosen” by the spirits, as evidenced in physical or spiritual crises. Such crises are seen as signs that the individual should be initiated into the service of a particular spirit. Initiation is characterized by intensive ritualistic, spiritual, physical, and intellectual training, which is carried out in seclusion, under the supervision of an elder priest. Mystical traditions and knowledge, preserved and transmitted orally, are passed from the priest to the initiate and onward.

Once initiated, priests and other practitioners interact with and seek assistance from the spirits for themselves and others. One common method is the possession trance, typically induced through music and dance or consumption of herbs or intoxicants, in which the spirit enters the priest’s body and communicates information to those present. Another common form of interaction is divination, the best-known example being the complex Ifa system among the Yoruba of Nigeria.

Indigenous Religions Compared with Christianity and Islam

The impact of Christianity and Islam on the African continent has been and continues to be profound. In most places, indigenous religious and practices coexist with, and may form new syncretic traditions with, Christianity and Islam. This results, increasingly, in the overlap and combination of mystical practices and trends. Many of these manifestations, readily observable today, take on a form that departs from the “pure” manifestation of African mysticism and is more in line with

the common understanding of mysticism. Nevertheless, in trying to isolate mysticism in indigenous African thought, it becomes apparent that African mysticism is of a different variety than mysticism in Christianity and Islam. To begin with, whereas mysticism in Christianity and Islam primarily focuses on knowledge and communion with the divine, African mysticism focuses on interaction with spirits. Mysticism in Christianity and Islam involves practices such as meditation and asceticism that require the individual to withdraw from the physical world in order to undergo a subjective experience of the divine and the resultant transformation. African mysticism retains a social, worldly focus, deriving its purpose and value from its functionality in effecting change in the society, rather than in the individual only. Christianity and Islam are based on prophetic traditions and written texts. Their respective mystical practices and beliefs have evolved as specific “paths” within the larger traditions, sometimes differing drastically from mainstream practice. These paths have been documented in written form and have developed into types of theology. Indigenous African mysticism is derived from oral traditions that have been evolving over many millennia. In most cases, these traditions are not contained in formal texts and are not associated with prophetic traditions. Mystical practices and beliefs are integrated into the larger, dynamic belief structure, which has no prophetic ideal.

MYTH. The study of myth across the disciplines is united by the questions asked. The main questions are those of origin, function, and subject matter. *Origin* in this context means why and how myth arises; *function*, why and how myth persists. The answer to the why of origin and function is usually a need, which myth arises to fulfill and persists by continuing to fulfill. What that need is varies from theory to theory. *Subject matter* here means the referent of myth. Some theories read myth literally, so that the referent is the apparent one, such as gods. Other theories read myth symbolically, and the symbolized referent can be anything.

For example, a myth told by the Trobriand Islanders of Melanesia, as described by Polish-born anthropologist Bronis-

law Malinowski (1884–1942) in *Myth in Primitive Society* (1926), says that the world “was originally peopled from underground. Humanity had there led an existence similar in all respects to the present life on earth. Underground, men were organized in villages, clans, districts; they had distinctions of rank, they knew privileges and had claims, they owned property, and were versed in magic lore. One day humans came to the surface and established themselves, bringing with them all their culture to continue it upon this earth.”

According to Malinowski, whose theory will be considered in detail below, this myth was devised to secure support for the social divisions, ranks, and rights that were still to be found among the Trobrianders. Because no people will readily tolerate impositions, this myth was intended to provide a limited kind of justification. It does not assert that the impositions are deserved, but rather that they are traditional and go back even to the time before the proto-Trobrianders emerged from underground. The need being fulfilled is on the part of society itself, not on the part of individuals. Malinowski reads the myth literally: the subject matter is the social life of the Trobriand Islanders, both while underground and once above ground.

It is commonly said that theories of the nineteenth century focused on the question of origin and that theories of the twentieth century have focused on the questions of function and subject matter. But this characterization confuses historical origin with recurrent origin. Theories that profess to provide the origin of myth claim to know not where and when myth first arose but why and how myth arises wherever and whenever it does. The issue of recurrent origin was as popular with twentieth-century theorists as with nineteenth-century ones, and interest in function and subject matter was as common to nineteenth-century theorists as to twentieth-century ones.

Disciplines differ in their definitions of myth. Not all even assume that myth is a story. For political scientists, for example, myth can be a credo or an ideology, which may be illustrated by stories but is not rooted in them. Even when myth is assumed to be a story, disciplines differ over the contents. For folklorists, myth is about the creation of the world. In the Bible, only the two creation stories (Genesis 1 and 2), the Garden of Eden story (Genesis 3), and the Noah story (Genesis 6–9) would thereby qualify as myths. All other stories would instead constitute either legends or folktales. For theories drawn from religious studies, the main characters in myth must be gods or near-gods, such as heroes. Theories from anthropology, psychology, and sociology tend to allow for secular as well as religious myths.

Myth and Science

In the West, the ancient challenge to myth was on ethical grounds: Plato (c. 428–348 or 347 B.C.E.) bemoaned Homeric myths for presenting the gods as practitioners of immoral behavior. The chief modern challenge to myth has come from science.

One form of the modern challenge to myth has been to the scientific credibility of myth. Did creation really occur in a mere

six days, as the first of two creation stories in Genesis (1:1–2:4a) claims? Was there really a worldwide flood? The most unrepentant defense against this challenge has been to claim that the biblical account is correct, for, after all, the Pentateuch was revealed to Moses by God. This position, known as *creationism*, assumes varying forms, ranging, for example, from taking the days of creation to mean exactly six days to taking them to mean “ages.” At the same time, creationists of all stripes tout their views as scientific *as well as* religious, and they enlist scientific evidence to refute “pseudoscientific” rivals such as evolution.

A much tamer defense against the challenge of modern science has been to reconcile myth with that science. Here elements at odds with modern science are either removed or, more cleverly, reinterpreted as in fact scientific. There might not have been a Noah who was single-handedly able to gather up all living species and to keep them alive in a wooden boat sturdy enough to withstand the strongest seas that ever arose, but a worldwide flood did occur. What thus remains in myth is true because it is scientific—modern scientific.

By far the most common response to the challenge of science has been to abandon myth for science. Here myth is taken as an explanation of its own kind, not a scientific explanation in mythic guise. The issue is therefore not the scientific credibility of myth but the compatibility of myth with science. Myth, here a part of religion, is considered to be the “primitive” counterpart to science, which is assumed to be exclusively modern. Because moderns by definition accept science, they cannot also have myth, and the phrase *modern myth* is self-contradictory. Myth is a victim of the process of secularization that constitutes modernity.

The pioneering English anthropologist E. B. Tylor (1832–1917) remains the classic exponent of the view that myth and science are at odds. Tylor subsumes myth under religion and in turn subsumes both religion and science under philosophy. Primitive philosophy is identical with primitive religion. There is no primitive science. Modern philosophy, by contrast, is divided into religion and science. Primitive religion is the primitive counterpart to science because both are explanations of the physical world. The religious explanation is personalistic, the scientific one impersonal. The explanations are incompatible because both are *direct* explanations of the *same* events. Gods operate not behind or through impersonal forces but in place of them. One cannot, then, stack the religious account atop the scientific account.

Modern religion has surrendered the explanation of the world to science and has instead become a combination of metaphysics and ethics, neither of which is present in primitive religion. One now reads the Bible for not for the story of creation but for the Ten Commandments, just as for Plato a bowdlerized Homer (fl. 9th or 8th century B.C.E.) would enable one to do. This irenic position is like that of the American evolutionary biologist Stephen Jay Gould (1941–2002). Yet for Tylor, myths are too closely tied to gods as agents in the world to permit any transformation like that of the rest of religion. Where, then, there is “modern religion,” albeit religion shorn of its prime role as explanation, there are no modern myths.

In pitting myth against science, as in pitting religion qua explanation against science, Tylor epitomizes the nineteenth-century view of myth. In the twentieth century, the trend was to reconcile myth as well as religion with science, so that moderns can retain myth as well as religion.

Closest to Tylor stands J. G. Frazer (1854–1941), the Scottish classicist and fellow pioneering anthropologist. For Frazer, as for Tylor, myth is part of primitive religion; primitive religion is part of philosophy, itself universal; and primitive religion is the counterpart to natural science, itself entirely modern. Primitive religion and science are, as for Tylor, mutually exclusive. But where for Tylor primitive religion, including myth, functions as the counterpart to scientific *theory*, for Frazer it functions even more as the counterpart to *applied* science, or technology. Where for Tylor primitive religion, including myth, serves to *explain* events in the physical world, for Frazer it serves even more to *effect* events, above all the growth of crops. Where Tylor treats myth as an autonomous text, Frazer ties myth to ritual, which enacts it.

The biggest difficulty for Tylor's and Frazer's view of myth as the primitive counterpart to science is that it conspicuously fails to account for the retention of myth in the wake of science. If myth functions to do no more than science, why is it still around?

Reacting against the views of Tylor and Frazer and other members of what he imprecisely calls "the English school of anthropology," the French philosopher and armchair anthropologist Lucien Lévy-Bruhl (1857–1939) insisted on a much wider divide between myth and science. Where for Tylor and Frazer "primitives" think like moderns, just less rigorously, for Lévy-Bruhl primitives think differently from moderns. Where for Tylor and Frazer primitive thinking is logical, just erroneous, for Lévy-Bruhl primitive thinking is plainly nonlogical.

According to Lévy-Bruhl, primitives believe that all phenomena are part of a sacred, or "mystic," realm pervading the natural one. Phenomena become one another yet remain what they are. The Bororo of Brazil deem themselves red araras, or parakeets, yet still human beings. Lévy-Bruhl calls this belief "prelogical" because it violates the law of noncontradiction: the notion that something can simultaneously be both itself and something else.

For Lévy-Bruhl, as for Tylor and Frazer, myth is part of religion, religion is primitive, and moderns have science rather than religion. But where Tylor and Frazer subsume both religion and science under philosophy, Lévy-Bruhl associates philosophy with thinking *freed* from mystical identification with the world. Primitive thinking is nonphilosophical because it is not detached from the world. Primitives have a whole mentality of their own, one evinced in their myths.

One reaction to Lévy-Bruhl was to accept his separation of myth from philosophy but not his characterization of myth as pre-philosophical or pre-scientific. The key figure here was Malinowski. Invoking Frazer, Malinowski argues that primitives are too busy scurrying to survive in the world to have the luxury of reflecting on it. Where for Frazer primitives use myth *in place of*

science, for Malinowski primitives use myth as a *fallback* to science. Primitives possess not just the counterpart to science but science itself. Where science stops, they turn to magic. Where magic stops, they turn to myth—not to secure further control over the world, as Frazer would assume, but to reconcile themselves to aspects of the world that cannot be controlled, such as natural catastrophes, illness, aging, and death. Myth explains how, say, illness arose—a god or a human brought it about—but primitive science and magic try to do something about it. By contrast, myth says that nothing can be done about it.

Reacting both against Malinowski's view of primitives as practical rather than intellectual and against Lévy-Bruhl's view of primitives as mystical rather than intellectual, the French anthropologist Claude Lévi-Strauss (b. 1908) has boldly sought to revive an intellectualist view of primitives and of myth. At first glance, Lévi-Strauss seems a sheer throwback to Tylor. Yet in fact Lévi-Strauss is severely critical of Tylor, for whom primitives concoct myth rather than science because they think less critically than moderns. For Lévi-Strauss, primitives create myth because they think differently from moderns—but, contrary to Lévy-Bruhl, still think and still think rigorously. For both, myth is the epitome of primitive thinking.

Where for Tylor primitive thinking is personalistic and modern thinking impersonal, for Lévi-Strauss primitive thinking is concrete and modern thinking abstract. Primitive thinking focuses on the observable, sensible aspects of phenomena rather than, like modern thinking, on the unobservable, insensible ones. Yet antithetically to Tylor, Lévi-Strauss considers myth no less scientific than modern science. Where for Tylor myth is the primitive counterpart to science per se, for Lévi-Strauss myth is the primitive counterpart to *modern* science. Myth *is* primitive science, but not thereby inferior science.

If myth is an instance of primitive thinking because it deals with concrete, tangible phenomena, it is an instance of thinking itself because it classifies phenomena. Lévi-Strauss maintains that all humans think in the form of classifications, specifically pairs of oppositions, and project them onto the world. Many cultural phenomena express these oppositions. Myth is distinctive in resolving or, more accurately, tempering the oppositions it expresses. Those contradictions are to be found not in the plot but in what Lévi-Strauss famously calls the "structure."

Karl Popper (1902–1994), the Viennese-born philosopher of science who eventually settled in England, breaks radically with Tylor. Where for Tylor science simply replaces it, for Popper science emerges *out of* myth—not, however, out of the *acceptance* of myth but out of the *criticism* of it. By "criticism" Popper means not rejection but assessment, which becomes scientific when it takes the form of attempts to falsify the truth claims made.

Myth and Philosophy

The relationship between myth and science overlaps with that between myth and philosophy. Yet there is an even greater array of positions held on the relationship between myth and philosophy: that myth is part of philosophy, that myth *is* philosophy, that philosophy is myth, that myth grows out of phi-

losophy, that philosophy grows out of myth, that myth and philosophy are independent of each other but serve the same function, and that myth and philosophy are independent of each other and serve different functions.

The most abrupt reaction to Lévy-Bruhl's opposing of myth to both science and philosophy came from the Polish-born anthropologist Paul Radin (1883–1959), who was brought to the United States as an infant. Radin grants that *most* primitives are far from philosophical but observes that so are most persons in any culture. Both the average “man of action” and the exceptional “thinker” types of temperament are to be found in all cultures, and in the same proportion. If Lévy-Bruhl is therefore wrong to deny that any primitives are reflective, Tylor is equally wrong to assume that all are. But those primitives who are get credited by Radin with a philosophical prowess keener than that granted even myth makers by Tylor. Contrary to Tylor, primitives, furthermore, are capable of rigorous criticism. Likely for Radin, as definitely for Popper, the capacity for criticism is the hallmark of thinking.

A far less dismissive reaction to Lévy-Bruhl came from the German-born philosopher Ernst Cassirer (1874–1945). For Cassirer, wholly following Lévy-Bruhl, mythic, or “mythopoic,” thinking is primitive, is part of religion, and is the projection of mystical oneness onto the world. But Cassirer claims to be breaking sharply with Lévy-Bruhl in asserting that mythic thinking has its own brand of logic. In actuality, Lévy-Bruhl says the same and invents the term *prelogical* exactly to avoid labeling mythic thinking “illogical” or “nonlogical.” Cassirer also claims to be breaking with Lévy-Bruhl in stressing the autonomy of myth as a form of knowledge—language, art, and science being the other main forms. Yet Cassirer simultaneously maintains, no differently from Lévy-Bruhl, that myth is incompatible with science and that science succeeds it. For both Cassirer and Lévy-Bruhl, myth is exclusively primitive and science exclusively modern. Still, Cassirer's characterization of myth as a form of *knowledge* puts myth in the same genus as science—not quite where Lévy-Bruhl puts it.

As philosophical as Cassirer's approach to myth is, he never contends that myth *is* philosophy. The theorists who do so are the German theologian Rudolf Bultmann (1884–1976) and the German-born philosopher Hans Jonas (1903–1993), who eventually settled in the United States. They apply to their specialties, Christianity and Gnosticism, a theory from the early, existentialist work of Martin Heidegger (1889–1976).

Myth and Religion

Myth approached from the field of religious studies naturally subsumes myth under religion and thereby directly exposes myth to the challenge to religion from science. Twentieth-century theories from religious studies sought to reconcile myth with science by reconciling religion with science.

There have been two main strategies for doing so. One tactic has been the recharacterization of the subject matter of religion and therefore of myth. Here religion is not about the physical world, in which case it is safe from any encroachment

by science. The myths considered under this approach to religion are traditional myths such as biblical and classical ones, but they are now read symbolically rather than literally. Myth, it is claimed, has been taken to be at odds with science because it has been misread—by those who, like Tylor, read myth literally.

The other tactic for retaining myth in the wake of science has been the elevation of seemingly secular phenomena to religious ones. Here myth is no longer confined to explicitly religious ancient tales. There are now overtly secular modern myths as well. For example, stories about heroes are at face value about mere human beings, but the humans are raised so high above ordinary mortals as to become virtual gods. This approach retains a literal reading of myth but recategorizes the literal status of the agents in myth.

The grandest exponents of a symbolic rendition of traditional religious myths were Bultmann and Jonas. Taken literally, myth for Bultmann is exactly what it is for Tylor and should be rejected as uncompromisingly as Tylor rejects it. But unlike Tylor, Bultmann reads myth symbolically. In his celebrated, if excruciatingly confusing, phrase, he “demythologizes” myth, which means not eliminating, or “demythicizing,” the mythology but instead extricating its true, symbolic meaning. To seek evidence of an actual worldwide flood, while dismissing the miraculous notion of an ark containing all species, would be to *demythicize* the Noah myth. To interpret the flood as a symbolic statement about the precariousness of human life would be to *demythologize* the myth.

Demythologized, myth ceases to be about the world and turns out to be about the human *experience* of the world. Demythologized, myth ceases to be an explanation at all and becomes an expression, an expression of what it feels like to live in the world. The New Testament, when demythologized, contrasts the alienation from the world felt by those who have not yet found God to the at-home-ness in the world felt by those who have found God. Myth ceases to be merely primitive and becomes universal. It ceases to be false and becomes true. It depicts the human condition.

Taken literally, myth, as a personalistic explanation of the physical world, is incompatible with science and is therefore unacceptable to moderns. Once demythologized, however, myth is compatible with science because it now refers at once to the transcendent, nonphysical world and, even more, to humans' experience of the physical one. But to say that myth is acceptable to scientifically minded moderns is not to say why it should be accepted. In providing a modern *subject matter* of myth, Bultmann provides no modern *function*.

Jonas argues that ancient Gnosticism presents the same fundamental view of the human condition as modern existentialism—but of atheistic rather than, as for Bultmann, of religious existentialism. Both Gnosticism and existentialism stress the radical alienation of human beings from the world. Unlike Bultmann, who strives to bridge the gap between Christianity and modernity, Jonas acknowledges the divide between Gnosticism and modernity. Yet for Jonas, Gnostic mythology can still speak to moderns, and not to modern believers, as for

Bultmann, but to modern skeptics. Like Bultmann, Jonas seeks to reconcile myth with science by recharacterizing the subject matter of myth. Yet no more than Bultmann does he offer any function of myth for moderns.

Hagiographical biographies of celebrated figures transform them into near-gods and their sagas into myths. For example, immediately after the First Gulf War, biographies of the American commander-in-chief, “Stormin’ Norman” Schwarzkopf (b. 1934), touted him as the smartest and bravest soldier in the world—so much smarter and braver than anyone else as to make him almost more than human.

The chief theorist here is the Romanian-born historian of religions Mircea Eliade (1907–1986), who spent the last three decades of his life in the United States. Unlike Bultmann and Jonas, Eliade does not seek to reconcile myth with science by interpreting myth symbolically. He reads myth as literally as Tylor does. Unlike Bultmann and Jonas, Eliade does not try to update traditional myths. But rather than, like Tylor, sticking to traditional, explicitly religious myths, he turns to modern, seemingly nonreligious ones. Yet instead of trying to reconcile those myths with science, as Bultmann and Jonas would, he appeals to the sheer presence of them to argue for their compatibility with science: if moderns, who for Eliade no less than for the others have science, also have myth, then myth simply must be compatible with science. Where Bultmann and Jonas argue meekly that moderns *can* have myth, Eliade argues boldly that they *do*. Where Tylor and Frazer assume that myth is the victim of the process of secularization, Eliade argues that only a superficial secularization has occurred.

Myth and Ritual

Myth is commonly taken to be words, often in the form of a story. A myth is read or heard. It says something. Yet there is an approach to myth that finds this view of myth artificial. According to the myth and ritual, or myth-ritualist, theory, myth does not stand by itself but is tied to ritual. Myth is not just a statement but also an action.

The myth-ritualist theory was pioneered by the Scottish biblicalist and Arabist William Robertson Smith (1846–1894). Smith argues that belief is central to *modern* religion but not to *ancient* religion, where instead ritual was central. He grants that ancients doubtless performed rituals only for some reason. But the reason was secondary and could even fluctuate. The reason was a story, or a *myth*, which simply described the origin of the ritual. In claiming that myth is an explanation of ritual, Smith was denying Tylor’s conception of myth as an explanation of the world.

Yet Smith is like Tylor in one key respect. For both, myth is wholly ancient. Modern religion is without myth—and without ritual as well. Myth and ritual are not merely ancient but “primitive.” In fact, for both Tylor and Smith, ancient religion is but a case of primitive religion, which is the fundamental foil to modern religion.

J. G. Frazer developed the myth-ritualist theory far beyond Smith. Frazer, rarely consistent, actually presents two distinct

versions of myth-ritualism. In the first version myth describes the life of the god of vegetation, and ritual enacts the myth describing his death and rebirth. The ritual operates on the basis of the voodoo-like Law of Similarity, according to which the imitation of an action causes it to happen. The ritual directly manipulates the god of vegetation, but as the god goes, so automatically goes vegetation. The ritual is performed when one wants winter to end, presumably when stored-up provisions are running low. A human being, often the king, plays the role of the god and acts out what he magically induces the god to do.

In Frazer’s second version of myth-ritualism, the king is central. Here the king does not merely act the part of the god but is himself divine, by which Frazer means that the god resides in him. Just as the health of vegetation depends on the health of its god, so now the health of the god depends on the health of the king: as the king goes, so goes the god of vegetation, and so in turn goes vegetation itself. To ensure a steady supply of food, the community kills its king while he is still in his prime and thereby safely transfers the soul of the god to his successor. As in the first version, the aim is to end winter, which now is attributed to the weakening of the king.

While this second version of myth-ritualism has proved the more influential by far, it actually provides only a tenuous link between myth and ritual. Instead of enacting the myth of the god of vegetation, the ritual simply changes the residence of the god. The king dies not in imitation of the death of the god but as a sacrifice to preserve the health of the god. What part myth plays here, it is not easy to see. Instead of reviving the god by magical imitation, the ritual revives the god by a transplant.

Outside of religion, the most notable application of the myth-ritualist theory has been to literature. The English classicist Jane Harrison (1850–1928) daringly derived all art, not just literature, from ritual. Using Frazer’s first version of myth-ritualism, she speculates that gradually people ceased believing that the imitation of an action caused that action to occur. Yet rather than abandoning ritual, they now practiced it as an end in itself. Ritual for its own sake became art, her clearest example of which is drama. More modestly than she, fellow classicists Gilbert Murray (1866–1957) and Francis Macdonald Cornford (1874–1943) rooted specifically Greek epic, tragedy, and comedy in myth-ritualism. Murray then extended the theory to the works of William Shakespeare (1564–1616).

Other standard-bearers of the theory have included Jessie Weston on the Grail legend, E. M. Butler on the Faust legend, C. L. Barber on Shakespearean comedy, Herbert Weisinger on Shakespearean tragedy and on tragedy per se, Francis Ferguson on tragedy, Lord Raglan on hero myths and on literature as a whole, and Northrop Frye and Stanley Edgar Hyman on literature generally. As literary critics, these myth-ritualists have understandably been concerned less with myth itself than with the mythic origin of literature. Works of literature are interpreted as the outgrowth of myths once tied to rituals. For those literary critics indebted to Frazer, as the majority are, literature harks back to Frazer’s second myth-ritualist scenario. “The king must die” becomes the familiar summary line.

For literary myth-ritualists, myth becomes literature when myth is severed from ritual. Myth tied to ritual is religious literature; myth cut off from ritual is secular literature, or plain literature. Bereft of ritual, myth can no longer change the world and is demoted to mere commentary.

Perhaps the first to temper the dogma that myths and rituals are inseparable was the American anthropologist Clyde Kluckhohn (1905–1960). The German classicist Walter Burkert (b. 1931) has gone well beyond Kluckhohn in not merely permitting but assuming the original independence of myth and ritual. He maintains that when the two do come together, they do not just serve a common function, as Kluckhohn assumes, but reinforce each other. Myth bolsters ritual by giving mere human behavior a real, not to mention divine, origin: do this because the gods did or do it. Conversely, ritual bolsters myth by turning a mere story into prescribed behavior of the most dutiful kind: do this on pain of anxiety, if not punishment. Where for Smith myth serves ritual, for Burkert ritual equally serves myth.

Ritual for Burkert is “as if” behavior. The “ritual” is not the customs and formalities involved in actual hunting but dramatized hunting. The function is no longer that of securing food, as for Frazer, for the ritual proper arises only after farming has supplanted hunting as the prime source of food. The communal nature of actual hunting, and of ritualized hunting thereafter, functioned to assuage anxiety over one’s own aggression and one’s own mortality, and at the same time functioned to cement a bond among participants. This shift of focus from the physical world to the human world typifies the shift of focus from nineteenth-century theories of myth to twentieth-century ones.

Myth and Psychology

In the field of psychology, the theories of the Viennese physician Sigmund Freud (1856–1939) and of the Swiss psychiatrist Carl Gustav Jung (1875–1961) have almost monopolized the study of myth. Freud’s key discussion of his key myth, that of Oedipus, fittingly occurs in *The Interpretation of Dreams* (1913), for he, and Jung as well, compare myths with dreams.

On the surface, or manifest, level, the story of Oedipus describes that figure’s vain effort to elude the fate that has been imposed on him. Latently, however, Oedipus most wants to do what manifestly he least wants to do. He wants to act out his “Oedipus complex.” The manifest, or literal, level of the myth hides the latent, symbolic meaning. On the manifest level Oedipus is the innocent victim of Fate. On the latent level he is the culprit. Rightly understood, the myth depicts not Oedipus’s failure to circumvent his ineluctable destiny but his success in fulfilling his fondest desires.

Yet the latent meaning scarcely stops here. For the myth is not ultimately about Oedipus at all. Just as the manifest level, on which Oedipus is the victim, masks a latent one, on which Oedipus is the victimizer, so that level in turn masks an even more latent one, on which the ultimate victimizer is the myth maker and any reader of the myth smitten with it. Either is a neurotic adult male stuck, or fixated, at his Oedipal stage of development. He identifies himself with Oedipus and through

him fulfills his own Oedipus complex. At heart, the myth is not biography but autobiography.

The Austrian psychoanalyst Otto Rank (1884–1939), who was Freud’s protégé at the time but who later broke irrevocably with the master, works out a common plot, or pattern, for one key category of myths: those of male heroes. The heart of the pattern is the decision by the parents to kill their son at birth to avert the prophecy that the son, if born, will one day kill his father. Unbeknownst to the parents, the infant is rescued and raised by others, grows up to discover who he is, returns home to kill his father, and succeeds him as king or noble. Interpreted psychologically, the pattern is the enactment of the Oedipus complex: the son kills his father to gain sexual access to his mother.

Mainstream psychoanalysis has changed mightily since Freud’s day. Contemporary psychoanalysts like the American Jacob Arlow (1912–2004) see myth as contributing to normal development rather than to the perpetuation of neurosis. Myth abets adjustment to the social and the physical worlds rather than childish flight from them. Furthermore, myth now serves everyone, not merely neurotics.

The classical Freudian goal is the establishment of oneself in the external world, largely free of domination by parents and instincts. Success is expressed concretely in the form of a job and a mate. Jungians accept that goal, but as that of only the “first half” of life, or from infancy to young adulthood. The goal of the uniquely Jungian second half of life—of adulthood—is consciousness—not, however, of the external world, as summed up by the Freudian term *reality principle*, but of the distinctively Jungian, or collective, unconscious. One must return to that unconscious, from which one has unavoidably become severed in the first half of life, but not to sever one’s ties to the external world. On the contrary, the aim is return in turn to the external world. The ideal is a balance between consciousness of the external world and consciousness of the unconscious. The aim of the second half of life is to supplement, not abandon, the achievements of the first half.

The American mythologist Joseph Campbell (1904–1987) provides the classical Jungian counterpart to Rank on hero myths. Where Rank’s pattern, limited to males, centers on the hero’s toppling of his father, Campbell’s centers on a journey, undertaken by an adult female or a male hero, from the known, human world to the heretofore unknown world of gods. Interpreted psychologically, that journey is an inner, not outer, trek from the known portion of the mind—ordinary, or ego, consciousness, the object of which is the external world—to the unknown portion of the mind—the Jungian unconscious. The successful hero must not only reach the strange, new world but also return. In psychological terms, success means the completion of the goal of the second half of life.

The most influential Jungian theorists of myth after Jung himself have been Erich Neumann (1905–1960) and James Hillman (b. 1926). Neumann systematizes the developmental, or evolutionary, aspect of Jungian theory. Jung himself certainly correlates myths with stages of psychological development, but Neumann works out the stages, beginning with

the “uroboric” stage of sheer unconsciousness and proceeding to the incipient emergence of the ego out of the unconscious, the development of an independent ego consciousness, and the eventual return of the ego to the unconscious to create the self. Neumann’s emphasis on heroism in the first half of life complements Campbell’s devotion to heroism in the second half.

By far the most radical development in the Jungian theory of myth has been the emergence of archetypal psychology, which in fact considers itself post-Jungian. The chief figure in this movement is Hillman. Another important figure is David Miller. Archetypal psychology faults classical Jungian psychology on multiple grounds. By emphasizing the compensatory, therapeutic message of mythology, classical Jungian psychology purportedly reduces mythology to psychology and gods to concepts. In espousing a unified self (or “Self”) as the ideal psychological authority, Jungian psychology supposedly projects onto psychology a Western, specifically monotheistic, more specifically Christian, even more specifically Protestant outlook. The Western emphasis on progress is purportedly reflected in the primacy Jungian psychology accords hero myths and the primacy it accords the ego, even in the ego’s encounter with the unconscious: the encounter is intended to abet development. Finally, Jungian psychology is berated for placing archetypes in an unknowable realm distinct from the known realm of symbols.

As a corrective, Hillman and his followers advocate that psychology be viewed as irreducibly mythological. Myth is still to be interpreted psychologically, but psychology is itself to be interpreted mythologically. One grasps the psychological meaning of the myth of Saturn by imagining oneself to be the figure Saturn, not by translating Saturn’s plight into clinical terms like depression. Moreover, the depressed Saturn represents a legitimate aspect of one’s personality. Each god deserves its due. The psychological ideal should be pluralistic rather than monolithic—in mythological terms, polytheistic rather than monotheistic, or Greek rather than biblical. Insisting that archetypes are to be found *in* symbols rather than outside them, Hillman espouses a relation to the gods in themselves and not to something beyond them. The ego becomes but one more archetype with its attendant kind of god, and it is the soul rather than the ego that experiences the archetypes through myths. Myth serves to open one up to the soul’s own depths.

Myth and Structure

Lévi-Strauss calls his approach to myth “structuralist” to distinguish it from “narrative” interpretations, or those that adhere to the plot of myth. Nonstructuralists deem myth a story, progressing from beginning to end, be the story interpreted literally or symbolically. Where the plot of a myth is that, say, event A leads to event B, which leads to event C, which leads to event D, the structure, which is identical with the expression and resolution of contradictions, is either that events A and B constitute an opposition mediated by event C or, as in the Oedipus myth, that events A and B, which constitute the same opposition, are to each other as events C and D, an analogous opposition, are to each other. Apparently, all oppositions for Lévi-Strauss symbolize the tension between humans as part of nature and humans as part of culture.

Lévi-Strauss is not the only or even the earliest theorist of myth labeled a structuralist. Notably, the Russian folklorist Vladimir Propp (1895–1970) and the French Indo-Europeanist Georges Dumézil (1898–1986) wrote both before Lévi-Strauss and independently of him. The French literary critic Roland Barthes (1915–1980) was a contemporary of Lévi-Strauss but was his own person.

The common plot that Propp deciphers in Russian fairy tales is his structure, which thus remains on the narrative level and is no different from the kind of structure found by Rank and Campbell. By contrast, the structure that Dumézil unravels lies as much beneath the surface level as Lévi-Strauss’s. But it reflects the order of society rather than, as for Lévi-Strauss, that of the mind, and is three-part rather than two-part.

Barthes is concerned with myth as ideology. In Lévi-Straussian terms, he writes to expose the way that French bourgeois culture creates myths to make itself seem natural—a fusion of culture with nature rather than the mere alleviation of the opposition between them. For Barthes, the function of myth is social rather than, as for Lévi-Strauss, intellectual. For Barthes, the structure of myth is its cultural context. By “myths” he means artifacts and activities more than stories. His clearest example is of professional wrestling, which, much more than a sport, is an attempt to alleviate lingering misgivings over the behavior of some French citizens during the Occupation by presenting clear-cut Good (the wrestler) as triumphing over clear-cut Evil (his opponent).

A group of French classicists headed by Jean-Pierre Vernant (b. 1914) have proved the most faithful followers of Lévi-Strauss’s brand of structuralism, though even they have adapted it. Lévi-Strauss has regularly been lambasted for isolating myth from its various contexts—social, cultural, political, economic, even sexual. In his essay on the American Indian myth of Asdiwal, he does provide a detailed ethnographic analysis of a myth. But he does so almost nowhere else. Vernant and his fellow classicists—notably, Marcel Detienne, Pierre Vidal-Naquet, and Nicole Loraux—have taken the analysis of Asdiwal as their model. As the heirs of Lévi-Strauss, these classicists have sought to decipher underlying, often latent patterns in myths, but they have then sought to link those patterns to ones in the culture at large.

Myth and Society

Where for Tylor and Frazer myth deals exclusively, or nearly exclusively, with physical phenomena—flooding, disease, death—for Malinowski myth deals even more with social phenomena—classes, taxes, rituals. Myth still serves to reconcile humans to the unpleasantness of life, but now to unpleasantness that, far from unalterable, *can* be cast off. Here, too, myths spur resigned acceptance by tracing these unpleasantnesses, or at least impositions, back to a hoary past, thereby conferring on them the clout of tradition. Myth persuades denizens to defer to, say, ranks in society by pronouncing those ranks long-standing and in that sense deserved. Here the beneficiary of myth is society, not the individual. The modern counterpart to myths of social phenomena—if for Malinowski moderns lack myths—would be ideology.

As the Frazerian counterpart to Rank and Campbell, Lord Raglan extends Frazer's second myth-ritualist scenario by turning the king who dies for the community into a hero. The function of myth is now as much social as agricultural: inspiring present kings to sacrifice themselves so that their communities will not starve. The French-born, American-resident literary critic René Girard (b. 1923) offers an ironic twist to Raglan. Where Raglan's hero is willing to die for the community, Girard's hero is killed or exiled by the community for having caused the present woes of the community. Indeed, the "hero" is initially considered a criminal who deserves to die. Only subsequently is the villain turned into a hero, who, as for Raglan, dies selflessly for the community. Both Raglan and Girard cite Oedipus as their fullest example, though both scorn Freud. For Girard, the transformation of Oedipus from reviled exile in Sophocles' *Oedipus the King* to revered benefactor in Sophocles' *Oedipus at Colonus* typifies the transformation from criminal to hero.

Yet this change is for Girard only the second half of the process. The first half is the change from innocent victim to criminal. Originally, the community selects an innocent member to blame for the violence that has erupted. This scapegoat, who can be of any rank, is usually killed, though, as with Oedipus, sometimes exiled. The killing is the ritualistic sacrifice. Rather than directing the ritual, as for Frazer, myth for Girard is created *after* the killing to *hide* it. Myth comes from ritual, as for Smith, but it comes to mask rather than, as for Smith, to explain the ritual. Myth turns the scapegoat into a criminal who deserved to die and then turns the criminal into a hero, who has died voluntarily for the good of the community.

Like Burkert, Girard roots myth in sacrifice and roots sacrifice in aggression. Yet like Burkert, myth functions to secure peace and not, as for Frazer, food. Myth deals with the human world; science, with the physical world. This shift of focus again typifies the shift from nineteenth-century theories of myth to twentieth-century ones.

N

NARRATIVE. Although the study of narrative goes back as far as Aristotle's *Poetics*, narrative theory emerged as a distinct field of inquiry only in the second half of the twentieth century. At that point, work on the theory of the novel intersected with structuralism's project of writing the grammar of stories and storytelling. This intersection in turn opened out to other streams of traffic in narrative studies, including the analysis of oral narrative by sociolinguists; reflections on historical narrative by historiographers; and the varied investigations of film scholars, among others. In the early twenty-first century many other disciplines—medicine, law, business, and psychoanalysis, prominent among them—both draw upon and contribute to narrative theory (see sidebar). In this respect, contemporary interdisciplinary thought has undergone a “narrative turn.”

From Novel to Narrative

The most influential figures in the early theorizing of the novel were novelists themselves, particularly Henry James (1843–1916) and E. M. Forster (1879–1970). In “The Art of Fiction” (1888) and in the Prefaces to the New York Edition of his novels (1909–1910), James describes and defends his own novelistic practice. He argues that the artistry of the novel depends on its representation of “felt life,” and, in the Prefaces, he describes, often with rich, extended metaphors, how he came to view the “treatment” (the technique) of his novels as even more important than their “subject” (their characters and situations). More specifically, James explains why he came to prefer the technique of narrating from the consciousness of his central character(s): such treatment highlights the impression of felt life even as it allows him to offer fresh ways of exploring his subjects. James's distinction between treatment and subject is a distinction between the how and the what of the novel that reappears in some form in every major theoretical approach to narrative. James's specific preferences soon became codified by his followers into a set of rules for good novelistic practice: use scenes rather than narrative summaries because they are more impersonal and objective; narrate from the perspective of a central consciousness rather than from the perspective of an external narrator because that treatment involves less rhetoric and more artistry. In short: show, don't tell.

If James is the theorist of treatment (the how), Forster is the theorist of character (one element of the what). In *Aspects of the Novel* (1927), he introduces a distinction between “round” and “flat” characters that is still frequently cited in the early 2000s: Round characters are capable of surprising in a convincing way, while flat characters can be summed up in a single sentence. Forster also distinguishes between story and plot (see sidebar), viewing the first as a kind of necessary evil (“yes, oh dear, yes,

the novel tells a story”), and the second with its inclusion of causality as what makes the recounting of events worthwhile. But he regards character as the most important element of the novel. In fact, he sees plot and character as often in conflict—one requires closure, the other does not—and he laments those novels in which he thinks character is sacrificed for plot.

Contemporaneous with Forster's theorizing, the Russian Formalists, a group including Victor Shklovsky, Boris Eichenbaum, and Yuri Tynanov, develop ideas about the novel that provide an especially interesting comparison with James's. They introduce a more formal and ultimately more influential distinction between the what and the how, identifying the *fabula* as the abstract chronological sequence of events independent of their expression in the *sjuzhet*, the actual presentation of those events in the novel's text. This distinction explains one's intuition that there can be different versions of the same narrative: different *sjuzhets* do not constitute different narratives unless they also are based on different *fabulas*. The Formalists also go James one better by arguing that the purpose of literature in general and the novel in particular is not the representation of felt life but defamiliarization or estrangement: the purpose of literature is to renew or revise our perceptions—in Shklovsky's famous phrase, to make the stone stony. This view leads the Formalists to an account of literary change built on the formal necessity of innovation, especially in the how of the novel: novelistic forms that once provided estrangement gradually lose that effect as they themselves became familiar, and so the inventive novelist discovers new devices of estrangement.

The next significant literary critical approach to form, that of the Anglo-American New Critics, emphasizes the distinctiveness of literary language itself, and so focuses on the image patterns of novels (the how) as containing the key to their thematic concerns (the what) and, thus, their formal artistry. The rivals of the New Critics, the Chicago School neo-Aristotelians, though generally unsuccessful in their effort to unseat New Criticism as the orthodoxy of the critical mainstream, turn out to be more influential than the New Critics in the evolution of narrative theory. R. S. Crane, working without knowledge of the Russian Formalists, develops a concept of plot that distinguishes between its “material action” (the what, roughly equivalently to the *fabula*) and the “plot proper” (the synthesis of what and how in the service of a given purpose and set of effects—roughly equivalent to *sjuzhet*). Crane's student Wayne C. Booth reexamines, from the neo-Aristotelian perspective, the Jamesian rules for novelistic success and repudiates them with a method that transforms Crane's neo-Aristotelian poetics into a rhetoric. In *The Rhetoric of Fiction* (1961), Booth argues that

techniques of showing are as rhetorical as techniques of telling; the choice is not between impersonal art and inartistic rhetoric but rather between different ways of trying to influence the audience—in short, different kinds of rhetorical appeals. More generally, Booth's insight that the novel is rhetorical from top to bottom paves one road for the entry of ethical and ideological approaches to narrative.

Another Russian scholar of the 1920s, Vladimir Propp, provides a model for a different approach to narrative in *The Morphology of the Folktale* (1929). Propp identifies thirty-one functions that occur in invariable order (for example, hero perceives a lack; hero meets a magical agent) in every Russian folktale. But more important than his specific account of the folktale itself is Propp's insight that underlying the surface variety of the folktale is a single deep structure (an *Ur-fabula*, if the reader will). The structuralist narratologists of the 1960s and 1970s, such as Tzvetan Todorov, Claude Bremond, and, in one phase of his work, Roland Barthes, look back to Propp and to Ferdinand de Saussure in their effort to uncover the underlying structures of narrative. Saussure's distinction between *langue*, the abstract system of language that underlies any utterance and makes it intelligible, and *parole*, actual utterances, provides an analogy for the structuralist project of describing the grammar of narrative that makes any given narrative intelligible.

Strikingly the results of these efforts are not a comprehensive grammar but a number of conceptual tools that remain both useful and influential to this day. Chief among these tools are the *story/discourse* distinction, a new version of the what/how distinction, and Gérard Genette's analyses of discourse. Story encompasses the characters, events, and settings (or states, events, and existents) of narrative, and discourse encompasses all the devices for rendering the story in one way rather than another. Genette groups these devices into three main kinds: (1) those of temporality, which include order, duration (the relation between story time and its expression in discourse time, for instance, twenty years may be summarized in a single sentence, just as one minute may be treated in several pages), and frequency (the relation between the number of times an event happens in story and the number of times it is reported in discourse); (2) voice, the answer to the question "who speaks?"; and (3) vision, the answer to the question "who perceives?" Even more significantly, as the link between Propp and the structuralist project suggests, the emergence of narratology makes possible the shift from novel to narrative—that is, storytelling of all kinds—as the central object of study, even if literary fiction narrative retains a special status within the project. Genette, for example, develops his conceptual toolbox from his analysis of Marcel Proust's *A la recherche du temps perdu* (1913–1927; Remembrance of things past). Consequently, in the 1980s the field of narrative theory emerged with a recognizable identity.

Contemporary Narrative Theory: Contextual and Interdisciplinary Models

Even as the field was emerging, it was being affected by the larger "theory revolution" of the last quarter of the twentieth century in two main ways: (1) the field's focus on narrative form expands and becomes complicated through attention to the relations between form and ideology; and (2) as already noted,

the field becomes increasingly interdisciplinary. The discovery and dissemination in the West of the work of Mikhail Bakhtin, another Russian scholar of the 1920s and 1930s, is especially significant in the complication of formal approaches. Bakhtin, in one sense, is as concerned with the form of the novel as Shklovsky or any other Russian Formalist; indeed one of his goals was to earn for the novel as a genre the kind of respect and status accorded to poetry in 1920s Russia. But Bakhtin conceives of the novel's form as inseparable from its ideological component, because he conceives of language as always already ideological. He views any national language (English, French, Russian) not as a unified system but rather as a collection of sociolects or minilanguages, such as the language of the working class, the language of the law, or the language of the academy, each of which carries the values of its group. Bakhtin argues that the novel necessarily draws upon multiple minilanguages and puts them into dialogic relationships with each other; this dialogue among languages is also a dialogue among ideologies.

Feminist narratologists such as Robyn Warhol and Susan Lanser participate in the spirit of Bakhtin's work by linking technique to ideology, though they are most concerned with ideologies of gender and their interests extend beyond novelistic language to other features of narrative discourse, especially the devices and techniques of woman writers and female narrators. Although other ideologically based theoretical approaches such as Marxist theory and postcolonial theory have not yet spawned their own branches of narratology, these theories also contribute to a general understanding of the inseparable connection between form and ideology: Each shows how an author's choice of particular narrative techniques and structures occurs within both a formal and a political context and therefore has both formal and ideological consequences.

Another significant complication of the formal model has been the rise of narrative ethics, itself a subfield of the burgeoning area of ethical criticism. Martha Nussbaum argues that narrative, due to its concrete particularity and its capacity to draw on the cognitive power of the emotions, is, in the hands of a novelist such as Henry James, a site for ethical exploration that rivals the explorations of philosophical ethics. Booth extends the rhetorical approach of *The Rhetoric of Fiction* to the ethical realm by focusing on the quality of one's life in the hours spent reading narrative. More specifically, Booth proposes the metaphor of "books as friends" and suggests the reader can judge the quality of such friendships by attending to the trajectory of desires they invite the reader to follow. Adam Zachary Newton and others develop approaches to narrative ethics through attention to the relation between the specifics of story and discourse, on one hand, and ethical categories derived from philosophers such as Emmanuel Levinas, on the other. James Phelan seeks to extend the work of both Booth and Newton by exploring the ethics of technique as much as the ethical dimension of characters' situations.

Contemporary narrative theory is interdisciplinary in two related ways. As the example of narrative ethics shows, it either brings the insights of other disciplines to the study of narrative or it brings the conclusions of narrative theory to the concerns of other disciplines. In each case, the interdisciplinarity is a two-way street: Not only does philosophical ethics illuminate narrative's

E. M. FORSTER'S KING AND QUEEN AND NARRATIVE ACROSS THE DISCIPLINES

“The king died and then the queen” is a story. “The king died and then the queen died of grief” is a plot. Thus spake E. M. Forster, who also points out that the difference between the two is causality. Theorists have debated the validity of the distinction since Forster proposed it in the 1927, arguing, for example, that the very temporality of “and then” entails causality (or at least invites the reader to supply it) so that the only difference between the two versions is the *explicit* naming of the cause in the second. The debate also includes objections to defining plot solely in terms of causality, since many narrative artists build plots on other principles. Nevertheless the debate itself shows that Forster identified four elements of narrative—character (or agent), event, temporality, and causality—that are essential to the contemporary interest in “narrative across the disciplines.” Because narrative spells out the specific relations among agents, events, time, and causality, it is capable of explaining phenomena that escape more abstract analyses such as those based on science-oriented ideas of general laws. In twenty-first-century culture, with its widespread abandonment of a belief in eternal verities, this capability is of great importance for many disciplines.

Many legal cases, for example, involve disputes about the relation among the agents involved, the temporal order of events, and the causes of those events; judges and juries often render their verdicts according to which side constructs the most convincing narrative about that relation. In medicine, the narrative of an onset of an illness with its particular relation of what the patient did when and for what reason can provide clues to both to the nature of the illness and the appropriate treatment. Furthermore many patients find the opportunity of relating their “illness narrative” to a sympathetic medical professional to be salutary in itself. The talking cure of psychoanalysis is a narrative cure: an analysand comes to recognize how the relation among agents, including herself, events of her past, and their causality are still affecting her and, thus, how she can break the grip of that narrative and write another one for her life. More generally, narrative’s interest in character, event, temporality, and causality provides the basis for claims that people’s identities are constituted by the narratives they tell about their lives. The queen died, in other words, because the event of the king’s death made her own passing the inevitable next event in her narrative of her life.

representations of ethical situations, but those representations have implications for philosophy’s investigations into ethics. Similarly not only does, say, medicine benefit from drawing on narrative theory, but medicine’s use of it has consequences for the field’s ongoing efforts. Among other things, this aspect of interdisciplinarity corrects literary study’s attraction to the experimental or innovative case and helps keep the focus on what seems to be the fundamental elements of narrative’s power (see sidebar).

One of the most promising current interdisciplinary developments is the cognitive approach to narrative taken by such scholars as David Herman. In a sense, this movement is an extension of classical narratology because it also has the goal of giving a comprehensive view of narrative, its elements, and their combinations. But rather than fashioning that comprehensive view by analogy with Saussure’s theory of language, the cognitivists start with the idea that narrative is a way of organizing experience, one that involves, in both its production and consumption, the development of a mental model of that organization. This starting point means that the cognitivists draw upon both the findings of narrative theory broadly conceived—including, for example, classical narratology, rhetorical theory,

and sociolinguistics—and the findings of cognitive science about how the human mind processes information, forms patterns from diverse data, and so on. Whether the cognitive approach succeeds in establishing a new dominant paradigm for understanding narrative or becomes, like classical narratology, a movement that is more significant for its local successes than the achievement of its ultimate goal remains to be seen. But the cognitive project is a telling example of the interdisciplinary nature of contemporary narrative studies and strong evidence, along with the undeniable ubiquity and amazing variety of narrative itself, that the future of narrative theory is very bright.

NATION. *Natio* derives from the Latin verb to be born (*nasci*) and refers to societies constituted by (assumed) common birth or descent, a meaning akin to the English word *race*.

Prepolitical Usages

In late Roman and early medieval texts, *natio* was less frequently used than *gens*, which also meant groups of common descent, though emphasizing kinship and family rather than race. Another group noun, *populus*, referred to the assembled citizens of a city-state. (*Plebs* referred to people in the negative sense of the masses.) This meaning translated from Greek city-states to the Roman Republic and then to the Roman Empire. Romans used *gens* and *natio* to describe *other* peoples perceived as extended kinship groups or subjects of quasi-religious dynasts.

Such groups were given specific names. Tacitus (c. 55–c. 117) in *Germania* (98 C.E.) named the people (*gens*) of “Germania,” differentiating distinct nations and subnations. However, there was no consistency in relating general labels to specific names. This ethnography was taken over by the late Roman Latin-writing intellectual elite and continued by their successors, the Roman Catholic clergy. The names given to certain territories (England, France, Germany) derive from Latin labels.

The Nation and Political Authority, 1000–1500

The Venerable Bede (673?–735), in the *Ecclesiastical History of the English Nation* chose the name *Anglii* or *gens Anglorum* for the subjects of Christian kings. As Roman Christianity expanded and the number of kingdoms contracted, clerics following Bede fixed the name to one kingdom and its people. Something similar happened with Franks, France, and the French. Why names like French and English survived, others disappeared (Goth, Lombard, Norman), and others attached themselves to the same group (German, Deutsch) is unclear.

Name that prevailed were detached from original connotations of race and kinship. Even before the Norman conquest in 1066, “English” rulers and elites were drawn, and were conscious of being drawn, from beyond the ranks of the Anglo-Saxons. The conquest of 1066 introduced a new ruling class with a clear sense of ethnic identity. Yet the names England and English quickly reasserted themselves. Possible explanations include the facts that Anglo-Saxon institutions were taken over by the new rulers; they married English-speaking women; later rulers identified with the land of their conquest rather than with Normandy.

The political concept of nation referred to monarchy and the ruling class. When the eastern Frankish empire took the name “The Holy Roman Empire of the German Nation,” nation meant the princes and high nobility of the empire. The nation, in becoming political, divested itself of populist elements associated with language and customs. Insofar as descent was claimed, this was dynastic and aristocratic.

Natio was used inconsistently and descriptively in political discourse. Sustained arguments about legitimate rule were couched in terms of religion, dynasty, and privilege. The king of “England” could claim the “French” crown; indeed such a claim by Henry V was recognized in a treaty even though his premature death prevented the agreement coming into effect. Rulers invoked the nation when rejecting jurisdictional claims by the papacy or other princes but dropped it when making such claims themselves. Occasionally they drew upon older ethnographic meanings to appeal to their subjects, though we have no idea how this was received. The word also figured in conflicts between princes and elite subjects, especially when nobles defended privileges as properties of the nation.

Natio was used in many other ways. Delegations to the Council of Constance (1414–1418) and bodies of students at the University of Paris were called nations and given specific names. The word broadly referred to specific groups of foreigners but lacked stable meaning, suggesting it was not disciplined by constant deployment in political arguments. So long as arguments about legitimate political authority excluded notions of equal citizenship and popular participation, the nation remained a marginal concept. Only when *natio* took on attributes of *populus* did it become politically significant.

Making Politics National, 1500–1800

There were two principal ways in which the political concept of nation developed. The first was during the Reformation. Protestants invoked the biblical idea of God’s chosen people, or elect nation, associating this with sacred territory and promised land. It is difficult to gauge the long-term significance of this.

Protestant resistance to authority took mainly sectarian and international forms; salvation was for individuals or small groups. Radical Protestantism was crushed by Catholic and mainstream Protestant regimes before the later emergence of popular national movements. However, by then it was commonplace to combine state, confession, and nation in political arguments.

Second, the growth of state power meant that ever-larger groups were brought into contact with the central government. If government was “national,” then groups deployed that term in political conflict. A significant example is eighteenth-century France. As the crown attacked privileged groups, its publicists portrayed these as factional interests undermining national interests. Those opponents in turn conflated nation with privileged institutions, insisting they were defending “national liberty.” These ideas of national interest and liberty could be combined and extended. Revolutionaries generalized the concept of the nation to *all* subjects of the crown.

New Ways of Thinking about the Nation

The Enlightenment view that human beings choose and construct their institutions, that society and state are contractual associations, and that all human beings are equal, endowed with reason and rights, entailed profound consequences for the concept of nation. It took on qualities of *populus*, extended to the populations of territorial states.

In February 1789 in France, the abbé Emmanuel Joseph Sieyès (1748–1836) published a pamphlet entitled *What Is the Third Estate?* His answer was that it was not one estate among others in a society of privileges, but was *everything*. The actual representatives of the Third Estate, meeting in the Estates-General summoned in 1789, acted out this answer by transforming themselves into the National Assembly and inviting members of the other Estates to join them. The Assembly issued a Declaration of Rights: “The Nation is essentially the source of all sovereignty; nor can any individual or any body of men, be entitled to any authority which is not expressly derived from it” (Article III). The French Revolution abolished privileges and devised political arrangements to realize national sovereignty. Despite the failure of these experiments the notion became entrenched as a basic tenet of modern democracy.

Apart from practical problems of implementing national sovereignty, there was a conceptual difficulty: Who belonged to the nation? If the nation was defined in relation to the state over which it claimed sovereignty, then it should consist of the subjects of that state, with all their accidental differences of customs, beliefs, and conditions. Even this required one to define state boundaries precisely, itself a novel practice. Then one had to devise rules for turning subjects into citizens. Citizens and inhabitants were two different notions. Children and women as well as foreigners were excluded from citizenship. Above all, there was the problem of reconciling nation as the sum of individual citizens with nation as a group bound by ties of culture and values. The Jacobins tried expanding the idea of politics so that these ties flowed from, rather than toward the state, but they failed. It seemed necessary to look beyond politics to find the nation.

This was already happening during the Revolution. Radicals in Paris suggested that Bretons, Basques, and other reactionaries were infected by cultures and languages that made them incapable of appreciating new truths. Conservatives in and beyond France, notably Edmund Burke (1729–1797), argued that revolution was destructive because it ignored the importance of the traditions and customs that made each society (nation) distinct; revolutionaries mistakenly imagined that human reason could design an ideal society and state.

The German thinker Johann Gottfried von Herder (1744–1803) moved from the idea of variety to that of uniqueness. Different languages were not variants on a universal language; human beings had not rationally constructed languages. Each language expressed and transmitted across individuals and generations unique values that embodied the national spirit. The argument could be extended to music, architecture, customs, laws, indeed, to every aspect of society. The Romantic movement promoted the view that societies were organisms; art, the expression of uniqueness; and human beings, bound together by feelings and emotions not by reason and interest.

Two kinds of nation? These two ways of thinking about the nation appear diametrically opposed. One stresses politics, reason, and choice; the other, culture, emotions, and belonging. This distinction has been linked to two kinds of nationalism variously called “western” and “eastern,” “civic” and “ethnic,” “political” and “cultural.” The distinctions differ in important ways but all relate to these opposed ways of thinking. We need to see how such ideas were combined or opposed as the nation became the justification for statehood.

Nation and State in Europe after 1800

The opposed elements combined in many ways. In the first half of the nineteenth century, nationality as citizenship was linked to “high” culture. Basques and Catalans, Welsh and Scots, Bretons and Provençals must become Spanish, British, and French, respectively, to belong to the nation. Educational and other policies were pursued to this end. Such policies were explicitly assimilationist.

The situation was more difficult when one could not link the state to a dominant culture. Habsburg, Romanov, and Ottoman rulers were reluctant to do this. In some regions they confronted subjects with their own elites and high culture, such as the Poles and Magyars. There were also large and culturally subordinate groups, especially Slav speakers. These ranged from peoples with indigenous elites, a literary language, autonomous institutions, and national consciousness to peasant communities with distinct ethnic qualities but without national consciousness. Other areas were splintered into small states with one dominant nationality, above all the German lands and Italian peninsula.

As the nation as the bearer of popular sovereignty became a central political concept, these nonnational states were confronted with difficult questions. The “answer” in the German lands and the Italian peninsula was “unification,” although these unifications included people who did not share in the national culture and excluded people who did.

In multinational empires no single national culture could assimilate others. The Russification project in the Russian Empire failed. The Habsburgs in the western half of the Austro-Hungarian Empire recognized distinct German and Czech nationalities. The Magyars practiced harsh assimilationist policies that alienated subordinate groups. The Ottomans conceded autonomy to Christian subjects but by the late nineteenth century had been expelled from areas claimed for “nations” using names such as Serbian, Greek, Bulgarian, Rumanian. Apologists for these “nations” legitimized political claims in cultural terms: creating a national literature, constructing a confessional identity, elaborating national customs, ceremonies, and histories. Ethnic-cultural ideas figured more centrally than they had in the national movements of dominant cultural groups in western European territorial monarchies.

Linking ethnicity and nationality was one response to problems in multinational empires. Ethnic censuses asked people whether they were Germans or Czech (one could not answer “both” or “neither”). The Austrian socialists Otto Bauer (1882–1938) and Karl Renner (1870–1950) elaborated arguments separating political citizenship from national identity, anticipating contemporary debates on multiculturalism. However, with the collapse of multinational empires at the end of World War I, the stage was set for the ethnic nation-state.

National cultures did not neatly distribute themselves as territorial blocks. Nationalities were brought together, as in Czechoslovakia and Yugoslavia (meaning “south Slav,” a name designed to bridge differences between Croats, Serbs, and Slovenes). National minorities were created. One attempt to address resultant problems was by entrenching minority rights, to be monitored and enforced by the new League of Nations. This failed. Without strong and united support from the major Western powers, the League could not enforce rules. The doctrine of national sovereignty was understood to mean majority rule in a state that recognized no higher authority. The notion of citizenship as a property of *individuals* made it difficult to frame limitations on state power with respect to *groups*.

The Soviet Union had a national policy. Vladimir Ilyich Lenin (1870–1924) recognized the need to gain support from non-Russians. The state was a *union* of republics named by their dominant or “titular” nationality. The state recognized “personal” nationality, embodying this in passports and educational claims. The destruction of all political autonomy under Joseph Stalin (1879–1953) included the autonomy conceded to nationality. Nevertheless, cultivation of national identity and a system of national republics shaped the way the Soviet Union collapsed.

The breakdown of political order in central Europe saw ethnonationalism taken to extremes. Nationalist and racist movements aimed to destroy “inferior” nations or races by expulsion, exploitation, and murder. Arguably, racist justifications for race empire and genocide go beyond the idea of the nation that, if only implicitly, recognizes plurality and difference. However, fascism and Nazism drew upon arguments about the nation.

These extreme forms of ethnonationalism were defeated by 1945, but not before they had altered the map and mentality of Europe. The national states created after 1945 were ethnically

more homogenous than those formed in 1919. Ethnic cleansing continued with the expulsion of Germans from other states. Yet the doctrine of national sovereignty was qualified by the formation of supranational blocs centered on the Soviet Union and the United States, as well as the formation of the United Nations. The title of this organization, as that of its predecessor the League of Nations, equates nation with state.

The Concept of Nation beyond Europe

The United Nations, an association of formally sovereign states, excluded colonies. Colonial nationalists argued for independence in political terms. Imperial powers could not reject democratic arguments, as these legitimized their own states. Racism, even if endemic in Europe and the United States, had been discredited. Imperialists could only argue that circumstances were unpropitious, divisions too acute, indigenous resources for self-rule inadequate.

There were other reasons for making the nation purely political. Boundaries of colonial states were arbitrary, dividing close-knit groups. The small-scale nature of many indigenous groups made it difficult, if not impossible, to identify a dominant culture. Nationalists confined themselves to challenging imperial rule within given boundaries. Hardly any postcolonial state has seen its boundaries change. The most important such case, Bangladesh, took the form of a separation within otherwise unchanged boundaries. Yet tension between nation as culture and as citizenship presented itself in the first important act of postwar decolonization, when Muslim movements achieved the separation of the state of Pakistan from India. The justification was that Muslims constituted a separate nationality.

Internal conflicts within postcolonial states have been explained in terms of cultural difference, variously described as ethnic, tribal, or national. Sometimes federal arrangements have been implemented to try to reduce these conflicts; sometimes there have been civil wars, expulsions, and genocides. However, in other cases a conception of nationality as citizenship has brought unity at the state level, even if multiple ethnic differences remain important.

Contemporary Problems with the Nation

There is tension between nation as citizenship and as culture, but such tension is frequently manageable. In specific cases it is difficult to imagine how, in the foreseeable future, Israelis and Palestinians or Croats and Serbs, for example, could live peaceably together in one state. Equally, it is difficult to see how the world could be stably organized on a thoroughgoing ethnonational basis.

First, there are problems of creating many small states and coping with the geographical intermixing of different nationalities. Second, there is the theoretical problem of what constitutes a nation. Making the nation-state the political norm encourages minorities to formulate demands in the name of the nation. When does a distinct cultural feature qualify for recognition as a separate nation? For some theorists the answer lies not in ethnonational states but in enabling nationalities to live together in one state. One approach seeks to divide political authority between nationalities geographically through federalism or explicit division of powers at the state level. Another

approach is to entrench nationality rights on issues such as language, education, and worship. An alternative to these public recognitions of multiple nationalities is to make a firm public-private distinction, regarding nationality as a private cultural preference and the state as a secular and public authority above such preferences. All these policies confront severe problems and are matters of fierce political and intellectual debate.

For some the nation is banal, equated with existing state, society, and everyday life. For others it is under threat. For a few it is a prison they wish to leave. All these experiences are modern. The premodern political lineage of *natio* relates to *populus*; its premodern cultural lineage to *gens*. The rise of the sovereign, territorial, public, and participatory state made the question “Who are the people/nation?” acute. Once the argument that the nation was the sum of the citizens of the existing state proved inadequate, the search moved on to consider the claims of culture. Nation as a significant political concept represents a series of attempts to answer that modern question.

NATIONAL HISTORY. The professionalization of history in nineteenth- and twentieth-century European universities was so closely related to the construction of the

nation-state that national histories came to be seen as the only objective form of historical writing—indeed, criticism of national histories was seen not only as unpatriotic, but as a threat to the integrity of the historical profession and its claim to objectivity.

National histories regard the nation-state as the primary unit of historical analysis, and social, economic, intellectual, and other processes are contained within it. The nation is the subject of history, and the object of historical development is the realization of the nation-state. The nation is said to have long existed in a latent state, and its members are regarded as having an unchanging character. In Hegelian fashion, the nation becomes conscious of itself by overcoming obstacles such as linguistic diversity, fragmented trade patterns, and foreign occupation. National histories are morally judgmental and teleological. Specific periods of history are judged—in all senses of the term—according to the degree to which they advanced or retarded the national cause. “Great men” figure prominently in national histories: they act creatively because they understand the movement of history. National histories are also populated with villains—representatives of foreign powers and traitors to the national cause. While noxious in the short term, their efforts are doomed historically.

Nation Building and Professionalization

National histories were written before history was professionalized. Whig historians like Thomas Babington Macaulay (1800–1859) located the English national genius in the development of parliamentary liberty. The Whigs’ French counterparts held that history provided the unifying force that prevented individualism from undermining the social body, and that the Orleanist regime (1830–1848) represented the culmination of French history because it reconciled individual liberty with the national good. Some amateur national historians, influenced by positivism, felt that the triumph of the nation was scientifically inevitable. National histories represented one element in disparate amateur historical writing, which also included social, economic, religious, revolutionary, and women’s history, and which were united by special pleading—often explicit. They were written as much to inspire as to inform.

The professionalization of history in the nineteenth century was predicated, as Lord Acton (1834–1902) put it, upon the removal of the poet and patriot from history. Acton’s hero, Leopold von Ranke (1795–1886), rejected Hegelian teleologies on the grounds that individual periods should be understood in their own terms. The uniqueness of a set of events would be grasped by careful criticism of primary sources and their arrangement into an interpretation. Historians would constitute a profession, endowed with a special ability to understand the past objectively through the mastery of special skills.

In practice, it might be argued, professional historians merely provided scientific authority for existing ideas about the nation-state. Modern universities were created in periods of nation building, for which governments expected historians to provide historical legitimacy. In Prussia the universities expanded after defeat in the Napoleonic wars, in France after defeat at the hands of Prussia in 1870, and in Britain during a

period when global preeminence seemed to be threatened by the rise of Germany and America.

It was not inevitable that nationalism should have acquired a historical dimension. The French revolutionaries (at least in theory) had preached a territorial nationalism, dependent upon the democratic choice of a people to live under a particular government. It was widely believed, however, that abstract rights had led to the dissolution of the social body and to the Jacobin Terror. Even democratic nationalists feared that abstract rights nationalism might permit the overthrow of any government at the behest of the people. A historically rooted nationalism limited a people's freedom to choose and provided a defense against unrestrained individualism, anarchy, and the recourse to despotism.

Moreover, nationalists and national historians were impressed by the pseudo-scientific pretensions of theories of race, Social Darwinism, and group psychology that depicted individuals as products of national and racial origin. But the extent to which individuals were prisoners of their nationality varied. Women, "inferior" races, workers, and peasants were seen as passive embodiments of the nation, who grasped the national idea "instinctively," or through the "fetishization" of national symbols and great men. The active carriers of the national idea were bourgeois men, who alone possessed the ability to understand the national idea rationally. To govern effectively, this elite needed to take account of national character and provide a people with a system of government in keeping with their characteristics. National history became an essential part of training for government, and in societies where gendered separate spheres were an integral part of bourgeois culture, it became an essential attribute of manliness too.

There were also intellectual reasons for privileging the nation-state. Ranke followed Johann Gottfried von Herder (1744–1803) in seeing peoples as "thoughts of God." Through a process of intuition, combined with careful documentary research, the historian could grasp the nation's unique spirit. While the historian could not discern the end of history, God was present in history, and the objective historian could glimpse something of God's divine plan.

Varieties of National History

Historians varied in the extent to which they were willing to endorse the particular version of nationalism espoused by their governments. In Germany professors were appointed by authoritarian conservative governments that monopolized power until 1918, and they shared the ruling nationalist ethos. In Britain political pluralism and the greater autonomy of the universities ensured a more diverse profession, but most historians wrote national histories of one sort or another.

The structures of national histories were flexible enough to encompass many different types of national history, including left and right wing, state and opposition nationalism. For some national historians the core of the nation is parliament, for some the state; for others it is the people defined in linguistic, historical, cultural, ethnic, or other terms. Contest over the meaning of national history was all the greater because professionals have never monopolized the writing of history.

Germany

Ranke's nationalism was relatively benign. He saw all nations as equal before God and urged historians to understand rather than judge. He was also conservative in an age when nationalism was a movement of the revolutionary and democratic left. His *History of Prussia* (1847) depicted Prussia as a territorial state rather than as the precursor of German unity. Nevertheless, Ranke held in *The Great Powers* that "the greatest possible unfolding of the rule of the spirit reveals itself among the most resolute" and believed that history should serve the state. The latter ideas were taken up by the neo-Rankeans of the 1890s. Max Lenz (1850–1932) saw the state as the expression of a people, engaged with other states in a struggle to preserve its uniqueness. He justified the expansionism of the German Reich while claiming to be wholly objective. Lenz's nationalism was not, however, aggressive enough for some extreme nationalists, who attacked both the "caution" and the "narrow specialization" of university historians. Amateur writers like Julius Langbehn (1851–1907) rewrote the history of Germany with a racially defined *Volk*, rather than the monarchical state, as its subject, and developed ambitious schemes for expansion in eastern Europe. Conservative nationalists survived the challenge of the extreme right, just as they did the German Revolution of 1918. Like *Völkisch* historians, the Nazis were critical of the "bloodless objectivism" of the historical establishment, but they too failed to breach the hegemony of the professoriat. While professional historians largely rejected the extreme racism of the Nazis, early medievalists in particular made concessions to the notion that the *Volk* was the agent of history, thus providing historiographical legitimation for Germany's mission in the east. From 1936 the prestigious *Historische Zeitschrift* published a rubric on the history of the "Jewish Question." After 1945 most historians continued to write traditional national history, denying German guilt for the outbreak of the Great War and reducing the Third Reich to a diversion from the normal path in German history. The German destiny was updated to lie in the Western alliance.

This picture was upset only in 1961, when Fritz Fischer published his *Griff nach der Weltmacht: Die Kriegszieldpolitik des kaiserlichen Deutschlands 1914/18* (1961; English trans. *Germany's Aims in the First World War*, 1967). Whereas German historians had traditionally regarded all powers as equally responsible for the outbreak of war in 1914, Fischer claimed that German politicians had consciously risked world war. Furthermore, in a reversal of the usual assumption that foreign policy determined the character of a nation, he argued that both the Great War and the accession to power of Nazism were the result of the attempts of the Prussian aristocracy to preserve a social position threatened by modernization. Neither Fischer nor his many heirs broke with the national framework, however. Borrowing from Max Weber (1864–1920), they assumed a normal pattern of national "modernization" (an updated version of the idea of "progress") and attributed the disasters of German history to the attempts of her leaders to work against the grain of history—they did not act as "great men."

Britain

British historians embraced national histories as enthusiastically as their German counterparts. They assumed an unchanging

national character and rooted the English constitution in the forests of Germany, but they disagreed on whether state or parliament was the vehicle of the national idea. Some historians had much in common with German partisans of power politics. The conservative J. R. Seeley saw Britain's racial destiny in imperial conquest and wrote his *Life and Times of Stein* in 1878. Geoffrey Elton did not speculate on the racial origins of English virtue but felt nevertheless that the English had discovered the perfect blend of order and liberty. In his *Tudor Revolution in Government* (1953), he claimed that the foundations of a unitary modern state had been laid in the 1530s by Thomas Cromwell, chiefly through the removal of the influence of the Catholic Church from government. He added that English rule over the "disordered" and "wild" Irish and Welsh was both beneficial and necessary. Interestingly, Elton, although a vociferous defender of value-free empirical history, argued for the theoretical primacy of political history. It concerned, he said, the ways in which people used their reason to organize society into a "properly constructed, continuously living body"—note again the Hegelian notion that through the development of the state a society becomes conscious of itself. Like Fischer, Elton assumed a necessary process of modernization, and the greatness of Cromwell lay in his ability to realize the meaning of history.

The liberal E. H. Freeman (1823–1892) developed the idea of an innate English love of liberty into a vast Aryan project, and his history of the Norman Conquest took the side of the Anglo-Saxons against despotic French invaders. In the interwar period, in the face of the Nazi threat, George Macaulay Trevelyan wrote a history of England as the home of liberty yet repeated conventional prejudices about the Irish. Postwar left-wing historians abandoned racism but retained the notion of an English predisposition to liberty. For A. J. P. Taylor, German authoritarianism represented the antithesis of Englishness. The crux of his *Origins of the Second World War* (1961) was that Hitler's foreign policy represented a continuation of traditional German national aims. Taylor was a member of the Campaign for Nuclear Disarmament and believed that the peace-loving British were ideally placed to find a middle way between the two superpowers. The Marxist historian E. P. Thompson was also a leading campaigner against nuclear weapons. In "The Peculiarities of the English," Thompson described himself as a "socialist internationalist speaking in an English tongue" (p. 37). In his classic *Making of the English Working Class* (1963), he argued that the English bourgeoisie, frightened by the French Revolution, had betrayed the cause of liberty and failed to carry out a bourgeois revolution. The working class became the bearers of the tradition of the free-born Englishman.

The adaptability of the structures of national historical writing is illustrated by the historical works of opposition nationalists. John Davies's *History of Wales* (1993) is based on the assumption that although Welshness might be expressed in many ways (the author is especially concerned to reconcile industrial English-speaking Wales with rural Welsh-speaking Wales), there is a core national identity. He traces the resistance of "Wales and its attributes" to predictions of imminent oblivion that go back to Tacitus in 100 C.E. "This book," he concludes, "was written in the faith and confidence that the nation in its fullness is yet to be." The nation constitutes the

subject of the historical process, and its realization in the nation-state represents the end of history.

John Davies's book is one of the major sources for Norman Davies's *The Isles: A History* (1999), which attacks the Anglo-centric Whig view of history and predicts the break-up of the British state. The book was welcomed by the Left and condemned by the Right. Yet its structure is typical of national histories, and in its emphasis on the reconciliation of Celt and Anglo-Saxon, and in the author's interest in J. R. R. Tolkien's dream of harmony between races, the book owes something to the new right's vision of a Europe made up of unique peoples. For Norman Davies, Britain has since the fourteenth century consisted of four distinct nations, all integrated into a European culture. The long separation of Britain from Europe, beginning with the Reformation, is an "aberration" in the history of the Isles. Britain returns to its true vocation with membership of the European Union.

Nation and History Today

Challenged by social, demographic, women's, and gender history, national histories no longer occupy the monopolist position they once did. In *The Practice of History* (1967) Geoffrey Elton reacted to the rise of explicitly theoretical social history with a vigorous defense of the objectivity of political history. In fact, the national framework has remained essential to historical writing. The social and women's history of the 1970s and 1980s continued to be written within the confines of nation-states, and much of it, as in Thompson's *Making of the English Working Class*, dealt with the question of national specificities. The impact of poststructuralism upon historical writing has not substantially altered the situation. Poststructuralism has led to suspicion of essentialist definitions of nation, class, and gender but has caused historians to focus upon the historical, and mutual, construction of identities, including national identities. As yet few historians have taken up the critique of national histories advanced by cultural transfer theorists.

The international political climate also sustains interest in national histories. In the Balkans, contemporary diplomats are as ready as their counterparts at Versailles in 1919 to use historical arguments to justify territorial claims. In eastern Europe postcommunist states are engaged in reassessing their pasts—often presenting the communist period as an aberration in the normal path of national development, just as German, Italian, and French historians explained away Nazism, Fascism, and collaboration. The European Union is also tempted by the use of history for purposes of historical legitimation. The Maastricht Treaty (1992) called upon the commission to "bring the common cultural heritage to the fore."

Nationalism in Music, Europe and the United States

OVERVIEW

Nationalism is one of the most significant political ideas of the nineteenth and twentieth centuries, at the heart of worldwide and local conflicts penetrating every region of the globe. It can be defined simply as a political ideology that aims to bring about or to increase the political representation or power of "the nation" and has appeared in many forms in a wide variety of circumstances. It is first and foremost a theory of political legitimacy, which arose and developed in opposition to various theories that derived political legitimacy from other principles. Firstly, nationalism contested the absolutist claim to the divine right of kings that had supported the monarchies of the European ancien régime, claiming that "the nation" was a more legitimate source of power than a monarch. Secondly, nationalism can be seen in opposition to the Marxist theories that aristocratic or bourgeois supremacy should or will be replaced by the unification of the proletarian lower classes around the world, where class is held to be legitimate, rather than a nation. Marxist theories give economics precedence over

culture and integrate the ideology of nationalism into a class-based understanding of the world by labeling it as a "bourgeois" theory of legitimacy. Thus nationalism in the nineteenth and twentieth centuries can be thought of as one theory of political legitimacy competing with others for acceptance.

In different historical contexts, nationalism has been compatible with a wide variety of other political positions, from nineteenth-century economic liberalism, to fascism in the early twentieth century, and indeed forms of Marxism in the post-colonial debate. It can be argued that much of its power as a mover of people comes from its flexibility and adaptability, which in turn can be attributed to the vagueness of the concept of the "nation" that underlies it. A nation is a group of people identified as sharing any number of real or perceived characteristics, such as common ancestry, language, religion, culture, specific institutions, historic traditions, or shared territory. The members of such a group can identify themselves and the others as belonging to the group, and who have the will or desire to remain as a group, united through some form of organization, most often political. Since no two nations need to be defined in the same way, many different combinations of characteristics may be used as the basis for a national identity at the foundation of a nationalist movement. Nationalism thus exists in a variety of forms, the common feature being the use of a culturally defined national identity in a quest for political representation, legitimacy, or power.

In order to understand the ideology of nationalism, it is helpful to examine several of the historical contexts in which nationalism has played a significant part, and then to turn to several theoretical approaches that have been used to classify and interpret nationalism, including areas of debate.

Historical Manifestations

Nationalism first came to prominence in the Western world during the late eighteenth and early nineteenth centuries. With roots in the Enlightenment, nationalism was proliferated during the French Revolution of 1789 and elsewhere by those who opposed absolutism, seeking the replacement of kings by nations as the source of all legal and political authority. The revolutionaries sought, for example, to bring about a constitutional, legal regime with a national assembly dedicated to representing the citizens of the nation, thereby overthrowing absolutism and the idea of a hierarchical society of privileges based upon birth.

The idea of the legitimacy of the nation was spread around Europe via the Revolutionary and Napoleonic French armies, who both took their ideology with them, as well as provoking "nationalist" reactions to the French conquests. Although following Napoléon's defeat in 1815 the absolute monarchies were restored around Europe, republican nationalism had already penetrated much of the Continent, and for the next half century there were repeated outbreaks of violence in support of popular nationalism. At this stage, many of the nationalists thought of each other as allies, that the fight against absolutism was one that needed to be fought by the many nations and peoples together. Secret societies of democratic, nationalist opposition, such as Young Italy, Young Germany, and Young Ireland, were affiliated with one another in the quest to overthrow absolutism. Wars and revolutions were fought both to

overthrow an absolutist order and to bring about some kind of representative liberal assembly, and at the same time to create individual nation-states, either through the unification of numerous smaller states (such as Italy and Germany) or via the breakup of larger empires (such as Austria-Hungary). During the first half of the nineteenth century, nationalism was primarily supported by the educated middle classes and associated with the economic doctrines of liberalism.

The reaction to invasion during the Napoleonic period sowed the seeds for the type of nationalism that would become more common later in the nineteenth century, when constitutional monarchies and republics had replaced absolute monarchies in most of the European nations. Once absolutism ceased to be the enemy, the common cause of the nationalists disappeared and nation-states found their principal rivals in one another. National leaders concentrated on solidifying their position both with respect to their own populations and with other nations through the championship of their own nation's virtues, often relative to those of other nations.

In each nation-state, national identities were encouraged and developed by national school systems and the proliferation of the symbolism of each nation through flags, anthems, or monuments. Historians such as Jules Michelet (1798–1874) in France, musicians such as Frédéric Chopin (1810–1849) or Giuseppe Verdi (1813–1901), and poets and writers from all over Europe, convinced of their political mission, encouraged

national awareness and gave the weight of their popularity and of their academically recognized publications to their nation's glory. Wars involving the conscription of the common citizens used nationalist rhetoric to motivate their soldiers to fight, and many wars were fought in the name of the defense of nations and of national honor and glory, culminating in Europe in World Wars I and II.

At this stage, nationalism became associated with more right-wing, populist parties who sought to promote their own national cultural values and to increase the power and glory of their nation, often at the expense of other nations or of immigrants, at least rhetorically. This kind of populist nationalism can be understood as more than just patriotism, which is a sentiment of loyalty to the nation to which one belongs, because it includes the beliefs that one's own nation has a higher calling and greater value than other nations.

Nationalism was also a key motivating factor in European imperialist expansion throughout the nineteenth century. However, this very imperialist expansion provoked a nationalist reaction throughout much of the rest of the world. Nationalist ideas of independence were brought by the colonizers, and the occupation and rule by the imperial powers led to the anti-imperial national independence movements. From the principle of self-determination found in Woodrow Wilson's Fourteen Points and used as a basis for the post-World War I international settlement came the theory to support the numerous twentieth-century

wars of national liberation both from colonial powers and from larger states composed of more than one “nation.”

The twentieth century saw innumerable conflicts in which nationalism was a motivating factor, and at the same time it saw the solidification of the system of nation-states as the primary form of social organization throughout the world. The United Nations became the primary international body, and nationhood became the goal of any group seeking to increase its political power.

Theories of Nationalism

In the same way that different nations may be defined according to quite different combinations of cultural characteristics, nationalism has not appeared in a single form, nor has it always conformed to the rough chronology outlined above. Sometimes nationalism emerges as a democratic antiauthoritarian movement, and at other times as a means to promote wars between nations, or obtain the unification or subdivision of territory, or as a force seeking the liberation of a territory from “foreign” domination. Nationalism’s diversity has made it extremely difficult to develop an all-inclusive theory that can explain every historical apparition. Distinctions can be made between reformist, unificatory, and secessionist types, between revolutionary and counterrevolutionary forms, between successive liberal and conservative variants, and between European and colonial manifestations of nationalism. Many of these

systems of classification have as their base a fundamental distinction between two types of nation: civic and ethnic.

Civic and Ethnic Nations

According to this model, civic nations are characterized by the early development of a unified state, a long and shared political history and an emphasis on citizenship, whereas ethnic nations are characterized by threatened elites, early democratization or late modernization, the consolidation of a national culture, xenophobia, and the repressive presence of polyglot empires. The model tends to categorize northern and western European nations such as Britain, France, or the Netherlands as civic, with Germany, Italy, Russia, and nations of the Austro-Hungarian and Ottoman Empires as ethnic. Held occasionally to be “good” and “bad” types of nationalism, the model aimed in part to explain the phenomenon of violent, expansionist, or anti-Semitic nationalism without qualifying all nationalism as negative. Recent work has demonstrated the limitations of this model, as all nationalisms exhibited both civic and ethnic characteristics, and a simple classification is not always helpful.

The Perennialists

The question of how certain cultural characteristics come to be identified as those defining a nation, as well as how they come to exist in the first place, has inspired two scholarly

debates: first the question of invention or preexistence of nations, and second whether nations and nationalism are linked with modernity. The first position with regard to the origins of the common cultural base is that national cultural characteristics exist and are a natural result of humans living in society. This is the position of the “perennialists,” who argue that nations, whether natural or not, have existed as long as humans have lived in “society,” as well as of many nationalists who seek to claim that their nations are “natural,” having existed for many centuries. According to this position, the history of nations and nationalism can be found by tracing the evolution of the cultural characteristics that define each nation and their inscription on the human landscape over time. Even where the characteristics are considered to be symbolic or mythical, they are held to preexist consciousness of them by the members of the nation.

This debate is linked to, but not completely identical with, the question of the existence of nations in the premodern period. Historians such as Adrian Hastings argue that even if they have not “always” existed, nations have existed in Europe for several centuries, and their development is not directly linked to the arrival of modernity. Their arguments are based upon the certain existence and consciousness of large ethnic groupings, as well as the use of the word *nation* by these groups to describe themselves during the Middle Ages.

The Modernists

The opposite position to those who describe nation as perennial is that nations as they are understood now have developed within a particularly modern context and are invented or imagined rather than naturally existing. This is the position of Benedict Anderson, who defines nations as “imagined political communities.” This imagination does not imply “falsity” but only that the reality of national cultural characteristics lies in the perception of them by both the members and those outside of the nation, rather than in an underlying “fact” of their existence independent of any consciousness of them. Further to this idea is the notion that much of the culture defined as national is made up of what Eric Hobsbawm and Terence Ranger have described as “invented” traditions: rituals or symbols that imply continuity with the past and seek, through repetition, to encourage certain patterns of behavior or thinking. According to this position, when examining questions about the nation it is more profitable to begin with nationalism and the nation than with the reality they represent. It is the differing concepts of the nation that eventually, through time, inscribe themselves into the very society that they claim to portray. Ernest Gellner writes that the high culture which characterizes nations is not something that is natural but that must be learned, and nationalism’s roots must be found in the pervading social order rather than in human nature, instinct, or the human psyche. The defined

national culture gradually infuses the rest of the population with the image(s) it has formed of itself.

According to this theory, the modern state is central in this endeavor as a framework within which nationalist movements can operate. It is also necessary as a mechanism to encourage the people's identification with national history and other images, as well as the extension of the national high culture that is at the center of the nation's identity. John Breuilly stresses this role of the modern state and its institutions in the growth of nationalism and argues indeed that the modern state is the most important feature of the political context in which a nationalist movement can arise. This does not imply that nationalism is a direct product of the modern state, only that within the context of such a state nationalism has much greater potential as a political force. Nationalism, seen as a form of political opposition to absolutism within the newly emerging type of state, leads directly to a conflict over organization and sovereignty. The increasing significance of the state, its institutions and administrative structure, as well as its ability to control and manipulate images in the modern period also contribute to the extension of both national ideologies or traditions and the literate culture to the masses once one group of nationalists has gained control.

The development of technology that enables mass communication, rapid travel, and sophisticated record keeping provided nation-states with enhanced resources to preserve the loyalty of populations and also to encourage what Michael Billig has termed *Banal Nationalism* (not "banal" in the sense of unimportant). He refers to the phenomenon of the reinforcement of national identity through numerous unconscious reminders of the nation in all of the small habits of social life, via expanding material culture and through the media. From "national" forms such as income tax or social security to the shape and color of mailboxes, lettering on license plates, vocabulary developed to describe diplomas, jobs, laws or customs, and national weather and news reports, everywhere there are subtle and subconscious reminders of the nation, in such a way as to make that which is national seem natural and given.

Permeating societies at a variety of conscious and subconscious levels, capable of application to any number of combinations of group characteristics, and compatible with a wide range of other political ideologies, nationalism is not yet a political idea that has inspired consensus among those analyzing it. Nevertheless, over two hundred years after its emergence as a political theory, it is still one of the most powerful political forces in the world.

AFRICA

The topic of African nationalism has been repeatedly contested and redefined over the past century. At the end of the nineteenth century, the European powers divided the continent and ruled virtually all of Africa, and African nations lost their sovereignty. During the 1950s and 1960s, when Africans began to seriously resist colonial rule, Africa underwent a major transformation and each colony eventually gained its freedom. Africans, in general, united in hopes of regaining their sovereignty. *Nationalism* originally referred to the process of uniting and regaining freedom from European rule, but it was also defined by pioneer African leaders to mean the creation of new nations as well as their economic and political transformation.

Development of African Nationalism

While a country such as Britain or Germany is viewed as one nation, in reality each contains a variety of nations or peoples. Uniting these various groups through common interests creates a nation. These nations are, as Benedict Anderson writes, "imagined" rather than "real." Anderson explains:

[A nation] is an imagined political community. . . . It is *imagined* because the members of even the smallest nation will never know most of their fellow-members, meet them, or even hear of them, yet in the mind of each lives the image of their communion. (p. 6)

A nation is a created community that believes that, though the community is diverse, as a whole it has a common interest that trumps all other interests; nationalism is the formation of this national identity.

African nationalism attempted to transform the identity of Africans. Rather than seeing themselves as Igbo or Hausa,

Kikuyu or Masai, nationalist leaders wanted Africans to view themselves as Kenyan, Nigerian, and so forth. While the idea appears simple in theory, it proved far more difficult in practice. The colonial powers never considered that the colonies would eventually form sovereign nations, and ethnic groups were treated as separate “tribal” or religious groups so that colonial officials could play them against each other, thereby keeping a colony’s populace divided, and, thus, less likely to work together to overthrow European rule. Various groups continued such practices even after independence, and the African continent in general suffered from religious and ethnic strife during the latter half of the twentieth century.

To compound matters further, the modern boundaries of African nations are not age-old ones recognized for centuries but arbitrary lines decided by European rulers in Germany at the Congress of Berlin in 1885. The events following that Congress are known as the “Scramble for Africa.” Whereas many European nations have one ethnic group, this was not the case for African nations, colonial boundaries throughout Africa were not in alignment with precolonial ones. Colonial borders often split ethnic groups, spreading them into various countries rather than uniting them into single nations. The Somali, for instance, were split up among four colonies. Therefore, when examining African nationalism, one must consider that borders are not “natural” or old, and that every African colony has many different factions.

A major dilemma that confronted early African nationalists was how to retain an African identity while appropriating the positive attributes of Western development. Whether to completely adopt English or French ways, to reject them completely, or find some sort of compromise were questions that Africans had to confront. Some, who realized the strengths of their missionary education and Christianity and were content to perpetuate colonial norms, felt that Africans should strive to mirror European culture and life.

Initially, African nationalist movements were led by middle-class intellectuals. These elites usually had a missionary education and viewed themselves as brokers between colonial officials and the African people. As Basil Davidson observes: “These were minority movements, restricted mostly to the ‘lawyer-merchant class,’ timid in their protests, opposed to any call for mass support” (p. 74). In other words, these early nationalist movements were inherently elitist, not true mass movements, and, thus, were not representative of “the people.” These elites were much wealthier and better educated than their peers, grateful for the advantages bestowed on them by their missionary education, and loyal to the colonial powers. Instead of transferring governing power to the African people, many of these early leaders felt that the colonial state should simply hand over power to them.

Others envisioned an “Africa for Africans” and sought to reclaim Africa for the native peoples. They refused to adopt European values and many aspects of Europe’s cultures, and thought it fruitless to do so. Edward Wilmot Blyden (1832–1912), widely regarded as “the Father of Cultural Nationalism,” felt that Africans must revive their cultures and relearn their traditions from those least influenced by colonial rule. Throughout the period of colonial rule, Africans were

repeatedly told that their cultures were uncivilized, primitive, evil, and barbaric, and that their history began with the arrival of Europeans. Therefore, nationalist leaders had to “decolonize” the African mindset as well as overthrow colonial rule. African nationalists sought to “reeducate” their followers, and began to promote black pride. African foods, music, dress, architecture, and religion were celebrated and promoted as equal to, if not better than, their European counterparts. While these steps may seem minor, nationalists believed that, without such a cultural revival, Africans would forever perceive themselves as inferior to Europeans if they failed to regain the pride and self-worth that colonization had taken away from them.

This return to “tradition,” however, was also problematic because African traditional rituals, leaders, governments, and policies were exploited or manipulated by colonial governments, often unintentionally. As Hobsbawm and Ranger explain:

British administrators set about inventing African traditions for Africans. Their own respect for “tradition” disposed them to look with favour upon what they took to be traditional in Africa. They set about to codify and promulgate these traditions, thereby transforming flexible custom into hard prescription. (p. 212)

Pan-Africanism

A major advance in African nationalist movements came with the Pan-Africanist movement. Though its roots were in early abolitionist movements, Pan-Africanism, which sought to unite Africans and overcome ethnicity by stressing the similarities and connections among all Africans, blossomed in the early twentieth century. Originally led by blacks in America, Britain, and the Caribbean, the movement did not initially fully represent the needs of Africans, but blacks throughout the world came to view themselves in a position similar to those of others of African descent in Britain, the United States, and throughout Latin America.

The two most notable leaders of early Pan-Africanism were Marcus Garvey (1887–1940) and W. E. B. DuBois (1868–1963). Garvey, whose outspoken nature attracted many followers, believed that blacks would never be treated as the equals of whites in America and must return “home” to Africa if they were to be free. DuBois, who had earned a doctorate in history from Harvard in 1896, may be the greatest Pan-Africanist intellectual ever. He argued that Africa had a glorious past and that Africans had deeply influenced Western civilization. He believed that Africa had to be freed from colonial rule if African Americans were to be liberated, and his work sought to end the caricatures of blacks as the “clown of history, football of anthropology, and the slave of industry” (p. ix).

The Great Depression hurt Africa greatly. Employment, especially in rural areas, was scarce. Many migrated from the countryside to urban areas, and the populations of cities swelled. These areas became overcrowded and poverty was rampant. The European powers were ill-equipped to combat these developments because resources and attention were focused on World War II. This furthered discontent and Africans became more disorderly. Bolstered by the influx of returning soldiers,

nationalist movements throughout Africa were energized. By the 1940s, nationalist movements were becoming more radical, and Africans everywhere began to protest colonial rule as they increasingly realized how wrong and oppressive it was.

As the century progressed, the nationalist movements began to attract more people and to wield more influence. Leaders who could relate to and represent more than one group or class became household names and heroes. These leaders mobilized “the people” rather than a select few or one ethnic group. Obafemi Awolowo (1909–1987; Nigeria), Kwame Nkrumah (1909–1972; Ghana), Jomo Kenyatta (1889–1978; Kenya), Julius Nyerere (1922–1999; Tanzania), and Nelson Mandela (b. 1918; South Africa) belong to this new generation of leaders who successfully reached out and enlisted the support of their countries’ population.

The Italian invasion of Ethiopia in 1935 marked a turning point in African history. Ethiopia was Africa’s only truly independent nation. The invasion radicalized African nationalist movements and caused Africans to see themselves as peers and comrades in similar struggles. In general, they felt that Ethiopia symbolized a free, proud, civil, and successful Africa. As long as Ethiopia remained free of colonial domination, many believed that their dream of freedom and independence remained alive and achievable. If Ethiopia fell, however, then the hope for an independent Africa would die with it. Africans across the continent rallied to support Ethiopia, and blacks around the world attempted to supply both military and financial support for the Ethiopian cause.

African Nationalism after World War II

The next significant event in the development of African nationalism was World War II. Nearly two million Africans were recruited as soldiers, porters, and scouts for the Allies during the war. When these soldiers returned home, they returned to colonial states that still considered them inferior. Many veterans had expected that their dedication to colonial governments would be recognized and they would be rewarded accordingly. This was not to be, and these soldiers returned home to conditions worsened by a weak global economy. Because they had fought to protect the interests of the colonial powers only to return to the exploitation and indignities of colonial rule, these men became bitter and discontented.

In 1945, the Pan-African Manchester Congress in England marked a turning point because it attempted to address the needs of all blacks. Pan-Africanism began to stress common experiences of blackness and sought the liberation of all black people around the world. African leaders became more influential in the movement as they used it to attack colonial rule, and the movement would become more African-based after 1945.

Pan-Africanism proved very popular among nationalist African leaders because it offered a way for them to overcome both regionalism and ethnic divides by stressing commonalities and a common oppression. By the 1950s, Pan-Africanism had profoundly influenced almost every African nationalist leader: Kwame Nkrumah, Kenyatta, Nyerere, Kenneth Kaunda (1964–1991; Zambia), Haile Selassie (1892–1975; Ethiopia), Albert Luthuli (c. 1898–1967; South Africa), and Nnamdi

Azikiwe (1904–1996; Nigeria), all were deeply affected by the movement.

Kwame Nkrumah is regarded as the father of “Africanized” Pan-Africanism. Nkrumah detested colonial rule. Schooled in the United States, he was deeply influenced by the African American civil rights struggle, and began to emphasize the similarities between those struggles and those of African peoples. He argued that African workers and peasants needed to reclaim their independence, and advocated the use of force if necessary. For this to happen, Africans had to shed their strong ethnic or religious identities and see themselves simply as black or African rather than Yoruba or Fante. Nkrumah’s intense disdain for colonial rule, zealous enthusiasm for independence, and the ideal of a United States of Africa made him popular among Africans throughout the continent. Nkrumah argued that they could not look to any outside power for support, and believed that foreign economic and political forces eroded African values. He also disagreed with the idea of returning to “African tradition.” Instead, he argued that a new African identity must be created out of Islam, Christian, and traditional cultures.

Nnamdi Azikiwe was a prominent Pan-Africanist and an important thinker. Unlike most Pan-Africanists, Azikiwe rejected various aspects of Africa’s past such as chieftaincy and informal education. He also rejected Nkrumah’s united Africa, and advocated the use of colonial boundaries to define nations. For him, a united Africa meant cooperation, but not an actual unification of the continent. As Nigeria achieved independence and rapidly moved toward regionalism, Azikiwe abandoned his Pan-Africanist ideals for regional politics.

Pan-Africanism reinforced notions of black pride, and African history was used to foster a national identity. Many nationalist leaders stressed past empires (for example, the Mali and Asante), achievements (such as those of great Zimbabwe and ancient Egypt), and leaders (Shaka Zulu [c. 1787–1828] and Emperor Menelik of Ethiopia [1844–1913] among them) as a means to instill pride among African peoples. By stressing the continent’s successes throughout its history, African leaders sought to convince their followers of their own worth and that Europeans were not superior to them. Again, the aim was to restore pride in Africa and create a sense of unity that nations could use to foster nationalism.

African women were major contributors to resistance to colonial rule and the promotion of nationalism. Many argue that women fared the worst under colonial rule. Governments such as those in Rhodesia, Kenya, and South Africa sought to restrict women’s movement and even banned them from urban areas. In rural areas, they were often expected to maintain food production and raise children while their husbands rotted in jails, migrated to other areas in search of wage labor, or fought in wars (both in World War II and various liberation struggles). These women did not idly sit back and allow colonial governments to impinge on their rights, and, in response to their harsh situation under colonial rule, they organized protests, boycotts, workers’ strikes, and demonstrations. In Kenya, Zimbabwe, Algeria, and other areas that attempted armed struggle, women as well as men carried messages, spied,

and prepared meals. Overall, their impact on the anticolonial and nationalist movements throughout Africa was profound.

While Africans were widely successful in fostering nationalism in order to overthrow colonial oppressors, maintaining this unity after independence proved far more difficult. African nationalism was overtly anticolonial. For these nationalist movements, energy was concentrated on gaining freedom rather than planning how to run a country once freedom was achieved. Overthrowing colonial regimes was quite difficult, so these leaders could not afford to spend manpower, funds, and effort planning how to govern their new nations if they were successful.

Postcolonial Nationalism in Africa

Each African nation took a unique path toward independence. Some, such as Algeria, Mozambique, and Zimbabwe, took extreme measures like waging a guerilla war on the colonial state; most countries pursued nonviolent means and achieved a peaceful transfer of power. But there were varying degrees of success. Some countries, such as Ghana, became completely independent while others, such as Congo, continued to depend on Europe, and their independence was superficial rather than absolute.

As the age of independence dawned, African leaders faced the daunting tasks of developing their vastly underdeveloped economies and reversing the economic ills of imperialism. Largely, African nations leaned toward leftist ideologies (such as Marxism and socialism) or capitalism. Because the Soviet Union possessed no African colonies, it was perceived as an ally of anticolonial movements. Nyerere, Nkrumah, Ahmed Sékou Touré (1922–1984), and Muammar Gadhafi (b. 1942; Libya) attempted to “indigenize” leftist doctrines and became the continent’s leading leftist thinkers. They blamed Western capitalists’ imperialism for Africa’s ills, and believed the overthrow of capitalism and imperialism was the only way to truly liberate Africa. Precolonial African societies were based on communalism, and many viewed socialist and Marxist ideologies as a way for African nations to return to their precolonial ways of living because they promised economic equality and a classless society. Others felt that nations on the left, such as Cuba, the USSR, and China, should be looked to as allies and for aid; the leftist powers proved incapable of providing enough aid and support, however, and both socialism and Marxism have been abandoned throughout Africa. Nations that chose capitalism proved equally unsuccessful because African economies were not diverse enough to sustain development. World Bank and structural adjustment programs proposed by the West only worsened Africa’s underdevelopment. The debt of these nations increased exponentially and their economies weakened considerably.

Consequently, African nationalistic ideals of the 1950s and 1960s have waned. African nations have not succeeded in convincing their countries’ populations to put national interests ahead of regional, ethnic, or religious ones. In various parts of Africa, politics has progressed so that leaders must rely on the backing of their own ethnic group, and, if one branches out too far, he or she will be replaced by someone who will better represent interests of the specific ethnic group. In other words, being loyal to one ethnic group, religious faith, or

geographical region can offer protection, but it also creates great divides in society. Ethnic divisions have hurt both nationalism and development in Africa. Countries such as Nigeria, Burundi, Rwanda, Uganda, and Zimbabwe have had their share of ethnic rivalries, civil wars, and genocide. In order to avoid ethnic clashes, some leaders advocated socialism, military rule, or one-party states, but these ideas have failed and such maneuvers have served only to widen ethnic divisions.

Many African nations have failed to maintain a strong sense of nationalism or national identity. Ethnic rivalries, diseases, unemployment, globalization, corruption, greed, and natural disasters have all played major roles in the dire reality that is post-independence Africa. African nationalism of the 1950s and 1960s was overtly anticolonial or anti-European. Once the colonial powers formally pulled out, Africans looked inward to consolidate power and rid themselves of political rivals. Military coups, one-party political systems, widespread corruption, and tyrannical autocrats became the norm.

As a result, numerous scholars have provided many valid criticisms of nationalist movements. Initially, scholars harshly criticized African ruling parties and political systems as they tended to promote corruption, violence, and tribalism as well as sponsoring useless plans for development. Most experts of the 1960s believed that independence would bring about progress and development. By the late 1970s, such optimism had been eradicated, most scholars became pessimistic about Africa’s future, and “Afropessimism” became an ideology of its own. Civil wars, depleted economies, increasing debt, skyrocketing unemployment, and despotic leaders led many to become disheartened and to give up hope.

More recent critiques have been twofold. One type offers deeper analyses of how these negative systems operate and goes beyond identifying the problems in order to fully understand how coups and tyrants can be eliminated. Leroy Vail’s work is an example of this approach. His *The Creation of Tribalism in Southern Africa*, an edited collection of essays, aims to explore why and how tribalism has been employed throughout both the colonial and postcolonial eras. Instead of accepting tribalism as inevitable, Vail discusses how ethnic identities have been manipulated and strengthened over the past century, while demonstrating how the educated elites and the continent-wide movement toward one-party rule promoted tribalism: it was a way for leaders to secure support even when their policies failed. As he puts it, “They concentrate upon its heroes, its historical successes, and its unsullied cultural purity, and are decked out with the mythic ‘rediscovered’ social values of the past” (p. 14). In other words, tribalism and ethnic affiliations became easy ways to achieve or consolidate power when development failed. They have allowed regional nationalism to blossom while weakening national identities as a whole.

The second type of critique emphasizes areas where Africans themselves have succeeded despite such difficult surroundings. Richard Werbner and Terence Ranger document how Africans, in general, react and cope with despotic leaders and harsh political realities. Werbner and Ranger aim “to show how and why the present reconstructions of personal and collective identity, of social subjectivity, and of moral agency draw on the

culturally nuanced resources of social memory for negation, for affirmation, and for playful fun” (p. 4). Their work recognizes agency on the part of the African masses, instead of assuming them to be helpless pawns in the hands of tyrants. While these achievements are not monolithic, acknowledging them does serve to diminish the pessimistic view that Africa is doomed to remain lawless and antidemocracy.

While Africa has failed to develop along the lines of nations such as Japan or the United States, nationalism has not been completely erased. Manifestations of nationalism and national unity are most apparent during times of natural disaster, sporting events, and international crises. For Africa to compete in the twenty-first-century’s global economy, African nations must foster stronger national identities that can be sustained for an extended period. The unity has to be permanent and not as easily dissipated as the attempts of the 1960s. It must also be strong enough to overcome ethnic divisions and rivalries that have plagued the continent since independence. Poverty, AIDS, starvation, globalization, and negative interference by the West may be common problems that will finally unite Africans and foster such nationalism.

CULTURAL NATIONALISM

Literary critics and historians use *cultural nationalism* to refer to collective practices that form modern political communities within, un sanctioned by, or even undercutting state authority. Such collective practices include the “high” culture disseminated via public media, established in publicly funded institutions such as universities and museums; as well as the “low” culture of popular performance and markets. Cultural nationalism, then, is distinct from patriotism, national literatures, or similar state-referenced collective identities. At present, cultural nationalism figures in discussions of why English literature should be taught in universities, as well as those concerning the content and selection criteria for what is taught as comparative literature. Even though Britain plays a minor role in international trade and politics, Britain’s works of literature continue to serve as the standard of taste and literary value. Bill Ashcroft, Gareth Griffiths, and Helen Tiffin (1989) note that, even when postcolonial societies achieve political independence, the issue of colonialism remains relevant. Early-twenty-first-century historians also use cultural nationalism to discuss affinities, experiences, or practices that serve as the basis for common political views; what unites individuals (who may even carry different passports) could be common language and ethnic identity—even literary and musical tastes, dramatic films, cuisine, and sports spectatorship.

Two references to the definition of culture can serve as starting points for a discussion of cultural nationalism in literature. The first is from Raymond Williams’s *Culture and Society* (1958). His four-part definition considers culture from both humanistic and anthropological perspectives, granting the same importance to those who define cultural practices for the global North’s institutions of higher education, as to those who live culture every day. Williams liberates nationalism from the state and its patriotisms. Those who were denied privileged access to the state and public institutions—women, economic underclasses, and others—participated in forming the nation even though Empire was a fundamental and constitutive part of Europe’s social fabric, intellectual discourse, and the imaginary lives of its citizenry. Politically committed British academics led by Stuart Hall (*Popular Arts* [1965] and *The Young Englanders* [1967]) insisted that ongoing economic and political relations with the postcolonial United States formed “universal” traditions increasingly identified with European-American modernity.

Culture and Nationalism: Separate Ideas

The term *cultural nationalism* has gained increasing acceptance since the late twentieth century. Previously, however, the ideas of culture and nationalism were treated separately.

Jean-Jacques Rousseau (1712–1778) was identified as the father of modern political nationalism, a role he shared with Johann Gottfried von Herder (1744–1803). Culture, that is, as defined before the idea of cultural nationalism was embraced, was closely tuned to Europe’s classical and modern history and philosophies: Etymologies and definitions for culture and civilization could be traced from the classical Mediterranean, including those provided by Giambattista Vico (1668–1744), von Herder, and Immanuel Kant (1724–1804).

Focus on the separate ideas of culture and nationalism continued among certain communities in the late twentieth century. In addition to accepting von Herder on culture, Ernst Gellner (1983) returned to Kant’s ideas regarding Europe’s “modern” ways of thought. Gellner relied on both von Herder and Kant to describe how education imposed “high culture” on industrial societies. National identities were not Europe’s primordial heritage; rather, for Gellner, nationalism was awakened or invented to accomplish the kind of cultural homogeneity industrial society considered necessary: “nations, like states, are a contingency, and not a universal necessity” (p. 6). Elie Kedourie gives von Herder his due with the assertion that nationalism was invented in Europe in the early nineteenth century. For Kedourie, nationalism seemed alien to the non-European world, the residents of which are denied authentic recourse to the claims of the nation: expression of unique character, self-determination, or contribution from their natural genius to humanity’s common fund.

From Europe to a Worldview

In the mid-1970s, observations concerning modern Europe and its ability to represent a universal ideal became increasingly contentious. Thus the discussion in this article turns from Europe’s culture to a worldwide perspective, following a brief detour from structuralist to poststructuralist philosophy, since that transition influenced studies by historians and literary critics of the world outside Europe.

Structural philosophy and linguistics used such binary oppositions as true/false, civilized/savage, culture/nature, modern/primitive, and public/private to decide what was worthy of study, and what was not. These opposing terms were indebted to the same forms of authority that created modern nation-states in Europe, and therefore owe some part of their power to states’ monopoly over coercive force. Jacques Derrida and other poststructuralist philosophers recognize that such binary terms are not equally valued since the term in the structurally dominant position assumes the power to define its opposite. Such hierarchical oppositions grant mind power over nature, cognition privilege over feeling, and reason over desire, as discussed in Derrida’s article, “La Différance” (1972). Feminists adopted similar strategies to conceptualize masculinist authority. For others, the West enjoyed a cultural nationalism not merely over “The Rest,” but at its expense.

Scholars employed in English and comparative literature departments around the world may describe their work as Third World literature, or literature of resistance. Discussions of cultural nationalism cluster around language, genre, and analogy. While postcolonial intellectuals recognize neocolonial economic and political relations, many write in European

languages. Drama and poetry in local languages were central to postcolonial politics of global literature; among prose genres, fiction and travelogue, which are closely tied to European forms, are used for critiques of nineteenth-century modernities. And by means of analogy, the feminine is marked as differentiated from European modernities.

Franz Fanon’s work—in particular, an address to the second Congress of Black Writers and Artists, which met in Rome in 1959, published as a chapter in *Wretched of the Earth* (1963)—asserts that the demand for a national culture and the affirmation of such culture’s existence represents a special battlefield. Reference to the dignity, glory, and solemnity of a past culture rehabilitates the nation when addressing colonialism’s distortion, disfiguration, and destruction of precolonial histories. Yet in discussing Arab cultural nationalism and negritude, Fanon notes the fatally ambiguous position of the native intellectual as it develops through three phases: unqualified assimilation, poetic exoticism, and finally the literature of national struggle. It is the “progress of national consciousness among the people” that “modifies and gives precision to the literary utterances of the native intellectual” (p. 239).

Ngugi wa Thiong’o noted that colonialism entailed a double procedure. Colonialism meant the deliberate discounting or even destruction of the colonized culture, whether its art, dance, religion, history, geography, education, or oratory, as well as the conscious elevation of the colonizers’ language (1986, p. 16). Beginning with the founding authors of liberalism (David Hume, Thomas Jefferson, and Georg Wilhelm Friedrich Hegel), nineteenth-century modernity denigrated the colonized. This system of domination’s final triumph was symbolized by the dominated singing the system’s virtues; the literature Africans penned in European languages was identified as African literature, as if there had never been a literature in the languages of Africa. But writing in African languages will only bring about an African cultural renaissance if these texts convey a struggle to create postcolonial political and economic community.

Michel Foucault’s philosophical/historical work, *Discipline and Punish* (1977), provided flexibility to those working in cultural nationalism outside Europe. Prison authorities, he notes, maintain discipline among the incarcerated through surveillance, normalization, and examination; the written language was essential to the influence of these techniques. The power of writing, Foucault explains, is that description and classification function not as procedures for creating heroes, but for transforming humans into objects and subjects. Taking direction from Foucault, Edward Said found coercive force exercised through those texts describing the predominately Islamic world. The radical otherness of the Islamic world need neither be praised nor condemned; once differentiation has been accomplished, an exemption has been made for universal humanism. Said’s *Orientalism* (1979) was widely read for its ability to forge a link between the literature that described the Orient, and Europe’s exercise of coercive force on overseas territories.

Barbara Harlow queried whether poststructural literary criticisms could be useful outside the cultural traditions that produced them: does “deconstruction” facilitate “decolonization”? Armed struggles for national liberation were and are no more

or less crucial than the struggle for cultural productivity and historical record. In describing the literature of Africa, the Middle East, and Latin America as resistance literature, Harlow notes that such works bear the mark of national liberation movements, that the commitment to political struggle prohibits “academic objectivity” or “scientific dispassion.” Post-colonial literature is always public, never private: “Resistance literature calls attention to itself, and to literature in general, as a political and politicized activity. The literature of resistance sees itself furthermore as immediately and directly involved in a struggle against ascendant or dominant forms of ideological and cultural production” (pp. 28–29).

Frederic Jameson (1987) argues that Third World literatures are distinguished by their use of allegory; in such texts, ostensibly personal issues such as libidinal investment are understood to bear public significance. However Jameson notes the incompleteness of African states’ independence, in that new state structures were not matched with the reconfigured social relationships and consciousnesses formed in revolutionary struggle. Indeed reference to cultural nationalism remains indebted to the new social movements: conscious public activism against militarization and environmental abuse, against class, race, gender, and sexual oppression. As Ella Shohat notes, due to “the collapse of the Soviet communist model, the crisis of existing socialisms, the frustration of the hoped for tri-continental revolution (with Ho Chi Minh, Frantz Fanon, and Che Guevara as talismanic figures) the realization that the wretched of the earth are not unanimously revolutionary (nor necessarily allies to one another), and the recognition that international geo-politics and the global economic system have obliged even socialist regimes to make some kind of peace with transnational capitalism” (p. 100).

Benedict Anderson built on the work of Gellner, Eric Hobsbawm, and Terence Ranger. Hobsbawm most usefully noted that those practices that seek to inculcate norms through reputation, and automatically imply continuity with the past, may be of quite recent origin or even invented. Ranger noted that European militaries and administrations in Africa relied on the practice of disseminating invented traditions. While for Gellner, the word invent meant fabricate or falsify; for Anderson, nations were “created,” “thought out,” or even “imagined” communities. Anderson identifies the nexus of market capitalism and the print industry as the institutional space for development of modern, national languages.

In responding to Anderson, Partha Chatterjee notes that Europe’s history was not that of the rest of the world: historically specific correspondences between economic change and epistemic privilege were unique to European society. Chatterjee identifies three “moments” for nationalist thought, as expressed in literature and political polemic. The first, the moment of departure, is predicated on essential differences between the West and the Rest, noting that while those not living in Europe or North America are deficient in European modernities, that lack is compensated for with spiritual gifts. The second, the moment of maneuver, described as the embrace of modernities antitheses as the national culture, may lie closest to Fanon’s ideals for postcolonial intellectuals. In the third, the moment of arrival, nationalist thought is phrased in its own vocabulary of modernist order. In another work,

Chatterjee notes the rhetorical significance of women’s issues to national movements. The discovery of tradition by nationalist movements relegates “the women’s question” to inner domains. Given the power of European modernist claims in the material sphere, colonial rule threatened the very institutions of home and family. The nationalist project justified selective appropriation of Western modernity along the lines of public/private life, specifying that women’s bodies and the domestic circle would occupy a central position in cultural nationalism.

Gayatri Spivak sharpened poststructuralist thought’s importance for worldwide cultural nationalism. She noted the exclusivity of Immanuel Kant’s metaphor “the turning of the mind to the feeling of the sublime” in *Critique of Judgment* (1790). Where other poststructuralists note the presence of unbalanced power, Spivak argues that universal observations exclude entire categories. The West’s knowledge hegemonies work at two levels enabling cultural imperialism to crush cultural nationalism. At one level, they define the system of concepts by which social and political reality is lived. These concepts need not be consensual or universal in order to be effective. At another level, hegemonies fragment the social order, so that divisions—along boundaries of class, race, and gender—proliferate.

One of the new locations for studies of cultural nationalism was the United States. While the United States witnessed a civil rights movement and university-based protests throughout the 1960s, such disturbances were only indirectly responsible for politicizing the movement for new forms of knowledge in academia. Rather, increasing university enrollment following general prosperity throughout the country meant that history and literature departments continued to hire scholars. The academic profession became more inclusive as international scholars and scholar-activists became tenured. While class-aware, subaltern, and feminist approaches may remain marginalized in Europe (whether shunted to Britain’s new universities or parked in France’s provincial institutions), they are surprisingly well represented in the most richly endowed institutions of the United States.

While discussions of cultural nationalism remain active in scholarly monographs in the early twenty-first century, interest in the subject is also widening in academic publishing. During the 1970s, editors at journals such as *Comparative Studies in Society and History*, the *Journal of African History*, the *Journal of Modern African Studies*, and the *Journal of the History of Ideas* entertained discussions of cultural nationalism. By the 1980s, literary journals such as *Callaloo*, *MELUS*, *Social Text*, the *New German Critique*, *Public Culture*, and *Yale French Studies* printed articles that mingled culture with nationalism; for example, a 1995 issue of *Boundary 2* was titled “Beyond National Cultures.”

MIDDLE EAST

Nationalism is generally regarded as a recent development in the Middle East, a contingent phenomenon produced by the unique conditions of the modern era. Prior to the nineteenth century, concepts of collective identity and allegiance appear to have been defined primarily on the basis of lineage, locale, or religion—communities of sentiment and solidarity either smaller or larger than the nationalisms that subsequently emerged. For the region's agricultural and pastoralist majority, living in largely self-contained village or nomadic communities, one's clan, tribe, or village are presumed to have been the primary objects of self-identification and affiliation. For the area's literate minority, usually urban residents and immersed in a milieu dominated by religion, collective identity was defined by a combination of locale (loyalty to one's city), polity (being a member of the ruling elite), and most vitally religion (self-definition as Muslim, Christian, or Jew). Ethnic or linguistic concepts of identity, on the other hand, were conspicuous by their absence. Terminology illustrates the point. Prior to the twentieth century the word *Turk* denoted a rural resident of Anatolia, not a member of the educated multiethnic elite of the Ottoman Empire. In Arab usage the term *Arab* referred to the wild Bedouin of the desert, not the area's sophisticated urban population.

The Emergence of Modern Nationalisms

The nineteenth century was the seedtime of nationalism in the Middle East. The region's geographic, linguistic, and religious heterogeneity has provided the basis for numerous and competing nationalist movements.

Fueled by their religious distinctiveness and their contacts with the European milieu where nationalism was becoming the hegemonic referent for collective identity, some of the region's Christian minorities developed nationalist movements prior to the region's Muslim majority. Most prominent in this regard were the Maronites of Mount Lebanon and the Armenians of eastern Anatolia, among whom constructs emphasizing their historical separateness and right to political autonomy took hold in the nineteenth century. Thanks to European assistance, Lebanon gained autonomous status within the Ottoman Empire by the 1860s. Such was not the case in historic Armenia, where an active nationalist movement came into conflict with the Ottoman state as well as with the area's Turkish and Kurdish population in the later nineteenth century, and where fear of nationalism led to the mass expulsion and massacre of Armenians by the Ottoman government in the early twentieth.

In both Egypt and Iran, distinct geographical areas existing as autonomous polities with their own ruling structure (Iran since the sixteenth century, Egypt since the early nineteenth) led Westernized Egyptian and Iranian intellectuals to assert the existence of historically unique Egyptian and Iranian "nations" by the later decades of the century. Egyptian nationalism took political form by the later 1870s, when indigenous Egyptian elites sought greater control over an originally Ottoman ruling family and the European financial domination that dynastic extravagance was producing; their movement's slogan "Egypt for the Egyptians" succinctly expresses its overall thrust. Active nationalist activity in Iran dates from the 1890s and was produced by much the same combination of dynastic incompetence and foreign economic penetration; in the Iranian case it generated a formally successful Iranian constitutional movement in the early years of the twentieth century.

For the Turks of Anatolia and the Arabs of the Fertile Crescent, both living under Ottoman rule through the long nineteenth century, the causes producing nationalism were parallel. A precondition for modern Turkish and Arab nationalism was the development of a firm sense of ethnic identity. This was stimulated in the Turkish case by the discoveries of European Turkology, the uncovering of the pre-Islamic history of the Turkic-speaking peoples in Central Asia and beyond that fostered identification with a historic ethnic distinct from both the Muslim community and the multiethnic Ottoman Empire, in the Arab case by the process known as the "Arab Awakening," the blossoming of Arabic literature and history that occurred in the middle decades of the nineteenth century. As elsewhere in the Middle East, increasing elite contact with Europe and a growing awareness of European ideas also played a role. Nationalism is a modular concept, "available for pirating" (to pirate Benedict Anderson's phrase) by all those impressed by Europe and the world supremacy its nations were able to achieve in the modern era.

The catalyst turning a heightened sense of ethnic identity into visible Turkish and Arab nationalist movements was the trajectory taken by the Ottoman Empire over the course of the nineteenth century. On the one hand, the empire's territorial crumbling as European powers established their control over its African dominions and the peoples of the Balkans gained independence raised the possibility of a similar dismemberment of its Asian heartlands, thereby generating a search for an alternative base for viable community. On the other hand, the Ottoman government itself assumed a more reactionary character by the later decades of the nineteenth century. For educated Turks and Arabs, who were absorbing the values of individual liberty and participatory politics from their European mentors, the Ottoman Empire increasingly came to be seen as an undesirable framework for modern life.

Turkish and Arab ethnic nationalism became active movements only in the early twentieth century, specifically in the "Young Turk" era (1908–1918). Among Turks new organizations with an explicitly Turkish emphasis (the Turkish Society, formed 1908; the Turkish Hearth Clubs, formed 1912) emerged; in the press, extravagant ideas of uniting all Turkic-speaking peoples in a ethnically based "Turanian" state were voiced; on the governmental level efforts at increased centralization emphasized the primacy of the Turkish language within the state and sometimes gave precedence to ethnic Turks (although not to the degree once assumed). Similar organizational and intellectual trends occurred in the Arabic-speaking provinces of the Fertile Crescent: new Arab societies with a political agenda (the Ottoman Administrative Decentralization Society, 1912) emerged; demands for Arab autonomy were expressed in the press; and an Arab Congress was held in Paris in 1913 to promote Ottoman decentralization. The continued drive for centralization being undertaken by the Young Turk regime ran counter to what was originally an Arab demand for provincial decentralization. By the eve of World War I, a new trend was developing in the Arab provinces as prominent individuals and secret societies began to think of Arab independence as the only way to avoid subjugation within what politicized Arabs were coming to see as an oppressive "Turkish" state.

Modern Jewish nationalism (Zionism) did not require a similar process of the rediscovery of national distinctiveness. A sense of collective uniqueness and solidarity existed among Jews well before the nineteenth century. This sense was solidified by Judaism's liturgical language (Hebrew), the rich tapestry of distinctive customs, and the shared isolation of and discrimination against Jews living in European countries. An active Jewish nationalist movement based on this sense of distinctiveness was produced on the one hand by the gradual process of emancipation and assimilation experienced by Jews in parts of Europe during the nineteenth century, a process of historical change that also involved the acceptance of modern nationalist concepts, and on the other by growing European anti-Semitism, a phenomenon that led Jews to question their future in national states where powerful movements were now defining Jews as an alien element. In direct response to rising anti-Semitism in the Russian Empire, in the 1880s Zionist societies emerged in eastern Europe and began to organize Jewish immigration to Ottoman Palestine. By the late 1890s an

international organization of Jews, the World Zionist Organization (WZO; established 1897), had been founded "to create for the Jewish people a homeland in Palestine secured by public law" (its founding declaration), and in the years prior to World War I the WZO worked to encourage Jewish migration and the initial development of distinctive Jewish national institutions in Palestine itself.

World War I and Its Settlement

World War I and its settlement had a crucial impact on nationalism in the Middle East. Ottoman entry into the war on the side of the Central Powers led to Ottoman military defeat. At war's end, the victorious allies began the process of partitioning the Ottoman Empire in accord with secret wartime arrangements. The postwar attempt at Allied domination was unsuccessful in the primarily Turkish-speaking Anatolian portion of the empire, where a vigorous Turkish nationalist movement led by the charismatic General Mustafa Kemal (later Atatürk) successfully resisted European domination and in the process abolished the Ottoman Empire and replaced it with the new state of Turkey (1923). Quite a different course of events were obtained in the Fertile Crescent, which Great Britain and France divided between themselves. France received a League of Nations mandate for "Syria" (initially including Lebanon, defined as a separate state in 1920), Great Britain mandates for the territories of "Iraq" and "Palestine" (the latter comprising today's Israel and Jordan). In the process of imperial partition, a nascent Arab nationalist movement that had emerged during the war and established an Arab government in Damascus was crushed by French military action. In Palestine, where the terms of the mandate allowed for large-scale Jewish immigration in order to facilitate the emergence of the Jewish "national home," the postwar settlement also laid the basis for the subsequent emergence of the state of Israel.

The contrast between the course of events in Turkish-speaking Anatolia and in the Arabic-speaking Fertile Crescent deserves emphasis. Turkish nationalism emerged successful out of the turmoil of World War I and its settlement, realizing its goal of the creation of a Turkish national state predicated on the existence of a linguistically based Turkish ethnic community. Nothing succeeds like success; Turkey has remained the object of national self-definition and allegiance for its Turkish-speaking majority ever since its creation in the early 1920s. In the Arab case a nationalist movement similar in genesis and aspiration, but geographically more vulnerable, was eliminated by European force of arms. In its stead the Fertile Crescent was divided into several artificial political units according to imperial fiat. None possessed deep roots; the reality and viability of all were to be deeply contested in the years to come.

Differential Nationalist Trajectories

The several nationalisms considered above have taken very different paths since World War I and its settlement. In Iran the territorially based nationalism that emerged in the nineteenth century remained dominant under the Pahlavi dynasty (1921–1979). It was never fully accepted, however, by more religious Iranians, particularly by the country's powerful Shiite religious hierarchy. In the late 1970s the religious class played a leading

role in overthrowing the secular nationalist government of the shahs. In the 1980s the promotion of worldwide Islamic solidarity and international Islamic revolution became the leitmotif of Iranian foreign policy. In the 1990s, as the Iranian revolution moderated, the concept of Iran as a distinct national community again received greater emphasis. The precise nature and implications of Iranian collective identity is a contested issue at the start of the twenty-first century, part and parcel of the struggle between more liberal and more conservative Iranians.

With the creation of a cohesive independent state in Anatolia, Turkish nationalism largely shed the grandiose visions of pan-Turkic unity that had been expressed by some of its early proponents. Reified and promoted by the government of the new Turkish state during the long ascendancy of Mustafa Kemal Atatürk in the 1920s and 1930s, belief in the construct of a Turkish nation centered in Anatolia gradually disseminated beyond the elite circles in which Turkish nationalism had been born. The post-Atatürk decades have seen intensive debate among Turks as to the orientation of the Turkish state, particularly over the question of the role of religion in public life; but the participants in these debates have by and large not challenged the existence of a Turkish nation. The one partial exception is Turkey's marginalized Kurdish-speaking population, among whom demands for cultural and political autonomy surfaced in the later decades of the twentieth century and generated a prolonged civil war in eastern Turkey in the 1980s and 1990s.

The Zionist movement realized its main goal with the creation of the Jewish state of Israel in 1948. Some religiously oriented groups have never accepted the legitimacy of a Jewish state created as a result of human rather than divine agency. Moreover, fierce debates over the internal character of the state (for example, the role of religion in public life and the relationship of the Palestinian Arab minority to state institutions), as well as over the territorial extent of the state (the fate of the Palestinian-inhabited territories of the West Bank and Gaza Strip occupied by Israel in 1967), have continued to perturb Israeli public discourse. However, these debates occur among a Jewish population the vast majority of whom have accepted Israel as their national community of destiny.

Egypt was granted formal independence by Great Britain in 1922 in response to a nationalist uprising after World War I, and territorially based nationalism remained the dominant political construct in Egypt for most of the three decades of the parliamentary monarchy (1922–1952). Its cutting edge was Pharaonicism, an intellectual movement that posited the existence of a distinctive national character deriving from the ancient Egyptians. From the later 1930s the primacy of this locally based nationalism was challenged by voices that insisted upon Egypt's Arab affiliations and that emphasized the common problem of imperialist domination facing all Arab regions. Thereafter, both Egyptian opinion and Egyptian state policy evolved in a more Arabist direction, especially after the Egyptian revolution of July 1952. Under the leadership of Gamal Abdel Nasser, by the late 1950s Egypt had become the champion of Pan-Arabism. In 1958 it joined with Syria in the major experiment in Arab unity of the twentieth century, the United Arab Republic (1958–1961). The collapse of

the UAR when Syria seceded in 1961 in effect marked the turning point in Egypt's involvement in the Arab nationalist movement. A drift away from commitment to Arab nationalism set in Egypt from the 1960s onward. It accelerated under Nasser's successors Anwar al-Sadat and Hosni Mubarak, both of whose policies have emphasized Egypt as a separate political entity with its own national interests.

The fate of nationalism in the Arabic-speaking lands of the Fertile Crescent since the post-World War I settlement has been complex. In the interwar era the new states created after the war gradually acquired a degree of reality in the minds of their inhabitants. The effectiveness of state consolidation varied from country to country. It was probably strongest in Lebanon, where spokesmen among the country's slight Christian majority expounded an exclusively Lebanese nationalist ideology focused on the country's long history since the era of the Phoenicians as a uniquely "Mediterranean" nation different from other Arabic-speaking lands. It was probably weakest in Syria, where much of the political elite clung to the vision of the united Arab state that had been destroyed by imperialist partition in 1920. Among Palestinian Arabs a distinctive local identity was on the one hand fostered by the conflict with Zionism, but on the other was undercut as Palestinians sought outside Arab solidarity and support in the same struggle.

The process of Arab state consolidation in the Fertile Crescent was uneven. Continuing foreign domination reinforced the perception that the new states created after World War I were artificial entities established to suit imperial interests. An aura of what-should-have-been hovered over Arab politics in the Fertile Crescent, a belief that Arabs had been swindled out of the unity that was their proper destiny. After World War II this disaffection with existing states and belief in the desirability of their replacement by a state uniting most Arabs blossomed into Pan-Arabism, the drive for integral Arab unity that was a central component of Arab politics through the 1950s and 1960s.

The process of territorial state consolidation was facilitated with the recession of Pan-Arabism from the later 1960s onward. Over the decades the expanding institutions of the territorial state (bureaucracy, schools, vested interests) and its new symbols (flags, monuments, national holidays) bound the population to the state and gave greater substance to what had been artificial entities. At the level of policy-making there has been a clear trend away from the pursuit of Arab unity toward the realization of state interests since the 1960s. Wider Arab nationalist sentiments—belief in the existential reality of an Arab nation transcending existing state borders—have not totally faded. There is also an impressive degree of inter-Arab economic and cultural cooperation that has developed over time under the auspices of the League of Arab States and similar agencies. Pan-Arab issues, especially Palestine, are capable of arousing deep emotions across the Arab world. But, in the shifting relationship between the alternative concepts of local/statal allegiance and a broader identification with an Arab nation based on the bonds of language and history, the former appears to be the more prominent tendency at the beginning of the twenty-first century.

After Nationalism?

A significant challenge to nationalism has emerged in the Islamist movements that have gained prominence in recent decades. At the abstract level, the primacy of the religious bond over loyalty to territory, polity, or *ethnie* is basic to Islamist ideology. The formulation of Sayyid Qutb, founding father of Sunni Arab Islamism, states the position starkly: “There is no country for a Muslim except that where the law of God is established. . . . There is no nationality for a Muslim except his belief, which makes him a member of the Islamic community” (*Milestones*, p. 103). In political terms, a considerable measure of sympathy, mutual aid, and collaborative action have marked the relations between Islamist activists and movements originating in different countries. From the galvanizing impact of the Iranian Revolution of 1979 on Islamist activism elsewhere, through international support for the mujahideen opposing Soviet occupation in Afghanistan in the 1980s, to the international makeup and operations of Al Qaeda in the 1990s and after, a revived emphasis on the Islamic *umma* (Arabic, “community” of believers) as the most meaningful community of solidarity and destiny for Muslims has reasserted itself in the contemporary era.

But this is not the whole story. Territorial and ethnic nationalism still have their advocates, ideologues, and public figures who question the political salience of the religious bond and who posit that political behavior should be based on non-religious criteria. The current division of the Muslim world into numerous states inevitably influences the practical articulation of contemporary Islamism. Many Islamist activists accept the reality of existing territorially or ethnically based states and operate within the political field determined by state structures, directing their activism toward infusing existing states with a more Islamic content.

By reasserting the centrality of a previously recessive collective identity, the Islamic resurgence of the late twentieth and early twenty-first centuries has complicated but not totally transformed the nationalist landscape of the Middle East. Sentiments of religious solidarity coexist with territorial, local, and ethnic/linguistic nationalism. The result is a complex, crowded, and unstable universe of imagined communities in which individuals are faced with determining the relevance of alternative referents for self-definition, allegiance, and action.

NATIONALISM IN MUSIC, EUROPE AND THE UNITED STATES

Nationalism in music has traditionally been described as a late-nineteenth-century phenomenon associated with countries or regions aspiring to nationhood whose composers strove to wed a national (most often folk-based) musical idiom to existing “mainstream” genres. Some of these accounts begin with Frédéric Chopin (1810–1849), but he is more often understood as “cosmopolitan” or “universal,” a Romantic composer of Polish and French parentage whose work was often based on Polish dance forms but was too early to count as nationalist. Most accounts of musical nationalism start with Russians in the next generation, especially the *moguchaya kuchka*—the “mighty little heap,” or the “mighty five,” including Nikolay Rimsky-Korsakov (1844–1908),

Modest Musorgsky (1839–1881), and Aleksandr Borodin (1833–1887)—and continue with the Czechs Bedřich Smetana (1824–1884) and Antonín Dvořák (1841–1904), the Norwegian Edvard Grieg (1843–1907), and the Finnish Jean Sibelius (1865–1957). Within this narrative line, the rise of a musical form of Impressionism in France and the genesis of a distinctively American music may be seen as late developments, somewhat out of step with general trends.

Yet nationalism has provided the principal cultural and political framework for musical expression within European-based traditions for most of the nineteenth century and has continued to do so up to the present. This tendency has not been widely noted for two main reasons: First, it remained overlooked because of the entrenched habit of considering European music history apart from history more generally, as encouraged by the doctrine of absolute music; and second, the genesis and development of musicology—the discipline entrusted to tell the history of music—were both intimately connected to nationalist ideologies.

Musicology and Nationalism

Music history in the nineteenth century has generally been perceived in terms of “mainstream” traditions continuing from the late eighteenth century, the general rise of Romanticism across these mainstreams, and the splintering into a variety of “nationalist” musics in the later part of the century. But nationalism lay at the heart of all facets of this master narrative, from the maintenance of the “mainstreams” to Romanticism and, most especially, to the narrative perspective. The principal task of historical musicology, for much of the time since about 1850, has been the promotion and development of a historicist canon to support a particular nationalist ideology. Moreover, as European nationalism, especially in Germany and Italy, led to two world wars in the twentieth century, some of its victims who fled to the United States (especially in the 1930s) established the American scholarly tradition in musicology, teaching the same history they had been taught and thus perpetuating the view that the most important musical tradition was German, which was to be understood as the least nationalist and most universal (Bach, Beethoven, Brahms, etc.), trailed by Italian opera and older Italian traditions, a few isolated “cosmopolitan” geniuses such as Chopin, and various “national” schools at the margin of respectability, whose legitimacy was cast in doubt not least because their music was widely enjoyed.

Nationalism and Art

Nationalism holds that a “people,” whether defined in terms of cultural or ethnic roots, constitutes the only legitimate basis for a political state. This belief took root in Europe around the beginning of the nineteenth century, as an outgrowth of German Romanticism, the French Revolution, the Napoleonic wars, and (according to some views) human inclinations. The merger of nationalist feeling and art was accomplished using the model proposed by German poet and philosopher Friedrich von Schiller (1759–1805) of how an artist might project—for those in the urbanized present who stand in imperfect relation to a more ideal past—either a fuller sense of that lost past (through idyll and elegy), a critical account of

the present (through satire), or a believable future restoration. Coupled with the idea of the *Volksgeist* (the spirit of a people) promulgated by fellow German Johann Gottfried von Herder (1744–1803), Schiller’s structure became a recipe for the nationalist artist: the idealized past, for the nationalist, is the past of a “people” who survive into the present (i.e., in the *Volk* of the countryside), and the ideal future for which one strives is a “nation” in which they are restored to their earlier oneness with the land of their past. Images, narratives, and projections that instill belief in a people’s valued past—that is, mythologies—thus quickly became a core ingredient in the artistic advancement of nationalism.

German Nationalism

The early stages of a specifically musical engagement with nationalism may be found in the late-eighteenth-century fascination with folk song, which fed the development of early nineteenth-century German lieder, folk-based chamber songs expressive of a yearning subjectivity. In his lieder, Franz Schubert (1797–1828) placed that subjectivity, often alienated, within a specific landscape, frequently carried within the piano’s figuration. Such placement of people within a landscape became a core strategy of nationalist art, and was more elaborately accomplished in German Romantic Opera, beginning with *Der Freischütz* (1821) by Carl Maria von Weber (1786–1826) and continuing in the next generation with the operas and music dramas of Richard Wagner (1813–1883); particularly effective were Weber’s evocations of the German woods, through horn choirs, and his (and Wagner’s) frequent recourse to mythology. Beethoven’s Ninth Symphony (1824) is implicitly nationalist, but in a forward-looking way, projecting a temporal and geographic fusion of classical Greek ideals (Elysium), “oriental” (“Turkish”) tropes, and modern German Christianity. In the generation following his death, Beethoven became the cornerstone of Germany’s nationalist claims to pre-eminence in music. By the middle of the nineteenth century, older German musical treasures from the past (especially those by J. S. Bach) were being systematically collected, establishing a milestone in the nascent field of musicology. After the Franco-Prussian War (1870–1871) and the unification of Germany that resulted from it, the Festspielhaus in Bayreuth—the opera house designed and built by Wagner—became an enduring monument to “Holy German Art.”

During the same general period, Italy also became unified, led by a movement—the Risorgimento—whose slogan (“Vittorio Emanuele Re D’Italia,” championing a leader of the movement) was based on the letters spelling the name of the foremost Italian composer, Giuseppe Verdi (1813–1901). After the Franco-Prussian war, French composers, who until then competed primarily with Italy, and mainly in the domain of opera, began to engage deliberately with Germany’s proclaimed mastery of instrumental music, at which point various musical nationalisms began to proliferate according to the familiar narrative outlined above.

Features of Nationalist Music

While musical nationalism could adopt a variety of specific profiles according to the “nation” involved, these all had a

number of features in common. Many nationalist musics relied on folk idioms that, however inaccurately, could be claimed as a national heritage. Opera and program music lent themselves easily to national themes; and opera also had recourse to rousing choruses, which could not only evoke the character and presence of a people—most notably “Va, pensiero” in Verdi’s *Nabucco* (1842) and the coronation scene in Mussorgsky’s *Boris Godunov* (1872)—but also cross over into popular currency. Ethnographic studies could either add legitimacy to native folk idioms or form the basis for a nationally conceived exotic “other” to be assimilated and synthesized in national terms. Thus, “Spanish” music provided both Russian and French composers an opportunity to indulge in coloristic orchestration that was itself a source of nationalist pride; such as in *Carmen* (1874) by Georges Bizet (1838–1875) and *Capriccio Espanole* (1887) by Rimsky-Korsakov. Similar use was made of Asian sources (e.g., in Rimsky-Korsakov’s *Scheherazade*, 1888), analogous to the earlier tradition regarding the “Turkish” topic. Eventually, ethnographic research evolved from a kind of colonialist interest in the “other” into another vehicle for nationalist endeavor, with some ethnomusicologists holding that only “authentic” members of a group ought to conduct research into its musical traditions.

The Legacy of Nationalism and the Special Case of the United States

Nationalism must be at least partly blamed for the Holocaust and other instances of “ethnic cleansing” in the twentieth century, given that nationalism’s intense focus on defining an authenticating group identity entailed a corollary focus on what that group was not. The most notorious early instance of this in musical discourse was Wagner’s essay *Das Judentum in der Musik* (1850; rev. 1869), which helped give nationalism a racialized profile it has never lost.

Nationalism has often moved in quite another direction in the United States, which, according to the European model, would have had either to elevate the American Indian as the core part of its authenticating past or to foster an alternative mythology of a “virgin” land settled by Europeans, transformed by their new setting. A third alternative, which has helped absorb the contradictions between the first two, has been to claim some form of “melting pot” nationalist basis; such was Dvořák’s approach in his “New World” Symphony, op. 95 (1893), blending “Negro” melodies (spirituals), Indianist idioms, and a European-based style, in a recipe later taken up by William Grant Still (1895–1978) in his blues-based *Afro-American Symphony* (1930), for example. More central exemplars of American nationalist music are the often nostalgic “New England” idiom of early modernist Charles Ives (1874–1954), the jazz-based concert idiom of George Gershwin (1898–1937), and the “wide-open spaces” idiom of Aaron Copland (1900–1990), which was often allied with an emergent American style of balletic dance. Departing from these “high art” traditions, many have chosen to locate America’s most distinctive musical profile within popular music, either within jazz (“America’s classical music”) or song, which has, historically, absorbed a wide number of influences. In terms of musical nationalism, perhaps the most fully realized

American tradition—based on popular song styles and a variety of mostly assimilationist plots—is that of the American musical, both for the stage and in films.

NATIVE POLICY. Before Europeans from a variety of countries began arriving on the shores of the two continents of the western hemisphere in the late fifteenth century, there were no “Indians.” At that point in time, millions of human beings, members of hundreds of distinctive societies speaking mutually unintelligible languages, inhabited the lands between Alaska

and Patagonia. The category of person called “Indian” resulted from the imposition of colonial rule by Spain, Portugal, France, England, and Holland upon the diverse societies the Europeans encountered on these two continents. Following European colonialism, the creation of independent republics in what came to be known, by another misnomer, as “the Americas” was also marked by dynamic relations between states controlled by elites of European descent and the peoples called Indians. First colonial regimes and then independent nation-states in Latin America and in North America have been concerned with the classification and regulation of who is Indian and what constitutes “Indianness.” We can call the operationalization of these systems of classification “Indian policy.”

Such a perspective, of course, is necessarily also a historical phenomenon itself. Historians and anthropologists have alternately ignored or obsessed over the indigenous peoples of the Americas that by convention are still called “Indians,” and have gone from understanding Indianness as an identity entirely tangential to the histories of nation-states, to the contemporary approach described above, in which Indianness and state policy are intertwined. Thus, at the same time that we review contemporary anthropological approaches to understanding Indian policy, we must simultaneously reflect upon those perspectives as substantially different from pre-1970 anthropological understandings of Indianness. This entry will discuss how Indian policy has developed in colonial and post-colonial nation-states of Latin America, and compare the evolution of Indian policy in Latin America as a whole with its evolution in the United States, acknowledging that this comparison increasingly parallels the pan-hemispheric struggles of indigenous peoples who themselves are engaging in such comparisons. Finally, describing indigenous struggles within and against the nation-states of the Americas in the twentieth century prefigures where those controversies are headed in the twenty-first.

Anthropology’s Changes

Up until the 1970s, most anthropologists approached Indian communities as discrete cultural units (a classic example would be Redfield and Villa Rojas), and were particularly fascinated by and drawn to those aspects of cultural practice and belief that appeared least influenced, distorted, or destroyed by European colonialism. Anthropologists were spellbound by the mystique of pristine, if not always primitive, Indian cultures—the more isolated and removed from the mainstream of nation-states, the better. Even attempts to move anthropology beyond an obsessive focus upon an “Other” that contrasted with “the West” did not necessarily conceptually reconnect Indians to the world system to which they had historically been joined since the fifteenth century. For example, Eric Wolf’s early taxonomy of peasantries, and much subsequent ethnography of Indian communities as peasant communities, also characterized such communities as discrete and bounded units, albeit in a different analytic light.

A major breakthrough was achieved by June Nash in her study of Bolivian tin miners, who in her work appeared clearly as simultaneously members of the industrial working class and as Indians. Nash elaborated an analysis that did not downplay the distinctively Indian religious and cultural practices of the

miners, their complex political ideological relationship with the Bolivian state, or their emplacement within the capitalist world system. After Nash, it became possible to study Indian communities not only as part of global economic and political systems, but also as part of Latin American nation-states. Describing the policies that such nation-states were developing in response to Indian communities was a logical next step in anthropological work.

Perspectives on Colonialism and Postindependence Latin America

In the 1980s and 1990s, historians and anthropologists alike elaborated new analyses of the colonial and early independence eras in Latin America. These analyses made clear that from the beginning of the Spanish colonial era, ruling elites legislated and implemented policies for governing Indians that consigned them to an exploited, subaltern class position, and distinguished Indians from the non-Indian population. Many scholars also emphasized that the peoples who became known as Indians were not simply passive recipients of the brutalities colonial conquest wreaked upon them. Such scholars portrayed Indian peoples as dynamically responsive to the national and global political and economic systems. This latter point is still controversial, and Orin Starn has shown that well into the 1990s many anthropologists working in the Andes remained wedded to views of Indians that emphasized their cultural discreteness and isolation from nationalist ideologies and identities.

While the conquest indeed precipitated a demographic collapse among all indigenous groups, caused by massacres, enslavement, and pernicious epidemics, many Indian peoples survived through their own efforts. Acknowledging Indians as active makers of their own destinies draws attention to the key differences in how different Indian peoples negotiated the policies imposed upon them by colonial authorities. In the urban centers of the old indigenous empires in Mesoamerica and the Andes, colonial authorities were eager to utilize the labor afforded by their domination of Indian societies, while using the markers of Indian identity to signify subaltern status. These regimes wanted to diminish distinctive Indian identities by converting Indian peoples to Christianity, eliminating their native languages, and controlling Indian lands and resources. Yet they also wanted to maintain a large mass of servile, exploitable laborers. The dual motivations behind colonial Indian policy likely made it possible for Indian communities and leaders to at least partly subvert the intentions of colonial regimes.

Roger Rasnake elaborates the creation of postcolonial Indian authorities and social systems in the regions that became Bolivia, showing that Indians were able to manipulate state policies to achieve forms of local political and cultural autonomy. In colonial Mexico, Claudio Lomnitz-Adler has shown that the semiautonomous communities referred to as the “Indian Republics” of the eighteenth century ultimately “meant that the Spanish system recognized the existence of two nations with political representation within the Spanish state” (p. 267). In the collection edited by Carol Smith, authors writing about colonial Guatemala agree to a certain extent, arguing that the segregationist policies of the Spanish colonial state helped to establish strong Indian communities. In another

quite different region, Joanne Rappaport's work in the Cauca region of colonial Colombia shows that Indian communities subverted the Spanish *resguardo* institution, intended to concentrate and manage the supply of coerced Indian labor to the Spaniards' haciendas (plantations), resulting in the creation of regions of refuge for Indian communities.

Florencia Mallon, a historian, established similar dynamics in the early independence period in both Mexico and Peru, emphasizing the dynamic role of Indian and non-Indian peasants in the making of those two nation-states. By contrast, Smith argues that successive nineteenth-century state forms built the Guatemalan nation around Indian policies that decisively excluded Indians from national identity, even as Guatemala's economy was increasingly developed and incorporated into the global economy. In other countries, nineteenth-century Indian policy aimed to continue, in effect, the work of the conquest by ultimately eliminating Indian ethnic identities. This process of assimilating Indian peoples in Latin America through biological miscegenation and the suppression of sociocultural distinctiveness, which Les Field has elaborated in Nicaragua, has for centuries been called *mestizaje*.

Indian Policies of the Twentieth-Century Nation-States

Shifts in the ways that anthropologists have been analyzing contemporary state policies toward native peoples in Latin America are highlighted in two important anthologies published since the early 1990s. In Joel Sherzer and Greg Urban's collection *Nation-States and Indians in Latin America* (1991), contributors elaborated a galaxy of distinctive Indian identity formations, within the context of national identities. As in colonial times, these national identities have in the main excluded indigenous peoples from full citizenship as Indians, but instead utilized state policy to culturally assimilate Indian peoples to thereby gain full control over Indian lands and resources. In this collection, authors document how Indian identities have resisted state-sponsored assimilation, but also experienced marked transformations of the cultural traits, practices, languages, and symbols that demarcate Indianness.

Twelve years later, the publication of Kay Warren and Jean Jackson's *Indigenous Movements, Self-Representation, and the State in Latin America* (2002) crystallizes the changes among Indian peoples in the interim, as well as the new anthropological responses to current conditions. Contributors in this collection have documented the importance of indigenous political movements as they marshal Indian cultural identities toward the twin goals of auto-representation (for local, national, and global audiences) and reordering the place of Indians in nation-states. The second goal signifies no less than the wholesale reconceptualization of national identities in Latin America, at the formal level of constitutions, political parties, laws, and leadership, as well as at the popular level. This anthology demonstrates anthropologists' commitment to even closer analysis of state policies and their multifarious effects upon Indian peoples.

Two other ethnographies demonstrate the vast differences evolving in state policy toward Indians in Latin America. In Charles Hale's exploration of "contradictory consciousness"

among the Miskitu of the Nicaraguan Atlantic coast, an Indian identity coalesced around opposition to the integrationist policies of the revolutionary Sandinista state. Even though this opposition became the banner for a florescence of Miskitu language and culture, it was allied to the United States' war against the Sandinistas. By contrast, left-wing coalition politics in the Juchitán region of Oaxaca, Mexico, described by Howard Campbell, created the local political conditions for both opposition to the federal Mexican state and the opportunity for Zapotec cultural renaissance. In these ethnographies, it is clear that state policies are having unpredictable effects upon and interactions with Indian peoples and cultures.

Comparisons with Indian Policy in the United States

Comparing the history of Indian policy in Latin America versus that history in the United States is instructive, particularly with respect to the issue of cultural assimilation of Indian peoples through *mestizaje*. *Mestizaje* as an intrinsic part of Latin American state policy profoundly departs from Indian policies in the United States, as elucidated by Les Field and Circe Sturm. In North America, treaty-making between indigenous peoples that began with the British colonial regime and continued under successive U.S. administrations in the eighteenth and nineteenth centuries ultimately created a category of officially acknowledged Indian people, the "federally recognized Indian tribe."

While the federal government has since the 1880s on at least three occasions attempted to disengage from the premise of federal recognition, which more or less accepts the indefinite existence of Indian peoples, these attempts have so far failed to put an end to this officialized status. Federally recognized tribes hold onto a sharply circumscribed, but nevertheless always potentially valuable, set of properties, that is, Indian reservations; furthermore, recognized tribes are authorized to make claims upon various parts of the U.S. federal bureaucracy. Indians who do not live on reservations but are members of recognized tribes can return to their designated reservations and make claims to resources. Even in urban areas, Indians from federally recognized tribes still maintain access to certain federally funded services, such as health and education. These resources are substandard in the estimation of Indians and non-Indians alike, and in no way compensate for the loss of immense territories, not to mention economic and political liberty. For this reason, Indian identities in the United States are closely policed by both federal and tribal authorities; tribal membership is substantiated via genealogy, or blood quantum, and the policies of both the tribes (acting as semiautonomous internal state forms) and the federal bureaucracy are obsessed with counting Indians and allocating resources.

Compared with the United States, state policy in Latin America is much less concerned with policing Indian identities for three reasons. First, whatever rights accrue to being Indian in Latin America are minimal, and wherever such rights exist, they depend upon residence in demarcated Indian communities. Second, popular genealogical theories in Latin America, that is, theories of "blood," encourage *mestizaje* as a means toward social mobility, rather than serving as legitimation for Indian identities as in the United States. Finally, nationalist ideologies in Latin America profoundly stigmatize

THE ANTI-QUINCENTENNIAL

The year 1992 marked the 500th anniversary of Columbus's fateful voyage that initiated the destruction of indigenous civilizations and the rise of nation-states dominated by elites of European descent. Pan-hemispheric organizing among Indian peoples mixed resistance to the plans by many countries in both North and Latin America to treat the anniversary as a cause for celebration, as well as an opportunity to express demands for profound changes in the relationship between Indian and national identities. Ecuador's indigenous confederation, CONAIE, which brings together diverse peoples from the Pacific coastal region, the Andean region, and the Amazon, formulated its demands during a series of uprisings in 1990, 1992, and 1994 (for a full description of the formation and politics of CONAIE, see CONAIE). CONAIE leaders called for a new kind of nation-state—*el estado plurinacional*—in which Indian identities would become by definition central to the nation, and for state policies explicitly intended to build the economic infrastructure for technologically advanced and politically autonomous Indian communities.

Such demands are mirrored in the post-1992 pan-Mayan movement in Guatemala described

by Kay Warren. Similarly, since the beginning of Mexico's Zapatista uprising in 1994, many anthropologists have been concerned to show this movement as both indigenous and national in scope. The economic and political goals enunciated by these indigenous movements in some ways resembled but in other ways markedly diverged from the objectives of the Latin American left in the 1990s. The differences manifested in anthropological analyses as well, with some anthropologists deciding to act as advocates for Indian movements, while others critiqued the Indian movements from Marxist or neo-Marxist perspectives (see, for example, the critical analysis in Alcida Rita Ramos's *Indigenism* [1998]). One area of future anthropological research will likely focus upon what happens when Indian movements in Ecuador, Mexico, Guatemala, and elsewhere achieve even some of their political and economic goals. Will finding a political and economic place in reconfigured Latin American nation-states exacerbate class differentiation and inequalities within and among Indian communities? How will new state policies affect such outcomes?

Indianness, associating it with poverty, ignorance, backwardness, and powerlessness. In the last regard, nationalism in the United States, and state policy over the last two centuries, do concur with state policies in Latin America. Yet without the history of treaties, reservations, and federal recognition that exists in the United States, which with all of its problems still provides a basis for both establishing and maintaining Indian identities, Latin American *mestizaje* has acted as a powerful ideological force aiding and abetting state policies aimed at disenfranchising and disarticulating Indian societies and cultures. Indeed, the struggles of indigenous movements to reconfigure nation-states in Latin America discussed above are aimed precisely at creating political and economic structures that will support the survival of Indian peoples into the future.

Indianness, National Policy, and Anthropology in the Twenty-First Century

Anthropologists sometimes exaggerate and sometimes underestimate the importance of their work and their ideas to “the

real world”—the world of governments and families, health and disease, happiness and despair. But in the case of Indian policy, anthropological knowledge has buttressed and often been the accomplice to national “regimes of truth” about Indian peoples. In the United States, an “official anthropology” funded and sponsored by the federal government has been a historic partner to state Indian policy. In Latin America, such an official anthropology has generally not had the same effects historically, with the exception of Brazil and Mexico. However, the rise of indigenous movements demanding control over lands and resources will likely oblige Latin American governments to act as “gatekeepers” and to utilize anthropological knowledge much more in order to ascertain and legitimize Indian identities in the twenty-first century. Anthropological knowledge in this century will therefore be simultaneously yoked to forging new state-Indian relations and new kinds of Indian policies, while also being engaged in reflective and critical analysis of these new relationships. These often contradictory roles will unfold in both North and Latin America.

Les W. Field

NATURAL HISTORY. Natural history, the study of natural objects, has been a feature of all literate civilizations. In the Western tradition, starting with Aristotle, natural history has engaged scholars and has been an important feature of Western literature. The perspective with which writers have approached natural objects, and the aspects of interest to them, have varied as much as their cultures. Natural history has been written about as a form of philosophy, as entertaining literature, and as a form of didactic lesson. Aristotle, Pliny, Albertus Magnus, and Ulisse Aldrovandi's "natural histories" in many ways have little in common other than the objects about which they wrote. In addition, non-Western civilizations have rich literatures that go back centuries, on plants, animals, and minerals. And, anthropologists make the claim that numerous non-literate peoples have developed sophisticated conceptions of the natural world and its objects.

As a scientific discipline, however, natural history has a more restricted domain. When the term *natural history* is used today, it is most often in reference to the subject as it emerged in the mid-eighteenth century. In this modern form, natural history is the systematic study of natural objects (animals, plants, minerals)—that is, naming, describing, classifying, and searching for their overall order. As such, it has been at the heart of the life sciences. The modern scientific discipline of natural history that emerged in the middle of the eighteenth century was closely tied to the careers of two individuals: Carolus Linnaeus and Georges Louis Leclerc, comte de Buffon.

Naturalists, particularly those interested in plants, faced a serious problem at the time. An enormous quantity of material had come into Europe from areas recently explored by colonial powers. Naming and classifying the new plants presented a challenge because they did not fit easily into previously established systems. The Swedish naturalist Carlus Linnaeus (1707–1778) created a classification system for plants that placed them into twenty-four classes according to their number of stamens (male part) and their relative positions. The classes, in turn, were broken down into sixty-five orders primarily on the basis of the number and position of the pistils (female part). He used other characteristics to break the orders into genera and species. Overall, the system was simple, easy to remember, and easy to use.

Of equal importance, Linnaeus also provided a set of rules for naming plants. Before his reform of nomenclature, the scientific names of plants consisted of two parts, a word or set of words that identified a group of plants, and then a string of words that distinguished the characteristics of the plant from other plants. As a result, the scientific name was awkward, and because various writers had used different characteristics to

distinguish different plants, considerable confusion existed. Linnaeus proposed a simple reform that made plant names like human names, a single name common to all the species in a genus, and a second specific name that distinguished the species from others in the genus. He used this binomial nomenclature in his *Species plantarum* (1753; The species of plants) and recorded all the known species of plants in it. Later he extended his approach to animals. His reform quickly caught on and is the basis for contemporary nomenclature.

Although Linnaeus's main goal was the naming and classifying of natural products, he described them as part of a divine order, a balanced and harmonious system. In his mind, every plant and animal filled a particular place in a balanced order and functioned to help maintain it. Carnivores, for example, daily destroyed animals that if not checked would reproduce at a rate that would outstrip their source of food in short order.

While Linnaeus labored in Sweden, to the south, Georges Louis Leclerc, comte de Buffon (1707–1788), worked on a more secular vision of nature, and in a somewhat different manner. Louis XV of France had appointed Buffon as director of his royal garden in Paris. The Jardin du Roi was an institution that provided public lectures in natural history, cultivated a large public garden, and housed the royal collection of natural history objects. Buffon had a brilliant career there: he expanded the physical space to double its former size, increased the collections, and helped make it into the foremost institution for the study of the living world. More important, Buffon set out to prepare a catalog of the royal natural history collection, a standard practice in most large collections. But instead of planning a mere annotated list of the curiosities and rare objects in the collection, Buffon envisioned a much grander project: a complete natural history of all living beings and minerals. Over a period of almost fifty years he published thirty-six quarto volumes containing a theory of the earth, and natural histories of human beings, minerals, quadrupeds, and birds. (The rest was completed by a team of specialists in the two decades after his death.)

Buffon's *Histoire naturelle, générale et particulière* (1749–1789; Natural history, general and particular) comprises an encyclopedia that reflects the goals of the French Enlightenment. In his introductory essays, he elaborated a general philosophy that stressed the importance of observation and claimed that through empirical investigation naturalists might uncover the order in nature. He had little use for the work of people like Linnaeus who devoted their attention to naming and arranging specimens. In contrast, Buffon envisioned natural history to be a general survey of the natural world and an attempt to summarize all available knowledge about it. Also unlike Linnaeus, Buffon did not conceive of natural history as a handmaiden to Christianity, but rather for him nature is a creative natural power responsible for the harmony, balance, and fullness of life. Natural history should be the portrait of nature. Like the physical world, so well described by the Newtonian physical scientists of his day, the living world follows natural laws that investigation would reveal. Buffon's secular vision provided an attractive alternative to Genesis and explains the importance of his reputation in the French Enlightenment.

1782 drawing of nutmeg by botanist Elizabeth Blackwell. In the eighteenth century, Swedish naturalist Carolus Linnaeus began classifying plants based on the number and positions of their stamens. He also pioneered the system of binomial nomenclature still used in the twenty-first century to identify individual plants. © STAPLETON COLLECTION/CORBIS

Collections and the Growth of Natural History

Buffon and Linnaeus, although different in perspective, each contributed to molding natural history and inspiring others. They had each relied primarily on natural history collections for their work, rather than going out into the field in search of information. The fourteen thousand species of plants and animals described by Linnaeus, and the extensive accounts of quadrupeds, birds, and minerals that comprise Buffon's thirty-six volumes, reflected the extensive empirical base of knowledge available in private and public collections in the later half of the eighteenth century. But as impressive as the collections were compared to those of the previous century, they were just the beginning. An enormous expansion of natural history collections took place in the early nineteenth century and completely transformed them as well as natural history. Explorers, colonial officials, traveling naturalists, and commercial natural history houses had supplied collectors in the eighteenth and early nineteenth centuries. With the conclusion of the Napoleonic Wars, however, a new wave of European colonial expansion began, one reflecting the vast industrial and commercial revolutions that had been taking place in western Europe. Merchants and governments increasingly sought international markets and commercial products, and with these new developments there came what must have seemed like limitless opportunities for the collection of plants, animals, and

minerals. The resulting new collections were not only larger, but they were more scientifically valuable because trained collectors in the field were instructed in what was of scientific interest. They knew how to adequately preserve specimens and how to label them with appropriate information.

Combined, the new opportunities to collect on a global scale made a new sort of natural history collection possible. Until the end of the eighteenth century, most natural history collections had been primarily amateur ones whose owners were not scientists and who did not publish anything other than the occasional catalog. The reorganization during the French Revolution of the royal garden into a national museum of natural history provided a new model and led to the establishment of the leading natural history collection in the world for many decades. The new public and semi-public museums that were inspired by the Paris museum had professional curators who were active scientists.

Not only did the nature of the collections change in the early nineteenth century, but the number of individuals involved in the study of natural history increased dramatically. In large part, this reflected the many new opportunities that became available for those interested in the subject. Not only were more museums created, with curator positions, but also private companies supplied paid positions for those willing to travel to exotic places to collect specimens. The increase in literacy and the revolution in printing created new markets for those interested in writing for the general public. As a consequence, more people came to be engaged in the study of natural history, and the subject became, overall, more rigorous and more specialized.

Although the specialization in natural history created new specialized subdisciplines, such as ornithology and entomology, the legacy of Linnaeus and Buffon continued to guide research—that is, description, classification, and the search of a general order in nature. New empirical data raised interesting new questions. The carefully collected and labeled specimens that poured into European collections showed interesting patterns of distribution of animals and plants. Fossils from local and exotic quarries led researchers to ponder the relationship of extinct forms to contemporary ones. And the immense number of specimens showed that even within a species there was an astonishingly large amount of variation. What did it all mean?

Maturity of Natural History

The nineteenth century was rich in new theoretical approaches that attempted to explain the vast diversity in nature and the patterns that were emerging. On a more practical level, international commissions were established and worked to produce agreed-upon standards in nomenclature, bringing Linnaeus's goal of unity in naming closer. Museum curators developed taxidermic techniques that eliminated the threat of insect pests and pioneered new methods of display that would culminate in the wonderful dioramas of the American Museum of Natural History in New York, the Biological Museum in Stockholm, and in the hundreds of other large museums that were established. Natural history museums became standard

institutions in all major cities, and the new museums were large, well funded, and well attended. By 1900, there were 250 natural history museums in the United States, 300 in France, and 150 in Germany. Beyond the United States and Europe there were museums from Melbourne to Bombay, from Buenos Aires to Montreal. Along with the development of museums, there was a parallel development of zoological and botanical gardens that displayed and did research on living specimens. These were extraordinarily popular: In its first year, 1828, the Zoological Gardens in London's Regent Park had 130,000 visitors, and over the following decade that number swelled to a quarter of a million a year. By the 1880s, the garden attracted more than 600,000 people a year. With size and public support, the zoological and botanical gardens played new and important roles other than public entertainment and scholarly research. Kew Garden, outside London, functioned in an important manner in the global agricultural network that linked British interests to the transfer of important economic plants such as rubber plants and cinchona trees (important for quinine) throughout the empire. The New York Zoological Society Park pioneered the preservation of endangered species.

Important as these institutional and technical developments were, they have been somewhat overshadowed by the major intellectual synthesis provided by Charles Darwin (1809–1882). His theory of evolution by means of natural selection resolved the leading questions in natural history and also provided an intellectual structure that has proved to be the unifying theory of the life sciences. Like other naturalists of the nineteenth century, Darwin had been struck by the enormous diversity in nature and the interesting patterns of distribution that he and others observed. He was, similarly, curious about the relationship of fossils to living forms, and like many of his contemporaries who were trying to classify large groups, he attempted to sort out the differences between varieties and species. He approached the study of natural history with a secular perspective and sought natural explanations for the questions he asked. In an interesting sense, he combined and synthesized the traditions stemming from Linnaeus and Buffon. He sought the key to a classification and nomenclature system, and was searching for a secular vision of the order in nature. His *Origin of Species* (1859) has served as a model for how to envision and study nature.

Not that everyone agreed with his conclusions or his methods. For several decades scientists debated Darwin's theory. Some, like Louis Agassiz (1807–1873), did not want to break the tie between natural history and religion, while others were disturbed by numerous scientific problems: the age of the earth was not believed to be old enough for the process to have occurred, the theories of inheritance did not adequately explain how variation arose or how it could be transmitted in a way that supported the theory. Those in the medical sciences had been making great strides in investigations by using the experimental method and were elaborating a theory of the body based on an understanding of the cell. It was not clear how Darwin's science fit with that body of research. This latter issue was of special importance because many universities and other institutions were tending to see natural history as "old fashioned" by the end of the century and sought a new synthesis for the

life sciences in the exciting research stemming from the experimental sciences that were elucidating how the body functions.

Modern Synthesis and Contemporary Natural History

Life scientists in the late nineteenth century were agreed that life had evolved over time, but there was considerable disagreement over how that evolution had taken place. Darwin's emphasis on natural selection was thought to be problematic, and a variety of alternatives were proposed. The research on genetics in the early decades of the twentieth century provided tools for a new examination of the subject. Starting with Theodosius Dobzhansky's (1900–1975) *Genetics and the Origin of Species* (1937), naturalists were able to bring together several different lines of research to construct a new theory of evolution, one based on natural selection and the genetics of population change. Like Darwin's earlier theory, the modern synthesis, as the new theory is called, proved widely synthetic. Dobzhansky once wrote that nothing made sense except in the light of evolution, and this very well sums up the tremendous generalizing power of the modern theory. It has brought an evolutionary perspective on traditional subjects like the study of fossils and distribution, or the foundations of classification and nomenclature, as well as subjects like animal behavior, ecology, and conservation biology. With techniques and information from molecular biology, the theory of evolution has been extended to an understanding of evolution on the molecular level.

With contemporary interest in molecular biology, and especially the potential medical applications that it promises, it is easy to lose sight of the importance of natural history today. The unifying theory of the life sciences is still the theory of evolution that emerged from the naturalist tradition and is deeply rooted there. Contemporary naturalists like Edward O. Wilson argue that natural history still provides the vantage point from which to stand back and conceptualize the general order in nature. By studying a particular group from its molecular aspects to its widest ecological dimension, Wilson contends, we can go beyond much of the narrow research and discover general features of life. On a more practical side, natural history provides the tools for examining environmental issues and has been central in the call for preserving the biodiversity of the planet.

Natural history has been at the heart of the life sciences for over two centuries and remains a powerful set of ideas about the study of nature and its order. It has given rise to the major unifying theory of the life sciences, and it remains the repository of what we know about natural objects on the earth.

NATURALISM. Naturalism was one of a wave of “isms” that swept through the cultural world of the late nineteenth century. Its most vocal advocate was the French author Émile Zola (1840–1902), a prolific novelist, dramatist, essayist, and critic. Highly controversial in the period between the heyday of realism (1830–1860) and the emergence of early forms of modernism at the end of the century, naturalism in France was so closely identified with Zola's fiction that few claimed the label after his death. The widespread translation of his work, however, gave Zola a global influence that led to the emergence of naturalist schools around the world. The influence of Zola's naturalism was particularly prominent in Russia, which in the nineteenth century had very strong cultural ties to France; in western European nations; and in the United States. The naturalist charge in the United States was led by novelist and critic Frank Norris (1870–1902), dubbed “the boy Zola” by contemporary critics. Although Norris is now considered somewhat of a secondary figure in U.S. literature, the naturalist aesthetic he popularized influenced major twentieth-century writers such as Theodore Dreiser, Upton Sinclair, and John Steinbeck.

In popular use, the term *naturalism* is sometimes used to mean fiction that exaggerates the techniques of realism, sacrificing prose style and depth of characterization for an exhaustive description of the external, observable world. Literary critics often accept this view, but add to it a laundry list of features used to identify the naturalist novel:

- a deterministic plot of decline or degeneration, where characters are crushed by the forces of a universe they can neither understand nor control;

1868 Portrait of Émile Zola by Édouard Manet. Oil on canvas. Zola's works turned an unflinching eye on the minutiae of human behavior, and he portrayed his characters with unstinting and often provocative detail. PORTRAIT OF EMILE ZOLA (1840–1902) 1868 (OIL ON CANVAS), MANET, EDOUARD (1832–83)/MUSEE D'ORSAY, PARIS, FRANCE, LAUROS/GIRAUDON/BRIDGEMAN ART LIBRARY/WWW.BRIDGEMAN.CO.UK

- attenuation of exceptional or heroic characters, so that each character is a balance of merits and flaws; the critic Philippe Hamon calls this an “aesthetic of normative neutralization” (p. 102);
- attention to lurid or squalid subject matter, particularly focused on the aspects of human experience conceived to be base or instinctual; main characters are often perverted by uncontrollable appetites, drives, or lusts;
- characters drawn from the working class—in U.S. naturalism particularly, perversion and degeneration are associated with working-class characters;
- a modern or contemporary setting, most often urban or industrial, rather than the geographically or temporally distant settings favored by adventure and romance fiction;
- sociological research by the author, including on-site investigation of a workplace, subculture, or location, expert advice, and incorporation of specialized vocabularies.

This list is derived in large part from Zola's most emblematic (and best-selling) novels, such as *L'assommoir* (1877), *Nana* (1880), *Germinal* (1885), and *La bête humaine* (1890), and closely matches other naturalist monuments, such as Frank Norris's *McTeague* (1899).

Origins of the Term

The precise meaning of the term *naturalism* varies across the disciplines: a literary critic, philosopher, theologian, and political scientist would each use the term in a slightly different way. In its broadest sense, naturalism is a doctrine holding that the physical world operates according to laws discernible through empirical science. The naturalist method, modeled after nineteenth-century innovations in the experimental sciences, involves informed, systematic observation of the material world. For the naturalist thinker, human beings are nothing more than a part of this world—like rocks, plants, and animals, they are subject to the laws of physics, chemistry, and biology, which govern human behavior as inexorably as they govern the natural world. Naturalism is thus materialist and anti-idealist in that it does not recognize the existence of nonmaterial or nonobservable phenomena (such as a spiritual realm or higher moral law); it is also antihumanist in that it grants no exceptional status to human beings. Every action taken by a human being, according to the strict naturalist view, has a cause in the physical plane; human behavior is thus entirely determined by the laws of cause and effect in the material world.

In applying this theory to literature, Zola drew on the work of an older contemporary, the French philosopher, historian, and literary critic Hippolyte Taine (1828–1893). Taine's monumental *Histoire de la littérature anglaise* (1863–1864; History of English literature)—a philosophical treatise disguised as literary criticism—sought to demonstrate that a nation's culture and character are products of material causes; as he put it in a famous quip, “vice and virtue are products, like vitriol and sugar” (p. 3). Taine argued that works of art are the products of three factors: *race*, *moment*, and *milieu*. Taine's English translator renders this phrase as “race, epoch, and surroundings” (p. 12), though the French term *race* is much closer to the English words *nation* or *people* than to *race*. In the analysis of literature, Taine claimed, “we have but a mechanical problem; the total effect is a result, depending entirely on the magnitude and direction of the preceding causes” (p. 13).

Zola's Understanding of Naturalism

While Taine sought to develop a scientific method for the analysis of literature, Zola's naturalism was a method for writing novels; where Taine sought to understand a nation through its literary output, Zola used naturalist philosophy as a basis for creating characters, and with them a portrait of French society in the second half of the nineteenth century. Combining Taine's theories with research developments in the biological and behavioral sciences, Zola conceived of the novel as a laboratory for the study of human behavior under the influence of heredity and environment. By his mid-twenties, having published several novels, he began to plot out his massive life's work, a twenty-novel series entitled *The Rougon-Macquart*—a work to rival the vast *Human Comedy* of Honoré de Balzac (1799–1850), to be based in science rather than intuition.

Zola tirelessly promoted his theories in columns that appeared in newspapers, magazines, and journals. Unfortunately, the most widely anthologized expression of this theory is also among the least thoughtful. This essay, “The Experimental Novel” (1880), is essentially an extended paraphrase of the physician Claude Bernard’s influential 1865 work, *Introduction to the Study of Experimental Medicine*. The essay is now regarded as historically interesting if theoretically naïve, and contemporaries—including former disciples of Zola, such as the author Henry Céard (1851–1924)—ridiculed it as a misunderstanding of Bernard’s work.

To take this essay as representative of Zola’s thinking about naturalism would be a serious error. Naturalism in literature was as much a promotional concept as a literary-critical one, and the range, variety, and energy of Zola’s writing about the term indicates he was perhaps less interested in providing a final definition than in keeping alive the heated debates about naturalism. As a literary critic, theater critic, and essayist, Zola was a provocateur: he was strident, often caustic, and prone to dramatic and sensationalist gestures. Early in his career, Zola came to understand and exploit the value of notoriety; his first volleys of criticism were collected in 1866 under the title *My Hatreds*, and his unrepentant slogan “I am here to live out loud” is still occasionally cited by artists and activists. “The Experimental Novel”—along with many of Zola’s defenses of naturalism—is best understood from this perspective: to criticize the essay for its lack of theoretical rigor is to miss entirely its brilliance as a provocation and a promotion.

If Zola’s criticism is more confrontational than systematic, a broader look at his writing on naturalism nonetheless reveals several consistent ideas. First, Zola often claimed that the lurid, pornographic subject matter of many his novels was incidental to naturalism; what counted was the method—which, as his former disciple Céard observed, could hardly be called “experimental,” but that nonetheless shared the careful, systematic observational methods of the emerging social sciences of psychology, sociology, and anthropology. For audiences that consumed Zola’s novels as quickly as he could write them and for critics and government censors who called naturalism “putrid literature,” the graphic content of the novels was naturalism’s most salient feature, and Zola and his publishers often faced obscenity charges in France and abroad (cheap pulp editions with racy covers appeared in the United States as late as the 1950s). For Zola, however, unflinching analysis was the substance of naturalism.

A second, often overlooked theme that runs throughout Zola’s writing on naturalism is his repeated association of naturalism and democracy. Perplexed scholars have called this connection a double dysfunction, a strange marriage, a paradox: nineteenth-century theories of biological determinism seem hardly compatible with the Enlightenment ideals of citizenship and self-government. In the words of the critic Harold Kaplan, for naturalist literature in the United States, “democracy seemed to require strong idealizations to support free choice” (p. 37). But for Zola, naturalism in literature and democracy in politics were logical, even necessary evolutionary developments. Zola likened the outsized protagonists of Romanticism to kings

and princes, out of place in the modern world. For him naturalism, like democracy, was a representation—faithful if at times unflattering—of the common people.

Critical Debates

Naturalism was politically controversial in its heyday—conservatives called Zola a “literary anarchist,” while liberals saw his work as a “calumny of the people”—and its place in literary history has been hotly debated by scholars. By the mid-twentieth century, three major strands of thinking about naturalism’s legacies had emerged in Europe. In the early part of the century, Zola was adopted by the French left and elevated to the status of one of France’s great writers. Thanks in part to Zola’s courageous role in the Dreyfus affair, a political scandal that rocked France in the 1890s, naturalism—once reviled for its unsympathetic portrayals of the working class—was reassessed as an eye-opening portrait of the exploitation of the weak. As a result Zola, spurned by the literary establishment and prosecuted by the French government during his lifetime, was eventually laid to rest in the Pantheon, France’s secular cathedral to the “Great Men” of France.

Twentieth-century critics who favored the difficult modernist writing of James Joyce or Marcel Proust, however, were suspicious of this popularity. Naturalism’s accessibility and faith in science were incompatible with the modernist turn toward self-consciousness, interiority, opacity, and style; from the modernist perspective, Zola’s naturalism looked like a kind of dead end of realism, an overextension of realist strategies at a time when modernist artists were turning away from representational art forms. As the critic James McFarlane put it, naturalism “exhausted itself taking an inventory of the world while it was still relatively stable, [and as a result] could not possibly do justice to the phenomena of its disruption” (p. 80).

A third response to Zola and naturalism is best represented by the Hungarian philosopher Georg Lukács (1885–1971), a prominent figure in leftist aesthetic debates in Europe in the mid-twentieth century. Lukács affirmed the common antithesis between realism and modernism, but saw naturalism as a form of modernism, not an outgrowth of realism. The differences between naturalism and modernism were, for Lukács, merely superficial differences of style. On a more substantive level—for Lukács, the ideological level—naturalism is a form of modernism. As he put it, “There is a continuity from Naturalism to the Modernism of our day”—a continuity of “underlying ideological principles” (1963, p. 29). In contrast to “critical” realism’s “dialectical unity,” both naturalism and modernism, despite their widely divergent styles, deny the possibility of understanding and action, instead presenting the human condition as one of alienated subjectivity, isolation, and psychopathology. For Lukács, then—in spite of Zola’s courageous politics (see his 1940 essay “The Zola Centenary”)—naturalism was, like modernism, “not the enrichment, but the negation of art” (1963, p. 46).

Naturalism in the United States

Naturalism was a short-lived phenomenon in France, where it was closely associated with Zola himself. Of Zola’s acolytes

(known as the “Médan group, after the location of Zola’s country estate), only one, Guy de Maupassant (1850–1893), has achieved a lasting reputation. Although short-lived, Zola’s influence was global: his work was translated into nearly every language, and writers from Tokyo to Buenos Aires to Moscow saw in his work both a modern sensibility and a fierce critical edge. Scholars have long discussed naturalist literary movements in England, Russia, Germany, and Spain, but are still hard at work mapping naturalism’s influence outside Europe: in the 1990s, two journals devoted to Zola and his legacy, *Excavatio: Nouvelle Revue Émile Zola et le naturalisme* and *Les Cahiers Naturalistes*, published a number of essays tracing naturalist movements, often short-lived, in eastern Europe, Asia, and South America.

The U.S. version of naturalism proved to be more enduring: the novelist Frank Norris succeeded in establishing naturalism as a permanent part of the lexicon of literary critics (in spite of his rather idiosyncratic view of naturalism as a magnification of Romanticism rather than a form of realism). Although naturalism was initially associated with Norris and his contemporaries Stephen Crane (1871–1900) and Jack London (1876–1916), a wide range of authors over the next seven decades have been shown to have been influenced by naturalism. As the U.S. scholar June Howard put it, “the name taken by a clearly defined, relatively short-lived movement in France [became] in America a broad term used by some writers and many critics to characterize a diverse group of works . . . over a long period of time” (p. 30). The critic Donald Pizer, in particular, has mapped naturalism’s influence on twentieth-century U.S. literature.

Although Norris also wrote adventure novels, his *McTeague* (1899), *The Octopus* (1901), and the posthumously published *Vandover and the Brute* (1914) are the touchstones of U.S. naturalism and were strongly influenced by Zola; some critics accused Norris of lifting passages directly from the French novelist. Although Crane’s novella *Maggie: A Girl of the Streets* (1893) is sometimes used to mark the beginning of naturalism in the United States, Norris’s criticism established the term in an American context. Norris also used his influence as a reader at Doubleday to promote naturalism; his most notable success was Theodore Dreiser’s masterpiece *Sister Carrie* (1900), which the publisher pursued on the strength of Norris’s recommendation in spite of his own distaste for the book.

Beginning in the 1980s, U.S. naturalism saw a critical revival, as new theoretical developments led to a fresh perspective on the genre—and indeed, on the notion of genre itself. For traditional literary criticism, focused largely on concerns of aesthetic merit and often, if implicitly, moral value, naturalism had been somewhat of a problem: as a genre, U.S. naturalism privileges blunt artlessness and—like Zola—posits an essentially amoral universe. Critical works such as Walter Benn Michaels’s *The Gold Standard and the Logic of Naturalism*, a tour de force of New Historicism, and June Howard’s *Form and History in American Literary Naturalism*, broadly informed by the theoretical developments of structuralism and post-structuralism, examine naturalism as a complex meditation on cultural contradictions faced by U.S. culture at a pivotal

moment in its history. Michaels, for example, sees both literary naturalism and debates about the gold standard as part of an entire culture’s struggle with the relationship between the material and the ideal—a struggle that, for Michaels, is constitutive of personhood itself. Howard, drawing on the French philosopher Louis Althusser’s notion of ideology, argues that naturalism was one way for turn-of-the-twentieth-century U.S. culture to process threatening contradictions in the social order, such as contradictions between the egalitarian ideals of democracy and prominent social and political inequalities of the period. For Howard, the most notable of these are the dominance of industrial capitalism and the increasingly visible presence of groups—a largely immigrant urban working class, women, and African Americans—seeking to be included as agents in U.S. political life.

NATURALISM IN ART AND LITERATURE. *Naturalism*, a term widely used in the nineteenth century, was employed by novelists, artists, and art critics as a synonym for

realism. But, in fact, *naturalism* was a much more complex term. The term derived from the theory of positivism developed by the French philosopher Auguste Comte (1798–1857). The roots of scientific naturalism, emerging from the eighteenth century and coming to fruition in the nineteenth century, considered knowledge as a pure science that was to be reinforced by a clear understanding of the laws of nature and an objective observation of facts. In the last half of the nineteenth century writers, primarily novelists, subscribed to this innovative positivist view of the world around them.

In the course of the nineteenth century the philosopher Hippolyte Taine applied scientific methods to the study of art and literature. From 1864 to 1884, as a professor at the influential École des Beaux-Arts in Paris, Taine taught students that the character and development of visual culture were determined by two qualities: race and the environment in which art was created. Taine presented the foundation for an evolutionary approach toward human nature and the importance of family genes in determining the ways in which people reacted. Similarly, this author's advocacy of studying the locale or place in which an individual was brought up emphasized societal implications in shaping an individual. Taine's widely read book *The Philosophy of Art* conveyed his beliefs to a broad audience.

Taine's ideas also provided a scientific method for historians that allowed them to understand the past and even predict the future since it was based on immutable historic laws. His approach contributed a foundation upon which contemporary thinkers could build literary and artistic examples of works that were meant to reflect their own era through a factual reconstruction of the "spirit of the time." This need to be "of one's own time" affected writers and visual artists until the end of the nineteenth century and into the twentieth.

The Father of Naturalism

The best-known "proponent of naturalism" was the novelist and French art critic Émile Zola (1840–1902); he was one of the most passionate defenders of Taine's theories, putting them to use in his novels. Zola's foreword to his novel *Thérèse Raquin* (1867) became the fundamental manifesto of literary naturalism. He maintained and enlarged his ideas in his *Experimental Novel* (1880) and *The Naturalist Novelists* (1881), where he advocated that modern literature needed to be as accurate as possible in order to provide a record of "modern history." To Zola, literature could only be truly real if it examined life in a verifiable way, similar to a medical experiment or analysis, where humanity, as an organism, would be able to function only by following predetermined hereditary laws that were to be studied within a very precise social environment. As a careful note taker of the world in which he lived, Zola used the documents he compiled as necessary building blocks in the construction of his novels.

Zola's naturalism created no less a sensation than the earlier realism of Gustave Courbet when he showed his paintings at the Salon in Paris (1850–1851). Very quickly, and certainly by the early 1880s, if not before, literary (and eventually visual) naturalism became the most popular method of creativity

The Haymakers (1877) by Jules Bastien-Lepage. Oil on canvas. Bastien-Lepage (1848–1884) was considered by many to be the pioneer of the naturalist style in painting. Though he died quite young, his work inspired the art of numerous other adherents of naturalism. THE HAYMAKERS, 1877, BASTIEN-LEPAGE, JULES (1848–84)/MUSEE D'ORSAY, PARIS, FRANCE, CREDIT: PETER WILLI/WWW.BRIDGEMAN.CO.UK

throughout Europe. Much of this influence was due to the wide dissemination of literary texts through popular journals. The consistent discussion of Zola's theories by writers and painters in the public eye made it clear by the world's fairs of 1878 and 1889 that naturalism was everywhere; it had become an international phenomenon.

The Early Naturalist Painters

As an art critic, beginning in the 1860s, Zola was a very passionate and effective critic of contemporary art. He profoundly admired the work of the French painter Jules Bastien-Lepage (1848–1884), an artist who was seen at the time as one of the leading naturalist painters, if not the primary painter working in this vein. Many younger painters idolized Bastien-Lepage's work, especially after his early death from cancer. Zola, along with the art critic Albert Wolff, saw Bastien-Lepage as the inheritor of the tradition of Jean-François Millet (1814–1875) and Gustave Courbet (1819–1877). Zola, and to a slightly lesser degree Albert Wolff, affirmed Bastien-Lepage's superiority over the Impressionist painters active at the time, since Bastien-Lepage could, it was believed, factually recreate his impressions in a most organized way. Bastien-Lepage's canvases, such as his *Hay Gatherers* (Musée d'Orsay, Paris) and *Potato Harvesters* (National Gallery of Victoria, Melbourne), because of their sense of the momentary and their large-scale presence, created lively discussion. Critics, and other artists, believed the artist had originated a naturalist painting style that was photographic and environmentally specific. The painter used the landscapes of his native region, the Meuse, for his naturalist reconstructions of rural life.

Bastien-Lepage's work excited the imagination of painters beyond France; he was seen as a pivotal figure in the international naturalist movement. His death was viewed as cataclysmic for the visual arts, and he was assured a position of importance in the creation of a "new style." His canvases became models for emulation in Scandinavia, eastern Europe, England, and the United States, where his example demonstrated that naturalism was a viable and fertile mode of representation.

Using Bastien-Lepage as a touchstone, other painters, including P. A. J. Dagnan-Bouveret, created a heightened naturalism that relied extensively on the use of photography as a tool, an aide-mémoire, without revealing photography as a primary source. Photography became for visual artists what note taking was for the novelist; it allowed them to gather visual facts they could use later in their reconstructions of reality. A number of well-accepted painters created a compelling version of "virtual reality" that deeply engaged the general public, who saw, accurately recorded, elements from their environment and types from society that they knew well.

Another French painter, one linked briefly with the Impressionist movement, was Jean-François Raffaelli (1850–1924). In a series of mostly small compositions, he represented people from the lowest level of society in order to convey authenticity and ugliness. Raffaelli's ragpickers, wanderers, and social outcasts revealed that beauty and strength came from character, no matter where this was found. He helped shift the visual perspective from "ideal nudes" toward the examination of those whose life was unfortunate, similar to many of the types in Zola's novels. Raffaelli's vision of the world suggested that sadness and hopelessness were aspects of life experiences that a modern naturalist painter needed to understand. With Edgar Degas and Gustave Caillebotte, painters with a strong naturalist streak in many of their works, the Impressionist canon was expanded to include themes drawn from urban life, thereby helping to fulfill the call from many art critics of the era that themes from modern life could be found everywhere. In his series of articles on realism published in the review of the same name, Edmond Duranty (1833–1880) foreshadowed Zola's ideas about the position of the artist, writer, or painter vis-à-vis nature. For Duranty, as for Zola, artists should be concerned with the truth, with an exacting study of nature. He called for the artist to portray the practical conditions of human life, the milieu in which people lived, in order to represent the social side of man and the influences that affected him.

Spreading Naturalism

As Zola's novels gained an international following, a large number of imitators appeared who helped promote the naturalist aesthetic in popular literature that was available to the masses. Writers such as Guy de Maupassant (1850–1893) based their stories on Zola's methodology. At the same time, Zola's best-known novels were turned into plays: Nana was one character who dominated the French stage in productions of *L'assommoir* from the 1880s onward; Zola's mining novel, *Germinal*, provided additional evidence of his influence when performed in popular theaters. During the 1890s, a series of

printmakers furthered the appearance of visual naturalism in posters and lithographs published by the ever increasing socialist press. Théophile Steinlen, an avowed radical, saw that such types as the print "The Barge Man" provided an opportunity to comment on the implied threat found in disgruntled wanderers; other images, for the periodical *Gil Blas*, stressed that those who were out of work and destitute could be found everywhere. The plight of the poor became a naturalist battle cry that many artists, in varied artistic media, answered. By using these themes, writers and visual artists enlarged the social dimension of the naturalist movement, which had first brought these types to the fore.

But it was the haunting impact of the environment and of the social milieu on life that remained one of the most trenchant aspects of the naturalist heritage after the turn of the century. In America, in the novels of Theodore Dreiser (1871–1945) or Frank Norris (1870–1902), the influence of Zola's brand of naturalism was paramount. In *Vandover and the Brute* or in the cataclysmic *McTeague: A Story of San Francisco*, Norris's characters were flawed, often overwrought, brutes whose nature was determined by genetic and environmental factors. Their pursuit of money underscored uncontrollable drives; naturalism was now focusing on obsessive traits. Significantly, Norris's novel *McTeague* led to another level of naturalist appeal: the influence on early cinema. When Erich von Stroheim completed his extremely long film *Greed*, based directly on *McTeague*, in 1924, he revealed that the naturalist aesthetic could be transferred to another medium, where it was used as a means of revealing fatal character traits that cast light on the lives of troubled people. In effect, Zola's idea of making art understandable for the masses by creating a detailed narrative had come full circle with the motion picture.

NATURAL LAW. Natural law theories have a venerable place in the history of philosophy, stretching back to the time of Plato (428–348 or 347 B.C.E.) and Aristotle (384–322 B.C.E.) when the relationship between law and nature first became a central dynamic of discussion in ethics. Since then such theories have provided staple ingredients within each major phase in Western philosophy down to the time of Immanuel Kant (1724–1804) and beyond into the contemporary era. While such accounts have often been short on detailed and practical guidance on right action, the outlook of natural jurisprudence has been highly influential in ensuring a continuous focus on the alleged rationality of the natural world and the constant and uniform accessibility to the human mind of such principles of observed regularity. However, there has always been a tension between the claim that these principles are eternal and unchanging, and the particular forms and uses assigned to natural law: in Ancient Greece the focus was more on the apparently unchanging character of nature and the distressing mutability of actual law; in the medieval age St. Thomas Aquinas (c. 1224–1274) above all emphasized the accessibility of regular patterns in nature to human nature; and in the early modern era natural law theories evolved as responses first to skepticism about the sources of knowledge, and secondly in reaction to the political turbulence that followed the Reformation, which seemed to shatter the easy symmetry between the uniformity of church and state both across Europe as a whole and also within its constituent political units. In each case the position of natural law was ambiguous, both very much of its time, and yet claiming its authenticity and authority from its position outside history.

Natural jurisprudential approaches to ethics have proved difficult to integrate into the historiography of philosophy because of just this same ambiguous relationship to history itself. On the one hand, natural law was viewed as a set of eternal verities presented by God to humanity in finished and perfect shape, and found embodied in the moral and civil order as evidence of its divine fashioning, albeit in a form diminished by the Fall of Man. But on the other hand, natural jurisprudence is a product of the interaction not just of different and succeeding schools of moral philosophy, but also of the interaction of the range of plausible accounts of divine instigation and human response within wider politics and society. So, for example, the neo-Thomist and Lutheran-Aristotelian systems of natural law that evolved in the sixteenth and seventeenth centuries in Spain and Germany were both a reaction to the

new ideological circumstances of the Reformation and Counter-Reformation eras as much as they were internal modifications and realignments within academic institutions of the legacy, above all, of Aquinas and Aristotle. The same epistemological ambiguity runs through the natural law systems of the early Enlightenment era and the interpretation that they laid upon the works of Hugo Grotius (1583–1645) and Thomas Hobbes (1588–1679), which were their foundation and self-conscious inspiration. The writings of Samuel Pufendorf (1632–1694), Gottfried Wilhelm von Leibniz (1646–1716), Christian Wolff (1679–1754), and Christian Thomasius (1655–1728) sought both to anchor themselves in a newly revealed metaphysics that stood outside time, and also to comment powerfully upon and if necessary direct the course of the world of contemporary practical politics.

Natural Law in the Ancient and Medieval World

At the heart of natural law is an attempt to extract general principles out of the confusing multiplicity of legal and social convention; in the Greek world, this was represented by the contrast and tension between those areas of human life governed by contingency and those controlled by the ineluctable force of nature. Given the variability of positive law both across cultures and within them, the question arose of how legal certainty could be identified and located; and immediately battle-lines were drawn between those who held that such a moral law could be found—usually as a divine creation—and those who remained skeptical of such normative claims, and either denied that there was any essential morality, or located it elsewhere. This pattern, which originated with the Sophists, was to be repeated throughout the history of natural law arguments.

Part of the explanation of why Aristotle's writings are regarded as the first important contribution to this discourse is that they adeptly try to reconcile the distinction between nature and convention. He achieves this by elevating human reason as humankind's dominant and defining characteristic, whose proper exercise mediates between what is permanent and what is ephemeral. This is taken up with greater vigor by the Stoics, and by Marcus Tullius Cicero (106–43 B.C.E.) in particular. He regarded human reason as the apex of a rational world order: human nature rather than an innate law outside human beings now provided the ground and basis for distinguishing between positive law and natural law. Moreover, all humans possessed the rational means, when properly exercised, to identify this law unaided by God, whose divine spark reason essentially is. The Stoics also initiated what was to become one of the most influential strands of natural law thinking—namely, the view that one of the core principles of natural law is a sense of broad sociability towards one's fellow humans, tempered though not obliterated by one's own personal priorities.

The rationalism of natural law still runs as a clear thread through the massive *Summa Theologiae* of Aquinas, despite its elaborate metaphysical architecture. Human nature and the rational conclusions that can be generated from it continue to be his point of departure. However, Aquinas is concerned to reinstate divine eternal law within his framework, and that does

lead to some tension within his overall concept of natural law as a bridge between positive and divine law. He tries to overcome this by recourse to a categorical division of natural law into primary and secondary principles, thus making natural law both fixed and mutable simultaneously. This sophisticated synthesis of pre-existing views within a Christian framework proved highly influential, and was continually refined, most notably by the later Spanish Jesuit Francisco Suarez (1548–1617); but ultimately the pressures generated by the Reformation and Thirty Years' War on the one hand and Renaissance skepticism on the other required a reconfiguring of the relationship between divine and natural law, a renewed emphasis on the Stoic formulas, and a fresh initiative to link the core principles of natural law to the emergent law of nations.

Early Modern Germany

In the era that followed the conclusion of the Thirty Years' War in 1648, it was generally held that the combined effects of Renaissance skepticism and the fragmenting effect of endemic confessional strife had destroyed the coherence of pre-existing accounts of political sovereignty. The rights and duties of monarchy, most especially in respect to churches and the enforcement of doctrinal and liturgical uniformity, were left open to question and redefinition as Europe sought to come to terms with the permanence of confessional division and the necessity of its diplomatic recognition. How could sovereignty remain unified and cohesive when religious truth had become fissiparous? How could absolutism be redefined in a way that preserved unity of political decision-making while paying due pragmatic recognition to the complexities of the new European order?

Nowhere were these tensions more visible than in the Holy Roman Empire, the epicenter of the recent military conflict, and the most graphic illustration in its uneasy religious tessellation of the need to find a new legitimization for political sovereignty. It is therefore no accident that it was from this region that there emerged the most systematic attempts to re-unify politics with metaphysics and devise new explanations of the appropriate exercise of political and ecclesiological power by the ruler. The pathbreakers in this respect were Grotius and Hobbes, far more than René Descartes (1596–1650), whose relative silence on morals gave no clear assistance in this area. Grotius was admired and praised above all for showing first in a series of specific works on the legal implications and meaning of colonial acquisition, and second in his larger work of synthesis, *On the Law of War and Peace* (1625), that there were still general principles of natural law that could be discerned right across the spectrum of international customary law. These were accessible to all, and, crucially, would obtain even if God and God's revealed intentions for humankind were taken out of consideration. From Hobbes European readers drew the key arguments of what is generally known now as voluntarism: that laws of general validity arose from the imposition of a unified, sovereign, rational will rather than the progressive discovery of general principles benignly imprinted on humanity's consciousness in the form of innate ideas. It was in the combination of Grotius's arguments in favor of the possibility and content of universal natural law, and Hobbes's insight into

how those laws may be isolated and implemented in contemporary, fragmented practical politics that produced a truly modern theory of natural law, associated with Pufendorf and Thomasius. It evoked in turn a powerful hostile reaction in the work of Leibniz and Wolff, which tried to rework the views of Aquinas in a different idiom.

The contest (for that is what it effectively became) between the voluntarism of Pufendorf and the essentialism of Leibniz was mainly played out within a framework of university disputation, but also spilled over importantly into the public arena in debates over such issues as confessional reunion. At stake here in essence was the way in which the principles of moral knowledge were obtained, an apparently recondite area of learning, but nevertheless one with crucial implications for method in all areas of modern philosophy. In his major work *On the Law of Nature and Nations* (1672), Pufendorf argued that humans gain knowledge of morals in a way that parallels the manner in which they devise languages, that is, through the imposition of categories and meanings to create shared, mutually accessible structures. God may give humans revealed truths, but this forms but one part of human duties; the majority of these duties are devised through unaided reason, which God gave to humans to use in this free fashion. From this initial insight, explicitly grounded in Stoic thought, emerges a complex analytical structure that frames an elaborately contractarian politics weighted heavily through the prudential calculations of individuals in an absolutist direction. It also resulted in a clearly articulated Erastian church politics, vesting the civil power with final control and powers of resolution in religious disputes.

In contrast to this, Leibniz and Wolff regarded the work of Pufendorf and his followers as an attempt to provide practical resolutions of disputes from poorly argued philosophical premises that either guilefully or ineptly justified secular voluntarism. In its place, Leibnizian posited an elaborately conceived metaphysical approach that sought to explain natural law in terms of divine justice and the "charity of the wise," arguing in essence that all practical morality can be derived from the reservoir of truth located in the perfect wisdom of God. Less daring in the practical politics with which it eventuated, Leibnizian natural law nevertheless performed virtuosic surgery on the corpse of Protestant-Aristotelian natural law, ensuring that Wolff's textbooks enjoyed equal credibility and popularity in both Protestant and Catholic universities until the later eighteenth century. Leibniz also pointed out disquietingly secular overtones in the work of the followers of Pufendorf that inhibited their unequivocal acceptance of their work even within Protestant Germany.

Early Modern France

While the grandest systems of natural law emerged in Germany, there was also a sustained focus on ethical discourse of this type among the French Huguenots, exiled by Louis XIV (1638–1715) after the Revocation of the Edict of Nantes in 1685, and forced therefore to construct a new political identity for themselves within a cosmopolitan intellectual framework, rather than that of a state. Their most eloquent writers, such as Jean Barbeyrac (1674–1744) and Jean-Jacques

Burlamaqui (1694–1748), sought to defend a right to religious conscience while retaining a political order that was primarily absolutist in character. The particular circumstances of their ideological preferences therefore led them to develop a proto-liberal language of rights in association with religious toleration that was genuinely original and powerfully influential, not least on John Locke (1632–1704). But the Huguenots also had to confront more directly than any other group of writers the potentially illiberal and austere utilitarian (using that term loosely) aspects of Pufendorfian absolutism, whose voluntarist assumptions sometimes appeared to produce results rather similar to the divine-right absolutism pursued for wholly different reasons by Louis XIV. This was a paradox not lost on Jean-Jacques Rousseau (1712–1778), who, with intimate knowledge of the local Swiss context of these writers, later castigated the Huguenots, and the natural law school as a whole, as a very clear case study in subservience to absolutism and a failure to follow through an analysis of the rights of conscience with sufficient rigor.

In four particular respects, the natural law disputes of the period between 1625 and 1760 left an important philosophical legacy. Firstly, the issues of how far religious toleration was to be permitted, what its political consequences should be, and what were the sources of its intellectual justification were played out within and refracted through the discourse of natural law above all others. Natural law theories therefore provided the framework for the discussion of the major question of the day on the interface between political theory and practical politics. Secondly, although this was not fully intended, the crucial separation of the fields of ethics and moral theology, argued for by Grotius, Pufendorf, and their followers, ultimately resulted in the final downgrading and devaluing of the formal divine content and origin of ethics and the promotion of individuals as separate self-sufficient moral persons capable of undertaking rational voluntary transactions. Thirdly, this Pufendorfian argument produced several very important discussions of the nature of contractarian government, of the right to own property and to pursue economic interactions untrammelled by the state, that powerfully anticipated some of the most radical and influential ideas of the philosophes and of the Scottish Enlightenment. Finally, the natural lawyers' preoccupation with securing links between the law of nature and the law of nations established the view that reason of state arguments were not sufficient in the world of public affairs, thus—ironically—reinstating a link between “eternal” principles of human ethics and the law of nations, just when the link between divine and natural law had been irretrievably severed.

Natural Law and Natural Rights

The disappearance of natural law arguments from mainstream philosophy was not nearly so abrupt in the nineteenth century as is often made out, as can be seen from the curricula and textbooks adopted at many universities. Nevertheless, the combined influence of Kantian idealism and utilitarianism did serve ultimately to undercut several of the key claims of the theorists of the preceding two centuries. In his *Foundations of the Metaphysics of Morals* (1785), Kant essentially generated a fresh account of moral obligation that was located not in the principles

of human nature, but in an autonomous will freely exercising practical reason: Obligation lay not in the harmony of a principle with human nature, but in whether a law could be objectively generalized in relevantly comparable circumstances. Thus it appeared that natural law arguments only yielded empirical “counsels of prudence” about human behavior, not conceptually coherent moral yardsticks. A second blow was struck by Jeremy Bentham (1748–1832), who stressed that there was no “external consideration” that permitted natural jurisprudence to distinguish between one person’s judgment of the law of nature and another’s: natural law had to act as its own circular proof and guarantor, which was unacceptable. Attempts to distill a common set of principles from the infinite variety of the law of nations were bound to fail; he believed it to be far better to move outside the categories of reason and human nature altogether, accept the pluralist nature of human definitions of the good life, and reassert the supremacy of legal positivism, based on accommodating majority preferences. This point was particularly difficult for natural lawyers to answer, given that they had failed to observe how easily their view that knowledge of the law of nature was not reliant on God could slide into a statement that grounds for obeying natural law are not dependent on God either—a conclusion that left no clear criterion of obligation to fall back upon.

However, the eclipse of natural law arguments was by no means complete even at the beginning of the twenty-first century. While natural rights theories have pursued their own separate trajectory towards an assertion of the protection of individual rights as a good in itself, perhaps best embodied in the American philosopher Robert Nozick’s *Anarchy, State and Utopia*, a number of Catholic theorists, most notably the Australian author John Finnis in *Natural Law and Natural Rights*, have reworked the idea of shared goods inherent in human nature, though the content of that list of shared goods and the relationship between them has proved to be controversial. As with the earlier versions of natural law theory that have taken their stand on human nature and its attributes, this version too stands or falls on the richness or poverty of its conception of that human nature, and on the clarity and self-awareness with which human nature is neutrally described or prescribed in relation to other norms at each step in the argument. All such theories explore very difficult philosophical territory because they seek to unify two essentially different projects: to provide specific prudential advice on how best to achieve one’s objectives (implying a recognition that human nature and its needs change in line with historical circumstances in ways that reason alone does not always fully comprehend), together with a parallel recognition that for human insights to be generalized as valid law, they need to be assessed according to a sole and unvarying standard, usually identified as rational truth. Those thinkers who have best overcome these paradoxes, such as the Stoics, Grotius, and Pufendorf, lived in periods of significant social dislocation, but were stimulated to identify and narrow general principles attributable to reason that were also imaginatively rich enough to meet the shifting empirical shoals of their own political and existential crises. That is why they are still worth studying in the twenty-first century, for this juxtaposition of moral philosophy with moral exigencies is a task that is never completed, despite the shift in intellectual

frameworks that makes the natural law era seem so distant and different from that of the present.

NATURAL RIGHTS. See **Human Rights; Natural Law.**

NATURAL THEOLOGY. The primary sense of the term *natural theology* rests on the contrast between natural and revealed knowledge. Natural theology concerns knowledge of the existence and attributes of God arrived at using only the natural faculties of sense and reason. Philosophical arguments for the existence, intelligence, power, and goodness of God based on the order and beauty of the world, or on purely intellectual considerations, are examples of natural theology. Knowledge of God that is based on divine revelation as set down in scripture is the subject of revealed theology.

A central metaphor for the distinction between natural theology and revealed theology is that of the “two books”—the book of God’s word (scripture) and the book of God’s works (nature). The mainstream theological position has always been that the primary source of truth was revelation and that natural reasoning—reading the book of God’s works—can provide ancillary support for revealed truths. Reason can confirm what is already known by faith. Natural theology has, therefore, been a more or less important, and more or less welcome, secondary support for Christian doctrine over the centuries. A constant worry for theologians has been the possibility of relying too heavily on natural theology and thus giving too much away to rationalistic and secular ways of understanding the world and placing insufficient emphasis on the importance of scripture and revelation.

Although the primary sense of “natural” in the phrase “natural theology” is natural as opposed to revealed knowledge, there is a secondary sense that is also important. Works of natural theology produced from the seventeenth to the nineteenth centuries frequently focused on the wonders of the natural world and on developments in natural science. The phrase “natural theology” thus came to stand for a rather particular kind of natural theology—a celebration of the beauty of the natural world and the power, wisdom, and goodness of its Creator, as revealed by the scientific study of nature. This sort of natural theology might also be thought of as a kind of “theology of nature,” to distinguish it from the broader intellectual enterprise of arguing about God independently of revelation.

Natural Theology and the Birth of Modern Science

Although it had roots both in ancient Greek philosophy and in medieval Christian theology (for instance, in Thomas Aquinas’s famous “five ways” of demonstrating the existence of God), the heyday of natural theology was between the seventeenth and nineteenth centuries and was intertwined with the rise of modern science (see Brooke, 2003; Brooke and Cantor).

Nature was investigated and interpreted in new ways in sixteenth- and seventeenth-century Europe. These innovations (which have traditionally been summed up as the “scientific revolution”) included the use of new scientific instruments (such as the telescope, the microscope, and the air pump), a new emphasis on experimentation, and the use of mechanical models to explain natural phenomena. The natural theological genre was one that both allowed practitioners of the new mechanical and experimental philosophy to justify their work to a sometimes skeptical religious establishment and also allowed religious apologists to enlist new knowledge in the service of Christian piety.

Many of the early members of the Royal Society in London (founded in 1660) saw a connection between their experimental investigations and their Christian faith. (Robert K. Merton famously argued that the Puritan religious beliefs of many of the founder members played a key role in shaping the activities of the Royal Society.) Robert Boyle (1627–1691), for instance, as well as conducting important experiments with his air pump to investigate the pressure of air and other gases, wrote on *The Excellency of Theology, Compared with Natural*

Philosophy (1674) and composed a work entitled *The Christian Virtuoso* (1690), subtitled, “shewing that by being addicted to experimental philosophy, a man is rather assisted than indisposed to be a good Christian.” Another early Fellow of the Royal Society whose writings explored the way that the new experimental and mechanical philosophy could be used to support theology was John Ray (1627–1705), whose *The Wisdom of God Manifested in the Works of the Creation* (1691) was to become a classic of the natural theological genre. In this work, Ray argued that since the creativity of God was present throughout the natural world, no part of it was too low or insignificant to be a subject of natural-philosophical study.

The experimental investigation of nature in seventeenth-century England was, then, justified as being to the greater glory of God and for the good of man. The natural theology produced by men such as Boyle and Ray reflected the character of the new natural knowledge they were engaged in producing. Their God was an able mathematician, a geometer, a designer, a mechanic. If the experimental philosopher displayed his ingenuity by designing and constructing a telescope or a microscope, how much more ingenious must be the God who could design and construct the human eye? If the man of science gave evidence of his intelligence by discovering that natural phenomena were governed by elegant mathematical laws, how much more intelligent and powerful must be the God who drew up and laid down those laws?

In his will, Boyle left money to pay for a series of lectures to promote this natural theological vision, which he hoped would prove the truth of the Christian religion “against notorious infidels, viz. Atheists, Pagans, Jews, and Mahometans” (quoted in Brooke, 2003, p. 157). The result was a series of Boyle Lectures, which were delivered for around forty years, annually, starting in the year of Boyle’s death, 1692, when the first Boyle lecturer was Isaac Newton’s friend, the Reverend Richard Bentley (1662–1742). Another Newtonian and theologian, Samuel Clarke (1675–1729), was the Boyle lecturer in 1704–1705.

Natural Theology and Its Critics in the Eighteenth and Nineteenth Centuries

Lectures and treatises in this same natural theological tradition continued to be produced throughout the eighteenth century and into the first half of the nineteenth century, across Europe, but with a particular popularity in Britain. Natural theologians argued from the harmonious, law-governed, architecturally sophisticated, mathematically precise wonders of nature—animate and inanimate—to the existence and attributes of a good, powerful, and intelligent deity. Natural theological works frequently relied on arousing their readers’ aesthetic feelings, but these could then be used in support of very different political programmes, from Joseph Priestley’s and Thomas Paine’s versions of radical republicanism to William Paley’s and William Whewell’s more conservative Anglicanism.

The most famous philosophical critique of natural theology, David Hume’s (1711–1776) *Dialogues Concerning Natural Religion*, appeared, posthumously, in 1779. Although the

use of the dialogue form meant that Hume did not claim any view directly as his own, some have thought that the arguments against natural religion voiced by the skeptical Philo are closest to Hume’s own views. In addition to throwing doubt on the soundness of the analogy between the universe and human artifacts, Philo suggests that if the analogy is to be taken seriously, then the correct inference should be to a cause more closely resembling the cause of human artifacts—namely, a being (or, more likely, a collaborating group of beings) of limited skill and foresight, not a single being of unlimited power and intelligence. Pressing the point even further, Philo asks why the natural theologian, once embarked upon the project of comparing human and divine designers, should not become a perfect anthropomorphite. Why not assert that the deity or deities has eyes, a nose, mouth, ears and so on, he asks.

Although the attacks upon the argument from design put forward in Hume’s *Dialogues* are often seen, in retrospect, as devastating to the natural theological enterprise, that was not how they were perceived at the time. The most famous treatise in the natural theology tradition postdated the *Dialogues* and did not consider the arguments put forward in them to be seriously troubling. This was William Paley’s (1743–1805) *Natural Theology* (1802), which is still considered the classic expression of the argument from natural design to divine designer. The Paleyite version of natural theology, with its focus on adaptation and design, was taken up by the authors of the *Bridgewater Treatises*. It was also the version of natural theology to which the young Charles Darwin (1809–1882) was introduced as a Cambridge undergraduate with a passion for natural history, in the late 1820s.

As the nineteenth century unfolded, however, the natural theology of Paley and the *Bridgewater* authors came under attack from a variety of different directions. Discussions about the intellectual status of natural theology overlapped with debates about the political desirability of church-dominated education. In Britain, for instance, the second half of the nineteenth century saw the Anglican monopoly on the universities and education being gradually eroded. Anglican men of science and their natural theological arguments were gradually displaced by agnostics and secularizers, with their more materialistic interpretations of scientific results, as the leading scientific authorities in Victorian Britain.

There had been, for some time, a radical, anti-Christian strand of natural theology—a deistic sort of natural religion promoted most famously by Thomas Paine (1737–1809) in his *Age of Reason* (1794–1807). On this view natural theology was not a supplement to revealed theology but a self-sufficient alternative to it. Paine argued that the book of nature was the only book that was needed to understand God and his creation. All churches, scriptures, and doctrines were anathema to Paine. Christianity was pilloried as a corrupt and oppressive system, run by a self-serving and power-hungry priesthood. The true theology—as opposed to the immoral superstitions of the churches—was to be found in the results of science and philosophy. Writing in the same freethinking tradition as Paine, but replacing Paine’s deism with outright atheism, the secularist campaigner George Jacob Holyoake

PALEY'S WATCHMAKER

William Paley (1743–1805) was an Anglican clergyman and successful writer whose *Principles of Moral Philosophy* (1785) and *Natural Theology* (1802) were widely read, especially by students, well into the nineteenth century. The central argument of *Natural Theology* was that living things are comparable to mechanical contrivances, such as watches; and just as from a mechanical contrivance we infer a human designer, so, by analogy, from natural contrivances we should infer a divine designer (see Addinall; Brooke, 2003; Nuovo). The opening paragraph of Paley's *Natural Theology*, quoted below, set the tone for the central analogy of the book. The title of Richard Dawkins's 1988 book, *The Blind Watchmaker*, alludes to this argument by suggesting that blind Darwinian processes of variation and natural selection have replaced Paley's divine watchmaker.

In crossing a heath, suppose I pitched my foot against a *stone*, and were asked how the stone came to be there; I might possibly answer, that, for any thing I knew to the contrary, it had lain there for ever: nor would it perhaps be very easy to show the absurdity of this answer. But suppose I had found a *watch* upon the ground, and it should be inquired how the watch happened to be in that place; I should hardly think of the answer which I had before given, that, for any thing I knew, the watch might have always been there. Yet why should not this answer serve

for the watch as well as for the stone? Why is it not as admissible in the second case, as in the first? For this reason, and for no other, viz. that, when we come to inspect the watch, we perceive (what we could not discover in the stone) that its several parts are framed and put together for a purpose, *e.g.* that they are so formed and adjusted as to produce motion, and that motion so regulated as to point out the hour of the day; that, if the different parts had been differently shaped from what they are, of a different size from what they are, or placed after any other manner, or in any other order, than that in which they are placed, either no motion at all would have been carried on in the machine, or none which would have answered the use that is now served by it. . . . This mechanism being observed (it requires indeed an examination of the instrument, and perhaps some previous knowledge of the subject, to perceive and understand it; but being once, as we have said, observed and understood), the inference, we think, is inevitable, that the watch must have had a maker: that there must have existed, at some time, and at some place or other, an artificer or artificers who formed it for the purpose which we find it actually to answer; who comprehended its construction, and designed its use.

(1817–1906), while serving a prison sentence for blasphemy, composed a pamphlet entitled *Paley Refuted in His Own Words* (1847). Holyoake pressed arguments similar to those put forward in Hume's *Dialogues* seventy years earlier. Holyoake's conclusion was that he had shown natural theology to be logically flawed, and thus also shown that revealed theology was groundless (since he held that revealed theology presupposed natural theology). He then went on to denounce Christian religion as a barrier to human progress and demand that it be replaced by a utilitarian and scientific secular morality.

Charles Darwin's explanation in *The Origin of Species* (1859) of how the processes of random variation and natural selection could combine to produce what appeared to be instances of

“design” in the natural world is often described as the final nail in natural theology's coffin. If blind natural forces could create adaptation, then surely no role was left for Paley's God. It was not quite that simple, however. Historians of science have shown that Darwin took over much of the language of natural theology (the discourse of “adaptation” and “design”) as well as some of its leading assumptions—such as the idea that every anatomical and behavioral trait should be assumed to have a function. Darwin was certainly no Holyoake. Whatever his own personal doubts about theology, he presented his ideas not as an argument for atheism but as an explanation of how the creator could make new species through the operation of laws rather than through miraculous interventions. Paley's watchmaker-God may have been banished in Darwin's new view of nature, but that had only ever been one of the

THE BRIDGEWATER TREATISES

In February 1829 the Reverend Francis Henry, earl of Bridgewater, died. His will made provision for £8000 sterling to be held at the disposal of the president of the Royal Society in London and used to finance the publication of one thousand copies of a work on the power, wisdom, and goodness of God as manifested in the creation. The result, eventually, was not one but eight such works. These works of natural theology were written by leading religious and scientific figures of the day and were published between 1833 and 1836 (see Addinall; Topham):

1. Thomas Chalmers (1780–1847), *On the Power, Wisdom and Goodness of God as Manifested in the Adaptation of External Nature to the Moral and Intellectual Constitution of Man* (1833).
2. John Kidd (1775–1851), *On the Adaptation of External Nature to the Physical Condition of Man: Principally with Reference to the Supply of His Wants and the Exercise of His Intellectual Faculties* (1833).
3. William Whewell (1794–1866), *Astronomy and General Physics Considered with Reference to Natural Theology* (1833).
4. Charles Bell (1774–1842), *The Hand: Its Mechanism and Vital Endowments in Evincing Design* (1833).
5. Peter Roget (1779–1869), *Animal and Vegetable Physiology: Considered with Reference to Natural Theology* (1834).
6. William Buckland (1784–1856), *Geology and Mineralogy Considered with Reference to Natural Theology* (1836).
7. William Kirby (1759–1850), *On the Power, Wisdom and Goodness of God as Manifested in the Creation of Animals and in Their History, Habits and Instincts* (1835).
8. William Prout (1785–1850), *Chemistry, Meteorology, and the Function of Digestion: Considered with Reference to Natural Theology* (1834).

In 1837 Charles Babbage (1791–1871), the creator of the famous “difference engine” (a calculating machine often cited as the earliest forerunner of the modern computer), wrote an unsolicited *Ninth Bridgewater Treatise*, which argued that a system operated entirely by mathematical laws could result in the appearance of unexpected novelties. Babbage’s suggestion that divine intervention could thus be replaced by the operation of natural laws was explicitly taken up in the evolutionary work *Vestiges of the Natural History of Creation*, published anonymously in 1844 (the author was later revealed to have been the Edinburgh journalist and publisher Robert Chambers), and, more tacitly, in Darwin’s *Origin of Species* (1859).

images of God with which natural theologians had been concerned.

The Twentieth Century

Twentieth-century developments add weight to the view that Darwin’s writings, while requiring theologians to rethink natural theology, did not compel them to abandon it. One of the institutions through which natural theological endeavors were continued was the Gifford lectures. These lectures, set up to promote the study of natural theology, were instituted by the will of Adam Gifford, who died in 1887. Delivered in the Scottish universities of Edinburgh, Glasgow, St Andrews, and Aberdeen, by a range of distinguished philosophers, scientists, historians, and theologians since 1888, the Gifford

lectures have resulted in a lively and ongoing series of natural theological reflections, conceived in the broadest sense. Gifford lecturers have included William James, Nils Bohr, Charles Raven, and Paul Tillich; and, more recently, the physicist and Anglican minister John Polkinghorne, historians of science John Hedley Brooke and Geoffrey Cantor, and the American theologian Stanley Hauerwas.

Discussions of natural theology have, ever since the mid-1930s, been carried out under the shadow of the figure of Karl Barth (1886–1968). In reaction to a 1934 treatise on *Nature and Grace* by Emil Brunner, Barth wrote a response titled simply *No!* In this and other works, Barth (and many others in twentieth-century academic theology who shared his dissatisfaction with nineteenth-century theological accommodations

with scientific rationalism) emphasized the centrality of revelation and a religious relation to Christ. For the Barthian, rational argumentation undertaken on secular foundations could never produce distinctively Christian knowledge, and to suppose that it might was a theological mistake (regardless of whether it was also a philosophical and scientific one). Interestingly, both Barth and Brunner were subsequently Gifford lecturers; Stanley Hauerwas, in his recent Gifford lectures, argues in favor of a form of natural theology reconceived along Barthian lines.

Given the Humean, Darwinian, and Barthian objections to any form of natural theology grounded in the sciences, attempts to revive it in the later twentieth century certainly seemed to be doing so in the face of formidable opposition. Nonetheless, such attempts have been made. In the area of “science and religion,” authors such as Ian Barbour, Arthur Peacocke, John Polkinghorne, Bob Russell, and Nancey Murphy have argued that divine purposes can still be discerned in the findings of modern science. There has been particular interest in the question of whether the “fine-tuning” of the fundamental physical constants of our universe might indicate that it was made by a deity with an interest in creating intelligent life. Another area of lively revived natural theological speculations has been quantum physics.

In the United States, the twentieth century saw the invention of another new variety of natural theology, namely “creation science” or “scientific creationism,” whose advocates continue to resist mainstream neo-Darwinian orthodoxy and to call for “balanced treatment” of Darwinian science and “creation science” in the classroom. In this American controversy, not only the relationship between church and state but also the ancient question of the relationship between the book of nature and the book of scripture continues to be contested. Each group has its own view about this relationship. For creationists, revealed theology (specifically a literalist interpretation of the book of Genesis) and natural theology (specifically an anti-evolutionary interpretation of scientific evidence) concur in teaching that God created separate forms and that humans do not have a common ancestry with other animals. For other Christians, revelation and nature can be brought into harmony by reading Genesis less literally and accepting mainstream science. For others again—those who take a view like Thomas Paine’s—churches and supposed revelations are all nothing more than human creations: the only real source of transcendent knowledge is the study of the natural world, and the most fruitful means of studying it are science and philosophy. It thus continues to hold true that debates about natural theology are closely connected with debates about the relationship between church and state, especially in the area of education.

NATURE. No interpretation of the idea of nature is good for all people in all places at all times. The interpretive position here reflects pivotal conceptual developments of the nineteenth and twentieth centuries.

Charles Darwin's century brought home forcefully the reality of time, of evolutionary process that ultimately transforms all things. Darwin's contemporary T. H. Huxley believed that evolution forced the question of our place in nature upon us. Twentieth-century science posed a further interpretive challenge. We have reached the end of credible claims to certainty concerning nature. Given uncertainty, open-ended inquiry becomes the hallmark of rationality, and the idea of nature remains inevitably in flux. A third interpretive factor emerges at the intersection of the twentieth and twenty-first centuries. The present cultural trajectory is on a collision course with the evolved biophysical scheme. The interpretive challenge is to account for the predicament of a naturally evolved species whose cultural evolution has led to maladaptive ideas of nature that must be transformed in order to avert biophysical catastrophe.

Nature before Literacy

Arguably, the nineteenth-century discovery of the Paleolithic, the period of human development stretching from about two million to about ten thousand years ago, is exceeded in significance only by the discovery of biological evolution. Ensnared within cultural cocoons of literacy and technology, we believe that paleo-people were stupid savages since they were not literate and possessed only rudimentary technology. There are two rejoinders to such notions. First, the paleo-strata unequivocally confirm that the historical epoch of literacy is a mere moment in a human past stretching across several hundred thousand years. And second, the assumption that we monopolize intelligence and genius is untenable. Our paleo-ancestors were capable of imaginings that rival those of the greatest minds of history.

Nevertheless, any reconstruction of Paleolithic ideas of nature remains conjectural. Interpretation depends on reading "texts" that, rather than being alphabetic, are material artifacts—stone points and knives, cave paintings and megalithic constructions, and tens of thousands of other artifacts. Additional evidence comes from paleo-notions of nature that resonate in surviving aboriginal cultures. Collectively these materials support three conjectures. First, Paleolithic hunter-gatherers realized that there was an order to the world that they inhabited. While the pattern varied seasonally, there was regularity in the movement of animals, in the growth of plants, in the presence or absence of water. Second, paleo-people

believed the inherent order of nature was cyclical, since the world moved in repeating cycles. Third, paleo-people believed their role was to harmonize with rather than change the circumstances of existence.

These conjectures can be challenged across multiple fronts. For example, there is evidence of climatic upheavals that through natural selection eliminated all but the most behaviorally adaptable hominid bands. How, then, could paleo-people believe in a cyclical nature? And yet evidence from the Neolithic strata suggests that the myth of the eternal return and the belief in the *Magna Mater* (the Great Mother) were foreshadowed during the Paleolithic.

Nature in Antiquity

Antiquity is defined here as a zone of cultural transition at the boundary between the Old and the New Stone Age, the Paleolithic and the Neolithic. Climate change is increasingly accepted as the environmental driver that ended the era of the great hunt. Whereas utility vanished at the margin of portability for paleo-people, the Neolithic brought profound changes to material culture and thus to notions of nature. Sedentarism, the cultivation of cereal grasses, and the domestication of animals transformed human relations to nature. Forests were cleared for fields and building materials. Crops were planted and tended. Rivers were diverted into canals to support irrigated agriculture. Permanent habitation was constructed. Wild creatures, such as bears and wolves, formerly totems with which humans empathically identified, became predators.

Materials for the conceptual reconstruction of ancient ideas of nature can be found in texts marking the passage from orality into alphabetic literacy, such as the Sumerian-epoch *Gilgamesh* and the Old Testament, the latter a primary source for prevailing if conflicting Western notions of nature. The Old Testament manifests two antagonistic ideas of nature. One reflects agriculture, where humankind increasingly asserts its dominion over the earth while paying the price of great toil. The other is that of a world of milk and honey where humans wandered the earth freely, living in an Edenic condition. On either account a creator god is posited as the agency of creation. A cosmos is constructed and populated, culminating on the sixth day with the arrival of Adam and Eve. Life is good, until the original pair fall into temptation and sin. The consequence was expulsion from the Garden, arguably a remembrance of a deep past free of the woes of agricultural existence.

Pre-Socratic Ideas of Nature

Alphabetic literacy changed the way that humans thought of nature. It is the pre-Socratics, the Greeks, and to a lesser extent the Egyptians and Romans, who in their theorizing of nature appear as our kindred spirits, even if we believe their theories are mistaken, in their commitment to rational explanation. A clear line separates pre-alphabetic from post-alphabetic accounts of nature; the mythical accounts of antiquity become topics of derision. Nature increasingly becomes a conceptual entity known only through rational inquiry.

The pre-Socratic philosophers Heraclitus and Parmenides laid down two basic channels in which contemporary ideas still

flow. According to Heraclitus (c. 540–c. 480 B.C.E.), reality is a moving river into which humans cannot step twice. And yet, since total chaos would defeat knowability, he posits the strife of opposites as a limit on chaos. Hot becomes cold, wet becomes dry, winter gives way to summer. The wise person behaves according to these basic insights into evanescence and its limits. Heraclitus's notions resonate with contemporary evolutionary thinkers, systems ecologists, and chaos theorists. Chaos theorists celebrate Heraclitus as the conceptual source of a second scientific revolution in the twentieth century. We can also recognize Paleolithic resonances in Heraclitus, including his notion of nature as a cyclical process with which humans should exist in harmony.

Heraclitus's conceptual antagonist was Parmenides (born c. 515 B.C.E.), who argued that reality does not move since "all is one." The apparent motion of nature was for him just that: appearance and not reality. His immediate followers, such as Zeno, devised the famous paradoxes of motion, such as the tortoise and the hare, that conceptually defeated all challenges until the twentieth century. If the tortoise, however slow, starts ahead of the hare, however fast, and if in any given unit of time the hare closes one-half of the distance to the tortoise, the hare can never pass the tortoise because there will always remain an unclosed interval between them. The appearance, then, that the hare catches and passes the tortoise is a deception—"the way of seeming," as Parmenides termed it, and not the "way of truth." The conceptual truths of nature deny perceptual appearances.

The best-known successors to Parmenides are the atomists, Leucippus and Democritus. Perhaps the first truly modern theorists, they corrected Parmenidean conceptual excess. The variety and phenomena of nature were constituted by the arrangement of many "ones"—that is, the atoms themselves. The perceptions of a changing world could now be admitted without undercutting nature's conceptual knowability. Atomic theory today traces its roots to Leucippus and Democritus.

Nature in Greek Rationalism

All these thinkers pale in comparison with Aristotle (384–322 B.C.E.), the greatest classical theorist. Aristotelian ideas of nature dominated Western civilization until the scientific revolution of the seventeenth and eighteenth centuries. So pervasive is his influence that some believe Western intellectual history is little more than footnotes to his work. Only a partial description showing Aristotle's continuing influence can be included here.

First, Aristotle introduced the category of cause as a key explanatory feature for theorizing nature. He understood the diverse phenomena and different kinds in nature in terms of four causes: the formal, material, efficient, and final. Aristotle's account of causation surpasses the theories of his predecessors. For example, his notion of material cause chimes with the atomism of Leucippus and Democritus, and yet the atoms themselves are neither a final cause, since they have been set into original motion, nor an efficient cause, since they can be rearranged by other factors, including human agency.

Second, Aristotle argued that all motion is a consequence of an original, unmoved mover. Without the unmoved mover

any causal sequence would entail an infinite regress. Aristotle's notion of an unmoved mover, while driven by his logical commitment to avoiding motion that cannot be explained, resonates not only with earlier Hebraic conceptions of a creator god but also with Parmenidean commitments to a final rational explanation for all that is, was, or ever will be. It also resonates with the Heraclitean stream of influence: natural processes and creatures move.

Third, Aristotle offered a theoretical account of living nature manifesting a sensitivity to the explanatory and descriptive requirements of the behavior of plants and animals. These motions could not be explained in the same way as those of inanimate objects. While not an evolutionary thinker in modern terms, he recognized the diversity of natural kinds with their characteristic patterns of reproduction and growth.

The theoretical legacy of the Greeks is highly significant. While it is an exaggeration to say that the period between the fall of Rome and the Middle Ages was a conceptual wasteland, and while descriptive accounts of nature flourished (in astronomy, for example), there were few developments beyond Aristotelian ideas. The Middle Ages brought some conceptual refinements, but no paradigmatic breakthroughs. For example, William of Ockham (c. 1285–1349?) deduced that a simpler explanation was to be preferred to a more complicated explanation when the explanatory power was equal—a logical principle of parsimony known as Ockham's razor. But it is the theorizing of classical Greek civilization that lives on, even if implicitly.

Nature during the Scientific Revolution

Facilitated in part by advances in instrumentation, such as the telescope and microscope, the scientific revolution brought paradigmatic change to the idea of nature. When Galileo Galilei (1564–1642) observed moons orbiting Jupiter on a predictable schedule, the consequences were enormous. Earth could no longer be conceived as the center of the cosmos, as the focal point of a godly creation. Bacteria were first observed by the Dutch naturalist Anton van Leeuwenhoek (1632–1723) in 1683 (although the science of bacteriology had not yet arrived). As with Galileo, so with Leeuwenhoek: the apparent reality of nature visible to the naked eye was not what it seemed.

Changes in instrumentation were accompanied by changes in the powers of mathematical analysis. Working independently, Gottfried Wilhelm von Leibniz (1646–1716) and Sir Isaac Newton (1642–1727) developed what is now called the calculus. The move into conceptual abstraction that began with the Greeks was radically transformed by such mathematics. The scientific idea of nature was more and more represented in terms of equations and laws, devoid of so-called secondary qualities such as color and sound. There was an increasing commitment to Parmenidean tendencies—that is, the reduction of nature to permanence through mathematically described mechanical relations. The hallmark of rationality thus continued in the tradition of Parmenidean One—nature as an unchanging and therefore totally knowable singularity—while admitting to diverse mathematical characterization of natural phenomena.

The scientific revolution is often thought of as culminating in the work of Newton and the view of nature according to what is now termed “classical physics.” But Newton is best understood as both an original thinker and a synthesizer. The work of three other thinkers is indicative of his precursors.

The first of these thinkers was Francis Bacon (1561–1626), aptly characterized as the man who saw through time because he straddled the medieval and modern ages. A practicing scientist, his scientific discoveries are less significant than his radical new ideas concerning nature itself. Science, he realized, was power—power over the natural world. And that power could lead human beings to a second world fashioned according to their wants and desires. Much of the utopian character of our own time, the belief that through the advance of theoretical knowledge and its technological application all problems might be solved, was first articulated by Bacon. His arguments effectively became a legitimating rationale for societal support of the natural sciences. While our rationales are primarily economic, his were ethical. He addressed the ancient problem of the fall into sin, which effectively sundered godly relations between humankind and nature. Toil and suffering, the ruined earth, affliction with drought and storm, insects and disease, were the consequences of the Fall. On the Baconian view a New Jerusalem could be had through the power of science to set nature right again, returning humans to an Edenic condition. Contemporary studies, including those based in critical, feminist theory, argue that the Baconian view of nature reflected an intensely hierarchical and patriarchal society. “Man” (meaning, the male members of the human species) would wrest scientific knowledge from an unwilling and unruly natural world, and through such knowledge gain power over “her.”

The second was Galileo, an Italian physicist and astronomer famous for his encounters with the Inquisition, whose work in physics fundamentally undercut Aristotelian physics. Building on the theoretical work of Nicolaus Copernicus (1473–1543), who overturned geocentrism, Johannes Kepler (1571–1630), who first theorized the laws of planetary motion and the sun’s influence on planetary orbits, and Tycho Brahe (1546–1601), who had achieved unparalleled accuracy in measuring the motions of the heavens, Galileo brought a new mathematical precision to the description of planetary motion (ironically, believing wrongly that the motion was circular rather than elliptical) and to falling material objects. Through his many experiments and observations, Galileo realized that there was but one kind of motion in nature, whether celestial or terrestrial, not two as the Greeks had believed.

Third, the work of the Frenchman René Descartes (1596–1650) had a profoundly important influence on physics. Descartes invented analytical geometry, a technique that allowed the precise description of the trajectories of material bodies in motion—later refined by Newton. His further work on methodology (the method of analysis) was likewise crucial. He argued that the way to understand complex physical phenomena was to reduce them to simpler components until reaching the level of irreducibility. Finally, Descartes argued that the new science of physics, built on mathematical

description and prediction, would make humankind the master and possessor of nature.

Isaac Newton’s Nature

While the advances made by Galileo, Bacon, and Descartes were considerable, history’s judgment is that Newton revolutionized Western thinking, dominating his age much as Aristotle did that of the Greeks. Many of his notions, such as the absolute nature of space and time, were repudiated in the twentieth century. And yet Newtonian ways of thinking rule today’s culture, lying at the heart of our notion of human dignity as control over nature. We have institutionalized notions that nature is little more than atoms in mechanical and therefore predictable motion. So construed, nature becomes nothing but raw material awaiting technological conversion into goods of economic value.

Newton himself was not concerned with such derivations from his ideas, but with nature as matter in motion, especially the movements of the heavenly and terrestrial bodies. His invention of the reflecting telescope, the calculus (which he called his “fluxional method”), and the laws of motion coalesced in an ability to describe physical systems mathematically and thus to make accurate predictions. For Newton material atoms were the fundamental characteristic of nature, bound together by the force of gravity. Newton theorized the law of planetary attraction, which he argued varied inversely to the square of the distance from the sun. However, Edmond Halley (1656–1742) did more to popularize the Newtonian idea of nature than Newton himself. Using a Newtonian reflector and Newtonian physics, Halley calculated the orbit of what is now called Halley’s Comet, accurately predicting its appearance in the night sky in the year 1758.

Classical science, as Newton’s science is now called, and the scientific picture of the world and humankind’s relation to it, became the way that Western civilization understood nature. But several problems with the classical view soon appeared. For one, nowhere in the cognizable world picture did human beings appear—as if nature was devoid of human presence. Further, the Newtonian notion of nature facilitated naive realism, the notion that nature was known without interpretation, as if Newton had given us a “God’s eye” view of nature as the way it was and forever would be. These conundrums continued throughout the twentieth century and remain with us today.

Nature in Darwin’s Century

Classical science assumed that objectivity depended upon the separation of the knowing observer from the world of nature. Charles Darwin’s (1809–1882) theory of evolution upset that assumed separation forever, reinserting humankind into a cognizable view of nature. Darwin’s penetrating insights into the nature of our own humanity—and the importance of language—are effectively a Copernican revolution in our self-understanding of the idea of nature itself. Humankind can no longer be thought of as separate from the cognizable world picture. The status of humankind as something apart from, rather than a part of, nature becomes, after Darwin, increasingly

incomprehensible (consider, for example, Werner Heisenberg [1901–1976], who makes clear that not only are humans embedded within biophysical systems but that our observations themselves profoundly color what can be known).

As with Newton, so with Darwin's precursors, who framed the stage upon which he stood. First, the work of scientists in disparate disciplines, such as geology and paleontology, combined with Darwin's work in natural history, led to what can be termed the discovery of time in four crucial dimensions, beginning with geological time. Irish Archbishop James Ussher (1581–1656) had calculated the age of the Earth, based on biblical interpretation, as no more than 6,000 years. Charles Lyell (1797–1875) heralded the arrival of a scientifically informed grasp of the enormity of geological time. Lyell's theory of very slow but uniform change in the Earth upset the dominant theory of catastrophism—the notion of a ruined Earth as God's punishment for sin. Geological inquiry expanded the notion of time over almost unimaginably large temporal scales: Ussher's estimate was off by nearly six magnitudes.

Second, paleontology disclosed through the discovery of successive layers of the fossil record a continual transformation of the forms of life. The natural world could no longer be rationally understood as frozen into eternal forms, but only as a ceaseless flux. The work of Georges Cuvier (1769–1832) drew in part from the geological law of superposition. Fossilized life forms found in lower strata were necessarily older than those lying above. Cuvier also observed that the various strata themselves had characteristic life forms, suggesting a coming and going of great epochs of life.

Third, Darwin's own studies made clear that the process of natural selection had not only shaped but continued to shape the flora and fauna. His five-year voyage on the HMS *Beagle* provided the data that were soon interpreted as evidence for natural selection over biological time. The adaptive radiation manifest in his famous finches, whose beaks illustrated the evolutionary diversification of forms through adaptation, became an exemplary case study. While Darwin lacked any knowledge of the genetic basis for inheritance of advantageous characteristics, discovered by Gregor Mendel (1822–1882), he clearly understood that natural selection was governed by the principle of survival of the fittest—an idea that the economist Thomas Malthus (1766–1834) had developed in relation to human populations.

Finally, near the end of the century, archeologists discovered the Paleolithic strata, a clear record of cultural transformation as successive generations of humans adapted their lives to the natural world. However dimly, these discoveries coalesced in a dawning awareness that humankind is a naturally evolved species that has moved into culture—a symbolically mediated space from where nature is increasingly and continuously theorized. The ongoing inquiries of prehistoric archeology and paleoanthropology have fundamentally changed both the ways we think of ourselves and our ideas of nature.

Nature in the Twentieth Century

Reflecting the dominant notion of nature as nothing more than atoms—in motion subject to mechanical laws, an unparalleled

fusion of science, technology, and market capitalism colored the twentieth century. During the eighteenth century the Newtonian worldview was translated into an economic theory of marketplace capitalism by Adam Smith (1723–1790). Market societies of the twentieth century believed they possessed the power to bend nature to any and all human purposes. The rational exploitation of nature for human benefit was publicly and privately institutionalized. Wild rivers were tamed, deserts made to bloom, old-growth forests harvested. The apparent mastery of the atom heralded an era of nuclear energy in which power would be too cheap to meter. Modern chemistry promised better living. The “green revolution” offered agricultural plenty to the hungry masses. There would be no Malthusian limits to the growth of human population nor to its steady economic advance. Mirroring the dreams of Bacon's New Jerusalem, cultural progress seemed to be virtually a law of nature.

But perhaps the greatest changes were in the life sciences, especially biology and ecology. Both were profoundly affected by the molecular revolution and the Cartesian belief that complexity must be reduced to analytical simplicity. James D. Watson's and Francis Crick's discovery of the double helix as the structure of DNA in 1953 promised mastery over life itself. Molecular biology, supported by advances in scientific instrumentation, combined with market capitalism to offer the promise of organisms better than those produced by nature. Genetically modified organisms (GMOs) became the rage in the late twentieth century. Biotechnology reinvigorated the Baconian dream of a second world. And yet, as the twentieth century wound down, scientific and other critics raised fundamental questions about the sustainability of a cultural trajectory built around the ideas of the scientific revolution. Classical physics, while theoretically useful, was neither the one, true view of nature nor the final word.

Twentieth-Century Ideas

There is no definitive twentieth-century idea of nature. The turn of the century marked the beginning of a virtual revolution in the work that collectively constitutes the new physics. Albert Einstein's (1879–1955) theory of special relativity challenged the Newtonian notion of absolute space and time. And yet Einstein's theories did not support conceptual relativism. He was a Parmenidean in modern guise. God, in his account, did not play dice with the universe. Einstein dedicated the last half of his life to discovery of what came to be known as God's equation—a mathematical expression of the fundamental reality that explains all that there is, was, or will be.

The middle of the twentieth century might be represented through the work of Werner Heisenberg (1901–1976). If Einstein is a Parmenidean, then Heisenberg's principle of indeterminacy and quantum theory manifest a Heraclitean vision. In his account, the very activity of the observation of nature made a profound difference in what was observed. Physical sciences could achieve relative precision in one measurement only by sacrificing certainty in another. Heisenberg's insights into the atom were equally brilliant. The particles within atoms did not, Heisenberg demonstrated, behave according to Newtonian mechanics. While the picture of nature offered by

classical physics remains useful in certain domains—for example, calculating the trajectories of flying objects or predicting the motions of planets and stars—the Newtonian view has lost intellectual hegemony.

The latter decades of the twentieth century can be represented by work of another Nobel laureate, Ilya Prigogine (1917–2003). Prigogine and many others constitute a rapidly growing epistemic community studying the phenomena of nature that are in disequilibrium—including life itself. After embracing chaos theory, the possibility of definitive description disappears, as does the notion that complex phenomena can be disassembled into constituent parts and then reassembled. Biological and ecological scientists in particular have challenged reductionistic mechanism. The principle of superposition, which underlies the description and explanation of linear phenomena, has been repudiated by the life sciences, where nonlinearity rules.

The implications of such accounts for our idea of nature, as well as the conceptualization of our place in nature, are enormous. The belief that humankind has sure and certain knowledge of nature is untenable. While remaining useful assumptions at some scales of inquiry, atomism, reductionism, and mechanism are not absolutes. Laplacian determinism, the notion that, given sufficient knowledge of nature, sure and certain prediction of the future is possible, has been discredited. Radically new perspectives on the nature of nature and the cosmos itself have started to emerge. Time itself has clearly been recognized as a fourth and absolutely essential dimension of any comprehensive idea of nature.

The notion that humankind has dominion over the evolved world has also been discredited. Our knowledge of nature is limited, more contingency and probability than necessity and certainty. Increasingly the lack of equilibrium in the natural world gives evidence that our present interactions with it are unsustainable over biologically and ecologically meaningful scales of time. Political and economic temporal scales are known to be discordant with nature's temporal horizons. The fragility of humankind's dominion is clearly manifest in multiple dysfunctional relations between cultural and natural systems. Despite the received idea of nature, nature profoundly acts on culture. The idea of nature as a passive material world over which humankind has dominion has failed, gravely intensifying the question of humankind's place in nature. Conceptual developments in areas such as cosmology also lead to a chastened view of our place in nature. The visible material cosmos is a very small portion of reality. Dark matter, as it turns out, while unseen, is as consequential in understanding the cosmos as visible matter.

As the twentieth century ended, the notion of a discord between the culturally dominant idea of nature and nature itself gained credence. The cultural system, which had given birth to and nurtured the idea of nature as passive matter in motion, subject to reductionistic explanation and technological control, began to experience pervasive environmental dysfunctions. The anthropogenic depletion of stratospheric ozone, collapse of oceanic fisheries, deforestation of Amazonia, disruption of global weather patterns, and extinction of biodiversity

posed ominous warnings as well as major conceptual challenges that can only be met by articulating alternative ideas of nature and humankind's place therein.

Nature in the Third Millennium

Clearly, the idea of nature is semantically and conceptually conflicted. If we think of nature as meaningful across multiple temporal and spatial scales, from the cosmic to the subatomic, then we can also understand that our dysfunctional relations are due in part to our lack of either the ability or the commitment to integrate knowledge of nature across scales. Contemporary thinkers argue that the hold of ancient dreams, especially the return to the Garden, must be put behind. And the failed idea of nature inherited from classical science must be replaced by alternative ways of conceptualizing nature and our place therein.

Some of these emerging ideas were first broached in the late nineteenth and early twentieth centuries by alternative voices such as Henry David Thoreau and Aldo Leopold, and then more vigorously in the latter part of the twentieth century by Ilya Prigogine and Edward O. Wilson. Thoreau argued that the best humankind could hope for was a sympathy with the intelligence of nature rather than sure and certain knowledge. Leopold, observing the destruction of nature at an unprecedented scale, argued that humans should think of themselves as citizens of the land community rather than as the conquerors of nature. Near the end of the century Prigogine argued that humankind must, for the first time in its history, engage the evolved complexity of the natural world in dialogue, as a conversational partner. And Wilson made clear that humankind's actions over the first few decades of the new millennium would have profound consequences for the future of life.

As a linguistically reflexive, naturally evolved yet culturally self-conscious species, we might yet find our way into more tenable and less destructive notions of nature. But the challenge is enormous. How might we break free of the notion that we are the dominators of a brute, blind, material world of nature into an idea that leads us to restore some sense of ourselves as natural creatures, living in harmony with nature, while also retaining our distinctive cultural identity? There is no ready answer. Perhaps we will come to know the idea of nature more fully when we have come more fully to realize the enormity of time and our own historicity. There are reasons to think, as we enter the twenty-first century, that humankind might come to embrace an idea of nature that includes ourselves as cognizing subjects within it while not reducing ourselves to it.

NATURPHILOSOPHIE. *Naturphilosophie* refers both to the specific philosophical program Friedrich Wilhelm Joseph von Schelling (1775–1854) initiated with his *Ideen zu einer Philosophie der Natur* (1797; Ideas for a philosophy of nature) and to the movement during the German Romantic period that Schelling's work is said to have spawned. The context of both is the achievement of Immanuel Kant (1724–1804),

whose philosophical system formed the background against which many of the themes of Romantic thought emerged. In this case, dissatisfaction with Kant's treatment of nature, in which there could be cognition only of the appearances of nature but not of nature-in-itself, provided the occasion for several individuals to attempt to complete what they thought Kant had only begun.

Schelling was by no means the first thinker who departed from Kant's understanding of the natural philosopher's role as a lawgiver to nature. Others from the 1790s who independently of Schelling addressed for various reasons what they saw as the inadequacy of Kant's system where nature was concerned included Franz Xaver von Baader (1765–1841); Carl Friedrich Kielmeier (1765–1844); Karl August Eschenmayer (1768–1852); and in his dissertation of 1799, Hans Christian Ørsted (1777–1851).

The Work of Schelling

But it was Schelling who set out to locate the knowledge of nature within a larger system of philosophy. He came to this task as a participant in the general philosophical examination of Kant's system that was underway in the 1790s. In addition to those largely sympathetic to Kant, there were others, especially Johann Fichte (1762–1814), who questioned Kant's reliance on the existence of things-in-themselves. Since we cannot have knowledge of things-in-themselves, how could Kant insist that they were the source of the sense data that reason utilized to create knowledge of the world? Schelling's initial sympathy for this critique made it appear that he agreed with Fichte's claim that even the manifold of sense had been produced by us out of our own creative faculty. But in spite of his agreement with Fichte that the possibility of our knowledge of nature did not depend on the existence of Kant's things-in-themselves, it was Schelling's ultimate disagreement with Fichte's reliance on the absolute ego that led to his wish to construct a system of philosophy in which nature retained its own integrity.

At first, in the *Ideen*, Schelling insists merely that our belief in a reality outside ourselves grew up at the same time that our belief in our own existence appeared, that one was as necessary as the other. But this first book is best seen as a preliminary attempt, a beginning to the new enterprise. In it Schelling does not yet himself realize the basic foundation of his later *Naturphilosophie*. The *Ideen* contains, like Baader's work before it, an attack on atomism as an outlook sufficient to capture the depth of nature's reality. In place of atomism Schelling proposed a dynamic conception of underlying polar forces he believed were more up to the task. With these he felt that he could show how what we experience of nature derives from the same source that gives rise to our belief in a nature outside ourselves.

So far he has not gotten outside the mind, since he is here speaking about instances of our belief. But with the rapid appearance of a series of works between 1798 and 1801, in which the work of Benedict de Spinoza (1632–1677) was influential, he would make clean the break from Fichte and insist that the realm of the real has equal status to that of the ideal. It was

these works that inspired many to abandon the viewpoint of Kant in favor of what they saw as the more realistic understanding that Schelling's approach provided.

It was likely while he was writing the *Ideen* that Schelling came to the realization that the realm of the organic, which had been dealt with only cursorily in his first work, altered fundamentally the direction in which he had been going. In the next book, *Von der Weltseele* (1798; *On the world soul*), the new emphasis became clear in the subtitle: *An Hypothesis of Higher Physics to Explain General Organism*. By recognizing that the metaphor for reality was not mechanism but organism, Schelling found a means by which he could overcome Kant's fracturing of human experience into two separate realms. If nature was an organism, then knowledge of organism would include knowledge of nature as a living whole. And that whole would include the life of the mind and soul as well as that of the body. There would not be, as Kant taught, two separate realms, only one of which was accessible to knowledge. For Schelling there was only one realm.

This perspective resonated with many in the early years of the nineteenth century. As a prolific author in Jena, Schelling had become an important member of the famous Romantic circle that had assembled there. He also got to know Johann Wolfgang von Goethe (1749–1832), who spent many hours together with Schelling reading the latter's work. Because of his youth—he was twenty-three when he received the call to Jena—Schelling established a reputation as a successful young genius.

Supporters and Detractors

Physicians were especially drawn to Schelling's focus on nature as an organic whole. Many of them found his emphasis on the organic especially appealing because they felt that healing was impossible without seeing the body in intimate connection to the soul that inhabited it. Of forty readily identifiable sympathizers of Schelling's system, for example, more than 70 percent held medical degrees. Given the development of what has been called an ideology of *Wissenschaft* that accompanied the upsurge of German culture during the latter half of the eighteenth century, scholars have also pointed to the promise some physicians felt that organic *Naturphilosophie* held for medicine. Because in these years medicine suffered from criticism that it lacked the systematic structure enjoyed by other *Wissenschaften*, physicians hoped that the rigorously reasoned program Schelling had outlined in his many works would supply the kind of intellectual foundation medicine needed.

Other natural philosophers were also attracted to Schelling's attempt, as he once said, to give wings to physics, that is, to give the natural philosopher the responsibility to move from particular empirical results to the larger meaning of the entire enterprise of natural science. Regarding nature as a living whole, for example, entailed the assumption that all of nature's forces were interrelated. A number of experimenters from the physical sciences persisted in exploiting this assumption, including Hans Christian Ørsted, whose commitment to the philosophical unity of nature's forces played a direct role in his discovery of electromagnetism in 1820.

While Schelling himself always retained great appreciation of and respect for empirical research, eventually the charge arose, in some cases justifiably, that his followers dealt primarily with the play of speculative ideas and had little interest in the empirical side of natural science. In addition, those still devoted to a Kantian position on nature and natural science, like the philosopher-physicist Jakob Fries (1773–1843), composed informed critiques of Schelling's work.

After the first decade of the century, Schelling turned in his writing to other matters, and his influence as the founder of *Naturphilosophie* waned. By the 1820s there were only a few who were willing to identify themselves as *Naturphilosophen*. Among those who were, however, was Lorenz Oken (1779–1851), who was the motive force behind the emergence of a German scientific community in the modern sense of the term. His founding of the journal *Isis* and his leading role in establishing the Society of German Natural Investigators and Physicians in 1822 were accomplished in spite of his reputation as an unrepentant *Naturphilosoph*.

NEGRITUDE. An aesthetic and literary movement inaugurated in the 1930s that centers on the creative potential of black consciousness, negritude was one of the premier cultural phenomena of the twentieth century. Curiously, negritude has no originating text as such; it took root and flourished in Paris in the mid-1930s, fed by the writings of two black scholars from the French colonies, Aimé Césaire (b. 1913) of Martinique and Léopold Sédar Senghor (1906–2001) of Senegal. Both of these figures would go on to become major writers, and each would play a leading role in the political life of his respective country of origin. Senghor became the first president of an independent Senegal, and Césaire served simultaneously

as mayor of the Martinican capital, Fort-de-France, and as Martinique's representative to the French National Assembly for more than forty-five years.

Influences

Négritude became internationally recognized with the publication of Césaire's book-length poem, *Cahier d'un retour au pays natal* (Return to my native land) in 1939. The Césaire-Senghor collaboration that led up to this moment was indeed serendipitous. They met as colonial scholarship students in Paris. Each had been strongly influenced by the scope for rehabilitating black history and culture evinced by such recent movements as the Harlem Renaissance, and admired greatly the work of such poets as James Weldon Johnson, Jean Toomer, and Claude McKay. René Menil, a constituent member of the Parisian group that published the radical manifesto *Légitime défense* (Legitimate defense) in 1932, was also a major influence on Césaire, and joined him later in launching the Martinique-based periodical *Tropiques*. The *Revue du monde noir* (Review of the black world), published 1931–1932, introduced them to the work of such writers and educators as Langston Hughes and Alain Locke; they were also influenced by the presence in Paris of the French Guyanese author René Maran, the author of *Batouala*, which had won the French Prix Goncourt in 1921 and was subsequently banned in French African colonies. Together with a group of fellow students, they launched a literary magazine, *L'Étudiant noir* (The black student), which took a militant stand against black cultural assimilation by actively seeking to explore and valorize the singularity of the black cultural experience. The publication inaugurated the use of the word *négritude*, and appeared roughly half a dozen times before closing in 1936. During this period Césaire and Senghor, along with their friend and collaborator, the French Guyanese poet Léon Dumas, culled from these influences a framework for rehabilitating and resituating the articulation of black consciousness and its attendant cultural expression, even within an ongoing context of colonialism and racism.

Philosophy and Practice: Césaire

Drawing on a binary structure that, as we shall see, would ultimately lead to its undoing, *négritude* sought to ground and, indeed, to legitimize the difference of the black aesthetic in a set of biological concepts meant to firmly separate the black experience from the white experience. Initially, however, from an artistic perspective, its founders drew heavily on French surrealism. This radical mode of poetic expression, which first made its appearance in postwar France, afforded a means of discursive liberation from French rationalism through the abandonment of traditional aesthetic and expressive constraints. To this expressive vein must be added the work of Leo Frobenius, whose groundbreaking *Histoire de la civilisation africaine* (1936; History of African civilization) exploded the myth of Negro barbarity as a European invention and was of cardinal importance in allowing the founders of *négritude* scope for a needed valorization of Africa-based civilizations and cultures. This concatenation of beliefs and arguments allowed them to posit that what was unique to the black experience—what separated it from Western subjectivity and provided the basis for the new aesthetic—was a predetermined predilection

for art, emotion, intuition, and rhythm, which were opposed to supposedly Western characteristics of order, reason, and logic. These, then, were the enabling categories of expression that mediated the appearance and argumentation of *négritude*.

In literary terms, and especially in the *Cahier*, which is typically seen as its foundational text, *négritude* functions as an illumination and affirmation of pride in black subjectivity. The sentiments voiced in the poem derive their importance equally from their form and their content as the poet joins lyricism to self-revelation in a rediscovered empathy with his African ancestry. This black subject revels in the rebirth of a black identity that is both historically and culturally grounded; *négritude* becomes a framework for creative cultural expression that valorizes black civilizations past and present and thus, at least in the *Cahier*, goes beyond a reductive essentialism based on biology. Ultimately, what is emphasized is the process of self-discovery and self-actualization, an ongoing voyage into blackness that replaces the static acceptance of colonial inferiority with the active uncovering of viable alternative identities.

Philosophy and Practice: Senghor

Senghor differed from Césaire in both his vision and his practice of *négritude*; for him, opposing the values of Europe to those of the African world led him to valorize life forces as the essential framework grounding his poetic portraits of African civilization. Arriving in Paris in 1928 on a partial scholarship in literary studies, he studied at the Lycée Louis-le-Grand and the Sorbonne. It was during this period that he began to be influenced by his discussions with Césaire, Maran, McKay, and the Haitian author and intellectual Dr. Jean Price-Mars. It was around this time that Senghor formed the belief that blacks could benefit by assimilating European culture without severing themselves from their own cultural origins. He promulgated a return to historical and cultural sources through the cultivation of indigenous languages and traditions, and sought to instantiate this value system through the vocabulary, themes, and symbolism of his published poetry. His *Hosties noires* (Black offerings) and the collection *Anthologie de la nouvelle poésie nègre et malgache de langue française* (Anthology of new black and Malagasy poetry in French) appeared to mark the centennial of the French abolition of slavery in 1948, joining the already-published collections by Césaire in rehabilitating the perceived "primitive" character of black colonial civilizations.

Senghor's primary themes are alienation and exile, along with a recognition of the central role played by the culture and tradition of his African homeland. The importance of the cultural heritage that he was thus able to describe and define for his fellow blacks cannot be overemphasized. This valorization of a cultural patrimony became a catalyst for black self-realization, demonstrating *négritude's* capacity to engender pride in authenticity and racial difference. Much more so than did Césaire's, Senghor's writing stressed claims for a particular black emotional and psychological experience, an affective rapport that draws on a specifically African relationship to the forces of the universe that are separate and apart from those of the West. Where the black African perceives and internal-

izes in a subjective way (the argument goes), relating to external stimuli in primarily emotional terms, the Westerner, in his turn, relates to the world through analysis and reason. This is not to claim a monopoly on either category for either group, in his view. While not denying the rational power of blacks or the emotive capacities of whites, Senghor does see very real differences in temperament and worldview that determine the ways in which certain cultures view and relate to the world. As limited and reductionist as this argument might seem today, it extended an elaborate and perhaps necessary ontology to the concept of negritude, providing an enabling framework for literally hundreds of African and Caribbean writers to express their vision of their own cultural and historical experience well into the 1960s.

Negritude, then, was in a certain sense a product of its time; despite its own claims to the contrary, its primary shortcoming was perhaps that it drew unconsciously on the binaries of the colonial era. It opened the way for a flood of creative black expression, but it would in time be superseded by alternative approaches to, and theories of, black identity. Critiques that would be leveled at negritude by Frantz Fanon, the Martinican intellectual, and Wole Soyinka, the Nigerian novelist and Nobel laureate, among others, would center on the concept's racial grounding and its implicit essentialisms, contradictions, and limitations. Given the widely varying social and historical situations involved in the development of black culture, any theory that sought to contextualize and mediate this development needed to be deracialized. By moving away from a race-based analysis of culture to one that reflects the range of influences inflecting black historical reality, the differing cultural expressions of black people could be taken into account, catalyzed, and valorized. The theories of Césaire and Senghor would in time give way to those of Glissant and Bernabé, Chamoiseau, and Confiant, among others, acknowledging the opening up of the categories of race and culture whose binary, colonially driven structures established the boundaries of blackness even as they sought to endow them with value and meaning.

H. Adlai Murdoch

NEOCOLONIALISM. Neocolonialism can be defined as the continuation of the economic model of colonialism after a colonized territory has achieved formal political independence. This concept was applied most commonly to Africa in the latter half of the twentieth century. European countries had colonized most of the continent in the late nineteenth century, instituting a system of economic exploitation in which African raw materials, particularly cash crops and minerals, were expropriated and exported to the sole benefit of the colonizing power. The idea of neocolonialism, however, suggests that when European powers granted nominal political independence to colonies in the decades after World War II, they continued to control the economies of the new African countries.

The concept of neocolonialism has several theoretical influences. First and foremost, it owes much to Marxist thinking. Writing in the late nineteenth century, Karl Marx argued that capitalism represented a stage in the socioeconomic development of humanity. He believed that, ultimately and inevitably, the capitalist system in industrially developed countries would be overthrown by a revolution of the working class; this would result in the establishment of socialist utopias. In 1916, Vladimir Lenin modified this thesis, claiming that the rapid expansion of European imperialism around the world in the last decade of the nineteenth century had marked the highest stage of capitalism. Presumably, then, the end of imperialism (which Lenin believed would be the result of World War I) would mark the beginning of the end of capitalism. However, neither imperialism nor capitalism came to an end after the war or in future years. European empires persisted well into the 1960s.

With the granting of independence to colonies, a theory of modernization took hold. This suggested that independent countries would begin to develop very rapidly, politically and economically, and would resemble "modern" Western countries. It soon became clear, however, that this was not happening. Postcolonial theorists now sought answers for the

continued underdevelopment of African countries and found a second influence in dependency theory.

Dependency theory first gained prominence as a way to explain the underdevelopment of Latin American economies in the 1960s. It proclaims that underdevelopment persisted because highly developed countries dominated underdeveloped economies by paying low prices for agricultural products and flooding those economies with cheap manufactured goods. This resulted in a perpetually negative balance of payments that prevented underdeveloped countries from ever becoming competitive in the global marketplace. Economic theorists of postcolonial Africa, such as Walter Rodney and Samir Amin, combined the Marxist-Leninist concept of colonialism as a stage of capitalism with the concept of underdevelopment to create the concept of neocolonialism, which Kwame Nkrumah called “the last stage of imperialism.”

According to Rodney and Amin, European countries, and increasingly the United States, dominated the economies of African countries through neocolonialism in several ways. After independence, the main revenue base for African countries continued to be the export of raw materials; this resulted in the underdevelopment of African economies, while Western industries thrived. A good example of this process is the West African cocoa industry in the 1960s: during this time, production increased rapidly in many African countries; overproduction, however, led to a reduction in the selling price of cocoa worldwide. Neocolonial theorists therefore proclaimed that economies based on the production of cash crops such as cocoa could not hope to develop, because the world system imposes a veritable ceiling on the revenue that can be accrued from their production. Likewise, the extraction and export of minerals could not serve to develop an African economy, because minerals taken from African soil by Western-owned corporations were shipped to Europe or America, where they were turned into manufactured goods, which were then resold to African consumers at value-added prices.

A second method of neocolonialism, according to the theory's adherents, was foreign aid. The inability of their economies to develop after independence soon led many African countries to enlist this aid. Believers in the effects of neocolonialism feel that accepting loans from Europe or America proved the link between independent African governments and the exploitative forces of former colonizers. They note as evidence that most foreign aid has been given in the form of loans, bearing high rates of interest; repayment of these loans contributed to the underdevelopment of African economies because the collection of interest ultimately impoverished African peoples.

The forces of neocolonialism did not comprise former colonial powers alone, however. Theorists also saw the United States as an increasingly dominant purveyor of neocolonialism in Africa. As the Cold War reached its highest tensions at roughly the same time that most African countries achieved independence, many theorists believed that the increasing levels of American aid and intervention in the affairs of independent African states were designed to keep African countries within the capitalist camp and prevent them from aligning with the Soviet Union.

If the forces of neocolonialism were so obvious to many theorists at the time, why then could independent African countries not simply recognize them and steer toward economic models that would allow them to be more competitive in the world market? Most students of neocolonialism had theories about the continuing drain of African resources. Perhaps the two most prolific were Kwame Nkrumah and Frantz Fanon. Many theorists and politicians came to espouse the ideas of these two men; a general understanding of the causal theories of neocolonialism may therefore be gained through a brief summary of their writings.

Kwame Nkrumah was a major figure in African politics for more than four decades. Born in Gold Coast (later Ghana) in 1909 and educated in Philadelphia and London, Nkrumah became a powerful leader in the movements for African independence and pan-African unity in the 1930s and 1940s. He became the first president of independent Ghana in 1957 and ruled until 1966, when his regime was overthrown by a military coup. Aside from his political activity, Nkrumah also wrote several books dealing with issues facing contemporary Africa. Of particular importance was his 1965 *Neo-Colonialism: The Last Stage of Imperialism* in which he sought to prove the existence of neocolonial forces in Africa and explain the impediments to overcoming them.

According to Nkrumah, the most important factor allowing for the perpetuation of neocolonialism in Africa was the “balkanization” of the continent that had occurred as a result of European colonialism. Colonizers had broken Africa into dozens of administrative units in order to govern it more effectively, and the colonial boundaries had become the lines within which African countries had been given independence. Nkrumah believed that the interests of Africa were being damaged by the need of each new country to fend for itself. For instance, the fact that each produced and exported its cocoa crop independently was what resulted in lower prices. Nkrumah believed that through African unity and cooperation, the continent could best combat neocolonialism. This required a policy of nonalignment in the Cold War. Believing that Africa had all the resources necessary to achieve true economic independence, Nkrumah promoted inter-African trade, so that the continent could wean itself from Western imports. He also believed that African unity would help to strengthen African countries' bargaining power on the world market, as well as in international politics. If Africans aligned with each other, rather than with the various Western countries that wished to exploit them, the future could be safeguarded. Nkrumah also believed that concerted efforts toward industrialization should complement agricultural and mineral exports in order that African countries become able to produce their own finished goods and reduce their reliance on European and American manufactured products. By enacting such policies, the spell of neocolonialism could be broken, ushering in an era of distinctly African “socialism.” Many African leaders of the day, including Sékou Touré of Senegal and Julius Nyerere of Tanzania, held similar beliefs. Although these men fought diligently for African unity and economic development, their goals were mostly not achieved.

Frantz Fanon offered a different perspective on the dilemma facing independent African countries. Fanon was born in

Martinique, in the West Indies, in 1925. Educated in France, he moved to Algeria in 1953 to practice psychiatry, and soon became embroiled in that nation's violent struggle to gain independence from France. As the Algerian war of independence was nearing its end, Fanon wrote his most celebrated book, *The Wretched of the Earth (Les damnés de la terre)*, in which he discussed, among other things, the causes of neocolonialism in Africa, and the solution he foresaw.

Fanon took much of the basis for neocolonialism for granted, seeing the exploitative tendencies of Western countries as inherent to their capitalist nature. He saw no place for Africa in this system. The African petty bourgeoisie, which had received power from the exiting colonial government, was the primary cause of neocolonialism in Africa. Fanon believed that the Africans who took power at the time of independence had been favored by European powers because they were willing to effect a smooth transition from colonialism to neocolonialism. Since they were generally of the Western-educated middle class who had in many ways benefited from the colonial system, they had the most to gain from a continuation of colonial economic policies. Fanon accused them of collaborating with the colonial power to ensure that the interests of both would continue to be met after the declaration of formal political independence; this class of Africans had betrayed the masses on whose backs the various nationalist movements had been borne. In order to achieve complete and final independence for African countries, "a rapid step must be taken from national consciousness to political and social consciousness" by the masses in order to check the power of the governing class, which had merely replaced the colonial administration as the most direct exploiters of African people. Violent revolution was the only means to drive oppressive neocolonial forces from the world. Fanon's ideology was supported by several political actors in Africa, including Amílcar Cabral of Guinea-Bissau, who warred against a deeply entrenched Portuguese colonial regime until his assassination in 1974.

Of course, neocolonial theory has its detractors as well. Opponents argue that the concept is merely an attempt to continue to blame colonialism for Africa's problems rather than confront the major issues hampering independent African governments, such as corruption, inefficiency, and protectionism. They argue that these problems, more than any systematic process of external exploitation, have been responsible for the poor performance of African economies since independence. Others continue to argue that neocolonialism persists, if in slightly different form. Transnational corporations, such as petroleum and mining companies, and international organizations such as the International Monetary Fund, World Bank, and World Trade Organization are responsible for much of the neocolonial influence in African countries in the early twenty-first century. The activities of these corporations and organizations transcend the boundaries and powers of the traditional nation-state, making it difficult to talk about interregional relationships except in terms of such paradigms as united North (Europe, Canada, and the United States) and underdeveloped and desperate South (Africa, Asia, and Latin America). As the understanding of international and intercontinental relations becomes more and more refined, the idea

of neocolonialism will continue to be revisited. It is for this reason that *neocolonialism* has entered the vocabulary of all students of Third World affairs and is an important concept in the history of ideas.

NEOLIBERALISM. The concept of neoliberalism is an interesting one in that, first, it is a label commonly used by its opponents rather than by its adherents. As with all such labels, the tendency for caricature may at times overtake the need for faithful rendition of the underlying idea. As the term implies, neoliberalism refers to what some view as a new form of liberalism, and what others view as a mere reassertion and ascendancy, in intellectual and policy circles, of classical liberalism. Neoliberalism has its roots in classical liberalism, which on the one hand criticized the constraints inherent in the old and dying feudal and mercantilist orders, and on the other hand advocated for political and economic freedom underpinned by a market economy based on private property rights in the form of the newly emerging capitalist mode of production.

History and Meaning

The terms *neoliberal* and *neoliberalism* have been variously used to refer to leading political exponents of the ideology, such as former U.S. president Ronald Reagan (yielding the label "Reaganomics") and former prime minister of the United Kingdom Margaret Thatcher ("Thatcherism"); particular intellectual trends, such as supply-side economics and monetarism, associated with academics such as Milton Friedman (b. 1912); intellectual traditions associated with particular institutions, such as the Chicago School (after the University of Chicago, where most of the leading proponents originated);

the policy stance of particular institutions that have been crucial in promoting its policy implications, such as the Bretton Woods Institutions (the World Bank and the International Monetary Fund, yielding the “Washington Consensus”); or more forthrightly “market fundamentalism” and “neoclassical orthodoxy.” In the developing world, neoliberalism emerged in the form of stabilization and structural adjustment programs (SAPs) that entailed a standard package of the above policy measures regardless of the situation in a given country.

Neoliberalism arose as a major paradigm shift facilitated by the conjuncture of a number of eventualities: persistent and intractable recessions beginning in the 1970s for which standard economic policy tools, primarily based on Keynesianism, appeared ineffectual; the impasse in economic policy at national and global levels; and the unsustainability of some welfare regimes, including those of social democracy, in the developed world in the face of recessionary trends and fiscal constraints. In the context of these developments, proponents of neoliberalism saw the state as the major constraint on the efficient operation of the market and the resuscitation of growth at both national and global levels. Accordingly, neoliberalism directed its criticism against what was seen as an overextended role of the state in the economy consequent upon Keynesianism, socialism, and social democracy. Thus the main thrust of neoliberalism entails the need to roll back the state by restricting its role to the provision of pure public goods and the need to ensure that the state provides the appropriate environment for the market to operate by protecting property rights and associated contractual obligations, facilitating the free mobility of resources within and across nations, and ensuring safety and security.

As the term is applied in the early 2000s, *neoliberalism* refers to an all-embracing economic and political ideology that advocates the supremacy of the market over any alternative social arrangements, viewed from both a comparative and historical perspective, in ensuring the efficient allocation and utilization of scarce resources for the maximum satisfaction of relatively unlimited human wants. The market, based on freedom of choice and respect for private property and individual rights, and underpinned by competition among producers and consumers alike, is seen as the ideal and optimal vehicle for the realization of human ends. Thus neoliberalism leads to the conclusion that individuals, rather than collectives, are the best basis for decision making and that the role of the state (or any similar collective agencies) should be limited to creating and ensuring an environment conducive to individuals freely and competitively making decisions and choosing between alternatives, thereby facilitating and consolidating the expansion of the market and protecting private property rights, and to the provision of pure public goods, which, by definition, cannot be provided for efficiently by the market. This recalls the “invisible hand” notion of the market in enhancing economic welfare articulated by Adam Smith in the eighteenth century in his *The Wealth of Nations* (1776).

Policy Implications of Neoliberalism

The foregoing tenets of neoliberalism are based on certain assumptions. A philosophical assumption is made that human

beings are driven by self-interest (as contended by Adam Smith) and that society is best advised to accommodate this drive since the welfare of society as a whole is best maximized by ensuring that individual self-interest is promoted and satisfied. Politically, neoliberalism accepts that individuals are formally equal and that they possess civil liberties that should be respected and protected, but it insists on the recognition that individuals have different capacities and potentialities which should be allowed to flourish, even if the result is income and wealth. Indeed, inequalities are seen as a major impetus to maximizing individual self-interest because inequalities require greater exertion and effort to acquire the most from the market. The philosophical assumptions about self-interest and freely arrived-at choices under conditions of competition have been relied upon to develop mathematically rigorous economic theories aimed at demonstrating the superiority of the unfettered market as a form of economic organization. In addition, neoliberalism has extended its terrain to the analysis of political and social behavior and arrangements to justify the superiority of the market as the major guarantor of both economic and social welfare, with minimum government involvement.

Some of the key economic policy implications of neoliberalism are found in the following prescriptions, which are rigorously and uncompromisingly promoted by its proponents:

Sound macroeconomic policy: The need for what are referred to as “sound macroeconomic fundamentals” by ensuring stable and predictable prices and positive real interest rates. This requires tight fiscal and monetary policy by ensuring that budget deficits and money supply are assiduously controlled to minimally acceptable minimum levels in relation to gross domestic product. The aim here is to stabilize key indicators of the market such as overall price levels, interest rates, and the exchange rate in the belief that the ensuing stability and predictability of the indicators provide a basis for rational economic behavior and decision making for all economic agents, thereby enhancing overall efficiency.

Trade liberalization: The need for trade liberalization by reducing tariffs and non-tariff barriers and freeing the exchange rate in order to enhance competition internationally.

Labor market flexibility: The call for flexible labor markets, in particular the freedom of entrepreneurs to hire and fire workers at will and to reorganize work as needed; and, for some, the need for the free mobility of labor within and across countries.

Privatization: The need for the state to exit from productive activities that can be undertaken by the private sector by transferring ownership or management functions from the state to the private sector. Over time, neoliberals have been able to drastically circumscribe areas that are seen to be legitimate government activities, thereby expanding those areas that need to be privatized. Thus, for instance, areas such as health, education, provision of water and sanitation, security,

and certain routine administrative functions such as the issuing of licenses, collection of fees and rates, issuing of fines, and so forth, have increasingly been identified as areas that need privatization.

Deregulation: The need to remove any regulations that may act as barriers or constraints to the mobility of goods and services, capital, and labor or that may interfere with the optimal functioning of firms. By the same token, it is demanded of the state that it provide an appropriate regulatory environment for the functioning of the market and the protection of property rights and contracts.

Export-oriented sectoral policies: A policy environment that is neutral in relation to export promotion or import substitution, or preferably biased through the use of narrowly targeted supply-side incentives, in favor of export promotion and integration into the global economy based on open trade and free movement of capital across nations.

The foregoing policies are also seen by neoliberals to be compatible with the increased globalization of economic activities, so that support for neoliberalism and support for increased globalization have become conjoined and indistinguishable.

Effects of Neoliberal Policies

Neoliberalism has also fostered a value chain that begins with theoretical activity in academia and various research institutions and feeds into various institutional vehicles that uphold and promote particular aspects of the neoliberal paradigm, right up to the production and reproduction of policy advisors and implementers who attempt to sustain and implement the policy implications of the paradigm at national and international levels. Neoliberalism has benefited from the support of key national and global-level corporations whose influence is exerted through their ability to shift funds instantaneously across the globe in response to changing environmental conditions, through financing various activities in the value chain and influencing policy in the government of developed countries, and through key multilateral and bilateral financial, trade, and development agencies.

The neoliberal agenda has had a tendency to effectively close out any competing ways of looking at economics and economic policy. At the political level, the promotion of neoliberalism approached tyrannical levels with some governments, such as the United States and the United Kingdom, seeing any challenge to neoliberalism as a challenge to a national way of life—and, indeed, to the protection of this way of life. This has been used as a justification to initiate campaigns for regime change in some countries. More generally, fairly effective sanctions and incentives are deployed throughout the value chain to ensure compliance with, or promotion of, the neoliberal agenda. However, neoliberalism has negatively affected large numbers of people through retrenchments, degradation of work, misuse of the environment, increased poverty, and marginalization of nationalities and households, particularly those in the non-formal sectors of the developing

world, while the net social gains have been spurious and remain quite open to debate. It is clear, however, that some financiers and corporations (and some countries in the developed world) have benefited immensely.

Nevertheless, it appears that neoliberalism has peaked as its presumed benefits have become more questionable and as the ideology is challenged from a number of quarters. The empirical evidence supporting neoliberalism is mixed in the developed world and is particularly dismal in the developing world. In the developed countries, the social implications of neoliberal policies have undermined social safety nets with no viable substitutes emanating from the market. In developing economies, particularly those in Africa, the pursuit of structural adjustment and stabilization programs has not yielded the desired benefits in either inclusive or equitable growth, which should be the aim of development. In these countries neoliberalism has had the consequence of jettisoning any semblance of development or strategic planning that those countries had attempted prior to the adoption of the recent economic reforms, so that the economies are currently in disarray. The early-twenty-first-century consensus on the creative manner in which the East Asian Tigers (Taiwan, South Korean, Singapore, and Hong Kong) combined the roles of the market and a proactive state have also done much to deflate the dogmatic opposition to the state advocated by neoliberals. At the theoretical level, the contributions arising from the new institutional economics, the economics of information, and the economics of risk and uncertainty are beginning to question neoliberal assumptions and prescriptions regarding the role of the state. And at the social and political level, global movements have arisen to challenge neoliberal policies.

In the wake of these challenges, shifts have begun to occur in the neoliberal camp in the early twenty-first century, and new syntheses of approaches have been proposed. The neoliberal agenda has begun to include welfare issues by supporting the promotion of sustainable livelihoods, social safety nets, and poverty reduction. In addition, given that neoliberal policies have tended to be unilaterally imposed, particularly in developing economies, there has been a shift to accommodating popular participation and good governance, as in the development of Poverty Reduction Strategy Papers (PRSP) associated with the Highly Indebted Poor Countries (HIPC) debt initiative of the Bretton Woods Institutions. More generally, there is less of a dogmatic stance on the nature and content of policy packages comprising economic reform initiatives, yielding what has been labeled the “post-Washington Consensus.” At another level, some have worked toward synthesizing lessons from neoliberalism with those from social democracy, resulting in the proposal for a “third way.” Finally, from a philosophical point of view, the assumptions underlying the neoliberal model have also been challenged, particularly as to whether methodological individualism assumed in the model, to the exclusion of other plausible assumptions that could be made, is necessarily the most appropriate or adequate assumption to guide formulation of social theories; and, if it can be contended that a particular proclivity of human beings is natural and inevitable, such a proclivity must necessarily be pandered to as a normative ideal. Thus, while as deductive

theory and approach neoliberalism may appear unchallengeable and highly persuasive, its benefits are increasingly viewed as unsustainable on intellectual, philosophical, social, and political grounds.

NEOPLATONISM. Neoplatonism is a modern term that refers to the philosophical movement that dominated the intellectual life of the Roman Empire from the third to the sixth centuries C.E.; its most prominent representatives were the pagan philosophers Plotinus, Porphyry, Iamblichus, and Proclus. These thinkers strove to elucidate ambiguities in Plato's philosophy with insights drawn from Neopythagoreanism, Aristotelianism, and Stoicism in order to establish a thorough summation of ancient learning. As such, Neoplatonism was the last flowering of pagan philosophy, which flourished until it was supplanted and to a certain degree absorbed by Christian theology. Christian thinkers who were deeply influenced by pagan Neoplatonism are often regarded as Neoplatonists as well, most significantly Augustine of Hippo, the Greek Fathers known as the Cappadocians, Boethius, and the author called Pseudo-Dionysius the Areopagite. The term is often applied to movements during the Middle Ages and Renaissance that were informed by Neoplatonic doctrines. All Neoplatonists, regardless of religious orientation, shared a belief in the superior quality of immaterial reality and regarded Plato as the greatest of ancient philosophers.

Terminology

Neoplatonism initially had a negative connotation. Enlightenment historians developed the term to dissociate the Platonists of the late Roman Empire from Plato, believing that they had distorted his philosophy beyond all recognition by their eclecticism. Jacob Brucker (*Historia critica philosophiae*, 1742–1744) branded them "the Eclectic Sect" before A. F. Büsching (*Grundriß einer Geschichte der Philosophie*, 1772–1774) dismissively suggested the appellation "new Platonists" (*neue Platoniker*). Edward Gibbon similarly disparaged the philosophy of the "new Platonicians" (*History of the Decline and Fall of the Roman Empire*, 1776). The prefix *neo* did not appear in English until the 1830s. Yet the idea of Neoplatonism is, in certain ways, unsatisfactory. It implies a sharp break with the thought of preceding generations, whereas considerable

continuity is evident; moreover, the Neoplatonists did not regard themselves as innovators but as elucidators of the true philosophy established by Plato. The word is now simply a term of convenience denoting a late phase in the reception of Plato's philosophy.

Before Neoplatonism

The Academy founded by Plato went through two major phases. The Old Academy (387–c. 250 B.C.E.) emphasized metaphysics, whereas the New Academy (c. 150–c. 110 B.C.E.) took a skeptical turn and focused on epistemology. The fall of Athens in 86 B.C.E. apparently ended the school, and circa 80 B.C.E. a former member, Antiochus of Ascalon, took the opportunity to found his own "Academy," which revived a dogmatic approach. This development marked the beginning of a phase known as Middle Platonism (c. 80 B.C.E.–c. 250 C.E.), which reaffirmed the centrality of metaphysics and coincided with a turn toward mysticism. In attempting to clarify Plato, the Middle Platonists did not hesitate to borrow ideas from rival schools of philosophy. Although this approach has traditionally been described as "eclectic," John Dillon recommends avoiding the term, since it implies an arbitrary recombination of ideas based on personal preference rather than a thoughtful reformulation made in light of ongoing philosophical discussion, which was surely the motivation behind both Middle Platonic and Neoplatonic adaptations.

Middle Platonists divided reality into three parts: God, the Ideas, and matter. God was subdivided into three hierarchical levels—the Primal God, Mind, and Soul—as outlined in a second-century Platonic handbook by Alcinous. The Ideas, or Platonic Forms, were identified as the thoughts of God. This metaphysical framework was further developed in Neoplatonism.

Plotinus

Plotinus (205–270) is commonly regarded as the founder of Neoplatonism. He studied in Alexandria before founding his own school circa 244 in Rome, where he devised a comprehensive philosophy that has been preserved in the *Enneads*. For Plotinus, philosophy was not exclusively an effort of reasoned argument, since he equated the love of wisdom with assimilation to God, which is possible only through mystical ecstasy—a state Plotinus himself experienced. Discursive reasoning merely assists in attaining this higher end by clarifying what constitutes reality.

Plotinus's ontology reflects his mystical vision. Adapting the Middle Platonists' threefold division of God, Plotinus called the highest level of divinity, or first hypostasis, "the One"—a perfect unity, infinite and unknowable. Its superabundant goodness impels it to emanate existence in a cascading chain of being. As the source of all existence, the One itself actually transcends being. Hence the highest being is the divine Mind, which is emanated directly by the One. This second hypostasis, in which the Ideas are located, further emanates a third hypostasis, which is called Soul as it contemplates the intelligible realm and Nature as it previews what it will produce. Time and the physical world thus emanate from Soul/Nature. The process of emanation ends when being is so

attenuated that a limit is finally reached. This lowest stage of emanation is matter, which exists only potentially. Inasmuch as being is linked with goodness, matter's virtual absence of being is seen as the source of evil. Although matter is not *substantially* evil, since it ultimately emanates from the One, nevertheless evil resides in its state of privation.

Human souls, like the third hypostasis, are divided into a higher part that perceives the intelligible world and a lower part that cares for a material body. The individual soul falls into degradation when it is excessively concerned with material things and forgets its true identity. Philosophy reminds the wayward soul that it is an immaterial substance and thus opens the way for salvation, whereby the enlightened soul chooses to return to the intelligible world, from which it can ascend to the bliss of union with the One.

Later Neoplatonists

Plotinus's legacy was preserved by his pupil, Porphyry of Tyre (c. 232–c. 304), who wrote a biography of the master and published his tractates under the title *Enneads*. Porphyry's own writings include a manual of Plotinian metaphysics (*Sentences*) and commentaries on various texts, including Homer's *Odyssey* (*On the Cave of the Nymphs*) and Aristotle's *Categories* (*Isagoge*). Porphyry took a religious view of the philosophical enterprise and, while denouncing Christianity as an irrational cult, introduced into the Neoplatonic canon the second-century *Chaldean Oracles*, Platonic texts that he regarded as true revelation.

These writings also inspired the Neoplatonist Iamblichus (d. c. 330), who founded what is sometimes called the Syrian school. Iamblichus did not share the optimistic Plotinian view about the ease of salvation; he supplemented philosophy with theurgy—rituals invoking the divine powers for aid. His innovations were adopted by the schools in Alexandria and Athens, the other major centers of Neoplatonism. The inclusion of traditional pagan elements in Iamblichus's system made it attractive to Emperor Julian (331?–363), who promoted Syrian Neoplatonism in his attempt to revive paganism.

The foremost representative of the Athenian school was Proclus (410?–485), who wrote two influential works of systematic metaphysics, the *Elements of Theology* and *Platonic Theology*. He was head of a revived academy, which remained a bastion of paganism, and attacked the Christian doctrine of creation. The Alexandrian school, however, was diverse; it included some Christians, one of whom, John Philoponos (c. 490–570), wrote a rebuttal to Proclus's attack. The Alexandrian school displayed a keen interest in Aristotle, and Philoponos is often regarded as an Aristotelian rather than a Neoplatonist, although his independence of mind makes either characterization questionable. Other noteworthy Neoplatonists were the Athenians Plutarch (d. c. 432), Syrianus (d. c. 437), Damascius (d. after 538), and Simplicius (d. 560) and the Alexandrians Hypatia (d. 415), Hierocles (fifth century), Ammonius (d. after 517), and Olympiodorus (d. after 565).

Ancient Christian Neoplatonism

Since Neoplatonists and Christians shared many common beliefs, the latter sometimes borrowed insights from the former,

in spite of the polemic between them. Among the Latin Fathers, Augustine of Hippo (354–430) remarked in his book *On True Religion* (chap. 7) that one need only change a few words to make Christians of the Platonists. The Greek Fathers, especially the fourth-century Cappadocians (Basil the Great, Gregory of Nazianzus, and Gregory of Nyssa), were similarly responsive to Neoplatonism, since men such as Origen (185?–254?) had already brought Middle Platonism into the Greek theological tradition. Neoplatonism waned, however, as the Roman Empire disintegrated. The emperors after Julian firmly championed the Christian religion, and in 529 Justinian closed the doors of the Academy. Neoplatonism's continuing influence would depend on the tolerance of religious thinkers.

Medieval Neoplatonism

The reception of Neoplatonism during the thousand years of the Middle Ages is an immensely intricate subject, complicated by the mediated nature of the transmission (largely through theological assimilations) and by the division of the Mediterranean world into rival cultural spheres. Hence Neoplatonic adaptation developed differently among Greek and Latin Christians, Muslims, and Jews.

In each culture, enthusiasts tried to reconcile Neoplatonism with their religion. Most extraordinary was the Christianization of Proclus's philosophy circa 500 by a Byzantine using the pen name of Dionysius the Areopagite, the first-century convert of St. Paul (Acts 17:34). This assumed name lent his writings an air of authority that was undeserved yet guaranteed their dissemination. The texts provided instruction in the "affirmative" and "negative" theologies—methodologies for achieving mystical union with God through the use and suppression of symbolic language. The affirmative theology describes what God is by way of analogy, but since God is ultimately unlike anything that exists (for God is beyond being), the alternative theology is required to transcend the limitations of language by negating the analogy. This contemplative process of description and denial prepares the soul for ecstatic union by correcting its misapprehensions about God. The Pseudo-Dionysian texts were translated into Latin and studied in western Europe, where they inspired the ninth-century Neoplatonic system of John Scotus Eriugena (c. 800–c. 877).

Greek Christians were the only group able to read the Neoplatonic texts in the original language, yet this direct access actually increased the difficulty of using the old pagan philosophy in the theologically charged atmosphere of the Byzantine Empire. Philosophers who attempted to further the patristic effort at assimilation sometimes endured accusations of heterodoxy—as did Michael Psellos (1018?–1096?) and John Italos (c. 1023–1085). Arabic culture was at times more tolerant. Muslim thinkers were impressed with Greek philosophy and tended to equate it with its final, Neoplatonic form. Even Aristotle seemed a Neoplatonist, perhaps due to Neoplatonic commentaries that minimized his differences with Plato but also due to the misattribution of certain Neoplatonic texts, such as the *Theology of Aristotle* (extracts from Plotinus) and the *Book of Causes* (extracts from Proclus). The most prominent Muslim Neoplatonist was Ibn Sina (Avicenna, 980–1037), whose works were favorably received before Al-Ghazali (1058–1111)

wrote a critique that prompted a phase of intolerance. Jewish thinkers were also impressed with the Greek heritage, most notably Ibn Gabirol (Avicbron, c. 1021–c. 1058), whose *Fontain of Life* featured Neoplatonic doctrines. Neoplatonism was the main philosophical influence on the Kabbalah of thirteenth-century Provence.

Neoplatonism in the Latin West

Compared with the other three traditions, Latin Christianity was slower in absorbing Neoplatonism, largely due to a paucity of sources, yet it became the most vibrant by the end of the Middle Ages. After Augustine, the principal Neoplatonic thinker was the Roman philosopher Boethius (c. 475–525), who brought Porphyry's *Isagoge* to a Latin audience and presented many Neoplatonic ideas in his own *Consolation of Philosophy*, which became a standard schoolbook. Two commentaries were also significant in the medieval schools: one on Plato's *Timaeus* by Calcidius (third or fourth century, considered by some a Middle Platonist rather than a Neoplatonist), another on the *Dream of Scipio* (an excerpt from Cicero's *Republic*) by the fifth-century Macrobius. The latter provided a concise summary of Plotinian metaphysics, which occasioned a controversy in the eleventh century, featured in Manegold of Lautenbach's *Book against Wolfhelm*.

A cultural revival during the twelfth century led to renewed interest in old texts and an influx of new translations. After thinkers such as Peter Abelard, William of Conches, Thierry of Chartres, and Bernardus Silvestris fruitfully reexamined the Calcidian *Timaeus*, their successors discovered that the newly arriving translations of Aristotle's treatises had more to offer the scholastic enterprise of systematic theology than did the less direct dialogues of Plato, of which only the *Meno* and *Phaedo* were added to the Latin corpus. However, since Aristotle came to the West via the Arabs, he was initially read as a Neoplatonist. Thomas Aquinas (1225–1274) was instrumental in correcting this error when he identified Proclus as the source for the Pseudo-Aristotelian *Book of Causes* after reading a Latin version of the *Elements of Theology* translated in 1268.

Although Aquinas was principally Aristotelian in outlook, his teacher, Albertus Magnus (c. 1200–1280), was partial to Neoplatonism and inspired a Neoplatonic approach in three other Dominican friars: Dietrich of Freiberg (c. 1250–c. 1310), whose interest in the Neoplatonic metaphysics of light inspired him to study optics; Meister Eckhart (c. 1260–c. 1328), the controversial mystic; and Berthold of Moosburg (c. 1300–after 1361), who wrote an extensive commentary on Proclus's *Elements*. Nicholas of Cusa (1401–1464) later drew upon these thinkers, as well as the twelfth-century Platonists and earlier sources, in constructing his own Neoplatonic worldview outlined in *Learned Ignorance* (1440), a reaction against the Aristotelianism dominant in the universities. Petrarch (1304–1374) had already urged a return to Plato, and this tendency within Italian Renaissance humanism culminated in the work of the Florentine philosopher Marsilio Ficino (1433–1499), whose translations and studies of the complete Plato, Plotinus, and other Platonic authors were influential throughout Europe for centuries.

Robert Ziolkowski

NEW CRITICISM. The New Criticism is the name given to the work of a school of formalist-oriented Anglo-American literary critics whose writings appeared in the years following World War I and came to prominence in the 1940s and 1950s. John Crowe Ransom (1888–1974) coined the moniker itself in his 1941 study *The New Criticism*, in which he provided an overview of the work of key “New” Critics, including I. A. Richards (1893–1979), T. S. Eliot (1888–1965), William Empson (1906–1984), and Yvor Winters (1900–1968). Other important critics associated with this school included F. R. Leavis (1895–1978), Kenneth Burke (1897–1993), Allen Tate (1899–1979), Cleanth Brooks (1906–1994), Robert Penn Warren (1905–1989), and René Wellek (1903–1995), to name a few. Arising, in part, as a response to earlier approaches such as comparative philology and biographical and impressionistic criticism, the New Criticism focused on the individual work of literature, usually the poem, as the sole object of study. These critics placed special emphasis on the formalistic aspects of the literary work, highlighting connotative and associative usage of words and the many figurative devices of language that functioned within the poem.

Beginnings in England

The poet and critic T. S. Eliot gave shape to many of the concerns that would eventually coalesce as New Criticism. Eliot articulated a sense of literary tradition that wrenched criticism

away from historical and biographical assessment. In essays such as "Tradition and the Individual Talent," rather than emphasizing the greatness of the individual poet, Eliot stressed the importance of directing criticism upon the poem itself. In turn, the tradition of poetry became the collective vessel through which cultural greatness was transmitted. By distinguishing levels of poetic appreciation, he stressed the benefit of technical appreciation as opposed to the more popular (and coarse) emotional. The aim of the critic was to mine "significant emotion, emotion which has its life in the poem and not in the history of the poet" (Eliot, p. 11). Eliot, then, was establishing a way of reading poetry that acknowledged Western tradition as a continuum dating back to Greek antiquity, in which "art never improves, but that material of art is never quite the same" (p. 6). In doing so, he sought a rigorous, formalist appreciation of art as a corrective to more popular modes of modern culture. Eliot, like later New Critics, hoped to cultivate an understanding of great literature as a countervailing force to the vulgar and degradative thrust of modern mass society.

The emphasis on rigorous technical understanding of the literary work would become the hallmark of New Criticism. Most practitioners generally eschewed explicit formulation of theoretical orientation but, rather, focused on the practical application of certain, specific ways of reading. This orientation was captured in the title of I. A. Richards's 1929 work *Practical Criticism*, in which the notion of criticism was allied with careful or "close" readings of poetic works. Richards used his Cambridge Honors students' responses to poetry to reveal the reading deficiencies of ostensibly well-trained readers. These misreadings allowed him to distinguish four distinct meanings that the critic needed to draw out in order to understand a poem: Sense, Feelings, Tone, and Intention. Such an emphasis on reading as a practice, whose focus was to be directed solely upon formal aspects of the literary object, would become a key trait of New Critical thought.

Indeed, the status of the literary object, isolated from historical and cultural context, would gain strength over the next two decades. The poem was the literary object par excellence, its condensed and intense use of language particularly conducive to close reading. For most of the New Critics poetry *was* literature, and they eschewed more lengthy and convoluted genres such as fiction and drama. In the 1920s, Richards had defined the poem as an autonomous and organic being whose unity as an aesthetic object was essential to its study. In the 1930s and 1940s, critics based in the American South would develop this idea further.

American New Criticism

In the United States, several poets and critics based in the South would pick up on Richards's work. This group, associated with the Agrarian Revival, would elaborate upon close reading and the autonomy of the poem, eventually developing these principles into a full-fledged critical ethos. In the 1930s, John Crowe Ransom's writing on poetry positioned literature against the rapacious force of dehumanizing scientific logic. Considering the Revivalists' opposition to Southern industrialization, the turn to poetry as a means to maintain

contact with a humanistic, organic, and agrarian tradition made sense. Most of the Agrarians shared a sense of distrust in technology and were religious and conservative in their social views. Ransom, Allen Tate, and others saw poetic knowledge as a remedy to an oppressive scientific modernity. For them, poetry offered access to means of human expression and communication that were not available in other, modern discourses.

Organic unity and the heresy of the paraphrase. In the journal *Southern Review*, the editors Cleanth Brooks (1906–1994) and Robert Penn Warren (1905–1989) provided an influential platform for New Criticism. From 1935 to 1942, Brooks and Warren, in addition to raising the profile of Southern writers, also established New Critical principles of criticism as central to American literary studies. In his 1947 work *The Well Wrought Urn*, Brooks brought together many of his previous essays into a key text for the movement. Not only articulating its principles, Brooks also provided exemplary New Critical readings of poetry. In positioning poetic against scientific knowledge, he argued that paradox was characteristic of the unique knowledge of the poem. Unlike science, which sought to eliminate paradox, the poetic work achieved its ontological status through contradictions, oppositions, and ambiguity. Brooks also described the "Heresy of the Paraphrase" in order to highlight the importance of the poetic object as a complete and unified whole. No part of the poem could be read outside of the whole, and the whole was constituted by each individual part. Thus, any summarization or paraphrase of a poem was grossly inadequate, as the internal multiplicities of the poem could not be reduced in such a way. Brooks would, in later work, elaborate upon William K. Wimsatt (1907–1975) and Monroe Beardsley's (1915–1985) concepts of the intentional fallacy and the affective fallacy to reaffirm the organic unity and autonomy of the poem. Aimed at biographical and impressionistic criticism, the former dismissed attempts to gauge the poet's intentions through examination of historical context, whereas the latter argued that the poem is not to be judged based upon its emotional impact on the reader.

Decline of the New Criticism and Continuing Influence

In the years following World War II, New Criticism became a force in Anglo-American literary studies. Its rise was attributed not only to the focus it placed on literature as a discipline unto itself but also to its ease of pedagogical transmission. In an era when universities were flooded with returning soldiers, the New Criticism offered a clear and direct approach to the analysis and appreciation of literature as a rigorous, objective form of study. Several prominent literary critics challenged New Critical methods during its heyday. Alfred Kazin (1915–1998), in the early 1940s, charged that it fetishized formalism. In the latter part of the same decade, R. S. Crane (1886–1967) attacked Brooks and others for their "critical monism," which was exemplified by their slavish adherence to poetry, and primarily lyrical poetry at that. While Brooks responded to this charge by setting his sights on fiction, he was forced to concede that historical context was an important component in the structure of the novel. But it was in the 1960s, with increasing social flux, when New Criticism began

to see its influence diminish. Its ahistorical approach to the study of literature was faulted for depoliticizing literature and, thereby, upholding a political status quo. With increased interest paid to Marxist, hermeneutic, structuralist, and feminist criticism in the 1960s, New Criticism ceded ground to a variety of theoretical and historicist concerns. While in the early twenty-first century the New Criticism is faulted for its limitation of focus and methodological austerity, the impact it has had on the rise of a discipline of literary studies in the United States and that discipline's underlying reliance upon various methods of "close" reading are lasting achievements.

NEW HISTORICISM. See *Literary Criticism*; *Literary History*.

NEWTONIANISM. A standard definition of *Newtonianism* or *Newtonian philosophy* found in early eighteenth-century dictionaries such as John Harris's *Lexicon Technicum* (5th ed., 1736) is: "The doctrine of the universe, and particularly of the heavenly bodies; their laws, affections, etc., as delivered by Sir Isaac Newton." An almost identical definition appears around thirty years later in the *Encyclopédie* of Denis Diderot and Jean le Rond d'Alembert: "Newtonianisme ou philosophie Newtonienne: c'est la théorie du mécanisme de l'univers, & particulièrement du mouvement des corps célestes, de leur lois, de leur propriétés, telle qu'elle a été enseignée par M. Newton" (Newtonianism or Newtonian philosophy: the theory of the mechanism of the universe, and particularly of the motion of the heavenly bodies, of their laws, their properties, as delivered by Mr. Newton).

The authority of Newtonian philosophy was established through the publication of the two major works of Sir Isaac Newton (1642–1727) in natural philosophy, *The Principia* (*Philosophiæ Naturalis Principia Mathematica*, 1687) and the *Opticks* (*Opticks; or, A Treatise of the Reflections, Refractions, Inflections & Colours of Light*, 1704). The former was a work in rational mechanics where Newton aimed to study "the motion that results from any force whatever and of the forces that are required for any motion whatever." His major stake was

to overcome the model of impact that dominated the mechanical philosophy of his time and to introduce the notion of attractive force as a proper dynamic factor of motion. Accordingly, he aimed to explain Kepler's laws through the use of universal attraction and to discard the Cartesian theory of vortices. The latter work was a study in the spirit of mechanical philosophy, where Newton investigated the phenomena of light. He introduced his experimental method and he elaborated the atomistic model of matter. In the successive editions of the work he enriched it with a number of "queries" where he developed his theoretical and metaphysical contemplations about the nature of matter, the various instances of attractive and repulsive force, and the theoretical grounding of experimental induction.

The publication of the *Principia* clearly marked the establishment of a new spirit in European natural philosophy. It is equally clear, though, that Newton's contemporaries differed significantly in the appreciation of his magnum opus. Followers like Edmond Halley (1656–1742) and Voltaire (1694–1778) were so excited by Newton's achievements that they placed him in the highest position of the philosophical firmament of the time. At the same time, however, Christiaan Huygens (1629–1695) was astonished by the fact that such an elaborate synthesis in mechanics was founded upon the notorious notion of universal attraction. Along a similar line, Gottfried Wilhelm Leibniz (1646–1716) accused Newton of turning the entire operation of Nature into a perpetual miracle. Having been nourished by the Cartesian rationalistic tradition, Huygens and Leibniz found that the adoption of attraction by natural philosophers would bring about a reversion to the "occult qualities" of Scholasticism.

Historians assume that the *Principia* is one of the least read documents in the history of ideas. Even in the early eighteenth century influential philosophers like John Locke (1632–1704) and Voltaire adopted its message without having read or understood its technical part. The reputation of the *Principia* was based primarily on the authority of very few competent readers. At the same time, quite a few nonmathematical philosophers made a systematic attempt to bring Newton's message to the general reader. To this purpose, they proceeded with the compilation of comprehensive treatises where they presented an outline of Newtonian mechanics and experimental philosophy.

The *Opticks* was a far more widely read work. A reason for this was its deceptive accessibility. The *Opticks* was not a revolutionary work in the sense the *Principia* was. It was rather a brilliant display of the art of experimentation, and it was often cited as a model of how to approach a difficult problem by experiment and how to conduct precise quantitative experiments. What was important in the *Opticks* from the point of view of the Newtonian synthesis was that Newton elaborated there the most comprehensive public statement he ever made of his experimental method:

As in Mathematics, so in Natural Philosophy, the Investigation of difficult Things by the Method of Analysis, ought ever to precede the Method of Composition

[or Synthesis]. This Analysis consists in making Experiments and Observations, and in drawing general Conclusions from them by Induction, and admitting of no Objections against the conclusions, but such as are taken from Experiments, or other certain Truths. For Hypotheses are not to be regarded in experimental philosophy. . . . By this way of Analysis we may proceed from Compounds to Ingredients, and from Motions to the Forces producing them; and in general from Effects to their Causes, and from Particular Causes to more general ones, till the Argument end in the most general. (*Optics*, 1779, p. 404)

Newtonianism, however, is much more than the direct impact of Newton's two major works on European intellectual life. First of all, Newtonian philosophy was neither a given system nor a definitive synthesis in natural philosophy. It was rather a multifaceted current shaped by the interpretations of Newton's works and, to a significant degree, by the adaptations of these works to various intellectual environments all over the European continent. Moreover, throughout the eighteenth century "Newtonianism" meant much more than a physical theory. It was an amalgam of scientific, political, and religious ideas, which only partially went back to Newton's original works. It was quite common for people who endorsed Newtonian philosophy to have only a vague idea of his mathematical and experimental investigations. Nevertheless, Newton became something of an authority people drew upon in order to resolve matters concerning not only nature's interpretation but also the conduct of man, the function of the state, and the doctrines of religion. Thus, in what follows we will briefly examine the many aspects of Newtonianism in a variety of intellectual contexts that assigned an accordingly variable meaning to the term.

The author of the aforementioned article in the *Encyclopédie* was Jean Le Rond d'Alembert. Being one of the protagonists in the developments that took place in the field of Newtonian natural philosophy in the mid-eighteenth century, he was well aware of the inadequacy of a general definition of Newtonianism. Hence, after the short descriptive definition he gave in the opening of the article, he immediately proceeded with the delineation of a broad spectrum of notions and practices that contributed to the formation of this intellectual current. Some authors, he notes, perceive Newtonian philosophy as a version of "corpuscular philosophy," enriched and corrected by the discoveries of Newton. In this sense, Newtonian philosophy is nothing else than a new philosophy, distinct from the Cartesian, the peripatetic, and the other ancient philosophies of the body. Others perceive Newtonian philosophy as the method Newton employs in his philosophy. This method consists in deriving conclusions directly from the phenomena, without feigning hypotheses, in starting from simple principles, in deducing the primary laws of nature from a small number of selected phenomena, and in using these laws in order to explain all the other natural effects. In this sense, Newtonian philosophy is nothing else than "experimental physics," opposing to the ancient philosophy of the body. Others perceive Newtonian philosophy as the branch of philosophy that examines natural bodies mathematically and applies geometry

and mechanics in the resolution of the respective problems. In this sense, Newtonian philosophy is nothing else than "mechanical and mathematical philosophy." It is clear, thus, that for d'Alembert and his contemporaries, even in the narrow field of natural philosophy Newtonianism means at least three different things: a new philosophy of body, experimental philosophy, and rational mechanics. In fact, all these philosophical and mathematical traditions have a bearing on Newton's own work and mark the distinctive research and philosophical directions that stem from the various pieces of the Newtonian synthesis.

The Philosophy of Body

The "philosophy of body" was deemed a crucial branch of philosophy in the eighteenth century dealing with the nature of matter. According to the traditional Cartesian view, the only essential property of a material body was extension. Figure, position, and motion were only "modes of existence" of an extended being. As a result, all natural effects should be processed on the basis of changes that occur in the shape, the relative positioning, and the motion of the bodies or of their parts. A significant advantage of this approach, according to the proponents of Cartesian philosophy, was that it made clear the distinction between the material agent of natural phenomena and the external cum immaterial causes of motion. This way it was made possible to disengage material bodies from the notorious "occult qualities" they inherited from Renaissance and some aspects of ancient philosophy.

Newtonianism brought about two important transformations to this view: Firstly, it maintained the implicitly theological idea that it is in principle impossible for people to grasp all the qualities of natural bodies. Thus, not only is extension not a unique essential quality of material bodies, but also the few other qualities we are able to know are but a subtotal of the qualities God may have provided the bodies with. Almost all the followers of Newtonian philosophy subscribed to this voluntaristic view of the divine design. Voltaire, Willem Jacob 'sGravesande (1688–1742), and Petrus van Musschenbroek (1692–1761)—to mention only the most active of them—insisted on the constitutional inability of human beings to penetrate God's will so as to acquire a definitive knowledge of the nature of material bodies.

The second transformation has to do with a new addition to the list of attributes of natural body, namely the force of attraction. According to the definition of Musschenbroek,

those things which we find to be in all bodies, we call their attributes. . . . Among these attributes there are some, which can never be intended or remitted, and others, which are capable of intension and remission. The former are extension, solidity, inactivity, mobility, a capacity of being at rest or having a figure. The latter are gravity and the power of attraction. (Musschenbroek, p. 10)

It is true that in the course of time, this addition gave much trouble to the proponents of Newtonian philosophy. Even in

the early eighteenth century, it was not clear whether attraction was an inherent active principle of the matter, or a force transmitted through an ethereal substance filling the whole universe. As a result, the supporters of this view were accused of reverting to the “occult qualities,” which had been banished from philosophy thanks to Cartesian philosophy. Concerning this issue, the Newtonians attempted to articulate a moderate philosophical thesis maintaining that attraction was simply a force of unknown origin that dominated the interactions between material bodies:

And lest any one should think, because we do not assign the Cause of the abovemention'd attracting and repelling Forces, that they too are to be reckon'd among the Occult Qualities: We shall say, with the great Newton, we do not consider those Principles, as Occult Qualities, which are imagin'd to arise from the specifick Forms of Things; but as the universal Laws of Nature, by which Things themselves are form'd; for the Phaenomena of Nature shew us, that such Principles do really exist, tho' no one hath explain'd yet what are the Causes of them. ('sGravesande, p. 24)

Concerning the idea that attraction might be an inherent quality of matter, however, things were more troublesome. Such an interpretation of Newtonian dynamics by some supporters of Spinozistic philosophy, like John Toland (1670–1722), favored materialism, which was much repudiated by the “orthodox” Newtonians, as we shall see below.

Experimental Philosophy

The second field where the contribution of Newtonian philosophy was considered decisive was “experimental philosophy.” Newton applied two new principles in this field. Both of them were an outcome of the aforementioned methodological approach he developed in the *Opticks* and the accompanying “queries.”

The first principle was that the only safe way to derive natural laws from the phenomena is to proceed inductively. Hypotheses have no place in this process. Moreover, sticking to this methodological commitment is the only way to protect ourselves from producing natural interpretations built upon “chimerical” suppositions, as was actually the case with Cartesian natural philosophy. “Analysis” (or resolution), as opposed to “Synthesis” (or composition), comprised the core of this method. According to extreme advocates of analytical method, like Abbé Étienne Bonnot de Condillac (1714–1780), analysis was the only correct method of reasoning, because it was taught to humans by nature herself. As a result, even composition would lose its significance: The demonstration of every proposition ought to go over the path of discovery; and the only due method to do so was analysis, not synthesis. It is true that the pronouncement of analytical method has been the source of much confusion, since it has been read by many Newtonians and, evidently, by Newton himself, as if it applies equally to mathematics and to experimental philosophy. On the other hand, however, this same aspect of Newtonian philosophy epitomized the anti-Cartesian stance of many

eighteenth-century scholars and became a cornerstone of the natural theology of the time.

The second element Newton introduced to his contemporary experimental philosophy was the quantitative principle. Some fifty years after the first edition of the *Opticks*, d'Alembert described experiments as processes that aim at intentionally producing new phenomena in order to force nature to disclose her hidden principles. The man who had brought experimental philosophy to its current state was Newton. He had done so by introducing geometry into physics and by unifying experimental practice with mathematical techniques. Thus, he achieved an exact, scrupulous, and innovative science. The object of this science was the study of the general qualities of bodies; observation might help us perceive these properties superficially, but only experiment could bring them forth in a precise and measurable manner. The outcome of this process was the formulation of general quantitative laws, especially for those natural phenomena that were perpetually repeated without making evident their causes or the principles that governed their succession. This same perception, however, was also the limit of Newtonian experimental philosophy: Although Newtonian method was considered the key to unlocking the secrets of nature, from the moment the fundamental laws had become known—as most philosophers believed, in the mid-eighteenth century—the usefulness of experimental physics was rendered limited. Any further investigation of natural effects should come under the field of “mathematical sciences,” that is, rational mechanics.

Rational Mechanics

Rational mechanics was, indeed, the third field where the Newtonian legacy was of major importance. In the seventeenth century, the term *mechanics* had a double meaning. In his preface to the *Principia*, Newton made a clear-cut dichotomy between “practical mechanics” and “rational mechanics.” The former referred to all manual arts people used to practice in varying degrees of exactness. Practical mechanics was closely related to geometry, for geometry “is nothing other than that part of universal mechanics which reduces the art of measuring to exact propositions and demonstrations.” However, this was not the kind of mechanics Newton wanted to deal with. “Since the manual arts are applied especially to making bodies move, geometry is commonly used in reference to magnitude, and mechanics in reference to motion. In this sense, rational mechanics will be the science, expressed in exact propositions and demonstrations, of the motions that result from any forces whatever and of the forces that are required for any motions whatever” (Cohen and Whitman, p. 382). Half a century after the publication of the *Principia*, rational mechanics was a well-established branch of Newtonian physics, clearly distinguished from other aspects of natural investigation. A standard definition of the term implied three significant features:

- Rational mechanics was the mathematical study of motions generated from specific forces as distinguished from statics, which examined the forces of a system being in equilibrium.
- The mathematical analysis employed in rational mechanics should be able to represent the generation of

the trajectories of moving bodies as distinguished from geometry, which sufficed only for the description of static curves.

- The current formulation of rational mechanics was based on the *Principia*, as opposed to practical mechanics, which originated in classical and Hellenistic antiquity.

The major contribution of Newton to the establishment of modern rational mechanics was threefold. First, he introduced the notion of attractive force as a dynamic factor of motion. He did so by mathematically constructing the *modus operandi* of a centripetal force acting as the inverse square of distance; subsequently, he assigned it a natural status by unifying terrestrial and celestial physics on the basis of attraction. His second contribution was that he clearly showed the limits of Euclidean geometry as far as the problems of motion were concerned. Although he himself did not totally reject Euclidean geometry when he composed the *Principia*, the modification of traditional geometry he suggested there, as well as his mathematical studies on “fluxions” and “fluents,” indicated that the only proper mathematical way to treat the problems of motion was infinitesimal calculus. His third contribution was the comprehensive study of celestial mechanics and the explanation of a wide range of celestial phenomena on the basis of universal attraction.

Although the last contribution established Newton as a heroic figure throughout the eighteenth century, the two former did not have an equally straightforward effect on his philosophical profile. There is no doubt that Newtonian mechanics bridged the gap between astronomy and cosmology by presenting a concise physico-mathematical model for the operation of the Keplerian laws. However, the mathematical and ontological foundations of Newton’s synthesis became the object of much discussion on the part of his successors. It is somewhat ironic that the transcription of Newtonian mechanics in the language of infinitesimal calculus was carried out on the basis of the mathematical notation suggested by Leibniz, his major philosophical opponent. In fact, it was characteristic of Newtonian mechanics throughout the eighteenth century that many of the people who undertook the further advancement of Newtonian achievements combined the legacy of the *Principia* with the philosophical and mathematical ideas of Leibniz. The incorporation of the *vis viva*, or living force, theory in many Newtonian treatises that circulated widely on the Continent, along with various attempts aiming to render the laws of motion compatible with the metaphysical principles of Leibniz, were two other instances of this characteristic.

The thorn of Newtonianism, however, was the ontological status of attractive force. Thus, by the mid-eighteenth century quite a few significant mathematicians, like d’Alembert and Lazare Carnot (1753–1823), insisted that the notion of force should be expelled from mechanics. Others, like Johann Bernoulli (1667–1748) and Leonard Euler (1707–1783), suggested that a dynamic factor was, indeed, necessary in mechanics, but they also tried to keep a distance from the metaphysical consequences of such an assumption. In any case,

the major pursuit of the time was the transformation of the Newtonian mechanics so that it might work exclusively on the basis of kinetic laws. This process culminated with the publication in 1788 of *Mécanique analytique*. Joseph Louis Lagrange’s (1736–1813) work was entirely analytical in contrast to the method employed by Newton in the *Principia*, which was entirely geometrical. Lagrange was an admirer of Newton but he was also a disciple of d’Alembert. Thus, he shared with the latter the desire to develop a new science of mechanics that would not need the metaphysically laden concept of force. As a result, his *Mécanique analytique* drew upon d’Alembert’s principle, the conservation of *vis viva*, and the principle of least action, none of which had a counterpart in Newton’s work. Additionally, he applied his method to constrained systems of masses, rigid bodies, and continuous media, which was again a substantial departure from Newton’s preoccupation with the legitimization of centripetal force acting at a distance.

Religion and Politics

Newton was not only a natural philosopher and Newtonianism was not only a scientific theory. Newton was also a pious Christian and an active theologian. Newtonianism, on the other hand, besides its scientific content or because of it, was gradually identified with the rise of a Whig oligarchy and with the new balance of power that resulted from the Revolution of 1687–1689 in England. Thus, soon after the publication of Newton’s two major works, Newtonianism became the cornerstone of a new intellectual program that affected significantly the political and theological trends of the time. The people who set out this program in England were Newton’s friends and supporters, including Richard Bentley, Samuel Clarke, William Whiston, John Harris, William Derham, and Jean Desaguliers. They actively propagandized the idea that Newton’s intellectual achievements provided a perfect model for social order, political harmony, and liberal but orthodox Christianity. Although the promotion of this aspect of Newtonianism employed the technical achievements of Newtonian natural philosophy, the discourse built on this basis was not technical in itself. It was primarily through the Boyle lectures (a series of lectures established in Robert Boyle’s will to defend Christian orthodoxy against the various forms of atheism) that Newton’s followers unfolded the ideological implications of Newtonian science and turned it into a component of moderate Enlightenment.

One major problem with Newtonian philosophy was that it was used by both freethinkers and its religious-minded supporters. The former adopted the mathematical and experimental method as a clue that provided a liberal spirit in the investigation of the natural world; the latter, in addition to this, championed the moral and metaphysical implications of Newton’s thought to wage war against pure rationalists and the various representatives of “irreligious pluralism.” The other major problem, however, was that in the course of this confrontation, the Newtonian philosophy gave rise to a “heretic” approach to Christian theology, which was much denounced by the official Anglican Church.

Freethinkers and materialists of the time picked up those elements of Newtonian philosophy that fitted their perception

of nature. The doctrine of universal gravity was of prominent importance to this process of adaptation. People with a preference for Spinozistic philosophy, like John Toland, gladly adopted this principle, but they suggested that one should perceive gravity as inherent to matter. Thus, in the hands of free-thinkers, the power of gravity provided another evidence that matter is inherently active and offered further support to a purely naturalistic explanation of the universe, devoid of supernatural agencies and occult qualities.

In this atmosphere, even Newton himself was credited with potential atheism. Quite a few Christian thinkers held him responsible for the “misinterpretations” of his theories that resulted in the rejection of divine providence. They cautioned that despite the obvious usefulness of modern science, one should not confuse human knowledge with absolute truth, since the latter becomes known only through revelation. Other thinkers, however, believed not only that Newton’s achievements were in accordance to Christian faith, but also that if the new theories were seen in their proper perspective, they would enhance the belief in a universe created and governed by God. Thus, Samuel Clarke (1675–1729), in order to fight Toland’s views on the inherently active character of matter, drew upon Newton’s argument about the reality of empty space. In his Boyle lectures of 1704 he argued that according to Newton’s own demonstration, the existence of a void space is a necessary consequence of the existence of gravitation. And this void space is, of course, the most clear demonstration that the existence of matter is not necessary.

Clarke’s belief in the existence of an empty space turned out to be decisive to his metaphysical investigations. This belief was firmly based on the notions of absolute space and time introduced by Newton in the scholium to Definition VIII of the *Principia*. Newton had stressed that only absolute space and time are real and Clarke extended this thought by stating that they are “affections which belong, and in the order of our Thoughts are antecedently necessary, to the Existence of all Things.” Space was not a substance in its own right, but from the fact that it is necessarily existent, Clarke inferred that it must be a property of God. This conclusion provided a decisive argument for the necessity of a universal self-existent Being whose attributes are eternity, infinity, and unity. Clarke was well aware, however, that at the theological level there was a potential conflict between the doctrine of Trinity and the view of God’s unity that ensued from the notion of absolute space. Although his initial intention was to fight Toland’s idea that both God and matter could be considered self-existent principles, in the course of the debate he came to entertain serious doubts about the validity of the doctrine of Trinity. Thus, what initially was an argument against materialism led him to a radical reinterpretation of the Bible in favor of Divine unity. By 1711, in the third edition of his Boyle lectures, Clarke had made this interpretation quite explicit, and one year later he culminated his scriptural investigations with the publication of the *Scripture-Doctrine of the Trinity*. The outcome of his analysis confirmed the distinction between the attributes of God and those of the Son; the former belonged to the eternal being and thus were absolute, whereas the latter belonged to a product of the divine will, and therefore were relative.

Newtonian philosophy found itself in the basis of the heterodox theology suggested by Clarke. It is now well-known that Newton himself was also an anti-Trinitarian. William Whiston, another disciple of Newton, publicly supported the same belief at the expense of his academic career. In the uncertain atmosphere of postrevolutionary England, all these manifestations of heterodoxy could not escape the attention of those who defended religious “orthodoxy” and a certain aspect of social order. As a result, Newtonianism was engaged in the political debate of the time. The degree to which the basic concepts of the Newtonian natural philosophy became acceptable by various groups of English society depended on the political and religious affiliations of these groups. The fact that Newtonianism might be viewed as a faction in philosophy caused a major discomfort to those who held “Tory sensibilities.” Political factionalism of the seventeenth century was deemed one of the factors that subverted the political basis of the Stuart monarchy. In this sense, the Newtonian philosophy represented much more than a new trend in the investigation of nature: for a significant part of the English society it symbolized potential social disorder, and Newton was largely held responsible for this. Therefore, words like *attraction* and *inertia*, as well as methodological commitments like experimentalism and the mathematical representation of nature, became part of a polemic.

This was not the case with another aspect of Newtonianism that prevailed on the Continent during the eighteenth century, namely Voltaire’s Newtonianism. It took nearly fifty years for the Newtonian worldview to find its first devoted advocates in France. Pierre Louis Moreau de Maupertuis (1698–1759) was the first who pleaded with his countrymen not to dismiss unwisely the exegetical power of attraction. Subsequently, Voltaire, convinced by Maupertuis’s assurance about the worth of Newton’s synthesis, launched a systematic attempt to familiarize the French educated public with the new natural philosophy. Inevitably, the propaganda for the Newtonian system had to go hand in hand with the undermining of the Cartesian tradition. The French public recognized numerous defects in Descartes’s natural philosophy but they believed that an advancement in philosophy would correct these errors and restore the primacy of Cartesian tradition; under no circumstances were they willing to cure Descartes’s deficiencies by replacing his philosophy with the Newtonian synthesis. Voltaire dated the beginnings of the decline of the “chimerical philosophy” of Descartes in France to 1730. The main objective of his own attack was to secure Newton’s primacy on the basis of the superiority of his analytical method: Newton was superior to Descartes because his discoveries were a product of a systematic inductive investigation of nature confirmed by geometry. Newton never mistook conjectures for truth as was, in fact, the case with Descartes.

An equally important aspect of Voltaire’s undertaking was related to the theological dimension of Newtonian philosophy. Quite unexpectedly, Voltaire proclaimed the superiority of Newtonian theology over the Cartesian conception of God, whose “rational” character might seem, at first glance, more appropriate to the atmosphere of the rational Enlightenment. What basically annoyed Voltaire was the inclination of many followers

of the Cartesian tradition to adopt a quasi atheist stance, in the context of which the universe was the poor product of matter and motion. In Leibnizian philosophy, the counterpart of this stance was a kind of “rational” atheism, since the principle of sufficient reason held good even for God. Newton’s voluntarism was a decisive answer to these stances. The will of God was absolutely impenetrable by human intellect. The universe was not a product of natural or logical necessity but the outcome of God’s unrestrained will. Fallen man had access only to the results of His choices as they were revealed by the order of universe and the laws that govern the natural phenomena.

Voltaire’s interpretation of the Newtonian philosophy became popular in a great part of the European continent. The favorable attitude toward Christian faith and the countering of the Aristotelian and Cartesian dogmatism that ensued from this interpretation was an invaluable tool for those who promoted religious tolerance and moderate political reform. John Locke’s survey of the limits of human knowledge served as the counterpart of this aspect of Newtonianism and comprised the basis of an intellectual current that defended freedom of thought in a variety of sociopolitical environments. As a result, experimental philosophy came to represent far more than a scientific method. It epitomized the ability of citizens to overcome the restrictions of the established authorities without disturbing the social order, to participate in the acquisition of knowledge by their own means, and to establish paradigmatic procedures of social consent that would guarantee human progress and happiness.

NIHILISM. In a history that spans more than two and a half centuries, the term *nihilism* has been employed to denote a wide range of phenomena. It has been variously used to express contempt or horror on the one side, approval and admiration on the other. In the twentieth and twenty-first centuries, it has almost always been an emotional and axiological term, frequently employed to cut off debate on a moral issue by representing a particular position as absolute, totalizing, and extreme.

Early History of the Term

The word *nihilism* is constructed from the Latin *nihil*, "nothing," and the Greek suffix *ism*. In the compendious *Historisches Wörterbuch der Philosophie* (Historical dictionary of philosophy), Wolfgang Müller-Lauter gives 1733 as the earliest known date for the occurrence of the German *Nihilismus* and notes the rise of the word *nihilisme* in France at the end of the eighteenth century.

From the late eighteenth century through the first half of the nineteenth century, nihilism followed a course that scholars have already traced in considerable detail. Enemies of German idealism threw the term at Immanuel Kant and Johann Gottlieb Fichte, for example, protesting against the emptiness of a philosophy that denies the possibility of any reliable contact with the world of things in themselves. As European thought increasingly moved toward dispassionate, secular explanations of religious belief (holding, for example, that such belief is a natural and predictable product of human consciousness or that it reflects a natural, human tendency to generate myths), those seeking to defend traditional faith increasingly leveled the charge of nihilism against secularizing thinkers. David Friedrich Strauss (1808–1874), the famed and much reviled author of *Das Leben Jesu: kritisch bearbeitet* (1835–1836; *The life of Jesus: critically examined*), one of the nineteenth century's many biographies of Jesus, and Ludwig Feuerbach (1804–1872), the equally noted author of the skeptical *Das Wesen des Christentums* (1845; *The essence of Christianity*), were both accused of propagating nihilism. Max

Stirner (pseudonym of Johann Caspar Schmidt; 1806–1856), author of the primary gospel of egoism, *Der Einzige und sein Eigentum* (1845; *The ego and his own*), and pre-Nietzschean messenger of the death of God, has been described as an early nihilist. All such thinkers, it was felt, had reduced to nothing (*nihil*) both faith and its transcendent object.

Nihilism in Russia and As a Russian Export

The term *nihilism* (*nigilizm* in Russian) had been used in Russia early in the nineteenth century, but it burst on the scene with particular force and with an entirely new meaning in January 1862, when Ivan Turgenev (1818–1883) published *Fathers and Sons*. Turgenev's hero, Evgeny Vasil'evich Bazarov, is a man of science, a member of the new generation who has decided that, at least in theory, nothing in the universe lies beyond the explanatory power of the empirical method. He is, in a word, a nihilist. As his callow young friend puts it to members of the older generation (the "fathers"), a nihilist is a man "who approaches everything from a critical point of view . . . who does not bow down before any authorities, who does not accept a single principle on faith, no matter how much respect might surround that principle." Bazarov dissects frogs (the better to understand human beings), denies the value of artistic expression, and is predictably flummoxed when he finds himself hopelessly in love, that is, in a condition that completely defies the very foundation of his materialist worldview.

If nihilism, as Turgenev's hero understood it, comprised both a thoroughgoing materialism and a thoroughgoing anti-aestheticism, it was already possible to find both in the apostle of the new progressive generation, Nikolai Gavrilovich Chernyshevsky (1828–1889), who would gain notoriety in 1863 as the author of the didactic novel *What Is to Be Done?* In his master's thesis, *The Aesthetic Relation of Art to Reality* (1855), Chernyshevsky had denied the existence of beauty as an autonomous quality in art, saying that beauty can be nothing more than life itself. And in *The Anthropological Principle in Philosophy* (1860), he had reduced human freedom and, for that matter, human distinctiveness, to nothing, arguing that individual freedom is an illusion as much in humanity as in the lower forms of animal life. Chernyshevsky would add a third feature to the definition of nihilism in *What Is to Be Done?* The idealized characters in his novel behave in accordance with an odd amalgam of utilitarianism and enlightened egoism, thus reducing traditional ethical values to nothing.

After the publication of *What Is to Be Done?* nihilism as a term or attitude took three principal directions in Russia. First, in literary life, it nurtured the trend toward realism. Dmitry Pisarev (1840–1868), the young critic who in a favorable review of *Fathers and Sons* helped disseminate a positive image of Turgenev's hero, took Chernyshevsky's anti-aestheticism one step farther in the 1860s, devoting a series of essays to the "destruction of aesthetics" and to the promotion of a rigidly realist style in literature. Second, in political life, the term *nihilism* came to be used, often with hostile intent, to describe a group within the revolutionary movement characterized by its unscrupulous methods and its unprincipled aims. Fyodor Dostoyevsky helped popularize this sense of *nihilism* by offering up the savage caricatures of left-wing political operatives

that we see, above all, in *The Devils* (also called *The Possessed*; 1871). The chief “devil” in this book, Peter Verkhovensky, is a self-described nihilist notable for his desire to bring about terrible destruction and for his utter lack of concern about what might follow that destruction. As Peter Verkhovensky’s real-life prototype, the notorious anarchist Sergei Nechaev (1847–1882), had written in the *Catechism of a Revolutionary* (1869), “The revolutionary disdains all doctrinairism and has repudiated all peaceful science. . . . He knows one science only: the science of destruction.” Third, the term *nihilism* came to be used, again in political life, in a sympathetic sense to denote the Russian revolutionary movement broadly speaking. The Russian revolutionary Sergei Mikhailovich Kravchinsky (1851–1895; better known by the pseudonym Sergius Stepniak), after fleeing Russia in 1878, spent much of his life publishing—in English and Italian—apologias for the Russian liberation movement that he broadly termed *nihilism*. And the anarchists Emma Goldman (1869–1940) and Alexander Berkman (1870–1936), both Russian immigrants to the United States, used the term *nihilist* in their memoirs to refer to the heroes of the Russian revolutionary movement, heroes that had inspired them to embark on their own revolutionary careers.

Nietzsche and Nihilism

Had it not been for Friedrich Nietzsche (1844–1900), nihilism—the word and what it came to designate—would no doubt have been very different from what it in fact became. We find an enigmatic reference to “nihilism according to the Petersburg model” (an apparent reference to Turgenev) in part 5 (1887) of *The Gay Science*, but the term occurs in his published writings mostly in connection with philosophies that Nietzsche views as world- or life-denying. In *The Genealogy of Morality* (1887), for example, he offers the term *nihilism* as a synonym for *Buddhism*, meaning a renunciation of the affairs of the world. In *The Anti-Christ* (1888), nihilism is essentially synonymous with “denial of life,” and Nietzsche defines pity, the root sentiment of Christianity, as “the praxis of nihilism.”

The bulk of Nietzsche’s comments on nihilism, however, appear in unpublished writings (the *Nachlass*, or “literary legacy”) from the 1880s. It is here that Nietzsche describes nihilism as a condition in which “the highest values devalue themselves” and in which the answer to the question “Why?” is missing. There are two possible responses to this condition, Nietzsche explains in a notebook he kept in 1887. We may rise up in strength and recognize that existing goals are no longer adequate, establishing new values in place of the older ones, or we may resign in weakness (“Buddhism,” as Nietzsche puts it), thus failing to generate new values. The first response is called “active nihilism,” the second “passive nihilism.”

There has been some debate over the years about whether Nietzsche himself was a nihilist. The debate is misguided. A cursory reading of what Nietzsche says on the subject shows that for him nihilism is alternately a lamentable and a potentially fruitful condition, but in either case a temporary one. Anyone inclined to construe the proclamation that God is dead as an expression of nihilism should remember that Nietzsche declared the religion whose God was allegedly dead to be itself a form of nihilism. Nietzsche’s true legacy was the association

Conspiracy in Russia: A Nihilist Meeting Surprised. Illustration, 1880. In late nineteenth-century Russia, *nihilism* was often used as a pejorative term meant to characterize certain left-wing radicals as dangerous and amoral, but supporters appropriated the same term to refer to the Russian revolutionary movement in a positive fashion. © BETTMANN/CORBIS

of nihilism with values (their absence, their rejection, their synthesis). Future social commentators who invoke the term *nihilism* to mourn the loss of traditional morality may blame or not blame Nietzsche; what they wittingly or unwittingly owe him is a definition that is at least implicit in what they say.

Nihilism and the Twentieth Century’s Ills

From 1936 to 1946, Martin Heidegger (1889–1976) wrote the component parts of what became a two-volume study of Nietzsche. A simple glance at the chapter and subchapter headings will show to what extent nihilism, in Heidegger’s eyes, was fundamental to Nietzsche’s thinking. World War II and the period immediately preceding it were an appropriate backdrop for Heidegger’s sense that we must view Nietzsche’s nihilism in the broader context of what he calls “the end of metaphysics” in Europe. He defines this end as “the beginning of a taking-seriously of that ‘event,’ ‘God is dead.’” As Heidegger sees it, nihilism is one of five “principal headings” (*Haupttitel*) in Nietzsche’s thought, the other four (with which it is inseparably connected) being the revaluation of all prior values, the will to power, the eternal recurrence of the same, and the superman. If Heidegger’s comments on Nietzsche’s nihilism are partly a comment on the contemporary European

Listening to my teacher revived the ghastly sight: the bleeding body, the piercing shrieks, the distorted faces of the *gendarmes*, the knouts whistling in the air and coming down with a sharp hissing upon the half-naked man. Whatever doubts about the Nihilists I had left from my childhood impressions now disappeared. They became to me heroes and martyrs, henceforth my guiding stars.

SOURCE: Emma Goldman, in *Living My Life* (1931), on learning of the flogging of peasants in Russia.

situation, they are also partly a comment on his own earlier work. In his chapter on the five principal headings, for example, Heidegger defines what he calls Nietzsche's "classical nihilism" as "that bringing-to-completion of nihilism in which nihilism considers itself to be released from the necessity of thinking precisely that which its essence constitutes: nihil, nothing—as the veil of the truth of the Being of that-which-is [*des Seins des Seienden*]." A passage like this is probably helpful more to the student of Heidegger's *Being and Time* (1926) than to the student of nihilism.

World War II and the entire history of totalitarianism in the first half of the twentieth century provoked one of the most forceful uses of *nihilism* as a moral and political term. In 1951, Albert Camus (1913–1960) published *L'homme révolté* (Man in revolt; translated into English as *The Rebel*). As Camus put it in the first few pages of his book, "If our age easily allows that murder can have its justifications, it is because of that indifference to life that is the mark of nihilism." The central question becomes whether it is possible to offer a rational justification for murder, as is done in this "age of ideologies." Nihilism has to do with values, as it did for Nietzsche. When Camus comes to show the inner contradiction in "the absurd" (his term for the attitude born of nihilism or "absolute negation"), he has this to say: The absurd is a contradiction "because it excludes value judgments while still wishing to preserve life, whereas to live is itself a value judgment. To breathe is to judge." One might argue that this position represents a *petitio principii* (begging the question), but even so, it is obvious that, to Camus, it serves as a palliative in a world still reeling from the Stalinist purges and the horrors of the Holocaust.

Outside Russian revolutionary circles, *nihilism* has been a term whose alleged exponents rarely embrace it, particularly because it is seldom used favorably. Some scholars have attempted to classify it into several subtypes. Donald A. Crosby, in *The Specter of the Absurd*, sees five types of nihilism: political (essentially the Russian revolutionary sort), moral (in which all moral judgments are rejected as individual or arbitrary), epistemological (in which all truth claims are seen as

purely relative), cosmic (in which the cosmos is seen as meaningless), and existential (in which human existence is seen as pointless). Karen L. Carr, in *The Banalization of Nihilism*, proposes a similar taxonomy. In her view, there are five types of nihilism: epistemological ("the denial of the possibility of knowledge"), alethiological ("the denial of the reality of truth"), metaphysical ("the denial of an independently existing world"), ethical ("the denial of the reality of moral or ethical values"), and existential or axiological ("the feeling of emptiness and pointlessness that follows from the judgment, 'Life has no meaning'").

With categories as broad as these, nihilism can be applied to a host of phenomena associated generally with a loss of values or centeredness. One might even say that nihilism as a label became so popular in the second half of the twentieth century that it was often left unspoken. A famous issue of *Time* magazine in 1966 posed the question "Is God Dead?" in stark red letters against a black background on its cover. In the article, whose immediate inspiration was the rise of the "death-of-God theology" practiced by a particular group of American theologians, John T. Elson reflected on his age as "a time of no religion," cited Søren Kierkegaard (1813–1855) and Nietzsche as prophets of modern godlessness, and offered this comment on modern art: "From the scrofulous hobos of Samuel Beckett to Antonioni's tired-blooded aristocrats, the anti-heroes of modern art endlessly suggest that waiting for God is futile, since life is without meaning."

Many, however, have not hesitated to name the illness. In 1987, for example, Allan Bloom (1930–1992) published his assault on American higher education, *The Closing of the American Mind*. He titled Part 2 of that book "Nihilism, American Style," taking aim at a pathological condition he saw in America both inside and outside the academy: "value relativism." The ultimate culprit is none other than Nietzsche. As Bloom saw it, Nietzsche's target was not only God but modern democracy. Displaying Nietzsche's own fondness for unsubstantiated, sweeping claims, Bloom declares, "Nobody really believes in anything

Although nihilism and its accompanying existential despair are hardly anything but a pose for Americans, as the language derived from nihilism has become a part of their educations and insinuated itself into their daily lives, they pursue happiness in ways determined by that language. There is a whole arsenal of terms for talking about nothing—caring, self-fulfillment, expanding consciousness, and so on, almost indefinitely.

SOURCE: Allan Bloom, *The Closing of the American Mind* (1987).

anymore, and everyone spends his life in frenzied work and frenzied play so as not to face the fact, not to look into the abyss.”

The Future of Nihilism

If the word *nihilism* during the twentieth century was frequently used to denote the condition—and the accompanying feeling of despair—that arises when established and fixed moral values are missing, it is not surprising that it gained currency at a time when much of the world was dominated by ideologies that rejected such values or openly embraced destruction. At the turn of the century, a major political source of obsessive fear in Western Europe and the United States was anarchism. For much of the remainder of the century, it was fascism and communism. At the beginning of the twenty-first century, it appeared to be Islamic fundamentalism. Whatever the phrase “Islamic fundamentalism” might be construed to mean, it is safe to say that, if it indeed represents a threat to the West, it is because of values that are perceived as alien, not because of the loss of all values. At this stage, *nihilism* as a term has perhaps become a mere relic.

NOMADISM. While numerous types of migrating peoples can be referred to as *nomads*, this entry focuses on *pastoral nomadism*, defined as human cultures that depend solely or primarily on herds of domesticated animals. People in these cultures as a result are required to relocate their homes to new pastures on a regular basis in order to sustain these herds—what anthropologists call *transhumance*. Such nomads are historically represented in three significant regions, all of which are characterized by sufficient grass for animals but insufficient rain and soil quality for sustained agriculture. These regions are Sudanic and East Africa, where herds consisted primarily of cattle and camels; Arabia, southwest Asia, and the Iranian plateau, with herds of camels, sheep, and goats; and the vast steppe region of Central Eurasia, famous for herds of horses.

Nomadic Society and Culture

The necessity of regular migration shapes almost all aspects of nomadic society and culture. While often seen by outsiders as “wandering,” the seasonal migrations of nomadic herdsmen are generally over fixed routes traveling between established pastures and water resources. These migrations begin in spring, as adequate rainfall or snowmelt (or both) open up additional pasturelands. In Central Eurasia, the general pattern was for nomads to move their herds northward as much as 500 miles as the weather warmed, and then to reverse course and work their way south as temperatures cooled. In other areas, nomads covered shorter distances, often following circular routes, or shifting from lower altitudes to higher pastures in mountainous regions. During these migrations the nomad’s animals were vulnerable to dramatic shifts in climate, including droughts and harsh winter freezes, as well as disease. Since they depended on their herds for survival, any significant loss of animals could spell disaster for the nomads themselves.

Socially and politically, most nomadic peoples have been organized according to kinship structures, which generally include legends of origin tracing all members of a particular group to a common ancestor. However, as more recent scholarship has demonstrated, historically these kinship ties have incorporated an element of flexibility, with individuals and even larger groups changing clans due to conflicts and other crisis events. Still, the dominant pattern has been to maintain tight bonds of family loyalty, tested and reaffirmed during economic crisis or during feuds with outsiders. Thus the famous cliché of both scholars and tribesmen themselves: “Me against my brothers; my brothers and me against our cousins; my brothers, cousins, and me against the world.” It is this aspect of nomadic life that was emphasized by the great Muslim social historian Ibn Khaldun (1332–1406) in his discussion of *‘asabiyya* or “group feeling,” which he saw as key to the Bedouins’ success in warfare against outsiders.

Pastoral societies were frequently resistant to large-scale political organization, at least under a single leader, due to the availability of flight as an option when faced with authoritarian claims to power. In fact, many scholars argue that leadership among nomads was often the creation of sedentary powers who sought someone to deal with in their contacts with nomadic peoples. While the general pattern of disunity limited the political power of nomadic peoples, it also served as an

Afghan nomads near Kabul, 1997. Afghanistan is one of several countries that still maintains a substantial nomadic population in the twenty-first century. During the summer, the Afghan nomads graze their herds in the highlands, but as winter approaches they drive the livestock to the lowlands to ride out the inclement weather. AP/WIDE WORLD PHOTOS

effective political adaptation to outside threats, making it much more difficult to conquer nomadic peoples who, lacking a centralized leadership, simply broke up into ever smaller autonomous units rather than concede defeat.

Among the many distinctive features of nomadic culture, military prowess has no doubt historically attracted the most attention. While many have sought to locate the martial skills of nomads within some cultural essentialism or even genetic predisposition, it is hard to sustain the notion that nomads are more war-like than anyone else. Rather, the military advantages of nomadic populations, as shown, for example, by the horse nomads of Inner Asia, derived primarily from a nomadic lifestyle that was in many ways “paramilitary” in its orientation, including the harshness of life on the move, and constant practice in horsemanship and archery while defending one’s herds. This, combined with greater mobility and speed of movement to, within, and (if necessary) away from the battlefield, gave nomadic peoples an advantage over their sedentary opponents.

Relations with Sedentarists

Much has been made historically of the so-called clash between the “desert” and the “sown,” the “barbarians” versus the “civilized,” exemplified even by the ancient Hebrew story of the first murder, when Cain the farmer killed Abel the herdsman. In fact, one must beware false oppositions and note that the relations between pastoral nomads and sedentary societies have, for the most part, been peaceful, symbiotic, and mutually beneficial. Indeed, as Anatoly Khazanov argues, nomadic cultures can be seen as to some extent dependent on sedentary cultures, at least economically, especially as the former became more specialized. Throughout recorded history nomads have provided sedentary populations with items such as horses, furs, meat, and wool, in exchange for grains, luxuries, and other

manufactured goods. These trade relationships have impacted the course of human history in many ways, not the least of which was the role of nomads in supporting and maintaining the so-called silk roads across Eurasia, which served as the conduit of long-distance interactions between sedentary civilizations for centuries.

Still, it is undeniable that the written historical record is dominated by numerous accounts of hostilities between nomadic and sedentary communities. This is due in part to the fact that these records generally emanate from sedentary writers seeking to portray nomads as “the other,” enemies in every sense to sedentary society. At the same time, hostilities were a significant part of the relationship, often initiated by nomads for various reasons. For example, nomads sometimes struck at sedentary regions in an effort to compel the latter to engage in trade. This was particularly true along the border with China, where officials would seek to dominate their nomadic neighbors by denying them access to Chinese markets. In other instances, climatic changes in nomadic regions could lead to overpopulation or, conversely, to loss of herds, driving nomads to invade sedentary areas to fend off starvation. And finally, it is certainly the case that nomads often attacked sedentary communities to obtain loot, especially when the nomads enjoyed clear military superiority.

State and Empire Building

The most significant and lasting influence of nomadic peoples historically has come as a result of supratribal cooperation that led to the conquest of and rule over sedentary states. The two great examples of this are the Arabs from the seventh century and the Inner Asian Turco-Mongolian tribes from the tenth century. In the famous analysis of Ibn Khaldun, the Arabs were able to put aside their differences and unite due to the influence of the non-tribal principle of Islam. Once accomplished, this unified Arab force successfully spread its power from Spain to the Indus.

For the Turco-Mongolian tribes of Inner Asia, who more readily accepted the notion of hierarchical distinctions in their societies, leadership arose from charismatic tribal chiefs and their families, who were then able to form tribal confederations, sometimes numbering in the millions, and spread their power over vast regions. The quintessential example of this type of leadership was the thirteenth century Mongol chieftain Genghis (Chinggis) Khan (who ruled from 1206–1227), under whose leadership the Mongols and their Turkish confederates established the largest land empire the world has ever seen.

For both nomadic Arabs and Mongols, the irony of their success in conquering sedentary regions is that, once they began to rule, the nomads invariably became sedentary themselves, thus leading to the weakening of the state’s initial military power base. Thus began the frequently discussed cycle of powerful nomadic conquerors, growing weaker in successive generations, until finally overthrown by more nomadic elements of their own people or by newly arrived nomads from outside.

Nomadism as a way of life has survived into the twenty-first century, though in much limited scope, due to the fact that nomads are still able to utilize parts of the earth’s environment

that are of no use to anyone else. Still, with the vastly improved technology of sedentary cultures, nomads are not likely to ever again play the central role in history that they once did.

William A. Wood

NONVIOLENCE. Gandhian nonviolence (*ahimsa*) is an active civic virtue that habitually disposes individuals, social groups, and political authorities to resist violence through nonviolent means and to resolve conflicts using peaceful methods. It recognizes violence as a fact and nonviolence as a norm of social life. Its normative character arises from the assumed natural sociability of human beings. Its focal point is the good of society, which includes the good of the individual as well. It is an active virtue, inasmuch as it imposes a twofold obligation on its adherents to resist violence in all its forms and to seek effective nonviolent means to resolve conflicts. To be nonviolent in the Gandhian sense, it is not enough to refrain from committing acts of violence; it is equally necessary to take positive steps to remove the causes of violence wherever they are found, whether in the political, social, economic, or religious arena.

In the Indian context, the organized practice of this virtue is called *satyagraha*. Coined by Mohandas Karamchand Gandhi (1869–1948), this Gujarati term means “firmness in adhering to truth”—practical truth. The discovery of the truth underlying a conflict situation by the parties to the conflict is a distinguishing feature of *satyagraha*. The parties to a conflict are considered not so much adversaries as partners in search of a common end. There is no question of one party losing and the other party gaining. On the contrary, the goal is for both parties to make some moral advance for having engaged in a conflict.

Nonviolence may be practiced by individuals or by groups. In either case, it requires careful moral training and the use of appropriate techniques. Its practice may take several forms: noncooperation (if the offending party is the state), boycott (if the offending party is a business or corporation), strikes (in labor disputes), or protest marches, and so forth. Joan Bondurant’s *Conquest of Violence* (1965) and Mark Juergensmeyer’s

Gandhi’s Way (2002) give excellent accounts of the techniques that Gandhi used in the organized exercise of this virtue.

Distinctions

Gandhi makes a number of distinctions that clarify the meanings of nonviolence: active nonviolence distinguished from passive nonviolence, nonviolence as creed distinguished from nonviolence as policy, and the nonviolence of the brave distinguished from that of the morally weak.

Active nonviolence is the disposition to use not only existing nonviolent means in settling disputes, but also to invent new means if the existing ones prove to be ineffective. Its active character makes it a creative and dynamic force in the culture of a given society. Passive nonviolence, by contrast, is a private, monastic virtue whose goal is the spiritual perfection of the individual. In and of itself, it is indifferent to, if not blind to, the violence that exists in society.

Nonviolence as creed prohibits, always and everywhere, the use of violent means to resist violence. Nonviolence of the brave raises the practice of this virtue to a heroic level, making personal suffering, even death, an acceptable consequence of practicing it. Gandhi saw these two forms of nonviolence as options open only to exceptional individuals; he did not make them mandatory for those who practice nonviolence as a civic virtue.

Nonviolence as policy is preeminently a civic virtue. It too is based on a strong moral conviction against the use of violence to resolve conflicts. At the same time, it permits the lawful use of violence in certain circumstances, as, for instance, in the maintenance of public order or public welfare. Also, wars of legitimate self-defense, conducted under strict rules of natural justice and international law, do not violate the norms of nonviolence as policy. Its object is not the total elimination of violence from society—which is taken as being existentially impossible—but the gradual reduction of its frequency and intensity. It stands for a realist, not pacifist, vision of society and polity. However, its practitioners too are obliged to seek, wherever possible, nonviolent ways of resolving conflicts. Finally, the nonviolence of the morally weak is hardly a virtue, since it is practiced for reasons of expediency, not moral conviction.

The Historical Context

The origin and development of Gandhian nonviolence were owed to four forms of violence that Gandhi had to face throughout his career. They were, first, colonialism as practiced in South Africa and India at the turn of the twentieth century; second, the rise of Indian nationalism aligned to terrorism; third, the violent treatment of the untouchables by upper-class Indians; and fourth, the rise of religious extremism in India.

Gandhi viewed colonialism as a product of modern Western civilization (the other product being Marxism). By definition, colonialism legitimized aggressive wars of conquest and condoned the treatment of the colonized as “lesser breeds” without rights. Its twin maxims, he claimed, were “might is right” and the “survival of the fittest.” The immediate context

of the birth of satyagraha (1906) was Gandhi's confrontation with what was perhaps the most violent form of colonialism—that practiced in South Africa.

Although in its early years Indian nationalism adhered to liberal values, by the turn of the twentieth century an extremist faction was turning to terrorist violence as a means of ending colonialism. Terrorist secret societies, such as the Abhinav Bharat (1904) and the Anusilan Samiti (1905), had gained ground in several regions of India. Gandhi was keenly aware of the dangers that political terrorism posed for Indian society.

Although racism was part of the colonial ideology, Gandhi was appalled more by the quasi-racist treatment of India's so-called untouchables by the Indians themselves than he was by the racism of the whites against nonwhites. The eradication of this form of violence from India was one of the major objects of his nonviolent campaigns. The Vykom Satyagraha (1924–1925) was directed specifically against untouchability.

What troubled Gandhi most, however, was the rise of religious extremism in India in the first quarter of the twentieth century. Vinayak Damodar Savarkar's (1883–1966) *Hindutva*, the basic text of Hindu extremism, was published in 1923, and Abul Ala Mawdudi's (1903–1979) *Jihad*, a basic text of modern Muslim fundamentalism, was published in 1927. Both rejected Gandhi's nonviolent vision of society and polity. Gandhi's position was that religious fundamentalism was corrupting both Hinduism and Indian Islam. His philosophy of nonviolence appealed to both moderate Hindus and moderate Muslims, but failed to prevent the partition of India along religious lines.

The Intellectual Context

The ideas that shaped Gandhian nonviolence were drawn both from Western and Indian sources. The trial of Socrates as described in Plato's *Apology* had a profound impact on Gandhi. In 1908 he published a paraphrase of this work in English and Gujarati under the title *The Story of a Soldier of Truth*. Socrates was a model for all those who would resist nonviolently the violence of the state. The ethics of the Sermon on the Mount, as interpreted in Leo Tolstoy's *The Kingdom of God Is within You* (1893), had a lifelong influence on him. Another of Tolstoy's writings, *Letter to a Hindu* (1908), made Gandhi rethink the role of violence in Indian society. Tolstoy had argued that the British were able to hold India by violence because Indians themselves believed in violence as the basis of society. That is why they submitted themselves to their rajas and maharajas, and treated the untouchables with extreme cruelty. Under these circumstances, the complaints of Indians against colonial violence seemed to him to resemble the complaints of alcoholics against wine merchants. The removal of colonial violence would not solve India's problems with violence. They would be solved only if Indians made nonviolence the basis of a new India. Gandhi was so persuaded by the *Letter* that he translated and published it in both English and Gujarati.

Gandhi's study of Western jurisprudence made him a lifelong defender of the idea of the rule of law and the legitimacy of the limited, constitutional state. The fight against violence

needed such a state as its ally. Here Gandhi departed from Tolstoy's radical pacifism that rejected the state as such.

John Ruskin's *Unto This Last* (1860) opened Gandhi's eyes to the hidden structures of violence in industrial capitalism. This work, too, Gandhi paraphrased and published in English and Gujarati (1908) under the title *Sarvodaya* (The welfare of all), a title that he later gave to his own economic philosophy.

Finally, there was the question of nationalism and how to free it from ethnic or religious or terrorist violence. Here he found help in the liberal nationalism of Giuseppe Mazzini, whose *An Essay on the Duties of Man*, published in 1892, became one of the recommended readings for all those who wanted to understand Gandhi's own fundamental work, *Hind Swaraj* (1909).

However, it was Indian philosophical thought that helped Gandhi to integrate the ideas he had absorbed from the West. Here three philosophical traditions were significant. The first was the pacifist tradition of Jainism, as interpreted by Rajchand—businessman, poet and mystic, and a personal friend. His advice was that a nonviolent way of life was possible only if one withdrew from politics and concentrated all one's energies on achieving inner harmony. Gandhi accepted the point about inner harmony but rejected the idea of withdrawing from politics. On the contrary, he sought to link the quest for inner harmony with that for outer harmony in society and polity.

The philosophy of yoga as expounded in the classic text, the *Yogasutra* of Patanjali, had also impressed Gandhi greatly. Like Jainism, it too believed in the incompatibility between maintaining inner harmony and engaging in active politics. However, it had recommended five moral virtues as being necessary for inner harmony. Nonviolence was one of them; the other four were truthfulness, abstention from theft, celibacy, and moderation in the use of material possessions. Gandhi gladly incorporated nonviolence into his ethical system—with one modification. He modified it from being a moral virtue into a civic virtue, thereby making it appropriate for political action.

But the philosophy that influenced him most was that of the *Bhagavad Gita*. He interpreted it as teaching the negative lesson of the futility of war. On the positive side, he interpreted it as teaching that the good life called for the disinterested service of one's fellow human beings, sustained by a deep love of God. Obstacles to the good life came from violence and the undisciplined state of the passions, notably anger, hatred, greed, and lust. Self-discipline therefore was the psychological key to nonviolence.

The philosophical anthropology underlying Gandhi's theory of nonviolence is adapted from that underlying the *Bhagavad Gita*. Humans are composites of body and soul (atman). As such, body force and soul force were both seen as active in human affairs—the first as a fact and the second as a norm. The body was the source of violence and the passions; the soul was the source of sociability and of the knowledge of good and evil. It was because the spiritual soul was a constitutive element of human beings that nonviolence remained the

norm of their behavior. A materialistic view of human life, in Gandhi's view, could not justify, much less sustain, a nonviolent way of life.

The philosophical anthropology of the *Bhagavad Gita* also gave Gandhi's nonviolence its ethical realism. Because humans are composite beings, perfect nonviolence was possible only in the atman's disembodied state, not in its embodied state. In its embodied state, the will to live always brought with it the will to use force in legitimate self-defense. In the embodied state, one must always abstain from culpable violence—that is, offensive violence used for illegitimate gains. Defensive violence used in legitimate self-defense is not judged culpable.

Fields of Nonviolence

Although nonviolence is a universal norm, Gandhi was insightful enough to recognize that its application depended on the nature of the society (or "field," to use his terminology) in which it was to be applied. He distinguished four such fields—the family, the state, the religious community, and the community of sovereign states.

The family, or family-like communities such as the ashram, were best suited to learn the basics of nonviolence. How to treat one another with love and forbearance and how to settle disputes amicably were first learned in the family.

Historically, nonviolence had notable success in liberal states, or colonial states functioning under the supervision of a metropolitan liberal state. Also, it operated well within religions that displayed a capacity for internal self-criticism. That was why it was able to rid Hinduism of untouchability. However, it was less successful in preventing the revival of jihad in South Asia.

In the international field, Gandhian nonviolence operated *suo modo*. Gandhi's philosophy permitted sovereign states the right to use military force in legitimate self-defense. However, a commitment to nonviolence also required them to strive for progressive disarmament and to increase the effectiveness of international organizations. Never a radical pacifist, Gandhi urged sovereign states to experiment with nonmilitary ways of securing national defense such as using "armies without lethal weapons." He did not envision a warless world, but at the same time he held out the possibility of wars becoming less frequent and less destructive.

The "Vast Majority" Principle

Gandhi's thoughts on the future of nonviolence led him to realize that unless the "vast majority" of the people in a state were nonviolent, that state could not be governed nonviolently. The vast majority principle distributed the responsibility for nonviolence equally on the shoulders of the leaders and ordinary citizens; political leaders could promote nonviolence only to the extent that their own people became nonviolent. And their own people could become nonviolent if they—the people—could dismantle, through non-governmental organizations, existing structures of internal violence.

The sociological insight contained in the vast majority principle led Gandhi to write his last major thesis on nonviolence, *Constructive Programme* (1941). In it he analyzed, among other

things, the structures of violence active in Indian society, and concluded that unless Hindus and Muslims in India learned to live in harmony, unless caste violence was set aside, and unless mass poverty was eliminated, there was no chance of India's becoming a nonviolent country.

A corollary of the vast majority principle is that unless a circle of sovereign states became nonviolent in the manner described above, there was no chance of their relations becoming peaceful. Gandhi's vast majority principle is reminiscent of Immanuel Kant's "republican principle," enunciated in his *Perpetual Peace* (1795).

The Impact of Nonviolence

Gandhian nonviolence has affected global culture in four ways. First, it changed for the better aspects of the political culture of particular countries. In India, for example, it influenced the manner in which colonialism was brought to an end and a new political philosophy introduced. In the United States, it had an impact on the civil rights movement led by Martin Luther King Jr.

Second, it inspired many individuals across the world to adopt active nonviolence as their own public philosophy. Those so inspired include the Dalai Lama, Lech Walesa of Poland, Lanza del Vasto of France, Aung San Suu Kyi of Myanmar (Burma), Anglican Archbishop Desmond Tutu of South Africa, Cesar Chavez of the United States, and Thomas Merton, the American Trappist monk.

Third, it contributed to the emergence of several non-governmental organizations worldwide, among them those devoted to disarmament, economic development from below, the green movement, and the dialogue between religions.

Finally, it gave further impetus for nonviolence to become a subject of serious academic study and research in institutions of higher learning throughout the world, notably in the fields of history, sociology, religious studies, theology, and comparative political philosophy.

NUCLEAR AGE. The nuclear age began in mid-July 1945 when an 18.6-kiloton nuclear bomb was detonated at the Trinity test site near Alamogordo, New Mexico. Three weeks later, on 6 August 1945, the world became aware of the existence of nuclear weapons when a U.S. B-29 bomber known as *Enola Gay* dropped a nuclear bomb on the Japanese city of Hiroshima. That was followed three days later by the dropping of another bomb on Nagasaki. The term *nuclear age* was coined almost immediately after the two bombs were used. Within days of the Nagasaki bombing, the publisher Pocket Books put out a special primer titled *The Atomic Age Opens*, edited by Gerald Wendt. The phrase *atomic age* remained more common than *nuclear age* through the mid-1950s, but *nuclear age* already enjoyed wide use in 1945. By the end of the year, it had even been inserted into the title of the second edition of a physics textbook by Harvey Brace Lemon. The title of the original edition, published in 1934, was *From Galileo to Cosmic Rays*, whereas the second edition, published in early 1946, was retitled *From Galileo to the Nuclear Age*.

Since those early days, the term *nuclear age* has been incorporated into almost every language as a designation for the international security system that has existed since 1945. Implicit in the term is the notion that the advent of nuclear weapons marked a far-reaching change from the system that existed until 1945. Although scholars have differed in their estimations of the extent to which the system has genuinely changed, few would deny that nuclear weapons have been one of the major elements in international politics since the mid-1940s.

Contending Ideas about Nuclear Weapons

The publication of a volume edited by Bernard Brodie, *The Absolute Weapon: Atomic Power and World Order*, in 1946 marked the first systematic attempt by specialists in international relations to think through the political and strategic implications of the nuclear age. Brodie and his colleagues—F. S. Dunn, P. E. Corbett, Arnold Wolfers, and W. T. R. Fox—sought to determine how warfare and international politics would be altered by nuclear weapons. Their findings prefigured many of the themes that came up over the next several decades in scholarly and official analyses of nuclear arms. Brodie argued that nuclear weapons had made total war obsolete and that U.S. military strategy from then on would have to emphasize deterrence: “Thus far the chief purpose of our military establishment has been to win wars. From now on its

chief purpose must be to avert them. It can have almost no other useful purpose” (p. 5). This view, which adumbrated the U.S. shift to a declaratory policy of “massive retaliation” in the 1950s, was broadly accepted by the other contributors. Brodie and his colleagues left no doubt that, in their view, nuclear weapons had fundamentally changed the nature of world politics and military strategy.

The Soviet Union’s acquisition of nuclear weapons in 1949, and the subsequent emergence of a U.S.-Soviet nuclear standoff, seemed to strengthen Brodie’s basic point. Nonetheless, from an early stage, his thesis had many detractors. Some analysts argued that Brodie failed to take account of the importance of limited wars, such as those fought in Korea and Vietnam. In two highly acclaimed books, *The Strategy of Conflict* (1960) and *Arms and Influence* (1966), Thomas Schelling elaborated the theory of what he called “compellence,” that is, the use of nuclear threats (and threats of the massive use of conventional weaponry) to coerce the adversary into taking a particular course of action. Schelling contended that nuclear deterrence did not eliminate the need for U.S. policymakers to deal with contingencies short of nuclear war and to think about how to use nuclear weapons to influence political and strategic outcomes.

Schelling also argued that even in relations between the two superpowers, strategy was not obsolete in the nuclear age. One of the other purposes of his books was to develop a better strategy for great-power competition within the context of deterrence. Schelling argued that deterrence of Soviet aggression in Europe or East Asia was crucially dependent on credibility. Unless the threat of retaliation was credible, Soviet leaders would have little reason to yield during a crisis. To cope with this problem, U.S. leaders, Schelling maintained, would have to demonstrate that they were prepared to act in ways that ordinarily would seem irrational. Schelling stressed that by actively preparing to carry out “threats that leave something to chance” (the title of a chapter in *The Strategy of Conflict*), U.S. policymakers would bolster their own credibility and thereby reduce the chance that they would ever be forced to make good on those threats.

Other analysts went a good deal further than Schelling in contesting Brodie’s views about nuclear weapons. Strategic analysts such as Herman Kahn in the 1960s and Colin Gray in the 1970s and 1980s rejected the whole notion of an “absolute weapon.” Kahn and Gray contended that even large-scale nuclear warfare between the two superpowers was not “unthinkable.” They acknowledged that nuclear weapons might induce greater caution on the part of policymakers, but they stressed that this did not mean that the chance of war was zero. On the contrary, Kahn and Gray argued, there was a possibility that nuclear war would break out, and therefore they believed that U.S. policymakers must be prepared to fight such a war and to win it. Gray summed up this view in an article he coauthored in 1980 with Keith Payne. The article stressed that “the United States must possess the ability to wage nuclear war rationally” and must develop “a plausible theory of how to win a war or at least insure an acceptable end to a war.” Gray and Payne urged the U.S. government to “plan

Mushroom cloud caused by atomic bomb, Bikini Atoll, 1946. In the 1940s, scientists began experimenting with atomic devices—the first nuclear weapons—and the first controlled explosion took place in August, 1945, in Alamogordo, New Mexico. © CORBIS

seriously for the actual conduct of nuclear war” and to develop a strategy “to defeat the Soviet Union and do so at a cost that would not prohibit U.S. recovery.” As they saw it, a combination of robust strategic anti-missile and air defenses, a comprehensive civil defense program, and a large and diverse arsenal of nuclear missiles and bombers would ensure victory.

Not surprisingly, the views expressed by Kahn and Gray proved controversial. Stanley Kubrick satirized the nuclear war-fighting school in his 1964 film *Dr. Strangelove*. (Many viewers guessed that the title character was based on Kahn, but Kubrick never confirmed this.) More seriously, critics argued that theories of victory in a large-scale nuclear war rested on untenable assumptions about nuclear weapons and strategic defense technology. In a widely cited article published in early 1982, Wolfgang Panofsky and Spurgeon Keeny maintained that a “effective protection of the population against large-scale nuclear attack is not possible” and that an exchange involving only a few thousand of the more than fifty thousand nuclear weapons deployed by the United States and the Soviet Union “could destroy most of the urban population and destroy most of the industry of both sides.” Even much smaller nuclear exchanges, they added, would have “very severe consequences.” Nuclear war-winning strategies, in their view, were based on “wishful thinking.”

Mutual Assured Destruction

Much of the intellectual debate about the U.S.-Soviet nuclear relationship was encapsulated in the perennial controversy about what became known as Mutual Assured Destruction (MAD). The concept of MAD was first enunciated in the early 1960s when both the United States and the Soviet Union

began deploying large numbers of intercontinental-range ballistic missiles (ICBMs) armed with nuclear warheads. Defense Secretary Robert McNamara and other U.S. officials at the time argued that, in a situation of MAD, any large-scale use of nuclear weapons by either side would provoke retaliation in kind by the other side, resulting in the effective destruction of both. Under this logic, no rational leader on either side could hope to gain a meaningful advantage by starting a nuclear war, and therefore mutual deterrence would prevail. Many observers construed these statements as an accurate reflection of U.S. nuclear doctrine.

The intellectual debate about MAD often was reflected in concerns raised in public discussions and policy circles. The notion that, as Winston Churchill put it, the “safety” of each side rested on the prospect of “mutual annihilation” was a discomfiting one for many Americans. The vulnerability inherent in MAD was in contrast to the relative invulnerability that the United States had always enjoyed by virtue of its geography. The desire to move beyond MAD and restore a sense of invulnerability lay behind periodic attempts to build defenses against ICBMs and submarine-launched ballistic missiles (SLBMs) and to develop more credible nuclear war-fighting strategies. The Strategic Defense Initiative (SDI) of President Ronald Reagan’s administration, announced in 1983 as a program to develop a comprehensive system of protection against ICBMs and SLBMs, was explicitly justified on the ground that indefinite reliance on MAD was too perilous an option.

Critics of these attempts to move beyond MAD, including Keeny and Panofsky, focused on two basic points. First, they argued that MAD was not a mutable doctrine but was instead a codification of the underlying strategic and technical realities.

In their view, MAD followed from the technical nature of nuclear missiles and the inherent vulnerability of urban populations to nuclear destruction. No plausible doctrinal or technological innovations could alter this reality. Second, they maintained that attempts to move beyond MAD were dangerous because they would create the illusion that MAD was a doctrine and could be changed. This misperception, they contended, would increase the risk of nuclear war. Keeny and Panofsky argued that if policymakers erroneously believed it was possible to fight and win a nuclear war without suffering “unacceptable damage,” they might be more willing to risk the use of nuclear weapons.

Unease about MAD also led in a very different direction. From the start of the nuclear age, a relatively small but vocal group of critics insisted that the only acceptable course of action was to ban all nuclear weapons. This school of thought was especially prevalent among scientists and intellectuals associated with the *Bulletin of the Atomic Scientists*, a specialized monthly publication that became famous for its doomsday clock on the cover. In later decades, many intellectuals supporting complete nuclear disarmament became active in ban-the-bomb campaigns and the nuclear freeze movement. Jonathan Schell’s best-selling *The Fate of the Earth* (1982), published at the height of the nuclear freeze movement in the early 1980s, laid out the case for the elimination of nuclear weapons. The book came under harsh criticism from many specialists on nuclear strategy and arms control, but it struck a chord with the U.S. “peace” movement and with a considerable number of ordinary Americans who were concerned about the sharp increase in U.S.-Soviet tensions in the early 1980s. Not until the Cold War drew to an end in the late 1980s and early 1990s—and Washington and Moscow agreed to much sharper reductions in their strategic nuclear arsenals—did the antinuclear weapons movement wane in influence.

Nuclear Thinking in the Post-Cold War World

After the Soviet Union disintegrated at the end of 1991, the formerly antagonistic relationship between Moscow and Washington ceased to exist. The U.S.-Soviet nuclear standoff, which had dominated strategic thinking in the nuclear age, was no longer relevant. Instead, thinking about the nuclear age shifted mainly to issues of nuclear proliferation and efforts to prevent (or dissuade) non-nuclear weapons states from acquiring nuclear arms. Although the United States and post-Soviet Russia continued to possess large numbers of nuclear-armed ICBMs that were maintained at full alert, fears of a large-scale nuclear war all but disappeared. Instead, strategic analysts worried about the possibility of nuclear terrorism and nuclear weapons programs under way in so-called rogue states like North Korea, Libya, Iran, and Iraq under Saddam Hussein.

Some analysts, such as Kenneth Waltz and Shai Feldman, had long argued that nuclear proliferation should be welcomed rather than discouraged. Waltz maintained that nuclear weapons would enable relatively weak states to deter stronger and more aggressive neighbors from attacking them, in much the same way that the United States and the Soviet Union had relied on mutual deterrence to ensure peace between them.

The “optimists” about nuclear proliferation (a label that was later attached to Waltz and others who shared his views) were never particularly numerous, however. In the post-Cold War world, the “pessimists” like Scott Sagan were far more common. In an illuminating exchange with Waltz, Sagan pointed to a number of dangers regarding potential accidents and unauthorized uses of nuclear weapons that would make nuclear war more likely, not less likely, in a proliferated world. Sagan and others also contended that nuclear proliferation would increase the risk that weapons might be diverted to terrorists.

Analysts who wanted to prevent nuclear proliferation differed in their views of how to achieve that goal. Some argued that unless the security concerns of proliferating states were allayed (or at least greatly mitigated), those states would be unlikely to forswear nuclear weapons. They cited the case of India and Pakistan, both of which openly acquired nuclear weapons in 1998 (though India had tested a nuclear bomb as far back as 1974), as an example of the pressures on states to build nuclear weapons in order to deter hostile neighbors. Analysts who subscribed to this view maintained that the best way to prevent nuclear proliferation was to address the underlying security concerns of potentially vulnerable states through international mediation. Other analysts wanted a more active policy to discourage nuclear proliferation. They advocated a “counterproliferation” strategy that would deal with regional security concerns but would also include a variety of sanctions against states that continued to pursue nuclear weapons programs. These sanctions would range from diplomatic pressure to condemnations by the UN Security Council to economic penalties and ultimately to military action. Scholars who believed that military action might, in the end, be desirable argued that Israel’s successful raid in 1981 against Iraq’s Osiraq nuclear plant underscored the importance of not ruling out the military option. Had Israeli jets not bombed the facility, Iraq most likely would have been able to build a nuclear weapon by the late 1980s, well before its program came under aggressive international scrutiny.

The prospect of nuclear terrorism was the other major issue of concern to specialists on nuclear weapons in the post-Cold War world. Contrary to popular wisdom, the threat of nuclear terrorism was not at all new. Concerns about the possibility that a nuclear bomb would be smuggled into a U.S. port had arisen as far back as the mid-1950s. Analysts such as Schelling, Brian Jenkins, and Paul Leventhal had written books and articles about the risk and implications of nuclear terrorism in the 1970s and 1980s. For the most part, however, the question of nuclear terrorism during the Cold War was generally overshadowed by the U.S.-Soviet nuclear standoff. Only in the post-Cold War world, when the U.S.-Soviet confrontation no longer dominated strategic thinking, did analysts devote much greater attention to the terrorist threat. This focus intensified, for understandable reasons, after the large-scale terrorist attacks on the United States on September 11, 2001.

Although experts on nuclear proliferation generally agreed that few if any terrorist groups had the wherewithal to build a nuclear weapon on their own, they warned that a weapon (or at least crucial components, including fissile material) might be

furtively supplied to a terrorist group by a state like North Korea or by a group of rogue scientists. The nuclear-supply trail involving the nuclear weapons programs of both Pakistan and North Korea that came to light in 2004 reinforced these concerns. Most analysts believed that such channels could be closed through concerted international action, but they held out little hope that the risk could ever be fully eliminated. Thus, even after the Cold War ended, the perils of nuclear weapons continued to dominate thinking about the nuclear age.

NUDE, THE. Although the English word *nude* is derived from the Latin *nudus* meaning "naked," "bare," it connotes, especially in such phrases as "in the nude" or "The Nude," more than a state of undress; rather it indicates a work of art, a cultural convention, and a socioreligious attitude. The term *The Nude* signifies a Western cultural ideology while nudity is a universal human condition.

The British painter Walter Sickert (1860–1942) is credited with the first art critical discussion of "The Nude" as a formal convention of academic art (1910). Formal academic analyses

were initiated with Kenneth Clark's 1953 Mellon Lectures in the Fine Arts on the meaning and motif of "The Nude" in Western art that he subtitled "a study in ideal form." Clark described the distinction between "The Nude" and "the naked" as a cultural attitude predicated on political, religious, and societal perceptions of the body and human sexuality. The classical Greek was nude while the medieval Christian was naked. The former recognized the body as an embodiment of sacred energy and form interdependent with philosophic and cultural attitudes toward the individual person, human dignity, and creativity. The latter was premised upon the recognition of human finitude and the sinful state in which Christians lived, and thereby affected Christian perceptions of the individual person, human dignity, and creativity.

As a state of both physical nakedness and spiritual power, the nude figure is an elemental component of the cultural legacy of human civilization. The vast differences in the spirit and the reception of both the human body and the meaning of nudity from the prehistoric to modern, from East to West, deepens the layers of cultural accumulations. Nude figures are found in gendered formations of both male and female in the guises of divinities, heroes, warriors, or mythological beings. This iconology is bequeathed visually from Egyptian monuments, Khajuraho reliefs, Cypriote statues, Indian and Persian miniatures, and classical sculptures.

"The Nude" as defined by Clark is not a proper iconographic category, although it appears in Western art both in religious iconography and in a variety of artistic topoi ranging from historical, mythological, biblical, allegorical, narrative, and pornographic themes to genre scenes. "The Nude," however, is a Western type relating concepts of the body, philosophy, religions, and aesthetics that begin with the recognition of "The Nude" as an aesthetic object and as "high art" first in classical Greece and then in the Renaissance.

Portrayals of the human figure as incarnation or manifestation of the deity is a fundamental connector through the arts and religious values of East and West. The Western disposition is premised upon the classical Greek tenet that the idealized perfection of the physical denotes the model of divine beauty. The Eastern classification proceeds from the Indian principle that the creation of supernatural beauty is through abstractions of the physical body. Nonetheless, there are regional interpretations on the meaning of nudity throughout Eastern and Western cultures. In India, nudity suggests simultaneously the sensuality of fertility spirits (female nudity) and supreme yogic control (male nudity); whereas the human body is a didactic illustration of moral and ethical teachings in the Far East, especially with the advent of Confucian ethics.

The decision to depict nudity whether for a male or a female figure is as much a decision of aesthetic and artistic appropriateness as it is a moral issue. For example, many world religions identify those believers who celebrate religious rituals and ceremonies "sky clad," that is, naked. Among Tantrics, the state of being "sky clad" signifies the state of being without rank, caste, or socioeconomic class. For Jains, because the Jain path to enlightenment is through extreme asceticism, there

was a conflict between nudity as a state of purity and the impurity of women. Nudity represented the highest ideal of nonattachment; however, the question was whether women could attain enlightenment and salvation. By 80 C.E., Jainism was divided into two factions over the relationship between nudity, salvation, and women. Digambara advocated the necessity of nudity and extreme asceticism as the path to salvation; and that, because female nudity was unacceptable, there was no salvation for women. Shvetambara recognized that ascetic nudity was not the only salvific path, thereby affirming the possibility of female enlightenment.

Other religious traditions, whether premised on mythology, revelation, or scriptures, identified female nudity as a positive value. For example, “the goddess” was identified as dwelling in her flesh, not in her garments. Her sacred power, as with that of mortal women, was released by a state of nudity, whereas the magic power of gods and men required the condition of being fully clothed as self-definition was concretized in uniforms, badges, and decorations of rank. Body types, attitudes toward the body, and the artistic renderings of the human form reflected religious and societal values as much

as the decision to depict an individual as an identifiable person or as simply a male or female type.

There are four principal philosophic perspectives on “The Nude” in Western culture. The classical perspective is established from the Platonic mathematical foundation of all forms in combination with the Neoplatonic conviction that the human was a symbol of the harmonious arrangement of the universe as a reflection of God. Christianity reversed this view in response to the theological attitudes toward human fallibility, finitude, and original sin as pronounced by Augustine of Hippo (354–430) and Jerome (c. 347–?420). Renaissance philosophers retrieved and reframed the classical definition as epitomized by Leonardo da Vinci (1452–1519), who identified “Man as the measure of the Universe” and envisioned “The Nude” in his *Vitruvian Man* (1492; Gallerie dell’ Accademia, Venice). The modern position is predicated on the liberation of “The Nude” from the boundaries of mythology and religion during the Enlightenment, and finds its fullest expression in Gustave Courbet’s *The Origin of the World* (1866; Musée D’Orsay, Paris).

Survey in Western Culture

Western art and culture have premised “The Nude” upon the classical Greek legacy and Christian transformations until the mid-nineteenth century when the philosophy and political revolution of the Enlightenment bore fruit in realism and the secularization of twentieth-century art movements. The Greek “cult of the nude” was imbued with cultural, philosophic, and religious meaning. Beyond the ideal of divine beauty was the Greek philosophy of freedom and dignity of the individual—nudity was synonymous with integrity. Legendary heroes, ideal figures, mythological personalities, and triumphant warriors were characterized as being “in the nude.” As the first flowering of “The Nude,” Greek art praised what it knew in daily life: the handsome beauty of the male form. Public nudity was a normative condition for men who participated in athletic competitions, exercised at the gymnasium, and partook of the public baths. The Greek ideal of a sound mind and a healthy body was attained in the gymnasium, which was simultaneously a center for education and athletics; all the academies of philosophy had their centers in a gymnasium. Clothes were removed in order to exercise and to be able to think without restraints. The Greek root of gymnasium is *gymnos*, “to be naked, nude, or bare.” Nudity was a condition of physical and mental freedom.

With the advent of Christianity, “The Nude” and the idea of nudity were transformed into reminders of human finitude and guilt, and of the sinful state, especially for women. Augustine of Hippo and Jerome, among other early Church fathers, decried the classical glorification of the human body and denounced the connection between “The Nude” and human sexuality, thereby transmogrifying nudity from a condition of innocence, idealism, and integrity into one of guilt, materialism, and vice.

Descriptions and depictions of “The Nude” in Christian iconography were restricted to scriptural narratives. The biblical narratives recount varied episodes in which nudity is

appropriate for the story, as in a bathing sequence, and for either men or women. For example, Adam, Eve, Susannah, David, Bathsheba, Salome, and Jesus of Nazareth are depicted in states of total or partial undress. However in Christian iconography nudity embodied more often than not the condition of shame, especially with regard to women as the “daughters of Eve.” The artistic and literary tradition of Western culture, especially Christianity, may be characterized as influenced by the legacy of Eve, and in particular, established the motif of the *femme fatale*, or fatal woman, from the characterization of women as seducers of men as prefigured in the scriptural stories of Eve, Delilah, Bathsheba, Salome, and eventually, even, the Jewish heroine Judith.

The Renaissance recovery of classical philosophy, art, and literature promoted a revival of interest in “The Nude” beyond the confines of scriptural narratives and Christian morality lessons. However, the Renaissance was distanced by centuries of political, social, and economic meliorations from classical Greece and Rome, and even further distanced from the classical philosophy and culture that were the foundation for the classical nude. Although premised upon classical models, Renaissance nudes differed in constructions of musculature and gender. The female nude, with the familiar exception of the *Venus pudica*, was absent from the mainstream of the classical arts. She became a popular motif in the Renaissance arts even up to Giorgione's (1477–1510) creation of the reclining female nude found in his *Sleeping Venus* (1508–1510;

Gemaldegalerie, Dresden). This Renaissance flowering of interest in “The Nude” extended into northern Europe where Albrecht Dürer (1471–1528) fashioned his famous study of the principles of perspective and anatomy in *Artist Drawing a Reclining Nude* (c. 1527: Metropolitan Museum of Art, New York), which affirmed the dichotomy of female passivity and male activity.

The popularity of “The Nude,” whether male or female, among both Renaissance artists and their patrons garnered the attention of ecclesiastical leaders. This impropriety was dramatically decried by the Dominican monk Girolamo Savonarola (1452–1498), whose preaching influenced significant Renaissance artists including Michelangelo (1475–1564) and Botticelli (1445–1510), and ultimately led to the infamous “Bonfire of the Vanities” in the public square in Florence. However, official Church condemnation of “The Nude” was not pronounced until the Council of Trent (1545), and then, only tangentially. From the Tridentine decree forward, artworks intended for the Church were to be inspected and approved by the bishop of each diocese; appropriate local or regional decrees were promulgated clarifying or expanding upon the phrase “all lasciviousness avoided.”

The modern conception of “The Nude” is premised upon the multiple political, social, and cultural revolutions of the late eighteenth and the mid-nineteenth centuries. It found expression in the arts of the realists, such as Gustave Courbet

(1819–1877), and the Orientalists, beginning with Eugène Delacroix (1798–1863) in *Death of Sardanapalus* (1827; Musée du Louvre, Paris), who present the plausibility and eroticism of “The Nude,” especially of the female nude. Freed from confinement of mythology, history, or narrative, the female nude flourished in the arts of the Impressionists, who reinterpreted the classical motif of the bathing Venus into secularized female bathers and who were influenced by Japonisme. (For example, Torei Kayonaga’s depictions of restrained geishas were translated into Édouard Manet’s [1832–1883] defiant prostitutes.) Furthermore, in the nineteenth century, the introduction of female students into art academies and ultimately into life drawing classes began a transformation of the “male gaze” into the “female gaze” whether the subject was a female or male model. Commensurately, the central position of the male nude was diminished, so that from the perspective of late twentieth-century art criticism and feminism to speak of “The Nude” is to speak of the female nude.

The female nude extends beyond the boundaries of allegory and metaphor to become an expression of sexual provocativeness, eroticism, sexual appeal, and potentially, voyeurism throughout twentieth-century art beginning with Pablo Picasso’s (1881–1973) famed *Les Femmes d’Alger* (1907; Museum of Modern Art, New York). “The Nude,” which had been a motif of spiritual and moral uplift for the classical world, was transformed not simply into an image of Christian shame and embarrassment but into a modern object of profane physicality.

The relationship of “The Nude” as both an object and a subject of high art to voyeurism and pornography has been raised since the mid-nineteenth century. As Clark so perceptively noted, there is no innocent depiction of a naked body. Each of us sees through a distinctive but personalized lens, so one person’s aesthetic encounter with “The Nude” is another person’s moment of voyeurism. Further, definitions of pornography shift with cultural attitudes as witnessed in the com-

The English language, with its elaborate generosity, distinguishes between the naked and the nude. To be naked is to be deprived of our clothes, and the word implies some of the embarrassment most of us feel in that condition. The word ‘nude,’ on the other hand, carries, in educated usage, no uncomfortable overtone. The vague image it projects into the mind is not of a huddled and defenseless body, but of a balanced, prosperous, and confident body: the body re-formed.

mentaries by the American writer Mark Twain or Supreme Court rulings.

Eastern and Western Attitudes toward “Nudity”

Eastern and Western attitudes toward nudity can best be compared through discussions of both the male and the female nude. The former signify the ideal of moral perfection and the latter the vitality of the life principle.

The Greek image of Apollo is that of a standing, aloof, proud, and nude male figure. He is the ultimate ideal athlete. He was anthropomorphized into the *kouros* who is distinguished by his rigid frontal pose accented by arms pressed closely down his sides. This stasis is relieved by the placement of one foot, thereby also the leg, forward from the other to signify human dynamism. The visual combination of ideal male beauty through an identifiable muscular structure and movement provides the viewer with the sensation of a vital man. The Greek ideal of the athlete is the conjunction of physicality and spirituality through the vehicle of “The Nude.”

The Jain image of the ascetic, or *tirthankara*, is that of a superhuman and heroic figure whose broad shoulders and narrowed waist were similar to that of Apollo or the *kouros*. This figuration of a frontal pose with firmly indented arms is balanced by his straight legs. The portrayal of suspended animation fulfills the requirements of the spiritual tenet of *kayotsarga*, or the dismissal of the body, as this yogic trance permits complete withdrawal from all earthly distractions. The Jain image of nudity is a signifier of asceticism and of the spiritual ideal. The identifiable, and thereby natural, muscular structure and intimated movement of the *kouros* promoted divine-human association, while the suppression, thereby abstractions, of muscular structure and motion of the *tirthankara* emphasized his symbolic value.

In both East and West, the female nude is predicated on a cult image that is provocative and sensuous in appeal. The Greek goddess, Aphrodite, was simultaneously the personification of love and beauty and the achievement of the idealized female body. The captivating undulations of the feminine form combined with softness and delicacy of skin and muscle denoted the sensuality necessary for procreation. Greek representations of the topography of the female nude vacillated between depictions of innocence, as in the motif of *The Birth of Aphrodite* (470–460 B.C.E.; Museo Nazionale Romano delle Terme, Rome), and of flirtation, as in the topos of the *Venus pudica* found in the *Medici Venus* (first century B.C.E.; Galleria degli Uffizi, Florence). The body proportions, like those of the Apollo and the *kouros*, were based upon mathematical formulations.

The Indian *yakshi*, the oldest indigenous nature goddess or fertility spirit, signifies fecundity through the abstractions of her nude body. Her spherical breasts, like her ample hips and conspicuous pudenda, are enlarged in mathematical relation to the female frame and head to emphasize feminine sensuality and maternal potential. *Yakshi* are situated in exaggerated

And they were both naked: to wit, Adam and his wife: and were not ashamed.
(Genesis 2:25)

And the woman saw that the tree was good to eat, and fair to the eyes,
and delightful to behold: and she took of the fruit thereof, and did eat, and
gave it to her husband, who did eat.

And the eyes of them both were opened: and when they perceived them-
selves to be naked, they sewed together fig leaves, and made themselves aprons.

And when they heard the voice of the Lord God walking in paradise at
the afternoon air, Adam and his wife hid themselves from the face of the
Lord God, amidst the trees of paradise.

And the Lord God called Adam, and said to him: Where art thou?

And he said: I heard thy voice in paradise; and I was afraid, because I was
naked, and I hid myself.

And he said to him: And who hath told thee that thou wast naked, but
that thou hast eaten of the tree whereof I commanded thee that thou shouldst
not eat? (Genesis 3:6-11)

postures and positions to denote the erotic abstractions of the female body. The naturalistic harmony of the human standards of feminine beauty found in Aphrodite made both the divine and the human female approachable and tangible, whereas the symbolic abstractions of the nude *yakshi* tempered physicality with yogic restraint.

The Conundrum of Non-Western Culture and the Idea of “The Nude”

Discussions and scholarship on “The Nude” are decidedly Western in form and focus. Ostensibly, this is not a result of Western imperialism but more likely than not the influence of the Western monotheistic traditions with their distinctive morality and defense of the integrity of the one God. For example, Islamic art is normatively interpreted as aniconic, or nonfigural, in its emphasis on geometric abstractions. Although there is no Koranic prohibition against figural art or art, there is clear prohibition of images of either of idols or of God. For some commentators, the absence of the figure, especially the nude figure, is interpreted as a visual sign distinguishing Islam and Islamic art from Christianity and Christian art, which is fundamentally obsessed with Eve’s nakedness and her role in the Fall. By contrast, Eve when she is depicted in Islamic art is the joyous companion of Adam. Commensurately, when those exceptionally rare nude figures

are painted, whether male or female, they appear only in commissioned works of what might be best termed “secular Islamic art.”

However in the non-Western world, attitudes toward nudity and the nude figure are characterized by their naturalness and ease and not categorized as a special art category or motif, except when the arts of Africa, Oceania, or Meso-America are examined with Western criteria. The first reality of nudity as a state of undress, whether ritually required or common to daily life experience, is a universal condition. The second reality of nudity is that neither the art nor religion of these indigenous cultures is monolithic as Western art and monotheism is perceived to be. Rather, for example, African figural art is naturalistic among the Ife and Benin of Nigeria but other African peoples image themselves with simplified and/or exaggerated anatomical features. A third reality of nudity is that differing climates and their resident cultures require a variety of dress in both fabric and style to accommodate native meteorological conditions. So thinner materials and lighter colors are more appropriate to warmer climates while heavier fabrics and darker colors conform to the needs of cooler climates. From the Western perspective, especially that of the nineteenth-century missionaries, the exposed breasts and bare feet of Polynesian or African women were consid-

ered a social affront. Simultaneously for some nineteenth-century European colonialists, the shock of this tribal or societal nudity was the foundation for the myth of “The Noble Savage” as the concept of the *le primitif* was for their twentieth-century counterparts. This Western myth of idyllic innocence and primal energy coincided with a belief that primitive peoples were free of moral constraints and middle-class concerns. However defined, the arts of these varied primitive cultures were highly influential on twentieth-century art from Picasso and Henri Matisse (1869–1954) to the Abstract Expressionists.

Scholarship of “The Nude”

Kenneth Clark, who distinguished between naked and nude with relation to cultural, philosophic, and religious attitudes in the classic and Western Christian worlds, initiated the formal study of “The Nude.” His masterful analysis of the postures, gestures, poses, and body formations of the undressed human figure defined the parameters of analyses on this topic. Whether consciously or not, all following studies on “The Nude,” whether differentiating between the male and the female nude, or looking at both gendered figurations, are dependent upon Clark’s fundamental definition either as a point of departure or argument. John Berger’s investigation of the relationship between the spectator and “The Nude,” particularly the female nude, and that between fine art and modern advertising, was a significant development in the study of “The Nude.”

Since the late 1960s, the establishment of the new scholarship of “the marginalized,” with its origins in the questions of race, gender, class, or ethnicity (Melody Davis, Julia Kristeva, Edward Lucie-Smith, Lynda Nead) has expanded the boundaries of examination. Feminist scholarship, for example,

The painting described is the motif of the reclining Venus:

You enter [the Uffizi] and proceed to that most-visited little gallery that exists in the world—the Tribune—and there, against the wall, without obstructing rag or leaf, you may look your fill upon the foulest, the vilest, the obscenest picture the world possesses—Titian’s Venus. . . . There are pictures of nude women which suggest no impure thought—I am well aware of that. I am not railing at such. What I am trying to emphasize is the fact that Titian’s Venus is very far from being one of that sort. (Mark Twain, *A Tramp Abroad* [1880], 578.)

disproved the cultural concept of a “hermeneutics of aesthetic innocence” and thereby of “The Nude” as neutral. Feminists then proceeded to examine the political and societal minefield of domination and submission when “The Nude” was created by a male artist for a male patron. Further, the critique of *le regard* as the (male) gaze was crucial for feminist and gender scholars who advocated the existence of a female gaze in which women artists painted either male or female nudes to be admired and to stimulate the female viewer. The presumption here is that men and women see, and experience art regardless of the subject matter, the same way; however, the primary question of whether seeing is engendered remains a lacuna. Early-twenty-first-century categories of scholarly conversation, including the issues of the body, the reclining (female) nude, body language, and gesture (Kristeva, Peter Brown, Camille Paglia, Marcia Pointon, Alison Smith), are reframing the central questions of “*who* is ‘The Nude?’” and “*what* is the character of nudity?”

We can now begin to see the difference between nakedness and nudity in the European tradition. In his book on *The Nude* Kenneth Clark maintains that to be naked is simply to be without clothes, whereas the nude is a form of art. According to him, a nude is not the starting point of a painting, but a way of seeing which the painting achieves.

To be naked is to be oneself.

To be nude is to be seen naked by others and yet not recognized for oneself. A naked body has to be seen as an object in order to become a nude. (The sight of it as an object stimulates the use of it as an object.) Nakedness reveals itself. Nudity is placed on display.

To be naked is to be without disguise.

O

OBJECTIVITY. Objectivity is the idea that the truth can be known independently of viewpoint, perspective, or bias. For example, “Gustav Mahler completed nine symphonies,” is an objectively true statement, independent of the person who utters it. “Gustav Mahler was the greatest composer in history” is not an objective truth—some people would agree, others would disagree, depending on their subjective aesthetic values. Objectivity has often been presented as diametrically opposed to subjectivity, the idea that people’s beliefs and value judgments reflect their individual situation and interests; historicism, the consideration of people’s opinions as reflections of the historical era in which they live; and relativism, which considers all points of view to be equally correct and inevitable.

History of the Term

The terms *subjective* and *objective* were introduced in European medieval philosophy. Their meanings then were nearly the reverse of their current use: *subject* meant that which exists, whereas *object* referred to what is perceived in consciousness. These uses of the terms persisted at least until George Berkeley in the eighteenth century. Lorraine Daston suggests that the current use of the terms was introduced in 1856 by Thomas De Quincey, although the concept of objectivity as knowledge based on fact had already been made in the seventeenth century. Previously, the Aristotelean tradition considered factual knowledge, historical knowledge of specific events, or knowledge of anomalies and novelties inferior to knowledge of “essences” and generalities. Daston attributes to Francis Bacon the novel promotion of facts to a level worthy of natural philosophy. These facts are the precursors of objective knowledge.

Immanuel Kant in his *Critique of Pure Reason* (1781, 1787) is probably responsible more than any other single thinker for spurring a debate about objectivity by “splitting” the world into “things for us” and “the thing in itself” (*Ding an Sich*). Kant analyzed human cognition and concluded that for anything to appear in our consciousness, it must fit into certain innate internal categories such as temporality and causation. It is impossible for us to perceive any phenomenon but within the matrix of these categories. For example, all phenomena must appear in time and be caused by other phenomena. Kant concluded that it is impossible to have knowledge of the world as it is, independent of human observers, beyond our categories, or to use later terminology, objectively.

Much of subsequent philosophy attempted to rise to the Kantian challenge. Phenomenology has attempted to reunite the world by eliminating the distinction between subject and object. Georg Wilhelm Friedrich Hegel (1770–1831) sought

to unite them as aspects of an ideal world spirit that we can know by an act of self-consciousness, because we are parts of this world rather than distinct from it. Edmund Husserl (1859–1938) designed his phenomenology to study pure consciousness through the method of *epoche*, the suspension of belief in subject-object distinction. Husserl claimed that prior to cognitive processes, such as scientific abstraction, that distinguish the objective from the subjective, we live in an immediate asubjective “life-world.” Husserl and his immediate and remote intellectual progeny (Hannah Arendt, Jürgen Habermas) attempted to recapture this lost preobjective life-world. However, their analysis resulted in a new chasm between what they considered to be universal immediate human consciousness and the objective scientific world view.

Conversely, the nineteenth-century school of positivism (Auguste Comte, John Stuart Mill) and the twentieth-century school of logical-empiricism (Ernst Mach, the early Ludwig Wittgenstein, Rudolph Carnap) claimed that the scientific method offers objective knowledge of the world, and therefore philosophy should explicate this method, and other disciplines would do well to use this philosophic blueprint to reform themselves. The logical empiricists shared an analysis of language as composed of distinct units that correspond with distinct chunks of reality. The objective meaning of words or propositions is then their empirical truth condition, a state of affairs in the world. For example “the cat is on the mat” is objectively true if and only if indeed the cat is on the mat.

The objectivity of our beliefs has been criticized by traditions that descend from Karl Marx (1818–1883) and Friedrich Nietzsche (1844–1900). Marx thought that the material conditions of production are the objective aspect of society. Systems of belief merely reflect economic interests. Nietzsche tended to reduce beliefs to power relations. Karl Mannheim (1893–1947), the founder of sociology of knowledge, and Max Horkheimer (1895–1973), one of the founders of the Frankfurt School, concentrated on economic or political influences over apprehensions of reality. Horkheimer argued that it is impossible to produce a metatheory to transcend the limits of a temporal worldview. Later, Michel Foucault (1926–1984) and Bruno Latour showed the dependence of research on social power relations, on what Foucault called discourses.

Contemporary Debates

Since the 1960s the debate about the objectivity of knowledge in English-speaking countries concentrated on explaining the history of science. Thomas Kuhn (1922–1996) and others demonstrated that there are no simple objective scientific facts

because scientific concepts are always embedded in conceptual frameworks, and so are confirmed holistically. After Kuhn, those who believe that science offers objective knowledge attempt to explain scientific change by referring to internal scientific reasons, the interaction between theory and reality. Those who claim that science is at least in some cases not objective, including sociologists of knowledge of “the strong program” (which is based on a critique of traditional philosophy of science), feminists (such as Helen Longino, Miriam Solomon, and Kathleen Okruhlik), and postcolonial thinkers explain scientific change by external social factors. They may be divided into moderates who argue that in many cases science did not adhere to its objective criteria, and radicals who claim that the very ideas of objectivity and rationality reflect the biases of male, heterosexual, and white European scientists.

These debates led contemporary philosophers like Nicholas Rescher to attempt to understand objectivity without referring to the world or truth conditions, to reduce objectivity to universal impersonal reason that should lead to the same cognitive output given the same informational or evidential input. Objectivity then is a general human point of view, avoiding the idiosyncratic.

One of the most influential twentieth-century discussions of objectivity was introduced by Thomas Nagel. He considered objective–subjective propositions to have different degrees of reliance on an individual’s makeup and position in the world. Since there is no “view from nowhere,” a point of view is inevitable. The subjectivity of consciousness is irreducible to its physical properties (the brain). In ethics, moral subjectivism considers moral principles personal; moral objectivism argues that moral judgments are defensible rationally and moral values exist objectively. Nagel considered the good to be subjective and irreducible, since we cannot act impersonally. According to Nagel the problem facing contemporary philosophy is the integration of our subjective-personal and objective-impersonal views of ourselves in the same worldview.

OBLIGATION. Since Plato wrote of political obligation in his dialogue *Crito*, obligation in general has been of ongoing interest to philosophers. In that dialogue, Socrates argues that he was under an obligation to obey the laws of Athens and comply with a sentence of death. During the course of

the argument, he raises and offers solutions to many of the central issues about obligation that philosophers still puzzle over. For instance, how can obligations have the grip on us that they do—in some cases, so that we are willing to die rather than not fulfill them? What is the nature and justification of moral and legal obligations? Do we have an obligation to obey the state, and if so, why?

The range of issues and positions relating to obligation is vast, given that there are few areas of moral and political philosophy in which obligation does not play a role. In what follows, four topics that have been of particular interest to contemporary philosophers are discussed: (1) the analysis and justification of obligations; (2) legal and moral obligations; (3) obligations, roles, and identities; and (4) agent-relative obligations.

The Analysis and Justification of Obligations

Obligation is normative, concerned with how things should be (not necessarily with how they are). In particular, it is a deontically normative—concerned with duty, or what is permissible, forbidden, and the like—as opposed to axiologically normative, concerned with what is good, bad, better, or worse. A given deontic normative perspective classifies actions, laws, institutions, or whatever as permissible (acceptable) or impermissible (unacceptable, wrong, forbidden). The classifications are interdefinable. For instance, an option is permissible when it is not impermissible, obligatory when permissible and every alternative option is impermissible.

Obligation is a relation with as many as three places: the person or entity who *has* an obligation (call this the *agent*), what that agent is obligated to do (the *performance*), and the person or entity to whom the agent owes the performance (the *object*). Because the object of an obligation is owed the performance, that person or entity has a *right* to it, and when an obligation has an object, obligations and rights are reciprocal: if someone has a right to your ϕ ing, then you have an obligation to ϕ ; and if you have an obligation to someone to ϕ , then that someone has a right to your ϕ ing. Philosophers differ over whether all or just some obligations have objects, and so whether all or just some obligations come with reciprocal rights. For instance, some hold that a person is morally obligated to help others, but this obligation does not give anyone a right to be helped. Often, obligations that do not generate reciprocal rights for their objects are called *imperfect* obligations, while those that do generate reciprocal rights are called *perfect* obligations.

Some obligations are *agent-relative* (or *agent-centered*) and others are *agent-neutral*. Agent-relative obligations are those whose performance contains within its scope an essential reference back to the agent and to the agent carrying out that performance (McNaughton and Rawling, 1991). Hence, such obligations state that the agent is obligated himself to perform some action. An agent-neutral obligation, by contrast, states only that the agent ought to ensure the performance of the action, whether by himself or someone else. For instance, my obligation to help a stranger is really just the obligation that I make sure the stranger is helped—whether by me or by someone nearby does not matter. By contrast, my obligation to go

to my son's birthday party is an obligation that *I* go to his party. I do not discharge that obligation by sending someone else. Likewise, if I promise that *I* will baby-sit your children, the obligation I have undertaken is that *I* baby-sit, not that a baby-sitter of some sort is provided. To the degree that obligations and rights are reciprocal, this distinction in agent-relative and agent-neutral obligations brings with it a distinction in agent-relative and agent-neutral rights. For instance, you have an agent-relative right that I baby-sit if I have promised as much.

What is obligatory is what one *must* do. A citizen has an obligation to obey the law, and so *must* obey the law; it is obligatory for a Boy Scout to keep himself physically strong, thus he *must* do so; parents are under an obligation and so *must* care for their children. Because of this, deontic classifications have been treated as modal notions—as what it is normatively *necessary*, *possible*, or *impossible* to do. Moreover, these modalities are often characterized much like causation and other kinds of necessity, as relations grounded in the governance of laws. Heat must boil water because there is a natural law governing these events; likewise, a Boy Scout must keep himself physically strong because there is a Scouting law governing his actions. Thus, an action is obligatory when a normative law or rule makes it normatively necessary, permissible when a normative law makes it normatively possible, and so on. The differences between moral, legal, etiquette, and club obligations can thus be made out as differences in the sets of normative rules or laws grounding the modal categorization. For instance, a club obligation is an action made necessary by the rules of the club.

An obligation is thus typically held to be an action that is normatively necessary according to some normative rule or law. A normative law, however, does not necessitate one's action, in the way that the law of gravitation makes a person stay on or near the surface of the earth. The laws of a state, club, or morality necessitate one's action not as nature or logic makes things necessary, because it is logically and naturally possible for a person not to act as these laws direct. What is normatively necessary is both logically and naturally not necessary, even if both logically and naturally possible.

For any deontic realm, there will be obligations *within* or defined by that realm, and there may also be obligations not defined by that realm, but whose performance is *regarding* the obligations within that realm—separate obligations to fulfill the obligations laid down by that deontic realm (Green, 1988). For instance, legal systems define certain legal obligations, such as the obligation not to exceed a certain speed on a given road. These are obligations *within* the law. Yet a club, such as the Boy Scouts, may define certain obligations regarding those obligations created within the law. Hence, one obligation of the Boy Scouts is never to fail in one's legal or moral obligations. This is an obligation within one deontic realm, the Boy Scouts, regarding the obligations within a distinct deontic realm, the law. In general, if there is an obligation regarding a given deontic realm (i.e., an obligation to fulfill the obligations laid down by a club, a state, or etiquette), then there must be some second deontic realm independent of it within

which the obligation regarding that realm exists. One of the most important kinds of obligation regarding a deontic realm is the moral obligation to conform to legal obligations, often termed *political obligation*.

Normative laws can make one's actions necessary in a variety of ways. One way in which they might do this is if the laws are created as means to ends that one has. In order to vote, one must register; in order to get badges in the Boy Scouts, one must keep oneself physically strong; and so on. This can be called *instrumental necessity*. Many have thought that the necessity of any obligation must be instrumental. The laws of a state, for instance, would generate obligations for a given person when and only when those laws necessary are necessary for her security and the avoidance of sanctions for disobedience.

Most philosophers, however, have thought instrumental necessity is neither necessary nor sufficient for deontic necessity. It is not sufficient because a law backed up by sanctions alone seems not to be an obligation but rather extortion. The law must at least be in some sense a legitimate law of that deontic realm. Following the legal philosopher John Austin, a mechanism to establish the legitimacy of a normative law or rule can be called a *pedigree*. Systems of normative rules or laws require a pedigree that establishes the legitimacy of those laws or rules in creating a genuine obligation.

Instrumental necessity is not necessary for deontic necessity either. For instance, according to the rules of chess, it is necessary that the bishop stay on his color; this is a normative necessity arising from a rule of chess. But that rule is not backed up by some clause such as “in order to avoid such and such penalty.” The rules of chess are in this sense “categorically” necessary. What is required for deontic necessity are laws that are nonoptional rules of behavior, and that at a minimum have a pedigree that makes them legitimate rules of the system.

Different deontic realms can have different pedigrees, and philosophers have offered different pedigrees for some deontic realms. For instance, philosophers such as St. Thomas Aquinas tied the legitimacy of a state's laws to divine pedigree. Genuine obligations, both within and to the law, arise only from demands conforming to laws God laid down for our nature when he created us. Hence, genuine legal obligations arise only from laws that comport with this natural law. And the moral obligation to obey the law is grounded in our obligation to obey God. The view that the legitimacy of law arises from acts of will, or “voluntarism,” underwent a transformation as the vision of the universe grounded in God's will receded (for recent accounts of the history of modern thought about obligation, see Darwell, 1995, and Schneewind, 1998). Human acts of will—acts of choice, consent, agreement, promise—came to take the place of God's will as a source of authority. Thomas Hobbes and John Locke, for instance, rejected Thomas's view that each person's good naturally comports with the good of others. Although we are naturally entitled to seek our own good, each person's good is at odds with that of others. This conflict inevitably leads to a devastating loss for all as everyone tries to secure their own good at the cost of others. It is only by leaving this natural state that all can secure their good. Each person's natural authority over

himself is transferred to the sovereign or the community, which then comes to possess an authority to enact and enforce laws obligating them. And our obligation to obey those laws is based on something like a promise we have made.

Some version of the law-based source of obligation and some version of voluntarism as a source of the legitimacy of those laws and the obligation to obey has held a dominant position among philosophers since the modern era began. Nevertheless, many have defended nonvoluntarist positions and/or have rejected the model of obligations as actions made necessary by a law. Some, for instance, hold that obligations are a special kind of reason that make actions necessary. Hence, the obligation to obey the law, for instance, is a reason that necessitates obeying it. Among voluntarism's important detractors was David Hume, who had misgivings both about the law-based analysis of obligation and about voluntarism as the required pedigree. Hume argued that consent "has very seldom had place in any degree, and never almost in its full extent" (II.XII. 20). We are born into or find ourselves with obligations. Obligations that we have because of our consent, such as promises, are few and far between. Hume's own view of obligation was complex and hard to deem entirely consistent. Nevertheless, the gist of his view was that deontic necessity should be explained in subjective terms: When I judge that someone has an obligation to perform some action, I judge that there is a admirable motive impelling her to do it. The motive might be unreflective and natural, as is the love of children. Or it may arise from reflection on the advantages of various institutions, such as property or promising. Such a motive gains legitimacy through my approval of it from an impartial point of view.

John Stuart Mill followed the spirit of this pattern of analysis, but focused on external actions rather than internal motives. His still influential account holds that an action is obligatory just in case failure to perform it justifies internal or external sanctions, "if not by law, by the opinion of his fellow creatures; if not by opinion, by the reproaches of his own conscience" (pp. 48–49). The pedigree granting authority to such internal or external punishments in the case of moral and legal obligations is general happiness. As David Lyons (1977) has argued, however, Mill's analysis in terms of justifiably sanctionable behavior is itself quite separate from his view of what justifies such sanctions, namely, the general happiness. Indeed, anarchists argue for a given analysis of political obligation but then deny that any such thing exists on the grounds that no legitimacy can be given for it (see, e.g., Simmons, 1979; Wolff, 1998).

Most philosophical positions separate the legitimacy or authority of a law laying down obligations (moral or legal) from the reason to comply. Whether a rule or law in some deontic realm is valid is one thing; whether a person has reason to comply with its obligations is quite another. The most famous attempt to unify the legitimacy and reason to comply with moral obligations was that of Immanuel Kant. Kant's insight was to view moral obligations as stemming from laws that each person imposes on himself rather than from laws whose origin is external to the agent. In particular, moral laws are requirements stemming from deep inside—from a person's very capacity to act and choose on the basis of reason itself. If the

source of a law was the moral agent himself, that is, if it were created and enacted by the agent's own rational will, then its authority would come from the agent himself, namely, the authority of his own rational will over his actions. Kant referred to this as the "autonomy" of a rational will. Moral obligations, in his view, stem from the demands of our own reason, and it is in virtue of this source that we have reason to comply.

Legal and Moral Obligations

The two most salient deontic realms are law and morality. But how are legal and moral obligations related?

Positivism is the doctrine that our legal and moral obligations are quite distinct, that what the law *is* is a separate issue from what it ought to be. In the form originally propounded by Jeremy Bentham and Austin, legal obligations are generated by commands of the sovereign, or that entity whom society is in the habit of obeying, who is not in the habit of obeying anyone else, and who has the power to sanction noncompliance. H. L. A. Hart showed that this form of positivism is subject to fatal objections. It can account for neither the continuity of legal authority across sovereigns nor the persistence of legal obligation after a given sovereign is gone. Moreover, he noted that it assumes that normative necessity must be instrumental necessity, which, as discussed above, is a mistake. What is needed are nonoptional *rules*, and sanctions are neither necessary nor sufficient for these (such as in the chess example). Part of the problem, Hart thought, was that Austin used *criminal law*, in which the law is a *barrier* to doing certain things, as his model for the whole of the law. *Civil law* (such as the law of contracts), in which law is a solution for various problems that would otherwise exist, is a much better model.

The law, Hart argued, is "a union of primary and secondary rules" (1994, p. 107). Primary rules direct each how to act ("don't eat shellfish," "no one may sit higher than the king," and so on). These rules impose genuine obligations, but not in the way that Austin thought. For Austin, rules are little more than means by which one can predict when the state will harm you. To see a rule in this way is to take an "external" view of it: conforming to the rules has no part in defining one's membership in the society. The first step in having a legal system is to have a system of rules that most take an internal view of, or see as standards of criticism and justification of one's behavior.

Hart argued that problems will inevitably arise in a system composed only of primary rules. First, in such a system, there will be *uncertainty* about whether a rule exists covering many situations and what to do when rules conflict. Second, the system will be too *rigid* to deal with changing circumstances. How will new rules come into and go out of existence? Third, the system will be *inefficient* in enforcing the rules and determining whether they apply in any case. What is required is a system of *secondary rules*, or rules concerning how to determine, introduce, abolish, change, and apply *primary* rules. Most importantly, what is required are *rules of recognition* that identify those features in virtue of which a rule is a rule of the group, to be supported by social pressures of various sorts. Rules of recognition are the sorts of rules that define lawmaking in U.S. state and federal legislatures. Thus, a rule exists as a rule in some

system if its pedigree can be traced to rules of recognition defining legality for that system. Notice that, in contrast to Austin's view, rules can exist even if nobody ever obeys them. As long as a rule is enacted in the right rule-defining and -creating way, it exists. Hart insisted, however, that the rule of recognition itself need not be backed in any sense by any standard of authority, legal or moral. A rule of recognition exists in the sense of an "external statement of fact," that is, if it is generally not disregarded in defining and creating law.

Positivism's stark separation of legal and moral obligation has been challenged most forcefully by Lon L. Fuller and Ronald Dworkin. Fuller argued that if a given system of directives is immoral in a formal sense, then it will fail to be a legal system because it will fail to be a genuine system of rules. A system of directives is arbitrary if it does not conform to principles such as treating like cases alike, making its directives public, or not introducing directives after the fact. And an arbitrary system is not a system of rules. Moreover, a system possessing precisely these nonarbitrary features is also considered to be formally just. Thus, a system of directives that is not formally just is not a system of rules. If legal systems are systems of rules, then it follows that a formally unjust system of directives is not a legal system at all and does not generate legal obligations.

Dworkin's view challenges Hart's positivism by arguing that the law requires more than merely formally moral features. He argues that the actual practice of judges shows that legal systems contain elements from the moral traditions within which they arise and to which a judge's decisions must appeal to be valid. In cases that are not clearly covered by an existing law, judges in his view actually legislate, reaching outside of the law to make laws on the basis of good social policy. Dworkin argued that this does not match either actual or good judicial practice. Legal systems are composed of more than rules. They include principles invoking moral rights and obligations that judges are bound by in deciding cases. Indeed, what litigants are typically claiming is that some principle protecting a right is on their side. For Dworkin, there is always a determinate answer to the question of who has a right. Thus, there is always a determinate solution to legal conflicts to which litigants have a right and the judge is bound to find and deliver. Dworkin's own account of the pedigree of law therefore requires invoking moral principles and so implies that judges do not have discretion to create legal obligations as required by Hart's account. They must find the answer to which litigant's rights to protect, and not by intuition, but by articulating and defending a view of rights. Thus, for Dworkin, there is no sharp separation of legal and moral obligations.

Obligations, Roles, and Identities

The problem of political obligation is the problem of establishing an obligation within the moral deontic realm regarding the legal deontic realm—a moral obligation to obey the law, for instance. Many offer the voluntarist account, that the moral obligation is based on what is in effect a promise. Others think that moral obligations, and *a fortiori* political obligation, are all tied to promoting the overall good. Still others follow Socrates in thinking we owe an obligation of gratitude to the state for preventing harms and facilitating our good.

Some have argued, however, that the whole issue is illusory because "it is part of the concept, the meaning of 'law,' that those to whom it is applicable are obligated to obey it" (Pitkin, p. 214). "U.S. citizen" means "person obligated to comply with U.S. laws." Obligations are in effect parts of our ordinary concepts defining our positions and roles. The seemingly deep question of whether a U.S. citizen is "really" obligated to follow U.S. laws either betrays a confusion about what "U.S. citizen" means or takes the language "on holiday"—that is, uses terms such as *obligation* and *law* outside of the contexts in which they have a meaning.

In the early twenty-first century, this conceptual argument has few adherents on the grounds that it does not dissolve the problem so much as relocate it (see, e.g., Pateman, 1979; Simmons, 1996). Suppose "citizen" *does* just mean "someone with a genuine obligation to conform to the law." Then we may legitimately ask, is anyone genuinely a citizen in this sense? Clearly, the selfsame problem has returned dressed in new clothing. Many, however, agree with the view that obligations come with one's social roles and positions. So although the connection between role and obligation is not *analytic*, it is still true in a deeper substantive sense that to occupy many roles means having certain obligations. The origins of the position are in Georg Wilhelm Friedrich Hegel, and a version of it was defended in F. H. Bradley's famous essay, "My Station and Its Duties." It can be found most prominently in "communitarian" views of such late twentieth-century figures as John Charvet, Margaret Gilbert, Michael Hardimon, and John Horton.

The basic outline of the idea is as follows: the conception of the bare presocial individual who voluntarily takes on various obligations and agreements is illusory, an abstraction. A person *just is* a collection of social roles, a nexus of connections to other roles in a social fabric, very few of which are voluntarily assumed, and none are in any deep sense voluntary. When you tell someone who you are, you tell them about the collection of positions you occupy in a variety of social structures and institutions—a parent, an American, a teacher, a lawyer, an Oregonian, a writer. Your social identity may include your gender, race, and sexual preference. If each person is made up to a significant degree or other by these roles, then we are deeply identified with them, in the sense that we are attached to these positions as "who we are." Each of these roles comes with a set of obligations: To be a parent is to be someone genuinely obligated to care for her child, to be a teacher is to be someone genuinely obligated to instruct students, and so on. The view is thus not that the meaning of the word *teacher* is "someone obligated to instruct," but that what it is to actually occupy this position is to have such a genuine obligation.

This viewpoint has come to enjoy wide acceptance. It faces serious difficulties, however, not the least of which is an analog of the question facing the conceptual argument. For even if to have a certain obligation just is to occupy a certain role, there seems to be a meaningful question about the normative status of that role and the practices that create it—a question of whether one *ought* to occupy that role, and moreover whether its obligations are genuinely binding. A defender of such obligations has to deny that there is any question of what one is

genuinely obligated to do *beyond* what is laid down by one's social positions. The question "Ought I occupy this role and take on these requirements?" can be understood only from the perspective of some *other* role and its requirements. It asks only which social position or role should win out when there is a conflict. No single distinctive question about what one ought or ought not to do can be asked of social positions and their directives in general, because there is no single distinctive position or role that every person has in common with every other person.

In her 1996 book, *The Sources of Normativity*, Christine M. Korsgaard applied a similar strategy to the problem of moral obligation. In her view, this is a requirement stemming from one's "practical identity"—an identity that is constituted by ongoing commitments to act in various ways in various circumstances. Her insight is that the power and legitimacy of obligations are tied to a sense of one's own identities. As mentioned earlier, most of us think that there are some actions about which we say "I would rather die than do that"—that the necessity of some moral obligations is sufficient to put the acceptance of death on the table as an option. Korsgaard takes this talk seriously. If death is the loss of identity, the necessity of obligation comes from the threat of this loss. There are actions one would rather die than perform, or at least things the doing of which would be as good as dying. But combining the idea that death is a loss of identity with the idea that everyone has a multiplicity of identities tied to various positions and roles yields the idea that we might die *as an F*, where *F* names some role or position we occupy. Thus, to be a parent *requires one* to pursue the care of one's child. To stop this pursuit *just is* to give up that practical identity (insofar as this is a "person who cares for her child"), and hence to *die* as a parent. The necessity of parental obligation is thus tied to the persistence of one's identity as a parent. Where Korsgaard differs from the neo-Hegelian turn discussed above is that she holds that some identities are not merely social roles. In particular, our deepest identity—an identity it is impossible for us rationally to lose or throw off—is our identity as a reflective rational agent. This identity, she argues, is constituted by a requirement to respect this reflective agency in oneself and others. Failures of respect are in this way moral deaths, ways of giving up one's identity as a rational agent. This, she contends, explains the special grip or authority of moral obligation.

Agent-Relative Obligations

Much debate in late twentieth-century moral philosophy has been over how deep the distinction between agent-relative and agent-neutral obligations goes and whether the existence of agent-relative obligations is compatible with utilitarian moral theories. Recall that agent-relative obligations seem to have a special attachment to the person whom they bind. This is particularly the case regarding moral obligations: I see children who need caring for and can with no cost to myself care for one but not all. I have a moral obligation to care for one, then, but it does not seem to matter which. Indeed, everything else being equal, any other person in my place would have this obligation too. By contrast, suppose one of the children is my own son. It seems that I ought to care for my son over the other children, that it now matters morally which one I care for and that I do the caring. This is an

agent-relative obligation: I have an obligation that *I* care for *my* son. The puzzle is that every child is equally valuable in objective terms; my son's care has no more and no less intrinsic value than the care of anyone else's child. Of course, he is more valuable *to me*, but that is not an objective measure of his value. Further, it would be abominable for me to care for my own child, but justify it by saying "I can't care for all children, so I flipped a coin and my son won." I seem to have an obligation *to him*, and he has a claim on my care that no other person has. How is that possible if there is no more objective value in my son's care than in the care of any other child?

To take another example, we are morally obligated not to torture. But suppose you could reduce the number of torturings in the world by a few by torturing some one innocent person. It is very tempting to think that you still have an obligation not to torture that person, even if by doing so you could bring about the reduction in torturings. You seem to have here an agent-relative obligation that *you* should not torture, rather than simply an agent-neutral obligation to prevent torturings. How is this possible? Surely if one torturing is evil, two are more evil, three even more so, and so on. Surely you should bring about as little evil as possible in the world. Moreover, if we increase the number of torturings you could prevent, there will be some number at which everyone will relent and say you ought to torture to prevent other torturings. So how could it be wrong to prevent more of the very same ills that one thinks one should bring about oneself, and only in some cases but not others? Much late twentieth-century work on obligation has focused on just this question.

Utilitarianism has been most often associated with the view that there are no genuinely agent-relative obligations, that all of our obligations are agent-neutral. Our fundamental obligation is always to bring about the better state of affairs. This is indeed a very intuitive position: How could it ever be impermissible to bring about the most good? Shouldn't one always do this? Some, such as Samuel Scheffler (1994), have argued that agent-relative *permissions* can be defended, but not agent-relative *obligations*. That is, we can be permitted, but not obligated, to tell the truth even when our lying would bring about more truth-telling. What justifies a permission here for Scheffler is the agent's need to preserve his integrity (or, for Thomas Nagel, his autonomy) as a moral agent. Others have taken a stronger position that there are genuine agent-relative obligations. For example, you have an obligation not to torture even if by torturing you would bring about fewer torturings overall. Nagel argues that such an obligation is justified on the grounds that one must never be led by evil. Whether these or related arguments will ultimately prove successful is an ongoing concern of moral philosophers.

Robert N. Johnson

OCCIDENTALISM. The term *Occidentalism* refers primarily to the many ways in which non-Western intellectuals, artists, and the general public perceive and present the West. Though it seems to be an inversion of Orientalism, it has acquired some unique aspects defying a simple definition. In fact, the practices and discourses of Occidentalism vary a great deal,

from time to time and region to region. If we can arbitrarily divide certain parts of the world into West and East, then the people of the East, like their counterparts in the West, had approached an understanding and knowledge of the West long before such terms as Occidentalism and Orientalism were coined. However, it was largely due to the seminal influence of Edward Said's *Orientalism* that the discussion and use of the term *Occidentalism* gradually, from the 1990s on, gained currency in academic circles. Also, the two discourses not only juxtapose but also overlap with one another, in that the non-Western people do not perceive the West solely on their own cultural terms; rather, given the presence of Western discursive hegemony, they present the West either as a contrast, or an exemplar, reminding one of the principal practices of Orientalism among the Westerners. Different from the Orientalist discourse, which is mostly made by and for the Westerners, however, the Occidentalist discourse is made by non-Westerners for both Westerners and themselves. In the early twentieth century, for example, when a group of Japanese Buddhists attended the World's Parliament of Religion, they exercised, to borrow James Ketelaar's terminology, a "strategic Occidentalism" in promoting Buddhism both at home and to the world. They appropriated elements from Christianity, and Western culture in general, and constructed an image of the West as the contrasting Other. In so doing, they threw into relief the value of Buddhism as a more integral part in Japanese culture. They also emphasized the potentials of Buddhism for complementing Christianity and redressing its shortcomings.

East-West Dialogue and the Other

While the discussion of Occidentalism is often in juxtaposition with that of Orientalism, it can also amount to a criticism of the latter. Edward Said's critique of Orientalist writings and studies raised important questions about the Western hegemonic power in shaping the imagery of the "Orient." But like the Orientalists, as Mohamad Tavakoli-Targhi charges, Said, in presenting his thesis on the Western discursive hegemony, underestimates and overlooks the intellectual power and contribution of the people in the Orient. In his study of the Persianate writings in history and travelogue by Iranians and Indians during the seventeenth and nineteenth centuries, Tavakoli-Targhi notes that prior to the spread of European power, the Asians not only traveled to and wrote about Europe, contributing to Persianate Europology, but they also helped the early European Orientalists to acquire a knowledge of the Orient. In other words, in the exchanges between East and West, the East was not a passive, silent Other, as portrayed by the Orientalists (and also, ironically, as endorsed by Edward Said). Rather, argues Tavakoli-Targhi, the Persianate writers displayed equivalent intellectual capability to engage in cross-cultural communications with their Western counterparts. That the Orientals contributed to the gestation of Orientalism has also been noticed by Arif Dirlik in his study of South and East Asian history, although he casts this contribution in a more critical light.

Moreover, Occidentalism can be used, as Couze Venn has attempted, to describe the rise of Europe in modern times. In this usage, the term no longer refers to the construction of the image of the West only by the non-Western peoples. It now

Still from Zhang Yimou's 1995 film *Shanghai Triad*. In the late twentieth century, Chinese filmmakers like Yimou found critical success outside of their home country for works that depicted a China customized to Western tastes and expectations. ALPHA FILMS/THE KOBAL COLLECTION

also includes attempts by Europeans to turn their historical experience into a universal, hegemonic model. "Occidentalism," states Venn, "thus directs attention to the becoming-modern of the world and the becoming-West of Europe such that Western modernity gradually became established as the privileged, if not hegemonic, form of sociality, tied to a universalizing and totalizing ambition" (p. 19). Engaging in this study of how Europe rose to become the West entails careful examination of the development of capitalism and spread of colonialism, not only during the seventeenth and nineteenth centuries, but also, as Venn suggests, in today's world. The legacy of both are well reflected in such global forms of regulations and organizations as the World Bank, the International Monetary Fund (IMF), and the United Nations. All of them have accompanied the Western hegemony in academic discourses. While different from Edward Said's theory of Orientalism, Couze Venn's study of Occidentalism defined as such suggests a similar interest in revealing the repressive side of modernity. In this regard, Occidentalism extends, as does Said's work, the project of post-colonial critique of the modern world.

If the definition of Occidentalism is complex, this is because the interaction and dialogue between East and West have been

a diverse experience, shaped by different forces under different circumstances. Even if we confine our discussion to the non-Western construction of the Western imagery, it still defies the simple understanding of it as a form of internalized Orientalism, in which the West is perceived as the exemplary Other, or of it as a defensive reaction against the West, in which the West is seen as a devilish Other. In addition to the various attempts to portray the West, Occidentalism has another dimension, or "double reflection" in Meltem Ahiska's analysis, that the non-Western also seeks to imagine how its image is perceived by the West. This is because the Occidental discourses often emerged as a result of the Western expansion to the world, which made it urgent and necessary not only for the non-Western to form its national and cultural identity, but also to do so by emulating and extending the Western model. It demands that the non-West seek identification of the West on the one hand in forming its modernity and, on the other hand, draw a line of demarcation between Self and Other in order to bolster its own contradistinctive identity.

China and Occidentalism

In the discussion on Occidentalism, scholars in the China field, including native Chinese scholars living in China and overseas, are quite active. This is perhaps because compared to its neighbors in Asia, China boasts a long historical and cultural entity and, since the mid-nineteenth century when its conflict with the West commenced, has remained quite resilient in resisting the Western influence and maintaining its cultural heritage. This marks a stark contrast to Meiji Japan in which a wholesale Westernization was set in motion almost as soon as the country was opened by and to the West. In China's cultural terrain until today, the China–West dichotomy appears quite salient, which suggests that the Chinese by and large have maintained, despite the ups and downs of their history, a clear self-awareness while constructing their relation with and perception of the West. In the New Culture movement of the early twentieth century, which was often perceived as a radical rupture of the Chinese cultural tradition, this self-awareness remained quite visible. In seeking a national identity, which was a main goal of the movement, the participants not only drew inspiration from the West, but also considered the Soviet experience. Moreover, despite its iconoclastic appearance, the movement did not entirely discard tradition. Instead, it gave rise to the National Studies project, in which the enthusiasm for modern science was translated into an endeavor at identifying similar, indigenous elements in the past.

This keen and persistent self-awareness bore upon the ways in which the modern Chinese imagined and construed the West. In her *Occidentalism: A Theory of Counter-Discourse in Post-Mao China*, Xiaomei Chen has identified two tracks of Occidental discourses in modern China. One is called Maoist, or official Occidentalism, in which the West is portrayed as the demon. The other is anti-official Occidentalism, advanced by various groups of the intelligentsia, in which the West becomes a useful metaphor for their critique of domestic oppression. Though the origin of Maoist Occidentalism can be traced back to the second half of the nineteenth century, marked by China's defeats in confronting the Western intrusion, it culminated in

the 1940s and the 1950s as the Communists rose to power and founded the People's Republic of China (PRC). By depicting the West as the imperialist aggressor, it incited nationalist sentiment among the Chinese and instigated their animosity toward the West. In so doing, it enabled the PRC government, in Chen's words, to use this essentialized West "as a means for supporting a nationalism that effects the internal suppression of its own people. In this process, the Western Other is construed by a Chinese imagination, not for the purpose of dominating the West, but in order to discipline, and ultimately to dominate, the Chinese self at home" (p. 5). While Chen's work mainly describes this type of Occidentalism in 1980s China, judging from China's situation today, its practice seems to have not only persisted but also intensified as the country often sees surges of ultranationalistic behavior in its (young) populace. This ultranationalistic, anti-West sentiment is not entirely spontaneous, but has a good deal to do with the PRC government's decades-long nationalist propaganda, which often taps into the historical pride of the people.

Like its counterpart, anti-official Occidentalism also has a history that predated the founding of the PRC. It originated in the New Culture movement of the 1920s, if not earlier, in which the Western idea of democracy was invoked as a means to shore up the fledgling Republic in the face of warlordism and factionalism. In the post-Mao years when the PRC intellectuals reflected critically upon the tragic legacy of the Cultural Revolution (1966–1976), they sought to revisit and revive certain themes of the New Culture movement. This revivalist endeavor gave rise to "a powerful anti-official discourse using the Western Other as a metaphor for a political liberation against ideological oppression within a totalitarian society" (Chen, p. 8). Central to this anti-official Occidental discourse was the production of *Heshang* (River elegy), a TV documentary mini-series that aired nationally in China in 1988. It became a cause célèbre in the history of the PRC's TV industry, for while it attracted hundreds and thousands of viewers across social strata, it was also criticized by professional historians and later banned by the government. The criticisms centered on *Heshang's* presentation of Chinese cultural tradition vis-à-vis modern Western culture, or Orient versus Occident, because the producers and writers, elevating the iconoclasm of the New Culture movement to a new level, vilified the Chinese cultural heritage and denied its relevance to modern life. Meanwhile, it glorified Western civilization, praising its openness, adventurousness, and youthfulness, to which the advance of capitalism and technology of the modern world were attributed. This China–West dichotomy was rendered vividly in *Heshang's* cinematic presentation, in which the Yellow River and yellow earth, symbols of Chinese civilization, conveyed a deeply sorrowful feeling of death and stagnation, whereas the West was symbolized by the azure blue ocean, emanating energy and liveliness. These contrasting images appealed to the Chinese audience who, in the aftermath of the Cultural Revolution, were still haunted by the terrible memories of the country's recent past and frustrated by the setbacks in the century-long search for wealth and power. While seemingly a cultural critique, marking a climax of the "Culture Fever" (*wenhua re*) movement prevalent at the time, *Heshang's* Occidentalism was, argues Xiaomei Chen, a counter-discourse to official Occidentalism, because it indirectly and

effectively translated this public frustration into a veiled criticism of the palpable failure of the Communist government.

The divergent ways in constructing the Western imagery in contemporary China underscore that it is important for us to consider the context in which various forms of Occidental discourse have occurred. The attention paid to this context question can also help highlight the essential difference in the constructions of Orientalism and Occidentalism. Different from Edward Said's critique of Orientalism, in which he presents the East-West dichotomy in an invariable manner in order to stress the Western dominance of power, the presentation of the Occidental discourse has shown that such relationships can be quite flexible, depending on the specific sociocultural context. This is because when the Orientals perceive the West, their perception is shaped not only by the international and global climate of the modern world, but also by the domestic context in which such perception is called for. This consideration, too, should be applied to the Orientals' construction of the Self, because such an image is also often constructed and presented under and for the Western gaze. This practice of presenting Self for the Western Other has been given various terms, such as "Orientals' Orientalism," "self-imposed Orientalism," and "cooperative Orientalism." But to the extent that it is predicated on a projection by non-Westerners onto the West on which they set out to present their own cultures, it also amounts to a form of Occidentalism. The Japanese Buddhists' endeavor at promoting their persuasion to the Western world is a good example of this.

A more current example is shown in the success of the "fifth-generation" Chinese movie directors, led by Zhang Yimou, in winning numerous awards for their productions at movie festivals in the West from the 1990s on. What made their success particularly salient as a form of Occidentalism is that while Zhang and others produced works about China and Chinese culture, their productions were often not shown within China. This was sometimes the result of government bans, but a more important reason seemed to be that these movies were originally tailored to the taste of the Western audience. While the moviemakers visualize and represent China, what they actually accomplish is rather an imaginary West based on their own projections. Judging from their successes at Western movie festivals, their understanding of the West and, moreover, their imagination of how China would likely be perceived by the West, are quite correspondent with the reality. However, their presentations of China, ironically, were often not approved by their compatriots back home.

If this exercise of Occidentalism acts on an anticipation of how the Western Other is to gaze at the Self, there seems another way in which the Western Other is shown more accessible and cooperative for the Self. After China opened its doors to the world in the early 1980s, there appeared a series of novels (some of them also made into TV shows) depicting the experiences of Chinese students and immigrants living in the West, such as Zhou Li's *Manhadun de Zhongguo nuren* (1993; A Chinese woman in Manhattan), Yu Heizi's *Bolin de tiaozao* (1993; Fleas in Berlin), and Cao Guilin's *Beijingren zai niuyue* (1994; A native of Beijing in New York). A recurrent theme

in these novels is that in order for a Chinese to succeed in the West, he or she must first know how to approach a thorough understanding of Western lifestyle and culture and adjust his or her life accordingly. But the Other never dominates the Self completely. Rather, it works with the Self in effecting the latter's ultimate success, an end that most of the protagonists managed to achieve. In this presentation, the East and West/Self and Other divide central to Said's critique of Orientalism becomes increasingly blurred. It thus calls for considerations of various contexts in which such conceptions are imagined and construed. This call for historical specificity perhaps marks the most notable contribution that the discourses of Occidentalism have made to our understanding of the world.

ORAL TRADITIONS.

This entry includes two subentries:

Overview
Telling, Sharing

OVERVIEW

The challenge of reconstructing the history of nonliterate or preliterate societies makes necessary the study and interpretation of oral traditions. Many such societies have gone to great extents to preserve and transmit the knowledge of their past in oral forms. The phrase *oral traditions* refers to folklore, legends, tales, taboos, and stories through which knowledge of the past is preserved and transmitted from one generation to

another. Oral traditions must be differentiated from *oral evidences*, which are experiential. Such traditions record the origins, movements, and settlements of peoples; the genealogy and chronology of royalty, priests, and citizens; and the important landmarks in history. Besides, much oral tradition can be gleaned from surviving cultural practices such as burials, rituals, games, and language.

Virtually all societies, including literate ones, have depended on oral traditions for the reconstruction of their histories at one point or other. "Once upon a time" or "long, long ago" are the usual introductions to the oral narratives that European and Native American children heard throughout their childhood and early adolescence. The knowledge of preliterate historical periods is derived in some form from oral accounts. As writing and documentation developed and literacy became widespread, however, this genre of historical recollection became less important in the literate societies. This is because of the presumed unreliability of oral traditions as compared with documents. Indeed, by the nineteenth century, a form of historiographical tradition had become established in Europe that held that only written sources could produce historical reliability. This was not unconnected to the development of archives and the documentary traditions of the medieval European courts. Europe-based historians of the nineteenth century tended to consider that nonliterate societies had no history.

Oral Tradition and the Search for the African Past

Thus, although oral traditions are not peculiar to black Africa; their use as a source for the construction of African history has attracted the most attention. Not many of the continent's peoples developed any extensive form of writing. Thus, the earliest written sources on African peoples were the accounts of European and Arab traders, travelers, and explorers who wrote about their experiences primarily for home audiences, or as personal memoirs. For this reason, many of the historical studies on Africa were considered not history but anthropology. Archaeological findings of early African civilizations were attributed to foreign influences. It is in this context that the British historian Hugh Trevor-Roper contended that Africa had no history apart from the activities there of Europeans and Arabs. This contention drew sharp responses from the intelligentsia on both sides of the Atlantic—including representatives of the evolving colonial African historical consciousness. There is also a sense in which the denigration of the African past was a replication of the European racial and colonial enterprise, referred to by Edward Said as a "race construct" of "otherness," that is, the creation of a negation of the European ideal in conquered and dominated peoples. The challenge for colonial African and indeed intellectual responses to the question of African history was to prove its existence through the only source that seemed available at the time: oral traditions.

Oral Traditions as a Source and as a Method of Historical Construction

African and Africanist historians have professed the value and reliability of oral traditions for the reconstruction of the history of African peoples. Their weaknesses as a source of

historical reconstruction have been argued as no worse than those of other sources of history, including written records. Various processes have been developed for the mitigation of these weaknesses by the methodical gathering and treatment of oral traditions. This has also involved the conceptualization of oral tradition and the classification of the genres that make up oral traditions. Each of these typologies has peculiar treatment types.

Oral traditions, among many African peoples, are more complex, better-organized forms of recording history than the stories and legends of some other preliterate societies. Traditional controls in the form of training and taboos have served to guarantee the reliability of historical accounts. "Palace historians" and griots often occupy hereditary positions, and the training of custodians of a society's history usually begins at an early age. Special occasions such as coronations, burials, births, and other rituals present opportunities to perfect their arts. Stringent sanctions are attached to any distortion of historical accounts. The fact that in such societies crimes and punishments are communal and that physical and spiritual influences guide social compliance provides added checks against manipulation of accounts. Oral traditions have thus been successfully employed to reconstruct the history of many societies in Africa. In Nigeria, the pioneering works of Kenneth Dike—*Trade and Politics in the Niger Delta* (1956)—and Saburi Biobaku—*The Egba and Their Neighbours* (1957, based on a 1951 thesis) relied mainly on gathered oral traditions and have survived much historiographical scrutiny to remain national historical classics. Substantial works on East African history have also depended on the collection and use of oral traditions following the pioneering works of B. A. Ogot. Jan Vansina's seminal theoretical work, *Oral Tradition: A Study in Historical Methodology*, articulated the major theoretical advances for the defense of the use of oral traditions in historical reconstruction. The case for oral tradition was further taken up in his more recent study, *Oral Tradition as History*. Vansina, however, not only makes a case for the validity of oral tradition in historical reconstruction but has produced historical works that fully utilize the method. These include *The Tio Kingdom of the Middle Congo 1880–1892* (1973) and *The Children of Wool: A History of the Kuba People* (1978). Vansina's influence as the foremost theoretician of oral tradition historiography is not in doubt.

The Use of Oral Traditions and Its Critics

There are obvious problems with the use of oral traditions. Critics easily point out that they lack absolute chronology, are extremely selective in their content, and are compromised by possible human errors. William G. Clarence-Smith argued that the value of using oral traditions has been not for their intrinsic worth but sentimental, as they offer African historians the opportunity to present an independent history, "uncontaminated by colonialism." Many of the theoretical advances in oral tradition have focused on how to lessen the impact of these weaknesses. The use of oral traditions demands a distinct professionalism that is not altogether dissimilar to that employed by historians who rely on other, "conventional" sources. Historians employing oral traditions, though, need to acquire additional qualities, including, as Phillips Stevens has com-

mented, intuition, which is not usually required by conventional historians.

Oral traditions have had much wider influence on global historiography than its critics would concede. The emphasis on written sources as the only reliable source of historical reconstruction has mellowed with the acknowledged contributions of other sources of history including archaeology, paleography, and linguistics, as well as oral traditions. An interdisciplinary approach to historical reconstruction has gained much currency among historians. Besides, the debate over oral traditions has also shed some critical light on written documents as sources of history, with a view to strengthening their reliability. It has become realized, for instance, that many written documents are in reality processed oral traditions. The study of oral traditions has developed as a recognized discipline and various projects in the collection and processing of these traditions are being undertaken in research institutions across the world.

TELLING, SHARING

For the vast majority of human history, the only way people could transmit information has been by speaking, listening, and remembering. Indeed, the capacity for speech and the connected capacities for learning and remembering might be thought of as the defining elements of human consciousness, shared perhaps with other, now extinct, members of the hominid lineage but not shared with any other existing species. Through speech, humans did more than coordinate cooperation necessary for individual and group survival; they transmitted knowledge. They taught new generations techniques

and ideas. They developed the ability to use abstract and theoretical thinking that allowed them to adapt to new circumstances. They created moral codes that regulated behavior between genders, between generations, between ranks, and between communities, and devised elaborate justifications for these codes. They speculated about the sublime question of the reason for the existence of it all and made up great cosmological explanations that usually placed humanity at the center of some sort of creation. For the vast majority of the at least 100,000 years that *Homo sapiens* has walked the earth (and perhaps longer if earlier hominid species had the power of speech), humans transmitted all of this orally. It would seem then that speaking and listening are the “natural” way humans learn.

Humans used several techniques to help them remember what they had learned. They created objects that served to remind them of the spirits that watched over them and needed succor. They made images of those that had gone before. They portrayed their fears on available rock surfaces. Perhaps most importantly, and in some ways seemingly universally, they used meter and rhyme in language, pitch and syncopation in sound, noises created by the ingenious noisemakers they devised, and the movement of bodies in time to music to remind them of what was important to know.

What they needed to know and to remember, though, changed over time. Humans learned to forget that which seemed no longer important. Knowledge flowed seamlessly from past to present, from the ancestors to the living, from God or the gods to the mortal. What was told always sought relevance with what the hearers of the words lived.

Sometime about five thousand years ago, in Mesopotamia and Egypt, some human societies began to use symbols etched in clay tablets, painted on papyrus scrolls, or carved into stone to record at first basic data. Eventually people developed the ability to use writing to capture the most complex of abstractions and the most beautiful of poetic expressions. Gradually literacy developed in other places and spread to still others. Almost everywhere it was associated with power. Those in power wielded the written word as one of the tools of domination. They determined what was truth, what was history, what God wanted people to do or be. While the struggles among the literate over these issues are the stuff of literate history, for most people knowledge continued to be transmitted orally. Even with the development of printing, the rise of mass literacy, and the spread of “universal” education, many elements of culture and community remain expressed primarily if not wholly in oral form. Especially among communities in some way or another disempowered by the apparatus of literate knowledge, oral tradition remains an important means of transmitting knowledge and maintaining social solidarity.

Oral Tradition

The introduction above sketches an expansive definition of oral tradition, using the term to refer to any form of knowledge transmitted in a regular way between generations verbally. This definition, while broad, does distinguish between oral tradition and oral history. Researchers (who need not be professional historians or scholars) elicit oral history by interviewing

informants. Oral history is information about the past that is spoken only in the context of personal memory. Generally, it includes life histories and personal recollections. It can include information told to an informant by others, such as parents. In the context of collecting oral histories, though, the research may also collect oral traditions.

While the expansive definition also allows for the existence of oral tradition in societies with literacy, oral traditions are usually associated with “preliterate” societies. In such societies, information can be passed on only through oral means. All known societies have oral texts that validate a moral order. Many have texts that depict the proper relationships between groups within a community and often with those outside a community. To the extent that social divisions exist, component groups often have their own form of traditions. In particular, women quite often have a distinctive body of oral texts circulated only among themselves. In addition to traditions that bind a community together, some types of traditions celebrate hierarchy and power. In particular, praise songs—panegyrics—not only signify power and prestige during the honoree’s lifetime but often become eulogies remembered long afterward. Finally, great narratives, epics, and sagas served to tell the story of heroes and founders, of creators and minions.

Even when literacy emerged and spread, knowledge often continued to be transmitted and developed orally. Only elites often had extensive literacy in large parts of the world for long periods of time. While they might codify the epics into scripture and history, oral traditions often remained alive as folk wisdom and oral literature. Sometimes, oral traditions served as ideological justifications for counterhegemonic movements among subject classes or communities. Often, a complex interplay developed between oral and literate traditions. Even after the rise and spread of mass literacy, oral tradition has continued to play an important role in helping create popular, folk, and subaltern identities; however, the interaction between oral and literate in those cases often becomes more intimate and immediate.

The broad definition of oral tradition used here does not deny that there are sharp differences between situations where the only means of transmission of information is through oral communication and those where oral transmission serves as a refuge for a group in some way marked different from the rest of society. This definition, though, sees the differences more in terms of genre and function, than in terms of oral and literate societies or oral and literate people.

Genres in Oral Literature

Scholars working with orally transmitted information have identified a number of broad genres. Scholars define the genres by both function and form. Not every society has each of the genres. Scholars often approach these genres as different types of oral literature (a seeming oxymoron that acknowledges the creative energy involved in the preparation of oral texts), so different are they in form and function. Genres of oral literature include epics and sagas, panegyrics, prose stories, lyric poems, ritual songs, and genealogies. While all transmit knowledge, the genres do have different but sometimes overlapping functions.

Epics and sagas. More narrow definitions of oral tradition often limit it to epics and sagas. Epics, defined by the use of poetics, and sagas, prose, serve as foundational texts for societies. They tell the stories of the culture heroes who create society, of the origins of civilized behavior, of the creation of heaven and earth and the people who populate it. Epics (used hereafter for convenience) sometimes tell history. Other times they reveal God's or the gods' design to humans.

Perhaps the epics best known to Western readers are the *Iliad* and the *Odyssey*, which date in their recorded form to about the eighth century B.C.E. Classical Greek authorities named a bard called Homer as their author. They exhibit, however, characteristics that define them as oral literature. They are recorded as verse with many elements of repetition. While they are historical, as opposed to sacral, they serve as foundation texts for ancient Greek ideas of civilization and culture. They focus on the deeds of "great men" and the ways the gods intervene in the affairs of people. The structure of the *Odyssey*—the plight of a "wanderer" and his spouse who must wait for him—follows a structure found in many other epics in other cultures and times. The question for these epics comes from their transcription. Were they the production of one or two authors who worked with oral literature but made the finished products their own (given, of course, the possibility of changes to the texts in later copies)? Or are the epics in their present form truly composite examples of oral literature in which no guiding author can be seen in form as well as narrative? Such debates have also animated scholars when they consider sacred texts such as parts of both the Old and New Testaments as well as texts from India and China. Clearly, many of these texts, for example the Torah or first five books of the Bible, began as oral literature, functioning as creation myths that define the proper relationship between God and humanity.

Understanding the nature of the question of authorship requires understanding oral traditions, and especially epics, not just as texts but as performances. Over the centuries since Homer and the codification of the Torah, records have come down on the transcription of oral performances and the preparation for them by performers. Each time the song is sung, the tale told, the epic performed, it changes. Bards often served as more than just entertainers. Telling the tale, singing the song involved making a link with the audience, and giving the audience what it came to hear or admonishing the audience for what it has failed to do.

Tellers and performers usually plan such variations in advance to make their point or curry favor with their audience. Jan Jansen tells of witnessing the preparations for the performance—which happens once every seven years—of the Sundiata epic of the Mande people at the shrine of Kamabolon at Kangaba in the Republic of Mali. The epic tells of the founding of the Malian empire in the fourteenth century. The Diabate griots, or bards, members of the clan that supplied Sundiata with his griot, perform the full epic in the sanctuary as it has a new roof placed on it by a newly initiated age group. The only others present in the sanctuary are members of the Kieta, or royal, clan of the old empire. Outsiders may not see or record the actual ceremony. Griots tell the epic itself throughout the

region, but the people hold the version told at Kangaba as the orthodox version, filled with secrets. Jansen, an outsider, attended the many practice sessions for the performance, as did almost anyone who wanted to. He reports that the griots debated quite intensely the wording and arrangement of the performance and the significance of its message. At the performance itself, Jansen noted that the griots cut it somewhat short. The performance, for a collection of royal clan members who had all heard it before, lacked the immediacy of the rehearsals, which featured the necessity both of working out the correct version of the epic among the professionals and of getting it right for the visitors who had come out of interest.

Even in cases where the performer is clearly subordinate to the intended audience, the performance of oral tradition creates a social persona for the performer. In most cases the performance creates society and social norms through linking people, communities, and institutions together. Whether the recitation of the Mansa Jigin, the Mande "gathering of kings," that confirms the centrality of the empire of Mali for the far-flung Mande peoples in diaspora all across West Africa (and in the early twenty-first century, New York and Paris), or the recital of a clan history at a funeral in central Tanzania by the heir to the deceased that recreates the ties of kinship and marriage linking people together across the region, oral traditions as performed generate community.

While epics and sagas are foundational documents akin to scripture in preliterate societies (and indeed scribes have sometimes converted them into scripture), they have component parts that bards stitch together (a direct translation from the ancient Greek of the bard's art). These components comprise some of the other genres of oral tradition. Bards can often recombine or condense or elaborate using these elements in the telling, combining them in different ways to fit audience and occasion. Taken as a whole, an epic is often no more than the most expansive collection of such components held together by the unity of theme and sometimes character.

Panegyrics. One of the most interesting and historic of these genres is the praise poem. This type of poetry, the panegyric, is found in a wide variety of societies. These poems are often composed for specific occasions, as happens among the Xhosa people of southern Africa. However, while the metaphors and similes used in them may sometimes be tropes of deep cultural significance, in particular cases praise poems become linked to particular historic figures, and hence become an important part of a culture's historic memory. The following quote comes from the praise poem of Shaka, the founder of the Zulu kingdom in South Africa in the early nineteenth century:

Shaka went and erected temporary huts
Between the Nsuzé and the Thukela,
In the country of Nyanya son of Manzawane;
He ate up Mantondo son of Tazi,
He felt him tasteless and spat him out,
He devoured Sihayo.
He who came dancing on the hillside of the Phuthiles,
And he overcame Msikazi among the Ndimoshes.
He met a long line of hah-de-dahs [ibis birds]

When he was going to destroy the foolish Pundos;
Shaka did not raid herds of cattle,
He raided herds of buck. (Owomoyela, p. 15)

These lines tell of several of the peoples and rulers Shaka conquered. Praise poems can then become one of the building blocks of epics, but in many cases they themselves become the most important form of historic memory. Cases where the elements of oral tradition do not coalesce into epics are more common than those where they do.

Stories. Stories, whether called folktales, fables, or even oral history, often serve the function of oral tradition. People use them to impart moral lessons and to promote a feeling of group solidarity through a sense of common history. They can be told in formal situations, such as initiation rituals or informally, such as around the hearth. Stories often tell moral tales, and sometimes they use structures, plots, and motifs spread quite widely across different cultures. However, with the addition of appropriate cultural detail, they also can refer to very specific episodes in local historical memory. As tellers tell and retell the story, it changes to provide a community with an agreed-upon explanation for the topic of the story. For example, in central Tanzania among the Gogo people, elders tell a story of something they say happened during the most serious famine in their history during World War I. A group of people fled hunger in their village to seek food from the newly established British administration in the wake of the East African campaign. They received no food at the administrative headquarters nor from the merchants in the small town along the rail line. They decided to camp for the night in a dry gully under the railroad tracks before trying to find food again the next day. That night a rainstorm filled the gully, and they all drowned. This author collected twenty-five versions of this story from throughout the region in Tanzania. While some details varied, all but one agreed that it occurred sometime between 1917 and 1919. The one outlier came from an elder who had been a colonial-era chief. He said he had known the people to which this tragedy had occurred and that it had happened not during World War I but during a famine several years later. As he was adamant, knowledgeable, and could name names, this author believes the former chief's oral history is "true." But the oral tradition created by the people out of this event encapsulates a complete explanation of colonial rule in the region. The people were conquered and ruled by Europeans who fought among themselves during World War I and killed many. They were exploited by an ever expanding market economy. Given these disruptions to the social order, they were abandoned by the forces of nature that first brought drought and then killed them with too much rain. Hence, the story became part of an agreed-upon explanation for colonial rule, and in memory they moved it back in time to the worst famine of their history.

As with panegyrics, some societies stitch such stories together to form epics. Stories such as this, though, often stand alone; and many societies never develop full-blown epics. Groups within societies often have their own sets of stories that emphasize their own particular place within society and relationship to other groups in it. Often, for example, women

tell stories markedly different from those told by men, and they often tell them in contexts reserved for women alone. These stories, which may emphasize gender solidarity or debunk the claims made for well-known characters in other stories, are often labeled by men or other dominant groups as fables or as untrue. Just as much as stories told by men or dominant groups, though, they represent an agreed-upon explanation for why the world is the way that it is.

Ritual songs and lyric poetry. Songs and lyric poetry function much like stories in that they focus on particular events or situations. Like stories, they are sometimes historic but often fabulist. They change as bards and singers change them to fit audiences and circumstances. While they are often individual performances, groups can also perform them. The demands of meter and music impose a certain stability on them, especially those performed by groups. Work songs and ritual songs fall into this category. Work songs can consist sometimes of little more than a few lines repeated rhythmically for as long as the task lasts, but they can also impart moral or historic lessons. They can recall individuals or events associated with particular activities.

Ritual songs likewise can impart both historic and moral lessons. Songs performed at sacrifices, at celebrations of life passages, at healing rituals, at divining sessions all can serve the function of oral tradition. Songs or chants used in rituals can call upon historically important people or groups as intercessors with the divine. People often use music and dance to compliment the words of the songs. Dance in particular can act out, as well as act as a mnemonic device for, the story.

Genealogy. Genealogy is the final genre of oral tradition considered here. Genealogies quite literally link the past with the present by charting the ancestors to those still living. Genealogies usually contain more than mere lists of names. Tellers usually include both stories and praise poems for the ancestors as well as often detailed descriptions of relationships between different kin groups. Genealogies, like other forms of oral tradition, change as conditions change. In the long run, genealogies telescope with generations and relatives lost over time. Often, founders remain in the story, but the number of generations between the founder and the present may remain constant. Sometimes genealogies expand, as with king lists that proclaim consistently long reigns. Genealogies also often regularize relationships between generations, especially for holders of positions of authority. Usurpers become legitimate heirs. Inheritance through the female line gets changed to the male line in patrilineal societies and visa versa in matrilineal societies. Finally, genealogies in performance change to fit the circumstances. Social networks become embedded in genealogies as fictive kin relations. Such is the case in central Tanzania, where the principal heir recites the clan genealogy at a funeral. As with other genres, genealogies often make up an important part of epics, with bards stitching them into the narrative to highlight the proper relationship between groups.

The Modern Study of Oral Traditions

Over the course of the last two centuries, scholars have developed three distinct approaches to the study of oral traditions.

One, the oldest, sees oral traditions as “oral literature” or “folklore” and promotes analysis on literary and humanistic elements, often focusing on comparative analysis. The second sees oral traditions as expressions of cultural values and norms. Anthropologists, especially ethnographers, analyze such traditions as functional promoters of group solidarity or structuralist explanations for the workings of society. Scholars working in both of these approaches focus little on the historical veracity of traditions and sometimes argue they contain no historically valid information. Historians, particularly of preliterate societies, on the other hand, attempt to derive from oral traditions historically valid evidence. All three approaches complement one another. Understanding the cultural and historical context of an epic enriches the appreciation of it as literature. Ethnographic analysis requires historical grounding and an understanding of the importance of performance. Historical analysis must take into account both the performative aspects of oral tradition and the cultural structuring that occurs in it.

Two issues, however, often divide students of oral traditions. One is the perceived difference between oral and literate societies. Some scholars argue that literate societies promote entirely different ways of comprehending the world than do those without or with only limited literacy. Oral traditions transmit knowledge in metaphor and ahistorical essences. Critics of this approach maintain that it minimizes the creativity and logical ability of people in preliterate societies. The second main issue dividing scholars is the historical validity of oral traditions. Many suggest they have none, that oral traditions are so attuned to the present that all information about the past is structured beyond relevance. Other scholars argue that properly understood oral traditions do transmit historically valid evidence.

The first field that developed around what is now called oral traditions was that of folklore. Folklorists sought to collect oral texts both from societies perceived as nonliterate as well as from among marginalized groups in literate societies. In the nineteenth century the field became tied with the Romantic project of recovering the “true” culture of the nations of Europe. In its less politicized form, folklore turned to the comparative method, seeking to show relationships between epics and tales found in different parts of the world. Early folklorists tended to work in Western societies, although by the middle of the twentieth century many had begun to work with non-Western oral literatures, bringing their emphasis on textual analysis to oral literatures hitherto the domain of ethnographers.

Folklore studies became the study of oral literature as the works of Milman Parry and his student Alfred Lord dramatically transformed the field in the first half of the twentieth century. Parry and Lord collected epics and songs among the Muslims of Bosnia. Their work, most famously elaborated in Lord’s *Singer of Tales*, generally saw epics as literature composed in performance but based on a formula that used meter to string together episodes and clichés from a common fund of such tales. Each performance, then, is different, and performers do introduce innovation, often to fit a particular audience. Epics, however, retain a broad stability over long periods of time. Lord, in particular, used the *Iliad* and the *Odyssey* as models for epics, and the great questions they sought

to answer concerned the actual “authorship” of such epics. Later scholars, such as Walter Ong and Werner Kelber, brought this approach to biblical studies.

Later scholars have criticized this oral literature approach for emphasizing textual analysis over context. The explicitly comparative approach minimizes the cultural and historically specific circumstances that have called forth the production of oral literature. They have charged that the importance placed on the difference between orality and literacy in the remembrance and performance of oral literature reduces it to a “formula” that denies the creativity of performers and the ways in which oral historians generate their histories.

Anthropologists, especially those engaged in ethnography, have also long used oral traditions as sources for their analyses of cultures and societies. Like folklore, anthropology originated as the study of a phenomenon outside the perceived mainstream of “Western civilization” in the nineteenth century. It began as the study of “primitive” societies. During the twentieth century, it quickly evolved into the study of culture broadly defined. As such, ethnographies have continued to draw heavily on a variety of genres of oral traditions in their efforts to portray culture.

Like folklorists, anthropologists have deemphasized the historicity of oral traditions. They have seen them functionally as means of promoting group solidarity and defining social norms. As such, they have seen them as entirely flexible, altered to suit changing circumstances. By the 1960s, the work of Claude Lévi-Strauss came to dominate such views. His argument that much of culture itself, as well as the expressions that defined and underpinned it, was structurally determined led to such important studies as Luc de Heusch’s *The Drunken King*.

Starting in the late 1950s, the rise of new fields of historical studies led to a movement among historians to reevaluate oral sources for history. In particular, historians engaged in trying to recover a usable past for African societies, as nations on the continent began to emerge from colonialism, turned to oral traditions to recover a precolonial past often derided by colonial sources. Jan Vansina pioneered the collection of oral traditions, by which he meant mostly epics. In addition, the widespread epic tale of the founder of the kingdom of Mali, Sundiata, also attracted scholarly attention. The epic, performed by casted bards, *griots* in French or *jeli* in Mande, among many of the Mande-speaking peoples, tells of the founding of the empire in the thirteenth century and yet continues to be performed as a living oral tradition in the early twenty-first century.

Over the 1960s and 1970s, historians scoured Africa for oral traditions and produced works of incredible subtlety and incredible naïveté. While very few historians argued for the literalness of oral traditions as history, some took a more critical look at the context of the production of oral tradition than others. Ruth Finnegan, a leading folklorist, felt compelled to take historians to task for such naïveté. By the 1980s, historians had refined their approach to oral traditions. Some, such as David William Cohen, had moved close to a structuralist position. Vansina himself reworked his position on the

collection of traditions, and many of his students showcased their work in *The African Past Speaks*, edited by Joseph Miller. Many scholars focused on the range of ways that historical information passed from generation to generation and the uses to which it was put. Since many African societies lack epic traditions, scholars have learned to use historical anecdotes, songs, stories, and life histories in innovative ways to answer questions about the past. These innovations have gone on to inform oral historical approaches in other areas and general historical debates about popular memory and history.

Oral Traditions and the Modern World

In a narrow sense, the rise of mass literacy and its spread (although still incomplete) across the globe has transformed the role of oral traditions in society. Just as happened in ancient Greece around 800 B.C.E., so it has happened repeatedly that when an epic is reduced to writing, it ceases to change. Written versions, with their stability, become orthodox, canonical versions. Yet, to see the gradual decline in importance of oral epics as the end of oral tradition takes much too narrow a view of the importance of the field. In some places, epics retain important functions and continue to be performed. The descendants of the royal griots of Mali who perform the full epic of Sundiata in a ritual reroofing of his shrine every seven years remain adamant that only they know the full version and that the transcriptions made over the years by many writers and scholars are pale glosses on the fullness of the epic.

More to the point, oral traditions in many parts of the world, including many communities in Western, wealthy, and industrialized nations, remain vibrant ways of expressing group solidarity. Oral traditions in the form of stories and songs continue to circulate widely in many communities as alternative takes on the world and its workings. They often express counterhegemonic tendencies and sometimes focus on communalism. They exist in situations where literate and especially formal discourse is dominated by state power.

Oral traditions have served to place humanity in the universe and to explain the workings of the world to humanity. The narrative mode of explanation embodied in the epic is a big part of what makes us human. But also the other genres of oral literature—the song, the riddle, the praise poem, the proverb, the genealogy—help delineate social relationships that define human society. Oral tradition remains the most immediate, the most “natural” way for humans to bring past and present together.

ORGANICISM. Organicism refers to the idea that some object or entity shares an important property or quality in common with a living or animate being. It is related to, although remains distinct from, holism, in the sense that organicist doctrines tend to uphold the view that the living creature is an integrated whole containing precisely the range and number of parts necessary for the maintenance of its existence and for its flourishing. Hence, organicism is closely aligned with the concept of “organic unity.” Organicism enjoys a long intellectual history in a number of fields of endeavor, including metaphysics and logic, aesthetics, theology, and social and political thought. While perhaps most fully articulated by Western thinkers, organic ideas seem to have a global purchase.

Logic and Metaphysics

Plato’s (c. 428–348 or 347 B.C.E.) metaphysical theories constitute an important starting place for organicism in the West. In the *Philebus*, he examined the problem of “how the one can be many, and the many one,” that is, the ways in which diversity comports with unity. The Platonic doctrine of the Forms, as presented in the *Republic*, constituted one such solution. Even when Plato later criticized the failings of his own metaphysical teachings, as in the *Theaetetus*, he remained committed to the principle that the totality is greater than the sum of its parts.

Aristotle (384–322 B.C.E.), in turn, rendered organicist doctrine a precept of logic by asserting that the whole is prior to its parts because it is only possible to conceive of the parts qua parts once one has grasped the whole. Hence, Aristotle maintained that the analysis of any organic unity requires a “decompositional” method that commences with the whole and then dissolves it into its constituent parts precisely in order to discover the contribution that each element makes to the totality. One finds applications of this logical method

throughout the Aristotelian corpus, including his metaphysics, aesthetics, politics, and natural philosophy.

Organicist metaphysics thus stands in stark contrast to metaphysical atomism. The organicist believes that some inhering force—the Good, *telos*—unites beings into a single Being and therefore that apparent clashes or disparities between opposites are entirely illusory. The neo-Platonic doctrine of a concordance or coincidence of opposites follows an organicist track, as does Hegelian dialectical logic.

Aesthetics

While the idea that a work of art was an organic unity whose very “beauty” was constituted by its totality can be traced back to the ancient Greeks (for example, Aristotle’s *Poetics*), this idea enjoyed its culmination in the modern world, especially among the Romantics. Johann Gottfried von Herder (1744–1803) emphasized the idea of an “inner form” that animated a poetic work, a precept that he applied, for instance, to Shakespearean drama. Herder’s disciple, Johann Wolfgang von Goethe (1749–1832), soon adapted his insight. The *Critique of Judgment* (1790) by Immanuel Kant (1724–1804) developed more broadly and explicitly the analogy between a work of art and a living creature, which was developed by German Romantics such as Friedrich Wilhelm Joseph von Schelling (1775–1854) and Friedrich von Schlegel (1772–1829). Georg Wilhelm Friedrich Hegel (1770–1831) declared in his *Lectures on Aesthetics* (posthumously published in 1835) that genuine art required “self-enclosed completion” to be judged beautiful.

The most influential English critics expounded similar doctrines. Samuel Taylor Coleridge (1772–1834) proclaimed that the principle of “unity in multiplicity” constituted the essential feature in human imagination. That is, the genius of imagination was to draw together disparate and even contrary elements into a single, unified, seamless whole. William Blake (1757–1827) seconded this organicist aesthetics, and it was restated regularly by the English as well as Italian schools of neo-Hegelian philosophy of the late nineteenth and early twentieth centuries, represented by figures such as Bernard Bosanquet (1848–1923) and Benedetto Croce (1866–1952).

Theology and Cosmology

Many of the world’s religions and philosophies have regarded the universe as possessing an organic unity as a macrocosm of a living body. For example, Hinduism, Sufism, the Russian philosophy of All-Unity, and numerous strains of Christianity (especially those of a mystical or neo-Platonic bent) display organicist tendencies by viewing the world as a collection of diverse beings that nevertheless possesses an integral unity. In this way, human beings may connect with God by submitting to the purposes found in the larger order of the cosmos; divinity is found in all things and orders diversity.

Perhaps the most controversial example of organic unity within the frame of religion is the Christian doctrine of the Trinity, that is, the idea that God is Three-in-One. Debates about the trinitarian character of divinity have long raged among theologians, who have been repeatedly challenged to explain how God can be composed of a single substance if He

is also three different and distinct beings. (Adherents to more strictly monotheistic doctrines, including Jews and Muslims as well as unitarian Christians, have found this teaching absurd or even polytheistic.) Some version of organicism has afforded trinitarian theologians a way to explain the three-fold yet single nature of God.

Social and Political Thought

Perhaps the most common expression of organicism on a global scale is the analogy between the living body (human or animal) and human community. The so-called metaphor of the body politic may be found in a number of ancient sources, including Asian works such as the *Analecets* of Confucius (551–479 B.C.E.) and the *Arthashastra* of Kautilya (fl. 300 B.C.E.). In all cases, the aim of authors in deploying the analogy is to move beyond a strict hierarchical system of subordination and rule in social relations and to proclaim a principle of “reciprocity.” A reciprocal relation connotes a natural self-regulating harmony or balance between the parts of the organism that aims at a higher goal such as justice within, or the material welfare of, the whole. Thus, the common tendency to equate organic theories of society with hierarchy *per se* is misinformed, although some conceptions of the body politic are stridently hierarchical.

In Western thought, the origins of the body politic can again be traced back to Greece and Rome in the writings of Plato, Aristotle, Cicero, and others. It was during the Latin Middle Ages, however, that the organic metaphor for society became commonplace. In its earliest expression, and perhaps under the influence of Plato’s *Timaeus*, medieval society was divided into a three-fold yet unified functional order of those who fight, those who work, and those who pray. This was later replaced by a more self-consciously organic doctrine, the most influential exponent of which was John of Salisbury (1115 or 1120–1180). His *Policraticus* (completed 1159) contained an extensive account of how each of the organs and limbs of the human body—from the head to the toes—had a direct counterpart in society, from the king all the way down to the peasants and artisans. John’s depiction of the organic community was widely disseminated and repeated by philosophers and political commentators, although many different implications (including surprisingly egalitarian ones) were drawn from it. In 1406, Christine de Pisan (1364–c. 1430) became the earliest author to construct an entire political treatise, *Le Livre du corps de policie* (*The Book of the Body Politic*), around the analogy. Christine made a special point of including advice even to the humblest of subjects—artisans and peasants—that explicitly demonstrated her respect for their contributions to the social whole.

Decline of Organicism

The rise of modern scientific thought and of moral and political individualism profoundly challenged and damaged the organicist outlook. The tendency to consider nature in mechanistic and evolutionary terms devalues the distinctively organic and purposive character of biological creatures, as does the emphasis on the individual as the building block of social institutions. Organicism has been conflated with methodological holism in

logic and metaphysics or, worse still, with collectivism and authoritarianism in politics. Likewise, poststructuralism and other twentieth-century movements in criticism disputed the very uniqueness of the work of art as a cultural form distinct from its surroundings. Still, the popular invocation of phrases such as “body politic” suggests that the inclination to conceive of diversified unities in organicist terms has not completely disappeared from the intellectual stage.

ORIENTALISM.

This entry includes two subentries:

Overview

African and Black Orientalism

OVERVIEW

The Arab-American political activist and professor of European literature Edward Said (1935–2003) durably redefined the term *Orientalism* with the publication in 1978 of his book by the same name. Before Said’s book, Orientalism had two distinct meanings. Both were politically neutral and marginal to the central concerns of the humanities and social sciences. After Said’s *Orientalism*, these two meanings have been collapsed into one that is highly charged politically and central to contemporary debates in the humanities and social sciences, while at the same time covering a smaller historical span than either of the two earlier meanings of the term.

One of the older meanings was the presence of motifs, themes, subjects, or allusions in the music, art, or literature of the Western world that were borrowed from, or meant to evoke or represent, the Orient. For the purpose of these artistic trends, the Orient meant, effectively, the lands immediately to the East and South of Europe: the Ottoman Empire (which included much of Southeast Europe), North Africa, the Arab lands, Iran, and Islamic Central Asia. While these lands have been in recent centuries the core of the Islamic world, Orientalist artists and writers did not separate the Islamic from the earlier ancient Orient in their imaginative constructions. And their interests could run from the current affairs of their own times to far earlier periods. Hence, Gustave Flaubert (1821–1880) wrote of nineteenth-century Egypt in his travel literature, but set his

novel *Salammbô* in ancient Carthage. Similarly, the painter Eugene Delacroix (1798–1863) could exploit the same imagery to portray current events such as the Greek revolt (like most Romantics, he took the Greek, anti-Turkish, side) or the death of the ancient Assyrian ruler, Sardanapalus.

Oriental elements played several important roles in European creative arts. Musicians from Ludwig van Beethoven (1770–1827) and Charles Camille Saint-Saëns (1835–1921) to Nikolai Andreevich Rimsky-Korsakov (1844–1908) and Mikhail Mikhaylovich Ipolatov-Ivanov (1859–1935) borrowed instrumentation or characteristic modes. Writers introduced Oriental tales and settings to create exoticism and/or to gain critical distance from European mores and institutions (for example, the work of Voltaire [1694–1778] and Montesquieu [1689–1755]). Painters sought dramatic exotic subjects, different light, and often also the titillation of harem scenes. But such erotic exploitations were also made of classical antiquity.

The second meaning of Orientalism was the scholarly study, in the West, of the Orient. Scholarly Orientalism was based upon the study of ancient languages, other than Greek and Latin and their modern descendants. This meant Hebrew and the other Semitic languages, including Arabic, as well as Ancient Egyptian and Coptic (along with Assyriology) and eventually Persian and Turkish in their various historical manifestations. Methodologically, such Oriental studies were the extension of Classical studies. Philology was the queen of the sciences and the critical edition carried pride of place among scholarly achievements.

As a scholarly endeavor, Orientalism was pursued in a variety of European countries, as well as the United States. While scholars in some countries were naturally drawn to areas of local interest (for example, Spaniards in the Muslim domination of the Iberian peninsula, Italians in the Muslim occupation of Sicily), the most important sources of Orientalist scholarship were Britain, France, and Germany (with an important U.S. role beginning after World War II). Of these countries, Germany was for many years the most important (and of the three, the most influential in the development of American Orientalism), in line with the general leadership role of German scholarship in the West in the nineteenth and early twentieth centuries.

For most of the years preceding Said, the Middle Eastern response to scholarly Orientalism was mixed, but low-key. Archaeologists were considered in most quarters to be treasure hunters, especially as markets in antiquities (black and otherwise) continued to parallel archeological activities. There was also a widespread suspicion, not always misplaced, that Western scholars in the region were spies for their governments. Yet, despite this, Orientalists were always well down on the list of suspicious foreigners, preceded, for example, by missionaries, Zionists, and the more formal actors of military, political, and economic imperialism. There have always been many in the region who have openly collaborated in the Western scholarly enterprise. Middle Eastern scholars even attended European Oriental congresses at the turn of the twentieth century. Some among Middle Eastern educated elites were

flattered by Western attention to their culture, some bemused, and most indifferent.

The attitudes of Western scholars to the imperialism that characterized so much of the nineteenth and twentieth centuries were also mixed. A few supported it, but many opposed it, taking the sides of the peoples they studied. Among cultural Orientalists, many Romantics (and some socialists such as the followers of Comte de Saint-Simon [1760–1825]) sought a strong East whose powerful spirituality could balance what they saw as the overly materialistic West.

Said conflated the two earlier meanings of Orientalism while associating the new amalgam with Western imperialism in the lands of Islam. For Said, both the cultural Orientalism of artists and writers and the scholarly study of the Middle East were separate facets of the same phenomenon: a hegemonic Western vision of the Islamic world. This vision was not a reflection, however distorted, of a Middle Eastern reality. Instead, it was an entirely Western construct reflecting Western fears and appetites in association with Western imperialism, which it both aided and benefited from. The usefulness of Orientalist knowledge to imperialism was based in its essentials not on the accuracy of practical information but on the notion of Western strength, activity, and superiority contrasted with Oriental weakness and passivity.

The thesis of Orientalism as the handmaiden of imperialism (or the other way around) was reinforced by Said's decision to ignore German scholarship and concentrate instead on British and French and, later, American production. If such a choice does not fit the history of scholarly Orientalism, it fits well the cultural marks that European imperialism left on the Arab world. A knowledge of English or French (and sometimes both) is common among the more Westernized members of the Arab intelligentsia. Many are those (such as Said himself) who received their instruction in French- or English-language schools in the region. German is rarely found outside of Turkey.

The same can be said of Said's choice of epochs. For scholarly Orientalism, the connection with the Ancient Near East was crucial. Arabic and Hebrew were studied together under the intellectual canopy of Comparative Semitics. Not only philologists but also anthropologists thought that studying the Arabs could help them understand the Hebrews of the Bible. In *Orientalism* as well as subsequent writings, Said concentrated on Western attitudes to the region in its Arab and Islamic periods. This, too, reflects cultural politics on the ground. Popular attitudes as well as the dominant political movements have almost always based their sense of identity on the region as it was remade by the great Arab Islamic military (and only later cultural) expansion of the seventh century. This is as true of the Arab nationalism whose influence is waning at the turn of the twenty-first century as it is of the Islamic revivalism simultaneously in the ascendant.

Interest in the pre-Islamic world has virtually no popular existence and is confined to relatively marginal branches of the Westernized intelligentsia and occasional clumsy manipulation by authoritarian governments. It should be noted that during

the heyday of imperialism, local participation in the study of the pre-Islamic East was not always encouraged, although since independence in the mid-twentieth century the situation has been completely reversed.

Focusing on the Arab-Islamic periods and especially on the period of Western imperialism supports the political claims of both Arab nationalists and Islamic revivalists. Attention to the period before the rise of Islam has the opposite effect, and instead could carry grist to the mill of Zionists, since it is on ancient history that the latter base their historical claims.

Said's insistence on the hegemonic implications of intellectual and cultural discourses harks back to Antonio Gramsci (1891–1937). But both the Arab-American professor's focus on discursive practices and their association with power, and his identification of a virtual episteme whose essence remains unchanging while its forms vary superficially, show the influence of Michel Foucault (1926–1984). One difference is that Foucault wrote of the invention of the human sciences while Said treated only a specific application, that of one civilization's vision of another. A second difference would be that in several of his most famous works, Foucault specifically linked intellectual discourses with institutional practices (for example, in medicine and penology). Said, by contrast, leaves the relationship between cultural discourses and specific imperialist practices unarticulated.

As cultural politics, Said's *Orientalism* brought together Zhdanovism, *tiers-mondisme*, and American multiculturalism. Zhdanovism, or intellectual Stalinism, is the extreme version of intellectual engagement. It argues that knowledge must be judged according to whether or not it serves the political interests of the forces of historical progress. In the original version, this meant the interests of the proletariat as confounded with those of the Communist movement and the Soviet Union. Said makes no such bald claim, but his assumption that Orientalist knowledge is vitiated by its association with imperialism, along with his complaint that such scholarship did not represent the historical aspirations of the peoples of the Middle East, leads to Zhdanovist conclusions. And this is certainly how his followers have applied Said's work. *Tiers-mondisme*, as associated for example with the work of Frantz Fanon (1925–1961), substituted the third world for the proletariat of advanced industrial societies as the carrier of historical progress, turning Western imperialism and resistance to it from relatively marginal events to the center of the story of the emancipation of humanity. As an academic practice, American multiculturalism redefines scholarly domains by the ethnic or other identity groups considered the subject of study. At the same time, academic multiculturalism stresses the distinct experiential knowledge of members of the group, implying that they should have a dominant, for some even exclusive, role in the study and teaching of these newly defined subjects. Multiculturalism then intersects with social policy as it blurs the distinction between diversity in the faculty and diversity in the curriculum.

Most reviewers of *Orientalism* found the work to be seriously damaged by errors that showed its general ignorance of the Middle East and scholarship on it. This was even true of reviewers who sympathized with Said's political positions on

the Middle East. Many also called attention to his tendentious arguments and highly debatable interpretive leaps. Yet despite these reviews, Said's extraordinarily dense prose, and his thinly stretched reasonings, *Orientalism* was an international best-seller. It has been translated into numerous languages and made of Said the best-known professor of English in the United States and one of the most influential academics on the world scene. In the field of Middle East studies, his impact was dramatic. Never, it would appear, has a long-established episteme been so swiftly overthrown, or at least never have so many run away from it so quickly. Orientalism became a dirty word. The international Orientalist congress even changed its name.

When Said's book appeared in 1978, Middle East studies in the United States, and to a lesser degree in Europe, was already at a turning point. The old philologically based Orientalism was ceding leadership to the new area studies paradigm supported by massive U.S. government post-Sputnik Cold War expenditures. If the old Orientalism favored ancient and medieval civilizations with their classical languages, the new area studies favored the imperial and post-imperial world while deemphasizing language knowledge. Institutionally, the rivalry was reflected in competition between the American Oriental Society, for the old school, and the Middle East Studies Association, for the new. In this environment, it was relatively easy for the area studies specialists to claim distinction from the Orientalists. And this despite the fact that Said was careful to include the new area studies in his condemnation.

The triumph of anti-Orientalist sentiment operated dialectically with other trends. The European-trained immigrants who founded American Orientalism after World War II largely failed to reproduce themselves. Some circles in the old Orientalism discouraged the participation of natives of the region. New waves of professors came less and less from the old classical languages mode. Increasingly, they were immigrants from the Middle East, aided by the contemporary cult of native-speaker language teachers. Or these professors were Peace Corps veterans who had fallen in love with their country of assignment (especially with Iran), and often with one of its citizens. Such experts were naturally more sympathetic to the political interests of the region they studied. In this, they reflected most area studies in which, with the pointed exception of Communist Eastern Europe, practitioners identified with the causes of chosen regions and were often sharply critical of U.S. government policy. Just as French *tiers-mondisme* was in many ways a reflection of the brutal and divisive Algerian War, American anti-Orientalism was nourished by the sequels of the Vietnam trauma. American elites after the civil rights movement were justifiably sensitive to any charge of racism, and anti-racism became a leading value in American academic circles. This is one of the reasons why anti-Orientalism has had a deeper impact on American scholarly production than that in Europe, despite the latter continent's history of direct imperial administration of the Middle East.

Said's public, and courageous, political assumption of his Palestinian identity and his outspoken defense of the Palestinian cause also strengthened the reception of his ideas. Few knew in those early years that Said grew up in comfortable

circumstances in Alexandria, Egypt, studied in English language schools such as the prestigious Victoria College, and was not at home in the language of his ancestors. The 1980s and 1990s also saw intellectual and academic sentiment in the United States, originally sympathetic to Israel, become increasingly critical of the Jewish state and concerned with the plight of the Palestinians.

Said's intellectual influence was apparent among graduate students in the early 1980s. Those who taught in those years remember the earnest objections to any comments or materials that seemed to cast the Middle East or its peoples in an unflattering light. A number of ideas, based upon Said, became common currency among students who later became professors. Generalizations about the region were vulnerable to opposite critiques. Applying a Western model to the Middle East was Eurocentric. Creating a distinct model for the region was censured as the fabrication of an Oriental essence. Critics who were ignorant of the history of their field of study, or who doubted the cultural and economic reality of the Islamic Middle East, argued that Orientalism (or Middle East studies) was the only field that had created its own object of research before describing it. Charges of reification and reductionism fell like rain.

The intellectual fracas around Orientalism played to predilections in the American academic market, especially the national reluctance to learn foreign languages. A movement dedicated to fighting Western arrogance has had the paradoxical effect of restricting knowledge. The Orientalists were language buffs and commonly worked in more than one Near Eastern language and half a dozen European ones. Their successors do not often have a command of more than one Near Eastern language, and regular use of more than one European language (other than English) is rare. At the same time, the scholarly study of the Western image of the Orient has blossomed from a minor subfield of English or French literary studies into a central area of inquiry, even among scholars of Middle East studies for whom such topics are politically safer and linguistically easier. The unflattering examination of images of the Arabs and the Middle East in American popular culture also flourished. Paradoxically, the Orientalism controversy has shifted relative attention from the region and back to an American society obsessed with identity politics.

But the impact of Professor Said and the *Orientalism* paradigm has gone far beyond Middle Eastern or other Oriental studies. Among scholars of English—and to a lesser degree of other European—literatures, Said was a major if not the most important force behind a shift in emphasis in literary studies. To his supporters, this was a salutary move from formal literary-textual properties to historical situations of creation and reception, from aesthetic interests to political ones. To its critics, this trend represents a license for writing on history and politics by scholars who have neither the background, training, nor methodological awareness provided by the disciplines of history and political science.

Knocking Orientalism off its academic pedestal also led to the creation of a self-consciously new academic subfield: post-colonial studies. Though some historians and anthropologists

have adopted this model, its major intellectual home remains departments of English and, to a lesser extent, those newly created departments and programs of Cultural Studies. The area treated by postcolonial studies is for the most part coterminous with the domain previously assigned to Third-World Studies. The greatest novelty of postcolonial studies is a relative shift of emphasis. On the one hand, by constantly referring to the post-colony, this approach deemphasizes both the earlier precolonial history of the societies in question and the differences in the nature of the imperial impact on different cultures. Postcolonialism emphasizes relations between the colony and the metropole, making imperialism the most important factor in the history of non-Western peoples, just as the term colony expresses the greatest degree of imperial subjugation. At the same time, postcolonial studies have highlighted the increasing interpenetration of Third World and First World societies associated with globalization. Said is generally credited as the godfather of postcolonial studies.

Events of September 2001 inaugurated a new phase in the evolution of Middle Eastern studies in the United States and at the same time in the debate over Orientalism. These 2001 phenomena have done so by accelerating trends already present. The better-known event was the terrorist attacks on New York and Washington, D.C. on September 11, 2001, carried out in the name of Islam. But only a few days before, an international conference against racism that took place in Durban, South Africa, inaugurated a new member into the club of social evils: Islamophobia. As an irrational fear of Islam, or even just a fear of Islam, Islamophobia is the progeny of Said's *Orientalism*.

But the attacks of September 11 were also the most violent expression of larger trends in the Middle East. The popularity of Said and of his works among the relatively secularized branches of the Middle East intelligentsia has masked the fact that the positions championed by Said—cultural openness and progressive politics combined with vigorous anti-imperialism and anti-Zionism—have lost ground to a frequently reactionary Islamic revival in religion and politics. Middle East experts did pay some attention to this trend, but they tended to underestimate its importance, its reactionary nature, and its capacity for violence. Ironically, this underestimation was at least partly caused by the effects of the Orientalism controversy. On the one hand, scholars were reluctant to broadcast bad news from the region. On the other hand, the attack on the Orientalists discredited, by association, everything they stood for. This included knowledge of the more classical forms of Arabic. Said's work accelerated the trend, already present in area studies, to shift Arabic instruction in American and European universities from the more classical to the more modern versions of the language, sometimes going so far as to seek to replace the modern literary idiom (which is universal for the region) with instruction in the local spoken dialects.

And yet the classical form of Arabic has been the preferred medium, in some ways the cultural signature, of the Islamic revival. The twenty-first century's Islamists and Jihadists use classical formulations and quote medieval sources and examples with great frequency. This goes well beyond the citation of the Koran and hadiths (the sayings and actions of the

Prophet Muhammad) to include medieval theologians, commentators, and historians. Academic Middle Eastern studies in the West was moving away from the classical idiom at the precise moment when the Arabs were returning to it.

The September 11 attacks reversed this trend by creating a new model for Middle Eastern studies, the institute or department of Islamic Studies. Increased public demand for knowledge on this now apparently important subject has been met with increased supply as both Muslim governments and Islamic groups in the United States have combined to support new university positions. This trend, when added to the slightly earlier expansion of Jewish studies, has further strengthened the identity-based nature of American university scholarship on the Middle East.

In the wake of September 11, American media, both popular and elite, are engaged in a debate about the nature of Islam and its role in the modern world. Is Islam a religion of peace? Or one that advocates holy war? Did the terrorists hijack a religion or merely express one of its options? Are those who criticize Islamic movements, institutions, or leadership echoing a long-held Western prejudice based on ignorance? Are fears of Muslims as potential terrorists in the United States prudence or prejudice? Would airport profiling or selective immigration rules be part of American racism? Are Arabs in America subject to discrimination as people of color? All these debates come back to the fundamental issue of Orientalism, as redefined by Said—a deeply held Western prejudice against the East, serving imperialist causes. In this way, the controversy over Orientalism continues, though the word itself has almost disappeared, victim of the political success of its critics.

AFRICAN AND BLACK ORIENTALISM

Edward Said's 1978 book, *Orientalism*, is the harshest critique to date of Western scholarship on the Muslim orient. However, its focus is almost exclusively on the Near and Middle East. The policy statements of William Ponty, the French governor-general in Senegal (1907–1915), quoted below suggest a link between Orientalism, as understood by Edward Said, and colonial scholarship on Muslim societies in sub-Saharan Africa.

It is our duty to study the Muslim society of our colonies in the minutest details. . . . It presupposes special studies of Islam which the great Orientalists of France and of Europe have now virtually succeeded in establishing. . . . [The study] will seem very attractive to many because of the scientific interest attached to it. But above all it is interesting for political and administrative reasons. It is almost impossible to administer an Islamic people wisely, if one does not understand its religious faith, its judicial system and its social organization, which are all intimately connected and are strongly influenced by the Coran [*sic*] and the prophetic tradition. It is this understanding of native society which, alone, will enable a peaceful and profound action on the minds of the people. It is, therefore, in this study . . . that we will find the surest bases and the most suitable directions for our Muslim policy. (Harrison, p. 107)

Writings such as these have prompted scholars to explore the links between Orientalism and European-language scholarship on Africa, produced notably during the colonial period.

Africa and European Colonial Scholarship

European governments commissioned much of Western scholarship on African Muslim societies produced in the colonial period. The most influential writers on African Islam were scholar-administrators, or at least closely linked with colonial administrations. Britain, Germany, Holland, and France commissioned the most respected specialists on Islam to study the Muslim societies that were coming under their rule. The scholarship therefore studied Islam as a focus of resistance to colonial rule. Sometimes the scholars sought to justify the colonial undertaking.

For example, the writer of the apology of British occupation of Northern Nigeria, *A Tropical Dependency* (1905), was

Flora Shaw, the colonial correspondent for the London *Times*, who eventually married Lord Lugard, the first high commissioner of the British protectorate of Nigeria. Lady Lugard argued that African Islam had lost its initial grandeur and had betrayed its own ideals. Britain could, therefore, no longer ignore her historic responsibility to take over.

An anthology of works on African Islam by colonial-administrators would be encyclopedic. François Clozel, Maurice Delafosse, Jules Brévié and Paul Marty, Lady Lugard, Christiaan Snouck Hurgronje, and C.-H. Becker, to name a few, all adapted their writings for use by the colonial establishments that they served. Other scholars, such as Edward Wilmot Blyden, were missionaries, who by and large saw Islam either as an obstacle in their bid to Christianize Africa or else as a temporary and intermediary stage in the black African's journey from "paganism" to Christianity.

The image of African Islam that emerges from these writings is not consistent. Islam is revolutionary; it is fatalistic. It is misogynist; it elevates the status of the African woman. It is egalitarian; it allows a small clique of religious men (*marabouts*) to live at the expense of their gullible followers. All these perceptions and more had a lot to do with the concrete experiences of the scholars, the diversity of the societies studied, and the changing priorities and political landscapes of the colonizing countries. In consonance with the essentialism that Edward Said decries, writers tended to explain the behaviors of individuals and communities by evoking the single, universal, and unchanging reality of their being Islamic.

Not all of the images about African Muslim societies in colonial scholarship are, therefore, negative. Moreover, one has to acknowledge the great contributions made by some of the Orientalists to our knowledge of the societies they studied. For example, it was Octave Houdas, a French Orientalist, who studied and translated into French, over a hundred years ago, two of the most significant histories of West Africa, the *Tarikh el-Fettach* and the *Tarikh es-Soudan*. He was aided in this by Maurice Delafosse, a French linguist and ethnologist, who also a French colonial administrator. It is the view of some modern commentators that many of the Orientalist approaches to African Islam have been carried over into contemporary scholarship on Africa and African literature.

Orientalism, African Literature, and Criticism

George Lang is likely one of the first scholars to draw attention to Orientalist features in European-language African writing. Lang explores the effects of the reductions of Islam's complexity upon Africanist writing. The denial of the complexity of Islam impedes the understanding not just of Islam but of Africa. In the area of literary criticism, very frequently one or other dimension of Islam is either missed by Western critics or cast out of context. This also leads to significant misinterpretations of African novels of Islamic inspiration. Similar arguments are developed in Ahmed Bangura's book *Islam and the West African Novel: The Politics of Representation* (2000).

Edris Makward acknowledges a new shift in the African novel from a linguistic (English-French) to a religious polarity

based on writers' attitudes to Islam. The thought was impressed upon him by an address given in 1979 by Wole Soyinka in which Soyinka praises Sembène Ousmane, a Senegalese writer, for being critical of Islam in his work while denying Cheikh Hamidou Kane, another Senegalese writer, the merit of authenticity for depicting Islam as part of Senegal's heritage rather than as an alien religion that was imposed through violence and other coercive means.

Similarly, in the early 1990s Ali Mazrui and Wole Soyinka were locked in a debate pertaining partly to the question of African authenticity and the Islamic factor. Ali Mazrui wrote the article "Wole Soyinka as a Television Critic: A Parable of Deception" in response to Soyinka's negative critique in *Index to Censorship* of Ali Mazrui's television series, *The Africans: A Triple Heritage*. In his article, Soyinka accuses Mazrui of denigrating indigenous African culture in the series. Perhaps more significantly, he alludes to the fact that Mazrui is not only culturally Arabized, he is also by both blood and vocal identification part Arab. In both the address alluded to by Edris Makward and the debate between Soyinka and Mazrui, Soyinka repeats some of the negative opinions about Islam that one finds in colonial writings: Islam is a seductive superstition that was imposed on the Africans through the sword. Perhaps more significantly, Soyinka is ready to discredit an African scholar's interpretation of African history on the bases that the scholar is a Muslim and has allegedly Arab-Islamic sympathies.

Wole Soyinka's critique of Islam is part of an intellectual current that some commentators would consider to be Orientalist. It is related to the issue of Islam and African or black identity. Some African and black scholars assert that black Americans and black Africans who profess or advocate Islam are committing a form of cultural apostasy. They are critical of all "alien" ideologies such as Islam, which have allegedly brought havoc to Africa and the Black Diaspora.

Black America and Black Orientalism

Ali Mazrui was probably the first person to use the term *Black Orientalism* in his critique of the PBS documentary *Wonders of the African World*, produced by Henry Gates, an African-American professor. According to Mazrui, Gates is a Black Orientalist because he made condescending, paternalistic, ideologically selective, superficial, and uninformed depictions of Africa. He also suggests that Gate's emphasis on black Africans' participation in the Atlantic slave trade ends up exonerating the West. Just as Western Orientalist scholarship was used to justify and promote colonialism, Gate's work is an apology for European colonization and domination of the African continent.

Mazrui's use of Orientalism is very unconventional. He does not focus on Gate's attitudes toward Arabs, Muslims, and Islam, although Gate's documentary made what could be construed as negative and problematic portrayals of Arabs in the segments on Egypt and East Africa. Moreover, it is not clear why Mazrui calls Gate's alleged Orientalism "Black" and not African-American or just American.

Black Orientalism and "Immigrant" Islam

Sherman Jackson's article on "Black Orientalism" helps one to see Orientalism in the context of the African-American

experience. Jackson detected a major shift in black American responses to Islam and the immigrant Muslim community in America. Prior to the wave of Muslim immigration to America in the 1970s, Islam was by and large perceived in the black community as an authentic expression of African-American spirituality and identity. The gains of Islam that resulted from this perception constituted a loss to other African-American religious denominations and movements.

Then the new immigrants came with historical Islam from the Middle East and other parts of the Muslim world. The center of Islamic religious authority started shifting away from its erstwhile black core to new forms of orthodoxy that did not always manifest an understanding of African-American religious and ideological aspirations. "Real Islam" came to be perceived in segments of the African-American community as the religion of Arabs and foreigners, and black Americans who professed Islam increasingly faced the criticism of being cultural heretics, "self-hating 'wannabees' who had simply moved from the back of the bus to the back of the camel" (Jackson, p. 22).

Jackson makes a distinction between a critique of Islam, Arabs, and Muslim societies based on experience and sound knowledge and criticism based on imagination, ideology, and projection. It is the latter that can be called Orientalist. Black Orientalism seeks to undermine the popularity of Islam among African-Americans by highlighting the alleged race prejudice of the Muslim world. Jackson singles out for particular criticism the Afrocentric movement as it is best articulated in the writings of Professor Molefi Kete Asante, notably in *Afrocentricity* and *The Afrocentric Idea*. While Jackson reveals the problems in Black Orientalism, he also cautions immigrant Muslims to be sensitive to African-American Muslims' historical experience and to be active in building bridges with indigenous American Muslim communities. A failure to do so will alienate African-American Muslims and provide evidence to Black Orientalists, who are all too eager to portray Islam as a foreign and racist religion.

Jackson's study indicates that Black Orientalists are critical of Islam mainly on racial grounds. It would have been more helpful had it addressed the interlocking issue of Islam and the black American Muslim woman's experience. After all, Islam is more commonly perceived as holding women in subordination. This perception is, however, at odds with the enduring attractiveness of Islam to many accomplished black American women. The illustrious life of the late Betty Shabazz is worth citing, and so are the endeavors of other African-American Muslim women such as the professors Aminah McCloud and Carolyn Moxley Rouse, as well as many others, who are making their mark in different spheres of life.

Incidentally, Rouse's book *Engaged Surrender: African American Women and Islam* (2004) seeks precisely to clarify what Islam may mean to some black American women who have accepted it as their faith.

Conclusion

Based on the foregoing analysis, one can see that Orientalism, as it applies to Blacks and Africa, describes realities that are

not necessarily in consonance with Edward Said's original use of the term. In Said's usage, Orientalism is place-bound. It refers to scholarship on the Muslim orient. George Lang, Sherman Jackson, and other scholars have focused on the central targets of Orientalist discourse—Arabs, Islam, and Muslims—regardless of the geographical location.

Ahmed S. Bangura

ORTHODOXY. The very suggestion of a unified tradition implicit in the idea of the word *orthodox* renders its meaning problematic for the simple reason that conceptions of any religion's traditions are notoriously pluralist. Moreover, the term is hardly universal, since it is seldom applied to indigenous traditions around the world, even though there are some beliefs and practices within each aboriginal group that might be regarded as orthodox to some practitioners—for example, the Plains peoples in North America regard the Sundance as an "orthodox" rite. Generally the articulation of a theological system is one requirement of an orthodox tradition, and indigenous traditions rarely have such a publicly acknowledged construction. Despite its problems, though, major religions continue to use the term, and believers, external observers, and sometimes scholars find it useful. In the contemporary period, it embraces notions of the

traditional, conservative, basic, and customary, all of which point to a normative idea about a religion's self-understanding. Because history, rituals, institutions, and doctrines all combine in manifold ways in each religion, orthodoxy really has to be understood from within each religion. Key notions will be drawn from diverse religious traditions.

Christianity

Christianity, for example, has a major group of churches whose links to each other in a single communion constitutes the Orthodox Church. Adherents look back to the great ecumenical councils and even to Jesus's apostles as the root of their identity, but the groups that make up national churches known as autocephalous (meaning that they are in full communion with each other, but independent of external, patriarchal authority) also acknowledge autonomous churches—that is, those that are not in full communion with them (usually because of some jurisdiction issue). Other issues related to identity also play a role; Orthodox Christianity makes much of its connection to the Greek fathers, has adopted the Julian calendar, affirms the validity of married parish priests, and gives an important place to monasticism, especially that of Mount Athos, from which the episcopacy is drawn.

Orthodox Christianity's central doctrinal difference with Western Christianity concerns the Trinity as developed by St. Augustine; Orthodoxy rejects the *filioque* affirmed by the Latin Church; the Latin idea was that the Holy Spirit proceeded from both the Father *and* the Son. Orthodoxy made the rejection of this doctrine a central fixture of its beliefs. Perhaps as a result, a different spirit is to be found in Orthodox liturgy, where the worshipper is encouraged to experience the presence of God in the sacraments, the icons, and the beauty of the rituals. This emphasis implies an engagement with God's mystical presence in many forms, whereas the Western Church emphasizes the person of Jesus Christ as the principal focus of that engagement.

Beyond this reference to particular institutional churches, however, one must acknowledge that Christianity in general holds certain notions to be orthodox: the idea of a sacred writing called the Scriptures, the role of the community of believers, the church, the central place of Jesus Christ in the understanding of revelation, and a firm commitment to the concept of God. While each of these doctrines is configured according to each group's theological instincts, all Christian groups insist on these conceptions as normative, and in some sense they all see them as existing from the beginning of the tradition. Feminist theologians have raised questions about the representativeness of such "orthodoxies," since, they hold, the orthodox theologians ignore the patriarchal substratum within which conventional theology was framed. The feminist claim is to a more authentic equality and inclusionary model before the official orthodoxy shaped the accepted discourse. Despite these claims, one point seems convincing: included in the term *orthodoxy* is the idea that it reflects a loyalty to the original or authentic content and expression of the religion.

Judaism

Religious orthodoxies are not necessarily historically ancient. Judaism's distinctive Orthodox tradition is fairly recent: 1791.

In this year, France recognized Judaism as a separate religion. This was partly in response to Moses Mendelssohn's influence, but also to Hasidism (established by Shem Tov [1700–1765]), which became an international movement emphasizing the return to the fundamentals of the tradition. By the beginning of the nineteenth century it had become clear to practicing Jews that the Orthodox way of life could be demarcated from those who affirmed a reforming vision of the tradition. Those who believed that the law, whether oral or written, was divine came to be known as Orthodox; for them, Torah could not be subject to modernization or cultural alteration, as the Reform Tradition insisted should be done.

For the Orthodox believers, however, the central ideas of their faith had nothing to do with Reform doctrine. Rather, Orthodoxy was based on limitations on the kinds of food that could be eaten under the laws of *kashrut*, proper observance of the Sabbath (i.e., restraint on activities on the day of rest), and a vigorous commitment to family purity. In effect, Orthodoxy was (and is) home-centered in ways other Judaic traditions were not, for the purity of the family arose out of relations between husband and wife and could not be observed by outsiders, while the laws of *kashrut* were principally practiced in the home. A life of training at home coupled with school-supported teachings and solid synagogue attendance constituted the main parameters of the Orthodox way of life; a corollary of this approach was (and is) a certain reluctance toward participation in modern life and even a trend towards isolation, especially in the face of contemporary secularism.

These beliefs have institutional impact; a central perception is that both non-Orthodox rabbis and converts to Judaism are beyond Orthodoxy and hence outside the community of those who practice the true Torah life. Consequently, community membership is hence strongly defined. In North America, Orthodox communities have steadily maintained their presence through an emphasis on the Hebrew language, *yeshivot* (day schools), and a trained rabbinate through Yeshiva University. Such an emphasis on a "true" Torah education also sets the Orthodox tradition apart from believers in the Conservative, Reform, and Reconstructionist branches of modern Judaism. The experience of the Orthodox in Judaism highlights the fact that orthodoxy is not always rooted in religion's antiquity.

Islam

Islam also reflects how difficult it is to define the term *orthodoxy*, even for a tradition that holds that the *umma* (the Islamic community) is theoretically united as one because God is one and He has given one divine Scripture, the Koran. There is, for example, no word in the Koran that is equivalent to the English word *orthodox*. Western writers often regard Sunnism, the tradition to whom the majority of Muslims belong, as orthodox, and many introductory texts define orthodoxy that way. But such a view is not valid, because Shiism, the other important group in Islam, does not regard Sunnism as defining Muslim orthodoxy for a variety of reasons, and even Sunnis would be reluctant to regard their beliefs as "normative," implying that others are not, because the Koran insists that one's true religion is to be judged by God, not by humans.

JEWISH ORTHODOXY

Of all the things you can teach, Gemara (explanations of the Mishna) is more important than anything else. Gemara is everything. It is *Torah sheh ba'al peh* (the Oral Law). It's the real stuff. Everything else will follow. In this world it is *Torah sheh ba'al peh*, which is the harder way, not the sweet way; it's demanding But we also give them what the guys call "bags of candy." We always laugh about it. They themselves call other studies bags of candy after a while. The rabbi calls it that, too. He says, "Okay. Give out bags of candy."

Moreover, contemporary Islam has been challenged by Islamism, or fundamentalism, which cuts across traditional distinctions between Sunni and Shii and embraces a neoconservative ideology that its practitioners regard as orthodox. Part of the doctrine of that stance involves an antipathy to all non-Muslim ideas and cultural expressions. Currently the West, in all its cultural diversity, is the object of that negative reading. This perception of Islamic orthodoxy is rejected by both mainstream Sunnis and Shiis.

Some scholars prefer to regard Sunnism as an orthopraxy, meaning that the way of life developed by most Muslims around the world reflects important common elements of belief and practice. The formation of a normative path for the believer to walk, particularly by means of the *shari'a* (Islamic law), became the preferred idea. Insisting on such a view accords with Sunni notions of their own tradition, because at a critical time in its development (c. 900 C.E.), Islamic doctrine moved away from Greek intellectual categories and the use of the mind to construct theologies. Such a movement reduced the input of the mind in constructing the true understanding of Islam. Still, even Shiis would accept that restriction with some modifications.

Despite these important qualifiers, orthodoxy does have a place in Islamic self-expression. For example, the Koran itself implores, "guide us in the *mustaqim* [straight] path" (1:6), thereby implying that there is a singular way of being Muslim that all should follow. Moreover, Muslims have always valued the noun *salaam*, a word whose meanings include soundness of being, an attribute of God, as well as peace; in its verbal form it means "surrender" or "submit," and in another form it gives the name of the religion, Islam. Furthermore, submitting to God is held to bring a special perfection to the human

The method of final salvation that I have propounded is neither a sort of meditation, such has been practiced by many scholars in China or Japan, nor is it a repetition of the Buddha's name by those who have studied and understood the deep meaning of it. It is nothing but the mere repetition of the "Namu Amida Butsu," without a doubt of his mercy, whereby one may be born into the Land of Perfect Bliss. The mere repetition with firm faith includes all the practical details, such as the three-fold preparation of mind and the four primordial truths. If I as an individual had any doctrine more profound than this, I should . . . be left out of the Vow of the Amida Buddha.

SOURCE: Honen's *Pure Land Buddhism*. In Ryūsaku Tsunoda, Wm. Theodore de Bary, and Donald Keene, compilers, *Sources of Japanese Tradition*. (New York: Columbia University Press, 1958), p. 208.

being, a perfection called *salaam*. Finally, from the Koran, the verbal form *waqaa*, which means to protect, defend, or preserve, has a noun form *taqwa*, god-fearing or righteousness. This word takes on special meanings in pious circles, for it suggests someone who lives according to normative Islam.

Some contemporary Muslim women have argued that too much of traditional scholarship, and indeed, most of the tradition since the Prophet, has been crafted without proper regard to the principles of equality. They therefore maintain that the true orthodox position of Islam was essentially gender-neutral; male scholarship subsequently skewed the true orthodox position away from women's equal rights (see Ahmed). They contend that Islam must return to the true orthodox position on gender relations. All these interpretations delineate the idea of ethical and religious exemplariness involved in any definition of orthodoxy.

Hinduism

Hindu tradition has always privileged diversity, and at first blush, discovering any form of orthodoxy in Hinduism may seem to be impossible. Indeed, there is no institutional form that the majority of Hindus would consider the orthodox group. Nevertheless, there are ideas within Hinduism that fulfill the notion of orthodoxy, such as those designated by the word *astika*, or assenting to the authority of the Vedas. Almost all Hindus would acknowledge the singular importance and basic religious authority of the collection of texts known as the four Vedas. Moreover, the ordinary believer would probably insist that the most important marker of orthodoxy is the religious activity and interpretation approved by the local Brahman; he defines normativeness for the common folk.

Scholars acknowledge that some rituals are not propounded in the Vedas—rituals such as cremation, for example. Yet cremation acts are certainly *smriti* ("that which is remembered"); they are required acts that go beyond the Vedic record but are held to be essential for an acceptable Hindu life. Such requirements may be found in writings such as the *Laws of Manu*, a work that provides evidence that local custom can also be a

source of the true *dharma* (duty). Yet once again such teachings are likely to be defined for the faithful by the most respected local authority. Those of a more philosophical bent might insist that the system of belief known as Vedanta is likely the most orthodox "theology," even where some of the notions of the philosophical system pose serious problems.

Finally, in Hinduism, even if orthodoxy is not enshrined in any one particular sect or group, it does take a social form. An orthodox Hindu social form is represented most plainly by the caste system. Following one's designated caste in everything, from how and with whom one associates, to the minutia of life (i.e., what caste the person is who prepares lunch) indicates a marker of special gravity in Hindu tradition. Hindu women are deeply affected by the traditional stance of the dharma on caste, for it has defined women's roles almost completely within the role of marriage. The subordination of women to their husbands is most graphically expressed in the rite of suttee (from the Sanskrit *sati*, "faithful wife"), in which the widow immolated herself on her husband's funeral pyre. Modern Hindu women struggle with the implication of an identity tied to husbands and not to their own dharma. Still, for many Hindus, whether male or female, proper caste interaction is a true measure of one's orthodoxy.

Buddhism

The issue of orthodoxy in Buddhism has been a matter of no little disputation; the earliest form of the teachings of the Enlightened One (the Buddha) held sway for several centuries before the variety of Buddhist converts pushed the tradition to embrace doctrinal diversity. The "original" dharma, meaning the teachings or truth taught by the Buddha, was embodied in a *sangha*, or religious order, which encompassed both lay and ordained disciples. These "three jewels"—the Buddha, dharma, and sangha—constitute the fundamental building blocks upon which the worldwide Buddhist community rests. Yet the tradition became so diversified and those who pursued enlightenment so far removed from the milieu of ancient India, where the Buddha flourished, that three distinctive ways

or “vehicles” developed: the Theravada, the Mahayana, and the Vajrayana.

The Theravadans hold that they are loyal to the original Buddhist tradition, insisting, then, that they are orthodox in their teachings. They are often dubbed Hinayana (“Little Vehicle”) by rival Buddhists, implying that they have restricted the means of enlightenment to a single kind of experience. Both the other vehicles, however, hold that they are just as orthodox. They maintain that they accept other cultural frameworks for configuring the dharma and they notably give great significance to the Bodhisattva in the practice of Buddhism. For the ordinary believer, weighed down by the chores of life, the assistance of one who has completed the way is a magnificent boon: the Bodhisattva puts off entering into nirvana in order to assist those who are less endowed with good karma by transferring some of the merit obtained in the process of enlightenment to the less advanced searcher for enlightenment.

Debates about orthodoxy arose largely because of Buddhism’s swift successes across manifold cultural frontiers, and these debates pitted those committed to the earliest texts and most common social forms associated with earliest Indian Buddhism (termed the Way of the Elders) against more manifold expressions. Buddhist orthodoxy, then, rests upon claims of authentic connection to the ideas, doctrines, and social forms deemed consistent with those of this early period. Those committed to the Theravadan tradition believe that theirs most closely follows these normative dimensions of that early Buddhism. Others insist that their enlightenment truth is the same (i.e., is orthodox) but that the formulas for expressing it in human language must be diversified in order to appeal to humans in their rich cultural environment. Initially such groups designated themselves as Mahayanist or “Big Vehicle.”

In addition, Mahayanist tradition developed several philosophical schools as ways to comprehend the true impact of the Buddha’s teachings for all kinds of minds. One of the most important of these was begun by a Brahman convert called Nagarjuna. His position is referred to as the “Middle Way,” or *Madhyamika*. It is sometimes regarded as the most orthodox of the many schools in Mahayana Buddhism. Nagarjuna declined to debate whether or not one could talk about what is absolutely real. He insisted, rather, that anything that could be claimed to be real had to be “empty” of self-essence or absolute truth claims. This was because all the evidence around us in the world of phenomena points to the fact that nothing is permanent. Nagarjuna noted that everything appears to have an essence that abides forever, but in truth it does not. Thus what is true must be empty of such claims—it is truly “nothing” in its most authentic expression.

His orthodoxy of thought is often contrasted to orthodoxy of practice, such as that expressed in the great Yogacara school of meditation practice developed by a *bhiksu*, or monk, named Maitreya (270–350 C.E.), who insisted on the momentariness of all conscious awareness. Once one had meditated to the point where the false nature of substance became apparent, one could then proceed to the point where consciousness itself would merge into ultimate reality. His sketch of the processes of meditation provided the foundation for subsequent meditational

developments and hence took on a kind of conservative orthodoxy. The citation of these schools as orthodox shows that the term relates to fundamental stances toward what is real or what exists.

Buddhist women in particular have no problem with the traditional religious understandings of the way, whichever of the three vehicles they belong to, but more and more they are objecting to the social restrictions imposed by the patriarchal structures of the Buddhist societies in which they live. Traditionally, monks were regarded as superior to nuns, and seldom were female practitioners of any Buddhism school accorded a leadership role. Monastic codes almost always insisted that females adopt a male stance in order to progress along the path. Currently women are insisting on the equality expressed by the Buddha’s original teachings, a notion of orthodoxy that differs considerably from the norm. In the final analysis, the case of Buddhist orthodoxy raises the issue of whether orthodoxy’s meaning can be limited to a single linguistic or cultural expression. Rather, it might well rest upon a core intuition which is then embodied in many cultural forms and languages, all of them ultimately unreal but all provisionally necessary for human knowledge.

This survey does not exhaust the religious environments in which the ideas of orthodoxy flourish, but what has been noted here should throw into relief some of the key ideas and affirm the multidimensionality of the term. Since the very use of the word implies exclusion, it runs counter to the more positive instincts of inclusion important today, especially in the West. Still, orthodoxy reminds us again of the immense power that religious affirmation and division have encapsulated in the human family.

ORTHOPRAXY.

This entry includes two subentries:

Asia

Western Orthopraxy

ASIA

The term *orthopraxy* means “right practice,” and stands as a contrast term for *orthodoxy* “right belief.” It is often said of Asian traditions generally that—in contrast to most Western traditions—right practice is of more importance than right belief, and to a certain extent this is true. For instance, Confucianism is primarily concerned with the rituals and practices that constitute a properly ordered society, while Buddhism is ultimately concerned with the practices that bring about enlightenment. This emphasis should not be overstated, however, as particular beliefs often undergird the practices of Asian traditions (as in Confucian beliefs about the nature of cosmic order) and the practices themselves sometimes vary so widely as to call into question the very notion of right practice (as in Buddhism). As the following accounts will indicate, orthopraxy plays an important role in Asian traditions, but the definition of this role is always strewn with the challenges of diversity, consistency, and regulation within each of these traditions.

Hinduism

Orthopraxy is difficult to define for Hinduism, not because there is no mention of what constitutes right action, but rather because there is such diversity within Hinduism that it becomes difficult—if not impossible—to say anything definitive about the tradition as a whole. For any practice that might be considered “right practice” within Hinduism, there are usually a few traditions for which it is either irrelevant or even “wrong practice” (*heteropraxy*). Yet whatever diversity there is pertaining to practice, there is still more diversity pertaining to belief. For example, some Hindus believe in one god, others believe in many gods, and still others believe in no gods at all;

yet, within Hinduism, none of these beliefs necessarily renders a person unorthodox. Indeed, Hindus have at times demonstrated a remarkable pluralism with respect to belief (although variations in belief have often been seen as inferior alternatives), but have tended to identify themselves and their tradition with the rites and practices that underlie Hindu society.

Perhaps the most consistent trait of Hindus is that some relation to the Vedic texts plays an important role in their religious and cultural lives. Hindus tend to distinguish between two broad groups: the *astika* (those who accept the authority of the Vedas) and *nastika* (those who do not accept the authority of the Vedas). It should be noted that such acceptance says nothing about what beliefs a person or group holds, but rather whether they are participating in the preservation and enrichment of Hindu society as inaugurated in the Vedas. Thus, “orthoprax” Hindus are considered *astika*, while Buddhists, Jainas, and Carvakas (those who reject the tradition stemming out of the Vedas) are considered *nastika*. The Vedic tradition is ultimately a belief in the dharma revealed by the Vedas—the cosmic order of reality that, when embodied in the structure of Hindu society, leads to social and cosmic harmony.

The most basic exemplification of the dharma is proper observation of caste distinctions (although there are additional distinctions made according to age, social position, etc.). Within Hindu thought, caste distinctions are not artificial constructs, but natural designations: one is born into a particular caste because of karmic residue from past lives. Moreover, society functions well only when these distinctions are respected, because each caste was created with particular capacities that correspond to particular needs within society. Traditionally, *Brahmans*—typically seen as the highest caste—are priests and scholars, *kshatriyas* are warriors and rulers, *vaishyas* are merchants and artisans, and *shudras* are farmers and laborers (the so-called untouchables typically fall outside of the caste system, and are seen as even lower than the *shudras*). Right practice for a Hindu is thus a matter of living according to one’s caste and performing the duties and obligations of that caste (that is, living according to the dharma); however, because those duties and obligations are often different for each caste, what constitutes right practice for any Hindu is typically dependent on their caste (as well as a number of other related social considerations). Needless to say, caste intermarriage and attempts at social mobility have traditionally been censured within Hinduism.

Just as there are exceptions to the aforementioned adherence to the tradition stemming out of the Vedas, so there are other, less central practices that are widespread among Hindus (for example, reverence for the cow, refraining from harming other creatures, etc.). Furthermore, there are a number of *dharmashastras* (texts of religious laws) and other post-Vedic literature that further specify right action with respect to rituals, caste relations, and personal discipline (e.g., the *Manava Dharmashastra* or *Manusmṛti*, *Laws of Manu*). What all of these manifold specifications of practice have in common, however, is that they all exemplify the attempt to act in accordance with the dharma for one’s position in life and to do so while accruing as little negative karma as possible. Thus, while the

Vedas may not be in the forefront of every Hindu's understanding of "right action," they ultimately inform the traditions that make such action properly Hindu.

With the *Brahman* class at the head of the Hindu caste system, one would expect authority to reside with them for interpreting orthopraxy with respect to the dharma. Historically, *Brahman* scholars have in fact seen themselves as the protectors of the dharma and have argued in the courts of their rulers (typically *kshatriya*) for the preservation and enforcement of a social structure based on the Vedic rules and ritual practices. However, because there has traditionally been no prevailing institutional authority for Hinduism, such preservation and enforcement has typically been possible only at the level of broad social pressure. Moreover, any authority the *Brahmans* have for interpreting the dharma has been at least matched by the authority afforded to extraordinary devotees and saints of any caste for reinterpreting it. Perhaps the most prominent recent example of this is found in Mahatma Gandhi (1869–1948), who proposed a radical shift in the structure of Hindu society by renaming—and thus repositioning—the so-called untouchables (those who reside in India but fall outside of the caste system); he renamed them *harijan*, or "God's people," and gave them equal status among other Hindus in temples. As Gandhi's case illustrates, the authority for reinterpreting the dharma does not necessarily reside with social position (Gandhi was a member of the *vaishya* caste), but rather with the moral authority—usually understood in terms of devotion and service—to speak on behalf of the dharma.

In the end, orthopraxy is crucial to the understanding of Hinduism not because Hinduism entails no particular beliefs or because it makes no claims for orthodoxy; different traditions do espouse particular beliefs, and many will not hesitate to claim orthodoxy for those beliefs. Rather, orthopraxy is important for Hinduism because the commonality of practices among Hindus far exceeds the commonality of beliefs. Indeed, it is not merely religious scholars but also Hindus themselves who define Hindu identity in terms of practices more than beliefs. This emphasis on practice rather than belief runs counter to the typical Western model of religions, but it is an emphasis that proves characteristic not only of Hinduism but also of Asian religious and social traditions generally.

Buddhism

Strictly speaking, Buddhism is not interested in right action, as action itself is tied up in the ignorance and desire that Buddhism is intended to overcome. At least with respect to its ultimate aims, Buddhism is primarily interested in realizing the emptiness (*shunyata*) of action (as well as all other things, especially the self), and thus achieving enlightenment (nirvana). As Buddhists find themselves faced with a world that demands decisions in the midst of this quest for enlightenment, however, they have found it useful and appropriate to comment on what would constitute right practice in such a context. The most prominent example of this is found in the Eightfold Path for achieving enlightenment, as laid out in Gautama Buddha's (c. 563–c. 483 B.C.E.) first sermon. This path consists of right views, right intention, right speech, right action, right livelihood, right effort, right mindfulness, and right concentration

(*Samyutta-nikaya*, 420). From this account, at least two things become clear: The first is that Buddhism is not entirely antinomian—it is quite possible to follow the wrong path; the second is that, while right beliefs play an important role in Buddhist practice, greater emphasis is placed on right practice. At least at the origins of Buddhism, enlightenment was possible only when one's practices were consistent with the Eightfold Path.

Following the death of Gautama Buddha, however, Buddhism ceased to have any centralized religious authority and thus found it difficult to maintain any consistency with respect to its interpretation of the Buddha's message. It is notable that the early Buddhists held councils to determine right belief and practice, but—as evidenced by the various accounts of different schools—they proved less than effective at achieving any substantive degree of consistency. Rather, as Buddhism was interpreted by different persons in increasingly different contexts (in Tibet, China, and Japan), this diversity only compounded. Indeed, such diversity of practice is often considered a virtue: according to the doctrine of *upaya-kaushalya* (skillful means), the Buddhist message is not seen as something static but rather something to be altered in such a way as to be effectively communicated to its intended audience. Thus, at least in theory, the diversity of forms that Buddhist practices can take is potentially limitless. These differences should not be overstated, because there is still an underlying consistency to Buddhism that affirms prevalence of illusion and the need for enlightenment; however, the practices that are pursued as a means to that end vary remarkably among the various schools of Buddhism.

Aside from the Eightfold Path, Buddhist orthopraxy is also exemplified in rituals and monastic orders. Rituals of one form or another are practiced by all Buddhists—monks and nuns, as well as laypersons—and pertain to actions whose merit can be applied toward achieving nirvana or a better position in the next reincarnation. This includes not only engaging in virtuous behavior and avoiding vicious behavior, but also participating in ceremonies, acts of devotion, and other symbolic acts. Significantly, whereas ritual is seen as secondary to meditation in most Buddhist traditions, it is given equal status and prominence in Tibetan Buddhism for the attainment of enlightenment. Monastic orders, in turn, offer a more disciplined approach, including an increased enforcement of orthopraxy in order to assist in aligning one's actions with the path to enlightenment (as the path is understood by that particular monastery). These practices differ from monastery to monastery, but they generally follow from the doctrinal commitments of each monastery. Like their monastic practices, Buddhist practices in general also vary markedly from context to context; what holds true in Buddhism across the board, however, is that these practices—whatever they are—are always designed to bring local Buddhists ever closer to nirvana.

Chinese Religion

From its very beginnings, Chinese society has placed a particular emphasis on the right performance of rituals. In the Shang dynasty (c. 1554–1045/1040 B.C.E.), this had to do primarily with performing rituals to appease the High God (Shangdi), one's ancestors, and other spiritual powers. It should be noted that the larger part of ritual activity was applied to the

Consider this doctrine as utilized some centuries later by Zhu Xi's (1130–1200) to (somewhat one-sidedly) compare Confucians and Buddhists on the question of ritual propriety.

[A student] asked how to tell the difference between Confucianism and Buddhism. The teacher said: just take the teaching 'what heaven has endowed is called the nature.' The Buddhists simply do not understand this and dogmatically say that the nature is empty consciousness. What we Confucians talk about is solid principles, and from our point of view they are wrong. . . .

Take the human mind-and-heart, for example. In it there must be the five moral relations between parent and child, ruler and minister, elder and younger, husband and wife, and friends. When the Buddhists are consistent in action, they show no affection in these relationships, whereas when we Confucians are consistent in action, there is affection between parent and child, rightness between ruler and minister, order between elder and younger, attention to their separate functions between husband and wife, and trust between friends." *Zhuzi quanshu* (*The Complete Works of Zhu Xi*) 60:14a. Translated by Wm. Theodore de Bary. In de Bary, p. 713.

reverence of ancestors, as it was generally felt that their approval was easier to attain than the more powerful but less reliable Shangdi. In all of this, the king bore a particular responsibility in performing the right rituals, since the success or failure of the state was seen to be a direct result of such performance. Indeed, proper performance of these rituals was seen to influence everything from harvests and weather patterns to illnesses and military campaigns. It should be noted, however, that this performance of ritual also served to legitimize the king's position, as it afforded him a special position as a mediator between spiritual forces and the welfare of the state.

In the Zhou dynasty (1045/1040–256 B.C.E.), this relationship became more formalized, largely in the attempt to legitimize the Zhou overthrow of the Shang. As recorded in the *Shujing* (Classic of documents), Shang rulers had once been virtuous and mindful of their ancestral obligations; toward the end of the dynasty, however, they became cruel and negligent. As a result, Heaven allowed the Zhou to rise up and overthrow the Shang, and thus to become the rightful rulers of China. As this account illustrates, the Zhou began to see the highest spiritual power as the impersonal Heaven (*tian*) rather than as the personal God, Shangdi; likewise, they saw the survival of the state as dependent on observance of a moral principle—the Mandate of Heaven (*tianming*)—rather than the allegiance of spiritual powers. Of course, this does not do away with the veneration of ancestors—a hallmark of Chinese practice—but begins to reinterpret it in terms of ritual responsibility rather than appeasement.

By the time of Confucius (Kong fuzi; 551–479 B.C.E.), the Zhou was in serious decline, such that there was military

upheaval, social unrest, and general devastation throughout the empire. Confucius's message, as found in the *Analects*, was that this devastation was the result of the fact that the order of Earth no longer reflected the order of Heaven and the order of Heaven could only be exemplified by reviving the classic virtues (most significantly, *ren*, or humaneness). These virtues, in turn, could only be realized by a revival of the rituals (*li*) that guide human relations. Confucianism brought ritual propriety to the fore by taking a term that had indicated guidelines for deference among the nobility and imbuing it with ethical implications for all people. In short, for Confucius, right practice is not a matter of mere politeness but is rather the very heart of a stable and prosperous society.

A good example of ritual propriety is found in the *Zhongyong* (*Doctrine of the Mean*), one of the central texts of the Confucian tradition. Among other things, it emphasizes acting in accordance with one's position: effectively, a person of lower position acts with deference without resentment, while a person of higher position acts with graciousness without disdain. Such ritual propriety applies on a diminishing scale as family relations become more distant and official positions less distinguished. Most importantly, the *Zhongyong* gives expression to the five relations taken to be the most important foci of right relation: "The five are those governing the relationship between ruler and minister, between father and son, between husband and wife, between elder and younger brothers, and those in the intercourse between friends. These five are universal paths in the world" (*The Doctrine of the Mean*, quoted in Chan, p. 105). It should be noted that, while Confucianism is often associated with patriarchy, not all of the relations

listed above are hierarchical. Thus, while many of its relations have historically been patriarchal, there is reason to believe that there is room in Confucian orthopraxy for more equitable relations.

While Confucianism is rightly seen as the dominant tradition informing social practices, it was only one of many approaches introduced during this tumultuous period; Mozi (fifth century B.C.E.), for example, argued for the eradication of all ritual (in that all people were equal before Heaven), while the so-called legalists argued for the strict enforcement of certain practices within the context of a system based on punishment and reward. Perhaps the most persistent counterpoint to the Confucian emphasis on ritual, however, was the Daoist tradition. Where the Confucians praised structured interactions, the Daoists prized spontaneity. To Daoists, the social constructs of the Confucians were unnatural at best, if not outright destructive. The opposition of these two schools of thought, however, should not be overstated, as each balanced the other and even borrowed from the other in its own development. Stated simply, even Daoists had their rituals, though they were less centralized than those of their Confucian counterparts (see, for example, Daoist liturgies, ordination rites).

Historically, however, it is the Confucians who have enjoyed the most government sponsorship, and have thus had the greatest influence on the nature and breadth of ritual practice in China. Consistent with the Confucian account, therefore, right practice was not enforced on any official level (as evidenced by its Daoist and Buddhist detractors), but it was upheld on an unofficial basis as a standard of social morality and decorum. Indeed, the prominence that ritual propriety still enjoys in Chinese society can be attributed in large part to the longstanding influence of the Confucian tradition on its history. Although the Confucian tradition is no longer officially sanctioned by the government in the early twenty-first century, the importance of ritual propriety continues to be very evident in Chinese social practices, and arguably will remain so for many generations to come.

WESTERN ORTHOPRAXY

Orthopraxy or *orthopraxis* (from Greek *orthos*, “correct,” and *praxis*, “action”) denotes proper action, particularly in a religious context. It is contrasted with *orthodoxy* (*orthos* and *doxa*, “opinion”), which denotes proper belief. The word *orthopraxy* is of relatively recent invention and has been used above all in connection with Latin American “liberation theology.” It does not otherwise have a significant history of its own in the West. Because of its pairing with *orthodoxy*, however, it is useful for a discussion of the conflict between action and belief, works and faith, obedience to law, and commitment to creed.

There has been some limited use of the term *orthopraxy* in connection with Islam. Malise Ruthven, for example, in his *Islam: A Very Short Introduction* (1997), speaks of Muslim fundamentalists (a term he disapproves of), commenting that for Muslims opposed to modern secularism, the emphasis is on action rather than belief. “Throughout history,” he writes, “Islamic rectitude has tended to be defined in relation to practice rather than doctrine. Muslims who dissented from the majority on issues of leadership or theology were usually tolerated provided their social behaviour conformed to generally accepted standards. It is in enforcing behavioural conformity (*orthopraxy*) rather than doctrinal conformity (*orthodoxy*) that Muslim radicals or activists look to a ‘restoration’ of Islamic law backed by the power of the state.”

But in the West, the dominant debates on orthopraxy and orthodoxy (whether or not these terms are used) take place in connection with Judaism and Christianity. This article will examine the conflict in those two religions.

Judaism

The Hebrew Bible is filled with statements that emphasize the importance of obedience to God's commandments. After his forty days and nights on Mount Sinai, Moses proclaims to his people, "So now, O Israel, what does the Lord your God require of you? Only to fear the Lord your God, to walk in all his ways, to love him, to serve the Lord your God with all your heart and with all your soul, and to keep the commandments of the Lord your God and his decrees that I am commanding you today, for your own well-being" (Deuteronomy 10:12–13). Elsewhere God directs Moses to say this to his people: "My ordinances you shall observe and my statutes you shall keep, following them: I am the Lord your God. You shall keep my statutes and my ordinances; by doing so one shall live: I am the Lord" (Leviticus 18:4–5).

In the twelfth century, Moses ben Maimon (Maimonides; 1135–1204) published his *Mishneh torah* (Repetition of the Torah, c. 1178), in which he gave definitive form to the list of 613 commandments (*mitsvot*) that pious Jews accept as binding on their daily conduct. Another milestone in the codification of Jewish practice is the *Shulchan 'arukh* (literally, "the set table"), written by the Spanish-born Joseph Karo (1488–1575) in the mid-sixteenth century. This work presents a legal code that many observant Jews continue to the present day to regard as definitive in the settlement of religious disputes. The emphasis that these works and Jewish tradition have placed on obedience has led many modern commentators, both Jewish and non-Jewish, to conclude that Judaism is a religion characterized primarily by its insistence on proper practice and obedience to God's law or, to put it in terms of this entry, a religion characterized by its insistence on orthopraxy over orthodoxy.

At the end of the eighteenth century, Immanuel Kant (1724–1804) declared Judaism to be a religion of "purely statutory laws" and therefore no religion at all. Georg Wilhelm Friedrich Hegel (1770–1831), in his early days, had followed Kant and (in "The Positivity of the Christian Religion") described Jews as struggling "under a burden of statutory commandments . . . that pedantically prescribe a rule for every casual action of everyday life." In their view of Judaism as a primarily legalistic religion, both men were following the German-Jewish philosopher Moses Mendelssohn (1729–1786), father of the modernizing Jewish *Haskalah* ("Enlightenment"). In *Jerusalem; or, On Religious Power and Judaism* (1783), Mendelssohn had stressed "divine legislation" (*göttliche Gesetzgebung*)—by contrast with "revealed religion" (*geoffenbarte Religion*) in the Christian sense—as an essential fact of Judaism.

A number of modern Jewish commentators agree that Judaism is a religion whose essence lies not in theory or belief but in practice. Samuel Belkin (1911–1976), president of Yeshiva University in New York and a respected Jewish leader, wrote, "Many attempts have been made to formulate a coherent and systematic approach to Jewish theology. All such attempts,

however, have proved unsuccessful, for Judaism was never overly concerned with logical doctrines. It desired rather to evolve a corpus of practices, a code of religious acts, which would establish a mode of religious living. . . . In Judaism, articles of faith and religious theories cannot be divorced from particular practices . . . the theology of Judaism is contained largely in the Halakha [Jewish law]—in the Jewish judicial system—which concerns itself not with theory but primarily with practice."

The issue arises with particular force in connection with the modern Orthodox movement. That movement arose in late-eighteenth- and early-nineteenth-century Germany, in response to various attempts to modernize Judaism, including the *Haskalah* and Reform Judaism. Orthodoxy's principal proponent, German rabbi Samson Raphael Hirsch (1808–1888), saw his movement as a means of accommodating traditional Judaism to the conditions of modern life. Still, Hirsch favored a strict interpretation of the practical duties of the Orthodox Jew. In his eyes, the fact of the revelation to the entire Jewish people at Mount Sinai obviated the need for faith or belief. The revelation is an established historical fact, and Judaism is thus a religion of law, not of belief. "Statutes of faith?" he asks in the fifteenth Letter. "Judaism knows 613 duties, but no commandments of faith." In light of such remarks, Jacob Katz, an historian of the movement, declared that *orthopraxy* would have been a more accurate term for the new movement than *orthodoxy*.

But Hirsch and modern commentators like Samuel Belkin by no means have the last word on this issue. There is a lively debate within rabbinic Judaism on the issue of whether belief should be considered a component of the religion alongside practice. After all, though Moses ben Maimon codified Jewish practice in his list of the *mitsvot* ("commandments"), he was also the author of the Thirteen Principles (*shloshah asar yesodot*) published in his commentary on Tractate *Sanhedrin* of the *Mishnah* (the codified oral law that forms the core of the Talmud). The Principles cover such matters as the existence (*metsi'ut*), unity (*yichud*), and incorporeality (*shlilat ha-gashmud*) of God, the divine revelation of Torah (*heyot hatorah min hashamayim*), and the resurrection of the dead (*techiyat hametim*). But the focus of the Principles is belief, so, for example, when Moses ben Maimon speaks of the existence of God, rather than simply declare it a fact, he tells us that we must believe (*leha'amin*) it. In the *Mishneh Torah*, he emphasizes the importance of *kavanah*, or intention, in prayer. *Kavanah* (from the verbal root *kun*, meaning "to be established" or "to be steadfast") had already appeared in the Talmud in roughly this sense, but Moses ben Maimon gives the word what is quite possibly its *locus classicus*, when he declares, "Any prayer that is not [said] with *kavanah* is not a prayer."

The history of Judaism is filled with challenges to what is perceived to be a rigid adherence to the letter of the law. *Kabbalah* (Hebrew *qabalah*, "tradition"), with its mystical emphasis on direct communication with the divinity, has roots that go back almost two thousand years. Some might regard this movement as representing a departure from legalism. The eighteenth century in eastern Europe brought a significant reaction to the aridity of Talmudic scholasticism, as practiced by then-powerful rabbis in Lithuania. The leader of the

opposition was Israel Ben Eliezer (c. 1700–1760), known popularly as the Ba'al Shem Tov (“master of the good name”), and his movement came to be known as Hassidism (from Hebrew *chasid*, “pious,” “righteous”). The Ba'al Shem Tov emphasized a nonintellectual, spiritual communion with God (though he certainly did not advocate a rejection of Jewish law). The Paris Sanhedrin, the group of Jewish notables that Napoleon convened in 1806 to determine the legal position of Jews in France, helped establish as a principle in French law that Jews would be regarded as one religion among others, in other words, that, because religious duties must fall in place behind loyalty to the nation, Jewishness in France would henceforth be determined by one's faith, not by one's birth or one's actions. The Reform Movement started out in Germany with a quasi-Hegelian notion of the progressive, historically unfolding spirit of Judaism, something very different from traditional “orthopraxy.” In the United States, the movement marked out its turf by expressly rejecting what it regarded as the religion's anachronistic legalism. The Pittsburgh Platform of 1885, which established the guiding principles of the American Reform Movement, contained this bold statement: “We hold that all such Mosaic and rabbinical laws as regulate diet, priestly purity and dress originated in ages and under the influence of ideas altogether foreign to our present mental and spiritual state.” The contemporary world, especially in the United States, offers the Jew a varied menu of choices, from the strictly regulated life of the “ultra-Orthodox,” to the secular humanism of Reconstructionism, to the mysticism of the modern Kabbalah movement.

While it might be tempting to claim that Judaism has traveled the path from orthopraxy to various forms of spirituality, one must not forget that many branches of Judaism in the modern world have emphasized praxis, but in the social and political rather than the personal, religious sphere. The Pittsburgh Platform, having affirmed the immortality of the human soul, concludes with this principle: “In full accordance with the spirit of Mosaic legislation, which strives to regulate the relation between the rich and poor, we deem it our duty to participate in the great task of modern times, to solve, on the basis of justice and righteousness, the problems presented by the contrasts and evils of the present organization of society.” The Reform Movement is not the only branch of Judaism to have dedicated itself to this cause.

Christianity

The debate about proper belief and proper practice began almost at the moment Christians became conscious of themselves as members of a new religion distinct from Judaism. The debate was framed as faith (Greek *pistis*, Latin *fides*) versus works (Greek *erga, praxeis*, Latin *opera, facta*), and it attracted virtually every prominent figure in the history of Catholic theology, as well as the founding fathers of Protestantism.

The apostle Paul set the terms of the debate. In the decades following the death of Jesus, Paul's mission was to consolidate and universalize the new Christian church, to establish the principle that Gentiles need not pass through a conversion to Judaism in order to join the church, and finally to formulate an explanation of the position that Judaism and its laws were

to occupy in the church. The doctrine of justification by faith was perfect for Paul's purposes. It demonstrated that all were eligible to join the fledgling church since faith alone—no works or Pharisaic obedience to Jewish law—was necessary, and it assured new converts that obedience to the law and loyalty to the legacy of Abraham would follow naturally from a profession of faith in Christ. We find this doctrine in the Epistle to the Galatians (probably one of Paul's earlier letters, written between 52 and 55 C.E.). “We ourselves are Jews by birth and not Gentile sinners,” he wrote, “yet we know that a person is justified not by the works of the law but through faith in Jesus Christ. And we have come to believe in Christ Jesus, so that we might be justified by faith in Christ, and not by doing the works of the law, because no one will be justified by the works of the law” (Galatians 2:15–16). Under this principle, the church becomes universal, as former distinctions among people disappear. At the same time, members of the church are implicitly incorporated into the traditions of Judaism: “There is no longer Jew or Greek, there is no longer slave or free, there is no longer male and female; for all of you are one in Christ Jesus. And if you belong to Christ, then you are Abraham's offspring, heirs according to the promise” (Galatians 3:28–29).

In his Epistle to the Romans, Paul reintroduces justification and once again links it with the principle of universality: “For we hold that a person is justified by faith apart from works prescribed by the law. Or is God the God of Jews only? Is he not the God of Gentiles also? Yes, of Gentiles also, since God is one; and he will justify the circumcised on the ground of faith and the uncircumcised through that same faith. Do we then overthrow the law by this faith? By no means! On the contrary, we uphold the law” (Romans 3:28–31). He also introduces two related principles that will guide discussions of faith and works for centuries to come: predestination (from Greek *proorizō*, “predetermine,” Latin *praedestino*) and election by grace (Greek *eklogē kharitos*, Latin *electio gratiae*). “For those whom he foreknew he also predestined to be conformed to the image of his Son, in order that he might be the firstborn within a large family. And those whom he predestined he also called; and those whom he called he also justified; and those whom he justified he also glorified” (Romans 8:29–30). “So too at the present time there is a remnant [of the Jews], chosen by grace. But if it is by grace, it is no longer on the basis of works, otherwise grace would no longer be grace. What then? Israel failed to obtain what it was seeking. The elect obtained it, but the rest were hardened” (Romans 11:5–7).

What might well have begun as an effort to distinguish a new religious sect from Judaism quickly and lastingly came to be incorporated into the very core of Christian theology. The ultimate victory of Saint Augustine of Hippo (354–430 C.E.) in his long polemic with Pelagius, a theologian of the same era who had insisted that volition and action proceed from men themselves and not from Christ or God, established by the early fifth century C.E. the position that the Catholic Church would retain permanently: faith is a gift from God; our freedom of will both to believe and to act proceeds from God's grace; God predestines some, but not all, to faith; and the reasons for which some are elected while others are not is “inscrutable” (*On the*

Predestination of Saints, 428 or 429 C.E.). “Predestination is a preparation for grace; grace itself, however, is a gift [*donatio*].” When it comes to faith and works, Augustine is unequivocal: “faith is given first.” Faith takes precedence and is the sign of the new covenant: “As the law of works [*lex factorum*] is written on tablets of stone,” he says, “so the law of faith is written in hearts.” The rewards of the former are associated with the Old Testament, those of the latter with the New Testament (*On the Spirit and the Letter*, 412 C.E.).

In the writings of Saint Thomas Aquinas (c. 1225–1274), we find a shift in emphasis to the inwardness of the human will and the dominance of reason. But Thomas is careful to safeguard the divine origin of the human faculties that he exalted: “The movement of the will is from within, just like natural movement. . . . The cause of the will, however, can be nothing other than God, and for two reasons: first because the will is a power of the rational soul, which is caused by God through creation . . . and second because the will tends toward the universal good, from which it follows that nothing can be the cause of the will except God himself, who is the universal good” (*Summa Theologica*, 1265/1266–1273). To be sure, Thomas attributes to man a greater degree of autonomy than we find in Augustine and many other Christian theologians. For example, he distinguishes between two types of grace, under one of which, “operating grace” (*gratia per operantem*), God is our sole mover and under the other of which, “cooperating grace” (*gratia per cooperantem*), our actions stem from both God and our minds. But when it comes to judging actions, Thomas is quite clear: “our actions are meritorious in so far as they proceed from free choice, *moved by God through grace*” (emphasis added).

With the new emphasis on individual, subjective freedom that we find in Luther and the Protestant Reformation, we might expect to see man newly invested with the dignity of free choice in his actions. But for Martin Luther (1483–1546), John Calvin (1509–1564), and others, freedom meant freedom from the tyranny of the Catholic Church, not freedom in the sense of an autonomous volition that is the source of our actions. In Luther’s view, faith and grace once again precede actions, and righteous actions by themselves do nothing to render righteous the individual who commits those actions: “Not he who works much [*multum operatur*] is just but rather he who without works [*sine opere*] believes much in Christ” (*Heidelberg Disputation*, 1518). Luther wrote *The Bondage of the Will* (1525) expressly to refute the existence of free will, on the strength of the argument that original sin deprives us of the freedom to choose. “God foreknows and foreordains [*praescit et praeordinat*] all things,” he writes, thus only what God wills can take place, and “there can be no such thing as free choice [*liberum arbitrium*] in man or angel or any creature.” “The Gospel,” he writes in the preface to his German translation of the New Testament, “does not demand works of us, so that we might become devout and blessed [*frum und selig*] thereby; in fact, it condemns such works but demands only faith in Christ” (*Preface to the New Testament*, 1522).

By the end of Luther’s life, John Calvin had completed his *Institutes of the Christian Religion* (1536). To the modern reader, Calvin’s theology appears, as regards the issue of faith and

works, to differ very little from that of Augustine. But for a sixteenth-century reformer extending the work of Luther, the doctrine of justification by faith served as a repudiation of the temporal authority of the pope and thus had a resonance different from what it had had for the bishop of Hippo. Faith for Calvin is a gift of God, as it was for Augustine, Thomas Aquinas, and Luther, and righteousness arises not from works but from faith. Works are not the cause of holiness but are, rather, gifts of God (*Dei dona*), signs of his calling (*vocationis signa*; *Institutes of the Christian Religion*, 1536–1559). If Calvin’s thought represents a departure from that of his predecessors, it is largely owing to his attitude toward life. Contempt for our present life (*praesentis vitae contemptus*) and the practice of abstinence, sobriety, frugality, and modesty in that life are the guides to proper conduct.

With the age of Enlightenment and its increasing tendency to ground moral issues in nature and humankind, we see the emphasis in Christianity shift increasingly from faith to the human arena. The nineteenth century produced a spate of books, in a variety of European languages, under the title *The Life of Jesus*, most prominently *Das Leben Jesu* (1835–1836), by David Friedrich Strauss (1808–1874) and *La vie de Jésus* (1863), by Ernest Renan (1823–1892). The kenotic tradition in nineteenth-century German Protestant theology emphasized the human dimension of Jesus (“kenotic” refers to the process, described in Philippians 2:7, by which Christ “emptied himself” [*ekenosen*] and became a man). French socialist theory in the first half of the nineteenth century modeled its conceptions of social justice on a vision of the early Christian church and the teachings of Jesus. In *Le nouveau christianisme* (1825; English trans. *The New Christianity*, 1834) by Henri de Saint-Simon (1760–1825), the “new Christian” expresses what he sees as the “divine part” of Christianity: “men must conduct themselves as brothers with respect to one another. . . . They must make it their aim to ameliorate as promptly and as completely as possible the moral and physical existence of the most numerous class.”

The late nineteenth and early twentieth centuries produced a spate of socially conscious Christian thinkers and activists, especially in the United States. The Social Gospel movement, from roughly 1870 to 1920, encouraged followers to devote themselves to social justice, in imitation of Christ. Walter Rauschenbusch (1861–1918), one of its leaders, went so far as to embrace communism as a Christian principle in his *Christianity and the Social Crisis* (1907). Reinhold Niebuhr (1892–1971) helped define theological liberalism in the United States in the first half of the twentieth century.

In the second half of the twentieth century, two developments steered the Catholic Church (or some of its members) increasingly in the direction of praxis. In 1965, Pope Paul VI issued, as one of the sixteen decrees of Vatican II, *Gaudium et spes* (Joy and hope; titled in English “Pastoral Constitution On the Church in the Modern World”), which affirmed the church’s commitment to service in the human world: “What does the Church think of man? What needs to be recommended for the upbuilding of contemporary society? What is the ultimate significance of human activity throughout the world? People are waiting for an answer to these questions.

From the answers it will be increasingly clear that the People of God and the human race in whose midst it lives render service to each other. Thus the mission of the Church will show its religious, and by that very fact, its supremely human character." The Society of Jesus (the Jesuit order) today has an Office of Social and International Ministries, whose purpose is to serve the "Social Apostolate (ministries addressing domestic and international social problems)." One Jesuit priest, Philip J. Rosato, has suggested that Karl Barth (1886–1968), the great twentieth-century Protestant theologian who became increasingly committed to social justice during his long career, helped, through dialogue with Catholics, to steer the post-Vatican II church toward orthopraxy in social affairs.

In 1968, a Peruvian priest named Gustavo Gutiérrez published *Teología de la liberación* (English trans. *A Theology of Liberation*, 1973), which served as the central text for the Catholic "liberation theology" movement in Latin America. Gutiérrez is explicit about the orthopraxy/orthodoxy relationship. Human history, says Gutiérrez, is an "opening to the future" (*apertura al futuro*), and this means an emphasis on action, or "doing the truth" (*hacer la verdad*). "Only by doing this truth will our faith *veri-fy* itself, speaking literally," he says. "Hence the recent use of the term *orthopraxis*, which might shock certain sensibilities. Nor should this be understood as denying the meaning of *orthodoxy*, understood as a proclamation and reflection of affirmations considered to be true." Liberation theology represents an odd amalgamation of Marxist theory (the last of Marx's "Theses on Feuerbach," 1845, reads, "The philosophers have merely *interpreted* the world in various ways; the point is to *change* it.") and Christian theology.

It would probably be safe to say that many branches of Christianity in the twentieth century have placed an increasing emphasis on orthopraxy at least in addition to, if not to the detriment of, orthodoxy. The praxis that has come to be favored is of the sort that takes place in the social and political world and not just of the sort that is directly connected with the rituals of a particular institution. Waging a struggle against poverty and waging a struggle against abortion rights can both be expressions of religious principle, but they are different in kind from practices like taking communion and confessing.

OTHER, THE, EUROPEAN VIEWS OF. All epistemological and hermeneutical investigations are predicated on the observation that the human self, like all objects around a person, gains an understanding of its identity through the

binary opposition of self and other. No value can be established for any element in the material and abstract world without the differentiation from “the Other.” The famous linguist Ferdinand de Saussure described all essential components of language in terms of value units that develop their identity by being separate from all other elements surrounding them both in the syntagmatic and associative context. The same applies to the historical subject, man (here understood not in gender-specific terms), who discovers himself only when he realizes that he is different from all people around him. When a small child begins to recognize its environment, it also observes its own self. Hans-Georg Gadamer defines the phenomenon of selfhood versus otherness in the following way: “Whatever is being distinguished must be distinguished from something which, in turn, must be distinguished from it. Thus all distinguishing also makes visible that from which something is distinguished” (p. 272). All individuality is intimately connected with the recognition of the Other as a phenomenological entity outside of the self, and all cultures, religions, and peoples have relied on this fundamental truth in order to establish their own selfhood, legitimacy, culture, religion, and nationhood. The “I” discovers itself, as Martin Buber pointed out, through the separation from the “You,” which, in its ultimate manifestation, proves to be God. Once the individual realizes that there is the Other, expressed by the pronoun you, the process of speaking, dialogue, discourse, and epistemology, both in the mundane and spiritual dimensions, begins.

The phenomenon of “otherness,” as a subject of philosophical discourse led, in the 1980s, to the development of a new academic discipline, xenology, or the study of “alterity.” Xenology focuses on the Other as a critical component of cultural anthropology, and as a key issue in the history of mentality, of the Church, and also of everyday life (Sundermeier, Wierlacher, Hallson). Study of the Other cannot be limited to the history of the Western world—the same phenomena also determine cultures in all other parts of the world to a lesser or greater degree—but for pragmatic purposes this article concentrates on the Judeo-Christian tradition. Most military conflicts throughout time can be explained either by religious disputes or material greed, or the two combined. These sentiments, however, result from hostility against or disregard of the Other whose own identity is not acknowledged but instead is treated as a dangerous challenge, if not an actual threat, to the existence and social construct of the dominant culture.

Considering military conflicts since the mid-twentieth century, including the Kosovo War in 1999, the terrorist attack on the World Trade Center on September 11, 2001, and the Iraq War in 2003, hostility against the Other and xenophobia in global terms continues and represents a major source of discord in increasingly multicultural societies and among nations (Gioseffi).

Since the end of World War II, the number of legal and illegal immigrants to Western nations has grown steadily. Once these asylum seekers or economic refugees settle in the new home country, they often face prejudice, rejection, hatred, and physical violence. In fact the early-twenty-first-century world is undergoing a major paradigm shift because the ethnic

composition of Western societies is experiencing a transformation, bringing representatives of different religious, ethnic, and cultural groups into close proximity. The degree to which foreigners are integrated into a particular society undoubtedly represents a benchmark of its developmental stage as an enlightened, tolerant, and humanistic community. Earlier societies had to cope with similar phenomena, but throughout history the fundamental conflict between self and other has shaped most cultural, religious, military, and political developments. As Irvin Cemil Schick observed, identity is the result of a construction process, not simply a given, “and narrative is the medium through which that construction is realized” (Schick, p. 21).

Perspectives in the Ancient World

In ancient Greece, peoples of other ethnic backgrounds were identified as *barbarophonoi* (Homer, in the *Iliad* [c. 800 B.C.E.]), or as those who spoke nonunderstandable languages. However since the Greek world did not have the concept of a larger national unit, everyone outside the family or urban community was perceived as foreign, as other (*allos*, *alloadapos*, and *xenos*). Significantly the Greeks did not necessarily differentiate between members of a foreign polis (city-state) and non-Greeks. Nevertheless the Greeks espoused the ideal of hospitality, which extended especially to foreigners; in later centuries many cities appointed a *proxenos* whose task it was to serve as a host for foreigners, perhaps comparable to the modern diplomatic institutions. At the turn of the sixth century B.C.E., a more xenophobic concept of the barbarian developed in Greece, triggered by a feeling of cultural superiority and also by fear of the growing Persian threat. Both Euripides and Aristotle, for instance, identified the barbarian with subhuman creatures and argued that their sole function was to serve as slaves—an attitude that slowly changed only after Alexander the Great’s conquest of the Persian Empire (Stutzinger). Whereas the early Roman republic was built on a fairly strict division between Roman citizens and foreigners, during the time of the Roman Empire the Roman *civitas* was extended to additional population groups. The *Constitutio Antoniniana* (212 C.E.) awarded Roman citizenship to all free people living within the borders of the state. Nevertheless the entire ancient world accepted the idea of slavery and treated all defeated foreigners as objects that could be sold or killed at will. During the age of migration, Germanic tribes attacked the Roman Empire strengthening the notion of the barbaric others, especially since Romans regarded their nomadic opponents—in close parallel to the ideology espoused by modern colonialists, especially in the Americas and Africa—as primitive, lacking in culture and civilization.

During late antiquity the concept of monsters—teratology—living at the outskirts of the Roman world became popular; these monsters have populated literary and artistic imagination ever since. Pliny the Elder collected some of the most influential accounts about these monsters in his *Naturalis historia* (before 79 C.E.), followed by Caius Julius Solinus’s *Collectanea rerum memorabilium* (c. 250 C.E.), which medieval and early modern encyclopedists and naturalists eagerly copied. Solinus’s works became the source for scores of artists and writers who blithely integrated this “information” about strange beings on

the periphery of human civilization into their texts and images (Williams).

Medieval Perspectives

The ancient world primarily projected images of the Other as a matter of curiosity, with the specific purpose of populating worlds far from the eastern Mediterranean to satisfy general scientific interest. But in the early Middle Ages the contrast between self and other gained in intensity because of the sharp conflict between the Christian Church and pagan cultures, the constant threat of famine due to undeveloped agriculture and farming, and constant military threats from other places (Huns, Saracens [Arabs], Vikings, and later the Magyars). A remarkable expression of the fear of the Other can be found in the myriad monster images depicted in churches, on government buildings, on the facades of houses, in wall paintings, in sculptures, and in numerous manuscript illuminations (Benton, Camille). Some of the best medieval art focuses on these monstrous figures and elaborates on their fearful, hideous features, reflecting a highly ambivalent and contradictory attitude toward the Other. Whereas Christian theologians established rigid criteria to determine good versus evil, or self versus other, in accordance with biblical teaching, popular culture continued to be dominated by strong undercurrents of paganism that derived strength from its fascination with and abhorrence of the Other (Milis). In the Old English heroic epic *Beowulf* (early eighth century), for example, the protagonist's struggles, first against the monster Grendel, then against its mother, and finally against a dragon, represent the individual stages of interaction with a foreign world and establishment of an identity for a particular social group. Many other heroic epics in Old Norse and Old and middle-High German literature can be explained in terms of their treatment of the Other and their interest in offering a medium of self-identification for the reader/listener (Lionarons).

Religious Perspectives

All early-twenty-first-century world religions, especially Judaism, Christianity, and Islam, are predicated on the exclusivity and absoluteness of their own religion and the truth of their faith, since the monotheistic concept negatively determines the relationship with all other religions, rejecting them as other and hence as false. By contrast, people in ancient Greece and Rome recognized many different gods and easily tolerated representatives of other religions as long as they demonstrated loyalty to the secular authorities and obeyed the rules of public mores (Assmann).

Since the early Middle Ages, factions of all three major religions have demanded absolute adherence to their own faith and have not hesitated to persecute and execute members of the other religions, unless the latter voluntarily submitted to the dominant religion. The history of the Western world is deeply influenced by constant, bitter struggles among these three religions, whether in the form of Arab conquests in the seventh and eighth centuries, or Christian crusades between 1096 and 1291. In antiquity and the Middle Ages, these conflicts and tensions were often addressed with violence (crusades, pogroms, expulsions, imperialistic warfare, and hostile

persecutions), victimizing the Jewish population above all. There were a number of attempts by Christian philosophers and theologians from the thirteenth to the fifteenth centuries to enter into critical discourse with Jews (Paris Disputation [1240], Barcelona Disputation [1263], Tortosa Disputation [1413–1414]; Maccoby), but these were intellectual experiments and ultimately yielded no positive changes in the relationship between the religions; the situation for Jews became increasingly worse (expulsion from Spain in 1492). Although Augustine (354–430) had firmly argued for a tolerant attitude toward Jews, insisting that they were “living testimony to the antiquity of the Christian promise” (Cohen, p. 33), and although Bernard of Clairvaux (1090–1153) had emphasized that Jews were the “living letters of the law” (Cohen, p. 388), anti-Semitic attitudes grew in intensity throughout the late Middle Ages and were promulgated even by prominent theologians and philosophers including Thomas Aquinas (1225–1274), who argued that Jews willfully rejected the true faith and could be compared to recalcitrant heretics. In the early sixteenth century, the Christian convert Johannes Pfefferkorn, who had been a Jew, became one of the most vicious enemies of Jews and made highly controversial allegations against them, allegations that even some Christian thinkers, such as the Hebrew scholar Johannes Reuchlin (1455–1522), severely criticized (Kirn).

Legal Perspectives

The modern, post-Reformation world witnessed at least some attempts to establish principles of coexistence, toleration, and, especially, since the age of Enlightenment, tolerance. Nevertheless intolerance, xenophobia, religious tensions, and subsequent military conflicts have continued to torture humankind, and the contentious relationship between self and other, both in its philosophical and political contexts, remains highly fragile and subject to manipulation and distortion. Racism, sexual intolerance, marginalization of minority groups, misogyny, and numerous forms of violence against weaker members of society are results of this binary opposition in which the self sometimes desperately struggles against the Other in order to establish its identity.

The First Amendment to the U.S. Constitution, ratified in 1791, clearly specifies a modern, tolerant attitude toward the Other: “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the government for a redress of grievances.” Although the meaning of this statement and its practical application have remained contested, the amendment continues to serve as the basis for intensive discussions about the relationship between the individual citizen and the state for the United States and many other Western societies in the early twenty-first century (Mittal and Rosset, Amar).

One of the most far-reaching and pragmatic expressions of the ideals of the Enlightenment was the legal code established under Napoléon, the *Code Napoléon* (1804), that stipulated the following: (a) equality of all in the eyes of the law; (b) no recognition of privileges due to the happenstance of birth; (c) freedom of religion; (d) separation of church and state; and

(e) freedom to work in an occupation of one's own choosing (Martin). Many of the principles in the *Code* decisively influenced legal systems developed in other countries in the Western world and continue to be cornerstones of modern societies.

Religious differences, even in the early-twenty-first-century West, are a major source of conflict and may always exist, as documented by numerous expressions of anti-Semitism, manifested most virulently in the Holocaust committed by the German Nazis. Each generation struggles with problems of cultural identity and differentiation from the Other, which is the basis for the exploration of the self. However when weakness on one's own part or ideological manipulation by authority figures are involved in the epistemological process, the Other can easily be abused for a wide range of political purposes. People are vulnerable to brainwashing, which relies on an underdeveloped sense of individuality and a high degree of insecurity in the face of ethnic, cultural, religious, linguistic, and political otherness. Fear, intolerance, and dogmatic thinking have always acted to strengthen the group identity and denounce the Others. This is evident in the centuries-old rejection of Sinti and Roma (formerly known as Gypsies), the persecution of Jews since late antiquity, the expulsion of the French Huguenots and the Amish and Mennonites in the sixteenth and seventeenth centuries, the abuse of blacks by colonialists and slaveholders worldwide, the genocide of North and South American Indians, the massive purge of alleged enemies of the Russian, Chinese, and Cambodian communist regimes, and the genocides in Armenia, Burundi, Kosovo, and elsewhere in the twentieth and early twenty-first centuries.

Mysticism, Demons, and the Other

Since the Middle Ages, belief in ghosts, demons, spirits, and other elements have represented a challenge to the Church, and philosophers and authorities struggle in vain against various forms of superstition and fear (Delumeau, Dinzelsbacher). During the high Middle Ages, supernatural phenomena were often associated with the divine, or regarded as emanations of the Godhead, leading to a widespread mysticism movement. Bernard of Clairvaux exerted great influence on his contemporaries and posterity not only due to his learnedness, but also because of his intensive examinations of mystical phenomena. His *super Cantica Cantorum* particularly developed a highly affective interpretation of the Song of Songs and its imagery of the Godhead as bridegroom and the soul as bride. Contemplation was the first stage in the quest for the religious other, followed by mediation, prayer, fasting, sleep deprivation, and grace, which ultimately allowed the mystic to experience revelations. Hildegard of Bingen (1098–1179), leader of a Benedictine convent, gained fame for her mystical visions, which were accepted as authentic by Church fathers (especially Bernard of Clairvaux and Pope Eugene III), who authorized her to go on preaching tours throughout Germany. Other famous mystics were Mechthild of Magdeburg (1208–1282), Mechthild of Hackeborn (1241–1299), Gertrud the Great (1256–c. 1301), Bonaventura (1217–1274), Henry Suso (1295–1366), Meister Eckhart (c. 1260–1327), Bridget of Sweden (1302–1373), and Catherine of Siena (1347–1380) (Szarmach). Although each mystic experienced individualized

visions, all mysticism commonly dealt with the ineffable quality of the Godhead and the absolute realization of the Other in the religious context (Classen, 2002a). Since there are no adequate words to explain the phenomenon of the soul's encounter with the divine, mystics commonly resorted to an apophatic discourse, or, as in the case of Meister Eckhart, to negative theology, which contended that man cannot really talk about God, the absolute Other, and emphasized the need to subjugate the self in the presence of the divine (Milem).

In the late Middle Ages and particularly from the sixteenth century, the Church intensified its control over individualized forms of religious experience and rejected those who claimed to have had visions or been privy to divine revelation (Caciola). As a consequence, women with prophetic abilities, visionaries, and ecstasies were increasingly regarded with suspicion and became victims of the Holy Inquisition.

Although attempts were made to reject magic and to oust different types of seers and sorcerers, such as *harioli*, *auspices*, *sortilegi*, and *incantatores*, these practitioners preserved their secret influence far into the modern age (Flint, 1991). Throughout Europe, both the rural population and intellectuals, even as late as the eighteenth and nineteenth centuries, subscribed to various forms of superstitions, including witchcraft, fear of the devil, and evil spirits (Ginzburg), not to mention a belief in astrology.

Surveying the eighteenth century, Theodor Adorno and Max Horkheimer identified the phenomena as the “dialectics of enlightenment.” But such beliefs continue in early-twenty-first-century society as well, allowing technocrats and bureaucrats to manipulate the Other for their own purposes without regard for the latter's nature, interests, and needs: “Enlightenment behaves toward things as a dictator toward men. He knows them in so far as he can manipulate them” (Adorno and Horkheimer, p. 9).

Even as rationality offers logical explanations of the world around us, people fall back to superstitions and irrational thinking, which permits ideologues to stereotype groups and blame them for a wide range of general ills. In the Middle Ages, the preferred object of this manipulative strategy was the Jews. In early modern Europe, women were accused of witchcraft and burned at the stake, serving as scapegoats for a heightened sense of religious insecurity, fear of the scientific paradigm shift occurring at the time, the growing pressure of the centralized power of the state, and a brewing conflict between popular culture and beliefs and intellectualism (Levack, Scholz Williams).

Ancient and medieval authors, chroniclers, and writers of travelogues projected images of a fabulous East, which was paradise-like in its luxuries and sophistication, but sometimes also populated by monsters. By contrast, early twenty-first-century authors, filmmakers, and artists have resorted to technological utopias, relying on a stereotypical fear of and fascination with extraterrestrial beings, but in anthropological and epistemological terms the differences are minimal. From the late Middle Ages, people imagined the East, especially India, as a sensuous paradise, just waiting for European colonization. This form of Orientalism, which Edward Said discussed

in his famous study (1978), continues to be a pervasive and manipulative concept of the Other both in its epistemological and social-literary dimensions in the early twenty-first century. Overcoming the monster, defeating extraterrestrial creatures, or colonizing their exotic worlds represent the triumph of the self over the Other and offer the chance to establish the self's identity. This phenomenon seems to have characterized all developmental stages of the Western world. Medieval monster lore was deeply influenced by ancient concepts developed by Herodotus (c. 484–between 430 and 420 B.C.E.), Ctesias (c. 400 B.C.E.), Pliny the Elder (23–79 C.E.), and Solinus (third century C.E.). Though Augustine, in his *City of God Against the Pagans* (BK. XVI, ch. 8) expressed doubts, he accepted the possibility that monsters might exist. He suggested that if these monstrous races were real, they should be treated as God's creatures: "He Himself knows where and when anything should be, or should have been, created; and He knows how to weave the beauty of the whole out of the similarity and diversity of its parts" (Augustine, p. 708). Decidedly excluding the idea that God might have erred when he created monsters, Augustine concludes that "just as some monsters occur within the various races of mankind, so there should be certain monstrous races within the human race as a whole" (Augustine, p. 710). One of the earliest examples of monster imagery in the Middle Ages can be found in the Anglo-Saxon *Wonders of the East* (c. 970–1150).

Throughout the Middle Ages, theologians and artists, writers and philosophers were deeply divided over the correct explanation of monsters, the absolute Other within human epistemology (Cohen, J. J., 1999). Jacques de Vitry (1160–1240) attempted to describe the European perspective of monsters: "And just as we consider Pygmies to be dwarfs, so they consider us giants. . . . We consider the black Ethiopians of bad character; among them, however, the one who is blackest is judged most beautiful" (Friedman, p. 164). The fascination that monsters exerted throughout the centuries was undeniable, as documented by numerous manuscript illustrations, sculptures, chronicle accounts, travelogues, textile images, and ivory, stone, and wood carvings (Bovey). Many bestiaries depict not only a wide variety of animals, but also a broad spectrum of monsters whose grotesque features were interpreted as signaling moral decrepitude or who were seen as symbols of imminent apocalypse. Often the treatment of monsters reflected a profoundly Manichean worldview that divided everything into good and evil. Late-medieval poets took a more diversified approach and developed accounts of basically good monsters, such as Melusine, half human and half snake (Classen, 1995, p. 141–162), who was eventually expelled from human society because of her human husband's failure to keep her true nature a secret (see the text versions by Walter Map, Gervasius of Tilbury, Jean d'Arras, Couldrette, and Thüring von Ringoltingen). Many medieval manuscripts, especially Psalters, contained images of hybrid creatures, grotesque beings, and monsters, which could have hardly served as deterrence from sinfulness; instead they represented a growing fascination with the Other and an emerging playfulness in the visual depiction of the world (Camille, Yamamoto). The encyclopedist Thomas of Cantimpré (1201–1272), relying on Augustine's ruminations, urged his readers to "consider the

forms of creatures and delight in the artificer who made them" (Friedman, p. 123). When explorers reached the shores of the New World in 1492, they used monster images to describe and depict the indigenous population, thereby casting them as other from the start (Flint, 1992, p. 53–54, 61, et seq.).

Tolerance and Toleration

The term "tolerance," reflecting a unique approach to the Other, requires a detailed explanation as to its meaning and manifestations during different cultural periods. While classical Greece and Rome generally tolerated people of different beliefs, it would be more correct to identify the openness toward Others as toleration. The persecutions of Jews, and later of Christians, was not the result of religious doctrines, but rather the consequence of claims by Jews and Christians as to the absolute truth of their respective beliefs. Augustine was the first to formulate a preliminary concept of tolerance toward those who embraced different religions (Jews) or were sinners in the eye of the Church, such as prostitutes (*Epistola ad Vincentium V* [1649]), as long as such open-mindedness contributed to the cohesiveness and stability of the Christian community. However, Augustine vehemently attacked those Christians who followed deviant teachings (Donatists), and approved of their persecution. In the Middle Ages, scholastic writers pursued the idea of tolerance in the light of sinful behavior that could be accepted as long as it did not affect the principles of Christian belief. Thomas specifically differentiated among heathens, Jews, and heretics, and argued for the toleration of various religious practices among Christians as long as they supported the truth of the New Testament. Moreover Thomas rejected forced conversion and baptism since such acts constituted a violation of natural law (Bejczy, p. 370).

A number of medieval writers explicitly advocated tentative models of tolerance. In his middle High German epic *Willhelam* (c. 1218), Wolfram von Eschenbach's female protagonist Gyburc pleads for humane treatment of the heathens, her own relatives who she had left behind when she fled to the Christian world with her lover and future husband Willhelam. In the pan-European love story *Floire et Blanchefleur* (Old French version, c. 1160), just as in *Aucassin et Nicolette* (Old French, early thirteenth century), the difference in religion of the young couple has no significance, whereas love is described as the dominant force that overcomes all social, ethnical, military, and political conflicts (Shutters, 2004). In the anonymous middle High German verse romance *Reinfried von Braunschweig* (c. 1280), the protagonist at first intends to force his opponent, the Prince of Persia, to convert to Christianity. But, upon the latter's plea, Reinfried allows the Persian to maintain his religion because he realizes that a forced conversion would never make the Prince into a true Christian. In fact the protagonist abandons all his religious goals and becomes a secular tourist who simply admires the wonders of the East. The Catalan mystic and poet Ramon Llull (c. 1232–1316) strongly advocated openness toward the Other in his *Book of the Gentile and the Three Wise Men* (c. 1275–1290). Similar to Peter Abelard's *Dialogue between a Philosopher, a Jew, and a Christian* (c. 1136–1139), Llull's treatise is built upon dialogues among representatives of the three world religions about their specific form of

belief. Although Lull, like Abelard, explicitly advocated Christianity, he accepted other religions as valid belief systems that he could not and did not want to condemn absolutely. On the contrary, both Abelard and Lull suggested that conversion to Christianity must be based on true conviction, which in turn was based on an intellectual, rational discourse in which the opponent was convinced of the falsity of his or her original belief and convinced by logical arguments and a newfound faith to accept Christianity (Nederman, Muldoon). Although in reality openness toward other religions was hardly ever practiced—as evidenced by the many persecutions and expulsions of and pogroms against Jews—many medieval and early modern philosophers can be credited with bold, farsighted exploration of the possibilities for various religions to exist side by side. Nicolaus of Cusa (1401–1464), in *De pace fidei* (1453), proposed embracing the concept of *concordia* (concordance) of the *religio una in ritum varietate* (one religion in a variety of rituals). Some humanists such as Thomas More (1485–1535) and Erasmus of Rotterdam (c. 1466–1536) advocated acceptance of religion as an individual worldview that should not be imposed on other people. Heretics should be persecuted, but only by the state and only when they represented a danger to the entire community (*De amabili ecclesiae concordia liber* [1533]). Conversely Martin Luther (1483–1546), although he had broken with the Catholic Church, strongly defended the persecution of Jews and members of various Protestant sects, and approved of the death penalty. John Calvin (1509–1564) defined tolerance as friendliness of the spirit (*mansuetudo animi*), but he did not raise any objections to imposing the death penalty on heretics, such as the Spanish theologian Miguel Serveto (c. 1511–1553).

On the opposite side of the debate was the French philosopher Jean Bodin (1530–1596) who defended the freedom of individual consciousness and tolerance (*Six Livres de la République* [1576]). In the tradition of Abelard and Lull, Bodin composed a dialogue text in which representatives of various religions discuss their theological differences (*Colloquium heptaplomeres* [c. 1593]).

Religious tolerance was an important issue in the wake of religious wars on the European continent and in England up to the end of the Thirty Years' War because the dominant religions persecuted minorities, which in turn led to military conflicts. Thomas Hobbes (1588–1679) was the first to define religious convictions as “private opinions” (*Leviathan* [1651]), which paved the way for John Locke's famous “Letter Concerning Toleration” (1689): “For no man can, if he would, conform his faith to the dictates of another” (Locke, see Zagorin). Nevertheless even Locke refused to accept atheists and charged them with refusing to abide by the basic rules of human society, which were predicated on the concepts of covenants, promises, and oaths.

Traditional scholarship argues that Locke's “Letter Concerning Toleration” represents the first attempt in the history of the Western world to establish philosophical principles of tolerance, followed by comparable statements by Wilhelm von Humboldt (1767–1835), Benjamin Constant (1767–1830), and John Stuart Mill (1806–1873). But even though the term

tolerance might not be fully applicable in other contexts, as early as late antiquity and the Middle Ages writers and philosophers embraced certain types of tolerance, or at least toleration, for example Augustine, John of Salisbury (c. 1115–1180), Marsiglio of Padua (1275–1342), Nicholas of Cusa (1401–1464), and Bartolomé De Las Casas (1484–1566) (Nederman, 2000). Francisco de Vitoria (1483–1546), insisting upon the inalienable rights of all peoples, formulated such astonishingly open-minded views regarding the North and South American Indians and their inhumane treatment at the hands of the Spanish conquistadors that his works were almost put on the papal index of forbidden books (Schmidinger, pp. 194–202). In particular, de Vitoria argued that conversion to Christianity can only be possible if the prospective convert has been convinced rationally. Infidels can never be forced to convert, since faith is also a matter of reason. This attitude resonated profoundly in John Locke's “Essay Concerning Human Understanding” (1690): “Such is the nature of the understanding that it cannot be compelled to the belief of any thing by outward force. Confiscation of estate, imprisonment, torments, nothing of that nature can have any such efficacy as to make men change the inward judgment that they have framed of things. . . . It is only light and evidence that can work a change in men's opinions; and that light can in no manner proceed from corporal sufferings, or any other outward penalties” (Vernon, p. 17). In other words, tolerance, or acceptance of the Other, in his inalienable character and nature, has been explored by philosophers throughout history, but has remained a fleeting concept regularly undermined and challenged by social, economic, political, and military realities.

Major breakthroughs in the history of modern tolerance did not occur until the late eighteenth century. Emperor Joseph II of Austria issued a law of tolerance for the various religious (Christian) communities in his inherited lands, giving members of non-Catholic communities recognition, as long as the dominance of the Catholic Church was not compromised. In letters that he exchanged with his mother Maria Theresa, he said that he remained an ardent defender of Catholicism, but wanted to give Protestants equal rights, at least in terms of their status as citizens, and to grant them the right to practice their religion. The Constitution of the United States was based on the principle of tolerance, best reflected in the Bill of Rights, as formulated by Thomas Jefferson (1743–1826), and Thomas Paine (1737–1809) in his enormously popular *Rights of Man* (1791).

The most influential and far-reaching public defense of tolerance, however, might well be that of the German Enlightenment writer Gotthold Ephraim Lessing (1729–1781) in *Nathan the Wise* (1779). Based on an episode from Boccaccio's *Decameron* (c. 1348–1350), the key component of the story is a parable that the Jew Nathan tells the Sultan Saladin. The Sultan, short of money, encourages Nathan to identify which of the three world religions is the only true one, hoping to extort money from Nathan who is sure to reveal his preference of Judaism. Nathan, however, does not provide a straightforward answer, and instead relates the parable of a man who owned a valuable ring that had the power to make its bearer loved by all people. The ring's owner leaves the ring to

the son who is dearest to him. The pattern of that legacy is continued for many generations, until one day a father has three sons whom he loves equally. When death approaches, the father has two perfect copies of the ring made and secretly gives one to each of his three sons, pretending that it is the only and true ring. After his death the sons go to a judge to determine who owns the authentic ring and hence who is heir to the father's estate. The judge refuses to decide and advises the three brothers to "Let each of you demonstrate his belief in the power of his ring by conducting his life in such a manner that he fully merits—as anciently promised—the love of God and man." The brothers are told to return to the ultimate judge, God, within a thousand years and to confirm before Him who had been the most loved because of his kindness and piety. Saladin understands Nathan's message and discharges him, accepting him as a friend. Saladin has learned that all three religions are equal in their basic essence and that believers of all faiths should tolerate each other, competing only in an attempt to be most worthy of the love of families and neighbors.

Assessment

Despite numerous efforts by lawmakers, philosophers, theologians, and poets, the deep gulf between self and the Other has continued to plague the modern world. Although Jews gained more freedoms after the early nineteenth century and were increasingly integrated into Christian society, by the 1890s anti-Semitism had reached new levels of intensity, making possible the atrocities committed by the Nazis during the Holocaust, and subsequent pogroms in Poland and Russia following World War II and continuing into the early twenty-first century. The world continues to struggle with the dialectics of self and other, in intellectual and popular culture, in economic and military terms, and in issues regarding the legal rights of immigrants, refugees, prisoners of war, criminals, and others who society at large does not accept or tolerate (Levinas, pp. 145–149). Ancient man regarded barbarians or even members of neighboring city-states as other. Medieval people used images of monsters to characterize believers of other religions as dangerous infidels or heretics. These as well as homosexuals, apostates, the possessed, and even women were considered to be the Other, both threatening and dangerous (Goodich). In the early twenty-first century, dominant societies have created a variety of new images of the Other, such as illegal immigrants, asylum seekers, political refugees, Muslim terrorists, and imagined creatures from outer space (Schreiner).

The content of the theoretical template of the Other has changed over the centuries but its fundamental binary opposition that the self always establishes barriers to the Other in order to create an identity—a process that is possible only through deliberate differentiations—remains. While not inherently hostile or dangerous, in most cases, throughout history people have tended to cast the Other in the worst possible light because the self usually chooses a path toward itself by rejecting the Other and establishing a close-knit community (family, village, church group, country, and people). Since the Middle Ages individual writers, poets, philosophers, and theologians have argued in defense of the Other and have made

serious attempts at breaking down the rigid barriers between it and the self, demonstrating that open-mindedness and tolerance are values that have long been important in human society. In other words, arguments for the humane, integrative treatment of the Other have been proposed throughout history, with the idea of tolerance arising in different contexts in different cultures and historical periods. Since the creation of the U.S. Constitution and the *Code Napoléon*, however, Western societies, particularly, have struggled, more or less successfully, to establish institutional frameworks and legal, social, economic, and religious conditions through which the constructive interaction between self and other have become increasingly possible (Wierlacher, 1993).

P

PACIFISM. The issues summoned up by the term *pacifism* are complex and varied because different concepts, traditions, and definitions exist throughout the world, often creating misunderstanding and confusion—sometimes intentionally so. For example, the term may be used pejoratively in political debates by individuals seeking to portray opponents who refuse to support a specific military action, or by those who prefer nonviolent approaches to a problem or conflict while not being principled pacifists. The term underwent a bifurcation, redefinition, and narrower specification with the watershed years of the so-called Great War of 1914. The distinction between absolute pacifism and “pacific-ism”—the latter a term coined by the modern historian A. J. P. Taylor and used by his successors—or other less ethically rigid “pacifist” positions emerged then. Before 1915 the term *pacifist* was employed as a more general term to describe one who opposed war as an institution, rejecting violence in favor of turning “swords into plowshares.” But the earlier definition of *pacifist* did not necessarily exclude violence—still less all force—as a means to an end, for example, in opposing slavery.

This more general understanding of pacifism did not necessarily imply a refusal to support, or indeed fight in, a war once it broke out. The more rigid position became defined as “absolute” or “pure” pacifism, identifying those whose stance in 1914 or from 1915 to 1916 was based on consistent principles. The terms *pure* or *absolute* have been dropped from the political debate since then, and the term *pacifist* now tends to mean rejection of all and any war—especially since the 1960s, when some “pacifists” remained equivocal on violence in Indochina.

The Religious Concept of Pacifism

The individual moral concept of “turning the other cheek” is one that belongs to a number of religious traditions, though the position has perhaps arguably been most fully developed as an ethical position in Judaism and then Christianity and as a spiritual position in Buddhism—and, mainly through Mahatma Gandhi (1869–1948), as a revision of Hindu thought. The major religious tradition with the least apparent pacifist dimension seems to be Islam. Secular ethical pacifism emerged in the nineteenth century alongside other “isms” based on humanist and universalist ethics and overlaps with several ideological strands from liberalism to anarchism and, since the 1970s, feminism.

Pacifism and Resistance to War

The biblical commandment “thou shall not kill” does not specifically refer to organized war and can thus be taken as a prohibition of individual murder, perhaps not the “legitimate”

killing by soldiers in war—an ethical sleight of hand that has been convenient to states and rulers and allows the concept of just war, elaborated by the Christian Church when it became institutionalized in the West in the fifth century and continuing for a millennium. The injunction to turn the other cheek in the face of violent provocation has been seen not as a theory of nonviolence but as one of passivity, suffering, and stoicism. Pacifist idealism and ethics have evolved toward a more formal position of war refusal or war resistance. More generally, pacifism worldwide has evolved from an ethic of suffering and detachment to active engagement through nonviolence as an alternative to war. The invention of Gandhian nonviolence thus represented a critical moment in the evolution of pacifist ethics—though Gandhi was not an absolute pacifist in the strictest sense.

Conscientious Objection Based on Pacifist Principles

Since laws of universal military service—conscription or the draft—and claims of conscientious objection spread gradually during the nineteenth century, the issue of refusal to fight in war did not appear to be a universal issue of conscience. It had been possible to avoid the choice if faced with it. Pacifism as opposition to war as an institution did not mean refusal to participate in it until the drafts of 1914–1918, when those who accepted the call of country (so-called pacifists) divided themselves from the minority absolute pacifists who remained antiwar in practice as well as theory.

War Resistance versus Pacifism

Similar ethical divisions over war in general and specific (just) wars have continued. War resistance (often to specific wars) and pacifism are not the same; some have refused to participate in specific “unjust” wars or opposed an arms race or particular (for example, nuclear) weapons without being pacifists in regard to all war. For example, the peace movement was often partisan regarding whose weapons and wars it most actively opposed—divided over emancipatory or “progressive” war or violence (such as the defense of the Spanish Republic against fascism after 1936). Other ethical issues for pacifism have arisen over the moral duty to counsel others to refuse military service (under some laws “incitement to disaffection”)—or to take nonviolent action, even sabotage, to obstruct war or destroy weapons.

Further examples of this dilemma abound. Should continued religious teaching against war or military combat be interpreted as treasonable or subversive of a state in time of war? Certainly not all those who refuse to be involved in war on ethical grounds are advocates of nonviolence or turning the

other cheek in other situations. Equally those who accept a nonviolent discipline in domestic politics (such as Gandhi's) do not necessarily condemn all war. The grounds for opposing war and conscription are often not strictly ethical; they may be political or personal—ethics of justice, liberation, equality or “national liberation” may be more important than nonviolence in antiwar protests.

The Personal versus the Political in Pacifism

The term pacifism is usually used of an ideological position that is more than purely personal—the U.S. anarchist Paul Goodman (1911–1972) called himself a “fist-fighting pacifist.” For others personal nonviolence in life, or a meditative path, is more important than whether one dons a uniform or picks up a weapon or takes a position against a war or revolution. It is essentially retreatist. There are many variants of these positions.

The millennia of otherworldly retreat—monastic or utopian—from a world that appears lost repeats itself as communitarian pacifism and recurrently inherits recruits from failed or dissipated antiwar movements. There is an emphasis on child development, peace education, and the construction of a more peaceful culture, which has had an impact on modern pedagogy.

Mahatma Gandhi (1869–1948). Gandhi's policy of passive resistance—or, as he preferred to call it, *satyagraha* (truth and firmness)—was first manifested during his sojourn in South Africa in the late nineteenth century and continued upon his return to his homeland of India. AP/WIDE WORLD PHOTOS

Gandhi's own ambivalence on these dilemmas, expressed in his retreat after the mass 1920s campaigns became violent—again is symptomatic of this ambiguity in pacifist idealism; yet by the 1930s and 1940s he once again advocated mass nonviolent resistance to British colonial rule in India, even during wartime, while also urging such resistance to Hitlerism from the 1930s on—for those brave enough to do so. Violence in this view was the inferior weapon of the weak, preferable to cowardice, but a lesser evil at best. Gandhi's model was reproduced in Ghana to some extent, but more violent methods adopted by leftist or nationalist revolutionaries tended to dominate such struggles thereafter.

Gandhi was also a political pacifist, however, in seeking programs of social and institutional change, not merely personal transformation. He saw them as being linked—following the teachings of Leo Tolstoy—but went further than the Russian Christian anarchists in creating a political ethic of nonviolent collective action (drawing also from Thoreau's principles of civil disobedience). These ideas in turn inspired Dr. Martin Luther King Jr. (1929–1968) and other human rights leaders. In the early New Left of the 1960s and the women's movements of the 1970s and 1980s and since, the personal and the political came together again in a fusion of pacifism and antipatriarchal women's peace activism that sought to “take the toys from the boys” not least the Cruise missiles deployed in the United Kingdom by U.S. President Ronald Reagan in the 1980s. The Greenham Common Women's Peace Camp at the Greenham missile base in the United Kingdom was symptomatic of hundreds of such projects, militantly antimilitarist but linked to feminist and pacifist ideologies and predominantly nonviolent in methodology.

Twentieth-Century Developments

In the twentieth century new forms of pacifism emerged that were linked to political traditions: anarchist or socialist pacifism, nationalist pacifism (for example, in Wales), nuclear pacifism or the refusal to support or tolerate the stockpiling manufacture, use, or threatened deployment of weapons of mass destruction. Many pure pacifists were ambivalent about such a movement against only one form of war, while others took leadership roles in movements opposing the atomic bomb, in turning the movement to the use of Gandhian nonviolence. Feminism took an interest in pacifism from the first women's movements, burgeoning in the antinuclear women's peace movements of the 1980s and reflected in writers such as Barbara Deming.

Since 1918 the link between individual pacifist ethics and political pacifism has been shown to be most obvious; the sum of individual conscientious stances can create a social force based on ethics that can have an impact on policy. While more noticeable in liberal democratic contexts, even in authoritarian and repressive situations, such movements have had enormous effectiveness. Acting against the military draft, opposing the threat to engage in war, or the planned deployment of a new weapon (for example, to target civilians), or the invasion of another country—such movements have suffered many short-term setbacks but some long-term successes. Yet often pacifist and pacifist groups have remained marginal in their attempt to bring ethical stances into political life; the peace

churches and “prophetic minorities” have kept ethics alive and provided leadership but are at best pressure groups or lobbies for change, as was the attempt to stop the strategic bombing of cities in World War II (1943–1945). In retrospect this was, even from the mainstream, not considered treasonable behavior but a legitimate ethical position. At the time it was seen as disloyal and questionable and was therefore marginalized by the allied military-political elites.

The war in Vietnam is another instance where, in hindsight, the pacifist positions that were marginalized in 1965 seemed justifiable only a decade later. The draft resistance movement led by pacifist groups has gained a respectable if not heroic image. However, this opportunistic application of just war or pacifist theories is anathema to absolute pacifists for whom even World War II, the “good war,” remains ultimately an injustice—to the victims and those forced to fight in it.

Ethical pacifists who have emerged in the twentieth century with leading roles in social movements—Dr. Martin Luther King, Jr., Mahatma Gandhi, and many others—have, like some of the great pacifist religious prophets of the distant past, had an impact on social consciousness and cultural history far beyond their immediate actions. Yet pacifist ethics are in tension not only with the institution of war but even with the violent origins, foundations, and operations of the state and its penal and security systems. Despite the Gandhian model, pacifism often finds itself in tension with nationalist aspirations, or the urge toward armed emancipation from oppression. The “Balkan Gandhi,” Ibrahim Rugova (b. 1945), witnessed two decades of nonviolent struggle for the autonomy of Kosovo, but also saw his nonviolent movement overtaken by a violent reaction to Serb oppression in 1998–1999 and ultimately by military intervention by NATO.

The episode in Kosovo, like the Spanish Civil War of 1936, underlines the dilemmas of pacifist ethics in a highly militarized world, socialized toward violent solutions to conflict. Such events do not prove pacifism right or wrong; they do raise issues of immediate effectiveness in the last resort (especially where peoples are under threat, or as in Spain where the long-term consequences of inaction may be disastrous), as against aspirations for long-term cultural and political change, and the failure to break the cycle or self-sustaining character of violent action. The great social structural insight of pacifism (as opposed to its ethical probity) is that violent conflict and change begets violent institutions, authoritarianism, and further violence. Whether nonviolence as a method can slowly replace that structural dynamic remains open to question, yet it is surely one of the prime issues of all human politics.

PAN-AFRICANISM. Because it refers neither to a single political ideology nor a clearly discernible philosophical tradition, *Pan-Africanism* is difficult to define. Many scholars avoid defining it, noting that black internationalism has varied drastically according to time and place. Indeed, various conceptions of Pan-Africanism have been aligned with disparate political and theoretical positions, from largely religious to communist to even, Paul Gilroy suggests, fascist forms. Yet, the concept can be said to signify a set of shared assumptions. Pan-Africanist intellectual, cultural, and political movements tend to view all Africans and descendants of Africans as belonging to a single “race” and sharing cultural unity. Pan-Africanism posits a sense of a shared historical fate for Africans in the Americas, West Indies, and, on the continent itself, has centered on the Atlantic trade in slaves, African slavery, and European imperialism.

Cultural and intellectual manifestations of Pan-Africanism have been devoted to recovering or preserving African “traditions” and emphasizing the contributions of Africans and those in the diaspora to the modern world. Pan-Africanists have invariably fought against racial discrimination and for the political rights of Africans and descendants of Africans, have tended to be anti-imperialist, and often espoused a metaphorical or symbolic (if not literal) “return” to Africa.

Origins and Development of Pan-Africanism

The modern conception of *Pan-Africanism*, if not the term itself, dates from at least the mid-nineteenth-century. The slogan, “Africa for the Africans,” popularized by Marcus Garvey’s (1887–1940) Declaration of Negro Rights in 1920, may have originated in West Africa, probably Sierra Leone, around this time. The African-American Martin Delany (1812–1885), who developed his own re-emigration scheme, reported in 1861 the slogan after an expedition to Nigeria during 1859–1860 and Edward Wilmot Blyden (1832–1912) adopted it when he arrived in West Africa in 1850. Blyden, originally from St. Thomas, played a significant role in the emergence of Pan-Africanist ideas around the Atlantic through his public speeches and writings in Africa, Britain, and the United States, and proposed the existence of an “African personality” resembling contemporary European cultural nationalisms. Blyden’s ideas informed the notion of race consciousness developed by W. E. B. DuBois (1868–1963) at the end of the nineteenth century.

The growth of Pan-African sentiments in the late nineteenth century can be seen as both a continuation of ethnic, or “pan-nationalist,” thinking and a reaction to the limits of emancipation for former slaves in the diaspora and European colonial expansion in Africa. There are a number of reasons why black internationalism had particular resonance during this period. African contact with Europeans, the slave trade from Africa, and the widespread use of African slaves in the New World colonies were the most salient factors, leading first those in dispersion and then many in Africa to envision the unity of the “race.” At the same time, as abolition spread gradually around the Atlantic during the nineteenth century, Europeans increasingly viewed race as a biological and, thus, inherent difference rather than a cultural one.

Back-to-Africa movements—particularly the establishment of Sierra Leone by the British in 1787 and Liberia by the American Colonization Society in 1816—also contributed to the emergence of Pan-Africanism, and were probably the original source of the phrase, “Africa for the Africans.” From 1808, English Evangelicals at the CMS Grammar School in Freetown taught their “liberated” students that there were other Africans around the globe, which instilled a sense of a common destiny. Many mission-educated Sierra Leoneans like Samuel Crowther (c. 1807–1891) and James Johnson (1836–1917) moved or, in some cases, moved back to Nigeria, primarily Lagos, beginning in the mid-nineteenth century, where they were joined by returning freed people from Brazil and the Caribbean. These groups quickly coalesced into the Christian, African upper class that produced the leaders of early Nigerian nationalism and Pan-Africanism. Pan-Africanism was the

product of extraordinary, European-educated Africans and African-Americans, in other words, those most exposed to metropolitan culture and the influences of the modern world.

Ethiopianism. Apart from the contributions of West Africans and African descendants in the New World, South Africa developed a distinctive form of race consciousness in the form of Ethiopianism. Up to the contemporary Rastafarian movement in Jamaica, the word *Ethiopian* has enjoyed a privileged position in the Pan-Africanist vocabulary as a term for all Africans and as one referring only to the inhabitants of a specific state (Abyssinia). The movement denoted by the term *Ethiopianism* draws on the former denotation and takes its name from the “Ethiopian Church” founded in 1892 by Mangena M. Mokone (1851–1931) who separated from the African Methodist Episcopal mission over discrimination in the church.

Ethiopianism emerged in response to European colonial settlement, the institutionalization of white supremacy, and rapid industrialization, particularly in mining areas like the Rand region near Johannesburg. Its leaders were largely graduates of missionary schools, but most in their audiences were illiterate. Thus, Ethiopianism became a significant means of spreading proto-nationalist ideas and a sense of Pan-African unity in southeastern and South Africa. Following the last Zulu uprising in 1906, white South Africans and the British associated the movement with the insurrection and became hypersensitive to any potential expressions of the “peril.” The notion of Ethiopianism, however, had spread to West Africa, notably the Gold Coast and Nigeria, by the end of the nineteenth century, where it blended with other Pan-Africanist currents.

Transnational Pan-Africanism

Although the exact origins are disputed, the term *Pan-African* first appeared in the 1890s. P. O. Esedebe maintains that the Chicago Congress on Africa held in 1893 marks both the transition of Pan-Africanism from an idea to a recognizable movement and the first usage of the word itself. In their collection on Pan-African history, however, Adi and Sherwood point to the creation of the African Association in 1898 and the convening of the first Pan-African conference in 1900 in London, both organized by the Trinidadian lawyer Henry Sylvester Williams (1869–1911), with the objective of “bringing into closer touch with each other the Peoples of African descent throughout the world,” as the beginning of the “organised Pan-African movement.” Despite these differences, scholars agree on the important role that the African American intellectual W. E. B. DuBois played in developing the idea of Pan-Africanism and marshalling a transnational political movement around it. Indeed, DuBois contributed significant speeches to the proceedings of the Chicago Congress and the Pan-African 1900 conference. In his “Address to the Nations of the World” at the latter, DuBois declared:

the problem of the twentieth century is the problem of the colour line, the question as to how far differences of race . . . are going to be made, hereafter, the basis of denying to over half the world the right of sharing to their utmost ability the opportunities and privileges of modern civilization. (1995, p. 11)

Although Williams was unable to bring plans for a second conference to fruition, DuBois soon initiated his own movement, resulting in five Pan-African Congresses during the first half of the twentieth century (1919, Paris; 1921, London, Brussels, Paris; 1923, London and Lisbon; 1927, New York; 1945, Manchester, England). During this period the nature and tenor of Pan-Africanist cultural and political activities changed drastically.

Pan-Africanism in the Early Twentieth Century

World War I brought thousands of African-Americans, Afro-Caribbeans, and Africans into contact with one another. The exigencies of war also led the imperial powers of Europe—Britain, France, and Germany—to train and employ colonial subjects in crucial industries while, as colonial combatants, many others saw firsthand the depravity that a supposedly superior European civilization had produced. Colonial soldiers also pointed to the racism implicit in being asked to fight to “make the world safe for democracy” when this world would not include them, a suspicion confirmed for many when the Allies refused to include a guarantee against racial discrimination in the League of Nations charter following the war. As a result, the interwar years witnessed an unprecedented growth in a sense of racial unity and the popularity of black internationalism.

Marcus Garvey. The most famous Pan-Africanist movement of the period was Garveyism. After struggling for some time to attract an audience in his native Jamaica, Marcus Garvey emigrated to Harlem in 1916, where he and a young, educated Jamaican woman, Amy Ashwood (who later married Garvey), relocated the Universal Negro Improvement Association (U.N.I.A.; founded 1914) on firmer footing. The U.N.I.A. quickly became the largest African-American organization in history due, in large part, to the diligent work of black women in the movement, especially West Indian emigrants like Ashwood and Marcus Garvey’s secretary and second wife, Amy Jacques (1896–1973).

The apogee of the U.N.I.A.’s success was probably its international convention in 1920, at which Garvey presented the Declaration of the Rights of the Negro Peoples of the World, demanding “self-determination for all peoples” and “the inherent right of the Negro to possess himself of Africa.” Garvey’s hubris—in declaring himself “the provisional president of Africa,” for instance—and autocratic leadership, however, cost him important friends and supporters, and his flair for ostentatious public spectacles and inflated expectations led many leading African-American writers and scholars, for example, Alain Locke (1885–1954) and DuBois, to decry him as a liability to the race. With most of his commercial enterprises like the Black Star shipping line failing or already bankrupt, in 1922 the U.S. government arrested and jailed Garvey for five years before deporting him in 1927, effectively ending the organizational life of the U.N.I.A. in the United States. Nevertheless, Garvey’s life and work left a powerful legacy around the African diaspora, and his ideas have reappeared in many guises, from the violent labor clashes in the Caribbean during the 1920s and 1930s to the more millenarian form of Garveyism that developed in South Africa.

Pan-Africanist literary and cultural movements. The interwar period also witnessed the flowering of a number of Pan-Africanist literary and cultural movements, especially in New York, London, and Paris, and the emergence of a trans-Atlantic periodical culture. In the United States, the New Negro movement of the 1920s, better known as the Harlem Renaissance, not only drew attention to the work of African American artists but also displayed distinct Pan-Africanist sensibilities. Writers like James Weldon Johnson (1871–1938) inspired others around the Atlantic, for example, the Nardal sisters from Martinique (Paulette, Jane, and Andrée, who ran a salon out of which came *La Revue de Monde Noir* [The Journal of the Black World] edited by Paulette Nardal and Léo Sajous) and Una Marson from Jamaica (1905–1965; the first major woman poet of the Caribbean and a playwright), to assert positive images of blackness while experimenting with stylistic innovations, often informed by black musical forms like the blues. Yet, the New Negro movement was not solely a literary or artistic movement: Pan-Africanist political organizations, including the explicitly communist African Blood Brotherhood, can also be seen as manifestations of it.

Pan-Africanists and communism. However, it was across the Atlantic in Britain—where by the mid-1930s a key group of West Indian and African radicals had assembled—that communism and, particularly, the recent success of the Bolshevik Revolution (1917) had its greatest impact on Pan-Africanist activists and intellectuals. The Trinidadians George Padmore (1902–1959) and C. R. L. James (1901–1989) were most significant in this regard. Padmore served as head of the International Trade Union Committee of Negro Workers and editor of its monthly newspaper, the *Negro Worker*, and James was an internationally known Trotskyite.

Growing awareness of Stalin’s abuses in the Soviet Union and, more importantly, the apathy with which the governments of Europe and the League of Nations greeted Mussolini’s invasion of Abyssinia (Ethiopia) and Haile Selassie’s pleas for intervention ultimately led them both to split from the Communist Party and foreground Pan-Africanism in their political and intellectual work. In 1938, James published two important books of Pan-African history, the *Black Jacobins* and *A History of Negro Revolt*. Both situated contemporary anti-imperialist struggles in Africa within a larger tradition of resistance stretching back to slave uprisings in the New World. As James explains in a revealing footnote that he later added to the *Black Jacobins*, “such observations, written in 1938, were intended to use the San Domingo revolution as a forecast of the future of colonial Africa.”

James formed the International African Friends of Abyssinia in 1935 along with Padmore, Amy Ashwood Garvey, the Trinidadian musician and journalist Sam Manning, Ras Makonnen (1892–1975) from British Guiana, the Sierra Leonean trade unionist I. T. A. Wallace-Johnson (1895–1965), and the future president of postcolonial Kenya, Jomo Kenyatta (1889–1978). The group soon became the International African Service Bureau and published a series of short-lived but important journals: *Africa and the World* (July–September 1937), *African Sentinel* (October 1937–April 1938), and *International African Opinion* (July 1938–March 1939).

Sojourners from Africa and the Caribbean created a number of other organizations in interwar Britain, most notably the West African Student Union (WASU) and the League of Coloured Peoples (LCP). Harold Moody (1882–1947), a West Indian doctor who was outspokenly anticommunist, founded the latter as an interracial association with the intention of fostering greater understanding and cooperation across racial boundaries. A small group of law students from West Africa, led by Ladipo Solanke (1884–1958), established the WASU to challenge racial discrimination and racist representations in Britain. However, they were also encouraged by the example of the National Congress of British West Africa under the leadership of J. E. Casely Hayford (1866–1930), which envisioned the creation of an independent “United States of West Africa.” The LCP and the WASU also published two significant mainstays of the black British press during the period, *The Keys* and *Wāsù* (Preach), respectively. Though initially neither was radical politically, by World War II both organizations had begun to call for an end to British colonial rule in Africa and the Caribbean, and the WASU’s local hostel in particular had become an important clearinghouse for Pan-Africanist ideas. In fact, several members of WASU went on to become prominent politicians in postcolonial Africa.

Pan-Africanism in France. Though they have received far less attention in the extant literature, students, writers, and activists from the Francophone Antilles and French West Africa also developed a distinct form of Pan-Africanism, or *internationalisme noir* (black internationalism), in Paris between the wars. After serving in World War I, the ambitious lawyer and philosopher Prince Kojouhounou (1887–1925) from Dahomey founded the *Ligue Universelle pour la Défense de la Race Noire* (International League for the Defense of the Black Race), which published the first black newspaper in France, *Les Continents*, during the second half of 1924. The Martinican novelist René Maran (1887–1960) also played a major role in the paper as both an editor and writer.

However, the most well-known expression of black internationalism in interwar France was the literary and philosophical movement known as Negritude. The Martinican poet Aimé Césaire coined the term during 1936–1937. In addition to Césaire, the work of Léon-Gontran Damas (1912–1978) and Léopold Sédar Senghor (1906–2001) are usually credited with establishing and defining the movement. Yet, Negritude emerged within a broader spectrum of Pan-Africanist activities, from the Senegalese communist Lamine Senghor’s (1889–1927) Comité de Défense de la Race Nègre (Committee for the Defense of the Black Race), which was founded in 1926 and published the short-lived journal *La voix des nègres*.

Women’s contributions to Pan-Africanism. The essential contributions of women to the development of both Anglophone and Francophone forms of black internationalism were overshadowed by their male contemporaries and have fared little better in scholarship on Pan-Africanism. Recently, however, the feminist-inflected Pan-Africanism of Jamaican women—Amy Ashwood Garvey, Una Marson, and Claudia Jones (1915–1964)—and West African women such as Constance Cummings-John (1918–2000) and Stella Thomas

has received more attention. Likewise, the crucial role of the Martinican Nardal sisters in initiating and articulating *internationalisme noir* in Paris—as illustrated, for example, by *La revue du monde noir*—is only beginning to be acknowledged. Moreover, as Brent Hayes Edwards points out, historians have failed to recognize the ways in which various formulations of Pan-Africanism and, more specifically, the Negritude movement were implicitly gendered.

Pan-Africanism after World War II and Postcolonialism

Coming as it did immediately after the upheavals of World War II, the 1945 Pan-African Congress in Manchester marked a watershed in black internationalist activities around the Atlantic. Though ostensibly under DuBois’s guidance, it was organized primarily by socialist Pan-Africanists in Britain, especially George Padmore, and was the first Congress to include a significant number of Africans like Jomo Kenyatta and Kwame Nkrumah (1909–1972), who served as assistant secretary and joint secretary, respectively.

Following the Manchester Congress, the site of Pan-Africanist activities shifted from the United States and Europe to the colonies in the Caribbean and, particularly, Africa. In fact, many of the key figures in the movement—DuBois, Padmore, and Alphaeus Hunton—relocated to Africa during this period. In 1956, Padmore’s classic *Pan-Africanism or Communism?* appeared, and in 1958 Nkrumah hosted the first All-Africa People’s Conference at Accra in the wake of independence from British colonial rule in 1957 and the creation of an independent Ghana.

In the postcolonial era, the nature of Pan-Africanism and the problems facing Pan-Africanist projects changed dramatically. For the first time, Pan-Africanism became a broad-based mass movement in Africa and enjoyed its greatest successes as an international liberation movement in the first two decades after the war. Through his rhetoric and, most importantly, his example as president of independent Ghana, Nkrumah dominated this period in the history of Pan-Africanism. The context of the Cold War profoundly shaped the struggle for independence in Africa, as it did global politics in general, but in spite of his commitment to Marxism, Nkrumah avoided taking sides in the East-West Cold War and, instead, emphasized African unity. As some historians have noted, the All-Africa People’s Conference at Accra in 1957, attended by some 250 delegates, established the basic tenets of Pan-Africanism for decades to come: the attainment of political independence, assistance to national liberation movements, diplomatic unity between independent African states at the United Nations, and nonalignment. As Nkrumah asserts in *I Speak of Freedom*, “a Union of African states will project more effectively the African personality.”

In 1963, due primarily to the efforts of Nkrumah, President Sékou Touré (1922–1984) of Guinea, President Modibo Keita (1915–1977) of the Republic of Mali, and Haile Selassie, the emperor of Ethiopia, the Organization of African Unity (OAU) was founded in the midst of decolonization and the euphoria of independence in West Africa. However, economic neo-colonialism and the limits of political independence quickly

extinguished the optimism of the immediate postcolonial period, leading Pan-Africanist scholars like the Trinidadian historian Walter Rodney (1942–1980) to reevaluate the long-term repercussions of the Atlantic slave trade and European imperialism for Africa. The 1960s also witnessed a number of intra-African disputes between newly independent states, many of which were precipitated by border issues inherited from colonialism.

Pan-Arabism and Pan-Africanism. Another significant feature of the postwar period was the convergence of Pan-Africanism and Pan-Arabism, which had hitherto remained distinct movements in North Africa. Traditionally, Pan-Arabism focused on North Africa's historical links to the east, to the Arabian Peninsula and the Fertile Crescent, while sub-Saharan Pan-Africanism looks across the Atlantic to African descendants in the Americas. Moreover, religion (Islam) enjoys pride of place in Pan-Arabism as the basis of the perceived unity of the Arab world, but loosely defined cultural similarities and "racial" solidarity or, in Nkrumah's words, a distinctive "African personality" underlie Pan-Africanism.

The flowering of anti-imperialist, nationalist movements in North Africa after World War II, and especially the Egyptian revolution of 1952, however, signaled the emergence of a fusion of the two movements. Initially, this resulted principally from the political vision of Gamal Abdel Nasser (1918–1970), who succeeded Muhammad Naguib (1901–1984) as Egypt's leader. He maintained that his country had historically occupied the center of three concentric circles—the Arab world, the Muslim world, and Africa—and argued on this basis that Egypt should not remain indifferent to liberation struggles in sub-Saharan Africa. Despite his exaggeration of the importance of Egypt to Africa's future, the appearance in 1959 of his book, *The Philosophy of Revolution*, marked an important moment in the intersection of the Pan-Arab and Pan-African movements.

The triumphant resolution of the Suez Crisis in 1956 also enhanced Nasser's international standing, making him a source of inspiration and a symbol of the larger struggle to free Africa and the Arab world from European hegemony. The pioneering works of the Senegalese historian and politician Cheikh Anta Diop (1923–1986), such as *The Cultural Unity of Black Africa* (1963) and *The African Origin of Civilization: Myth or Reality* (1974), which resituated Egyptian history within its larger African context, represent another important intellectual manifestation of this moment in the history of Pan-Africanism.

The final, bloody years of the Algerian war of independence (1954–1962) also strengthened ties between Pan-Arabism and Pan-Africanism. The anticolonial war in Algeria had originally split intellectuals and politicians in Francophone Africa, due largely to the special status accorded the territory as a legal part of France. This began to change, however, after Ghana's independence in 1957 when Nkrumah, an outspoken proponent of the Algerian cause, became the new state's first president. In addition to Nkrumah's Ghana, Guinea and Mali joined the predominately Arab, pro-Algerian Casablanca Group, and Nkrumah became the first sub-Saharan African leader to support Arab nations in denouncing Israel as a "tool of

neocolonialism" in Palestine when he endorsed the Casablanca declaration.

After Algeria gained its independence in 1962, the Organization of African Unity (OAU) emerged as the primary agent of Arab-African cooperation after 1963. Many then interpreted the June War of 1967 between Arabs and Israel as an attack on a member of the OAU and an occupation of African territory by Israeli forces, which only served to strengthen the importance of anti-Israeli sentiment as a basis for Arab-African solidarity. By the time of the October War of 1973 between Arab nations and Israel, politics in the Middle East and Africa were more intertwined than ever due to the nearly unanimous severing of African states' diplomatic ties to Israel.

Pan-Africanism in the Late Twentieth Century

The mid-1970s saw the elaboration of a new philosophy and a new outline for long-term economic, technical, and financial cooperation between Africa and the Arab world. In some respects, oil and, particularly, the creation of the Organization of Petroleum Exporting Countries (OPEC) were important in this regard and transformed Nigeria into a crucial state in Arab-African relations. Oil profits and the institutional framework of OPEC enabled significant capital transfers from Arab to African states between 1973 and 1980. Yet, those funds fell well short of Africa's real needs for development capital, and these factors often proved to divide rather than promote unity. Ultimately, the dramatic downturn in oil prices beginning in the early 1980s not only hurt oil-producing countries but drastically reduced Arab aid to Africa.

At the end of the twentieth century, debates surrounding "globalization" and renewed interest in transnational communities and cultural networks sparked a number of attempts to "reconsider" the history of Pan-Africanism, particularly among scholars associated with the nascent fields of African diaspora studies and Atlantic history. The delegates at the Sixth and Seventh Pan-African Congresses—held in Dar es Salaam, Tanzania, and Kampala, Uganda, in 1974 and 1994, respectively—also revisited this history. They did so, however, in an attempt to emphasize the need for unity in confronting contemporary economic exploitation in Latin America and Africa as well as the revolutionary potential of Pan-Africanism for the future. Likewise, following the end of both the Cold War and apartheid in South Africa, the new African Union, founded at Sirte, Libya, in March 2001 to replace the OAU, was called on to address problems as diverse as the marginalization of Africa in international affairs, the global economy, and the AIDS pandemic on the continent.

The Future of Pan-Africanism

The career and rise to international prominence of Thabo Mbeki (b. 1942) as South Africa's second freely elected president exemplify the mixture of promise and immense difficulties facing Pan-Africanist projects and Africa in general in the twenty-first century. Like Nelson Mandela (b. 1918), Mbeki devoted his life to the fight against apartheid in South Africa, but, whereas Mandela was imprisoned for much of his adult life, Mbeki spent years in forced exile in Britain after 1962, earning a Master's degree in economics from Sussex

University in 1968 and working with Oliver Tambo (1967–1991), the effective leader of the African National Congress (ANC) in Mandela’s absence.

In 1969, like most ANC leaders, many of whom were also long-time members of the South African Communist Party (SACP), Mbeki went to the Lenin International School in Moscow for a year to receive military training. After serving as political secretary for Tambo, the ANC president in the late 1970s, he became the ANC’s chief diplomatic liaison, which increased the antiapartheid movement’s profile abroad as well as his own, and rose to the SACP’s central committee in the late 1980s. However, following F. W. de Klerk’s (b. 1936) lifting of the ban on dissident organizations like the ANC, SACP, and the Pan-Africanist Congress on February 2, 1990, Mbeki gradually distanced himself from the SACP, allowing his membership to lapse at the same time as he spearheaded attempts to transform the ANC from a prohibited liberation movement into a legal political party. Then, having served as Mandela’s deputy president from 1994 to 1999, Mbeki was inaugurated as his successor in June 1999.

Mbeki’s presidency became mired in a series of controversies, most famously concerning his flirtation with “dissident” views on the nature and treatment of HIV/AIDS, but his espousal of an “African Renaissance” made possible discussions over the relevance and potential of Pan-Africanism in the twenty-first century and, more specifically, the role of a free South Africa on the African continent. Mbeki’s notion of an “African Renaissance,” though deliberately vague, has a number of ideological roots. For one, it is situated within the long tradition of South African leaders who, regardless of their ideological or physical hue, have asserted the country as the driving force behind development on the continent in general. This is a position that, it is said, South Africa must reclaim and would otherwise already occupy had it not been for the artificial privileges accorded by race under apartheid.

The international stature of Nelson Mandela reaffirmed this assumption of the naturalness of South African leadership in both internal diplomatic relations in Africa and projecting Africa’s interests into the global market and international political organizations like the United Nations. Yet, as Peter Vale and Siphosiso Maseko observe, it was largely “the appeal of Mbeki’s lyrical imagery that turned the obvious . . . into a tryst with destiny.” It is clear that Mbeki’s thought rests on a social-contractual reading of the African Renaissance. It represents essentially a double-edged agreement that not only commits the South African state to a democratic concord with the people of South Africa but also to the cause of peace and democracy across the continent.

Unfortunately, the emancipatory potential of Mbeki’s message remained unrealized and, by and large, more promise than policy, limited changes like South Africa’s assumption of a peacekeeping role in Africa notwithstanding. Moreover, some have criticized the limitations of Mbeki’s approach: buoyed by the same modernization theory that inspired economic ambitions under apartheid, though directing attention backward to Africa’s past, it fetishizes new technologies, endowing the latter with the power to trigger profound social changes almost

single-handedly. Nevertheless, the ambiguity and potential weaknesses of Mbeki’s rhetoric have created a political space in which a multiplicity of competing interpretations of Africa’s future can be debated.

Vale and Maseko identified two distinct approaches to the idea of an “African Renaissance,” one “globalist,” the other “Africanist.” Based firmly in the modernist tradition, the former seems to assume that what is good for South Africa is also good for the rest of Africa, views the continent as principally an expanding market, and sees free markets, privatization, and cuts in public expenditure as prerequisites to curtailing the power of authoritarian governments. The latter, however, envisions an African Renaissance to promote a series of complex social constructions that turn on issues of identity and call for a reinterpretation of African history and culture outside of the analytical frameworks and narratives of European imperialism. Thus, representatives of the Africanist approach eschew the modernizing tendency toward Africa’s encounter with Europe, or “chasing of scientific glory and money,” and maintain that the globalist perspective will merely result in an externally driven consumerist movement in Africa. According to this view, Africans will continue to be valued solely for their capacity to absorb foreign goods if development on the continent continues to follow the globalist path. Despite advancing a powerful critique of globalist/modernist assumptions and encouraging alternative visions of Africa’s future, Africanist arguments rarely appear in mainstream political discussions of interstate relations in Africa. This is due in large measure to prevailing socioeconomic conditions on the continent in which states, suffocating under the burden of international debt, increasingly fail to provide their constituencies with basic amenities like water, electricity, and adequate housing.

One final development in black internationalism—the emergence of the concept of the “Black Atlantic”—figures in the future of Pan-Africanism. The idea was originally introduced by black British scholars, most famously Paul Gilroy, who emerged from the Cultural Studies group under the leadership of Stuart Hall at Birmingham University and whose work focuses heavily on African American and black British literature and popular culture. The notion of the Black Atlantic injected new life into attempts to examine the historical formations outside of the analytic framework of the nation-state by highlighting the singular importance of the legacy of the Middle Passage and African slavery around the Atlantic. In *Black Atlantic* (1993), Gilroy offered a compelling critique of the increasingly unproductive impasse between “essentialist” and “anti-essentialist” positions on racial and ethnic difference and what became known in the late twentieth century as “identity politics.” Many of the insights—as well as the potential pitfalls—of this approach have been picked up by academics in the Americas, and especially the United States. For example, Brent Hayes Edwards expands on this scholarship while also exposing the tendency of much work on the African diaspora to overemphasize similarities and obscure differences rather than recognizing the management of difference (cultural, economic, linguistic, etc.) as an inescapable and, indeed, constitutive aspect of the elaboration of any particular vision of diaspora.

Marc Matera

PAN-ARABISM. Pan-Arabism is the concept that all Arabs form one nation and should be politically united in one Arab state. The intellectual foundations of pan-Arabism were laid down in the early decades of the twentieth century, in the context first of Arab alienation from Ottoman rule and later in response to the imperialist partition of the Arab provinces of the Ottoman Empire after World War I. The doctrine became politically significant in the post-World War II era, when it produced the drive for integral Arab unity that culminated in the union of Egypt and Syria in the United Arab Republic (1958–1961). Since the 1960s pan-Arabism has receded as a meaningful political aspiration, giving way to the acceptance of the reality of the existing Arab state structure overlaid by a continuing sense of Arab cultural unity and political solidarity.

Both as theory and practice, pan-Arabism was a child of its times. Its roots lay in the linguistic unity of elite culture across the Arabic-speaking world, where classical Arabic provided a common means of communication transcending geographical barriers, and in Arab awareness of their historical importance as the people responsible for the spread of Islam. This latent Arab consciousness was politicized in the early twentieth

century, when educated Arabs in the Fertile Crescent provinces of the Ottoman Empire began to chafe at growing Ottoman centralization as well as at their partial exclusion from participation in Ottoman rule due to the growth of Turkish nationalism. With parallel aspirations for autonomy developing in the several Arabic-speaking provinces of the empire by the pre-World War I years, these first nationalist stirrings in the Fertile Crescent had an implicitly pan-Arab character. The proximate referent for an explicit pan-Arabist ideology was the Arab-run state that emerged in greater Syria by the close of World War I as a result of the wartime Arab Revolt. Although crushed by the French in 1920, Emir/King Faisal's short-lived Arab Kingdom was thereafter a constant reminder of the united Arab polity that might have been were it not for the machinations of imperialism.

An explicit ideology positing the existence of one Arab nation and calling for the unity of all Arabs emerged in the interwar years. Articulated particularly by ideologues from the new mini-states of Iraq, Syria, and Palestine, it was in large part a reaction to the externally imposed division of the Arab East. Its key spokesman was the Iraqi educator Sati' al-Husri (1880–1968), whose numerous essays hammered home the message that language and history were the main determinants of nationhood and consequently that the Arabs, united as they were by one language and a shared history, deserved a parallel political unity. Husri's message was reinforced and deepened by Arab pedagogues of the interwar era, whose histories of the Arab nation expounded on the concepts of linguistic unity and a glorious Arab history reaching into antiquity. By the 1940s the doctrine of the existential reality of the Arab nation had been internalized by much of the younger generation, generating new political movements dedicated to working for Arab political unification. The most important of these was the Ba'th or Renaissance Party formed in Syria in the 1940s, an organization that rapidly found adherents in other eastern Arab lands. Its slogan—"one Arab nation with an eternal mission"—encapsulated the pan-Arabist vision; its 1947 program—that "[t]his nation has the natural right to live in a single state and to be free to direct its own destiny"—set the pan-Arabist agenda.

Pan-Arabism became a major political force in the decades after World War II. The circumstances of the postwar era—the entry into political life of a younger generation imbued with pan-Arabist ideas; individual Arab countries obtaining a greater measure of independence from foreign domination, and with it a greater ability to pursue pan-Arabist goals; the existence of the common problems of Western imperialism and the new state of Israel, both of which were perceived as necessitating Arab cooperation to be successfully addressed—provided a receptive medium for the flourishing of political pan-Arabism. The new League of Arab States (formed 1945), although strictly a confederative arrangement in which the separate Arab states retained freedom of action, nonetheless indicated the new postwar mood envisaging greater inter-Arab cooperation in the future. The Ba'th and other pan-Arabist political parties grew in size and influence in states such as Syria, Iraq, and Jordan from the 1940s onward, occasionally succeeding in stimulating a measure of inter-Arab political cooperation and at least lip-service to the goal of Arab unity

from their governments. Most meaningful politically was the emergence of a new champion for pan-Arabism in the 1950s, in the person of Jamal 'Abd al-Nasir (Nasser) of Egypt. Although his own nationalist outlook was at base primarily Egyptian nationalist, Nasser nonetheless perceived the desirability of greater inter-Arab cooperation in order to attain the goal of complete independence for the Arab world. Nasser's successes in opposing Western imperialism in the mid-1950s made Nasser and Egypt the natural focus of pan-Arabist hopes.

The high point of pan-Arabism as a political movement came in 1958, when pan-Arabist activists in Syria approached Nasser to request the integral unity of Egypt and Syria. Not without reservations, but also snared by his own previous advocacy of Arab nationalism as a mobilizing slogan, Nasser assented. The result was the United Arab Republic (UAR), a new state uniting Egypt and Syria under Nasser's leadership. The creation of the UAR set off considerable agitation for unity with the UAR by pan-Arabist enthusiasts in other eastern Arab states such as Lebanon, Jordan, and Iraq, agitation resisted only with difficulty by more localist leaders and forces concerned about their own prospects in any unified Arab state.

In the end Nasser's reservations about the UAR were borne out. Frustrated by their marginalization within the counsels of the regime, and opposed to the socialist measures being introduced by the early 1960s, in September 1961 elements of the Syrian military revolted, expelled their Egyptian overlords, and effectively terminated the reality of the UAR (although Egypt retained the name until 1971). The breakup of the UAR was a crucial setback for the pan-Arabist goal of integral Arab unity. To be sure, the dream did not die; when Ba'thists seized power in Syria and (more briefly) in Iraq in 1963, both governments immediately entered into "unity talks" with Nasser. These collapsed (as did the subsequent but less substantial initiatives aimed at negotiating Arab federation initiated by Mu'ammarr Gadhafi of Libya in the early 1970s) on the rock of political power-sharing. A further and greater setback for pan-Arabism came in June 1967 with the stunning military defeat of Egypt, Jordan, and Syria by Israel, an Arab catastrophe in which the leading exponents of pan-Arabism, Nasser and the Syrian Ba'th, were indelibly discredited as potential leaders of the drive for Arab political unity.

As a political movement, pan-Arabism has receded since the 1960s. Just as the context of the post-World War II decades provided the necessary medium for its earlier flourishing, so changed conditions since the 1960s have contributed to pan-Arabism's fading. The gradual consolidation of the power and legitimacy of what were initially artificial Arab states; the end of overt imperialist domination, thereby undercutting much of the reason for inter-Arab solidarity; the growing acceptance of the reality of Israel; the increased clout of the Arab oil monarchies, regimes apprehensive about what Arab unity might mean for them; not least the growth of the rival transnational ideology of Islamism, many of whose spokesmen view Arab nationalism as an alien, Western-inspired concept designed to subvert Muslim unity: all these developments of the 1970s, 1980s, and 1990s have worked against significant movement toward Arab political unity.

Politically, pan-Arabism has stalled since the 1960s. Other than the union of Yemen and North Yemen in 1990, a local development with no broader nationalist implications, there have been no further mergers of separate Arab states since the formation of the UAR in 1958 (the forced “merger” of Kuwait with Iraq in 1990 was quickly reversed by international opposition, including that of most other Arab states). The post-1970 leaders of those states that had led the pan-Arabist movement in the 1950s and 1960s—Anwar al-Sadat and Husni Mubarak of Egypt; Hafiz al-Asad of Syria; intermittently Saddam Husayn of Iraq—all concentrated on promoting the interests of their respective states, rather than on pursuing integral Arab unity, during their long tenures in power. There have been various regional organizations of Arab states created since the 1970s, the Gulf Cooperation Council formed in 1981 by the six Arab monarchies bordering the Persian Gulf being the most durable and meaningful; but these have been confederative arrangements that guarantee the territorial integrity of their members.

If political pan-Arabism is in eclipse, what remains? The League of Arab States continues to exist, and through its various subsidiary organizations has fostered an impressive level of interstate Arab cooperation in the economic, social, and cultural fields. Inter-Arab migration for occupational or educational reasons boomed in the 1970s and 1980s, driven particularly by the demand for Arab labor in the Arab oil states. Literally millions of Arabs lived, worked, or studied in Arab countries other than their homelands in the 1970s and 1980s; this inter-Arab migration decreased from the mid-1980s onward. Perhaps most important in perpetuating and deepening a shared Arab consciousness in recent decades has been the mass media. First radio, then television, more recently the Internet and the emergence of Arab media outlets capable of reaching Arabs everywhere have spread a common Arab culture and kept “Arab” issues, Palestine being the most vital, at the forefront of Arab awareness. Political pan-Arabism may be stalled; but an abiding sense of the Arabs as one people with a common culture, similar problems, and shared aspirations has increased and penetrated more deeply into the fabric of Arab society.

The temporal trajectory of political pan-Arabism was thus significantly different from that of the cultural Arabism on which it was in part based. Whereas the former emerged, flourished, and then declined over the course of the twentieth century, the latter has steadily increased and disseminated more widely. Arabism is by no means an exclusive identity; it exists in tandem with affinal ties, a longstanding self-definition as part of the Muslim community (for most Arabs), and a more recent loyalty to the state in which Arabs live. But it remains part of the blend of referents that define collective identity, shape popular sentiment, and inspire political action.

PAN-ASIANISM. *Pan-Asianism* as a general term refers to a wide range of ideas and movements that called for the solidarity of Asian peoples to counter Western influences in the late nineteenth and early twentieth centuries. In Japan, where Pan-Asianism had a decisive influence on the course of its modern history and served as an ideological justification for its military expansionism through 1945, it is referred to as “Asianism” or “Greater Asianism.”

Origins and Development in Japan

In the late nineteenth century, when the leaders of the Meiji government pursued Western-style modernization, Pan-Asianists emphasized Japan's affinity with Asia. They felt that Japan's progress could not be secured without the liberation of Asian neighbors from poverty and backwardness and that the Japanese had a mission to lead Asians out of stagnation. Many of the early Pan-Asianists began their political activities in the Freedom and People's Rights movement, demanding democratic participation in the national government. Miyazaki Tōten (pen name of Miyazaki Torazō; 1871–1922) came from a family of rural samurai well known in their area for their devotion to the People's Rights movement. He was an outstanding example of romantic Pan-Asianism who devoted some thirty years of his life to the cause of Sun Yat-sen's republican revolution in China.

Anxiety over national security was at the root of Pan-Asianism. Tarui Tōkichi (1850–1922), who explored the coast of Korea in the early 1880s, wrote *Daitō gappōron* (Federated

states of great East), a proposal for a federation of Japan and Korea. His idea, that the only hope for survival for the small Asian nations was in joining forces, reflected a perception among the contemporary Japanese that the “white race” was superior in physical, intellectual, and financial power to the “yellow race.”

Defense of indigenous tradition was another issue at this time of rapid modernization. Miyake Setsurei (Yūjirō; 1860–1945) and other cultural nationalists formed in 1888 a political association, *Seikyōsha*, for the purpose of raising national pride in *kokusui* (cultural essence of the nation), and published a series of popular periodicals, *Nihonjin* (the Japanese), *Ajia* (Asia), and *Nihon oyobi Nihonjin* (Japan and the Japanese). Naitō Konan (Torajirō; 1866–1934), a prominent Sinologist, associated with this group in his early career as a journalist. He held China’s culture in high esteem but maintained that China had lost its vigor and needed Japan’s guidance for reform. Okakura Tenshin (Kakuzō; 1862–1913), a gifted art historian who studied with Ernest Fenollosa at Tokyo University, called for the resurgence of the East. He underscored the creative vitality of Chinese and Indian civilizations that had adapted to changing historical circumstances over millennia and attained high levels of maturity. “Asia is one,” stated at the opening of Okakura’s *Ideals of the East*, was frequently quoted and had enormous influence.

Pan-Asianist Organizations in Japan

To promote good will among Asian neighbors, the Japanese government encouraged Pan-Asianist organizations. *Kōakai* (Raise Asia society) was the earliest among them, organized in 1880 by Japanese literati and members of the Chinese legation. In 1898 Prince Konoe Atsumaro (1863–1904), the chairman of the House of Peers, formed the *Tōa dōbunkai* (East Asia common culture society). It played a major role in enhancing Japan’s cultural policies in China through 1945. Tōyama Mitsuru (1855–1944), of Fukuoka, the most influential Pan-Asianist outside the government, founded *Gen’yōsha* (Black ocean society), an expansionist association, in 1881 and named it after *Genkainada*, the sea between Fukuoka and Korea. Uchida Ryōhei (1874–1937), one of Tōyama’s followers, headed *Kokuryūkai* (Amur River [black dragon] society), organized in 1901. They cooperated with government authorities as unofficial handlers of visitors from Asia. Numerous Pan-Asianist groups were organized under their influence. Their followers served as freelance agents for the Japanese government, military, and commercial establishments in China.

Development in Twentieth-Century Japan

After Japan joined the ranks of colonial powers following its victories over China in 1895 and Russia in 1905, the Japanese government adopted a policy of cooperation with the Western powers. At the same time it asserted Japan’s special interest in China. Around World War I phrases like “Asia for Asians,” “Asian Monroe Doctrine,” and “White Peril” appeared in newspapers and popular periodicals. The earlier emphasis on solidarity with Asian neighbors was replaced by emphasis on Japan’s leadership and supremacy in Asia. The opinions of Tokutomi Sohō (Iichirō; 1863–1957), the long-lived influential publicist, reflected the changing mood in Japan. Kita Ikki (1884–1937),

who once joined the revolutionary activities in China, urged Japan’s aggressive expansion in Asia and called for a radical reform in Japan to establish a kind of state socialism under the emperor. Ōkawa Shūmei (1886–1957) believed that Japan had a mission to replace white men’s imperialism with a federation of all nations and to create a new world blending the civilizations of the East and the West. Ōyawa had close ties with ultranationalist army officers, including Ishiwara Kanji (1889–1949), the mastermind of Japan’s conquest of Manchuria in 1931. During the 1930s and early 1940s, when the Japanese government openly adopted military expansionism, Pan-Asianist ideas were expressed in official declarations proclaiming a “New Order in East Asia” and the “Greater East Asia Co-Prosperty Sphere.”

Asians and Pan-Asianism

Japan’s 1905 victory over Russia, a European power, was received as an exhilarating event throughout Asia. During the following decade, a large number of students and revolutionaries from China, Korea, Philippines, India, and other areas of Asia came to Japan hoping to find encouragement for their nationalistic causes. Sojourners in Tokyo developed a sense of community as Asians. In 1907 Zhang Binglin, Zhang Ji, Liu Shipai, and other revolutionaries from China organized a *Yazhou heqin hui* (Asiatic humanitarian brotherhood) with revolutionaries from India, Vietnam, Burma, Philippines, and Korea, as well as Japanese socialists, to help each other’s anti-imperialist activities. Among its members and their associates were Phan Boi Chau of Vietnam and Mariano Ponce of Philippines. This organization and other similar associations did not last long because Tokyo became a less hospitable place for expatriate revolutionaries. Other Asians increasingly criticized Japanese Pan-Asianism as mere rhetoric for Japanese imperialism. In 1919 Li Dazhao wrote that weak nations in Asia must unite themselves to form a “new Greater Asianism” to defeat Japan’s “Greater Asianism.” Sun Yat-sen gave a lecture on Pan-Asianism in Kobe in 1924 and tried to persuade the Japanese to join a truly pan-Asian movement instead of becoming a watchdog for Western imperialists. To the 1926 Japanese call for a Pan-Asian conference in Nagasaki, Chinese and Korean newspapers responded with strong protest against Japan’s “Twenty-one Demands” on China and imperialist oppression of Koreans.

In India, in the early decades of the twentieth century, Bengali intellectuals had lively debates on the civilizations of the East and the West. Rabindranath Tagore (1861–1941) eloquently advocated the revival of Asian culture and the unity of Asia, but was against political nationalism. Jawaharlal Nheru followed Tagore in spirit in promoting the ideal of united Asia giving peace to a troubled world.

PAN-ISLAMISM. A term of European origin, *pan-Islamism* denotes the intellectual and institutional trends toward Islamic unity that emerged among Muslim peoples, starting in the mid-nineteenth century and continuing throughout the twentieth century. The need for a unified Islamic identity was a product of the challenges posed by Western intervention in and domination of Muslim societies during the colonialist period. Leaders throughout the Muslim world appealed to the Islamic tradition to solidify public opposition to foreign occupation and thereby gain political independence. Like its European namesakes pan-Hellenism and pan-Slavism, pan-Islamism used cultural ideas to achieve nationalist political ends. Unlike the ethnic identities emphasized in European nationalisms, however, pan-Islamism emphasized the religious heritage and symbols that both united all Muslims and set them apart from their Western Christian colonialist occupiers. The nationalist purposes to which pan-Islamism was primarily directed may seem at odds with the universal principles on which it rests, but this tension was largely resolved in the practical drive for political, economic, and social progress that enveloped Muslim societies. Nowhere is this resolution more clearly defined than in the life and work of Jamal al-Din al-Afghani (1839–1897), a Muslim reformer and key advocate of pan-Islamism.

Jamal al-Din al-Afghani

Born in Persia, not Afghanistan as his name suggests, al-Afghani led the life of an itinerant scholar and activist. After his initial education in Persia, he studied in India and then worked in Afghanistan, Istanbul, Egypt, and Paris. Al-Afghani's travels provided him with a unique insight into the modern condition affecting all Muslim peoples, a condition he believed was characterized by political weakness, social instability, and cultural ignorance. Contact with the West did not cause this condition, according to al-Afghani, but it did bring it into high relief; it also alerted Muslims to an essential but long-dormant element of their own tradition: rational thought. For al-Afghani, the power and success of the modern West rested on its rejection of the stultifying restrictions of Christianity and its turn toward reason; since Islam, by contrast, was rooted in rationalism, Muslims need only return to the essence of their faith to overcome the developmental asymmetry that had come to differentiate Western and Muslim societies.

Arguing for the rational nature of Islam was a common strategy among Muslim reformers, who wanted to facilitate change while maintaining cultural identity. It was a strategy that recognized the Western orientation of modern development and the threat this orientation posed to cultural authenticity in the Muslim world. Indeed al-Afghani believed that social and political change could only be brought about if Muslims had a firm sense of the civilization to which Islam had given birth. By *civilization*, al-Afghani meant the intellectual and moral achievements that contributed to the unity and greatness of a people—a notion he borrowed from the French statesman-historian François Guizot (1787–1874) and employed to foster a usable Islamic past. This past did not lead inexorably to the unification of the entire Muslim community (the *umma*) under a single Islamic state. Instead, al-Afghani viewed Islamic civilization, the foundation of pan-Islamism, as a common cultural stream that fed the national political aspirations of such distinct countries as India, Persia, and Egypt. Here the logical appeal of Islam as universal glue for all Muslim peoples was subordinated to the practical realities of a world where nation-states had become the political norm. Pan-Islamism, however, had served a very different political purpose under the Ottomans.

Late Ottoman Politics

If al-Afghani was the father of pan-Islamist thought, Ottoman sultans were the first to implement pan-Islamism as official state policy, a policy with imperialist, not nationalist, goals. As early as the 1860s, the then-sultan, Abdul Aziz (r. 1861–1876), tried to extend his political authority beyond the Ottoman Empire by casting himself as the caliph, the designated ruler of all Muslims and the defender of the faith. His successor, Abdul Hamid II (r. 1876–1909), adopted the same mantle of authority. This pan-Islamic appeal was tied to the growing Western influence in the Muslim world that the Ottomans themselves had facilitated through their efforts to reform. The need to reform had become apparent as European peoples began to win back territory in the seventeenth and eighteenth centuries that had been lost to the Ottoman expansion into Europe during the fifteenth and sixteenth centuries. The same rising tide of technological advancement that had allowed European nations to defeat the Ottomans in Europe also permitted them to project their power abroad. This new political reality was made clear to the Ottomans when, in 1798, one of their autonomous possessions, Egypt, was invaded and occupied by the French under Napoléon Bonaparte.

Conscious of their declining power, the Ottomans embarked on a series of military, educational, social, and governmental reforms throughout the first half of the nineteenth century, and they sought technical assistance and advice from the very European nations that threatened the empire's territorial sovereignty. While dramatic and far-reaching, the reforms came too late to prevent the Ottomans from becoming known as the Sick Man of Europe, an inefficient and weakened empire whose lands in the Middle East and Central Asia looked ripe for the picking. The competition to take control of Ottoman possessions was widespread in Europe in the late nineteenth century and early twentieth century, but it was

played out on a grand scale—referred to as the Great Game—by two imperialist powers bent on world domination, Great Britain and Russia. For the Ottomans, pan-Islamic propaganda seemed a viable means of reasserting its sway over Muslim subjects whose loyalty was being tested by new ideas like nationalism and undermining the progress of European influence among Muslim peoples in places such as India. Ultimately unsuccessful as an imperialist ideology, pan-Islamism did serve the nationalist desires of Muslim peoples trying to break free from both Ottoman and European rule. It failed, however, to take hold in modern Turkey, the nation that arose out of the heartland of the defeated and dismembered Ottoman Empire.

The Khilafat Movement

The first popular pan-Islamist political movement, the Khilafat movement (1919–1924), emerged in India after World War I, though support for the caliphate locally among Indian Muslims had been gaining momentum throughout the second half of the nineteenth century. Chafing under British occupation and mindful of the glory days of Mogul rule, Indian Muslims directed their spiritual and later political longings toward the remaining seat of independent Muslim rule: the Ottoman caliphate. With the Ottoman Empire in ruins after World War I and the office of the caliph, the caliphate, under threat of extinction, Indian Muslims organized to preserve what many viewed as the last vestige of Islamic unity and power. In 1919 activist groups like the Association of Servants of the Ka'ba and the Council of the All-India Muslim League convened a Khilafat Conference, during which the movement took official form as the All-India Central Khilafat Committee.

The politics of the Khilafat movement were clearly anti-imperialist and pro-independence, which accounts for the popular support it received across Muslim sectarian lines in India and across the Muslim world. Activists within the movement spread their message through publications at home and abroad. Delegations were sent to England, France, and Switzerland to shape public attitudes and government policy regarding the caliphate and the future of Muslim societies. In the end, however, it was not European leaders but the new leaders of Turkey who decided the fate of the movement by adopting a secular path for the nation based on a narrowly conceived ethnic identity—a path that mirrored European strains of nationalism—and then abolishing the office of the sultan in 1922 and that of the caliph in 1924. The Khilafat movement protested Turkey's actions, but with no power to impose its will and with its reason for existence eliminated, the movement had gradually faded from public view by the late 1920s. Pan-Islamism in India, however, continued to play a part in Muslim cultural and political life, especially the communal debates that resulted in the formation of Pakistan in 1947.

A World of Nation-States

The division of the Muslim world into nation-states has given rise to new strands of pan-Islamism. First, transnational organizations like the Organization of Islamic States (OIC) have been formed to express the collective sentiments and concerns of Muslim peoples. It remains to be seen whether the OIC or similar organizations can be effective in a world of nation-states, a

question made more serious in light of the events following September 11, 2001. Like the United Nations, the OIC depends on its integrity and moral authority to effect change unless it has the backing of a strong state. Second, Islamism, or Muslim fundamentalism, has laid claim to the pan-Islamic heritage in order to remake, if not undermine, the modern system of nation-states that divides Muslim societies. While pan-Islamism advocates Muslim unity and strength, it is not conducive to the totalizing agenda espoused by Islamists who wish to (re-)Islamize every aspect of society. Lastly, pan-Islamism remains a current of feeling and thought—typically associated with calls for justice and hope—that runs throughout Muslim societies and also minority Muslim communities in the West. Like religion itself, there is a certain ambiguity and ambivalence about the purposes to which it is put and the events that evoke it. The only certainty surrounding pan-Islamism is its perennial nature.

PAN-TURKISM. The term *Pan-Turkism* refers to an intellectual and political movement advocating the union of all Turkic peoples. Although some promoters of this ideology went as far as calling for a political union including all Turkic groups, many others envisioned only a cultural unity.

Intellectual Origins and the Impact of European Works

European works such as Joseph de Guignes's *Histoire générale des Huns, des Turcs, des Mogols, et des autres Tartares occidentaux*,

Éc. avant et depuis Jésus-Christ jusqu'à présent (Paris, 1756–1758) and Arthur Lumley David's *A Grammar of the Turkish Language with a Preliminary Discourse on the Language and Literature of the Turkish Nations* (London, 1832) paved the way for a debate on Turkish peoples living under different administrations and their common ethnic bonds. David rejected the lumping together of all Turkic tribes under the rubric of Tatars, and proposed the generic name Turk for all these peoples; this made many intellectuals in the Ottoman Empire and other Turkic states reevaluate their approach to their peoples' ethnic origins. A French translation of the work was submitted to the Ottoman Sultan Mahmud II in 1833, and was widely read by Ottoman intellectuals and linguists. A Polish convert, Mustafa Celâleddin Pasha (Constantine Borzecki), who had fled to the Ottoman Empire after the unsuccessful 1848 revolution, liberally used de Guignes's work in preparing his own study, *Les turcs anciens et modernes* (Constantinople, 1869). Mustafa Celâleddin Pasha maintained that Turks and Europeans were from the same "Touro-Aryan" race. Works of Arminius Vámbéry, who traveled widely in Central Asia and underscored the common racial "Turanian" characteristics of the Turkic peoples, and Léon Cahun's *Introduction à l'histoire de l'Asie* (Paris, 1896) presented the "Turanian" race as one that brought civilization to Europe; this strongly influenced many Turkish intellectuals. Vámbéry should be credited as the first non-Turkish savant who, in 1865, entertained the idea of a Turkic "empire extending from the shore of the Adriatic far into China." Many Ottoman intellectuals paid close attention to these new ideas. It is interesting to note that in the prefatory article of the Young Ottoman journal *Hürriyet* (established 1868), the Turks were portrayed as "a nation in whose medreses Farabis, Ibn Sinas, Ghazzalis, Zamakhsharis propagated knowledge." Another leading Young Ottoman, Ali Suavi, underscored the common ethnic origins of the Turkic groups in his journal *Mukhbir* (1878). In an essay on Khiva he criticized the Ottoman policy toward this Central Asian khanate and described its people as "Muslim Turks who belong to our religion, nation, and ethnic family." In 1876 Süleyman Pasha prepared the first volume of his "World History" to be used as a textbook at the Royal Military Academy; in it he underscored the common bond uniting the Turkic peoples by drawing heavily on de Guignes's work. Beginning in 1877 history textbooks referred to the Turkish ancestry of the Ottomans, and the Ottoman press developed a keen interest in Turks living in Central Asia and the Caucasus, publishing many articles on them.

First Pan-Turkist Ideas

Despite the emergence of a national consciousness among the Turks living in the Ottoman Empire and the Turkic peoples of the Caucasus, Central Asia, and Iran, and a strong focus on their common origins, no intellectual or politician openly promoted unification of the Turkic groups until 1904. In an essay published in 1881 Gaspıralı İsmail (İsmail Bey Gasprinskii) debated the reasons for the decadence of the great "Turco-Tatar nation scattered in Asia and parts of Europe." He argued that "Turks, Turcomans, Mongols, Tatars, Uzbeks, and Yakuts [were] all from the same family." He advocated similar theses in his journal *Tercüman*, published in Bakhchesaray in the Crimea. The importation of this influential newspaper was occasionally banned by the Ottoman authorities. Nevertheless,

it was widely read by Ottoman intellectuals and strongly influenced them.

In 1903 a Young Turk journal called *Türk* started publication in Cairo. This journal promoted a more developed Turkish nationalism and devoted its efforts toward "the moral and material progress of the Turkish world." In it Yusuf Akçura, a Young Turk intellectual and a former military officer of Tatar origin, published an essay entitled "Üç Tarz-ı Siyaset" (Three kinds of policy). He asserted that there were three alternatives before the Ottoman administration—Pan-Ottomanism, Pan-Islamism, and Pan-Turkism—and that the best choice would be "to pursue a Turkish nationalism based on race." This essay, which first appeared in 1904, might be considered the first clear-cut intellectual formulation of the Pan-Turkist idea. Following the Russian Revolution of 1905, Gaspıralı started using the motto "Unity in Language, Thought, and Work" under the masthead of his journal *Tercüman*. He presented his aim as an attempt to create a united front of Turks living under tsarist rule. He maintained that such unity would enable the Turks to defend their rights better. There is no doubt, however, that in reality he intended more than uniting Turks living in Russia. The Russian Revolution of 1905 and the increased cultural activities of the Turkic peoples under tsarist rule made the Ottoman press in the empire and in exile pay more attention to these groups and to relations between them and the Ottoman Empire. Many Turkic journals, mostly published by Azerbaijani and Tatar intellectuals, promoted closer cultural relations among Turkic peoples.

Another organization that developed an interest in such ideas was the Ottoman Committee of Union and Progress. Following its reorganization in 1905–1906, this committee established ties with Turkic intellectuals and provided finance to help some of them publish their journals. The committee supported the creation of a "Turkish Union in the regions from the Adriatic Sea to the Chinese Sea" and promised to extend a helping hand to these Turkic groups once it had toppled the regime of Sultan Abdülhamid II. Strident letters sent from Azerbaijani and Tatar organizations to this committee reveal that such an idea was also popular among the intellectuals of these peoples.

Pan-Turkism, 1908–1922

The Young Turk Revolution of 1908 brought the Committee of Union and Progress to power in the Ottoman Empire. Many Turkic intellectuals participated in its policy-making bodies along with Turkist intellectuals. The committee supported the establishment of various organizations such as the *Türk Ocağı* (Turkish Hearth) (established in 1912), and it published journals such as *Türk Yurdu* (Turkish homeland) promoting cultural or political Pan-Turkism and Pan-Turanism. It should be remembered, however, that despite their Turkist and Pan-Turkist proclivities, the leadership of the Committee of Union and Progress viewed these ideologies as tools with which to save the Ottoman Empire and employed them alongside the rival ideologies of Ottomanism and Pan-Islamism. The Ottoman entry into World War I against Russia gave a considerable edge to Pan-Turkism and a free

hand to the Committee of Union and Progress leaders in propagating it. The leading ideologues of Pan-Turkism and Pan-Turanism, such as Moiz Cohen (Tekin Alp), Ziya Gökalp, and Ömer Seyfeddin, further entertained the idea of a future Turanian state including all Turkic peoples. Ottoman war propaganda made much use of this idea. Despite this fact, the accomplishment of that goal had been envisioned by its major promoters as a gradual and long-drawn-out development. Even in 1918 Ziya Gökalp likened the accomplishment of this distant ideal to reaching a pure communist society. During the war, Ottoman agents worked in the Caucasus and Central Asia and were aided by the German government in their efforts to spread Pan-Turkist sentiments. In the final phases of the war, new governments promoting Pan-Turkism were set up in the Caucasus through Ottoman military incursions. Even after the war, the Young Turk leaders in exile made efforts aimed at arousing Pan-Turkish sentiment in an area stretching from the Caucasus to Central Asia and Afghanistan. During this period between 1918 and 1922, Pan-Turkish ideas were put to a test on the ground; however, the Soviet victories and the establishment of the Turkish Republic reduced Pan-Turkist activities to the publication of a few journals by various Turkic expatriate groups in France, Germany, Poland, and Romania.

Pan-Turkism from 1922 to the Present

Both the Soviets and the Turkish Republic, which was established in 1923, officially shunned Pan-Turkism and considered it a harmful form of adventurism. This view continued to be the official Soviet position on Pan-Turkism until the end of the Soviet Union. In Turkey, however, various Pan-Turkist groups were allowed to publish journals beginning in 1931. They were nevertheless closely scrutinized by the government. These groups were later backed by the Nazi government and tolerated by the Turkish administration, which wanted to avoid a confrontation with Germany; but with the waning of the German power in 1944, the leading Pan-Turkists were tried and sentenced to hard labor. The subsequent deterioration of Turco-Soviet relations, however, triggered a retrial in 1946 resulting in the dismissal of all charges against the leading Pan-Turkists. Later, Pan-Turkism was promoted by various cultural groups and political parties, the most important of which was the Nationalist Action Party under the leadership of Alparslan Türkeş.

The collapse of the Soviet Union and the emergence of new Turkic states gave fresh hope to many Pan-Turkists in Turkey, the Caucasus, and Central Asia. Developments to date, however, suggest that the most that they can hope for is a better cultural understanding between peoples living in nation-states with clearly molded identities and well-defined borders.

PARADIGM. *Paradigm* is the key term in Thomas Kuhn's (1922–1996) very influential book, *The Structure of Scientific Revolutions* (1962). As is frequently the case when new ideas are presented, Kuhn took an existing term and gave it a specialized meaning. The term *paradigm* now occurs frequently in every kind of discourse, usually to mean something like “way of thinking” or “approach to a problem.” Kuhn has generally been given credit for introducing this usage, but the way that *paradigm* is popularly used misses a central aspect of his argument. Kuhn emphasizes that a paradigm cannot be reduced to a set of beliefs or to a list of rules and indeed that a paradigm cannot be put into words. Scientists have to learn by doing, both by thinking in terms of the concepts that are used in a particular science and by physically manipulating material to create phenomena.

Kuhn argues that the history of science is best understood as exhibiting stable periods, which he calls normal science, punctuated by revolutionary changes. *Paradigm* is the central concept that Kuhn uses to make his case, since a period of normal science is defined by its paradigm and a scientific revolution is, in Kuhn's terms, a change in paradigms. Typically a paradigm is first established by the publication of a groundbreaking book that sets out problems and solutions, then others adopt the aims and methods of the original, thus establishing a period of normal science. Contrary to the traditional view that science was founded in Renaissance Europe by “the scientific revolution,” Kuhn sees multiple revolutions in the history of science, that is, multiple cases of the overthrow of one scientific paradigm by another.

Paradigm is defined in the *Oxford English Dictionary* as a pattern, exemplar, or example. Kuhn acknowledges this meaning by giving the conjugation of a regular Latin verb as an example of a paradigm. Furthermore, since he believes that a normal science is typically established by an important book and often by a series of experiments, it is clear that Kuhn has the idea of a paradigm as a pattern that will be followed very much in mind when he is explaining his view. A key aspect of paradigms is that they set out problems and also show how to solve them. Newton's laws of motion and the force of gravity combine to explain planetary motion, for example. There is more to a

paradigm than a good model to follow, however. Kuhn also thinks that among scientists who are working under the same paradigm, the historian can find common methods, common standards, common aims, and fundamental agreement about the nature of the world and the nature of the processes in it. Periods of normal science are characterized by consensus, especially about fundamentals, and this agreement allows for specialization, or as Kuhn puts it, “professional and esoteric work” (1996, p. 23). The function of normal science is to extend the original work by applying its methods to new areas as well as to revisit old ground in order to refine the paradigm. Because normal science is based on agreement and has well-defined parameters, it can make progress and accumulate knowledge.

On Definition

Kuhn compresses his discussion of the centrality of the notion of paradigm into a single chapter entitled “The Priority of Paradigms.” Paradigms have priority because there is nothing more basic by which “paradigm” could be defined. In logical terminology, the word *paradigm* functions as a primitive term. Properties of paradigms can be given and examples of paradigms can be enumerated, but the word cannot be defined, any more than *number* can be defined in arithmetic. Kuhn justifies his introduction of the term *paradigm* by arguing that, for the historian, it is a better organizational concept than any other. By looking for paradigms and changes in paradigms, the historian can classify scientists and historical periods in ways that lead to productive research and a better understanding of the history of science. Turning to philosophers to justify the undefinability of paradigms, Kuhn invokes Michael Polanyi’s (1891–1976) idea of tacit knowledge and Ludwig Wittgenstein’s (1889–1951) idea that some human activities cannot be captured by a set of rules, arguing that while paradigms cannot be reduced to a set of methods and beliefs, they are recognizable to the historian as the organizing principle underlying a period of normal science.

The root definition of *paradigm* as both pattern and example exhibits both sides of a classical philosophical debate over the nature of definition. Plato (c. 428–348 or 347 B.C.E.) argued forcefully that providing examples is not adequate; the real definition of a term must specify what the examples have in common and thus explain why they all properly fall under the concept being defined. In the terminology of later philosophy, Plato argues that a definition must tell us the essence of a thing. For Plato, this is the *eidos*, the eternal form or idea to which all objects falling under a concept must conform. Kuhn sides with David Hume (1711–1776) and Wittgenstein in rejecting Plato’s requirement that the essence be given in the proper definition of a concept. Like Hume, Kuhn argues that it is enough to say that the objects falling under a concept resemble one another in various aspects that can be specified and to take that resemblance as a starting point. Kuhn claims that paradigms do not have an essence, since there is always some disagreement and some difference in emphasis among scientists who are working under the same paradigm. In Wittgenstein’s terminology, the historian can find a family resemblance among the views of these scientists rather than single common set of beliefs and methods.

Kuhn also defends his view that paradigms cannot be reduced to a set of beliefs and rules of method by pointing out that scientists learn by working through concrete examples of problems, not by learning rules. Thus learning a paradigm is more like learning a skill than like learning a body of knowledge, a point that Joseph Rouse has rightly emphasized. Kuhn is very close to using *paradigm* in its original meaning here, since the problems and solutions through which students learn are to be taken as patterns of scientific thought and work.

Criticism of Kuhn’s Paradigms

Kuhn’s use of the term *paradigm* was immediately criticized, especially by philosophers, for being too broad and vague. In the postscript to *Structure* (1962), Kuhn conceded that the term was perhaps too broad, saying that he would use *paradigm* to mean “exemplar,” that is, the founding book or experiment of a particular science, and that the rest of the elements that make up normal science will be called the “disciplinary matrix.” However, this change in terminology played no role in Kuhn’s later work, so it provides little gain in understanding his viewpoint.

Kuhn was also accused of circularity, since it seems that in order to determine the nature of the paradigm behind a particular period of normal science, the historian must first determine which scientists belong to that group and then study their work to discover their aims, methods, and assumptions. However, since normal science is defined in terms of a paradigm, it seems that the historian must also recognize a paradigm first in order to know which scientists are working under it. Kuhn acknowledged that this was indeed a problem, suggesting that scientists should be categorized first on purely sociological grounds, such as who works with whom, and then the paradigm that underlies these connections be can determined.

Revolutions

Kuhn argued that his use of the term *revolution* to describe changes in science is appropriate because, like political revolutions, scientific revolutions overturn existing rules and institutions in order to establish new ones. By definition, there can be no legal way to have a political revolution, since any changes that follow the processes of the old regime would merely be reform, not revolution. For Kuhn the key point of the analogy between political and scientific revolutions is that in both cases there are no rules that could help adjudicate between the two systems. The supporters of the old and the new paradigms will each follow their own methods, emphasize their own aims, and accept their own solutions to problems, without necessarily accepting any of the methods, aims, or standards of supporters of the other paradigm. In an influential paper that helped redirect criticism of Kuhn’s book, Gerald Doppelt emphasized the apparent relativism of Kuhn’s view, given that there is no right or wrong answer to the question of when an old paradigm should be abandoned and a new paradigm adopted. Antoine-Laurent Lavoisier (1743–1794) and Joseph Priestley (1733–1804) independently discovered oxygen, but while Lavoisier used this discovery as a basis for a new chemistry, Priestley never accepted Lavoisier’s revolution and maintained the old phlogiston paradigm instead. Kuhn argued that

Thomas S. Kuhn. The Harvard-educated Kuhn first proposed his personalized theory of paradigm in his 1962 *Structure of Scientific Revolutions*. Kuhn posited that paradigms were conceived through thought and physical experimentation, rather than by representing established sets of beliefs. PHOTOGRAPH BY STANLEY BROWN. REPRODUCED BY PERMISSION OF THE ESTATE OF THOMAS S. KUHN

both of these famous scientists were acting reasonably. Nothing can force a scientist to change paradigms, according to Kuhn, because a scientist can always find a way either to incorporate new data into the existing paradigm or to show why the new data can be dismissed as unimportant from the point of view of the existing paradigm. It is important to note, however, that Kuhn is not saying that anyone can believe anything. Paradigms must be well developed and cover a wide range of phenomena. It is not easy to develop a new science that will justify the overthrow of an established paradigm.

Rather than promoting general relativism, Kuhn saw himself as rejecting particular philosophical accounts of science. He criticizes the idea of confirming scientific theories and comparing how well they are confirmed, a view of science associated with Rudolf Carnap (1891–1970), and he criticizes the idea of testing scientific theories to show that one theory is false, a view of science associated with Karl Popper (1902–1994). Both of these views require that a body of neutral evidence be available to scientists, a position that Kuhn disputes because, he claims, all evidence is acquired on the basis of a paradigm and therefore an element of it. He also points out that Popper's view that theories should be rejected when negative evidence is found is unrealistic, since there are always anomalies—problems that the paradigm cannot solve.

Leaps of Faith

Given that no new evidence or argument could overthrow a paradigm, Kuhn needs to explain “What causes the group [of professional scientists] to abandon one tradition of normal research in favor of another” (1996, p. 144). After pointing out that it is possible for a revolution to take place over generations without requiring individual scientists to change from one paradigm to another, Kuhn sets out four reasons that scientists may have for deciding to change paradigms. Two of these reasons, aesthetic considerations (including simplicity, unity, and so forth) and personal or political beliefs, are clearly subjective. We can understand how Lavoisier could have reasons to revolutionize chemistry that Priestley did not share, if the reasons given are personal and subjective. We do not expect others to have the same personal or subjective views or tastes that we do. Kuhn also says that a scientist may change from one paradigm to another if the new paradigm solves problems that the old one could not. New paradigms are successfully introduced when there is a crisis, that is, when scientists feel that the old paradigm is not working. To revolutionary scientists, what had been anomalies are now seen as refutations of the old paradigm. Although this reason for changing paradigms sounds objective, Kuhn argues that there is no objective way to know how seriously anomalies should be taken. Some, like Lavoisier, will feel that there is a crisis and a need for revolutionary change, while others, like Priestley, can look at the same situation and feel no need for change. To add to the sense that these two positions are subjective, Kuhn famously describes the change from one paradigm to another as a Gestalt shift, in which a picture of an old woman suddenly looks like a young woman or a duck suddenly looks like a rabbit. When they are seen from the perspective of the new paradigm, what had been minor anomalous puzzles suddenly show that the old paradigm was terribly wrong. Finally, Kuhn points out that in a revolutionary period, scientists must decide which paradigm is more promising for future success. Such forward-looking predictions are bound to be based on partial information and require belief in the promise of the paradigm. Kuhn calls this a matter of faith and argues that it too is subjective, like all of the reasons that scientists may have to change paradigms.

Criticism of Kuhn's Relativism

Kuhn was rather surprised at the reaction of many philosophers and scientists to his work. He did not see himself as claiming that science is irrational or subjective but rather as developing a philosophy of science that was true to the actual history of science. While this may be true, it is also clear that Kuhn was quite capable of using inflammatory rhetoric that was bound to offend many supporters of science. For example, when explaining the analogy with political revolution, he says that the defender of a new viewpoint must resort to “techniques of mass persuasion, including force” when political recourse fails (1996, p. 93). In the mythology of modern science, the church represents the Dark Ages, superstition, and jargon-filled Scholastic rationalizations, whereas science represents reason, knowledge, and the objective quest for the truth. Yet Kuhn says that science textbooks are as dogmatic as orthodox theology, and, in arguing that there is no objective criterion

THOMAS KUHN

Thomas Samuel Kuhn was born on 18 July 1922 in Cincinnati, Ohio. He graduated *summa cum laude* from Harvard in 1943 with a bachelor's degree in physics, and after some work in the government Office of Scientific Research and Development during World War II, he returned to Harvard for his master's and doctoral degrees in physics in 1946 and 1949. He remained at Harvard until 1956 teaching in the Department of the History of Science that had just been created by his mentor James Conant, who aided his transition from theoretical physics to the history and philosophy of science. Kuhn next joined the faculty of the University of California at Berkeley, where he developed the idea for his most influential book. In 1964 he moved to Princeton, where he was the M. Taylor Pyne Professor of

Philosophy and History of Science. Kuhn returned to Boston to complete his career at the Massachusetts Institute of Technology as professor of philosophy and history of science from 1979 to 1983 and the Laurence S. Rockefeller Professor of Philosophy from 1983 until 1991. Kuhn was the author or coauthor of five books and scores of articles on the philosophy and history of science. He was a Guggenheim Fellow in 1954–1955, the winner of the George Sarton Medal in the History of Science in 1982, and the holder of honorary degrees from many institutions, among them the University of Notre Dame, Columbia University, the University of Chicago, the University of Padua, and the University of Athens. Kuhn suffered from cancer during the last years of his life and died in 1996.

for deciding between paradigms, he says changing from one paradigm to another is a “conversion experience” (1996, p. 151). Explaining how the existence of multiple revolutions has been covered up by traditional histories of science, Kuhn compares these histories to those given to the population in George Orwell's (Eric Arthur Blair; 1903–1950) *1984* (1949), which is about as far from objective truth as can be imagined. Kuhn also compares science textbooks to tourist brochures.

Incommensurable Worlds

In order to justify his claim that there is no neutral set of observations or experiments that could help scientists determine which paradigm is true, Kuhn argues that the Gestalt experiments show how it is possible to think of a scientist as seeing the world very differently after a change of paradigm. Examples of scientists seeing different things after a change of paradigm include the following: The earth was seen as the center of the universe, then as a planet orbiting one of millions of stars. Light was seen first as a particle, then as a wave, and finally as a photon. Uranus was first seen as a star, then as a comet, then finally as a planet when William Herschel (1738–1822) “discovered” it. Dephlogisticated air was later seen as oxygen. Stones restrained from falling to their natural place were later seen as the repetitive motion of a pendulum. Kuhn argues that the revolutionary changes described in these examples are not simply changes in the name of something: Phlogiston is not anti-oxygen, the pendulum is not a falling stone, and so forth. Scientists working in different paradigms collect different data and work on different problems. Something that formerly needed to be explained may be seen as natural under a new paradigm, and what seemed natural before may now seem to need an explanation. Therefore “the historian of

science may be tempted to exclaim that when paradigms change, the world itself changes with them” (1996, p. 111).

Although he occasionally said contradictory things on this issue in *Structure*, Kuhn later insisted that the scientists working under different paradigms really do live in different worlds. Paradigms cannot be said to be different interpretations of a single objective world because “interpretation” only happens within a paradigm. We do not see the world as it really is but rather have to learn how to see, guided by the paradigm. Without a paradigm, there would be no science at all; rather there would only be confusion, a point that Kuhn makes with his reference to the experiments of Jerome S. Bruner and Leo Postman with anomalous playing cards and of George M. Stratton with inverted vision. Kuhn introduced the term *incommensurability* to describe the difficulty of comparing one paradigm to another. There is no way to test a paradigm as a whole or to compare the predictions that derive from paradigms against one another, as scientists do when they test theories. Kuhn argues that in cases where the same word is used in two different paradigms or when it seems that the same phenomenon can be described in both, the words in fact have different meanings in each paradigm and the phenomenon is not the same.

Revolutions have been covered up by textbooks, whose job it is to teach current science, not to teach history of science. Words are applied anachronistically, and the development of science is made to look linear and cumulative. As a historian, Kuhn discovered that there are radically different ways of doing science. He sought a way of expressing his discovery and of explaining the immersion into a historical text that is required for understanding. The concept of a paradigm is

central to Kuhn's expression of his discovery and to his attempt to correct philosophical misrepresentations of science.

PARADISE ON EARTH. The word *paradise* develops in Western languages from the Greek word *paradeisos*, the old Persian word *pairidaeza*, and the modern Arabic and Persian *firdaus*, all of which originally denoted a walled garden. In the arid environment of the Near East, a garden must be carefully and laboriously constructed with watercourses for irrigation, and its precious flowers and fruits protected from theft by a surrounding wall. The conflation of this term for a type of gar-

den built and cultivated in the Near East with religious imagery of heaven, especially in Judaism, Christianity, and Islam, has given the term a far more complex set of meanings, which have come to permeate the cultures of the Christian West and the Islamic world, creating a metaphoric bridge between divine paradise and paradise on earth.

In these cultures the concept of paradise developed in two related levels. The first was scriptural and thus a part of religious belief: paradise is either a place for life after death—often serving as a more tangible and concrete substitute for the vaguer term *heaven*—or the setting for a primal, idealized epoch in human history: the Garden of Eden. The second way in which the concept developed was through the actual physical depiction or recreation of the religious image of paradise on earth, either in the form of actual gardens or through the use of certain types of garden imagery—with or without religious connotations—in music, literature, and the visual arts.

Religious Conceptions of Paradise

In the Jewish Torah, paradise first appears as the Garden of Eden in Genesis. It also is regarded as the abode of God, to which the righteous are welcome (Psalm 73:24–25):

Thou shalt guide me with thy counsel, and afterward receive me to glory. Whom have I in heaven but thee? And there is none upon earth that I desire besides thee.

In terms of concrete imagery, the most famous Old Testament vision of paradise is set forth in Psalm 23:2: "He maketh me to lie down in green pastures: he leadeth me beside the still waters." In Christianity paradise is the blessed afterlife promised by Christ in the Gospels—"And Jesus said unto him, Verily, I say unto thee, To-day shalt thou be with me in Paradise" (Luke 23:43)—or the more complex, mystical, and tangible paradise of the Book of Revelation (22:1–2):

And he showed me a pure river of water of life, clear as crystal, proceeding out of the throne of God and of the Lamb. In the midst of the street of it, and on either side of the river, was there the tree of life, which bare twelve manner of fruits, and yielded her fruit every month; and the leaves of the tree were for the healing of the nations.

In Islamic scripture the image of paradise (Ar. *janna*, garden) is far more concrete and descriptive, a garden with flowering trees, running streams, silken cushions, and chaste companions promised in so many passages in the Koran:

This is the picture of Paradise promised to those who fear God: it contains rivers of ever-fresh water, rivers of milk that never sours, rivers of wine that are a delight to those who drink, and rivers of pure honey; also for those who fear God are found every fruit, and their Lord's forgiveness. (47:15)

They will be attended by youths perpetually young, carrying chalices and ewers and cups filled from a flowing spring, neither giving a headache nor intoxication, and

The Adoration of the Lamb (c. 1425–1429) by Jan and Hubert van Eyck, from *The Ghent Altarpiece*, open-center panel. Christian interpretations of paradise in art were often drawn from passages in the Bible and other religious works, a practice discouraged by other faiths. such fruits as they wish, and the meat of birds as they wish. They will have as companions beautiful black-eyed maidens, pure as well-guarded pearls, a recompense for their righteousness. There will not be heard any vain or profane words, but only: “peace, peace, peace.” (56:10–25)

Although the concept of paradise as a religious afterlife is primarily found in the three monotheistic religions originating in the Near East, the association of a garden with religious repose is also found in Buddhism, where it ultimately influenced secular garden culture in China and Japan. Of course for those of a secular bent, the metaphor of a heavenly garden may ultimately derive from the ancient use of a garden as a place of earthly pleasure, rest, or contemplation, but in the world of metaphor the heavenly garden precedes and influences its earthly counterpart.

In an intermediate step from scriptural sources toward earthly recreation in the arts, paradise forms a part of various liturgies, especially those involving funerals. Thus paradise is invoked in the Jewish prayer for the dead, the Islamic *mawlid*, and the Roman Catholic requiem mass, where paradise is also seen as the heavenly Jerusalem, what St. Augustine of Hippo termed the City of God: “May the Angels lead you into paradise; may the martyrs receive you and lead you into the holy city of Jerusalem.”

Representations in Western Culture

From scriptures and liturgical texts the concept of paradise emerges as a dominant image in the religious art of Christianity

and Islam over the centuries and eventually develops what we might term quasi-secular cognates as well, in which theological paradise in effect loans part of its meaning to secular palaces, poetry, and visual arts. In the Christian tradition, images of an essentially scriptural paradise figure prominently in literature of the West. These range from the Neoplatonic vision of a multi-tiered heaven in the early-sixth-century *Celestial Hierarchy* of Dionysius the Areopagite through the paradise described by the ninth-century Beatus of Liebana in his *Commentaries on the Apocalypse* to the lofty poetic visions of Dante’s *Divine Comedy* in the early fourteenth century and Milton’s *Paradise Lost* in the seventeenth, finding echoes in the earthy twentieth-century representations of Roark Bradford and Marc Connelly, epitomized in the latter’s *The Green Pastures*.

These scriptural, liturgical, and literary images of paradise in turn had a profound influence on music and the visual arts, starting with illustrations to the texts in question. The medieval sculptural reliefs of the Last Judgment that so often grace the doorways of eleventh- and twelfth-century Romanesque churches traditionally depicted the rewards of paradise on the left (to the right of a central figure of Christ) and the torments of hell to the right or below, with details taken from Revelation and from the Beatus manuscripts. From Dante’s late medieval exegesis and expansion of biblical texts came a view of paradise that was to influence later generations of visual artists. From Genesis combined with Milton’s poetic text came Franz Joseph Haydn’s musical depiction of paradise in *The Creation* as well as a number of depictions in painting.

Court of the Lions in Casa Real Palace, Alhambra, Granada, Spain. The concept of paradise on earth developed partly through physical representation in gardens, palace courtyards, or the cloisters of medieval monasteries. © PATRICK WARD/CORBIS

The image of paradise on Earth in the Western tradition is not exclusively Christian in inspiration. An idyllic earthly paradise is also evoked in the rich tradition of poetry and art inspired by the Greek myths of Arcadia and given defining shape in the poetry of Virgil. The classical Arcadia is a land of shepherds and idyllic peace that returns again and again in the poetry, prose, and painting of the West, given perhaps its most characteristic form in the paintings of Claude Lorrain and Nicolas Poussin in seventeenth-century France.

In Western art of the Christian tradition, where the illustration of religious texts is encouraged rather than actively discouraged as in Judaism and Islam, depictions of paradise are as likely to recall the primal innocence of Eden as they are the reward awaiting Christians in the afterlife. Seen from a strictly narrative perspective, the artistic potential of Christian hell is rich in pictorial possibilities, full of emotion and activity, while that of heaven or paradise is, comparatively speaking, both formulaic and limited, with the exception of the high drama of the expulsion of Adam and Eve from Eden. The Western art tradition does not, however, possess the embedded cultural tradition of the walled garden, and so, to paraphrase Freud, in Western art a flower is often simply a flower.

Among the many depictions of paradise in Western art, two may serve to illustrate the gamut of imagery. In the famous Ghent altarpiece painted by the Van Eyck brothers between 1425 and 1432, a literal depiction of paradise in the lower central panel of the open altarpiece shows a green meadow populated by crowds of angels, apostles, clerics, martyrs, and other saints, adoring the Holy Lamb on a stone altar, while an octagonal basin in the foreground, recalling the baptismal font with its water of salvation, contains a playing fountain of life. The inspiration for the imagery comes in part from Revelation and probably in part from the liturgy of All Saints, and the imagery itself is Roman Catholic in conception and detail. By contrast, the various depictions of the *Peaceable Kingdom* by the American naive painter Edward Hicks recall the Old Testament prophecy of Isaiah 11:6, the peaceable kingdom that will

arrive on earth with the coming of the Messiah: “The wolf also shall dwell with the lamb, and the leopard shall lie down with the kid; and the calf and the young lion and the fatling together; and a little child shall lead them.”

Explicit physical recreations of paradise in Western landscape architecture are rare. The enclosed cloisters of medieval monasteries sometimes carried such an association, and the forecourts or enclosed gardenlike settings for some churches, referred to as *parvises*, carry the same connotation.

Islamic Art and Literature

In Islamic culture there is likewise a literary tradition of direct depiction of paradise, most typically represented by Mir Haydar’s *Miraj-nama* (Book of the ascension), a fourteenth-century poetic description of the Prophet’s mystical journey to heaven and hell, which takes much of its imagery of paradise directly from highly descriptive scriptural passages of the Koran. The most famous illustrated manuscript of the poem, created for the Timurid ruler Shah Rukh in Herat in about 1435, depicts a paradise with triple gates, four flowing rivers of water, milk, wine, and honey, and flowering trees, among which the houris engage in games and provide refreshments. In a *fal-nama* or “book of divination” manuscript created in Istanbul around 1600, a famous miniature depicts Adam and Eve expelled from paradise along with the serpent, as an astonished angel and a peacock look on.

In the complex metaphorical imagery of Persian poetry, the drinking of wine in the setting of a garden combines secular cultural praxis with the mystical notion of divine intoxication. For this reason, illustrations to the texts of poets such as Hafiz often show couples or individuals drinking wine in a garden, or even, in one famous example painted around 1529 by the Tabriz artist Sultan-Muhammad, a sort of half-earthly, half-heavenly saturnalia of elderly sheikhs and heaven-sent angels.

While paradisiacal imagery is found in many different Islamic arts, from ceramics and metalwork to miniature painting, some of the most memorable evocations of the heavenly garden are seen in textile arts. Many of the most famous Islamic carpets created under the Safavid dynasty in Iran in the sixteenth century are in the form of what one scholar has termed a “paradise park” format, in which an outer border symbolic of the surrounding wall encloses a lush vision of paradise that often includes depictions of the drinking of wine, the royal sport of hunting (itself often a metaphor of the soul’s search for paradise), and lovers enjoying the floral ambience of the garden. The same motifs grace many of the famous figural Safavid velvets, in which the images of lovers in a garden are conflated with the idea of the soul’s love of God. The two celebrated Ardebil carpets, probably woven in Kashan around 1537, depict the reflection of the sun’s medallion—a metaphor for God as the giver of light—in a dark blue formal pool filled with countless floating lotus flowers on scrolling stems. Other Islamic carpet forms, such as the *sajjadah* or prayer rug, often depict a gateway to a tree- and flower-filled paradise, while one carpet form, the garden carpet, actually depicts a traditional Islamic garden with its cruciform axial watercourses (often filled with fish) and rectangular plantings, in a woven form that conveniently remains in bloom throughout the year.

Detail from Edward Hicks's *Peaceable Kingdom* (c. 1833; oil on canvas). Many of Hicks's paintings were illustrations of scenes in the Bible, such as his famous *Peaceable Kingdom*, which was based on a prophecy from the Book of Isaiah in the Old Testament. © BURSTEIN COLLECTION/CORBIS

In the Islamic world, the combination of a pre-Islamic form of walled garden from Iran known as a *char bagh*—literally a “fourfold garden”—and the imagery of the Koranic texts combined to foster a long tradition of princely garden building in which religious ideas formed a sort of symbolic overlay. The four long pools arranged in cruciform fashion that divide the garden into four represent the four heavenly rivers; a pavilion set in the middle of the garden might then take on equally heavenly symbolism, as in the Hasht Bihisht (“eight heavens”) Safavid palace from seventeenth-century Isfahan. Among the countless Islamic attempts to create an earthly paradise, two gardens have achieved unusual historical prominence. The earlier of these, known today as the Court of the Lions, graces the fourteenth-century Nasrid Alhambra palace in Granada, Spain. Its four streams, fed by a central playing fountain in a basin borne on the backs of twelve sculpted lions, recall the heavenly rivers of the Koran, together with the fountain Salsabil that graces Islamic paradise (Koran 76:12). The other Islamic garden of special prominence is the great *char bagh* arrayed before the Mughal royal mausoleum known as the Taj Mahal, created in the mid-seventeenth century in Agra, India, by the Mughal emperor Shah Jahan. The inscriptions of the Taj Mahal itself stress the metaphor of an earthly depiction of heavenly paradise, in which the mausoleum itself is a symbol for the throne of God. The popularity of the *char bagh* in Islamic cultures from India to Iberia is a strong testament to its Islamic religious associations with paradise, as well as to the astonishing persistence of pre-Islamic forms in Islamic art.

East Asia

While the concept of an earthly paradise as a reflection of a heavenly paradise permeates much art in cultures under the influence of Christianity and Islam, a somewhat similar concept of a heavenly presence on earth—not specifically derived from the west Asian *firdaus*—can also be seen in other cultures, notably those influenced directly or indirectly by Buddhism. A final example of a constructed heaven on earth may

be seen in the succession of Chinese capital cities and royal palaces built in Beijing by the Jin, Yuan (Mongol), Ming, and Qing dynasties. The elevation of the emperor in China to semi-divine status encouraged the creation of a quasi-celestial abode for the emperor on earth. The hierarchical organization of the Forbidden City, with its succession of courts and gateways, each leading to a more rarified and exclusive precinct, also represents an attempt to create a heavenly city on earth, if not embodying direct metaphors for a scriptural paradise such as those found in the Christian and Islamic West. This in turn led to reflections of an earthly paradise in the palace architecture (and, in Japan especially, in the construction of palace gardens as places of aesthetic as well as religious contemplation) in other cultures of East Asia.

PARADOX. *See Logic.*

PATRIOTISM. Patriotism is one of a large class of words that are linked to the virtues of membership. To participate in relations of, for example, friendship, community, nationhood, citizenship, or marriage implies normative conventions. In other words, there are value expectations built into such membership. One important dimension of any membership relation is an expectation of loyalty. Fidelity or loyalty to a nation, community, friend, citizenship, marriage, or state is thus implied in the actual practice. To participate openly and self-consciously, therefore, in any of these membership practices involves adherence to loyalty-based virtue. In this context, the term *patriotism* usually denotes a specific loyalty virtue, consequent upon membership of a country or state. However, the term *loyalty* alone does not quite cover the range of values associated with patriotic membership. Patriotism also signifies a sense of personal identification with, and concern for, the well-being or welfare of that country or state. Further, it entails a readiness to make sacrifices for its defense or welfare. In addition, it provides (for some) the ground for all moral action—in the sense that morality, in itself, is seen to be, quite literally, premised on patriotic membership. Patriotism also indicates a

special affection, feeling, or emotive response. This emotive response is commonly designated as a “love of country.”

Origins

A distinction is often drawn between the terms *patriot* and *patriotism*. The former is seen as an older usage, traceable back to the ancient Roman republic, while the latter is viewed as an eighteenth-century neologism. Patriotism, as in most ideological “isms,” is therefore often considered a more recent word. However, the older term *patriot* still covers many of the conceptual aspects of patriotism. The term *patriotism* figured in European and North American political discussion (and poetry) over the nineteenth and early twentieth centuries. However, during the larger bulk of the twentieth century its academic usage diminished. Certainly up to the 1990s it was considered, in academic debate, to be an antiquated term—particularly in liberal and Marxist political theory. However, there has been, over the last decade, a rediscovery of patriotism (among other membership-related concepts) within political theory and related disciplines. This rediscovery began in the 1980s with communitarianism and then developed into a renewed academic interest in nationalism, multiculturalism, citizenship, and the like. Patriotism is one of the latecomers to this process. It should be stressed, though, that this academic interest, or lack of interest, has little bearing on the ordinary political usage of these terms. Patriotism, regardless of academic concerns, persisted in lay political vocabularies throughout the twentieth century.

The deep roots of the word *patriot* lie in Roman antiquity, particularly in terms such as *patria* and *patrius*, which indicate fatherland, city, native, or familiar place. *Familiar* has links with the word *family* (*familia*). This also has ties with the term *father* or *paternal* (*pater*, *père*, *Vater*, *padre*), or what is implied by the “role of the father” within a family. In terms of the “role of father,” *patria* and *patrius* have subtle connections with property, authority, and status. The word *patriarch* evolves from this dimension. The links between father, authority, family, property, and politics can be observed, for example, in the Roman patrician class, who possessed considerable wealth in land and were dominant in the older Roman political structure. Their property enabled wide-ranging political influence. This was also connected to the original use of the cognate terms *patron* and *patronage*. Early Roman political factions, as in later European monarchies, worked through powerful wealthy families. Loyalty to kin in politics was supremely important for survival and political success. Early Roman *pietas* was, therefore, originally loyalty to the family hearth. However, Roman republican writers, such as Cicero, also saw a wider patria in the *res publica* (the public thing). The later Roman legal *Digesta* and *Institutiones* referred to two patrias affecting citizens: the more local (*patria sua*) and the more abstract public Rome (*communis patria*). Under the later Roman Empire (and again under later European absolute monarchies), this second patria became increasingly more abstract and legalistic.

In effect, the highest patria (status and estate) became synonymous with the state. The state was, in a sense, paternal authority “writ large.” This idea can still be seen in seventeenth-century doctrines of political rule, such as patriarchalism, where

all authority is traced to the paternal role. The prince thus embodied the essence of the state. Traces of this can still be seen in eighteenth-century writings, such as Henry St. John, first viscount Bolingbroke’s (1678–1751) *Idea of a Patriot King* (1749). The opposition to this reading of the state also employed the language of patriotism. Yet it wanted to colonize the state with a different set of values. Thus, liberty under the law became a motif for a divergent set of arguments. Consequently, if republicans, dissenters, and revolutionaries absorbed the language of patriotism, they could claim to be struggling for the “real” rights and freedoms of the people, and consequently for the soul of the state. At this point in the argument, in the early nineteenth century, the language of patriotism began slowly to mutate into nationalist language.

In summary, the qualities of “local familial or community loyalty” and an “impersonal abstract legal loyalty” have remained part of the vocabulary of patriotism to the present day. Local communal identification implies a more visceral loyalty, an attachment and love for the “familiar.” This is why some contemporary commentators can still insist that patriotism is more of an emotion than an intelligible political idea. Yet at the same time, the loyalty to the remote authoritative legal abstraction of the state or city-state embodies another important formal aspect of the legacy of patriotism.

Objects of Patriotic Loyalty

First, in the medieval period, the patria could be identified with a locality, hamlet, clan, village, township, or city. The patriot was one who submitted to the village or city and was prepared to defend it. Second, in terms of the feudal structure, defending homelands could also entail defending the lands of a local lord or prince. In this sense, feudal and vassal relations became integral to patriotic argument. Third, in Augustinian Christian thought the significant patria was the “city of God,” which transcended all cities and states. During the later medieval period, Roman imperial thought was utilized by secularizing territorial states (initially city-states) in Europe. However, “abstract legal Rome” (*communis patria*) was a movable feast. It could apply equally to Venice, Florence, Paris, or London. Princes became, in effect, supreme lawmakers (sovereigns) and emperors in their own realms. The objects of patriotism thus became the new territorial states with their fatherly princes.

From the twelfth century, the notion of patria often arose in the context of defense of a state territory. Defense of patria was a key ground for “just war.” This identification with patria intensified with renewed study of writers such as Cicero (106–43 B.C.E.), and later, with the thirteenth-century rediscovery of Aristotle’s political writings. Thomas Aquinas (1225–1274) also touched on the issue of the religious duty of citizens to render themselves vulnerable to death for their patria—*pro patria mori*. Religious language was immensely important here. Death for patria and death for the Christian faith became virtually coeval by the late medieval and early modern period. The emotive religious memorials and formal recognition we still give to patriotic war dead are a testimony to how deeply this idea has permeated state theory. It is crucial to the understanding of patriotism to the present day. Finally, it is

important to underscore the point that patriotism is formally compatible with any political creed or “object of attachment.” Family, locality, city, tradition, land, absolute monarch, total state, and republic have all been objects of patriotic loyalty.

Forms of Patriotism

In contemporary discussion there have been a number of renderings of patriotism. These can be distinguished between two forms—strong and moderate patriotisms. The stronger version argues that patriotic loyalty is the sole source of any meaningful moral claims. The content of patriotism is therefore always particular or local. In this context, the loyalties demanded from the patriot are simply to whatever values are regarded as dominant within a state or community. The key critical opposition to this perspective comes from universalist forms of argument, such as universal human rights claims. However, the larger bulk of recent writings on patriotism have appeared within the moderate category. The moderate category tries to mediate between universalism and localism.

Strong patriotism. The strong variant of patriotism does not have as many proponents as the moderate form. One key example of this is strong communitarian patriotism. In his 1984 essay, “Is Patriotism a Virtue?,” Alasdair MacIntyre sees patriotism as one of a class of “loyalty-exhibiting virtues.” These virtues exhibit “action-generating regard” for particular persons or groups, and they are embedded in highly particular relationships. Morality is thus rooted within communal relations. For MacIntyre, morality is always learned from within a particular way of life. Goods are always the particular goods of communities. The morality of patriotism is therefore seen as perfectly natural to us as communal beings. MacIntyre’s citizen is basically a very mild-mannered political animal; however, it is important, nonetheless, to realize that the strong particularist arguments he deploys have been utilized by much more worrying forms of politics. Racial exclusivism or political authoritarianism could well be justified within this framework. The dangers implicit within this perspective are those of extreme exclusion and the lurking possibility of communal jingoism. In the twentieth century, strong variants of patriotism have been associated (rightly or wrongly) with the militaristic or bellicose stance of German national socialism and Italian fascism in the 1930s.

Moderate patriotism. The more recent moderate account of patriotism contains four subtle variants. First, for neo-classical republicans the distinctive character of patriotism is its focus on political liberty and civic virtue. Love of country is not love of a language or ethnicity, but rather of political liberty. This is not a love of a particular liberty, but a generic nonexclusive liberty as embedded in law. It is seen essentially as a universalizing force. A republic is seen to embody a powerful sense of local solidarity contained within a universal vessel of liberty under law. For its proponents, republican language is thus a viable alternative to current liberal foundationalism, ethnic nationalism, and strong patriotic arguments.

Second, for recent theorists such as Charles Taylor, moderate communitarian patriotism envisages a direct link between patriotism, republicanism (although some would categorize it

as civic humanism), and communitarian motifs. Communitarians are clearly not of one mind here. The distinction between strong and moderate patriotism has direct parallels with the distinction, made within communitarian theory, between strong and moderate senses of community. Whereas MacIntyre sees a direct synonymy between nationalism and patriotism and adopts a narrower, stronger, and more exclusive sense of community, Charles Taylor seeks some separation between patriotism and nationalism and adopts a more differentiated view of community (incorporating multicultural diversity). Further, whereas, for Taylor, moderate patriotism is a matter of self-conscious citizen identification with a polity, strong patriotism swims in murkier waters, usually envisaging patriotism as a prepolitical, nonintentional attachment. Moderate communitarian patriotism, for Taylor, has no “prepolitical” reference. It rather implies more intentional attachment to a country and its laws. Patriotism is therefore always “politically defined,” as in the American and French Revolutions. However, most moderate communitarian patriots admit that in the nineteenth and twentieth centuries the vocabularies of nationalism and patriotism became confusingly intermeshed.

Third, Stephen Nathanson, in constructing his moderate liberal patriotism, has contrasted it with both the “extreme patriotism” of MacIntyre and communitarian arguments. Moderate liberal patriotism basically sees certain liberal universalist, essentially neo-Kantian, moral constraints acting upon patriotic goals. Too much patriotism, or too much liberal universalism, is to be avoided. Patriotism therefore requires a middle way. Thus, liberal universalism can and should legitimately restrain local solidarities and membership loyalties. Nathanson’s position is at least a salutary reminder to republicans that liberal universalist language is not necessarily always antipatriotic.

The fourth, final strand is constitutional patriotism. This is associated with the writings of Jürgen Habermas on what he calls *Verfassungspatriotismus*. This is essentially, again, a neo-Kantian orientated loyalty to the universalistic principles of liberty and democracy embodied in a constitution. The emphasis is quite explicitly legalistic. Constitutional patriotism is an allegiance to a constitutional juristic tradition embodying certain fundamental rational values. The background to this is Habermas’s own deep sensitivity to the events of World War II in Germany, particularly in relation to nationalism. In Habermas’s case, constitutional patriotism is patriotic loyalty to the universalistic principles embodied in the German constitution. Citizens, in this scenario, are linked together by a formal common agreement on the shared values of the constitution. Habermas is insistent that constitutional patriotism has no connection with any prepolitical attachments, characteristic of nationalism or strong patriotism. This kind of general constitutional theme can be found, for some Habermasians, in the polity of the United States and, possibly, even the burgeoning European Union legal structures.

Nationalism and Patriotism

There are negative and positive arguments for both separating and fusing nationalism and patriotism. The positive statement for their fusion is contained in stronger views of communal identity. Both concepts embody powerful statements on the

moral priority of the community. The positive view therefore involves the direct normative assimilation of nationalism and patriotism to communitarianism. This can be termed the “positive assimilation model.” MacIntyre articulates this view, in which patriotism and nationalism become indistinguishable.

The negative reading of the “fusion” views patriotism and nationalism with equal contempt as blemishes on political and moral discourse. This can be termed the “mutually disagreeable model.” There are a number of background points to this model. First, patriotism is seen as a verbal “sleight of hand” to avoid the pejorative connotations of nationalism; however, basically they are the same. The separate use of patriotism therefore has a face-saving character. Second, it might well be the case that patriotism did have an older individual meaning, but since the nineteenth century that older sense has been totally lost. Patriotism is exactly the same appalling entity as nationalism. Patriotism should therefore share all the opprobrium heaped upon nationalism. The “mutually disagreeable model” was well formulated by Leo Tolstoy at the beginning of the twentieth century. Tolstoy found both ideas repellent. Despite great efforts by states to foster patriotism, it is the same doctrine as nationalism. In the final analysis, both entail the renunciation of all human dignity, common sense, and moral conscience.

The opposite thesis to the above is the separation of nationalism from patriotism. This again has positive and negative dimensions. The positive reading of the separation is most forcibly rendered by recent republican writers. Thus, true patriotism must be kept completely distinct from nationalism. For such republicans (as Maurizio Viroli), the language of patriotism invokes a specific love of the political institutions and laws that embody a nondominatory concept of liberty. It is therefore about sustaining a particular way of life in a republic. Nationalism, on the other hand, is seen as a highly exclusive, prepolitical, culturally oriented attachment that is antagonistic to liberty. It is therefore deeply pernicious to confuse patriotism and nationalism, since patriotism is the theoretical and practical antidote to nationalism.

The negative reading of their separation suggests that patriotism and nationalism should be kept distinct on negative grounds. The concepts are historically different. Each has a distinct historical trajectory. Patriotism, for example, is an older terminology that has a much more intimate connection with both the state and religious language, whereas nationalism has closer connections to modernity and secularism. However, both terms are to be mistrusted for different reasons. Both are equally objectionable as narrow, exclusive, tribal, and deleterious to human dignity. In this context, the separation between patriotism and nationalism is valid, but this redeems neither doctrine.

PEACE. The peace concept has a long history both in the Western and Eastern intellectual traditions. While Greco-Roman and Judeo-Christian ideas regarding peace have expanded and changed over time, this is not so much the case in Muslim, Hindu, and Buddhist thought.

Ancient and Early Christian West

For the ancient Hebrews, *shalom* signified a state of prosperity and well-being as well as security. The Greek word, *eirēnē* from which we get the word *irenic*, also denotes the contentment and fruitfulness that comes from concord and harmony. Order (*tranquillitas ordinis*), quiet (*quies*), and repose (*otium*) inhere within the Latin word *pax*, which Romans sought and maintained as a higher good. Altars to peace were erected by both Greeks and Romans, and the Stoic view of the universe visualized an intrinsic natural harmony, which the virtuous endeavored to restore. In all of these ancient conceptualizations, there was a belief that an Eden-like time of peace had existed before war and disorder disrupted it. Peace, then, was understood mostly as a cessation of the chaos of the created disorder, including war. While it may have been the natural state of humankind at one time, in the early twenty-first century it is an idyll that can only be approximated by a good government that can ensure the security necessary for the achievement of concord and personal well-being.

The corresponding development of just-war ideas provided a program for realizing peace, or the restoration of order. Strict guidelines were erected in an attempt to prevent any behavior, especially by governments, that would be disruptive, unless it resulted in the ultimate acquisition of peace. While the earliest Christian writers eschewed war altogether, seeing it as contrary to the “way of love” taught by Christ, by the third century some Christians were fighting in Roman wars without compunction. Augustine of Hippo (354–430) did much

to establish the components of the just war that would affect subsequent attitudes toward war in the West; but he also more fully defined what peace meant in a Christian context. For this early church father, peace was largely a spiritual concept. In his famous *City of God*, as well as in other works, Augustine incorporated the earlier Greek, Roman, and Jewish elements and contended that peace is essentially a right relationship with God that, through the indwelling of the Holy Spirit, will advance love and concord among human beings. The earthly city is a fallen one and original sin will prevent temporal peace from being established fully; thus, only when Christ returns to judge humanity will true, lasting peace be possible. By removing true temporal peace from the realm of possibility, Augustine bequeathed to the European Middle Ages a concept that was relatively idealistic and millennialistic, even as he sought to mitigate the horrors of warfare with a rigorous just-war doctrine.

Western Middle Ages

The medieval period produced elaborations of Augustine's idea of peace within the context of crusade and feudal politics. The fall of Rome in the late fifth century led to the foundation of numerous bellicose Germanic kingdoms, which struggled to create a new basis for social and political order while adopting gradually much of the culture of antiquity, especially as the Germanic peoples converted to Christianity. The Western Church in the early Middle Ages required exacting penances for the shedding of blood, which were enhanced in early Carolingian laws (eighth century). In this context it was often difficult to distinguish between war and peace, and peace came to be viewed mostly in practical terms as simply a respite from fighting, sometimes even being depicted as the goddess of victory. The Peace of God (*pax Dei*) movement around the turn of the first millennium attempted to regulate warfare through strict papal restrictions on times of fighting and types of weaponry used, violations of which could lead to excommunication or interdict. As feudal relationships came to provide a new negotiated basis for order and peace by the twelfth century, the emerging chivalric code incorporated just-war theory, and set as one of its objectives the perpetuation of order or peace. The inclusion of the Augustinian motivation of love as necessary in any just war helped to ensure that the Christian spiritual ideal regarding peace would remain the goal even if in practical terms it would always remain elusive. The Crusades became the ultimate expression of the just war in continental Europe, but the barbarous actions of the knights who journeyed to the Holy Land compromised the church's credibility in fostering peace, since plenary indulgences seemed to excuse all kinds of violence and manslaughter in this supposedly sacred cause. This situation also created the intellectual climate for the first real investigation of peace as an idea, coming as it did on the heels of charges of corruption against the clergy.

While there were new investigations of peace in continental Europe—such as Dante's (1265–1321) vision of a Christian emperor in *Monarchia* (c. 1315), who established a one-world government that would provide true peace and order—the concept of peace itself underwent little change. Only in England during the Hundred Years' War (1337–1453) is there

found a protracted military enterprise provoking extensive criticism of warfare as an institution and, subsequently, suggesting a more complicated notion of what peace itself means. By the 1380s, writers such as John Gower (1330?–1408), Geoffrey Chaucer (c. 1342–1400), William Langland (c. 1330–c. 1400), Thomas Hoccleve (1368 or 1369–c. 1450), John Bromyard (d. c. 1390), John Lydgate (c. 1370–c. 1450), and John Wyclif (c. 1330–1384) all were attacking the justifications for wars, and the insincerity behind the putative goal of restoring order and peace. A new typology of peace emerged from this crucible of war and critique that would remain the basis for understanding peace right up until the modern period. First, the original Augustinian idea of personal, spiritual peace remained, along with its association with mercy, love, and patience. But for the critics of war, it was no longer enough to expect spiritual renewal to end the killing on a one-to-one basis. Relying on personal forbearance did not seem to reduce incidence of war at all. The other, older view of peace as order, including its affiliates—quiet, rest, concord, and law—now took on new resonance as writers excoriated the behavior of knights who supposedly followed a strict, peace-loving code of arms.

Two new elements of peace, however, which had been introduced by the early fifteenth century, proved to be more practical. First, Wyclif and the Lollards, who could easily be termed pacifists, emphasized the un-Christlikeness of war, and thus attempted to return to an early Christian ideal of peace as reflecting the image of Christ (*imago Christi*), demonstrated through acts of love. Unlike the Augustinian concept, here, to live like Christ is to work to stop war and to promote peace, not just in one's spiritual journey, but in society at large. The idea is that Christ believed that peace was possible, and in fact the Gospels say the angels proclaimed peace at his birth. Regardless of whether a cause seems just or not, war is always wrong and it must be a matter of conscience for all Christians to oppose it. By undercutting just-war arguments as inimical to God's way of peace, the concept for the first time emerged from the cloak of impossibility and became an obligatory pursuit. Issuing from this was the related idea that peace offered many practical benefits, thereby stressing its pragmatic nature. Lydgate, Hoccleve, and works such as *The Libelle of Englyshe Polycye* (c. 1436) equated temporal peace with economic well-being, personal security, and the growth of learning. From the late fifteenth century the value of peace was located increasingly in the language of political economy with its complex associations to the public good, which war was less likely now seen to promote.

Renaissance and Reformation

Renaissance humanists, especially those in northern Europe who had spent time in England, took the peace imperative and fashioned it into an ethic based on a dedication to the public good, or commonwealth. Desiderius Erasmus (1466?–1536), Thomas More (1478–1535), Juan Luis Vives (1492–1540), and John Colet (1466 or 1467–1519) all published works hostile to war, promoting all four meanings of peace elucidated above. Within the context of emerging nation-states in western Europe, Erasmus, in his *Complaint of Peace* (1517) and many other works, argued that spiritual peace, embodied in

the virtuous Christian prince, would be the foundation of a true and lasting temporal peace. His somewhat Stoic view of the kinship of humanity emphasized the *concordia* aspect of *pax*, which would lead to a personal closeness to God, Christ-like behavior, an absence of strife, and the practical rewards of greater happiness such as the promotion of learning and economic prosperity. While events tended to make humanist pacifists appear idealistic in their own day, their endeavors enshrined peace as an uncontested value and its advancement a virtuous pursuit.

The Protestant reformers, many of whom were also humanists, came to stress the obligations to pursue peace as well through their literal interpretation of the Bible, although they were less optimistic concerning the depraved nature of humankind. One group, however, the Anabaptists, took Christ's words literally when he said "blessed are the peacemakers," and their devotion to all forms of peace became one of their most distinctive characteristics. Not since the time of the early church had a Christian position been so unilaterally in favor of peace; and later groups, such as the Quakers, also came to adopt this position. For these "separatists" peace continued to be understood as both a spiritual condition and a way of life, in all of its practical applications leading to a harmonious and godly society.

The Modern West

The peace concept in the Western tradition from this point onward changed very little in meaning. In the modern period, however, a humanitarian ethos largely replaced the once Christian foundations for valuing peace, but the growing interdependency of nations also produced new concerns about the survival of human existence. By the eighteenth century, many intellectuals opposed the unreasonableness and barbarism of war, and as a result, construed peace as a rational pursuit by enlightened peoples. The philosopher Immanuel Kant (1724–1804), in his *Perpetual Peace* (1795), argued that a world order built upon reason and prudence, which is basically enlightened self-interest, will produce a peaceful society, and bring with it all that is good. The nineteenth century witnessed few large-scale wars in Europe, leading some to believe that Kant's admonition had become a cultural reality. Attempts at balances of power up through the early twentieth century seemed to prove that the West had found the practical solution to the problem of war, and that temporal peace could be realized and perpetuated by sophisticated diplomacy and the careful and humane study of international politics. This rather hegemonic view of peace recalls the ideas of Aristotle and of later officials of the Roman Empire, both of whom believed that empire—that is, rule by a presumably superior civilization—was best positioned to ensure peace. Peace took on the additional nuance then of a planned arrangement for cooperation among nations, even as its moral and practical elements remained prominent.

World War I, the rise of fascism, and the development of nuclear and atomic weapons, all in the twentieth century, left the West once again arguing for peace more from an ethical stance. Since diplomacy and international institutions devoted to peace (such as the United Nations) often fail to prevent wars, the survival of humanity may depend more on people

recognizing the moral necessity for keeping peace. This outlook tends to reduce the peace idea to its most basic meaning as the guarantor of continued human existence, a good for which there is universal agreement and support across cultures.

By the early twenty-first century, especially in Western societies, the concept of peace was most often linked to notions of justice and fairness. The modern ethical paradigm for peace espoused by most pacifists assumes that only when economic and political inequities are minimized or eliminated can we provide a basis for real and lasting peace and the consequent guarantee of prolonged human existence. Many contemporary intellectuals, such as Peter Brock, Peter Calvocoressi, Martin Ceadel, Michael Howard, and Charles Chatfield, have explored creatively the implications of this connection and have tried to offer specific and practical means for achieving true justice and, successively, peace.

Muslim, Hindu, and Buddhist Traditions

The Arabic word *salam*, a cognate of the Hebrew *shalom*, means "making peace." For Muslims, one comes to a purest state of peace by submitting to the will of Allah (*isalm*), and anyone who has accomplished this is a *muslim*. *Salam* is even one of the ninety-nine names of Allah in the Islamic religion. In the Koran, anyone doing the will of God and giving all to exalt his sacred name, including the making of holy war (*jihad*), will receive the divine blessing of peace and eventually live with God in that perfect state. Peace also can become an earthly state, in that good Muslims desire temporal peace, not war, realizing that only through an Islamic polity, serving Allah faithfully, can people prosper and live in harmony with one another. Thus, in Islam, ultimate peace, both spiritual and temporal, harmonizes within a submission to the divine will.

In eastern intellectual traditions the spiritual and practical elements of peace have cohered much more intricately and consistently than they have in the west. The Chinese word for peace, *heping*, is comprised of two characters meaning harmony and level (or flat), which suggests equalizing and balancing. (This type of peace may be inherent in the famous Taoist cosmic principles of *yin* and *yang*, which when symmetrical restore order and oneness to the universe.) The Japanese cognate *hewa* means much the same.

In classical Sanskrit *shanti* is the word closest in meaning to peace, usually denoting tranquility, calm, bliss, eternal rest, and happiness, but usually in connection to destruction or death. The term is often synonymous with *sandi* (association, combination) and the opposite of *vigraha* (separation, isolation, hostility). Peace here is contrary to the "absence of isolation" (*vigrahabhava*) or the "absence of strife or war" (*yuddhabhava*). From earliest Hindu thought it became the goal of the individual to escape from the necessity of being reborn, which was accomplished through deep meditation and the avoidance of bad *karma*, thus bringing ultimate peace. Another Indian concept, *ahimsa*, which is found first in the sacred *Upanishads* (c. eighth century B.C.E.), means nonviolence to animals and humans, and is based on the assumption that harm to living creatures produces bad *karma* by endangering or killing the soul of another. All life is one, and any animal

could contain the soul of a relative who has been reincarnated, and so harming it is wrong, Mahatma Gandhi's (1869–1948) pacifism owed a great deal to this tradition of peace. By the time caste distinctions separated the ancient Indians, and led to warfare and strife, the famous meditation known as the *Bhagavad Gita* found in the epic classic Indian poem, the *Mahabharat* offered another means for achieving ultimate peace. *Krishna* tells the warrior Arjuna that in honoring the conditions of caste/race he brings honor to himself, and since souls return to new bodies after the old ones die, death does not matter. But one must reject all greed and anger, and therefore one can, even in the midst of battle, have peace within. Peace is ultimately an inner state that will beget positive ramifications as well for society as a whole.

Buddhist ideas of peace derived from these early Hindu notions that asserted self-denial was the key to contentment and ultimate peace with the universe of which we are all a part spiritually. Also centered in the idea of *ahimsa*, Buddhists have believed that true peace and happiness come from the eradication of all desire, including the desire for permanence that creates conflict and division. Through meditative practices, selfish desire can be gradually eliminated until absolute peace, in this case, *nirvana*, is reached when our state of being ends. Part of this process entails the gradual shutting down of all sensory awareness and feeling, in what is known as *sannavedayitanirodha*. Since one does not stay in this state of contemplation permanently, this does not provide a lasting peace. Buddha believed that peace (*shanti*), both internally and externally, can only be achieved truly when it becomes part of one's conception of the world and of those who live within it. Peace is conditional for Buddha as he taught that the insistence on any type of permanence led to inflexibility, and ultimately, to conflict. This recognition of "dependent arising" forms the path to enlightenment and brings freedom and peace within, but also peace without, since it allows for change and newness.

Conclusion

In summary, while the Eastern and Western intellectual traditions historically have construed peace differently, there are certain characteristics that appear to transcend culture and that are held in common, even if the emphasis varies. There persists a spiritual notion of peace that represents inner calm, wholeness, contentment, and selflessness. The internal condition tends to affect the external so that if individuals are not at peace with themselves, they are unlikely to engender temporal peace. On the contrary, they are more apt to participate in wars, since conflict among peoples usually comes from a dissatisfaction with the current state of being (or affairs) that needs redress, perhaps even violently. In most cultural traditions, peace is the natural state of the universe, and throughout history one of the most universal endeavors of humankind has been the quest to end strife and to restore a beneficial order and tranquility. In linking these various but complementary aspects of what it means to be at peace, peace scholar Gerald James Larson has concluded:

To be at peace with oneself is to accept what or who one is and to have stopped warring with oneself. To be

at peace in community is to make an agreement to end hostility, to live together in harmony, accepting the presence of one another. To be at peace in the cosmos is to accept, largely on faith, that the universe is benign, a more or less fitting habitat for the sorts of beings and forces that dwell or operate within it. (Rouner, p. 138)

PEASANTS AND PEASANTRY. The words *peasants* and *peasantry* are generally associated with a way of life and mind-set that is the opposite of modernization. The terms referred, initially, to small-scale agricultural producers, also known as serfs, who comprised the majority of the populations of Western Europe from the fall of Rome in the fifth century C.E. and during the Middle Ages. Deriving their livelihood mainly, but not exclusively, from agriculture, medieval peasants depended heavily on landlords to whom they had sworn an oath of loyalty and on whose land they lived and farmed. They were expected to provide certain services and to meet specified obligations such as paying rent and taxes, in

cash or in kind, and providing free labor as well giving tithes to the church. Lords, on their part, were obligated to protect the peasants under their care. While most peasants lived directly off the land, some earned their living from nonagricultural activities, namely as blacksmiths, tavern owners, or millers. Dependence on small-scale agriculture, lack of ownership of land, and subservience to a dominant class to which they gave their surplus were, thus, early characteristics of peasant societies and influenced the manner in which scholars conceived of them. Hence, Eric Wolf defined peasants as “rural cultivators whose surpluses are transferred to a dominant group of rulers” (1966, pp. 3–4). Similarly, Douglas Kincaid maintained that peasants were “rural cultivators from whom an economic surplus is extracted, in one form or another, freely or coercively, by non-producing classes” (p. 145).

Defining the Modern Peasantry

Currently concentrated in Africa, Asia, and Latin America, the peasantry has been defined differently by various scholars, depending on the degree of emphasis placed on any one of several characteristics. Definitions of the peasantry embrace some of the following characteristics: ownership and use of land, production methods, subordination to other social sectors, and the degree of integration into the market. For some scholars, therefore, peasants are agriculturalists who control most of the land they work, produce for the market, and who have obligations to other social classes, while for others, they are farmers who lack control over the land, labor, and capital they need to produce crops. For yet others, peasants are farmers who control the land they work as tenants or smallholders and who produce for the market and have obligations to other social classes.

Generally, however, with the exception of the more well-to-do peasant classes who own land and exploit the labor of poorer peasants, most peasants are associated with poverty; primitive production methods using little if any modern technology; small-scale production, mostly for subsistence purposes; and economic exploitation by and political and social subservience to a dominant elite class such as landlords or urban elites. They also lack capital and other production resources and, often, do not have control over the land on which they live and work. Where they do own the land, they tend to regard it as family property and not a commodity. In peasant societies, the family tends to be the central economic unit of production, consumption, reproduction, socialization, and welfare, while socially and culturally, peasant communities tend to be isolated from mainstream society and to have a distinctly local culture, as opposed to the dominant wider or higher national culture. They also have a conservative, inward-looking worldview revolving around the household and the kin group and are suspicious of outsiders and new ideas. Peasant communities are sometimes looked down upon by other social sectors who regard them as not only poor, ignorant, and subservient, but also backward, parochial, and closed.

Scholars, however, sometimes make a distinction between closed and open peasant communities; describing closed societies as being highly exclusive, suspicious of outsiders and new ideas, separated from wider society, and determined to protect

their way of life by, among other things, discouraging the accumulation and display of wealth. Open societies, on the other hand, are characterized as being plugged into the modern capitalist economy and made up of individuals who own their own land, welcome change, and are largely integrated into the larger society. According to some scholars, therefore, open peasant societies are relatively independent actors who produce for the market and exercise considerable autonomy in deciding what to produce, depending on their analysis of inputs that have to be sourced outside the community and rent and tax requirements.

Clearly, while there are certain characteristics common to most peasant societies, there can be no simple all-embracing definition of peasants and peasantry, as scholars tend to highlight different aspects of what marks peasants as a class. Indeed, while the terms are widely used to describe rural communities all over the world, it is evident that they can no longer be regarded in their classical sense, since the groups that are now referred to as peasants in most countries no longer live exclusively by agriculture, as did most of the serfs in medieval times, but combine various survival strategies that often include wage labor, craft making, trading, and other off-farm activities. They can be part-time farmers, factory workers, small business people, traders, and workers on commercial agricultural establishments or seasonal workers in urban factories, all at the same time. Others maintain links with members of the family unit who are urban workers and who send money to supplement the rural family members' income. This leads to the conclusion that, although large populations who live in rural areas derive most of their livelihood from agriculture and regard themselves as peasants, it no longer really makes sense to identify rural society with the role of the peasant farmer.

Yet other scholars insist that the terms peasant and peasantry can only be appropriately applied to medieval or early modern Europe, as the African, Asian, and Latin American situations are so different as to make any comparisons meaningless. With respect to Africa, specifically, the question of whether small-scale agrarian communities on the continent can be regarded as peasants or not has been contentious, with some scholars arguing that Africa did not have distinct social classes, let alone a class that could be identified as peasants. Consequently, Africa only had primitive, rather than peasant, economies. According to this view, distinguishing features of peasant economies include production for the market by the majority of the people and access to resources such as land, labor, and tools, either for purchase or for rent. African rural dwellers, on the contrary, neither had access to nor produced for the market, being merely subsistence producers.

Thereafter, following a prolonged debate, the existence in Africa of a distinct class that could be called peasants was gradually and begrudgingly acknowledged, and discussion moved on to analyze the experiences and role of this class in recent history. By the 1980s, studies were recording peasants' lived experiences and analyzing peasant social structures, histories, inter- and intrapersonal relations, and relationships with the dominant social and economic structures and systems such as colonialism or the postcolonial state and elites. Peasants had, thus, become fully integrated into African studies.

Phases of Historical Study

Meanwhile, in world history in general, the peasantry long occupied the attention of economists, political scientists, sociologists, and anthropologists. The first phase of scholarly interest in the peasantry began with classical economists, such as Adam Smith (1723–1790), who recognized rural workers as a group, but one that was insignificant in the evolving division of labor that he was interested in. Later, Karl Marx also recognized the presence and importance of peasants, but he, too, dismissed them as an economically and politically backward and doomed class, destined to fall into one of the two antagonistic classes of capitalism, namely, the bourgeoisie or the proletariat. Where Smith and Marx had treated peasants as a homogenous mass, the Russian theorist and revolutionary Vladimir Lenin highlighted the existence of peasant class differentiation, identifying three layers, namely, rich, middle, and poor peasants, according to land area, capital accumulation, and wage or family labor and sought to analyze their role in the twin processes of industrialization and socialist revolution.

The second phase of scholarly attention to the peasantry began in the 1960s and 1970s, mainly due to peasant political activism and insurgence in Africa evident in the anticolonial struggles throughout the continent, and in Asia in the form of the Vietnam War and the Chinese Cultural Revolution following the Chinese Revolution of 1949. This second phase is characterized by revived and growing interest by Western anthropologists in the rituals, social structures, and belief systems of peasant societies and the place of poor agricultural areas at the periphery in the world capitalist system with its center in the developed countries. It was a time of peasant activism in the immediate aftermath of the Cuban Revolution in Latin America that led to agrarian reforms that undermined the latifundio agrarian structure in Chile, Peru, Ecuador, Colombia, and other countries. It was also the period characterized by scholarly debates on “articulation of modes of production,” of development economists and donor agencies promoting the green revolution and encouraging peasants to participate fully in the world market in the belief that this would modernize “smallholder” agriculture and make rural producers full participants in the world economy.

Meanwhile, the development economists’ optimism was countered by some scholars who pointed out that peasants would forever remain exploited because of the problems of declining terms of trade and “unequal exchange.” Faced with the failure of the peasantry in the developing world to rise to expectations by raising their food productivity despite the efforts of development specialists to diffuse modern production values to them, Western governments began to blame this on developing country governments’ flawed food pricing policies and inefficient marketing structures and to call for economic structural adjustment programs in order to correct these ills. These programs, sponsored by multilateral financial agencies, by ending government subsidies to the agricultural sector, worsened the plight of the peasantry at a time when the establishment of the World Trade Organization (WTO) had exposed peasants to the harsh environment of international market forces.

Historical Precedents

Although marginalized and oppressed by other social sectors, such as landlords and urbanites, and dismissed by Karl Marx and Friedrich Engels as lacking revolutionary consciousness, peasants have periodically asserted themselves politically throughout history either single-handedly as a class or in alliance with other deprived groups such as workers. Among some of the most known peasant political actions was the Peasants’ Revolt of June 1381 in England when peasants from the English counties of Kent, East Anglia, Somerset, and Yorkshire rose up in protest at their oppression. They were particularly unhappy with the labor demands placed on them by the church and the poll tax that King Richard II had imposed in 1380. Under the leadership of John Ball and Wat Tyler, they destroyed tax records and registers, and burned down buildings housing government records before capturing the Tower of London and compelling King Richard to negotiate with them at Mile End. By late 1381, however, the movement had fizzled out after its leaders were hanged.

Another important peasant uprising in Europe was the Peasants’ War in Germany from 1524, when the peasantry and the lower classes of the towns rose up against their feudal overlords protesting growing economic, religious, and judicial oppression under the nobles and clergy. The peasants’ demands included the right to choose their own ministers, the abolition of serfdom, the right to fish and kill wild game, the abolition of many kinds of feudal dues, and the guarantee of fair treatment in courts presided over by the feudal nobles. Peasants also played an important role in the French Revolution and in the Russian Revolution in 1917. In Russia, although nominally emancipated by Tsar Alexander I through the Emancipation Manifesto of 1861, which decreed an end to serfdom and permitted former serfs to rent or buy land from the landlords, most Russian peasants, numbering some twenty-three million, were still landless by the turn of the twentieth century, as most land remained in the hands of the rich landlords. Among the grievances that the 1917 Russian revolutionaries were able to exploit, therefore, was the peasants’ land hunger. The peasants’ reluctance to fully embrace the socialist goals of the Bolshevik Party, particularly under Joseph Stalin, made them targets of Stalin’s sustained campaign to destroy them during his collectivization drive of the 1930s, which resulted in the death and exile of thousands of peasants.

In Africa, peasants played a crucial role in resisting colonialism and its prescriptions, as evident in the 1905 Maji Maji uprising in Tanganyika (Tanzania), where German conquest and colonization between 1895 and 1900 provoked a massive uprising when African peasants objected to the taxes, forced labor, and harsh working conditions that came with German colonialism. Although it failed to dislodge German colonialism, the Maji Maji mass uprising forced the German colonial authorities to reform their administration and practices. Another example of armed peasant resistance is the 1896–1897 Chimurenga/Umvukela uprising in Zimbabwe (Southern Rhodesia) where, following British occupation in 1890, African peasants lost their land and cattle to colonial settlers and were subjected to forced labor and an array of taxes designed to force them into the labor market. Similarly, in

Namibia, German colonial rule also provoked armed resistance from the Herero and the Nama between 1904 and 1907. Here, too, colonialism brought with it massive land alienation, loss of sovereignty, loss of cattle to incoming German settlers, numerous taxes, openly racist policies and practices that marginalized Africans, corporal punishment, and other ills associated with European colonialism in Africa. In January 1904, the Herero rose up against German rule. In late 1904, the Nama began a three-year guerrilla campaign against German rule that was only crushed by German forces in 1907.

After the first wave of resistance, peasant protest continued throughout the interwar years and, thereafter, flowered into militant mass nationalism that finally led to the demise of colonialism. In Kenya, Zimbabwe, Angola, Mozambique, and Namibia, peasants participated in the armed struggle that brought about independence in those countries. Their contribution to the struggle for independence notwithstanding, most peasants benefited little from political independence, as post-colonial political and economic systems were dominated by the urban elite who promoted their interests at the expense of the peasant majority. Meanwhile, in Asia, peasants also participated in political movements, the most notable being the struggle of the Red Army organized by the Chinese Communist Party in the late 1920s, which ended with the setting up of the People's Republic of China in 1949.

In attempting to understand why peasants rebel, J. C. Scott contended that peasants tend to rebel when they perceive their traditional moral order or moral economy as being violated. The above examples seem to validate this claim, as they show that peasants have not been merely passive victims of other classes' machinations but have asserted and defended their rights and way of life when they felt that these were threatened.

PERIODIZATION. Periodization, which became a branch of historical method and the philosophy of history in the twentieth century, has to do with the division of time's arrow—the theoretical timeline of the movement from past to present and future. In Western tradition this speculative aspect of history has its roots in myth and in the Bible—in Hesiod's succession of gold, silver, and bronze ages, for example, and in the periods and generations of the nation of Israel since Creation and the Fall, which long furnished the framework for the Judeo-Christian story of humanity, within which other cultural traditions were synchronized. To these, Christian theologians added ideas of particular ages (*aetates*), especially those before the law, under the law, and under grace, and later the ages of the Father, Son, and Holy Ghost, inspired by Joachim of Fiore (c. 1130 or 1135–1201 or 1202); and such messianic periodization passed also into eastern Europe, especially Poland. In ancient and medieval times, as in the work of St. Augustine of Hippo, Isidore of Seville, and the Venerable Bede, there was much speculation about the natural "ages of man"—three, four, six, or seven of them—which carried the analogy of the trajectory of human life (birth, youth, maturity, degeneration, and death) into the collective experience of nations or of humanity as a whole. Thus in the twentieth century Claude de Seyssel adapted Joachim's conceit of four ages to French history, marking infancy from the legendary Pharamond, youth to the end of the Merovingian dynasty, maturity under the Carolingians,

and old age under the Capetian. On the political level the commonest way of describing the structure of history was through the biblically inspired conceit of the succession of four world monarchies—Medes, Persians, Greeks, and Romans, which included the Carolingian refoundation, the “Holy Roman Empire of the German Nation,” down to its extinction by Napoleon in 1806. The notion of periods defined through political dominance was continued in the modern European tradition by recognition of Spain, France, England, Germany, and the United States (and the Soviet Union) as leading powers in their respective hours of glory.

For five or more centuries Western history has been dominated by the ancient-medieval-modern periodization, which arose from the conception of a “middle age” between ancient cultural splendor and its modern recovery by the humanists of the fourteenth and fifteenth centuries and by Protestant Reformers reacting to the intellectual “barbarism” of medieval scholasticism. As Petrarch (1304–1374) wrote in one of his sonnets (*Epistolae metricae* 3.33): “Long before my birth time smiled and may again, / for once there was, and yet will be, more joyful days. / But in this middle age time’s dregs / sweep around us. . . .” And “in order to forget my own time, I have constantly striven to place myself in spirit in other ages”—whence the conceit of a rebirth of antiquity and the aforementioned triad of periods. Similar to Petrarch’s perspective was the view of Christian humanists and reformers like Martin Bucer (1491–1551), who wrote of “the various periods of the church,” from the purity of the primitive church to the centuries of oppression under Antichrists to his own time of a return to the true gospel in the Kingdom of Christ. The seventeenth-century notion of “a middle time between ancient and modern,” fixed in the textbook tradition by Conrad Cellarius (1574–1636), and continued into the later period, when the “renaissance of letters” was essentialized and publicized as simply “the Renaissance” by Jules Michelet, Jacob Burckhardt, and their epigones, later became the subject of debate by twentieth-century scholars. In the nineteenth century his convention of three ages was applied by European historians also to India, China, and America.

Periodization focused first on literary and artistic change, but from the eighteenth century it attended also to the material base and, in the work of Adam Smith, Anne Turgot, and Y.-A. Goguet, developed a stadial conception of human history. “The four stages of society,” wrote Smith in 1762, “are hunting, pasturage, farming, and commerce.” He explained these stages and the “origins of government” with the help of the ancient theory of three constitutional forms: “In the age of hunters there can be very little government of any sort, but what there is will be of the democratical kind. . . . The age of shepherds is that where government properly commences, followed by agriculture, property, and rule by a few rich men, and then by the emergence of chieftains, marking a monarchical government.” Arts and manufactures are then cultivated, “as property arrangements and disputes are multiplied and civilized through writing” (pp. 201, 459). By the end of the century this thesis, promoted also by Lord Kames, James Dalrymple, John Millar, Lord James Barrett Monboddo, William Russell, Christoph Meiners, and others had become

commonplace in Britain as well as the continent, and it had a significant impact on the ideas of Karl Marx, Friedrich Engels, and later world historians and textbook writers.

This line of inquiry and interpretation were part of what Dugald Stewart called “conjectural history,” and there were many examples of efforts at periodization in this connection, beginning with the old biblical narrative, which Bishop Bossuet (1627–1704) divided into twelve “epochs” from Adam and the Flood down to Charlemagne’s empire. A more secular periodization was devised by Giambattista Vico, who posited a succession of three ages—poetic (barbaric), heroic (feudal), and human (civil). Perhaps the most famous system was that of Marie-Jean Caritat, Marquis de Condorcet (1743–1794), who, like Bossuet a century earlier, divided universal history into “epochs,” but ten instead of twelve and following not Biblical chronology but rather a “reasoned” sort of history, analogous to Lockean psychology but projected onto a collective tabula rasa. Condorcet followed the improvement of social skills, technology, and the advancement of learning—from tribal, pastoral, and agricultural society, through the ancient and medieval periods, down to the invention of printing, the rise of modern philosophy, the founding of the French Republic in the age of revolutions, and his own agenda—“reason, toleration, and humanity”—which he presented in the form of prophecy. So he made his transition from the ninth to the tenth epoch, which was devoted to “the future progress of the human mind” and which represented a secular version of the eschatological dimensions of Christian tradition. As humanity approaches perfection, so history becomes futurology, and this heritage was taken up by French Utopians, Socialists, Positivists, Marxists, and not a few historians in the next century, who offer a wide range of ideas of progress.

Marx continued the economic interpretation, making the primary mode of production and class conflict the criteria, and the result was the threefold division of history of (primitive) feudal, capitalist, and proletarian, which inspired research, speculation, and polemic for over a century. For Marx history begins in barbarism and its kinship relations and moves on to the higher form of feudalism, based on control of landed property and serfdom, and then, with the development of trade, commerce, and finance, to a capitalist mode of production and industrialization that, generating proletarian class consciousness, looks forward to a transition to communism. The materialist view of history, inherited by Marx from Enlightenment political economy, was taken up as well by prehistorians, who on the basis of archeological researches distinguished the ages of stone (old and new—paleolithic and neolithic), bronze, and iron, which replaced or gave solid reinforcement to the “four-stage” system of eighteenth-century conjectural history, by connecting it with more precise chronological—that is, stratigraphic—calibrations. In the twentieth century the *Annales* school shifted attention from events and periodization to structures of long duration, and historians of women have questioned the relevance of traditional periodization to the turning points in the history of women.

Systems of periodization continue to appear, but most are variations on these old themes, applying ideas of evolution and “modernization,” if not decadence and decline. Of course there

are lower levels of periodizing, that is designating periods, whether by centuries, decades, cultural styles (Romantic, Baroque, Gothic, fin de siècle), political domination (Elizabethan, Napoleonic, Victorian, Soviet, Nazi), or individual celebrities (the age of Shakespeare, Bach), and the like. As for the time line for the story of the human species the parallel columns started by Eusebius and filled in by later chroniclers has been vastly expanded by geographical, archaeological, and anthropological discoveries, and periodization in the old sense has been marginalized, although appending a “postmodern” age to a modern one suggests that the impulse still survives.

PERIODIZATION OF THE ARTS. Notions of boundaries, categories, and periods frame discussions of art and visual culture. The desire to organize visual information and material into clearly defined, manageable units has provided an irresistible impetus for periodization since the emergence of art historical and critical studies in the Renaissance. The application of periods to art and visual culture was extended in the nineteenth and twentieth centuries, when philosophers, historians, and critics of the arts searched for objective ways to explore their world. Their search for objectivity resulted in their conceptualization of periods as a metalanguage rooted in empiricism through which to communicate ideas. Centuries of scholarship have produced a multiplicity of periods underscoring diverse perspectives and serving diverse ends. For some observers, the study of periodization is an exercise in disillusionment. The absence of any single, consistent system of periodization is construed as a symptom of the failure of the intellectual disciplines surrounding the arts. For other observers, the study of periodization is an affirmative endeavor. The existence of alternative schemas for periodization indicates that intellectual discourse about the arts is open to debate, reconsideration, reorganization, and reinterpretation.

What Is a Period?

Art historians and aesthetic philosophers employ a number of ways to group world arts into systems of classification, known

as *periods*. Periodization subdivides the continuous flow of artworks through time and space into groupings. Period groupings are defined by the perception that the artworks within them share a single quality or a set of qualities that are significant. Significant qualities can include the formal, stylistic, iconographic, thematic, or other aspects of art. Moreover, period groupings are further defined by the perception that the quality or qualities by which each grouping is defined is distinctive.

Rather than being neutral, periodization organizes art according to critical viewpoints and explanatory hypotheses. The definition of a period reflects judgments about the nature of meaningful connections between artworks and between art and its larger context. The divisions made between periods reveal judgments about the paths of artistic development or moments of artistic disjunction.

Periodization also influences the perception of the audience according to the quality or qualities that are used to group artworks. Qualities in individual artworks that are deemed significant to the period are more visible to viewers, while other qualities in the same artworks tend to be overlooked.

Is it necessary to periodize? Some theorists object to the concept of periods as a contradiction against the very nature of the art. According to this viewpoint, periodization merges the individuality of the artist and the uniqueness of artworks into homogeneity that is inherently the antithesis of creativity. Other theorists object to the utilization of periods as a distortion of the historical process. According to this viewpoint, periodization falsely divides the continuity of history. Critics of periodization argue that history should be written as a continuous chronicle of occurrences and their interrelations and that the principal purpose in writing art history should be to enhance our appreciation of the uniqueness of individual works of art.

One such critic was Roger Fry (1866–1934). While employing period names in his critical writings, Fry applied an overall approach that is essentially timeless. In his analysis of early-twentieth-century art, Fry denied that modern art was the next element in a cycle or sequence of periods. Artworks, in Fry’s view, should be construed as the fruitions of independent creative acts, and hence as fundamentally unhistorical. Instead, Fry postulated a great tradition whose representatives can belong to any age.

Despite objections, most art historians and critics have utilized systems of periodization. Heinrich Wölfflin (1864–1945) both recognized that time can be convincingly presented as an uninterrupted flow and asserted that systems of periodization were crucial apparatuses to intellectual understanding. While acknowledging that, at some level, the concept of periods is invented, Wölfflin felt that periodization was necessary for the self-preservation of the scholar. He pragmatically observed that the infinity of images and events was overwhelming unless structured in some way.

The pragmatic justification for periodization offered by Wölfflin has been extended beyond its utility on the personal level. Periodization is defended as a necessity in educational

enterprises, including community programs, college and university courses, and media programs. According to this viewpoint, periods offer institutions a useful way to package information into topics and courses; periods offer introductory students a reasonable way to absorb information; and periods offer professional teachers a commonly acknowledged way to define a special area of study by which to justify inclusion in the academy. When education is treated as a businesslike enterprise selling a commodity, the information must be packaged in a manner that meets the expectations of all its consumers to some extent.

There is a widespread consensus that periodization is a convenient and utilitarian schema. At the same time, debate persists over whether periodization is an arbitrary system that segments historical continuity or an embedded structure that reveals historical meaning. Proponents of the second viewpoint argue that, without periodization, observations about artworks would consist of little more than masses of unrelated visual observations and historical incidents. With periodization, it is suggested, not only is visual data collected and organized but relevant comparisons about artworks over time and space can be discerned; the past visual traditions can be described in a meaningful way; and the present imagery can be interpreted as a logical outcome of the past. Periodization is defended as being embedded in history because with it intentions, patterns, and purposes can be revealed, and without it some types of visual analysis and interpretation become impossible.

What types of periods are used? Both extrinsic and intrinsic periods are applied to the visual arts. Extrinsic models that are used to categorize and organize art rely on elements external to the artworks themselves, particularly chronological time and political history. Most extrinsic systems of classification are anchored by firm dates to mark beginning and end points. Therefore, extrinsic period names can be shared between various disciplines (the Neolithic period, for example).

Models of periodization that correspond to specific centuries and decades are among the most conventional and most deeply entrenched systems used to divide Western art into groups. These models result in familiar periods such as the medieval, Renaissance, and modern periods.

Additional factors extrinsic to the artworks themselves can also provide the frameworks through which periods may be defined. Some systems of periodization are determined by political figures and events. These models generate periods based on factors including the reign of particular rulers (as in the Georgian, Victorian, or Edwardian periods) or dynasties (Carolingian, Ottonian, Tudor), revolutions (such as the French and Bolshevik Revolutions), wars (such as World Wars I and II), and other public events. Still other extrinsic models of periodization are grounded in factors such as inventions (for example, the invention of writing as the endpoint of the "prehistoric period" or of metallurgy as the beginning of the "Bronze Age").

Extrinsic periods can become internal factors that influence artists and imbue artworks with particular qualities. Artists in

the last decades of the nineteenth century were conscious of their art as *fin de siècle*, just as artists in the last years of the twentieth century were aware that they were producing art at the end of a millennium. But passages of chronological time and even events in political history are rarely determinants of aesthetic changes or stylistic choices. Since extrinsic periodizations are usually extraneous to the arts, many systems of periodization group artworks on the basis of factors intrinsic to art. Differences in the appearance of artworks, changes in the production of artworks, shifts in the purposes of artworks, and other factors particular to the history of art are frequently cited as more significant bases for the definition of periods. Therefore, some systems of periodization are considered to be intrinsic, rather than extrinsic, in nature. Intrinsic periods can be determined by either single or combined qualities, including skills (such as the discovery of foreshortening, perspective, light and shade in painting), materials (oil painting, ferroconcrete), content (dada, surrealism), and formal choices (abstract expressionism, cubism). Changes in these qualities are often explained as the result of changes in the ideals, interests, beliefs, and/or lifestyles of artists and audiences. Thus intrinsic periods are correlated with sets of values that are distinctive to themselves and assumedly or demonstrably different from sets of values prevailing in previous or successive periods. The most common paradigm used to explain changes in the values considered normative for a period is a gradual process during which ideas are first proposed, then fully realized, later regarded ambivalently, and eventually replaced by newly formulated ideas.

In contrast to extrinsic period names that can be extended to many disciplines, intrinsic period names are usually appropriate to only a few areas or to a single field (such as abstract expressionism or pop art). Although they arise directly from the study of the artworks, intrinsic periods in art history can become complex. The complexity of intrinsic period names is exemplified by the term *Baroque*. *Baroque* initially was a pejorative label for shapes and designs that were regarded as bizarre or extravagant. It was applied as a negative characterization for the art of the seventeenth and first half of the eighteenth centuries that followed after and differed from Renaissance art. It later became identified with a period style admired for distinct values of its own. As a period, the Baroque takes on a spatial character defined by the spread of those characteristics to different regions. This spread is recognized as occurring earlier in some countries and later in others, resulting in chronological dates of the Baroque period that vary according to region. Moreover, the Baroque period is also differently regarded in terms of a period sequence. Sometimes it is regarded as the last major subdivision of the Renaissance and sometimes as reaction against the "classicism" of Renaissance art. But the Baroque also appears in geographical regions in which Renaissance art is absent and therefore is sometimes independent of the paradigmatic style by which it is defined. Finally, the Baroque is sometimes regarded as a set of values that infuses morphological unity into all artworks of the period. This viewpoint stresses putative shared values underlying the artworks of contemporaneous painters such as Georges de La Tour, Nicolas Poussin, and Pietro da Cortona, artists who were born within three years of each other. In contrast, the

Notre Dame Cathedral, c. 1900. Notre Dame was built during the intrinsic High Gothic period in architecture, which art historians note was marked by high, vaulted ceilings, a sense of flowing, uninterrupted space, and an abundance of light. © BETTMANN/CORBIS

Baroque is alternatively regarded as what James Ackerman described as one of several “confluent, overlapping, and intersecting” stylistic trends. This viewpoint stresses the evident dissimilarities in the visual qualities of the same artworks by the same painters.

The complexity of intrinsic period terms is further illustrated by other uses of the term *Baroque*. *Baroque* is used as a period concept either to imply that a set of ideals or values pervaded an age or to suggest a set of visual elements that were predominant in a given spatiotemporal context. At the same time, *Baroque* is used as a style name that imputes a certain visual quality independent of time and space. Thus the term *Baroque* can be applied to one of the visual arts to designate formal elements that were widespread in the seventeenth century. But it can also be applied to other cultural phenomena, such as the “Baroque” organ, that share a common temporal context but none of the formal elements by which the Baroque was originally characterized. And it can be applied to visual designs produced in distant regions at unrelated dates, such as contemporary Latin American Baroque art.

The complexity of periodization is compounded by the convergence in the practical usage of extrinsic and intrinsic periods. Some extrinsic periods become identified with distinctive cultural and intellectual attitudes (such as “the Roman Empire”), others with a set of shared myths and memories (the 1960s, “the Reagan years”), or still others with a specific aesthetic outlook (“the Victorian era”). Because they can assume attributes of intrinsic periodizations, extrinsic period terms can mistakenly imply that each period automatically had a distinctive and unified visual character and necessarily differed from its predecessor or successor.

Periodization is complicated by at least one more issue, the issue of whether every period is unique or whether periods can be analogous. Meyer Schapiro (1904–1996) argued that periodization must recognize the fixed and unrepeatable order of events. However, intrinsic definitions of periods are based on qualities that are potentially applicable to more than a single period. One strategy that is frequently used in order to preserve the uniqueness of a period employs a dual method of description. A period description can be defined principally in

The Annunciation (c. 1432) by Fra Angelico. Tempera on panel. Critic Henrich Wölfflin (1864–1945) composed an analytical study of art that divided the discipline into three phases based on conflicting visual concepts. He applied his model to European art during the Renaissance. PHOTO CREDIT: ERICH LESSING/ART RESOURCE, NY

terms of intrinsic qualities but can also claim that those qualities are fully realized only in the extrinsic context of a specific time and place. As a consequence, for example, many periods might contain art with baroque qualities, but the claim is sometimes made that only one period can be Baroque.

How do periods change? Because periods, with their beginning and ending moments, purportedly chart shifts in visual expression, the use of periodization poses questions about the nature of artistic change over long durations of history. The nature of these changes has been addressed by many writers, among them Alois Riegl (1858–1905). According to Riegl, art always develops under universal laws, and these laws dictate that art always moves in a forward, unremitting progression. Riegl saw the final phase of a period as a necessary stage because it formed the foundation upon which the next phase would rest. Period endings and beginnings, therefore, blurred together almost seamlessly.

The use of periodization also poses questions about the nature of change within shorter spans of time. Periods are

generally subdivided into shorter units of time that purport to track internal dynamics of stylistic development. Descriptions of the progression of art through sequential subperiods generally employ metaphors of either organic evolution or physical mechanics.

Metaphors of organic evolution describe change in terms of the biological processes of birth, florescence, decay, and death. An early, and highly influential, art critic who utilized such a metaphor was Giorgio Vasari (1511–1574). In his *Lives of the Artists* (1568), Vasari celebrated the accomplishments of fellow Renaissance artists in an anthology of biographies. While Vasari portrayed the lives of famous painters, sculptors, and architects in a roughly chronological order, he divided the corpus of biographies into three distinctive groups. In the prologues that introduce each section, Vasari reveals the purpose for his divisions.

According to Vasari, the quality of the artists' works paralleled the relative time period in which they worked. Vasari

The Conversion of St. Paul (1600–1601) by Michelangelo Merisi da Caravaggio. Oil on canvas. During the Renaissance scholars and historians first began to divide works of art into specific units or periods. © ARALDO DE LUCA/CORBIS

placed the earliest Renaissance artists, such as Cimabue (Benvenuto di Pepo) and Giotto di Bondone, into his first group. The works of Piero della Francesca and Andrea Mantegna occupied the second category, while the third, and temporally latest, group included the works of Leonardo da Vinci, Raphael, and Michelangelo. Vasari's primary criterion for judging the quality of the artworks was based on the degree to which the art adhered to nature. Thus Vasari admired those artists, including Cimabue and Giotto, who initiated naturalistic styles of representation. He awarded high acclaim to Piero della Francesca and Mantegna for their increasing facility in accurately depicting nature, but Vasari bestowed the maximum degree of praise upon Leonardo, Michelangelo, and Raphael for not only masterfully portraying nature but also surpassing nature by perfecting its flaws.

Vasari's scheme established a biological model as a way both of dividing periods and of judging the quality of artworks. According to Vasari, internal cycles dictated the progression of art, and these perpetual cycles transcended any individual artist's talents. Vasari equated the artistic change to the human life cycle, a cycle governed by a clock beyond human control. To Vasari, art was born, grew to maturity, and eventually died. The artists who were described by Vasari as surpassing nature itself and as thereby attaining the highest level of artistic mastery were placed in the category of growth and florescence; they

represented the blossoming maturity that would eventually decline with subsequent artists of the seventeenth century.

The biological analogy utilized by Vasari has been adapted and applied to the arts for centuries. The twentieth-century literary critic Northrop Frye (1912–1991) also compared stylistic change to organic growth. Frye attributed the dynamics of change to the necessary process of technical mastery required of artists and craftsmen. He argued that, in any art form involving complex technical knowledge, each generation of practitioners must learn from its elders as it also struggles to introduce innovations. The phase of initial experimentation is followed by another of mature development and a final one of exhaustion and abandonment.

In counterpoint to metaphors of organic evolution, metaphors of physical mechanics have also been applied to periods. These metaphors describe change in terms such as cycles, oscillations, waves, and pendular swings. An influential critic who used a cyclical model was Heinrich Wölfflin. Wölfflin ushered in a phase of artistic inquiry in which formal qualities of art constituted primary data. Using this primary data, Wölfflin devised a new method of analysis that centered on comparing the observable formal qualities. According to Wölfflin, art follows cycles of three phases, early, classic, and baroque. In order to identify these phases, Wölfflin identified five pairs of opposed visual concepts by which art could be analyzed: linear versus painterly; plane versus recession; closed versus open; multiplicity versus unity; and absolute versus relative clarity. Wölfflin applied his comparative scheme of vision to European art of the fifteenth, sixteenth, and seventeenth centuries and associated the early Renaissance, or quattrocento, with the early phase of an artistic cycle, the High Renaissance, or cinquecento, with the classic phase of the cycle, and the Baroque with the late or baroque phase of the same cycle.

Some eighteenth-century aesthetic theorists, including Edmund Burke (1729–1797) and Johann Christoph Friedrich von Schiller (1759–1805), described period changes in terms of a series of pendular swings between polar opposites such as optic and haptic, additive and divisive. In the twentieth century, Martin Warnke (b. 1955) proposed a model of pulsation in which every age of classicism will be followed by an age of anticlassicism.

While pointing out the shortcomings in the pendular and pulsation metaphors, Ernst H. Gombrich (1909–2001) utilized the dialectic of the classical with the nonclassical. To Gombrich, every form of unity represented by classicism is followed by nonclassicism, that is, by disintegration. But Gombrich also consistently stressed the relevance of the changing functions of images in their social context and proposed an ecological metaphor for art. Similarly, Marxist and social historians of art have explained period dynamics in demographic and socioeconomic terms.

Critics have objected to analogies drawn from biology and physical mechanics. In the view of Horst W. Janson (1913–1982), such analogies result from the imposition of similar critical viewpoints rather than from an inherent organic unity.

According to Janson, these analogies amount to no more than pathetic fallacies in which living consciousness is attributed to historical accident. Other skeptics include James Ackerman (b. 1919) and George Kubler (1912–1996). Ackerman refuted the premise that change follows innate dynamics. He considered the process of change to be motivated by the constant incidence of probings into the unknown. Kubler cautioned that changes within a period often result from myriad randomly timed shifts rather than from a patterned progression.

Why should accepted periodizations be challenged? Periodization can be regarded as intellectually restrictive if it is accepted as the inevitable foundation of art history and theory rather than as a trigger for critical analysis and debate. Revisions to accepted periodizations often arise when researchers recover materials that have been ignored or dismissed. Reevaluations of the art corpus that are initiated to redress social injustices and to counter stereotypical imagery lead not only to the expansion of the visual record but also to the reconsideration of periodizations. Revisions to accepted periodizations also arise when new art theories are promulgated or when new visual styles are formulated. Challenges to existing periodizations can consist of modifications within an accepted structure or the proposal of an entirely different scheme. Rival periodizations do not necessarily diminish their utility or discredit the concept of periods. Instead, they may serve to underscore the dynamics of artistic complexity and to express the multiplicity of aesthetic creativeness.

Periodization and Globalization: Mesoamerica as a Case Study

When scholars encountered the artistic traditions outside of the Western world, they applied conventional systems of periodization that had initially been developed to organize the investigation of Western art. One non-Western region to which conventional, formalist periodization was applied was ancient Mesoamerica. Present-day Mexico, Guatemala, Belize, and Honduras constitute a region described as Mesoamerica, based on its position between North and South America and a number of cultural practices and characteristics shared among the many peoples who occupied this area between 1800 B.C.E. and the sixteenth century C.E. When the explorer Hernán Cortés arrived in the New World early in the sixteenth century, he immediately became interested in indigenous artworks fashioned of gold and precious stones. Cortés sent a sampling of Aztec-crafted gold objects back to Spain as evidence of the potential richness of the region, along with a few Aztec books and maps. Despite this early appreciation of indigenous artworks, within a few years of the Spanish arrival, Spanish governors and religious leaders ordered the mass burning of thousands of native books and the destruction of sculptures. Europeans entering the New World saw native artworks as dangerous purveyors of indigenous religious beliefs, as crafts, and as “idols,” which were far inferior in quality to known Western art.

It was not until the nineteenth century that scholars took an interest in analyzing the aesthetic qualities of the arts of the ancient Americas. An early system of periodization was designed by Wendell Bennett and Junius Bird to classify the great

variety of artifacts from the central Andean region of South America. Bennett and Bird consciously addressed theoretical issues involved with the creation and application of periods in artistic traditions outside Western, literate society. They noted that the choice of features by which a culture was identified was in some respects an arbitrary outcome of historical preservation and archaeological recovery. They further recognized that the problem of determining general periods was compounded by the absence of absolute dates and by the use of differing relative systems of dating employed in local regions. These relative systems included dating by the use of stratigraphy, surface collections of ceramics, sampling pits, and trade pieces. In addition, Bennett and Bird realized that a single system of periodization risked obscuring regional cultural variation within the central andean region.

Nonetheless, Bennett and Bird argued for the definition of overall cultural horizons as a means to permit the central Andes to be treated as a single unit and to be compared in its cultural developments and achievements with other parts of the world. The system designed by Bennett and Bird simplified relative chronologies of different regions named after

local sites into cultural horizons named by terms that cross-cut local terminology. Their system of periodization employed accessible period names, in part because period names were based on Western perceptions of indigenous economic and political organization. Those periods were termed Early Farmers (c. 2500–1200 B.C.E.), Cultist (c. 1200–400 B.C.E.), Experimenter (c. 400–1st C. B.C.E.), Master Craftsman (c. 1st c. C.E.–900), Expansionist (c. 900–1200), City Builder (c. 1200–1450), and Imperialist (after c. 1450–1532). The sequencing of periods in a linear progression suggested an evolutionary model of development.

The principles by which the Andean system of periodization was created were subsequently adapted for use in Mesoamerica. The occupation of the region was divided into Archaic (prior to 1500 B.C.E.), Formative (c. 1500 B.C.E.–250 C.E.), Classic (250–900), and Postclassic (after 900). While this periodization utilized less descriptive names, it was nonetheless based on the same Western perceptions of indigenous economic and political organization as the Andean scheme. Thus Archaic corresponded to Cultist, Formative to Experimenter, Classic to Master Craftsman, and Postclassic to Expansionist, City Builder, and Imperialist. Similarly to the Andean scheme, this periodization suggested an evolutionary model of developmental progression in its linear serialization while the subdivision of periods into phases echoed Vasari's organic model of biological cycles.

Still another Western model of periodization was also applied to Mesoamerica. The artworks created by the ancient Maya particularly interested Western scholars, and Maya artworks and style became a measuring stick against which all Mesoamerican artistic traditions were judged. The Maya occupied much of the eastern portions of Mesoamerica. Between 250 and 900 C.E. they constructed numerous large cities, with elaborate palace complexes, soaring temples, and vast plaza systems. They lavished their built environments with hieroglyphic inscriptions, paintings, and large-scale sculpture. The great architectural achievements evident in ancient Maya cities, combined with a style of sculpture that portrayed the human subject in an especially naturalistic manner, impressed Western viewers, who saw affinities between Classic Maya art and the celebrated Greek art of the Classic period (480–323 B.C.E.).

Like Greek sculpture during the Classic period, Maya art created between 250 and 900 seemed to exhibit the highest degree of naturalism and idealization, as though the indigenous artists looked to nature for their models and fused this observation with native ideals. Like the Classic period in Greece, the Classic period for the Maya was seen as the pinnacle of civilization—a time in which the Maya excelled in the realm of sciences, especially astronomy, and a time when Maya scribes recorded temporal and mythical histories using sophisticated calendrical systems. Western scholars also saw the Classic period as a moment in which theocratic rulers, guided by piety, religion, and logic, governed the activities of the Maya cities (an assumption that has subsequently been disproved in both the cases of Classic Greek and Classic Maya periods). With the term *classic* denoting a period of brilliance and the pinnacle of Greek cultural production, *classic* was similarly

employed to describe the apparent florescence of the Maya world between the years 250 and 900 C.E.

The periodization of Maya art thereby grafted Western perceptions of qualities described as “classical” or “less than classical” into a system of periods originally based on Western principles of economic and political organization. The resultant schema resembles the pendular models of periodization based on physical mechanics and parallels Gombrich's theory of periodization and style. In the literature on Maya art, the time period that chronologically preceded the Classic period frequently was termed the Preclassic rather than the Formative. The choice of this term suggested that the period represented a stage of infancy that would eventually mature and blossom into the splendor of the Classic. In examining the artworks created after the Classic period, scholars observed that artists no longer lavished monuments with lengthy hieroglyphic texts; artists no longer focused their attention on building large-scale architecture; and sculptors no longer placed priority in inscribing each monument with the most sophisticated systems of calendrical notation. In addition, Maya artists no longer imbued the human subject with the elements of naturalism and idealism that they had in the past. Thus the period known as the Postclassic was seen as a period of decline and decay.

Far-reaching consequences emerged as a result of the assumptions intrinsic to the system used for periodizing Mesoamerican art. These assumptions implicate the scholarly, economic, and social spheres that surround the artworks themselves. For decades, Maya art created during the Classic period received the most acclaim. Acclaim translated into importance, and Classic period art drew greater numbers of scholars than Preclassic and Postclassic art.

The desire to celebrate aesthetic qualities deemed Classical has promulgated a skewed picture of Mesoamerican art. Far greater financial support is directed, especially by North American and European institutions, toward the preservation, restoration, and exhibition of Classic period Maya art than to any other Mesoamerican artistic tradition. By extension, a distorted concept of Mesoamerican culture has also resulted. Far more archaeological investigations are proposed and funded for the purpose of studying Classic period Maya sites than any other set of Mesoamerican sites. As a result, both art historical and archaeological scholarship presents a lopsided view of Mesoamerica in which the importance of the Classic Maya period is overestimated.

By the turn of the twenty-first century scholars attempted to eliminate the attendant value judgment from conventional models of periodization by replacing value-laden terms with more neutral terms. The period named “Formative,” for example, gained popularity over the period name “Preclassic.” In addition, scholars strove to present the names of periods simply as temporal boundaries without attached notions of quality or sophistication.

Technology and periods in Mesoamerica. Technologies that had been unavailable in the formulation of early models of periodization now allow for the discussion of artworks based

solely on time. Radiocarbon dating, for example, provides a simple and reliable way to date ancient artifacts (if they contain organic matter), by measuring the residue of radiocarbon. Another useful dating method termed obsidian hydration is especially useful since Mesoamerican peoples frequently fashioned local obsidian into tools and artworks. Thermoluminescence, a more recently discovered dating technique, is employed to date rocks, minerals, and pottery. These recently developed methods allow investigators the option to remove artworks from previously codified systems of periodization, to reinterpret past models, and to define periods in new ways.

Western and indigenous traditions of time and periodization. Western-imposed modes of periodization often clash with indigenous traditions of dividing time and indigenous approaches to conceptualizing their material past. Among the ancient Maya, time was seen not as a single linear progression but as a series of unremitting cycles. Divided into sub-cycles and almanacs, native concepts of temporality dictate that time itself possesses distinctive qualities and purposes. Unlike some Western theories of time, which operate outside the boundaries of intrinsic nature, the Maya situated time as an entity that acts upon and shapes the content that it frames.

Feminism and Periodization

Voiced principally by women, radically new questions about artists and artistic canons emerged during the late 1960s and early 1970s. Feminist artists and writers, particularly Linda Nochlin (b. 1931), vigorously probed the history of art in order to understand why female artists were not celebrated in Western history and in contemporary culture. Deep within the internal structures of the discipline itself, feminist writers located inherently exclusionary foundations. One exclusionary strategy has been identified as the construction of definitions of art. Women traditionally created artworks that were often made, used, and exhibited within their homes. Media conventionally seen as “crafts,” such as embroidery, miniature painting, and ceramic production and decoration, constitute some examples of artistic production in which women historically participated. Conformist notions of “high art” and canons disregarded artworks created by women and subsequently excluded such art from the majority of periodization models (Alois Riegl is a notable exception who regarded crafts as equally important as figural arts). In the 1960s and 1970s women identified this exclusion and fought to unravel the system.

While designers of periodization paradigms ignored women, the trajectory of feminism itself gradually became divided into periods. Rather than hinging on factors external to feminism, feminist ideologies operated as the content around which periods were framed. Known as “waves,” these periods became incorporated into discussions of the differing interests within feminism, which loosely correlate with periods of time. Writers now place some of the earliest feminists in the first wave of feminism, which began in the late nineteenth and early twentieth centuries, when women fought for legal rights, including suffrage. Influential women such as Simone de Beauvoir and Susan B. Anthony have been placed within the first period or wave.

During the 1960s and 1970s, women concentrated on reviving the efforts and trajectories of issues explored by feminists during feminism’s first wave. This new movement, now known as second-wave feminism, strove to elevate the position of women, especially in professional contexts. Women of this period wanted to “have it all,” including equal access to privileges and positions along with equal compensation. Other paramount concerns for second-wave feminists included rights and control over their bodies. Other trajectories of feminism within the second wave focused on the difference between male and female in terms of sex and different reactions to gender. Cultural feminism and radical feminism, for example, held opposing views about the goal of feminism. The radical view argued for the cultural reconstruction of gender, reducing gender differences of males and females. Cultural feminism, on the other hand, emphasized the need to liberate, valorize, and preserve female difference as an absolute category.

The second wave of feminism bears particular relevance to periodization of the arts because it is within this period that Nochlin and others began to deconstruct the cultural paradigms that omitted women artists from the canon of masters. Second-wave feminist artists include Judy Chicago, Audrey Flack, and Miriam Schapiro, all of whom subverted notions of artistic canons by creating artworks that foreground the feminine through subjects and techniques that reference the artistic traditions of women and femininity itself.

Beginning in the 1980s and 1990s a new wave of feminism took shape and aimed at probing and revising some of the aspects of second-wave feminism. The third wave of feminism recognized exclusionary tendencies that characterized the interests of second-wave agendas and doctrine. Blurring the loose boundaries that separate the second and third waves, some feminists from the second wave shifted their interest and entered the third. Third-wave feminists recognized that the second wave had advocated social change primarily directed to the rights of white, straight, middle-class women. Third-wave feminism deemphasized the role played by sexual difference and explored the social structures, material and economic, that oppressed both women and men. As a result gender was framed in more neutral terms and as a product of enculturation rather than an innate quality.

Third-wave feminism’s multiplicity of foci and fluid boundaries oftentimes incite criticism. This strategy simultaneously generates power to sustain the movement. By their presence in popular media, participation in politics, and commitment to academic discourse and critique, proponents engage feminism with other discursive modes. Because they share the quality of persistent cultural subversiveness, second-wave artists such as Judy Chicago and Audrey Flack are embraced by new feminist artists. With its roots broadly anchored in cultural dialogues, third-wave feminism addresses immediate issues and influences that affect far-ranging audiences.

Conclusion

No single system of periodization has emerged. Some observers regard the existence of multiple systems based on varying criteria as a symptom of the arbitrariness and illogicality of

period schemes, while others interpret the same multiplicity as a positive result of the study of history. In this view, each periodization offers a possible strategy for the study of art, which encompasses widely diverse activities, including writing surveys, artistic biographies, catalogues raisonnés, iconographic analyses, or cross-cultural overviews. If the definition of periods and their temporal limits can be regarded as provisional strategies rather than objective reality, then the choice of periodization schema can be determined by the problem at hand. Different systems of periodization can be regarded as beneficial rather than chaotic when they permit the same masses of data to be organized by different principles and to yield different insights. Thus the ongoing debate about periodization contributes to the continuing vitality of the disciplines related to the visual arts.

PERSON, IDEA OF THE. Western European ideas about the person have long centered on the duality between body and soul (in religious discourse) or between body and mind (in the domains of philosophy and psychology). Consequently, early anthropological interest in non-European ideas of the person tended to mirror such deep-seated European conceptualizations, focusing on the origins of the concept of the soul.

The preoccupation of evolutionary Victorian anthropologists with religion focused on the question of its origins. By and large, these thinkers were apostles of secularism and science, committed to the notion that religion and its associated ideas (the soul included) were outdated, survivals from human prehistory. Religion was a repository of conceptions, which, while not entirely irrational in and of themselves, were fallacious or erroneous. In particular, Edward Tylor, in his book *Primitive Culture* (1871), saw in the idea of the soul the most ancient and fundamental of all religious beliefs, the key to understanding the subsequent development—but also the ultimate irrelevance—of religious ideas:

It seems as though thinking men, as yet at a low level of culture, were deeply impressed by two groups of biological problems. In the first place, what is it that makes the difference between a living body and a dead one; what causes waking, sleep, trance, disease, death: In the second place, what are those human shapes which appear in dreams and visions? Looking at these two groups of phenomena, the ancient savage philosophers probably made their first step by the obvious inference that every man has two things belonging to him, namely, a life and a phantom. These two are evidently in close connexion with the body, the life as enabling it to feel and think and act, the phantom as being its image or

second self; both, also, are perceived to be things separable from the body, the live as able to go away and leave it insensible or dead, the phantom as appearing to people at a distance from it. The second step would seem also easy for savages to make, seeing how extremely difficult civilized men have found it to unmake. It is merely to combine the life and the phantom. As both belong to the body, why should they not also belong to one another, and be manifestations of one and the same soul? (pp. 12–13)

In Tylor's scheme, the idea of the soul constituted the core of the most primitive form of religion, Animism, both in the form of the worship of the souls of departed ancestors and in the idea that inanimate objects—trees, rocks, bodies of water—also possessed souls and could be worshiped in their own right.

Durkheim's Critique

Émile Durkheim's (1858–1917) monumental treatise of *The Elementary Form of Religious Life* (1912) begins with the bold assertion that “a human institution cannot rest upon error and falsehood . . . when I approach the study of primitive religions, it is with the certainty that they are grounded in and express the real” (p. 2). Durkheim definitely had Tylor in mind when he wrote these lines, and devoted an entire chapter of the book to a refutation of Tylor's theories. Specifically, he argued that Tylor's account of the generation of ideas of the double and the soul from primitive explanations of dreams was radically circular. Rather, such notions presupposed the very ideas whose origins they were supposed to explain. For Durkheim, ideas such as the soul, ancestor spirits, totems, or gods could not be derived from the experience, much less the speculations, of individuals. Rather, they were intrinsically social phenomena.

Nonetheless, Durkheim concurred with Tylor that the idea of the soul was fundamental to religion: “Just as there is no known society without religion, there is no religion, however crudely organized, in which we do not find a system of collective representations dealing with the soul—its origin and destiny” (p. 242). Unlike Tylor, who drew for examples for his theories from around the globe and throughout history, Durkheim's examination of primitive religion focused on ethnographic accounts from Australia, and his discussion of the idea of the soul was correspondingly centered on Australian examples. According to native Australians, there exists a limited stock of souls. Each individual is a reincarnation of an ancestor, and all people are ultimately reincarnations of the original totemic *alcheringa* ancestors, powerful beings who existed in dreamtime and whose natures were merged with those of totemic species. For Durkheim, these representations addressed the critical problem of the relationship of society to the individual. The ancestral souls embodied the fundamental reality of society of which the individual was a particular manifestation.

Within the context of his discussion of the soul, Durkheim quietly introduced the idea of the person. The person, Durkheim suggested, represents the conjunction of an impersonal and personal principle, the soul and the body. The first, impersonal, derives from “the spiritual principle that serves as the soul of the collectivity . . . the very substance of which

individual souls are made” (p. 273), whereas the body, by situating this impersonal principle in a specific location in space and time, serves as the differentiating element. Hence, “individuation is not the essential characteristic of the person. A person is not only a singular subject that is distinguished from all the others. It is, in addition and most of all, a being to which a relative autonomy is imputed in relation to the milieu with which it interacts most directly” (p. 274).

The idea of the person, for Durkheim, squarely embodied the relationship between the individual and society at the very core of his approach to sociological theory. While it still reflected European dualistic thinking about body and soul, reading his own society's dichotomies into the thought of native Australians, it opened the way to new, less ethnocentric ways of understanding non-European conceptions of the person.

Mauss: The Person as “A Category of the Human Mind”

In a seminal lecture, which he delivered (in French) to a British audience in 1938, Durkheim's nephew, Marcel Mauss (1872–1950), was the first to bring the ideal of the person to center stage. Like Durkheim, he saw in the religious categories of so-called primitive societies a key to the understanding of modern European ideas. Citing examples from Australian societies as well as from Native Americans—Zuñi, Kwakiutl, Winnebago—he stressed the importance of names for the establishment of personhood. Names as such were not necessarily the hallmark of the individual, but rather of a persona, a fixed role or position within a society. Thus, a clan or other similar group might possess a finite stock of names. The name typically represented, not only membership in a group but also a specific position within it, and so individuals might change names within the course of their lives. Such names, Mauss suggested, were akin to masks—another phenomenon he related to ideas of personhood. The theatrical metaphor was intrinsic to Mauss's argument. In relatively “primitive” societies, there were a relatively fixed number of “roles.” Personhood in such instances reflected the individual's place within such a fixed scheme.

In his essay, Mauss contrasted this relatively fixed conception of personhood in non-European societies with a dynamic vision of the changing idea of personhood in Western Europe, through Greek philosophy, Roman law, Christian theology, and ultimately the Enlightenment. The end result of this evolution was a conception of personhood in terms of individual consciousness rather than as the embodiment of set social relationships. These ideas have been rejected by the overwhelming majority of anthropologists who reject any teleological dichotomy between European societies as essentially dynamic and non-European ones as static. However, if this part of Mauss's argument has fallen by the wayside, his insistence that conceptions of the person are culturally and historically constituted constantly subject to change provided the foundation for most subsequent anthropological writing on the subject.

The Anthropology of the Person since Mauss

While Mauss's essay provided inspiration to both French and British anthropologists, the implications of his work were

developed in substantially different ways by anthropologists belonging to different national schools. At the same time, American anthropologists were to approach the problem from a very different starting point. In all three cases, concepts of the person were explored in the context of extensive fieldwork in specific cultures. Rather than generalizing from the vantage point of European categories, taken as the end point of a process of evolution, anthropologists grappled with non-European conceptualizations firsthand.

Griaule and the French school. Marcel Griaule's work among the Dogon of modern Mali (then French Sudan) was to mark the French approach for at least a generation afterward. For Griaule, the complex esoteric cosmology of the Dogon, as revealed to him by his key informant, Ogotemmel, constituted an intricate and sophisticated philosophical system, an alternative way of thought in no way inferior to European equivalents. Dogon ideas of the person are consequently one element of this entire system. Crucial to these ideas is the principle of the ideal duality of all creatures. In the original acts of creation, only the Creator's firstborn—the jackal—was created single, and it is for this reason that the jackal is the quintessential trickster and embodiment of disorder, but also the agent through whom truth is revealed to the diviner. After the jackal, a couple, the Nommo, were born: demiurges who represent the ideal dual order. Twins consequently represent the ideal birth, and human twins become the object of a cult as soon as they are born. Even ordinary humans have double souls—*kinndou-kinndou*—one for each gender. The female principle resides in the man's foreskin, the male in the woman's clitoris; rites of circumcision and excision are consequently required at adolescence to transform ambivalently gendered children into fully male or female adults. In short, for Griaule, the Dogon myth of creation contained the key to their conceptions of personhood and of the world in general.

British social anthropology. The British school of social anthropology, also profoundly influenced by the work of Durkheim and Mauss, adopted a less abstract and more sociological approach to the study of ideas of the person. E. E. Evans-Pritchard's pioneering study of *Witchcraft, Oracles and Magic among the Azande* (1937), published a year before Mauss's lecture, did not explicitly mention the concept of the person, but his explanation of Azande notions of witchcraft nonetheless represented a landmark in the ethnographic exploration of personhood. Witchcraft is a common explanation of misfortune among the Azande, and is caused by a grudge or ill will on the part of a witch. However, not all people are witches. Witches are born with innate witchcraft substance, inherited by boys from their fathers and girls from their mothers. It operates through *mbisimu mangu*, the soul of witchcraft, which travels from the body of the witch to the body of the victim, although the witch himself may not be conscious of the harm he is perpetrating. However, Evans-Pritchard was not simply concerned with the ideology of witchcraft in itself, but in the way in which these ideas underpinned the everyday actions of Azande, so that they understood and reacted to the ordinary misfortunes of everyday life through consulting oracles, attempting to cool the anger of witches, and ultimately pursuing vengeance when witchcraft proved fatal.

In an essay titled "On the Concept of the Person among the Tallensi" (1973), Meyer Fortes explicitly developed Mauss's insights with specific reference to a particular West African culture:

observance of prohibitions and injunctions relating to the killing and eating of animals, to distinctions of dress, to speech and etiquette, to a wide range of ritual norms, to the jural regulations concerning marriage, property, office, inheritance and succession, play a key part in the identification of persons. Persons are kept aware of who they are and where they fit into society by criteria of age, sex, and descent, and by other indices of status, through acting in accordance with these norms. By these actions and forms of conduct they, at the same time, show to others who they are and where they fit into society. (p. 282)

Seen in this light, an individual's birth is merely the first step in the process of turning him or her into a full person, a process which only ends with death, when, as an ancestor, one may eventually become a full person. Tallensi personhood is thus not a feature of the individual per se, but of the individual's interaction with society as a whole. For Fortes as for Evans-Pritchard, this process of interaction was played out in the miniature crises of everyday life.

American anthropology and the problem of personality. During the first half of the twentieth century, anthropologists in the United States were far less influenced by the theories of Durkheim and Mauss than by the work of Sigmund Freud (1856–1939). Rather than evincing interest in "the person" as a category of thought, they focused on the formation of the individual personality in different cultures. Ruth Benedict's *Patterns of Culture* (1934) is the most famous example of this approach. For Benedict, each culture has its ethos, its style, which characterizes its art, its ritual, its ideology, the emotional tenor of social relationships, and so on. Individual children are raised in conformity with this ethos, internalizing patterns of feeling as well as of behaving. Those with little natural aptitude for the predominant ethos are deviants, though deviance in one culture can well be normality in another. Moreover, cultures may also have established deviant roles, such as the *berdache* in Native North America, a person who was born biologically male but who dressed as a woman, adopted women's occupations, and sometimes even married another man.

In the 1960s, Clifford Geertz attempted a synthesis between the American emphasis on personality and Mauss's conception of the person, most notably in his essay, "Person, Time, and Conduct in Bali" (1966). Geertz focused on those aspects of Balinese culture—names and titles—central to Mauss's formulation of the development of the idea of personhood. However, for Geertz, these component features of the Balinese conception of personhood were expressions of an overall Balinese ethos. Children are given a personal name, but this is generally a nonsense term and rarely used to address or refer to them. Children are more generally known by standard birth

order names, and adults (except for childless adults, who in some sense remain socially children themselves) by tekonyms—"father (or mother) of so-and-so (their first child)." Balinese status titles as well as names serve

to stress and strengthen the standardization, idealization, and generalization implicit in the relation between individuals whose main connection consists in the accident of their being alive at the same time and to mute or gloss over those implicit in the relation between consociates, men intimately involved in one another's biographies, or between predecessors and successors, men who stand to one another as blind testator and unwilling heir. (Geertz, pp. 389–390)

In short, the Balinese concept of the person, in keeping with the Balinese ethos, is depersonalizing, at least from a European point of view.

These different approaches to the study of the idea of the person, whether French, British, or American, have convincingly demonstrated that there is no single "primitive" conception of personhood, much less of "the soul." The different cultural constructions of "personhood" around the globe cannot be interpreted in terms of narratives of the progressive emergence, either of rationality or of individuality, in Europe as opposed to the rest of the world, as nineteenth and early twentieth century theorists attempted to argue.

PERSONHOOD IN AFRICAN THOUGHT. What is a person? Two basic types of considerations are apparent in African answers to this question. The first is ontological, the second ethical. Ontologically a person is a combination of a physical constituent, namely the body and a set of two or in some cases three constituents of a rarefied character requiring careful elucidation.

The nonbodily constituent on which all the accounts of personhood seem agreed is what might be called the life principle. This is thought of as an entity whose presence in the body means life and its absence death. The Akans call it *okra*, the Yoruba *emi*, and the Nuer, roughly, *yiegh*. By common agreement it derives directly from God himself. Indeed the Akans are explicit that it is a speck of the divine substance. As metaphorically and often literally understood, this entity or an ontologically analogous one goes before God to take leave of him before coming to the world to be born of man and woman. It is at this meeting that God apportions the prospective person's destiny.

The Yoruba account of this meeting is the most dramatic of all. For them, unlike the Akans, it is not the life-giving constituent, like the Akan *okra* or Yoruba *emi*, but another nonbodily entity called the *ori-inu* that receives the apportioned destiny. It stands before God and proposes a destiny, which God either confirms or refashions. Or it kneels before God and has a destiny affixed to it. Either way, the apportionment is ultimately God's own. Moreover the destiny, which is the outline of one's earthly career, is doubly sealed, for on its way down to the world the individual encounters God's gatekeeper, who typically asks, "Where are you going? . . . What are you going to do?" To which the individual replies with a recitation of the destiny just assigned. The gatekeeper then says "*To*," which Bolaji Idowu translates as "It is sealed." Idowu comments, "And so the person passes into the world with his destiny doubly sealed" (p. 174).

This doctrine is widely received, though not universal, in Africa. Okot p'Bitek (chap. 9) argues that the Central Luo do not have a place in their worldview for a predetermined destiny. Wherever entertained, however, it is significant as indicating the moral uniqueness of every human individual, but it is also the source of some of the deepest problems at the intersection of morals and metaphysics. The African mind has been sorely challenged to fathom how an individual can be held responsible for his or her conduct if what he or she does is in fulfillment of a divine plan. Furthermore, even though it is generally supposed that the destiny assigned by God is unalterable, various African peoples are known to seek the help of "specialists" to rectify a dreary destiny.

Some writers on African thought, such as Idowu, content themselves with the observation that “the paradox involved in this two-sided conception is accepted by the Yoruba without question” (p. 183). Kofi Opoku writes similarly with regard to the Akans. It is, however, possible that the apparent inconsistency, euphemistically described by Idowu as a “two-sided conception,” is due to the fact that what one is dealing with is the confluence of a variety of unnamed sources amalgamated into a strand of the oral tradition. Kwame Gyekye (1995) and Kwasi Wiredu (1996) offer further suggestions. But the priority here is to elucidate the ontological character of the nonbodily components of personhood. In addition to those already noted, the Akans, for example, speak of *sunsum*, which may be rendered as that which is responsible for an individual’s personal presence. This seems to be thought of as a kind of entity. The *tali* of the Lugbara seems to be a similar conception.

In general the nonbodily constituents of personhood, as conceived by African peoples, number at least two. How do they compare, ontologically speaking, with the analysis of personhood best known in Western philosophy, namely that a person consists of body, mind, and soul, with the soul usually, as in René Descartes, identified with the mind? In both the African and the Western conceptions, all the items named are regarded as entities. But the similarity ends there. The elements of the African inventory of human personality are conceived as material, save only that they are supposed to be exempt from the ordinary laws of optics and dynamics. If such entities are, for convenience, called quasi-material, then the contrast might be expressed as follows. The nonbodily components are, as a rule, conceived as quasi-material in Africa, while among thinkers of a Cartesian predilection they are thought of as spiritual, in the sense of being immaterial, nonextended.

The quasi-material orientation of African thought is especially apparent in notions of the afterlife, which are often heavily laden with material imagery. On the present interpretation, this marks a fundamental difference between the many African and Western systems of ontology. Whereas the categories of material, quasi-material, and immaterial entities are widespread (though not universal) in Western ontologies, only the material and the quasi-material are admissible in the African counterparts (Wiredu, 1996, pp. 52, 55). This interpretation of African thought is not uncontested (see Gyekye, 1995, pp. 85, 89). Still it is interesting that, on the quasi-material interpretation of the nonbodily aspects of personhood, it is an ontological mistake to identify any of them with the Western concept of the soul.

According to the foregoing account, a person, in African thought, consists of a body combined with quasi-material entities that account for its animation and for its destiny and other marks of uniqueness. Nothing has been said of mind. But this is not a mindless omission. Africans do not appear to construe mind as a kind of entity. Certainly the Akans do not. For them, mind is the capacity to engage in various activities, such as perceiving, reasoning, feeling, talking, and dancing. (For more on this conception, see Wiredu, 1987; for a

contrary view, see Gyekye, 1995, chap. 6.) To the question as to what is the basis of this capacity, the answer is implicit but unmistakable. In Akan discourse it is the *amene* (the brain). The Yoruba too cite the *opolo* (the brain) as the seat of the human power of reasoning. They also, presumably metaphorically, invoke the *okan* (the heart) as the seat of will and emotion. In this, Bantu thought resembles closely that of the Yoruba. In his exhaustive study of the concept of personhood entertained by the Bantu peoples of Africa, Alexis Kagame, a Rwandan philosopher and linguist, found that the Bantu generally think of a human person as consisting of a body, an animating force (which he describes metaphorically as “shadow”), a principle of intelligence, and finally, the heart, which is not thought of as a pump. According to Kagame, the Bantu, exactly like the Yoruba, also speak of the heart as the seat of will and emotion.

In whatever way one looks at African conceptions of personhood then, mind, though not generally conceived as an entity, is accorded a high degree of importance. The topic of mind moreover brings up the second basic type of consideration discernible in African thought about personhood. Mind is crucial in a special way in the definition of personhood. In the normative part of the African conception, a person is not just an individual of human parentage. To ascend to the status of a person, an individual has to have attained a certain degree of moral maturity and social responsibility. This obviously is a matter of the quality of one’s mind.

Probably every conception of a person has the notion of a certain degree of moral competence annexed to it. This is certainly the case in English language discourse. But among many African peoples, such as the Akans and the Yoruba, such a notion is not additional to the concept of a person; it is an integral part of it. The comparison may be illustrated with the following anecdote. At the conclusion of the peace conference between the freedom fighters and the white settlers of present-day Zimbabwe that led to independence in 1980, Kenneth Kaunda, then president of Zambia, wishing to pay the highest compliment to Margaret Thatcher, then prime minister of Great Britain, for her contributions to the success of the negotiations said to her that she was very much a person. Not wishing to be considered (presumably by the Western press) as the author of the greatest understatement of the century, he hastened to explain that in his language to be said to be a person was praise indeed. Without this clarification, Western observers, he must have thought, would have had to be excused immeasurable puzzlement. On the other hand, any Akan journalists present would have been pleasantly surprised to discover that the concept of a person in the president’s language was, in this respect, exactly the same as their own.

But this linguistic clarification needs amplification. The word for a person in Akan, for example, is *onipa*. This carries an ambiguity. In one sense it means simply a human being; in another it refers to a human being of a certain moral and social status. Even the most elementary sense of context, however, suffices to disambiguate. An individual, for example, who is by reason of confirmed laziness or waywardness unable to hold down

a job long enough to make worthwhile contributions to the welfare of the family and community would be said not to be an *onipa* (person). But if one kills such an individual, one has killed an *onipa* (a human being), and there will be severe consequences. Any human being, according to the traditional understanding, contains an element of divinity and is, on that ground alone, entitled to life, liberty, and an ample dispensation of natural rights (Wiredu, 1996, chap. 12).

A similar circumspection is necessary regarding the status of children. In the normative conception, a child is not yet a person, not having reached the time of the requisite maturity in moral thinking and social action. But there is not here the criticism that would normally be intended of, say, a constitutionally wayward adult. The adult has taken the test of personhood and failed; the child is not yet due for the test and deserves the kindest solicitude. Even in the case of the adult, criticism is reformatory in intent and soon gives place to concerted efforts at helping the individual achieve or regain personhood.

The following propositions therefore should not seem paradoxical. Personhood, to the African, is not something one is born with. It is something one has to work for and something at which one can fail. Furthermore there are degrees of personhood, and its lower gradations can shade off into nonexistence in the life of a human individual. Life then, on the African conception, is a struggle for personhood.

One might now ask what accounts for this conception among Africans. The answer is quite simple. African societies are, famously, communalistic. The individual is brought up, from the beginning, with a sense of belonging and solidarity with an extensive circle of kith and kin. The basis of this solidarity is a system of reciprocity in which each individual has obligations to a large set of other individuals. These are matched by rights owed him or her by the same number of individuals. Living amid the reality of this reciprocity, one soon begins to see oneself as presupposing the group. This is the mainspring of the normative conception of a person.

In contemporary African philosophy the locus classicus of the normative conception of a person is Ifeanyi Menkiti's "Person and Community in African Traditional Thought" (1984). But the anthropologist Meyer Fortes had already in the 1940s noted the normative character of the concept of a person held, for example, by the Tallensi of northern Ghana. Wiredu's independent interpretation of the Akan concept of personhood as normative is in total agreement with Menkiti's main position on this matter. John S. Mbiti's now classic remark that the African individual "can only say 'I am, because we are'" may perhaps be called Africa's communalist answer to Descartes's *Cogito*; it is only one step away from the normative conception as outlined above. Gyekye's (1997) "moderate communitarianism" is, broadly speaking, an interpretation of normative personhood, and Gbadegesin is also sympathetic. These are some of the signs that the normative conception of a person, preached and practiced by the African ancestors, may perhaps become a source of insight and commitment for the larger community of contemporary African philosophers as well, possibly, as others.

PERSPECTIVE. In the visual arts, the English word *perspective* refers to the optical illusion whereby a picture on a flat, two-dimensional plane appears to be three-dimensional; as if the represented objects were actually in a deep space receding behind the picture surface (like looking at them through a window or in a mirror), and in some cases seeming even to project forward in front of the picture. The term itself derives from the Latin participle *perspectus* of the verb *perspicere*, meaning “to see through.” While artists in nearly every world culture since the beginning of the human race have sought to create some kind of illusion of visual reality in their image-making, none were so preoccupied with perspective mathematics as the painters of the Italian (and then pan-European) Renaissance.

Renaissance-Style Linear Perspective

Alternative means of creating the illusion of visual reality in other times and cultures will be discussed later, but this entry will begin with a review of what is generally taken for granted in our Western culture as the one “legitimate” construction, the method invented during the early Italian Renaissance (or rediscovered, if one believes the ancient Greeks and Romans already had discerned the basic geometric principles). Sometime in the late thirteenth century in central Italy, artists hired to paint frescoes on the walls of the new churches began to conceive of their pictures not as flat patterns in the traditional Romanesque manner, but as if they thought of their painted spaces as framed theatrical *proscenia* behind which the sacred scenes of the life of Christ and his saints were being acted out. Indeed, these artists may well have been inspired by the plethora of miracle plays performed on street corners, town squares, and even in the portals of churches in cities all over Europe during those intense years of religious uncertainty after the Crusades failed and the papacy fell into schism. Italian painters from Rome (who still remembered ancient wall-painting techniques) and from Florence—including the brilliant Giotto di Bondone (c. 1266/67–1337)—all working in the new basilica dedicated to the recently canonized Saint Francis in the Umbrian town of Assisi (Fig. 1), inadvertently began a revolution that was to radically change the style, and ultimately the content of Western art for the next six hundred years. No longer would artists simply repeat traditional medieval formulas for representing the sacred narratives. No longer would viewers sense these images only as abstracted iconic symbols. Rather, they should now feel as if they could reach beyond the frames right into the picture space and actually touch the holy beings represented on the other side—“seeing and believing” in the manner of St. Thomas, who, according to Scripture, put his finger into the very wounds of Christ in order to prove his Savior had really come back from the dead.

While these early perspective paintings did not depend on the old two-dimensional symbolic manner of representation, they also did not employ any systematic geometry for creating their exciting new optical illusions. The Italian artists were simply intent on depicting religious scenes as if they were being acted out before their eyes *de naturale*, or according to nature. They even introduced cast shadows and modeling as if the subjects they painted were illuminated on one side and in shade on the other, giving an effect of sculpture in relief. This nascent

perspective style is often called *empirical* to distinguish it from the more systematic mathematization of art that followed in the fifteenth century.

Art historians remain in some disagreement as to whether this early development of perspective from the thirteenth to the fifteenth century was an evolution within the painters’ profession itself, that is, isolated from the ideology and politics of contemporaneous Christian Europe, or whether it was nudged, so to speak, by a remarkable science, ancient to the Greeks and Arabs, but quite new to the Latin West when manuscripts of it were first discovered in Moorish Spain and Sicily after the Christian reconquest in the twelfth century. This science was called, in Greek, *optika*, that is, *optics*, which translated into Latin as *perspectiva*, but having no association yet to the art of painting, later termed *perspectiva artificialis* to distinguish it from the original *perspectiva naturalis*. In fact, the original *perspectiva* had only to do with explaining the nature of light rays, how they always travel in straight lines, how they are reflected in mirrors, refracted when entering a denser medium, and, especially, how they affect the way the human eye sees.

Perspectiva naturalis was regarded as the special handmaiden of Euclidean geometry, the latter also just revealed in the West in the twelfth century. Since light rays were understood by the ancient Greeks as always radiating from their source in the shape of a pyramid (a three-dimensional triangle), Euclid reasoned that the images framed by them must conform to his fundamental law of similar triangles; for instance, in Fig. 2, if A be the point of light source, and BCD the surface illuminated, then a consistent proportion always exists between the distance of AC from BCD and the relative size of BCD; in other words, AC:BCD as AF:EFG as AI:HIJ, etc. Greek and Arab commentators on Euclid were quick to realize the significance of this in explaining how the images of very large objects can penetrate the tiny pupil of the eye. Let A in Fig. 2 now stand for the human eye, and HIJ the object being observed (Arab commentators liked to use the camel as their example). As the distance AI between these points diminishes to AF and then to AC and so on, the illuminated “camel” will grow ever smaller in proportion until it is finally able to enter the eye and be “seen.”

Medieval Christian theologians were fascinated by these Greek and Arab revelations. The English bishop Robert Grosseteste (c. 1175–1253) noted that since God created light on the first day (Genesis), he intended to apply the absolute laws of geometry in the creation of the universe. Indeed, he must have formed its tiny shape a priori in his divine mind’s eye and then projected it full-scale into the void, creating the world’s three-dimensional space and volume according to the same Euclidean theorems. In other words, the science of optics seemed to be the very key to the mind of God.

Members of the young Franciscan order, headquartered in the Basilica of their founding saint in Assisi, were especially moved by these ideas, and none more so than his fellow Englishman, Roger Bacon (c. 1220–1292). Bacon’s famous treatise, the *Opus majus* (Great work), is replete with calls upon Christian leaders to study both Euclidean geometry and *perspectiva naturalis* as weapons against the Moors. Bacon was particularly intrigued by the way concave mirrors can convert light to heat, and so considered how they might be made to

Figure 1. Mural by Giotto di Bondone; Bay B, right wall, upper church, Basilica of San Francesco, Assisi, Italy (late thirteenth century). SCALA/ART RESOURCE, NY

burn Moorish ships! Furthermore, he advised, geometry had application to the visual arts. If only religious pictures of, say, the Ark of Noah and other sacred objects mentioned in Scripture, were represented in the exact scale of their biblical description, Christians would be inspired as never before to renew the holy crusade and retake Jerusalem.

Speculum, Latin for mirror, became almost a synonym for divine revelation during the Middle Ages. Numbers of treatises with titles like *Speculum salvationis humanis* (Mirror of human salvation) were published everywhere in Christian Europe. Moreover, the technology of manufacturing mirrors was improving at this time, too, particularly in Venice where both flat and convex mirrors of glass began to be manufactured in convenient size, eventually becoming upper-class household items where their reflections might be compared, both actually and symbolically, with painted pictures.

According to medieval optical theory, the eye itself was nothing less than a mirror. The convex lens within the eye was understood (incorrectly, as we now know) to receive and display the minutely scaled image of whatever object is being seen,

just as if reflected in a mirror; the image then passed to the optic nerve for cognition in the brain. It should come as no surprise that the next critical development in the history of Renaissance perspective involved comparison to a mirror reflection. It is now generally agreed that the great Florentine architect, engineer, and impresario Filippo Brunelleschi (1377–1446) created the first picture ever to be constructed by adapting the geometric laws of *perspectiva naturalis*. The fact is that the optical pyramid explains both how a large image can be reduced to scale, and also how a small image might be similarly increased in reverse, in much the way that a modern film projector magnifies a small transparency that becomes enlarged to the same scale when it reaches the screen. Indeed, by this means, God must have formed the universe: first, it was a tiny shape in His divine mind’s eye, and then God projected it full-blown into the void. What Brunelleschi apparently realized is that the eye level of the person looking into a mirror sees not only his or her own eye reflected at that same level, but the edges of other reflected objects parallel to the ground on which the viewer stands, all appearing to converge to “vanishing points” on that same eye-level line. This is referred to as the “horizon” principle (Fig. 3).

Figure 2. Euclid’s concept of *Perspectiva naturalis*.

In any event, sometime between 1413 and 1425, Brunelleschi did paint a small picture of the Baptistry of Florence as seen from the portal of the Duomo. Unfortunately, this historic painting is lost, but its composition was probably based on a geometric diagram combining mirror principles with certain other traditional measuring techniques employed by land surveyors, and possibly new projection methods inspired by cartography. We may presume the mirror connection because Brunelleschi’s biographer distinctly recalled that his hero demonstrated the first perspective picture by having the viewer hold its back side against one eye, the front side of the picture facing away, then peep through a small hole bored through the back side and see the painted image of the Baptistry on the obverse side reflected in a flat mirror held in the viewer’s other hand (Fig. 4). This was apparently the earliest acknowledgement of the true vanishing point in a perspective picture on line with the artist’s eye from which the depicted scene was imagined, and at which all receding perpendicular edges of objects represented in the picture appear illusionistically to converge.

Figure 4. A demonstration of Brunelleschi's exercise with a mirror to establish perspective. COURTESY OF THE AUTHOR

In 1435 and 1436, the humanist Leon Battista Alberti (1404–1472), having just returned to Florence after a lifelong exile from the home of his forefathers, was so impressed by the city's fecund artistic activities that he wrote a treatise, *Della pittura* (On painting), dedicated to Brunelleschi and other contemporary artists. At the beginning of his book, Alberti advocated that painters must learn geometry if they are to be successful; he even spelled out the basic Euclidean definitions of point, line, and plane, and then proposed a simple geometric optical formula for laying out a perspective picture, perhaps a simplified codification of Brunelleschi's method. (See the sidebar for Alberti's textual explanation with accompanying illustrations.) Rather than comparing his system to a mirror, he likened it to looking through a window fixed with a gridwork of strings (Fig. 6). "Alberti's window" has since become the metaphor of Western civilization's concept of linear perspective, that is, perspective determined only by drawn lines signifying edges of things seen that converge or recede toward a single horizon.

Why was linear perspective so unique to Western civilization? As argued above, the advent of artificial linear perspective in the West had much to do with an idealized geometry that seemed to reveal the workings of God's mind, and thus, when applied to the making of holy pictures, should reenergize Christian faith. Perhaps it was no coincidence that the very first monumental painting to be constructed according to Brunelleschi's perspective had as its subject the *Holy Trinity* (Fig. 5), a large fresco depicting near-life-size figures on the nave wall of the Church of Santa Maria Novella painted c. 1425 by his friend Masaccio (1401–1428). This picture was certainly an attempt

Figure 5. The fresco *Holy Trinity* (c. 1425) by Masaccio. Church of Santa Maria Novella, Florence, Italy. ERICH LESSING/ART RESOURCE, NY

to convince Christian viewers that the most metaphysical mystery in all Christian theology could actually be manifested in physical form before their very eyes.

Some present-day scholars, nonetheless, still maintain that Masaccio's *Trinity*, as well as Renaissance perspective from the very beginning, were secular reactions to medieval religiosity. Hubert Damisch, for example, thinks its advent is better explained ahistorically, by means of postmodern structuralism and Lacanian psychoanalysis (Damisch, 1994). In any case, by the sixteenth century, artists and their aristocratic patrons were showing less interest in applying perspective to uplifting religious pictures than to the revival of pagan antiquity. Indeed, instead of elevating human eyes to an intensified contemplation of the divine, Alberti's window had actually succeeded in

Figure 6. Leon Battista Alberti's method for laying out a perspective picture.

bringing heaven down to earth, revealing more materiality than spirituality in its ethereal essence. Even angels were henceforth transmogrified as secular solids, rigid Euclidean volumes that raised questions as to how they could convincingly appear to take flight. Galileo Galilei (1564–1642), beginning his career as a teacher of perspective at the Florentine Academy of Art, grew so expert that he built his own optical telescope in order to observe the moon. With an eye long nurtured by artificial perspective, especially from drawing shades and shadows of spherical solids, he was able to discern what no one in the world had ever understood before: that the lunar surface was covered not with mysterious supernatural blotches, but high mountains and low valleys catching sunlight and casting shadows—just like the Alpine region of northern Italy.

In the long run, linear perspective's most important contribution to Western art has been to its technology rather than its aesthetics. Even more importantly, it changed not just the way we draw pictures, but how we can actually see what we draw—but that's another story.

Other "Perspectives"

Although every human being (of whatever ethnicity) experiences the natural visual illusion of parallel edges—like

Figure 7. Drawing by five-year-old Anna Filipczak. Pen and crayon. COURTESY OF ANNA FILIPCZAK, WILLIAMSTOWN, MASS.

Anna, a five-year-old Ukrainian girl. Notice how she shows the trees and hammock in schematic side view but, because she wants to indicate her mother lying inside the hammock, depicts her posed as teetering on the edge; it is as if her mother is now imagined as being viewed from above. Until the infusion of Euclidean geometry and optics in the arts of western Europe during the early Renaissance, no artists anywhere had cultural need to have their pictures replicate the optics of single-viewpoint vision, and almost all the conventions they employed for signifying solid form and distant space—even in the most sophisticated art of the pre-Renaissance West and all other non-Western cultures—evolved from similar expressions found in the instinctive art of children.

This does not mean that non-perspectival pictures should be labeled “childlike” in the sense of being primitive (or inferior) to the Western style. Quite the contrary. Multiple viewpoints and other innate pictorial signifiers, such as placing nearby figures and objects at the bottom of the picture surface and those more distant at the top, have been refined into some of the most aesthetically beautiful and stylish painting in all art history. Manuscript illumination in medieval Persia is a fine example (Fig. 8). Interestingly, while medieval Islam possessed Greek optics, including Euclidean geometry, long before the West—with Muslim philosophers even adding their own commentary—Muslim painters never applied optics to art, and only used geometry for the creation of elaborate abstract designs in their magnificent architecture.

Artists in China and Japan, on the other hand, refined two perspective conventions that had naught to do with optical geometry. (Euclid was unknown in the Far East until the seventeenth century.) One method was a kind of axonometric projection whereby rectilinear objects were drawn as if their perpendicular sides were set at an angle, just as in Western perspective, but with their parallel edges remaining parallel and never converging (Fig. 9). The other convention, called aerial or atmospheric perspective, provided an effective illusion of distant landscape simply through the tonality of color. Far-off mountains, for instance, were painted in hazy gray or blue in contrast to the brighter colors of nearer foreground objects, thus creating an ideal complement to the Chinese predilection for philosophic contemplation. During the Renaissance, atmospheric perspective was also explored by Western artists, notably Leonardo da Vinci.

Another perspective convention, foreshortening, does not necessarily involve optical geometry and was also independently realized in other cultures. This is the pictorial illusion of an object appearing to extend forward or backward in space even though only one end of it can be observed, such as a body limb depicted as if thrust directly at the viewer. (Think of James Montgomery Flagg’s famous “I Want You” World War I recruiting poster.) Ancient Mayan artists in Central America, for ideological reasons peculiar to their culture, applied a similar foreshortening convention when representing their rulers seated with one leg bent sharply sideways (Fig. 10): note the twisted right foot of the seated male. This pose had special meaning because it signified the auto-sacrificial ritual in which Maya

roadsides or railroad tracks—appearing to converge toward a point as they approach the horizon, it is not natural to reproduce this illusion in pictures. In other words, while everybody sees the same phenomenon in reality, no one, no matter how artistically talented, is innately predisposed to picture it (except, remarkably, certain autistic prodigies). Perspective is a technique that generally must be learned. Therefore there is no reason to believe that nature rather than nurture had anything to do with why artists in other ages and cultures did not pursue the “realism” preferred in the West.

Young children do instinctively make pictures from a number of viewpoints simultaneously, as in Fig. 7, a drawing by

Let me tell you what I do when I am painting. First of all, on the surface of which I am going to paint, I draw a rectangle of whatever size I want, which I regard as an open window through which the subject to be painted is seen; and I decide how large I wish the human figures in the painting to be. I divide the height of a man into three parts, which will be proportional to the measure commonly called a *braccio* [.5836 meters]; for, as may be seen from the relationship of his limbs, three *braccia* is just about the average height of a man's body. With this measure I divide the bottom line of my rectangle into as many parts as it will hold; and this bottom line of the rectangle is for me proportional to the next transverse equidistant quantity seen on the pavement [Illus. A]. Then I establish a point in the rectangle wherever I wish; and as it occupies the place where the centric ray [from the painter's eye] strikes, I shall call this the centric [vanishing] point [Illus. B]. The suitable position for this centric point is no higher from the base line than the height of the man to be represented in the painting, for in this way both the viewers and objects in the painting will seem to be on the same

plane. Having placed the centric point, I draw straight lines from it to each of the divisions on the base line. These lines show me how successive transverse quantities visually change to an almost infinite distance [Illus. C]. . . .

I have [another] drawing surface on which I inscribe a straight line, and this I divide into parts

Illustration b.

Illustration c.

like those into which the base line of the rectangle is divided. Then I place a point above this line, directly over one end of it, at the same height as the centric point is from the base line of the rectangle, and from this point I draw lines to each of the divisions of the line [Illus. D]. Then I determine the distance I want between the eye of the spectator and the painting, and, having established the position of the intersection at this distance, I effect the intersection with what mathematicians call a perpendicular. . . . This perpendicular will give me, at the places it cuts the other lines, the measure of what the distance

d.

Illustration d.

Illustration e.

should be in each case between the transverse equidistant lines of the pavement. In this way I have all the parallels of the pavement drawn [Illus. E]. . . . A proof of whether they are correctly drawn will be if a single straight line forms a diameter of connected quadrangles in the pavement [Illus. F]. When I have carefully done these things, I draw a line across, equidistant from the other lines below, which cuts the two upright sides of the large rectangle and passes through the centric point [Illus. G]. This line is for me a limit or boundary, which no quantity exceeds that is not higher than the eye of the spectator. As it passes through the centric point, this line may be called the centric [horizon] line. This is why men depicted standing in the parallel furthest away are a great deal smaller than those in nearer ones, a phenomenon which is clearly demonstrated by nature herself, for in churches we see the heads of men walking about, moving at more or less the same height, while the feet of those further away may correspond to the knee-level of those in front.

PHENOMENOLOGY. Phenomenology is the study of experience, how things appear to us. The word comes from the Greek but was elaborated in the early nineteenth century on the basis of Immanuel Kant’s conception of the world as phenomenon, the world of our experience (as opposed to the world as noumenon, the world as it is “in itself”). Georg Wilhelm Friedrich Hegel famously employed the term in *Phänomenologie des Geistes* (1807; *The Phenomenology of Spirit*), suggesting that all knowledge was a matter of appearance with no world “in itself” other than the one we know. But phenomenology came of age with Edmund Husserl, who turned the Hegelian perspective into a rigorous philosophical method. Husserl in turn gave birth to a number of remarkable students, who together would set the tone for much of European philosophy in the twentieth century. Among them are Martin Heidegger, Max Scheler, Emmanuel Lévinas, Jean-Paul Sartre, and Maurice Merleau-Ponty.

Edmund Husserl

As a movement and a method, as a “first philosophy,” phenomenology owes its life to Edmund Husserl (1859–1938), a

German-Czech (Moravian) philosopher who started out as a mathematician in the late nineteenth century and wrote a book on the philosophy of mathematics, *Philosophie der Arithmetik* (1891; *The Philosophy of Arithmetic*). His view was that there was a strict empiricism, but on being shown (by the great German logician Gottlob Frege) that such an analysis could not possibly succeed, Husserl shifted his ground and started to defend the idea that the truths of arithmetic had a kind of necessity that could not be accounted for by empiricism. Thus, one of the main themes of his next book, *Logische Untersuchungen* (1913, 1921; *The Logical Investigations*), was a protracted argument against “psychologism,” the thesis that truth is dependent on the human mind. Rather, Husserl argues that necessary truths are not reducible to our psychology. Phenomenology was Husserl’s continuing and continuously revised effort to develop a method for grounding necessary truth.

Given Husserl’s beginnings in the rigorous field of mathematics, one must appreciate the temperament that he brought to his new discipline. By the end of the nineteenth century, a new perspectivism (or some would say a relativism) had come into philosophy. Friedrich Nietzsche, in particular, had argued that all knowledge is perspectival and that philosophy could not be reduced to a single perspective, that philosophy might be relative to a people, or to our particular species, or even to individual psychology. Husserl’s contemporary Wilhelm Dilthey defended a milder but similar thesis, and the “sociology of knowledge” was just beginning its ascension. Against any such relativism, Husserl insisted on philosophy as a singular, rigorous science, and his phenomenology was to provide the key.

It is often debated whether phenomenology is a philosophy or a method, but it is both. As a “first philosophy,” without presuppositions, it lays the basis for all further philosophical and scientific investigations. Husserl defines phenomenology as the scientific study of the essential structures of consciousness. By describing those structures, Husserl promises us, we can find certainty, which philosophy has always sought. To do that, Husserl describes a method—or rather, a series of continuously revised methods—for taking up a peculiarly phenomenological standpoint, “bracketing out” everything that is not essential, thereby understanding the basic rules or constitutive processes through which consciousness does its work of knowing the world.

The central doctrine of Husserl’s phenomenology is the thesis that consciousness is intentional, a doctrine that is borrowed from Franz Brentano. That is, every act of consciousness is directed at some object or other, perhaps a material object, perhaps an “ideal” object—as in mathematics. Thus, the phenomenologist can distinguish and describe the nature of the intentional acts of consciousness and the intentional objects of consciousness, which are defined through the content of consciousness. It is important to note that one can describe the content of consciousness and, accordingly, the object of consciousness without any particular commitment to the actuality or existence of that object. Thus, one can describe the content of a dream in much the same terms that one describes the view from a window or a scene from a novel.

In *Ideas: A General Introduction to Pure Phenomenology* (1931), Husserl distinguishes between the natural standpoint and the phenomenological standpoint. The former is our ordinary everyday viewpoint and the ordinary stance of the natural sciences, describing things and states-of-affairs. The latter is the special viewpoint achieved by the phenomenologist as he or she focuses not on things but on our consciousness of things. (This is sometimes confused by the fact that Husserl insists that the phenomenologist pay attention to “the things themselves,” by which he means the phenomena, or our conscious ideas of things, not natural objects.) One arrives at the phenomenological standpoint by way of a series of phenomenological “reductions,” which eliminate certain aspects of our experience from consideration. Husserl formulates several of these, and their nature shifts throughout his career, but two of them deserve special mention. The first and best-known is the *epoché* or “suspension” that he describes in *Ideas*, in which the phenomenologist “brackets” all questions of truth or reality and simply describes the contents of consciousness. (The word is borrowed from both the early Skeptics and René Descartes.) The second reduction (or set of reductions) eliminates the merely empirical content of consciousness and focuses instead on the essential features, the meanings of consciousness. Thus Husserl (like Kant) defends a notion of “intuition” that differs from and is more specialized than the ordinary notion of “experience.” We have intuitions that are eidetic, meaning that we recognize meanings and necessary truths in them, and not merely the contingent things of the natural world.

In his early work, including *Ideas*, Husserl defends a strong realist position—that is, the things that are perceived by consciousness are assumed to be not only objects of consciousness but also the things themselves. A decade or so later, Husserl made a shift in his emphasis from the intentionality of the objects to the nature of consciousness as such. His phenomenology became increasingly and self-consciously Cartesian, as his philosophy moved to the study of the ego and its essential structures. In 1931 Husserl was invited to lecture at the Sorbonne in Paris, and on the basis of those lectures published his *Cartesianische Meditationen* (1938; *Cartesian Meditations*, 1960). (The *Paris Lectures* were also published some years later.) He argues there that “the monadically concrete ego includes the whole of actual and potential conscious life” and “the phenomenology of this self-constitution coincides with phenomenology as a whole (including objects)” (*Cartesian Meditations*, 68, para. 33). These statements suggest the strong idealist tendency in his later philosophy.

As in the 1930s, Husserl again reinvented phenomenology, this time with a shift toward the practical, or what some might call the more “existential” dimension of human knowledge. Warning of a “crisis” in European civilization based on rampant relativism and irrationalism (an alarm that the logical positivists were raising about the same time in Vienna), Husserl published his *Krisis der Europäischen Wissenschaften* (1937; *Crisis of European Sciences and Transcendental Phenomenology*). In *Crisis*, the focus turned to the “lifeworld” and the nature of social existence, topics that played little role in his earlier investigations of the philosophy of arithmetic and the nature

of individual consciousness but would come to play a much greater role in the “existential” phenomenology that would follow. But it is much to Husserl’s credit that he continued to see the inadequacies of his own method and correct them, in ever-new efforts to get phenomenology right.

Martin Heidegger

Martin Heidegger (1889–1971) was a student of Husserl. Before that, he was a theology student, interested in much more concrete matters of human existence than his teacher, and his questions concerned how to live and how to live “authentically”—that is, with integrity, in a complex and confusing world. His use of phenomenology was subservient to this quest, although the quest itself soon transcended the phenomenological method. Heidegger’s phenomenology is most evident in his first (and greatest) book, *Sein und Zeit* (1927; English trans. *Being and Time*, 1962). Like his teacher Husserl, Heidegger insists that philosophical investigation begin without presuppositions. But Husserl, he says, still embraced Descartes’s basic picture of the world, assuming that consciousness, or “the mind,” was the arena in which phenomenological investigation took place. Such a philosophy could not possibly be presuppositionless. So Heidegger abandons the language of mind, consciousness, experience, and the like, but nevertheless pursues phenomenology with a new openness, a new receptivity, and a sense of oneness with the world.

Heidegger’s early work is defined by two themes: first, Heidegger displays a profound anti-Cartesianism, an uncompromising holism that rejects any dualism regarding mind and body, any distinction between subject and object, and the linguistic separation of “consciousness,” “experience,” and “mind.” This also demands a reconsideration of the Cartesian thesis that our primary relationship to the world is one of knowledge. Second, Heidegger’s early philosophy is largely a search for authenticity, or what might better be described as “own-ness” (*Eigentlichkeit*), which we can understand, with some qualification, as personal integrity. This search for authenticity will carry us into the now familiar but ever-renewed questions about the nature of the self and the meaning of human existence.

To ensure that we do not fall into Cartesian language, Heidegger suggests a new term (the first of many). *Dasein* (literally, “being-there”) is the name of this being from whose perspective the world is being described. *Dasein* is not a consciousness or a mind, nor is it a person. It is not distinguished from the world of which it is aware. It is inseparable from that world. *Dasein* is, simply, “Being-in-the-World,” which Heidegger insists is a “unitary phenomenon” (not being + the world). Thus, phenomenology becomes ontology (the nature of being) as well.

Being-in-the-World is not primarily a process of being conscious or knowing about the world. Science is not the primary concern of *Dasein*. *Dasein*’s immediate relation to the world is better captured in the image of the craftsman, who “knows his stuff,” to be sure, but might not be able to explain it to you nor even know how to show it to you. What he can do—what he does do—is engage in his craft. He shows you that

he knows how to do this and that by simply doing it. This knowing *how* is prior, Heidegger tells us, to knowing *that*. In effect, our world is essentially one extended craft shop, a world of “equipment” in which we carry out various tasks and only sometimes—often when something goes wrong—stop to reflect on what we are doing and look at our tools as objects, as things. They are, first of all, just tools and material to be used, and in that sense we take them for granted, relying on them without noticing them. Our concept of “things” and our knowledge of them is secondary and derivative.

Thus the notion of *Dasein* does not allow for the dualism of mind and body or the distinction between subject and object. All such distinctions presuppose the language of “consciousness.” But Heidegger defends an uncompromising holism in which the self cannot be, as it was for Descartes, “a thinking thing,” distinct from any bodily existence. But, then, what is the self? It is, at first, merely the roles that other people cast for me, as their son, their daughter, their student, their sullen playmate, their clever friend. That self, the *Das Man* self, is a social construction. There is nothing authentic, nothing that is my own, about it. The authentic self, by contrast, is discovered in profound moments of unique self-recognition—notably, when one faces one’s own death. And so Heidegger’s phenomenology opens up the profoundly personal arena of existentialist phenomenology.

Max Scheler and Emmanuel Lévinas

Max Scheler (1874–1928) was also a student of Husserl, but he, too, took phenomenology in a different direction, toward ethics (which had been ignored by both Husserl and Heidegger). Scheler was an intense man whose considerable contribution to philosophy was the introduction of emotion into the overly formal Kantian conception of ethics that still ruled the Continent. In *Wesen und Formen der Sympathy* (1913; English trans. *The Nature of Sympathy*, 1954), he resurrected moral sentiment theory and gave a central place in ethics to such emotions as love and hate. He argued that emotions have been understood by philosophers as merely “subjective” and argued a “cognitive” view, such that emotions could be construed as a source of knowledge. There is even, he argued, an emotional a priori, a universal and necessary status to the emotions that philosophers had neglected.

Scheler summed up the theme of the unfolding century between the wars in his book, *Ressentiment* (1961), in which he develops Nietzsche’s accusation that modern morality is a “slave morality,” a morality of resentment. But where Nietzsche blames Christianity, Scheler (a Catholic) exonerates his religion and shifts the blame instead to the bourgeoisie. Scheler’s phenomenology, unlike Husserl’s, was primarily concerned with value and, in particular, the source of values in feelings. What was becoming evident in phenomenology—and in European philosophy more generally—was a loosening up, a rejection of formality, an acceptance and an attempt to understand the less rational aspects of human existence. Worth mentioning here as well is Emmanuel Lévinas (1906–1995), who also elaborated a phenomenological ethics based on our felt relations with other people. “The face” is the focus of Lévinas’s phenomenology. It is an interpersonal phenomenology rather than an Ego- or

Dasein-based phenomenology, and interpersonal ethics, including love, plays a central role in it.

Jean-Paul Sartre

Jean-Paul Sartre (1905–1980) attended Husserl's lectures at the Sorbonne, and he became an enthusiast of phenomenology. He was first of all concerned with the nature of human freedom and the correlative sense of responsibility. Sartre's phenomenology is largely modeled on Heidegger's work, but in his *L'être et le néant* (1943; English trans. *Being and Nothingness*, 1956) he retreats from Heidegger's attack on the Cartesian view of consciousness, Sartre argues that consciousness (described as "being-for-itself") is such that it is an activity, not a thing or substance ("no-thing"), and it is always to be distinguished from the world it intends. Consciousness is free to choose and free to "negate" (or reject) the given features of the world. Thus, Heidegger's "being-in-the-world" phenomenon gives way to a conflicted portrait of human consciousness resisting and challenging the world.

As in Husserl, consciousness is essentially intentionality, but for Sartre it is nothing but intentionality, an activity directed at the world. Consciousness is active, essentially critical, and consists not just of perception, thoughts, and ideas but as much of desires, wishes, emotions, moods, impulses, and imaginings, negating the world as it is. Sartre celebrates our remarkable freedom to imagine the world other than it is. Our perceptions of the world, he argues, are always permeated by imagination, so that we are always aware of options and alternatives. Furthermore, there is no self or ego behind consciousness, no agent behind the activity. Thus, Sartre distinguishes consciousness from the self, and self, he insists, is "in the world, like the self of another [person]." The self is an ongoing project in the world.

Sartre defines his ontology in terms of the opposition of "being-in-itself" and "being-for-itself," manifested in the tension between the fact that we always find ourselves in a particular situation defined by a body of facts that we may not have chosen—our "facticity"—and our ability to transcend that facticity, to imagine, and choose—our transcendence. He tells us that consciousness "is what it is not, and is not what it is"—a playful paradox that refers to the fact that we are always in the process of "transcending" ourselves. He also defines a third ontological category, "being-for-others," which makes our lives with other people an essential part of our existence.

Maurice Merleau-Ponty

After the war, Sartre's younger colleague Maurice Merleau-Ponty (1908–1961) convinced him that he should modify his "absolute" insistence on freedom in his later works, although his insistence on freedom and responsibility remains. Merleau-Ponty went on to develop his own radical revision of the phenomenology of freedom and the essentially embodied nature of human consciousness. Following Sartre, Merleau-Ponty expanded the role of the body in phenomenology. Accordingly, Husserl's intentionality becomes motility, and instead of disembodied perception we have the body's orientation to the world. It is a radical move, and phenomenology could not

quite keep up with it. So when phenomenology was replaced in French thinking, by the new wave of poststructuralism, the body retained its now privileged position but phenomenology moved to the margins. It is still practiced by diehard Husserlians and Sartreans, and it has become a valuable tool—one among many—for researchers on all sorts of psychological topics, but as an exclusive approach to philosophy, a "first philosophy," it is now for the most part simply a part of history.

PHILANTHROPY. Active in English usage by the seventeenth century, *philanthropy* has been shown more recently to have a long, complex, and controversial history displaying multiple meanings of the term. Now *philanthropy* is normally construed as love of mankind, a voluntary, practical benevolence toward others, or an effort to promote the welfare of humanity by gifts without self-benefit. However, philanthropy over the long span of its use in Western civilization has gained and shed a more diverse array of meanings. Historically, the dynamic succession of human ambitions and virtues associated with the term implicate philanthropy in the creation of cosmic and social hierarchies, the politics of city life, the proliferation of faiths, the making of laws, and the governance of states. Philanthropic behavior also helped to form economic systems like capitalism and has accelerated both the pursuit of knowledge and the pace of artistic innovation. To comprehend the significations of philanthropy over time requires a multidimensional perspective attentive to its many spatial, material, cultural, psychological, and ethical impacts over time.

For much of recorded history, charity and philanthropy are indistinguishable and must be analyzed together to understand

the evolution of the latter term. Historically, such giving has more often been construed as an imperative duty rather than as a choice of the fortunate toward the misfortunate. Only recently have forces of religious schism, liberalism, and individualism broken charity's traditional lien on property. Ancient service to the needy requires attention not only to the actual poor and their real needs, but also to the social imagination of the rich. Perceptions of dangerous want by the wealthy, accurate or not, more often determined the type and direction of their giving. The demand for and the supply of philanthropy rarely accord. Past disjunctures here, grown unbearable to new generations of aspiring benefactors, have caused epochal changes in the practice and meaning of philanthropy, religion, and politics.

Ancient Mediterranean Examples

The peoples of the ancient Mediterranean world made enduring contributions to the definitions and practices of philanthropy. In their law codes from the third millennium B.C.E., Babylonian kings decreed special punishments for the strong who abused the weak. These provisions made justice and clemency hallmarks of nobility. Babylonian epic poetry, exemplified by the *Gilgamesh* cycle (c. 2000 B.C.E.), reiterated this message. Verses retold the misfortunes of misanthropic kings while celebrating generosity and self-sacrifice as vital steps toward civilization. Contemporaneous Egyptian sacred writings such as *The Book of the Dead* make it clear that anyone's successful passage to the afterlife depended on a lifetime record of benevolent acts toward the suffering. Egyptian deities expected postulants for immortality to swear that they had never denied food to the starving, drink to the thirsty, and clothing to the ragged. Islam's many later commandments that the faithful must be charitable derive from philanthropy's sacred character among Semitic peoples in antiquity.

Judaism. Ancient Judaism went farther, postulating a single God as the epitome of generosity. All of creation belonged to Jehovah, but he gave the Israelites the promised land, sheltering them as refugees ("for the land is mine; for you are strangers and sojourners with me"; Lev. 25:23). Israel itself is defined in Jewish sacred writings as a foundling nation, rescued by the Lord. Repeated Mosaic descriptions of the deity as an avenger of the orphaned, the widowed, and the homeless compel Jews, in turn, to help the bereft ("Love the stranger therefore, for you were strangers in the land of Egypt"; Deut. 10:19). Here, misanthropy equals apostasy, and pious Jews are required to be givers. Charity becomes a mode of divine worship, and rituals of giving organize all Hebrew calendars. Days of celebration and atonement marking the lunar year must be accompanied by shared meals and presents. Seasonal harvests close with free gleanings in the fields accorded to the impoverished. Tithes to benefit the poor, priests, and slaves run at three-, seven-, and fifty-year cycles, perpetuating acts of charity among the tribes of Israel. Synagogues themselves embodied Judaism's charitable imperatives with spaces designed for the kindly deposit and distribution of alms. Donors left gifts secretly in one room of the temple. Beneficiaries collected the offerings in a second room unseen by contributors and thus immune to any shame in the transaction. Such philanthropic constructs prefigure the hierarchies of giving explained by

Jewish sages such as Moses ben Maimon (1135–1204 C.E.). Voluntary donors who act anonymously and who succeed in organizing others in durable networks of mutual aid get highest praise in this literature.

By the turn to the common era, gifts in Jewish communities had intensified as markers of social status and priestly privileges. More punctilious but also more debatable charitable acts invigorated Jewish sectarianism. Out of this controversy, disaffected Jews, like the Galilean, Jesus, sought for a more humble and true charity.

Greek models. Westerners owe the word *philanthropy* to the Greeks, who, since the fifth century B.C.E. ceaselessly elaborated on their idea of *philanthropia*. This concept they first embodied in the benevolent god Prometheus, who dared to share divine fire with mortals and suffered Zeus's wrath for his generosity. Greeks also revered their gods Hermes and Eros as especially philanthropic for the gifts of wisdom and desire they imparted to men. Greek fascination with knowledge as a gift freely communicated to mortals by other wise men registers in Plato's presentation of the philosopher Socrates stating the philanthropic nature of teaching (*Euthyphro*, c. 400 B.C.E.). The love of learning and discriminating art patronage employed by the Persian ruler Cyrus the Great induced his Greek biographer Xenophon to praise the monarch's supremely philanthropic soul (*Cyropaedia*, c. 380 B.C.E.). Here are the origins of the honorific by which Greek subjects addressed the emperors of Byzantium for centuries: "Your Philanthropy." This title was doubly appropriate since, by the sixth century C.E., a "philanthropy" in Greek also meant the tax exemption Byzantine emperors regularly gave to their favorite charities such as hospitals, orphanages, and schools. The tax-exempt condition of many modern philanthropies is ancient, and this type of privilege has long contributed to shaping various status hierarchies within Western societies.

In Greek cities, many forms of philanthropy combined to strengthen urban culture. Most important were the civic liturgies rich men assumed either voluntarily or under heavy peer pressure. These duties obligated wealthy citizens to subsidize personally the cost of temples, city walls, armories, granaries, and other municipal amenities promoting inhabitants' common identity and welfare. Prominent citizens vied with one another in the performance of these indiscriminate gifts to show the superiority of their own civic virtue. Personal vanity was a prime motive for donors, but rich citizens risked ostracism by peers and plebs if they failed to appreciate their wealth as a trust in which the community had a share. Greek philanthropists showed a genius for converting their gifts into potent symbols of communal strength and solidarity. Groups of wealthy men regularly paid for all the equipment necessary to stage the great Greek dramatic festivals. Such gifts of theaters, scripts commissioned from leading playwrights, costumes, and actors shaped the physical and cultural environments of Greek cities, gave audiences memorable lessons in civility, and enshrined drama as one of the greatest media of collective artistic expression in the West.

Roman philanthropia. As conquerors, heirs, and cautious emulators of the Greeks, the Romans assumed better regulation of what they called *philanthropia* to be among the greatest

obligations of their civilization. Influential authors like Cicero and Seneca composed manuals on the arts of proper gift giving and receipt. Seneca, tutor to the emperor Nero, emphasized that elite giving must generate gratitude between the vertical ranks of Roman society and argued that philanthropy rightly done formed the “glue” that held the Roman people together (*On Benefits*, composed c. 60 C.E.). Thus benefactors had to select appreciative beneficiaries carefully and choose presents capable of eliciting maximum acknowledgment from recipients. Heads must rule hearts in discriminate Roman philanthropy. Roman rulers took this advice with emperors asserting exclusive right to make choice gifts of baths, gymnasia, fountains, and gladiatorial games to the Roman population. The elaboration of Roman law aided less exalted philanthropists by giving legal status to trusts, charitable endowments, and mutual-aid societies. But the propensity of many donors to use such legal instruments for self-glorification, personally advantageous politicking, and the conservation of family wealth did little to help larger numbers of the destitute in growing Roman imperial cities. To Latins, philanthropy also meant the proper conduct of diplomacy, special respect for foreign ambassadors, fidelity to sworn treaties, and generous terms of alliance offered to defeated enemies. The propagandists of empire cited these philanthropies as justifications of Roman imperialism and the superiority of Roman civilization.

Christian Regimes of Philanthropy

The radical, roving holy man Jesus of Nazareth rebelled against all existing regimes of self-serving philanthropy in the ancient world simply by proclaiming: “Blessed are the poor” (Luke 6:20). The master commanded early apostles to abandon without recompense all material possessions by almsgiving and to strive for ever deeper humility through personal alms seeking, courting rejection and abuse at every door. The earliest Christian writings, the letters of Paul—composed c. 54–58 C.E.—advocate in part this radical social ethic demanding that all believers become tireless benefactors. Those formerly accustomed to being mere protégés of greater patrons must now aspire themselves to become protectors of their neighbors no matter how humble they all may be. Paul raised up new communities of donors to be inspired by Jesus’s manifest love and empowered spiritually and philanthropically through the church. New Testament evangelists amplified this charitable theme, emphasizing how Jesus immediately cared for the suffering even by doing good works on the Sabbath in contravention of Jewish worship protocols (Mark 3:4 and 6:2–5). Jesus personified as the Good Samaritan (Luke 10:29–37) emphasized that one’s obligation to help the stricken must extend to all and transcend ethnocentric notions of racial superiority, caste privilege, and self-interest. Fundamental tenets of Christianity formed as its exponents did battle with more ancient regimes of philanthropy.

Early Christian bishops, locked in vicious power struggles with old pagan elites for control of crumbling Roman imperial cities, could not be so generous. Anxious to portray themselves as potent “lovers of the poor,” they continually revised Christian doctrines on alms, riches, and the poor to gain disciplined blocks of loyal followers. Fidelity to Jesus’s more selfless teachings was sacrificed as bishops toned down earlier

rebukes of the wealthy, courted rich donors with preferred places in new congregations, and increasingly described almsgiving as a means by which the ordinary faithful could atone for their personal sins under reinforced church discipline. The crucial Christian linkage of philanthropy and penance enticed givers to look upon their alms as a form of spiritual capital accumulation and intensified self-centered motives for giving. Worldly charitable deposits would ultimately enable pious donors to boast in heaven about the purity of their own souls and to secure personal salvation.

Church efforts to monopolize regulation and distribution of alms, especially through fixed monastic offices, were continually challenged during the Middle Ages. Philanthropic insurrectionaries—like St. Francis of Assisi—embraced poverty in apostolic fashion and preferred direct care to the wretched within recovering European cities. Lay members of medieval civic confraternities, who pledged to help one another and to care for needy fellow citizens, thereby diminishing urban violence, also challenged ecclesiastical control of philanthropy. Voluntary brothers and sisters sought to convert their good works into better lives for fellow citizens, enhancing the social and spiritual capital of all.

Early Modern Refinements

Both the rise of the state and intensified religious conflict in early modern times contributed to critical redefinitions of philanthropy. This was especially true if kings meddled in religious affairs, as when King Henry VIII of England organized a new English Episcopal Church in the 1530s while systematically destroying Catholic institutions of worship and charity within his realm. These royal actions promoting the English Reformation first made it imperative for Tudor rulers to create a tax-supported poor-relief program to replace vanished Catholic charities. Then statesmen became determined to increase the efficiency of all remaining private philanthropic organizations so as to spare the state from unnecessary subventions of the needy. The result was the famous Elizabethan Statute of Charitable Uses (1601) that defined in passing legally acceptable charities. But this legislation far more amply encouraged private citizens and government officers to investigate and to sue surviving philanthropies and their private trustees for any suspected mismanagement of endowments now deemed vital to maintenance of public order.

The Reformations became a manifold gift crisis as Europeans questioned God’s bounty to man, what humans could offer the divine, and what they owed to one another. With Protestants facing off against Catholics, the integrity of Christian charity collapsed as giving became more sectarian. Surviving benevolent organizations competed fiercely for the smaller pools of total gift capital rival faiths could muster. Charity officials turned to perpetual fundraising campaigns and creatively diversified their funding sources, enhancing tactics of resource management vital to capitalism’s success. Churchmen on all sides complained that impetuous philanthropy would be not only wasteful, but also a boon to heresy if it wrongly benefited religious opponents. Agents of police, including clerics, denounced the poor as disruptively irreligious and denied them any legitimate right to aide from the rich.

These conditions sanctioned a reconceptualization of philanthropy as a riskier matter of choice and optional capital investment that should produce demonstrable returns in accord with the sacred and secular beliefs of donors. The current vogue for “entrepreneurial philanthropy” has ample precedents in early modern history.

Modern “Scientific” Philanthropy

Reformation-era debates over giving accelerated the secularization, rationalization, and nationalization of philanthropy. Disgusted with doctrinaire religious bickering and giving, statesmen-philosophers of the European Enlightenment sought to define and effect a “scientific philanthropy” that would efficiently benefit the truly needy and entire nations as well. Legislators in England, France, and central Europe simultaneously denounced private and religious endowed charitable foundations whose limited antique purposes or beneficiaries had been rendered obsolete by the passage of time. Parliamentarians enacted legislation to curb the creation of foundations via gifts of land to permanent endowments and they favored methods of ad hoc fundraising to meet any community’s pressing needs. Utilitarians of the nineteenth century, like John Stuart Mill, advocated closer national supervision of all charities and politically mandated investment of their liquid assets in state bonds to enhance their public benefit and economic partnership with government. Britain’s national Charity Commissioners, first deputized by Parliament in 1818 and made permanent in 1853, soon exercised authorization and annual inspection powers over all philanthropic organizations.

In America, colonial and then state constitutions differed widely in the encouragement and discouragement of private philanthropy leading to the failure of many interstate charitable bequests and organizations. This frustrating situation spurred many legal battles and multiple interventions by the U.S. Supreme Court, including the famous Dartmouth College case decision in 1819. Here, the justices quashed an attempt by the governor and state legislature of New Hampshire to take over Dartmouth College and change its curriculum to meet state needs. The court held that the state’s plan violated the school’s charter and grossly abused the law of contracts. That charter, obtained from the royal provincial governor by the college’s founders in colonial times, was itself a contract between the government that issued it and the trustees of the college. By the U.S. Constitution, such agreements could be altered only if all parties to the original contract, or their successors, concurred. This point of law reinforced the separation of church and state while also promoting the freedom of conscience and speech for the agents of philanthropic corporations.

Early Americans fought hard in the courts to compile a body of law stipulating the rights of incorporated philanthropies and protecting them against government spoliation. Boosters of charity organization societies in England and America campaigned successfully for greater coordination and professionalization of philanthropic work, castigating “mere charity” as wasteful, sentimental, and incapable of solving the modern socioeconomic problems caused by urbanization and industrialization. The rise of “social work” as an accredited, data-driven service vocation in modern times exemplifies the triumph of a

professionalized and scientific philanthropy. This trend strengthened when immensely wealthy and influential captains of U.S. industry, like Andrew Carnegie and John D. Rockefeller Sr., transferred their millions to personal philanthropic corporations organized and operated in accord with rigorous business principles. Foundation executives, confronted with the necessity of managing endowments now more often comprised of corporate stock, recruited highly skilled staffs to handle the accumulation and pay out of philanthropic capital.

Jewish benefactors contributed to these trends by subsidizing a wider array of causes and organizations, like loan funds, hospitals, and support networks for Eastern European immigrants, the aid being more practical and scientific than pious in nature. The advent of Zionism in the nineteenth century, the calamity of the Holocaust, and the creation of the state of Israel catalyzed modern Jewish philanthropy as a means of nation building and commemoration of historic events.

By contrast, ancient Islamic forms of philanthropy have remained very influential in Muslim communities throughout modern times, especially support of Koranic schools, mosques, public works, and poor relief. Vital here is the enduring medieval institution of the *waqf* (pl. *awqaf*), a transfer in perpetuity of real estate or productive property to support a religious or charitable institution forever. Islamic law stipulates the inviolability of such endowments, postulating Allah himself as their owner. This level of material security greatly appealed to elite Moslem property owners living under rapacious monarchs and without recourse to fixed laws of testation and property succession by heirs. They created many family *awqaf* with immediate kin and descendants richly rewarded as the direct beneficiaries or well-paid administrators of these endowments. Here, institutionalized philanthropy as protection of clan interests and as projection of political protest elicited the wrath of Muslim state rulers, ancient and modern. In the post-colonial Mid-East, secularizing Turkish and Arab nationalist governments (in Algeria, Egypt, Syria, and Tunisia) have resorted to confiscations of *waqf* properties, advancing state policies at the expense of traditional philanthropies and their prime beneficiaries, especially clerics. Such tactics underscore the fragility of civil society in the region and promote sectarian conflict.

In modern times, the rise of mass-circulation daily newspapers and muckraking exposés significantly reshaped Western philanthropy, as journalists produced stories decrying socioeconomic problems, the irrelevance of existing charities, and the need for better benevolent organizations. Learned societies and professional bodies—like bar associations, incorporated as nonprofit organizations, contributed their journals and specialized studies to a growing flood of information about the best means, measures, and objectives of effective philanthropy. Generalized contempt for charity’s dead hand made constant self-scrutiny and a capacity for self-renewal to meet new social problems prized attributes of modern philanthropic organizations. Many newer charitable foundations are even primed to spend themselves out of existence and self-destruct after a set period of time so as to prevent their social obsolescence. These achievements have often brought greater coherence between the demand and supply of philanthropy. The

remarkable dynamism of the nonprofit sector in the United States and abroad, signaled by the proliferation of private family foundations, grassroots community foundations, and donor-advised funds highly responsive to the fluid social awareness and giving interests of contributors, demonstrates broader public participation in historic debates over the real meaning of philanthropy. For the moment, this agitation confirms rather than subverts modern philanthropy's scientific pretensions.

Feminist, Twentieth-Century
Islamic

AFRICAN

Ancient Egypt has been offered as a point of origin of African metaphysical speculation. According to the work of Senegalese historian Cheikh Anta Diop, Egypt is to Africa what the

Greco-Latin civilization is to the West, and texts such as *The Book of the Dead*, written more than 3,500 years ago, could play the role of a founding text for a tradition of philosophical thinking on the African continent. Most of Diop's work has been devoted to demonstrating that the history of ancient Egypt cannot be separated from the history of the rest of the continent. The cosmogony of the Dogon people, for example, described by the sage Ogotemméli and recorded by French ethnologist Marcel Griaule, is a testimony to the cultural and metaphysical continuity existing between the ancient Egyptians and the people living in the region of the Niger River's loop. Thus, the philosophy behind the practice of male and female circumcision is similar to what is found in ancient Egypt: that is, human beings have inherited from their divine origin an androgynous nature; at puberty, therefore, the right ontological order of things commands that the sexes be radically separated through circumcision and excision. Another important element of continuity is to be found in African languages, which, Diop claims, need to be studied in relation to the Egyptian language. In support of this, he presents in much of his work Egyptian philosophical concepts that survived in his native Wolof. Subsequently, Diop's disciple Theophile Obenga has emphasized the continuous presence in African tongues and cultures of the notion of *maat*, which is central in Egyptian philosophy and means "reality," "truth," "justice," "righteousness," "evenness," or "perfection." In Coptic and in other African languages spoken in Ethiopia, Congo, Gabon, Cameroon, Sudan, or Nigeria, recognizable derivatives from *maat* are indications of the permanence of this philosophical concept in the peoples' worldview as the expression of an African ideal of harmony in society. African philosophy could be characterized as a philosophy of *maat*.

Diop's views have provoked heated ideological debate, Egyptology being premised on the notion that ancient Egypt belongs to Asia rather than to the African continent, where it is and was situated. The German philosopher Georg Wilhelm Friedrich Hegel (1770–1831), in particular, insisted that Egypt and North Africa be culturally detached from Africa, the purpose being to erase any indication that what he called "Africa proper" could produce civilization, let alone philosophy, which for him uniquely represented the spirit of Europe.

The Islamic Past

To detach North Africa from the rest of the continent also meant to take out of it the chapters in the history of philosophy written in cities such as Alexandria, Carthage, or Hippo, where St. Augustine, "the most celebrated African thinker in history" as D. A. Masolo presents him, was a bishop in 396. It also meant ignoring the intellectual consequences of the penetration of Islam into Africa, starting in the eighth century, when the graphic rationality of the Muslim religion became part of African life. It is true that, by the end of the thirteenth century, the period of development of philosophy (*falsafā* in Arabic), which started in the ninth century, was coming to an end in the Sunni world. Still, Aristotelian logic was studied and philosophical thinking remained part of religious disciplines such as theology (*kalam*), commentary (*tafsir*), and mysticism (Sufism). In many learned centers in the Islamized regions of Africa, scholars in these

disciplines have created and developed an African written intellectual tradition, partly concerned with philosophical speculation. The legendary city of Timbuktu is the most famous of such centers. Ahmad Baba, who lived at the end of the sixteenth and in the early seventeenth century, was the best representative of the scholarly elite of Timbuktu. For Muslim scholars, the Saharan desert was not the wall Hegel supposed; they traveled in the Islamic world, North Africa, Egypt, and Arabia for intellectual purposes, often taking the opportunity of the pilgrimage to Mecca to do so. There is in the early twenty-first century a need to assess the importance of a written tradition of African philosophy in Arabic and in *Ajami*, that is, in African languages using Arabic script. This tradition is still widely unknown because many manuscripts kept in private family libraries are yet to be exhumed, restored, cataloged, and eventually published.

The Beginning of a Discipline

While Egyptian and Islamic components of African philosophy are now being researched, showing the historical depth of the intellectual tradition of speculation on the continent and questioning the received view that African cultures are naturally and essentially oral, the beginning of African philosophy as a discipline and an aspect of contemporary scholarship on Africa came after World War II. The publication in 1945 of Placide Tempels's *Bantu Philosophy* (in Dutch; it was translated into French in 1949 and English in 1959) was a crucial moment in this process, and so was the publication in 1948 of Griaule's *Conversations with Ogotemméli*.

Both works represented a break from the colonial negation of African cultures. Ethnologists such as Lucien Lévy-Bruhl had characterized the Africans' approach to reality as prelogical and magical, therefore foreign to any systematic view and organized philosophy; his concept of "primitive mentality" epitomized the face of anthropology as a science of the "other," which justified the "mission" of colonialism to bring civilization and rational thinking to people who were devoid of both. *Bantu Philosophy* showed a different face of anthropology as it affirmed, beyond the cultural traits, customs, and behaviors studied by ethnographers, the existence of a systematic "philosophy" that gives meaning and coherence to these cultural features. African philosophy as a discipline continuing, questioning, or criticizing the fundamental approach of *Bantu Philosophy* was born at that time, when Tempels's book was acclaimed by African and European scholars as doing justice to an African tradition of speculative thought.

Major Themes

The concept of *vital force* is considered characteristic of African philosophy. According to Tempels and to Alexis Kagame, it is a fundamental trait of African thought to hold that the force of life is the supreme value and to posit "being" and "force" as equivalent: such ontology is said to be dynamic. Although Tempels and Kagame limited their description of it to the Bantu peoples, this ontology has been considered valid for other African cultures and regions as well. It is central to the philosophy known as Negritude, defined by one of its heralds, Léopold S. Senghor, as the concept of a specific black identity founded on a core set of values shared throughout the black world.

African *religion* is an area in which the philosophy of vital force is visible. Contemporary African philosophers have established a general structure of religions other than Christianity and Islam and based on the following elements: a supreme being or force who created the world, which depends on him for its continuous existence; divinities or spirits or forces that are active in the world; ancestors who are the departed elders of the community and whose forces are still active (they have reached after their death the status of spirits, and the custom of pouring libation to them is still alive even in Christianized or Islamized groups); living creatures that are mineral, vegetal, animal, or human forces. All these beings or forces form together a field of interaction. This explains the conventional opinion that the Africans' worldview is essentially religious and indicates why this religiosity has been misunderstood as magical thinking (according to which a "force" can act on another "force" to increase or diminish it, apparently without an actual causal relationship).

African conceptions of *personhood and community* are to be understood within this cosmology. Many African philosophers hold that at the foundation of African socioethical thought is a communitarian philosophy. John Mbiti, in his *African Religions and Philosophy*, has thus summarized this notion of a priority of the community over the individual: "I am because we are; and since we are, therefore I am." *Nit, nitay garabam*, "the remedy for a human is another human," is a Wolof proverb that expresses this feature of African humanism and communalistic ethics. But a slightly different form of it—*nit niteey garabam*—is also often offered, meaning: "the remedy for a human is human behavior." This play on words is significant. The emphasis is now on the person and on the goal set for individuals to become what they have to be: accomplished humans. The community is ontologically rich in the individuals who compose it and who must realize through it their potential as accomplished persons. This dialectics of the community and the individual is considered by Kwame Gyekye as the basis for an African notion of human rights.

African cosmologies are also said to convey a specific African philosophical concept of *time*. One very controversial question is whether the future truly exists in African worldviews. After an examination of a few Bantu languages, John Mbiti has stated that, for African people, time is a composition of events and not a frame that remains when the events are taken out of it. The implication is that the past is the most important temporal dimension, while the future barely exists beyond the tiny span ahead, a mere continuation of today's events. Other African philosophers have brought forward counterexamples from other African cultures to argue that Mbiti's account was mistaken and tantamount to the prejudice against Africans as supposedly culturally unprepared to plan, manage time, or project themselves into the future.

African art is a major domain of investigation for African philosophy, as it is arguably in the arts that the greatest contributions of Africa to world culture in the twentieth century have been acknowledged. The use of stylization, the obvious symbolism of art objects that deliberately use disproportion, geometrical figures, and emphasis on certain parts of the body

have exercised influence on contemporary art worldwide and are regarded as expressive of an African metaphysics. This is also said of African music and drumming. The metaphysical significance of African dance as a way of participating in the life of the universe is central to Senghor's philosophy of African arts.

The Controversy about the Meaning of Philosophy

The radical rejection of the approach inaugurated by *Bantu Philosophy* came in the early 1970s from some African philosophers who characterized it as "ethno-philosophy," that is, a systematization of ethnological traits presented as philosophy. Paulin Hountondji and Marcien Towa are famous critics of the idea of a philosophy defined as the worldview of an ethnic group or a whole continent, arguing that philosophy is not the expression of a culture but the very possibility of stepping out of that culture and the unexamined collective opinions it carries in order to develop individual and critical thinking: folk wisdom expressed through proverbs cannot be considered the equivalent of philosophical argumentation, and one cannot speak of African philosophy in the absence of a written tradition because in oral cultures the function of memorizing is so demanding that it makes critical distance impossible. Hountondji also made the point that equating philosophy and culture would mean that everybody shares the same view in a society where unanimity would be a value; consequently, the political danger of legitimizing authoritarianism in the name of philosophical consensus could hardly be avoided. Thus traditionalism could be valued even when oppressive—to women, for example, when it comes to practices such as female circumcision.

The criticism of "ethno-philosophy" has been denounced as accepting an exclusivist Western notion of philosophy that fails to comprehend the challenge African and other speculative traditions present to this view.

For Odera Orika, beyond the controversy about philosophy lies the task of establishing a program of research in African sagacity. Individual sages—such as the Dogon Ogotemméli—have always existed in the different African societies, and these sages can explain, question, and often criticize the elements of the culture, not simply regurgitate them. Such sages are also living today, and their thoughts must be acknowledged and recorded as part of the African philosophical library at large. Another way out of the debate about the meaning of philosophy is for contemporary African philosophers to call for a critical approach to African cultures, not to excavate their latent philosophical content but to illuminate the African context and experience and the task ahead: philosophizing in matters pertinent to the African peoples. Thus Kwasi Wiredu insists on an African orientation in philosophy that would mean conceptual decolonization. The simple test of using African languages to examine concepts such as reality, being, truth, justice, God, self, and reason would be a crucial step toward such a conceptual decolonization.

AMERICAN

American philosophies are as varied and diverse as the many backgrounds and cultures that collaborate to form American life. Even so, there are some similar emphases that cross these differences. Often, philosophies in America valorize action and the practical aspects of thought; American philosophers are regularly concerned with problems of race, class, gender, and other ethical and political forces that shape and undergird more abstract thought; and even the more religious and spiritual elements of American philosophies are characteristically addressed to matters of community and personal growth.

Native American Philosophy

Well prior to the arrival of European colonists, the Iroquois had developed sophisticated political thought and a government with a clear division of powers; Mississippian peoples

had constructed one of the largest cities in the Western hemisphere at Cahokia, spreading Mississippian religious and cultural influence throughout the region; and the Pueblo people had created intricate agricultural innovations, community structures, and economies. While it is impossible to tie together all the diverse traditions of thought and belief among the various cultures indigenous to the Americas, a few basic contrasts may be made between much of Native American thought and much of Western thought. There are clear differences in the treatment of individuality and community, in emphasis upon writing and oral communication, and in the separation, or lack thereof, between humanity and nature.

Such differences have, throughout the history of the Americas, led to misunderstandings between Native American peoples and European-Americans, as well as served as excuses to lie to, abuse, and kill indigenous people. Perhaps the most important of contemporary Native American thinkers, writers, historians, intellectuals, and activists is Vine Deloria, Jr. (1933–), whose works are extremely critical of much of U.S. culture and call for a reevaluation of the richness of Native American ways of life and thought. In 2003 the philosopher Anne Waters published an anthology, *American Indian Thought: Philosophical Essays*, a work key to understanding the breadth and depth of traditional and contemporary Native American thought.

Puritan Thought

Puritan philosophy arises out of sense of the separation and uniqueness that developed as the Puritans left England because of religious persecution and settled in the New World. The difficulty of such a journey and the problems of living in an unfamiliar land combined to add a kind of rigor and harshness to the Puritans' Christian theology and a strict ethical and social control over the members of their communities.

The first truly influential and famous of Puritan philosophers, Jonathan Edwards (1703–1758), came years after the Puritans settled in the New World, and is perhaps best known for his fiery sermons and his active role in the religious revivals of the Great Awakening. His endeavor to reconcile Calvinist theology and Congregationalist religious practices with Enlightenment philosophy and science put him squarely in the middle of the conflict between religious traditionalism and the increasing secularization of American society. Edwards's philosophy sought to discard neither religion nor science; rather, his systematic study of both brought him to espouse a naturalized religion in which religious affections and their effects on human conduct replace the supernatural as the primary objects of concern.

Transcendentalism

Transcendentalism, which blended philosophy, religious thought, social reform, and environmental concern, was most active during the first half of the nineteenth century, and most of its key figures lived in New England. These figures include Ralph Waldo Emerson (1803–1882), Henry David Thoreau (1817–1862), and Margaret Fuller (1810–1850). Through its major outlet for publications, the journal *The Dial*, transcendentalists focused on the individual as the source of moral authority and truth. Far from believing that this gave everyone the right to

do whatever he or she pleased, however, the transcendentalists described how, by looking within oneself, one can experience and reflect upon the universal that exists through all things. People all have a spark of the divine with them, according to the transcendentalists, and thus can transcend, or overcome, their limitations by turning toward the beauty and truth that lies within. Criticized for being overly optimistic about the nature of humanity and impractical for their eschewing of accepted social norms in their quest for more esoteric and ephemeral insights, nevertheless, the transcendentalists had a long-lasting and far-reaching influence on American philosophy, literature, and social thought.

Pragmatism

Pragmatism developed primarily out of the work of Charles Sanders Peirce (1839–1914), William James (1842–1910), and John Dewey (1859–1952). Peirce, a logician, semiotician, and philosopher, first developed the notion of pragmatism as a theory of meaning, a way of clarifying terms used in philosophical debate. Peirce claimed that when one understands “all the conceivable experimental phenomena which the affirmation or denial of a concept could imply,” one understands the definition of that concept. Peirce was attempting to force otherwise unending metaphysical speculation to come to terms with the effects and consequences of philosophic debate—to arrive at agreement as to the meaning of concepts by bringing those concepts into the shared realm of common experience.

While Peirce is normally heralded as the father of pragmatism, William James and John Dewey are usually credited with the popularization and refinement of this distinctly American philosophy. James, a psychologist, physician, and philosopher, emphasized the personal elements of pragmatic thought—focusing on what the adoption of pragmatic belief might mean for individuals confronted with difficult personal and philosophical dilemmas. James believed that by looking to consequences, and thus getting one's bearings through a consideration of the practical elements of a situation, one could resolve for oneself answers to otherwise endless difficulties. Dewey, also a psychologist and philosopher, and a key figure in the development of American educational theory, emphasized the social, political, and educational aspects of pragmatic thought. By looking to public and shared experience as the means of resolving philosophical debate, rather than antecedent arguments and abstract truths, Dewey's version of pragmatism focused on experimental inquiry and the refinement of practical, philosophic instruments of ongoing communication.

African-American Philosophy

African-American philosophy has historically struggled against the efforts of many European-Americans to marginalize and denigrate the importance of African-American experiences and reflections upon the unique situations of black Americans. For many centuries punished if they learned to read or write, black Americans communicated largely through the development of rich oral and religious traditions that cultivated unique and diverse philosophies of justice, morality, and human nature. As public participation and formal education among

African-Americans increased following the Abolitionist Movement of the nineteenth century and the American Civil War, African-American scholars and activists such as W. E. B. Du Bois (1868–1963), Alain Locke (1886–1954), and Martin Luther King Jr. (1929–1968) contributed to national and international debates on human rights and the nature of justice.

W. E. B. Du Bois is most famous for his explanation of the phenomenon of “double-consciousness,” by which he described the ambiguous ways in which African-Americans see themselves both from their own perspectives and from the perspectives of others. Du Bois, throughout his long career, argued that racism separates the human community, thus betraying its interdependent natures. From the founding of the National Association for the Advancement of Colored People (NAACP) early in his career to his later development as a communist, Du Bois worked continuously to embody and refine his social philosophy and reflections upon African-American experience.

Alain Locke, a Rhodes scholar and the first African-American to earn a doctorate from Harvard University, remains perhaps the most famous of African-American philosophers. During his time at Howard University, the school became the prime location for the education of African-American social thought and philosophy. Locke also published *The New Negro* in 1925, an anthology of work meant to encapsulate and present the Harlem Renaissance. According to Locke, this movement embodied and carried forward the notion of value pluralism, a rejection of absolutist philosophies and a positive construction of alternatives to the essentializing tendencies of Western philosophy.

From his inspirational sermons, to his elaboration of the philosophy of non-violence, to his leadership role in the American civil rights movement, the life and work of Martin Luther King Jr. is a testament to the American spirit of uniting philosophy with action, theory with practice. Steeped in both the tradition of the Southern black churches and the philosophy of personalism espoused by Borden Parker Bowne (1847–1910) and Edgar S. Brightman (1884–1953), King believed in a living, personal God whose struggle for justice is evidenced in the concrete actions of ethical human persons. King urged that people treat each other with respect for the presence of God in the growth of individuals and communities—that is, he urged that individuals treat each other as persons. King’s personalism and his encounter with the work of the Indian religious leader Mohandas Gandhi (1869–1948) led him to preach a philosophy of non-violent resistance toward social injustices, thus providing the grounds for one of the more momentous public movements in American history.

Feminist Philosophy

Women in American society have also been marginalized and their unique perspectives have been often overlooked and many times simply discarded. Despite this forced invisibility, American women have contributed to worldwide feminist movements, often in uniquely American ways far different from their counterparts in other nations and cultures.

Western civilization seems clear, orderly, obvious, and without possibility of reform primarily because it defines the world in certain rigid categories. The product of this clarity, however, is a certain kind of insanity that can survive only by renewed efforts to refine the definitions and that, ultimately, becomes totally self-destructive.

SOURCE: Vine Deloria Jr., *Spirit and Reason*, p. 4.

From childhood, Jane Addams (1860–1935) was deeply troubled by the blight of economic and social inequality. As a philosopher, social activist, and founder of Hull House, a settlement house for immigrants and the working poor in Chicago, her work focused on rehabilitating communities in theory and in practice, and rectifying inequalities not by philanthropic charity work, but by cultivating sympathetic understanding and mutual concern. Addams offered her principle of *reciprocity* as an important tool with which to approach the building of communities. Addams insisted that the interaction of otherwise separate social groups be treated as reciprocal, that is, as offering mutual benefit. Viewed in this way, what might otherwise become an impersonal philanthropic enterprise that serves to make more explicit the line between giver and taker becomes instead an opportunity for mutual enrichment and the sympathetic understanding necessary to create a community.

In the late twentieth century, feminist Carol Gilligan (1936–) wrote *In a Different Voice: Psychological Theory and Women’s Development* (1982), calling for recognizing the different and valuable ways that women think and evaluate moral situations. Having done extensive study on moral and psychological development, Gilligan found most research to be biased toward the male point of view. Focusing instead on care for others and responsibility toward relationships, feminine morality should be valued for its own merits and not treated as secondary to a more masculine emphasis on rules, rights, and laws, according to Gilligan.

Catharine MacKinnon (1946–), an attorney, social activist, and writer, successfully argued that sexual harassment is, legally, a form of sexual discrimination. Her books and other writings have had a powerful impact on American and international movements in the legal status of pornography, hate speech, and women’s rights. Other key contemporary American feminists are Sandra Harding (1935–), Nancy Fraser, Donna Haraway (1944–), and Alison Jaggar.

Anglo-American Philosophy

Anglo-American philosophy, also known as analytic philosophy, is largely an import from European thinkers who immigrated to the United States during the first half of the twentieth

century and their followers. Perhaps the most famous of these immigrants was Bertrand Russell (1872–1970), who was a serious academic philosopher and a great popularizer of both analytic philosophy and his own controversial ethical and political beliefs. Analytic philosophy focuses on rigorous argumentation, is typically quite amenable to scientific evidence and concerns, and tends to primarily address linguistic, logical, epistemological, and metaphysical issues. In some ways, analytic philosophy arose as a reaction to what was seen as a weakness in much of European philosophy—its increasing tendency toward vagueness, metaphor, and literary conceit. By the end of the twentieth century, Anglo-American philosophy and its methods had become the most influential force in most academic philosophy departments in the United States, as well as in the largest group of professional philosophers, the American Philosophical Association.

FEMINIST, TWENTIETH-CENTURY

The term *feminism* is used both in reference to social movements, such as the late-nineteenth century women's rights movement or the mid-twentieth century women's movement in Europe and the United States, and to theories that identify and critique injustices against women, such as *A Vindication of the Rights of Woman* by Mary Wollstonecraft (1759–1797) or *The Book of the City of Ladies* by Christine de Pisan (c. 1364–1430). Although there are various uses of the term, a core connotation of *feminism* is the commitment to revealing and eliminating sexist oppression.

If one searches the discipline of twentieth century philosophy for philosophers who were feminists, few if any names surface prior to mid-century. It was only beginning in the last half of the twentieth century that philosophers systematically turned their attention to the issues of feminism and embraced the label of “feminist philosophy” to signify a method or focus of attention for doing philosophy. Although it would be a mistake to conclude from this that earlier philosophers were not concerned with the identification and elimination of gender injustice, it does reflect the fact that this was not a central concern of academic philosophy.

It could be argued that feminist philosophy in the late nineteenth and early twentieth centuries began outside the academy, birthed through the writings and radical activities of such feminists as Charlotte Perkins Gilman (1860–1935), Ida B. Wells-Barnett (1862–1931), Emma Goldman (1869–1940), Jane Addams (1860–1935), and Anna Julia Cooper (1858–1964). Indeed, one important tenet of feminist history of philosophy is an awareness of the fact that due to the systemic exclusion of most women from the dominant sites of philosophy—the academy and the seminary—one must look to those locations where women are doing philosophy at different historical periods, such as the salon, the convent, and the women's movement.

Many scholars have marked the genesis of contemporary feminist philosophy with *The Second Sex* by Simone de Beauvoir (1908–1986), and there is good reason for doing so. *The Second Sex* provides one of the first sustained analyses of the lived experience of “becoming woman.” Beauvoir examines the institutions and practices that lead to women internalizing a sense of inferiority to men, that is, woman as Other. Beauvoir's philosophical insights are contained in her now famous phrase, “One is not born a woman: one becomes one.” In this she presages feminist distinctions between sex and gender, and the ways in which women are “produced” through complex disciplinary practices such as marriage, motherhood, and sexuality.

Beauvoir's philosophy not only provided an important source of modern feminist philosophy, the reception of her work illustrates the very types of exclusions feminists have critiqued. Her writings were, until recently, often relegated to asides or footnotes, and typically treated as derivative of the philosophy of Jean-Paul Sartre (1905–1980). The 1967 *The Encyclopedia of Philosophy*, to cite just one telling example, only refers to Beauvoir in two entries, one on Sartre where she is described as one of the founders of the review *Les Temps Modernes*, and another on existentialism that asserts that she employed some of Sartre's analyses in her writings. Contemporary feminist philosophical scholarship on Beauvoir has transformed her position in the philosophical canon by demonstrating the significant impact of Beauvoir's ideas on Sartre's philosophy and by locating her work within the phenomenological tradition.

Social and Political Theory

Feminist philosophical work that emerged after Beauvoir's *Second Sex* was influenced by the women's movement and had

a strong focus on issues of justice and equality. Feminist philosophers began by paying attention to women, to their roles and locations. What are women doing? What social and political locations are they part of or excluded from? How do their activities compare to those of men? What do women's roles and locations allow or preclude? How have their roles been valued or devalued? Because of the centrality of questions such as these, feminist philosophers grappled with political theories that would be adequate to such concerns.

Alison Jaggar's 1983 *Feminist Politics and Human Nature* provided an influential discussion of the various political theories feminists employed in efforts to argue for women's liberation. Jaggar delineated four primary frameworks: liberal feminism, which focuses on rights and equal access, and argues that the primary cause of women's oppression is laws and rules that limit women's equal access to educational, economic, and political institutions; Marxist feminism, which argues that at the root of sexist oppression is class oppression; radical feminism, which identifies patriarchy and male control over women's bodies, including sexuality and reproduction, as the cause of sexual subordination; and socialist feminism, which views economic and social institutions as interdependent and thus attempts to incorporate the insights of the class analysis of Marxism with the radical feminist critique of patriarchal social organizations.

Ethics

Contemporary feminist philosophers have also enriched and arguably transformed the field of ethics. Through their attention to the concerns of women, feminist philosophers have introduced new issues to feminist ethics and social theory, such as affirmative action, sexual harassment, and comparable worth, and have brought new insights to more traditional issues, for example, discussions of abortion, and the institutions of marriage, sexuality, and love.

Some feminists who work in the field of ethics have argued that traditional ethical theories are inadequate in that they ignore the experiences and perspectives of women by overstressing rights or duties and neglecting issues of care and relationships. Virginia Held argues for an enriched moral theory that is based not on the ideal of the "autonomous man" but rather on the ideal of the "relational woman." Others, such as Sara Ruddick, have argued that traditional Western ethical theories have trivialized those virtues historically associated with women and in so doing have neglected the fact that the typical moral situation is not between two completely autonomous and equal individuals, but rather, more like the relationship between parent and child: that is, between individuals with different strengths and weaknesses. Ruddick claims that maternal practices, with their aims of preservation, growth, and acceptability of children, provide a particularly rich alternative to the "contract model" of liberal social theory.

Feminist philosophers have also argued that attention to gender cannot be done in isolation from other axes of oppression, such as sexuality, race, ability, or class. The work of feminist philosophers such as Linda Martín Alcoff, Claudia Card, Nancy Fraser, Marilyn Frye, Sarah Lucia Hoagland, Eva

Kittay, María Lugones, Anita Silvers, Elizabeth Spelman, Iris Marion Young, and Naomi Zack reveal the importance of analyses that identify the structure and consequences of the interaction between different forms of discrimination or subordination.

While ethics and political theory have been a focal point of contemporary feminist philosophers, feminist philosophical work has included all the core areas of philosophy and has made use of all the philosophical traditions. The "difference" of feminist philosophy does not have to do with philosophical traditions or themes—indeed, feminist philosophers work in all the traditions of philosophy including analytic, Continental, and classical American philosophy, and their thematic focus is often influenced by the topics and questions highlighted by these traditions.

History of Philosophy

Feminist work in the history of philosophy was initially concerned with analyzing canonical philosophers' accounts of women and their conceptions of femininity. Although there were exceptions, the philosophical canon is rife with conceptions of women as lesser or misbegotten men, a bias that has had a profound structuring impact on the history of philosophical and scientific conceptions of men as the true form and women as inferior. Luce Irigaray argues that woman has been defined not in terms of true difference from men, but in terms of lack according to an A (male) / -A (female) logic. Men are the true form; women the deviation. Men are rational animals; women less capable of reason.

But the "question of women" in feminist scholarship in the history of philosophy is far broader than canonical (male) philosophical views of women. Much feminist philosophical scholarship has been devoted to recovering the work of women philosophers who have been "forgotten" or, like Beauvoir, seen as too marginal to be included in the canon. Philosophers of history such as Mary Ellen Waite, Eileen O'Neill, Therese Dykeman, and John J. Conley, who have devoted their attention to recovering the work of women philosophers, argue that the lack of women philosophers in contemporary histories of philosophy is due neither to the absence of women philosophers nor to the significance and value of their work, but is the result of complex values that inform the narratives of philosophy and determine what questions and styles count as philosophical and whose voices are sufficiently influential to be chronicled.

Feminists working in the history of philosophy have further argued that gender leaves traces not only on canonization processes, but deeply inscribes the very concepts of philosophy. One common theme in feminist histories of philosophy is the contention that many of the central categories of philosophy are formed through the exclusion of the feminine. In a complex two-step process, concepts such as reason, morality, and agency are produced through the prioritizing of masculine characteristics and the forgetting of gender. The concepts so constructed are then posited as objective and universal rather than gendered and particular. As just one example, Genevieve Lloyd argues that "rationality has been

conceived as the transcendence of the feminine; and the ‘feminine’ itself has been partly constituted by its occurrence within this structure” (p. 104).

To the extent that the central categories of philosophy have been inscribed in this way, not only is philosophy *not* the objective, universal practice many philosophers have believed it to be, it is also complicit in a social organization that impoverishes the lives of women as well as men. The question of the maleness of reason, for example, may be what is behind common judgments of women as less capable of rational thought, but the question itself is far more complex. To investigate the maleness of reason, one must consider the extent to which conceptions of rationality have privileged traits historically associated with masculinity. In other words, one must consider the extent to which the attainment of rationality has been perceived as involving the control or transcendence of attributes historically identified as female—the body, the emotions, the passions, the appetites, the erotic. If it is the case that what Michèle Le Dœuff has called the “philosophical imagery of gender” (1989) is inscribed onto a philosopher’s conception of reason, then one can not simply ignore his (or her) sexism for it is at the core of the values from which this central category emerges.

Feminist philosophy’s attendance to the denigration of the feminine in the history of philosophy presents an important step, but one that must be seen as a first step of a much larger inquiry. Feminists delineate such bias not to simply reject a philosopher, but rather to participate in new ways of reading historical texts that identify resources for engendering the central concepts of philosophy in ways not predicated on the forgetting of gender. These reading strategies are diverse and reflect the different positions and training of feminists themselves. Some, such as Le Dœuff, Penelope Deutscher, Sarah Kofman, and Irigaray, bring deconstructive methods to bear on canonical texts. Others, such as Annette Baier, Barbara Herman, and Martha Nussbaum, read through the lens of contemporary feminist revaluing of the emotions.

Epistemology and Philosophy of Science

Feminist philosophers have also made significant contributions to epistemology and the philosophy of science. Lloyd’s insights about the gendering of reason led to substantive analysis of contemporary conceptions of rationality, the process of inquiry, and the knowing subject. Epistemologists and philosophers of science such as Lorraine Code, Sandra Harding, Helen Longino, Lynn Hankinson Nelson, Elizabeth Potter, and Naomi Scheman have critiqued traditional “S knows that P” models of knowledge. A common theme of feminist epistemology is that the traditional view of the knowing subject as distinct but not distinctive is inadequate in that it occludes the ways in which human knowledge practices emerge out of and are influenced by social structures, including those of gender. In other words, the goal of a generic knower is misguided in that subjectivity is always at least partially socially constituted. On this position, no one, regardless of gender, race, class, or ability, is a generic subject.

This conception of situated knowers is a key component of many feminist epistemologies and philosophies of science.

Harding develops a version of standpoint theory to account for the ways in which social location can impact knowledge practices, and argues that this theory supports a strengthened conception of objectivity, one that is less susceptible to the production of community-wide biases than research modeled on the “neutrality ideal.” Longino and Nelson have also critiqued the individualism of “S knows that P” accounts, arguing in the case of Longino that knowledge is held by persons who are part of complex social communities where both the knower and what is known are marked by that relationship. Nelson, building on a naturalized epistemology inspired by W. V. O. Quine’s emphasis on studying how humans in fact reason, argues that it is communities rather than individuals who know.

The commitment to situated knowers has led to an appreciation of the role of embodiment in knowledge practices (for example, in the work of Susan Bordo, Elizabeth Grosz, and Gail Weiss), as well as the role of emotion, imagination, empathy, and values (for example, in the work of Louise Antony, Susan Babbitt, Lorraine Code, Longino, and Alison Wylie).

Conclusion

Feminist philosophical work is making an impact in other areas of philosophy such as metaphysics (Charlotte Witt, Sally Haslanger, Marilyn Frye, Christine Battersby), aesthetics (Peg Brand, Cynthia Freeland), and the philosophy of religion (Pamela Sue Anderson, Ellen Armour, Gail Jantzen).

For those who would critique feminist philosophy as motivated by political concerns and thus not a pure philosophy, Alcoff provides a reminder that much work in the history of western philosophy emerged out of particular political motivations, including the work of René Descartes (1596–1650), Immanuel Kant (1724–1804), John Locke (1632–1704), and Bertrand Russell (1872–1970). As Alcoff explains, “like Kant, feminist philosophers are committed to using philosophical methods to clarify and disempower the current dogmatism that inhibit political advance” (p. 55).

ISLAMIC

All Muslims hold the Koran as the very word of God, who provides guidance and understanding of creation and proper human conduct by divine wisdom (*hikma*). This wisdom is also reflected in the oral statements of the prophet Muhammad collected in the Traditions (hadith) and in the reports of the life and deeds (sunna) of the Prophet. The study of these in the traditional Islamic religious sciences of Koranic commentary (*tafsir*), Traditions, religious law (*al-fiqh*), Arabic grammar, and related religious studies is the human response to the command of the Koran to seek out knowledge and understanding (20:114; 39:9). That search for knowledge and understanding is not limited to studies strictly religious since the whole of creation manifests divine wisdom. Hence medicine, mathematics, and study of nature can be included in the divine command, though these are classified as foreign sciences and rational or intellectual sciences. Philosophy, which retains its reference to its non-Islamic origins in its transliterated form as *falsafah*, is located in this second group but nevertheless came to be identified by the philosophers of the Islamic milieu with the wisdom (*al-hikma*) mentioned in the Koran and Traditions of the Prophet. In the classical period (eighth to twelfth centuries) the major philosophers of the lands of Islam (*dar al-islam*) characterized philosophical understanding at the highest levels as concerned with principles ultimately founded in God and thereby claimed a rightful stake in knowledge of the divine and of God's creation for the rational sciences. The significance of this idea can hardly be overemphasized since this controversial assertion of the value of independent rationality was a hallmark of philosophy in the classical period and has had a deep and lasting influence not only among Muslim, Christian, and Jewish philosophical thinkers in Islamic lands but also in the medieval Latin West, where its effect was shocking and altogether new.

Philosophical Theology in Islam

Among the most important participants in *kalam* or Islamic theological dialectics were the Mu'tazilis whose name came from their reasoned disassociation from extremist views of moral purists (Kharijīs), who would exclude sinners from the community and from those more accepting of transgressors (Murji'īs). The name came to be associated with theologians asserting the value of human reason in the judging of religious issues, famously insisting on rational coherence in regard to divine attributes by denying scriptural literalism in favor of allegorical interpretation and the denial of attributes to divine unity, on the rational necessity of the restraint of divine justice by human freedom, and on the created nature of the Koran. Abu'l-Hasan al-Ash'ari (873–935), breaking away from his Mu'tazili teacher, al-Juba'i (d. 915), argued for the literal understanding of divine attributes recounted in God's revelation, for what is now characterized as divine command moral theory (that Justice is itself defined as whatever God decrees), and for the eternal speech of God and the uncreated Koran. This was so, he asserted, because on such matters the statements of the Koran must be accepted *bi-la kayf*, "without asking how." Insofar as all power belongs to God, all actions are dependent upon God and are merely "acquisitions" (*aksab*) by humans of states and actions created by God. This led to the

development of an occasionalist atomism in which transitory atoms having no persisting natures are renewed in existence only by divine power and apparent regularity of nature is fully dependent on divine will. The Ash'ari analysis receives its most powerful expression in the later thought of al-Ghazali, who attacked Aristotelian accounts of natural causality by famously arguing that there is no metaphysically necessary connection between what purport to be cause and effect.

Transmission and Development of Greek Science and Philosophy

The quantity of important works of science and philosophy translated into Arabic was unrivaled until modern times. Among the philosophical writings translated were the entire corpus of Aristotle's works (with the notable exception of his *Politics*), the dialogues of Plato as well as their *Summaries* by Galen, a vast array of medical works by Galen and others, substantial portions of the *Enneads* of Plotinus, the *Isagoge* and other works of Porphyry, and works by nearly all of the writers of the philosophical commentary tradition, such as Theophrastus, Alexander, Iamblichus, Themistius, Syrianus, Proclus, Ammonius, Simplicius, Philoponus, Olympiodorus, and others.

The extraordinary transference of philosophical and scientific knowledge from Greek into Arabic that took place during the long period of the Abbasid caliphate may be traced to a large array of factors: a desire to enhance Abbasid power by opening Islamic society to many different peoples; concerns of the ruling class for future success (thus the interest in Greek astrology) and for good health (thus the interest in Greek medical writings); the needs of a new, powerful, and growing empire for knowledge both practical and theoretical; and perhaps also a cultural ideology of valuing knowledge in all its forms as part of a Zoroastrian heritage. Whatever the precise reasons, it is clear that the translation, assimilation, and development of Greek thought was a broad cultural movement involving Christians, Muslims, and Jews working in concert both as translators and as philosophers teaching students and developing new approaches that, though founded on Greek thought, inevitably led to new doctrines argued not solely on the basis of tradition but on the basis of new scientific analyses and on the basis of reason itself.

Al-Kindi and the Assimilation of Greek Neoplatonic Metaphysics

Research on the thought of al-Kindi (d. c. 870) and an early phase of the translation movement at Baghdad has led to the conclusion that this Arab philosopher was part of a circle or group of thinkers with special interest in Greek metaphysical texts concerning God, the higher intellects moving the heavens, and the soul. Among the works translated wholly or partially and studied by this group were Aristotle's *Metaphysics* by Eustathius; selections from Plotinus's *Enneads*, books 4–5 (portions of which were revised, edited, prefaced by al-Kindi to be issued as the *Theology of Aristotle*); Plato's *Timaeus*; Aristotle's *On the Heavens*, *Meteorology*, *Prior Analytics*; works on animals by Yahya Ibn al-Bitriq; and selections or perhaps all of the *Elements of Theology* of Proclus as well as other selections by Proclus attributed to Alexander of Aphrodisias

by unknown translators (Endress). This group produced a paraphrase of the *De Anima*; the widely read and influential *Theology of Aristotle*; and the *Discourse on the Pure Good*, a creationist treatise based on the *Elements of Theology* of Proclus and the *Theology of Aristotle*. The *Discourse* was read in Arabic by a number of philosophers but had its greatest influence in the Latin West as the *Liber de causis*, where its highly influential discussion of the First Cause as being alone, devoid of form, was read as the completion of Aristotle's discussion of God in the *Metaphysics* (D'Ancona and Taylor). That metaphysical doctrine was borrowed from the Arabic Plotinus, which had already probably been "adapted" by the Christian translator Ibn Na'ima al-Himsi to monotheism and to an Aristotelian conception of God as the First Being and cause of all other beings (Adamson). In the pseudo-Aristotelian *Theology of Aristotle*, metaphysics ("what is after the physical") is presented as identical with divine sovereignty (*rububiyya*) and divine things (*ilahiyat*). Al-Kindi as editor and presumed author of the preface of this work set forth the view that the subject matter of metaphysics is the same as that of dialectical theology or *kalam*.

Arguing against those theologians of his day who would reject any role for the foreign science of philosophy, al-Kindi boldly asserted in what is extant from his *On First Philosophy* that the goal of the philosopher is the attainment of truth by causal knowledge of the True One, which is the cause of existence for all things. Identifying the religious study of divine unity (*tawhid*) as having the same end as the philosophical pursuit of the truth, al-Kindi not only argues for a major role for philosophy in defending against unbelievers of various sorts but also asserts that philosophical metaphysics has the God of revelation as its ultimate object of study. By an examination of the nature of unity or oneness (*wahda*), al-Kindi concludes that there is no true or essential unity in created things and that unity must be derived from the True One. Creation is also argued in another work to be the only True Agent insofar as it alone acts by a creative agency presupposing nothing, while all other agents are mere metaphorical agents insofar as their agency is not essentially their own but rather derived from their being and power, which are to be traced to God. These accounts of God as True Unity and as First and Primary Cause of all are also found in the *Discourse on the Pure Good* and contribute to the view that al-Kindi himself may have been the author or editor of that work as well as of the *Theology of Aristotle*. Al-Kindi's philosophical psychology is also based on a mixture of genuine Aristotelian teachings and adapted teachings of Plotinus, though other sources from the Greek tradition are detectable. His treatise *On the Intellect* with its assertion of intellect as of four kinds (intellect eternally in act, intellect as potency in the soul, intellect as an actualized disposition in the soul, and intellect as act in the soul) shows more immediate dependence on the school account of the Christian Alexandrian John Philoponus. He also employed the arguments of Philoponus to assert for philosophical reasons the temporal creation, a doctrine thought to be in accord with the apparent sense of Koranic revelation. And in his ethical treatise, *On the Art of Dispelling Sorrows*, he draws upon the Stoic argument for restraint regarding earthly desires and the cares they engender for the sake of a hoped-for lasting and

permanent intellectual fulfillment of the higher realm not further elaborated.

In his teachings al-Kindi clearly showed a degree of affinity with the rationalist goals of the Mu'tazili theologians of his day as well as a desire for conciliation of philosophy and Islam, though his commitment to Greek philosophy was foundational. That his followers used his works and those of his group for the understanding of Islamic teachings is particularly evident in the work of al-'Amiri (d. 992) who wrote *On the Afterlife*, drawing on Aristotelian and Neoplatonic sources for arguments for personal immortality promised in the Koran. He made use of a large array of materials from al-Kindi's group and was quite familiar with the Arabic Plotinus texts as well as with the *Discourse on the Pure Good*, which he paraphrased in *Chapters on Metaphysical Topics* (Rowson). The tradition of al-Kindi, however, was soon eclipsed by the work of Avicenna, who drew upon the thought of al-Farabi, a thinker who was less sanguine on the harmony of philosophy with Islam.

Hunayn ibn Ishaq and Baghdad Aristotelianism

Contemporaneous with the circle of al-Kindi, the Christian Hunayn ibn Ishaq (d. 873) initiated a tradition of sophisticated translation of Greek philosophical, medical, and scientific works into Syriac and Arabic. In contrast to the al-Kindi group, Hunayn's group of translators and their successors made extensive efforts to track down works for translation, exercised greater care in selecting and collating manuscripts, translated by consideration of whole phrases or sentences rather than individual words, and standardized much vocabulary. Translation, particularly of works by Galen and other physicians, was a lucrative business, and some of its practitioners were paid well by wealthy families for quality translations and the revision or retranslation of earlier versions. The enormous wealth of translations of this period recorded in the *Fihrist* or book catalogs of Ibn al-Nadim bears witness to the fertile ground for the rise of a new Aristotelianism in Baghdad fostered by Christian translators and philosophers of Syriac background, such as Abu Bashr Matta, Ishaq ibn Hunayn, and many others who were able to consult Syriac as well as Arabic translations. F. W. Zimmermann notes that "in the contemporary milieu of Baghdad the predominant language of Christian scholarship still was Syriac. Syriac Christianity, owing to its roots in the Greek church and a considerable tradition of Hellenic learning in Syriac, had a virtual monopoly of access to the Greek legacy" (al-Farabi, 1981, lxxvii). The tradition this movement inherited was that of late Aristotelianism of the Alexandrian School. And while he apparently did not know Syriac and depended on his teachers and colleagues for philosophical sources, the representative of this tradition most well-known today is al-Farabi.

Abu Nasr al-Farabi

Abu Nasr al-Farabi (c. 870–950) likely worked for the greater part of his eighty-year lifespan in Baghdad, where he was a student of logic with the Christian Yuhanna ibn Haylan and taught the Christian Yahya ibn 'Adi, who came to be a leading philosophical figure in Baghdad. Al-Farabi was thoroughly engaged in the great project of the establishment of a new

Alexandrian Aristotelianism in the Arabic philosophical context. His apparently enormous literary output, of which only a modest portion survives, includes sophisticated paraphrases and commentaries on Aristotle's logical works as well as lost commentaries on Aristotle's *On Generation and Corruption* and *Nicomachean Ethics*, innovative emanationist accounts of principles governing the universe and human societies (*The Principles of the Opinions of the People of the Virtuous City* and *The Political Regime or the Principles of Beings*), a set of works on Plato and Aristotle (*The Attainment of Happiness*, *The Philosophy of Plato*, *The Philosophy of Aristotle*, *The Harmony of Plato and Aristotle*), complex works on the nature of metaphysics, logic, and language (*On One and Unity*, *The Book of Letters*, and *The Purposes of Metaphysics*), and more.

Al-Farabi worked to build a coherent understanding of philosophy as a systematic discipline founded on Platonic insights and Aristotelian principles. At the foundation of this was his apparent correction of the view of al-Kindi and his group that the end of philosophy and religion is the same, namely the knowledge of divine unity and truth. In his *Intentions of Aristotle's Metaphysics*, al-Farabi argues for metaphysics to be understood not as a special science dealing primarily with God, as in al-Kindi, but as a general science dealing with the principles of being. On this understanding the study of God and higher causes (special metaphysics) is understood as encompassed within general metaphysics, which deals with all being and unity. Since metaphysics deals with the more universal causes of beings of the material world, al-Farabi does not neglect special metaphysics but rather sets out to explain that causality by way of an account of emanation following Ptolemaic astronomy in *The Principles of the Opinions of the People of the Virtuous City* and *The Political Regime or the Principles of Beings*. From the noetic activity of the First Cause, which in Aristotelian fashion is self-thinking thought, another emanates and from this there emanate both another intellect and the outermost celestial sphere, a process that continues giving rise to intellects and planetary spheres terminating with the final and lowest intellect, the agent intellect (*al-'aql al-fa'āl*), which oversees the sublunar realm, the matter for which comes from the celestial spheres. This last intellect in the emanative hierarchy al-Farabi identifies with the agent intellect that Aristotle posited in *De Anima* 3.5 to account for the understanding of intelligible universals in contrast with sensation and imagination, which apprehend only particulars. In his *Treatise on the Intellect* based on his study of Alexander of Aphrodisias rather than the *De Anima* directly (Geoffroy 2002), he explains that human happiness lies in the transcendence of the body and some degree of immaterial noetic identity with the agent intellect. The separate agent intellect enables abstraction and brings the potential intellect to act with intelligibles in actuality existing in individual minds. When the acquired intellect has been perfected by the understanding of universal principles, the philosopher no longer requires the body and is able to associate with the separate agent intellect. Although this doctrine of intellectual perfection plays an important role in al-Farabi's teachings, Averroës, Ibn Bajjah, and others report that he abandoned this view that a generated human knower could become immortal and eternal in his lost *Commentary on the Nicomachean Ethics* as an old wives' tale.

Al-Farabi's account of intellect and the knowledge of universal principles provides the noetic account essential for his understanding of human beings and society. Just as with Plato, who singled out the philosopher-king to rule because of his highest, most perfect knowledge in the ideal city-state of the *Republic*, so too according to al-Farabi the rightful place of rule belongs to the philosopher-king, who has exact scientific knowledge through philosophical demonstration and proof, not the mere dialectical accounts of poetry and rhetoric. While these are understood to be included in the *Organon* with Aristotle's logical works, they aim only at persuasion by the prompting of images in the hearer and not at the rigorous truth of demonstration. Ideally the images of religion conveyed by a prophet and taught by an imam work to prompt those receiving them into action in accord with the end of human beings, which is happiness in perfection of intellect. Yet few are intellectually capable of this, so rhetoric, poetry, dialectic—all of which are contained in religion and revelation—provide a way for the truth (which is known to the philosopher directly but to the others in the emotive movement of the soul's imagination) to be shared with the community. This allows for the prophet-imam-philosopher to guide the community toward its perfection, which is the perfection of individual human beings to the point that they ascend to the level of the agent intellect. In accord with this, al-Farabi says at the beginning of his *Book of Religion*, "religion is opinions and actions, determined and restricted with stipulations and prescribed for a community by their first ruler, who seeks to obtain through their practicing it a specific purpose with respect to them or by means of them" (al-Farabi, 2001, p. 93). Thus rather than being one with philosophical metaphysics as al-Kindi had it, religion is concerned with particular human responses to the general end of human intellectual perfection. For al-Farabi, metaphysics and philosophical theology concern the intellectual study of the essential matters of being, unity, and its causes, while religion is concerned with particular and varying ways for the establishment of the conditions for highest human intellectual fulfillment on the part of select individuals.

This was a period of great intellectual diversity and creativity at Baghdad and elsewhere. The renowned physician Muhammad Ibn Zakariyya al-Razi (d. 925) wrote a wide range of works in philosophy, theology, cosmology, medicine, and more; he gave an account of creation as the fall of soul infused with knowledge by God and permitted to fulfill its yearning to be in matter, space, and time. It is likely that at about this time at Basra the Brethren of Purity (Ikhawan al-Safa) crafted and assembled much of their collection of treatises drawing upon Aristotle and the Arabic Plotinus to weave a view of philosophy as an essential part of the religious goal of the saving of the soul. But much of the work of this era was dwarfed and nearly forgotten in the shadow of Islam's most influential philosopher, Avicenna.

Avicenna (Ibn Sina)

The brilliant Persian philosopher, physician, and vizier Avicenna (Ibn Sina; 980–1037) was born in the village of Afshanah near Bukhara in present-day Uzbekistan. A diligent and exceptionally insightful student according to his own autobiographical account, Avicenna mastered medical, legal, scientific,

and philosophical studies in short order and went on to develop his own philosophical teachings. The context in which he worked was that of the harmonization of the philosophies of Plato and Aristotle and the effort to bring about a complete and consistent teaching of the sort found in the late commentator Ammonius and pursued by al-Farabi, whose work guided Avicenna's understanding of Aristotle's *Metaphysics*. From this and his studies of Islamic theology, Avicenna crafted a new synthesis most evident in his broadly influential teachings on God as the Necessary Being and the human soul's separability from the body.

Avicenna's arguments for the Necessary Being appear in a number of important works. In the *Metaphysics* of his *Shifa'* (Healing), the argument that leads to the Necessary Being begins in book 1, chapter 5, which is on being (*mawjud*) and thing (*shay'*). There Avicenna writes that there are three first intentions that arise initially in the soul: being or existent, thing, and necessary. These are primary intentions that naturally arise as first principles grasped by the mind in the consideration of reality in any of its forms. But apprehended quiddity or essence has of its very nature an indeterminate openness to various sorts of existence determined by something outside the essence. The arguments for the existence of the Necessary Being then proceed by rejection of the impossibility that all beings are merely possible or contingent and the acceptance that there must be necessary being for the actual existence. Since there cannot be an infinite regress of beings necessary by another, Avicenna concludes that there must be a first, the unique Necessary Being that causes the existence of the dependent necessary and possible beings and is itself uncaused. This analysis leads to the Avicennian distinction of essence and existence so influential in Arabic philosophy and in the Latin West. The First is the True One that is existence alone, free of the limitation of form, while all other things are form and being received ultimately from God. Causality here is by way of emanation, as with al-Farabi, in a hierarchy of necessary beings, except that for Avicenna there is an emanation of an intellect, a celestial sphere, and a celestial soul associated with the celestial intellect as its mover. Holding firm to the principle "from one only one can arise," Avicenna asserted that there first was emanated an intellect and from that plurality arose. This emanation continues down to the level of the moon, at which point the agent intellect generated the world and all the forms in it.

This agent intellect is denominated the "giver of forms" because it gives forms both to human minds and to natural entities of the world. The human soul has a temporal origination and its individuation in being is the result of its association and joining with the body. But its nature as intellectual shows that it is not merely the form of a body. Rather, its nature as rational indicated to Avicenna that the soul is incorruptible and that it does not die with the death of the body. This is illustrated (not proved) by the famous "Flying Man" argument which holds that it can be imagined that even if a man is suspended in the air and in complete sensory deprivation as if bodiless, he would nonetheless affirm his existence as a rational soul. According to his *Letter to Kiya*, the key principle is found in Aristotle's discussion of the atomism of Democritus

in the *De Anima* and the notion that intelligibles can only exist in immaterial subjects. The common explanation that these intelligibles come to be in the soul by emanation when the soul is prepared for their reception and not by true abstraction has been challenged recently with texts suggesting a greater role for the activities of the soul itself. Still for Avicenna the soul of a prophet has special powers of imagination to receive intelligibles directly from the agent intellect and to communicate them to the people in religious discourse.

Avicenna's philosophy dominated the tradition that continued to develop after his death even after the harsh attacks of the Ash'ari theologian Abu Hamid Muhammad al-Ghazali (1058–1111). In the *Incoherence of the Philosophers*, al-Ghazali attacked the thought of the philosophers (al-Farabi and Avicenna) as insufficiently founded and also as contrary to Islam on the eternity of the world, God's knowledge of particulars, and the resurrection of the body. While the stated purpose of this work is to undermine the pronouncements and arguments of the philosophers, al-Ghazali's own Ash'ari occasionalism plays a role, for example, when he argues that there is no necessary connection but rather only habitual association between what are customarily called cause and effect. Such connections must be traced to divine will and power and are not found in the natures of things themselves.

Philosophy in Andalusia

While philosophical texts and ideas are present in the eclectic thinking of the Cordoba native and Sufi Ibn Masarra (883–931), who drew upon Mu'tazili theology and Neoplatonic and pseudo-Empedoclean texts, the beginnings of rigorous philosophical study are with Ibn Bajjah (d. 1138). This philosopher from Saragossa is most famous for his challenge to the understanding of motion in the natural philosophy of Aristotle with a theory of impetus and momentum, for his theory of intentional forms and intellect and for his political philosophy of solitude. His theory of intellect is based on the consideration of spiritual forms or intentions that are apprehended in sensation and must be traced to higher realities. Using arguments from Neoplatonic sources against Aristotle's rejection of Plato's transcendent forms, Ibn Bajjah holds in his *Treatise on Conjunction with the Intellect* that intelligibles in act or universals cannot be founded on abstraction from particulars but rather can only be grounded in forms located in the unique agent intellect. True knowledge is not tied in any way to the transitory world but rather is the grasp of the eternal and unchanging forms causative of things of this world. These are apprehended by an intellectual "conjoining" with the agent intellect that is a uniting in oneness without the destruction of the individual. In this the end is the perfection and happiness that consist in conjoining and uniting with a separate agent intellect, and the means is intellectual understanding. Those who are intellectual in nature either are in a society in which they can lead as philosopher-king or they are rejected by the ignorant masses and must live a solitary life. Most often they find themselves in an unreceptive society, as in Andalusia and elsewhere, where they are like weeds. A similar theme is found in Ibn Tufayl's tale *Hayy ibn Yaqzan*, in which the protagonists find it impossible to lead the people by religion and take refuge in a solitary life apart from society.

Averroës (Ibn Rushd)

The Cordoban jurist, physician, and philosopher Averroës (Ibn Rushd; 1126–1198), more influential in the history of philosophy by his commentaries on Aristotle translated into Latin in the thirteenth century than for his work extant in Arabic, is famous for his commitment to the proper interpretation of Aristotle's philosophy and the rejection of the innovations of Avicenna, for his detailed response to the theologian al-Ghazali's attack on the philosophers in his *Incoherence of the Incoherence* and his rationalist critique of *kalam*, and for his own creative completion of Aristotle's doctrine of human intellect with the theory of a single shared receptive and incorporeal intellect (called "material intellect" following Alexander of Aphrodisias). While Averroës thought philosophy had attained its highest achievement in the thought of Aristotle ("I believe that this man was a model in nature and the exemplar which nature found for showing ultimate human perfection" [Averroës, 1953, p. 433]), his *Short, Middle* and detailed *Long Commentaries* expounded the difficult texts of Aristotle and completed unfinished philosophical accounts. Although he followed emanationist views in some early works, in his own mature account he argued that God is "creator" as the ultimate final cause drawing generated things from potency into act, continuing the heavens in eternal motion, sustaining the separate intellects (angels in religious language), and generally attracting all things toward the perfection of which he is the exemplar. He rejected Avicenna's distinction of essence and existence as philosophically unwarranted insofar as it is founded on *kalam* and also Avicenna's theory of the soul as an immortal substrate for the reception of intelligibles by emanation from the agent intellect. While in his early works on psychology Averroës held that each person possesses a distinct receptive material intellect, his final position was that both the material intellect and the agent intellect are distinct immaterial substances in which human knowers share. He was prompted to this position by the need for there to be one set of intelligibles for intersubjective discourse and understanding and by the realization that intelligibles in act received into a plurality of particular minds would become particulars, not the universals needed for knowledge. As a consequence he held the eternity of the material and agent intellects and also of the human species that provides images for abstraction by the agent intellect to impress upon the receptive material intellect. Contrary to Ibn Bajjah, Averroës viewed conjoining with separate intellect not as the end itself but as the means to human happiness in intellectual understanding. These mature positions were expounded only after he had written several works critical of *Kalam* advocating for a central role for philosophy in the attainment of truth concerning God and his creation. Most famous of these is the *Decisive Treatise*, in which this jurist who served as chief judge (*qadi*) of Cordoba mounted a vigorous defense of the pursuit of philosophy on the basis of Islamic religious law. He argued that philosophy is not only permitted but is the surest method of the attainment of truth and philosophical demonstration and so is endorsed by the Koran. Holding that there can be no conflict between the truths of demonstration and religion, he declared, "Truth does not contradict truth but rather is consistent with it and bears witness to it"—without mention of his source in Aristotle's

Prior Analytics—thereby dispelling any concerns about the issue of a double truth, one for religion and one for philosophy. Where conflict between religion and reason arises, particularly concerning scriptural interpretation, reason's method of demonstration of truth is primary in determining the need for allegorical interpretation of otherwise conflicting explanations.

Condemned and exiled toward the end of his life, Averroës founded no school, and his influence in the subsequent development of philosophy in the Islamic milieu is hardly detectible until a revival of interest in the nineteenth century in the Arab world, where his thought was used to support various causes current then and later. His greatest influence was through Latin and Hebrew translations of his work that taught Latin and Jewish thinkers to read Aristotle and stirred great controversies among religious authorities wary of reason acting independently of the traditions of faith.

Before, during, and after the time of Averroës, Sufi mystical thought was a strong presence in Andalusia, and it is reported that the elderly Averroës met the very young Sufi Ibn al-'Arabi (1165–1240). Ibn al-'Arabi's notion of the unity of all being (*wahdat al-wujud*) and the perfect human being as the mirror of the divine brought to the fore the importance of imagination in apprehending the divine and contributed powerfully to the development of mystical philosophy in the East. Detailed work on the texts of philosophy is evidenced in the work of the pantheistic Sufi Ibn Sab'in (c. 1217–1270), whose broad knowledge of philosophy made him a suitable candidate for answering philosophical questions posed by the emperor Frederick II of Sicily. Ibn Khaldun (1332–1406) of Tunisia was an astute reader of philosophy, including the work of Averroës, and in his *Muqaddimah* he set forth a philosophy of history explaining political change in terms of social and structural changes.

In the East, philosophy continued to flourish with new developments in which the philosophy of Avicenna was the centerpiece, particularly his *Pointers and Reminders (al-Isharat wa'l-tanbihat)*, the last section of which was read literally as mystical and religious. The Ash'ari theologian Fakhr al-Razi (d. 1209) attacked Avicenna, as later did the mystic illuminationist Suhrawardi (d. 1191), for whom Avicenna's Peripatetic epistemology was to be replaced by the necessity of Platonic Forms for true knowing in a doctrine of knowledge by presence in the intellectual ability to apprehend essences. The illuminationism of Suhrawardi had a lasting impact on philosophy in the East, as did the continuing legacy of Avicenna in figures such as Nasir al-Din al-Tusi (d. 1274), who expounded Avicennian metaphysics and authored the widely influential *Nasirian Ethics*. The development of *isbraqi* or illuminationist philosophy was continued by Qutb al-Din al-Shirazi (d. 1311), who studied Avicenna and wrote a commentary on Suhrawardi's *Philosophy of Illumination*. By the time of the founding of the School of Isfahan by Mir Damad (d. 1631) and Sadr al-Din al-Shirazi or Mulla Sadra (d. 1641), the Safavid dynasty had long supported mystical thinking in Twelver Shiism. This new school systematically completed the synthesis of philosophical and Sufi mystical teachings from Ibn al-'Arabi and others in ways that continue to be reflected dominantly in Shiite thought. One notion of lasting philosophical

interest is that of knowledge by presence with a focus on the “I” as knowing subject in lieu of a role for Avicenna’s separate agent intellect. In the early twenty-first century the writings of Mulla Sadra and Suhrawardi play a powerful role in Iran, where philosophy is taught not only in religious schools but also in universities. Contemporary thinkers of the Shiite tradition of Iran, such as Mehdi Ha’iri Yazdi, who studied in the West and published *The Principles of Epistemology in Islamic Philosophy* in 1992, continue these traditions by placing the thought of Avicenna, Suhrawardi, and Mulla Sadra in dialogue with modern Western thought.

PHILOSOPHY.

This entry includes two subentries:

Historical Overview and Recent Developments
Relations to Other Intellectual Realms

HISTORICAL OVERVIEW AND RECENT DEVELOPMENTS

Philosophy is the noble art of thinking carefully, persistently, even obsessively, about the Big Questions of life—the meaning of life and with it the business of living, that is living well.

It is also, as Aristotle (384–322 B.C.E.) famously said, looking with wonder at ourselves and the world around us, being intrigued by both nature and the way we look and talk about nature, and the ways in which we think and talk about ourselves. But philosophy—and even the word *philosophy*—is shot through with contentiousness and is subject to endless debate. This was true in the days of Socrates, Plato, Aristotle (teachers and students, respectively) and it is certainly true today. The word itself is a Greek coinage, supposedly by Pythagoras (c. 580–c. 500 B.C.E.), who when asked if he was wise gave the modest answer “no, but I am a lover of wisdom.” Thus the words love (*philein*) and wisdom (*sophia*) were fused into “philosophy,” the love of wisdom. But the true nature of philosophy is perhaps better captured by Socrates, who showed quite clearly that philosophy is essentially the love of argument. Or, as Bertrand Russell cynically noted, “philosophy is an unusually ingenious attempt to think fallaciously.”

The prototype of philosophical disagreement was captured by Raphael Stanza in his well-known painting *The School of Athens*, where he depicts Plato (c. 428–348 or 347 B.C.E.) and Aristotle in animated conversation, elderly Plato pointing up to the heavens and a younger Aristotle, no longer just the pupil, making a down-to-earth gesture, palm toward the ground. Thus the history of Western philosophy displays profound disagreement between those philosophers who would appeal to the otherworldly and those who would remain unabashedly worldly. If the long history of medieval philosophy kept its eyes fixed on the heavens, the subsequent history of “modern” philosophy has tended to be resolutely worldly and secular, even when religion remained lurking in the background, in awe of science and often taking philosophy itself to be a science—or to be at least “scientific.” Since René Descartes (1596–1650) followed Galileo Galilei (1564–1642) and embraced the scientific revolution in the fifteenth century, philosophy has been primarily concerned about the objectivity of knowledge. Since the eighteenth-century Enlightenment, in particular, the philosophy of religion has been a marginal specialty and not the whole or at any rate the heart of philosophy, as it was from St. Augustine of Hippo (354–430) to St. Thomas Aquinas (c. 1224–1274), almost a millennium. But before that, Plato, writing in playful, witty dialogues, and Aristotle, whom we know only through his matter-of-fact lectures, exemplified a dramatic difference in philosophical style, already raising the question whether philosophy is a science or an art, the literal pursuit of truth or the metaphorical expression of deep inner longings. From Plato and Aristotle, two opposed but complementary threads of the history of philosophy continue to interweave.

Dialectic in Philosophy

The dialectic between religious and secular philosophy and the split between those who think of philosophy as akin to poetry and those who insist that it be exact and rigorous are not the only oppositions that rend modern philosophy. There is also the perennial tug-of-war between those philosophers who stubbornly hold onto the ancient paradigm of philosophy as the more or less practical search for the good life and those who insist on philosophy being “heavenly” in a different sense,

namely that philosophy is hopelessly impractical and esoteric and has nothing to do with the problems of real life. It is this opposition, perhaps, that best allows us to understand the current situation in philosophy. A good deal of contemporary philosophy has become quite technical, almost like mathematics. Philosophers are entranced by problems mainly of their own making and enraptured by the difficulty of solving them, with very little concern for others outside their academic circle, who have no interest anyway. Others have turned directly to real-life problems, in business and in medicine, for example, and “applied” the skills of philosophy to questions about fairness in the marketplace and to life and death issues in health care. Then, too, others have turned these skills at argument to an enhanced appreciation of the arts and aesthetics, to the improvement of psychology and the other social sciences, even to physics and evolutionary biology. For several decades, now, feminist philosophers have challenged the male archetypes of philosophy and argued that philosophy is in fact gender-defined and have elaborated in many directions, especially concerns with motherhood and “sisterhood,” just what this amounts to. Still other philosophers, steeped in cultures outside the West, have turned their eye to comparing ideas and cultures, drawing sometimes dramatic contrasts between both strains of philosophy since Plato and Aristotle in the West and dramatically different (but sometimes dramatically similar) traditions in other parts of the world.

If one were to paint a broad-brush history of Western philosophy from ancient times, it would begin with the origins of philosophy and science together in ancient ontology and cosmogony (the Pre-Socratic philosophers from Thales to Democritus, culminating in Aristotle) along with a heavy emphasis on the Good and living well (Socrates, Plato, and Aristotle through the Stoics and the Skeptics). After Aristotle, science is almost totally eclipsed as the philosophy of religion becomes virtually the whole of philosophy, culminating in the rich convergence of Judaic, Christian, and Muslim ideas and cultures in the thirteenth century. With the Renaissance, the classics come alive again, humanism becomes the reigning philosophy, science is again on the rise, Niccolò Machiavelli (1469–1527) and Thomas Hobbes (1588–1679) revolt against the supposedly gentlemanly art of politics of the ancients. Then comes Descartes and with him the pre-occupation with epistemology (“the theory of knowledge”) and skepticism. But whereas ancient Skepticism was always concerned with the best way to live, modern skepticism became narrowly epistemological, “absurd” even to its most illustrious defender, the Scot David Hume (1711–1776). Thus by the end of the nineteenth century, the German philosopher Friedrich Nietzsche (1844–1900) would complain, “Philosophy reduced to theory of knowledge—that is philosophy in its last throes.” Over the course of the nineteenth century, philosophers in both Europe and America tried to regain their cosmic reach, in the magnificent multiple *Critiques* of Immanuel Kant (1724–1804), by way of the cranky pessimism of Arthur Schopenhauer (1788–1860), through the all-bracing Spirit of Georg Wilhelm Friedrich Hegel’s (1770–1831) phenomenology, and in the German-inspired American “Transcendentalism” of Ralph Waldo Emerson (1803–1882), Henry David Thoreau (1817–1862), Amos Bronson Alcott (1799–1888), and Margaret

Fuller (1810–1850). This brings us to the border of the twentieth century and then philosophy today.

Philosophy West and East

If there is a single word that best captures the spirit of twentieth-century philosophy, it would be *relativism*. Nietzsche prefigured the new century in the 1880s with his doctrine of “perspectivism,” the idea that there is no singular truth and no “God’s eye” view of the world. Albert Einstein (1879–1955) defended relativity in physics at the same time that Pablo Picasso (1881–1973) was displaying it in the new art of “cubism.” Not that every thinker of the twentieth century was a relativist, of course. Some fought bitterly against relativism: Edmund Husserl (1859–1938) and Alfred North Whitehead (1861–1947), for instance. But if the perennial struggle had been primarily between the this-worldly and the otherworldly, the new tension in philosophy was between relativism and one or another form of absolutism, whether it was the residue absolutism of religion (as in contemporary America) or by way of fascism, which gained a frightening foothold in Europe mid-century. At the beginning of the twenty-first century, this struggle has by no means been resolved. If anything, it has intensified, as absolutism takes the form of religious fundamentalism and relativism finds new stylistic expression in the writings and sometimes the ravings of the postmodernists.

But this broad-brush sketch leaves out most of the world. As noble as the philosophical traditions of the West may be, they should be humble in comparison to the much longer-standing traditions of Asia. The first philosophical scriptures were the Vedas, produced in India some thirty-five hundred years ago. Indian philosophy progressed through scholarly commentary and argument by way of Vedanta and the great literature of the Mahabharata and through the breakaway philosophies of Buddhism and Jainism. Buddhism migrated north and east through Tibet and southeast Asia to China, where it joined with the indigenous Chinese philosophies of Daoism and Confucianism, and on to Japan where it transformed the local spirit-worship called Shintoism and gave rise to the dramatic philosophy of Zen, captivating the Samurai class who ruled the country. But the fate of philosophy in Asia displayed some dramatic differences from the fate of philosophy in the West. In Asia there was never so much of an opposition between philosophy and religion, nor for that matter were the various philosophy-religions so antagonistic. Buddhism, Daoism, Confucianism, and Hinduism had more of a mix-and-match relation to each other, and they were treated more as a spiritual smorgasbord than as competing occasions for a “leap of faith.” Beneath the Eastern emphasis on spirituality is that thread familiar to us from the ancient Greeks, the ultimate ideal of living a good life, philosophically. And, ironically, the Asians pursued this ideal in what is supposed to be the prototypical American fashion—pragmatically.

Contemporary Philosophy

Philosophy from its inception has always been all-embracing and thus lends itself to both a learned eclecticism as well as dilettantism. Ironically, then, philosophy has also always tended to encourage a certain sense of superiority as well as

schoolishness, even cultishness. The schools of the ancient world—Skeptics, Stoics, Cynics, and Academics—and the schools of medieval Scholasticism were paralleled (unknowingly) by the many competing schools of Confucianism, Daoism, Legalism, Buddhism, Zen, and neo-Confucianism in Asia. In the “professional” philosophy of the twentieth century, especially in American universities, the tendency to overspecialization can be partly explained by philosophers’ efforts to distinguish philosophy from all of those other disciplines that it originally spawned from its womb. But it is also the very nature of philosophy itself, which while striving for the all-embracing universal has always tended to be laughably parochial. Thus contemporary philosophy has predictably become Balkanized, not quite to say cult-like. In particular, there is the well-known opposition between “analytic” and “continental” philosophy, although it should be said from the first that the distinction itself is problematic as well as destructive. To begin with, the contrast is a false one. “Analysis” refers to a method that, superficially at least, concentrates on the use of language and is mainly concerned with logic and conceptual analysis. “Continental” refers to a place, namely, Continental Europe. Apart from the fact that “the Continent” so referred to usually includes only Germany and France and the fact that “analytic philosophy” includes a fair number of contrasting and competing methodologies, there are many twisted and interwoven schools, methods, and styles of philosophy that are not distinguished by such a narrow body of water as the English Channel.

Analytic philosophy is often defined in terms of its interest in logic and language, but that interest emerges first in Germany (with Gottlob Frege [1848–1925], in particular) and is fully shared by the progenitor of this century’s “Continental” movements, Edmund Husserl. The most influential philosopher of the century, Ludwig Wittgenstein (1889–1951), who was twice the definitive philosopher of the “analytic” tradition, came to England from Austria, never leaving his “Continental” roots behind him. He was particularly interested in the limits of language, but so are such contemporary poststructuralists as Jacques Derrida (1930–), the nemesis of most analytic philosophers. There are analytic philosophers who, like their peers on the Continent, talk and write about sex, gender, death, and the meaning of life. And despite the more polemical pronouncements of some of its practitioners, analytic philosophy is not just logic, devoid of concern for content. Though it still prides itself on being “scientific,” analytic philosophy is not wholly devoid of interest in history, context, empirical content, and etymology. If Bertrand Russell (1872–1970) misrepresented the analysts’ case against the Hegelians at Cambridge in his day, he was, nevertheless, the very model of an engaged and popular philosopher, with a great deal to say to ordinary people about immensely important issues. At the start of the twenty-first century, too, there are philosophers at the barricades, which means on television, talking about the vital issues of the day. One of the areas of contemporary interest in philosophy is “cognitive science,” which brings together the empirical research of neurologists, evolutionary biologists, computer specialists, psychologists, and linguists with the conceptual demands and arguments of the philosophers. At its best, contemporary philosophy breaks through its

traditional provincialism—as it always has in those golden epochs of the past—and synthesizes as well as analyzes the knowledge of the world. In this endeavor, analytic and continental philosophers work best when they work together, when they try to overcome their respective mind-numbing technical devices and jargon and grapple with what Husserl kept referring to as “the things themselves,” the distinctive content of human experience and the Big Questions of philosophy that get us all started down the philosophical road to begin with.

The ancient quest for the good life has all too often tended to get lost, or at any rate eclipsed, by the contemporary squabbling over the name “philosophy.” (Is philosophy, indeed, nothing but logic and conceptual analysis? Or is it worry about matters of “ultimate concern”? Or is it a bottomless spiral of self-reference that ultimately leads to nothing at all?) The perennial quest for the good life, shared by philosophers and non-philosophers alike, ensures that everyone is a philosopher, not just a few thousand university-trained specialists. (French philosopher Maurice Riesel has commented, “sooner or later, life makes philosophers of us all.”) This explains, in the face of increasingly specialized and inaccessible academic philosophy, why there continues to be widespread fascination with Eastern philosophy, often repackaged as “New Age” philosophy. If philosophy abandons what has always been its noble aim, to teach us how to live well, other alternatives will always be attractive. But this particular fascination with the East only began in the nineteenth century (Arthur Schopenhauer’s flirtation with Buddhism was particularly significant), when the first wave of professionalized academic philosophy swept over Germany in the wake of Immanuel Kant. (Before that, most of the great philosophers were “independent scholars,” except perhaps for Plato and Aristotle, who owned their own academies.) The importance of the East and cosmopolitan philosophy has only become more intense as the distortions of the Cold War on geopolitics came to an abrupt end, as global markets open up, and now that Islam has made a new forceful entrance into the world of ideas. But despite its disdained “popular” appeal and the intricacies of ideology and ideas, the fascination with non-Western and comparative philosophies is one of the most exciting late developments of the twentieth and now the twenty-first century.

To contrast “Eastern” with “Western” philosophy is not to suggest that false stereotype too long accepted among Western philosophers, namely, that Eastern philosophy is all religion and mysticism devoid of concern about knowledge and science. Buddhist philosophy, in particular, has a long rich history of logic and brilliant logicians. But the theme of living a good life is pervasive, and it is this, perhaps, that explains the appeal of the generic “East” in the West. There is also the obvious concern with spirituality that pervades so much of Eastern philosophy. Spirituality should not be confused with mysticism, nor should it be conflated with mindlessness. (It is instructive than one of the favorite terms in New Age philosophy today is “mindfulness.”) Spirituality is, as the present author has written, “the thoughtful love of life.” But in the pursuit of a rigorously “scientific” philosophy, Western philosophy since the Enlightenment has tended to dump all mention of spirituality as just so much “superstition” and

sentimentality. Thus it is often said that there is a widespread “spiritual hunger” that is not satisfied by either philosophy or traditional organized religion. But if scientific philosophy has thrown out the baby with the bath water, traditional organized religion has violated philosophy’s new insistence on pluralism (relativism), even if orthodox (absolutist) pretensions still remain. Much of Eastern philosophy, not burdened with the antagonism between philosophy and religion, has less trouble capturing both spirituality and truth in the same intellectual package, even where the main conclusion is that neither spirituality nor truth can be captured intellectually.

Conclusion

What is happening in philosophy at the start of the twenty-first century? Philosophy is as vibrant as ever, an opinion that is shared by the various Balkanized citizens of the philosophical profession, although from dramatically different perspectives on what that vibrancy consists of. Analytic philosophers will puff with pride about the technical abilities that are so much in evidence among the newly minted philosophers among them. Poststructuralist philosophers will point with pride to the number of art and literature departments, especially, that have been converted to their ways of thinking. Comparative philosophers with an eye on the East (and, to a lesser extent, on the southern hemisphere) will make sure to mention the number of courses and the extensive interest in ideas from beyond the ever more narrow borders of Anglo-American and European philosophy. Philosophers who do “cognitive science” will beam with satisfaction at the progress being made in understanding the human brain and its manifestations. And more practical (“applied”) philosophers will tell you about the number of philosophers employed by business schools, law schools, medical schools, and hospitals. But the truth is that philosophy continues as always, stimulating wonder and argument and spawning intelligent if not always loving attention to the world and to the myriad of human activities that, on reflection, become philosophical.

Robert C. Solomon

RELATIONS TO OTHER INTELLECTUAL REALMS

According to an ancient tradition deriving from Heraclides of Pontus (388–310 B.C.E.), a disciple of Plato (c. 428–348 or 347 B.C.E.), Pythagoras of Samos (c. 580–c. 500 B.C.E.) was the first to describe himself as a philosopher. Three types of person, he is alleged to have said, attend the festal games: those who seek fame by taking part in them; those who seek financial gain by selling their trade goods there; and those (“the best people”) who are content to be spectators (Diogenes Laertius, *De vita et moribus philosophorum*, I, XII). Philosophers or “lovers of wisdom” resemble persons of this third class: spurning both fame and profit, they seek to arrive at the truth by means of contemplation. Pythagoras distinguished the wisdom (*sophia*) sought by the philosopher—knowledge of the truth—from the mercantile skills of the merchant and the physical prowess of the athlete. Whether or not these distinctions derived from an actual utterance of Pythagoras, they can most certainly be found in the works of other ancient thinkers such as Plato, who was much preoccupied with the question of what philosophy is and how it differs from other forms of intellectual inquiry. Many of Plato’s contemporaries had thought his teacher Socrates (c. 470–399 B.C.E.) a sage; some considered him a Sophist, while others believed him to be a cosmologist. In Plato’s eyes and in the judgment of posterity, Socrates was none of these things; he was first and foremost a *philosopher*. But what made him different from a sage or Sophist? What made him recognizable as a seeker after wisdom and truth? In attempting to find answers to these questions, it is possible to learn something of the manner in which philosophers have traditionally characterized their métier, and how their different views on the scope and point of philosophical practice has led them to speculate on the relations between philosophy and other forms of intellectual labor.

Many ancient savants believed Socrates to be inimitable for the reason stated by Marcus Tullius Cicero (106–43 B.C.E.): he “first called philosophy down from the heavens” and thereby made the study of nature instrumental to human happiness (*Tusculan Disputations*, 5.X–XI; cf. Diogenes Laertius, *De vita et moribus philosophorum*, II, 16, 45). In other words, Socrates’ life as a philosopher was devoted not to the scientific description of the universe in the manner earlier advanced by Ionian cosmologists, but to the pursuit of wisdom in order to secure genuine human happiness. For this reason a philosopher, according to Socrates, could not devote himself simply to the study of the requisite arts and sciences, but had to have his mind attuned to the requirements of wisdom in the context of striving to live the best possible life. Such a life *had* to be

lived, even if it entailed the bitter fate of drinking a draft of hemlock.

For Plato, the first characteristic of philosophical wisdom is that it meet the needs of rational inquiry. As he suggests at *Apology* 22, this criterion precludes all types of quotidian knowledge and other homespun verities in favor of genuine philosophical insight. Neither the statesman, the artisan, nor the poet can explain *why* he is doing what he is doing, for none of them has formulated a clear, tractable, and explicit method of self-reflexive reasoning. That some members of humanity may act wisely on occasion does not prove that they possess genuine wisdom, for to be wise such persons must be able to offer explanatory and justificatory reasons for their deeds that will stand up to dispassionate scrutiny. The philosopher has this ability, and by means of dialectic, he can make progress in the quality of his self-understanding by criticizing received opinions. Philosophy thus liberates the space of reasons and never imposes itself upon the human mind by means of arbitrary techniques or conflated methods. Even mathematics, which for Plato is the most developed and admirable of the sciences, is subject to philosophical criticism. Philosophy is the highest form of speculative thought because it alone involves no presuppositions and is predicated on gratuitous reflection.

Unlike other branches of human learning and industry, philosophy has direct access to a “true reality” as distinct from the phenomenal world of ever-changing things. Having access to such a world, philosophy can offer pertinent and definitive criticisms of received opinions about the nature of meaning, beauty, and goodness. And since it concerns itself with the relationship between eternal and unchanging entities and verities, philosophy can validate its claim to possess certain knowledge of what actually exists rather than what seems to exist. At *Phaedo* 98–99, Plato suggests that the Ionian cosmologists did not possess true philosophical learning because they could not explain the purpose and nature of things. Being ignorant of the reality that upholds and sustains the universe and its objects, the cosmologists could not explain anything of real value concerning the nature of the world.

Lastly, and on account of a philosopher’s certain knowledge of an eternal and unchanging reality, he can know how people ought to live. For Plato, this entails that the speculative excellence of philosophical thought can be applied to the variable conditions of action, thereby reforming the moral quality of human life. Echoing the earlier pronouncements of Socrates, Plato readily castigated the proud claim of the Sophists to teach their charges the art of immediate worldly gain by means of quick wit and self-serving judgment. Such “fruits” of sophistical learning can never amount to genuine knowledge, since the mere exertion of intelligence is not comparable to the exercise of wisdom. Though the philosopher might look forlorn and foolish next to those who claim to teach the most efficacious route to fame and fortune, he is privileged by being in receipt of a form of understanding whose enduring qualities stand in stark contrast to the fleeting glories and superficialities of the world. For Plato, any attempt to explain and interpret the nature of the universe and human beings must involve philosophy. That is why the ideal ruler must be

a philosopher, and those who would claim to be wise must be imbued, like Socrates, with a spirit of critical reflection.

What can be learned from Plato's specification of the differences that separate philosophy from other branches of human learning is the idea that philosophy is quite unlike anything else. It is not reducible to another art or science, and its subject matter as well as its point and scope are not circumscribed by considerations that are external to its method of enquiry. Philosophy, then, belongs at the very summit of human knowledge. If prosecuted appropriately, it bequeaths to the individual mind a form of sagacity and judgment that will enable any human being to live well. Like Socrates, the philosopher stands apart from the world while seeking to make sense of it; philosophy is a *sui generis* activity.

After Plato

These ideas found repeated expression, albeit in different forms, throughout the course of ancient philosophy. Aristotle, although he made enduring contributions to most forms of human knowledge (especially the natural sciences), was mindful of the differences between more rarefied forms of intellectual speculation, such as metaphysics and theology, and prosaic methods of taxonomy and description that belonged to the sciences of physics and what we could now term biology. Aristotle can be said to preserve the spirit if not the letter of Platonic teaching, especially in his insistence that the goal of human life is gratuitous contemplation of the divine.

In the schools of the Hellenistic period and late antiquity, the writings of adherents to Stoicism, Epicureanism, Cynicism, and Skepticism demonstrate a similar commitment to preserve a conception of philosophy as an autonomous discipline that can authenticate a reflective way of life. While individual members of these schools all emphasized the need to preface philosophical study by securing a sound knowledge of other fields of human enquiry, they held firm to the belief that the study of subjects such as physics, mathematics, or rhetoric is but a preface to the more challenging regime of philosophy. Even in certain Neoplatonic schools, where the view that theology is the goal of any genuine intellectual quest had gained momentum, there is little evidence to suggest that philosophers were prepared to characterize their subject, or at least to specify its difference from other branches of intellectual enquiry, in a manner that radically departed from the views of Socrates and Plato. Seen thus, an important aspect of the intellectual legacy of the ancients was the idea that philosophy stands apart from all other abstract and cerebral pursuits. Philosophy is not a physical science concerned with the description of natural phenomena; it is not a form of poetical discourse or artistic endeavor; it is not civic religion; philosophy is about critical reflection on the nature and conditions of human life leading to the development and practice of wisdom.

Although the idea that philosophy enjoyed a unique position in the scheme of human knowledge and was thereby unanswerable to anything but itself did not go unchallenged in antiquity, when ancient philosophy came into contact with biblically-based monotheistic religions of the Judeo-Christian tradition, it met with a thorough reappraisal of its claim to

dominance. While Jewish and Christian thinkers such as the Alexandrians, Philo Judaeus (20 B.C.E.–45 C.E.), St. Clement of Alexandria (c. 150–between 211 and 215), and Origen of Alexandria (185?–?254), all endeavored to make sense of doctrinal issues by appropriating philosophical insights, a growing and increasingly vocal constituency, especially in Christian circles, argued that philosophy ought to be subservient to the claims of revealed religious teaching.

From the advent of the common era, a discussion was set in place that aimed to clarify the exact relations between philosophy and theology or sacred teaching (*sacra doctrina*). At its simplest, this debate sought to posit clear lines of demarcation that would distinguish the nature of philosophy and remit it from the province of theology. The debate sought to arrive at a view of how philosophy might or might not contribute to the path of individual salvation as that idea had been set down by Jewish, Christian, and from the seventh century onwards, Islamic teaching. The debate between “Athens and Jerusalem,” so famously instituted by Tertullian (c. 160–c. 220), was in part a discussion as to how ancient philosophy might or might not be arrogated by the theological doctrines of a biblically-grounded monotheism. A by-product of this discussion would be its detailed consideration of the relationship of philosophy to other fields of intellectual activity.

In their distinctive ways, Christian thinkers as dissimilar as the Cappadocian Fathers, St. Augustine of Hippo (354–430), Boethius (c. 480–c. 524), and Gregory I (c. 540–604); early medieval thinkers such as John Scotus Erigena (c. 810–c. 877), Peter Abelard (1079–?1144), and St. Anselm of Canterbury (1033 or 1034–1109); and the scholastics of the thirteenth and fourteenth centuries all attempted to clarify the relationship of philosophy to theology. For these thinkers, the subject of “philosophy” amounted to the scientific teaching and ethical wisdom of the ancients (specifically Aristotelian learning conjoined to aspects of the Neoplatonic tradition and trace elements of Stoicism), while prevailing ideas of “theology” were distilled from ongoing attempts to codify the requirements of revealed teaching by means of ideas of tradition and authority. In different guises and with very different exigencies, these efforts were replicated by thinkers in the Jewish and Islamic traditions. One of the more pressing questions confronted by all who attempted to gauge the relationship between philosophy and theology was the issue of *duplex veritatis* or “double truth,” a problem that was debated in earnest from the thirteenth century onwards following the reintroduction of the *corpus Aristotelicum* to the Latin West.

Medieval and Renaissance

Given the authority assigned to Aristotle's arguments on a wide variety of philosophical and scientific questions, it became apparent to many that what he had to say about such pressing topics as the origins of the world, the nature of the soul, and the final end of human life were at variance with the strictures of revealed biblical teaching. Some thirteenth-century theologians such as Albertus Magnus (c. 1200–1280), St. Thomas Aquinas (c. 1224–1274), and St. Bonaventure (1217–1274) advocated the use of aspects of Aristotelian philosophy, supplemented and corrected by the “higher truths” of revelation.

Other thinkers, though—especially members of the Arts Faculty of the University of Paris, the so-called Latin Averroists—attempted to balance Aristotelian philosophy in its own right over against Christian revelation by arguing that a distinction could be enunciated between philosophical teaching and theological truth. In short, they proposed a theory that looked to their opponents and generations of more impartial scholars as a theory of “double truth,” according to which something might be true in philosophy, such as Aristotle’s well-known cosmological theory of the eternity of the world, yet false in theology and vice versa.

As medieval scholarship has long pointed out, the Latin Averroists, most notably Siger de Brabant (1240–between 1281 and 1284) and Boethius, did not themselves argue for a theory of double truth; rather, they reserved the term *truth* in an ultimate sense for revealed doctrine and never claimed the possibility that there could ever be two equally true contradictory truths specific to the competing requirements of theological and philosophical discourse. Nonetheless, they did recognize that reason rightly used could reach conclusions that did not agree with revealed doctrine, or else placed the veracity of certain biblical statements in question. Such was the hostility to their views in theological circles that Bishop of Paris Stephen Tempier issued condemnations of propositions associated with their work in 1270 and 1277.

In the later Middle Ages, yet another element was added to the general debate about the relationship of philosophy to theology by the nominalists and Scotists, followers of John Duns Scotus (c. 1266–1308): they contended that rationally deducible concepts and theological systems do not necessarily stand in any pertinent relationship to one another. The issue here is not one of *duplex veritatis* but rather one of a radical diastasis between philosophical or, in a Scotist dispensation, specifically metaphysical argument and the claims and requirements of theology. Some scholars have argued that this late medieval perspective underlies a good deal of the early Reformers’ rejection of philosophy in their initial attempts to codify their emerging theological positions. The problem set in motion by late medieval Scotism was further complicated by a shared proclivity among many Lutheran and Reformed theologians to embrace an Augustinian view of how the effects of original sin corrupt and deprave an individual’s powers of reasoning and the exercise of will.

The issue of double truth also appears in sixteenth-century philosophy in the writings of the Renaissance thinker Pietro Pomponazzi (1462–1525). He turned the medieval discussion on its head by arguing for the superiority of philosophical over theological truth. As an Aristotelian philosopher whose principal work was the exposition and analysis of the pages of Aristotle for the sake of developing a modern Peripatetic philosophy, Pomponazzi addressed the issue of the immortality of the soul and argued that the question could only be clarified and resolved philosophically. His conclusion was that the soul was indeed capable of discovering knowledge of higher things, especially the eternal truths of the universe, but he also indicated that such knowledge was restricted temporally to the life of the individual. The mind cannot survive the death of

the body and cannot exist in a disembodied state. All of this Pomponazzi argued from the perspective of (Aristotelian) philosophy, while at the same time acknowledging that Scripture is without error and the doctrine of the immortality of the soul can be proved from it. More so than the much-maligned Siger de Brabant and Boethius of Dacia, Pomponazzi began to trespass into the territory of *duplex veritatis*, and can be said to have reasserted the traditional claim of philosophy to be the final tribunal in any dispute of reason.

One consequence of the protracted and sophisticated medieval debate on the relationship of philosophy to theology—a discussion that can be said to have continued in different guises, albeit with slightly altered terms of references, in the polemical disputations of the Renaissance and Reformation—was to initiate by the end of the sixteenth century a willingness on the part of philosophers to assert their independence from the theologians. In the time of the ancients, philosophers had enjoyed preeminence among the cognoscenti, yet with the advent of biblical monotheism and the rapid expansion of Islamic and Christian civilization, the place of philosophy had been relegated in importance next to theology. In addition to this, the developing system of university education that was established in Western Europe supported subjects such as medicine and law, each of which claimed their own unique intellectual status and professional structure. For the medieval tradition, philosophy (which included logic and the natural sciences) was at best the handmaid of theology, a valuable intellectual training that prepared the able minded for the dizzy heights of speculation on the truths of the bible and the mystery of the Godhead. While many of the most important and enduring achievements of high scholastic theology are framed within philosophical terms of reference (e.g., the use of the language of Aristotelian metaphysics to describe issues concerning the Trinity, the Incarnation, and the Eucharist), for the authors of these works these discussions were theological, pertaining to *sacra doctrina*, and not philosophy.

Early Modern

With the dissolution of the medieval outlook in the sixteenth and seventeenth centuries, philosophers set about the long enterprise of recasting their subject so as to ensure its independence from theology but also to align it with new developments in scientific thinking. These tendencies can be observed in the writings of influential figures in the history of early-modern thought ranging from Galileo Galilei (1564–1642), Francis Bacon (1561–1626), Thomas Hobbes (1588–1679), and René Descartes (1596–1650). That said, what in the early twenty-first century tends to be thought of as philosophy—a broad but relatively precise discipline distinct from the humanities, sciences, and religion and characterized by certain kinds of difficult and even irresolvable questions—would have struck an early modern thinker as a definition all too parsimonious in scope. The term *philosophy* in the seventeenth century included a great deal more than it does in the twenty-first, and this complicates any attempt to clarify the relationship of philosophy to other forms of human leaning in the early modern period. Philosophical learning would include the physical and biological sciences, as much as the logical structure of argument,

conceptions of the good life, as well as questions about being and the existence and nature of God. Thus, a natural scientist in the seventeenth century would consider himself a “natural philosopher,” and though preoccupied with issues in mathematics and physics, would attempt to relate his understanding of these questions to more general areas of philosophical concern. Here one thinks of the very different writings of Marin Mersenne (1588–1648), Pierre Gassendi (1592–1655), Johann Clauberg (1622–1665), Robert Boyle (1627–1691), and Sir Isaac Newton (1642–1727). Similarly, it would be wrong to detach figures who are believed to be purely “philosophical” (as that term is currently understood) from those who were “theologians,” “biblical exegetes,” “political theorists,” and “jurists.” Authors such as John Locke (1632–1704), Ralph Cudworth (1617–1688), Gottfried Wilhelm von Leibniz (1646–1716), Nicholas Malebranche (1638–1715), Antoine Arnauld (1616–1694), Baruch Spinoza (1632–1677), Blaise Pascal (1623–1662), and Hugo Grotius (1583–1645) all displayed expertise in these disciplines. The range and generality of so many seventeenth-century philosophical questions, and the continuing disputes concerning the appropriate characterization of the world of nature accompanied by several thorny theological problems concerning divine grace and predestination, provides evidence that philosophy was connected to most fields in the arts and sciences, and enjoyed a close association with theology. The synoptic enterprise of seventeenth century philosophy would have to include not only the well-known canonical figures but also confessional apologists, corpuscularian scientists, alchemists and chemists, Jansenist polemicists, Jesuit moralists, activists advancing toleration, country clergy, urban rabbis, city intellectuals, and a panorama of intellectually gifted royalty and nobles.

From the seventeenth century to the Enlightenment, a new intellectual entity known as “culture,” an enterprise that connoted more than simple custom but less than learning, began to occupy the middle ground between knowledge and ignorance. Most philosophes of the salons conceived their métier quite differently from the preceding generation of seventeenth-century thinkers who had attempted, with some optimism, to translate the fruits of scientific knowledge into an accessible idiom open to all educated persons. Not all the protagonists of the European Enlightenment upheld belief in the incremental democratization of human learning; rather, they held to the view that an encyclopedic understanding of all branches of knowledge would enhance the cause of civilization and harmony among nations.

Such ideas helped to facilitate a very different understanding of philosophy and its relationship to the arts and sciences. Enlightenment thinkers and their successors no longer embraced a model of the subject that was directly influenced by the ancients. Aristotle’s teaching was believed to have been made obsolete by the intellectual developments of the seventeenth century, and while the deeds and opinions of ancient thinkers like Socrates, Plato, the Stoics, and the Epicureans were widely respected and valorized, post-Enlightenment thinkers looked more to the “novelties of the moderns” than the “wisdom of the ancients” for essential instruction about the nature of the world and the purpose of human life. In

addition, the increasing secularization of European thought and the general advancement of science in society, industry, and learning became increasingly opposed to the earlier models of philosophical practice that had encouraged the gratuitous pursuit of wisdom or the importance of a metaphysics leading to theology. Such views of philosophy were deemed to be out of keeping with the intellectual, cultural, and mercantile needs of the age. Perhaps more than at any other time in its illustrious history, the proud boast of the ancients that philosophy should stand at the top of the hierarchy of knowledge was now forcefully challenged by thinkers who remained unconvinced that philosophy was any different than other reputable branches of learning.

Modern Times

What one might term the conversion of philosophy from the quest for wisdom to the more prosaic pursuit of conceptual analysis, or the abstract clarification of the claims of more important scientific theories, is a marked feature of the philosophical thought since the turn of the nineteenth century. Since Immanuel Kant (1724–1804), philosophers have become more limited in their intellectual ambitions and, at times, have dispensed with the pretensions of their subject to be a synoptic discipline, or else to propose something of enduring value or pertinence on the subjects of God, ethics, and beauty. For good or ill, modern philosophy has preferred to restrict its purview to those matters that can be demonstrated to be legitimate objects of discourse and has eschewed ways of talking about issues that are deemed to lie outside the boundaries of sense meaning.

The prominence of such views, especially in the English-speaking world, eventually led to a recasting of the relationship of philosophy to other subjects of intellectual concern. In those quarters where the influence of scientism has been unyielding, there has been widespread support for the view that philosophy can never pretend to emulate the accuracy, reliability, and verisimilitude of valid scientific theories. Going on from there, some thinkers have taken the further step and argued that there are no perennial philosophical questions, and that traditional philosophical puzzles concerning the nature of the mind, the structure of the world, and the moral qualities of human beings have either been resolved or else superceded by advancements in physics, biology, and psychology. For these thinkers, there is nothing special about philosophy, and there is nothing to privilege it over and above other branches of intellectual inquiry. A well-known position associated with the work of the American thinker Richard Rorty (b. 1931) has even suggested that philosophy has expired through exhaustion. Now that science has demystified the world and resolved the perennial mysteries, what else is there for philosophy to do? Given the end of philosophy, Rorty has suggested that scholars turn to subjects such as literature in order to make sense of the seeming intractabilities of human worldly existence.

Yet Rorty’s position, though it is based on a set of metaphysical commitments that are widely shared by contemporary philosophers, is by no means universal, and despite the blandishments of fashion and novelty, the daily grind of philosophical speculation still goes on. Few are persuaded that the

subject first commissioned by father Thales (c. 625–c. 547 B.C.E.) and so suggestively ameliorated by Socrates and his successors is really at an end. What is perhaps significant about this phenomenon is the fact that the very practice of philosophy, whether it be in dialogical or in written form, helps to ensure the impression among practitioners of the subject that the discipline is really quite different from every branch of the humanities, sciences, and theology. Why is this so? It really comes down to the type of question, the supporting framework of reference, and the variety of answer that it invites that identify and individuate a question as a *philosophical* question. Socrates understood this and the Sophists did not. That each generation of his successors has attempted to honor the special nature of the discipline he did so much to create stands as testimony to the fact that philosophy will always enjoy a vicarious relationship to other branches of human learning.

PHILOSOPHY, HISTORY OF. A respected Princeton philosopher keeps a sign on his office door forbidding the discussion therein of any philosophy more than ten years old. At this late stage in his career the restriction includes a good deal of his own work. This may well be the limit case of the anti-historical attitude that prevailed throughout much academic philosophy of the twentieth century, motivated by the view that philosophy, as an academic discipline, need have no more connection to its past than does any other positive domain of inquiry. A physicist, for example, may be interested to know how exactly Newton came upon his discovery of the laws of gravity.

But this interest is, as it were, extracurricular, not a necessary part of the specialized knowledge of a competent physicist. It will be enough that the physicist learn the relevant laws in a textbook; Newton's name need not appear at all, much less the details of his distinctly seventeenth-century concerns.

Can philosophy be understood in the same way? At the other end of the spectrum from our Princeton philosopher, we find some maintaining that philosophy is entirely constituted by its history, that the study of philosophy can never be anything but the study of the history of philosophy. Between these two extremes, there are a vast number of intermediate positions concerning the value of philosophy's history to its present practice. Among those who accept that this history is in some degree valuable, moreover, there are vastly different conceptions of the nature of this value. What follows is a review, with the help of some slightly cumbersome "-isms," of some of the possible perspectives on the history of philosophy from within philosophy at the beginning of the twenty-first century, with an eye toward the deeper understanding of the nature of philosophy itself that informs these perspectives.

Indifferentism

Indifferentism is plainly summed up in the message on the Princeton office door. But this label does not tell all, for indifferentism's vociferous defenders are anything but indifferent about what philosophy (as an ahistorical discipline) is, and about what philosophers ought to be doing. Most likely, the indifferentist would like to see philosophy come forward as a science, to adapt a phrase of Immanuel Kant's (1724–1804), and believes that it can do so by simply focusing on an appropriate, rather narrow set of questions. In the twentieth century, these were questions arising in the analysis of language and the methodology of science, and so it has been with some justice that indifferentism has commonly been associated with analytic philosophy.

Around the turn of the twenty-first century, though, most philosophers working in this tradition had come to recognize the usefulness to their own work of the history of philosophy, and particularly of the history of analytic philosophy itself. It has become rare that a philosopher of science or language who does not also have some competence in the history of these subdisciplines will find a job. Some of the best contemporary analytic philosophers choose to congregate at meetings of the History of the Philosophy of Science group to discuss, among other things, the revision of our understanding of the very notion of "analysis" as it was understood in early analytic philosophy by, for example, Rudolph Carnap (1891–1970) or Otto Neurath (1882–1945). What is sometimes described as "post-analytic philosophy," then, might better be thought of as analytic philosophy after its historical turn, and is in any case a sure sign that strict indifferentism is on its way out.

Indifferentists tend to believe that philosophy, like any other discipline, has seen some progress over the past few millennia. One standard example is the resolution of the paradoxes of Zeno of Citium (c. 335–c. 263 B.C.E.) with mathematical tools that had to wait until the nineteenth century to see the light of day. On another understanding, though, what happens

when a philosophical question is “solved” is that it ipso facto ceases to be a philosophical question at all and becomes a mathematical or scientific one. Thus, any philosophical question is by definition unanswerable, and the history of philosophy becomes but the prehistory of science, the initial recognition that a problem exists without any clue as to how to render it scientifically tractable. It may be impossible to say which perspective is right; but those who believe that the mathematization of Zeno’s paradoxes was an instance of philosophical progress will likely think that there is no reason to dwell too much in the past. Why waste our time on those who hadn’t yet figured out as much as we have? We may be grateful to past philosophers for having discerned the problem and taken some initial stabs at solving it, as a twenty-first century astronomer might appreciate Claudius Ptolemy (c. 100–c. 170), but there is no pressing need to figure out the details of their theories and how they came up with them.

Those who believe philosophy is cumulative and progressive, then, will likely incline toward indifferentism in some degree. Others, though, believe that what makes philosophy unique is that it never really gets anywhere. There may be personal progress that comes from studying it and learning how complex the problems it addresses are, but the discipline as a whole witnesses no real progress over the course of centuries. On this view, history will be of tremendous value, because it is only through the study of philosophy’s history, the way it keeps circling back around the same challenges, always coming up with solutions from within a limited range of options, that one can experience personal progress out of an adolescent optimism, or even arrogance, about these problems’ facile solvability.

Appropriationism

Appropriationism may describe any approach to the history of philosophy that seeks to take from it tools that may be of service to one’s ahistorical philosophical task. An appropriationist asks of the history of philosophy: What can it do for me? Representatives of different strains of appropriationism will have different answers to this question.

Reconstructionism. This breed of appropriationism searches philosophy’s past for arguments that have stood the test of time and can still be of service in defense of some philosophical position advocated by the appropriator. For instance, a reconstructionist who believes that no better account of personal identity has been offered since the late seventeenth century than that presented by John Locke (1632–1704)—who roots it in continuity of memory—will cite Locke’s argument for this theory in support of his or her own, similar one. The same reconstructionist, though, will not feel obligated to adopt, or even take an interest in, Locke’s support of, say, a cosmological argument for the existence of God. Reconstructionists take piecemeal from philosophy’s past what is useful for their own projects, and will generally not feel obligated to consider whether the argument borrowed from a past figure was *really* offered in response to concerns similar to theirs. As Jonathan Bennett approvingly describes this approach to history, dead philosophers should be approached as colleagues, with the one minor but not insurmountable difference that they are, well,

dead. In this spirit, twentieth-century scholars of the philosophy of René Descartes (1596–1650) have been able to portray him as engaged, to use Bernard Williams’ phrase, in a “project of pure enquiry,” without acknowledging that he was also engaged in a project of empirical physiology, and other areas of seventeenth-century philosophy that have since been outsourced to the appropriate science departments.

Neo-x-ism. An absolutely dogmatic Marxist would be an entirely uninteresting character, not because Karl Marx (1818–1883) was wrong, but because a follower who adheres utterly to every aspect of his predecessor’s thought is in essence only a relay station for that thought’s dissemination, not a thinker in his own right. Any noteworthy Marxist thinker, other than Marx himself, will be in his or her unique way a *neo-Marxist*, even if the prefix remains only implicit. Thus V. I. Lenin (1870–1924), a Marxist if there ever was one, nonetheless modified some of Marx’s central doctrines concerning the essential class-rootedness of conflict to account for the new phenomena of imperialism and the growing antagonism between the colonizing and the colonized parts of the world that at least the early Marx could not possibly have foreseen. Similarly, Jacques Lacan (1901–1981) adopts the basic categories developed by Sigmund Freud (1856–1939) for the analysis of the psyche but explicates them in terms of a poststructuralist philosophy of language. Lenin and Lacan are not reconstructionists; they do not pretend that Marx and Freud were concerned with the same problems they themselves face or even that their predecessors would approve of the way they are tackling these problems. But they are appropriationists of a different stripe, mastering and defending the ideas of a predecessor, while showing how these ideas can be of use in application to new and unforeseen problems.

Neo-x-ists will speak of working within a “broadly *x*-ian framework” while dealing with questions that admittedly did not concern *x*. Conversely, a reconstructionist will find and extract passages in which some predecessor *x* dealt with the same questions that interest him or her today, without, in performing this extraction, feeling obligated to confess to any broadly *x*-ian framework or world-view.

Contextualism

A contextualist will, to the extent possible, let philosophical predecessors speak for themselves through the texts they have left behind. If a great thinker from some bygone era turns out to have believed in ghosts or astrology, then so be it; these features of his or her thought need to be acknowledged and understood just as much as those that have stood the test of time. Facing up to these odd and sundry concerns of our predecessors, a contextualist thinks, has more than just the virtue of shocking our shockingly narrow colleagues. Contextualism, in its honesty about the distance between our concerns and those of our predecessors, reminds us that past philosophers were not just early models of ourselves, but were concerned with a largely different set of problems and saw their role and responsibility as thinkers very differently. In this way, contextualism can help overcome the tendency to see the past as a mere prelude to the present. And this benefit may be of more philosophical significance than it first appears.

Contextualism, understood as the “merely” historical study of the history of philosophy, helps history to be something more than history of the present, in the same way that the study of natural selection in now-extinct evolutionary lines can help to drive home the important point that evolution is not a teleological process that has as its end its crowning accomplishment, *homo sapiens*. The present state of philosophy is not the end toward which the past has been striving, just as human beings are not the end toward which evolution has been striving. Against this view, it might be pointed out that the tradition of philosophy has been a common project, whereas evolution has been a blind and stumbling affair. But the contextualist will remind us that, even if we might recruit the dead to help us with our philosophical tasks, this does not mean that they would recognize as much commonality with us as we claim with them if *per impossibile* they could have been given advance warning about their posthumous affiliations. Among the contextualists, we may mention, by way of example, the names of Dan Garber, Roger Ariew, Lloyd Gerson, and Michael Frede, each of whom seeks, to a greater or lesser extent, to reveal the circumstances of time and place that help to shine light on the philosophical thought of that time and place.

Constitutivism

A constitutivist tends to believe that philosophy just is a particular tradition, fundamentally rooted in history and comprehensible only synchronically. For the constitutivist, it is our primary task today to investigate how we came to inherit the philosophical concerns we have, rather than to continue to seek answers to questions as though they were timelessly meaningful. Thus for Marx, each era’s philosophy is one of the superstructural reflections, along with other outcroppings of culture, of the class relations that fundamentally define that era; for Michel Foucault (1926–1984), philosophy as the contemplation of timeless questions is in need of replacement by a genealogy of the concepts that came to predominate, mostly in only very recent history, in philosophical discourse. There is an air of subject-changing in these accounts of the history of philosophy: they want to reveal the true nature of philosophical discourse, rather than to continue to participate in it. For instance, when Frederic Jameson describes Daniel Dennett’s *Consciousness Explained* (1991) as an allegory of late capitalism—as outlined by Slavoj Žižek in the *London Review of Books* (“Bring Me My Phillips Mental Jacket,” 22 May 2003)—he is not engaging with Dennett’s arguments in a way that could even permit the author to respond. He is explaining Dennett’s concerns, his very conception of philosophy, as the product of a history of which Dennett need not be at all aware. Dennett may say this is unfair (though more likely he will not say anything at all); Jameson, for his part, could respond, true to his Marxist constitutivist convictions, that the deepest and most fundamental account of the philosophy of any era, including recent analytic philosophy, will be one that roots it in its time and place. Any account that does not do this will fail to grasp what the theory it is studying is really “all about.” And any constitutivist would insist that such a failure is a philosophical failure, perhaps the cardinal one.

Conclusion

Most scholars working in the history of philosophy will combine in varying degrees some or all of these various approaches. Many scholars believe that, qua *historian* of philosophy, one is required to accomplish some serious historical research, preferably involving archives and manuscripts, in order to claim any expertise on the subject studied. A real *historian* must know at least a few languages, understand the basics of historiographical method, and know at least a bit about the social and political background of the era in question. But, qua *philosopher*, at the end of the day one must also prove able to do what other philosophers demand of their colleagues: namely, offer some insight into the essences of things, or show that what was thought to have an essence lacks one, or show, as the American philosopher Wilrid Sellars says, how things hang together in the broadest sense. This may be done simply through the discussion of what some past thinker thought on these topics, but the crucial thing is that essences, hangings-together, and other such philosophical staples be tackled directly or through the mediation of one who has gone before, rather than resting content with, say, a tally of the dates and recipients of some seventeenth-century philosopher’s letters.

Some historians of philosophy might not be exactly sure what they’re doing. While many of us know of no other way to talk or write about the history of philosophy than by purporting to explain what the philosopher in question *actually meant*, we are too sophisticated to believe that this is what we are really doing. We claim to be setting the record straight, but sense that at least to some extent we are pushing our own agendas. These need not be mutually exclusive tasks, however. A feminist historian of philosophy may wish to push her worthy agenda, for example, by setting the record straight concerning the great number of largely ignored women active in the central philosophical debates of the seventeenth century, such as Anne Conway (1631–1679) and Damaris Masham (1658–1708). And yet, even after this correction to the record is made and women gain their rightful place in the canon, it would be naïve to think that the record has been set straight once and for all. A future generation will undoubtedly discover something else that has remained sub-rosa in earlier generations’ reception of our shared past. There are ever new and previously undetected angles from which to consider philosophy’s past. So long as it interests us, we will never cease to find new ones. The ones we find, moreover, will always be at least partially a reflection of our own interests, even if we hold out just letting the texts speak for themselves as the soundest methodology. We might worry that this is to allow rather too much “as if” to enter into our understanding of our own projects: know that you can never do more than reflect your time and place in your reception of the past, but approach the past as if you had the power of discernment to say once and for all what it was all about. This and similar worries, far from indicating professional incompetence, might be better understood as proof that the study of the history of philosophy is a quintessentially philosophical endeavor, and carries with it all the aggravation and perplexity one might expect from any endeavor deserving of this label.

PHILOSOPHY, MORAL.

This entry includes four subentries:

Africa

Ancient

Medieval and Renaissance

Modern

AFRICA

Morality consists of two parts: first, morality in the strict sense; and second, morality as custom or mores. The defining principle of the first is the golden rule, that of the second, local utility, idiosyncrasy, or even accident. The first is known to be universal to all human cultures. This has to be so of a necessity, in view of what the rule entails. The golden rule, to follow Harry Gensler, enjoins that one ought not to endeavor to do something to somebody without conceding that it would be acceptable for that person to do the same thing to one in an imagined, exactly reversed situation. From this, specific imperatives of honesty, fairness, and respect are derivable without which human community is inconceivable.

To take an example reminiscent of Immanuel Kant (1724–1804), suppose a particular individual's project is to make a promise to someone that he or she has not the slightest intention of keeping. If that person pauses for a moment to consider whether he or she is prepared grant that it would be all right for the other person, in an exactly reversed situation, to do the same, the person making the promise will see that this is not possible. Moreover, if one has basic intelligence, one will see that the general avowal among all people of the reverse of the injunction against false promises would bring human community to an end.

The working of the golden rule in the shape of specific rules, such as this last, is manifest in moral conduct and discourse all over the world, irrespective of differences of culture or even of individual thought habits. Thus, for example, if Christians are at least theoretically dedicated to the counsels of the golden rule, so also have Chinese Confucians have also been so since pre-Christian antiquity. Nor, similarly, is it difficult to find formulations of the golden rule in the repertoire of didactic epigrams in the oral traditions of Africa. The Yoruba say, "Whenever a person breaks a stick in the forest, let him consider what it would feel like if it were himself [who was thus broken]" (Idowu, p. 166). And defining the quintessence of moral insensitivity by way of the inverse of the golden rule, the Akans remonstrate, "Sticking into another person's flesh, it might just as well be sticking into a piece of wood" (Wiredu, 1992, p. 198). To be moral, accordingly, is to evince empathetic impartiality in one's actions on the model of the golden rule.

Notwithstanding this universality in the living of the moral life, the theorizing of it, that is, its philosophy, gives rise to great diversities of persuasion not only among cultures but also within them. Famously, Western philosophers, sharing basically the same moral values, have been in earnest conflict about the nature of moral ideas and the ultimate principles of moral judgment. So among other "isms," there are subjectivism and objectivism, on the first front, and consequentialism and deontology, on the second. In contemporary African philosophy, too, unanimity does not reign. But the bone of contention lies in the interpretation of the traditional communal philosophy of morals.

Morality Based on Religion in African Thought

By one account, African life and thought is religious through and through, and ethics is only a special case of this orientation: everything in morality, as regards both meaning and principle, comes from God. A most eloquent articulation of this view is found in Bolaji Idowu's *Odumare: God in Yoruba Belief*. After rejecting any suggestion that morality derives from society's need for self-preservation or that morality is "the product of commonsense" (Idowu, p. 144), he asserts "Our own view is that morality is basically the fruit of religion and that, to begin with, it was dependent upon it. Man's concept of deity has everything to do with what is taken to be the norm of morality" (p. 145). More specifically, "The sense of right and wrong, *by the decree of God*, has always been part of human nature" (p. 146, italics added). Again, "With the Yoruba, morality is the fruit of religion" (p. 146). See also, in support of this standpoint, M. Akin Makinde's *African Philosophy, Culture, and Traditional Medicine* (1988).

There is a general objection to a view of this sort that is well known in Western philosophy. If something is good irrespective of its intrinsic character simply because it is decreed by God, then if God were to decree something like slavery, it would have to be accepted it as moral. But surely, one might retort, God would never decree so radical an affront to human dignity as slavery! Exactly this is the point. One is inconsistently proceeding with a criterion of moral goodness that is logically antecedent to God's decrees, on the basis of which

one already esteems God as morally good (in the highest). Note further that if moral goodness were defined in terms of the decrees of God, then to say that God is good would amount to just saying that God decrees what he decrees. In African philosophy, however, it is not these objections but rather a consideration linked to a deep feature of African culture that has militated against any kind of divine-decree view of morals.

The feature in question is, actually, the lack of a feature familiar to students of the “world religions.” These religions—almost all of them—are *dogmatic* religions, and the dogma relevant here is that of revelation: God is supposed to reveal directly to a select few what the rules of right conduct are. This is necessary because if right conduct is by definition what is decreed by God, there is an urgent need to know what those decrees are. Obviously this is too important to be left to fallible individual speculation. On the other hand, in African traditional religions, as far as one can see from the literature and from one’s experience, direct revelation from God is unheard of. Alleged “specialists” do indeed claim direct knowledge from extrahuman sources, frequently hyperbolically described as “gods.” But these are mundane sources, and the information volunteered by them is empirical and open to falsification. In fact, in the traditional scheme of things, repeated falsification of the messages of such “gods” can lead to their demise by reason of the accumulated contempt of their erstwhile devotees.

It is of a piece with these last considerations that there are no prophets of God in African traditional religion and, in particular, none with any pretences to moral or any kind of revelation. J. B. Danquah, speaking of the Akans, has declared with good reason that “Never in the history of the Akan people, so far as we know, have we had what is known as a revealed religion, a revelation to, or by, a prophet, of duty to a Supreme or Lord” (p. 3). Naturally, therefore, the Akans and, it would seem, Africans south of the Sahara generally do not seek the rationale of morality in the decrees of God but in the exigencies of social existence (see Wiredu, 1991). The Akan philosopher Kwame Gyekye has argued to the same conclusion (Gyekye, 1995, chap. 8). Regarding the Yoruba, Segun Gbadegesin also maintains that they “are very pragmatic in their approach to morality, and although religion may serve them as a motivating force, it is not the ultimate appeal in moral matters” (p. 82).

The remaining impediment to a just conception of the African approach to the foundation of morals is the notion that African morality is determined by the decrees of the ancestors. Two things may be meant here. First, the suggestion may be that the conduct of Africans is decisively influenced by considerations as to the likes and dislikes of the ancestors. If so, some validity may be conceded to it. It is true that in “family” (or, more strictly, lineage) matters the ancestors are believed to reward rectitude on the part of the living and punish its opposite in their own extrahuman manner. But the principles supposed to be used in their evaluations are the moral and in some cases customary principles by which the ancestors themselves lived when they were alive in this world, and these, as suggested above, have a this-worldly rationale. Besides, those in African society who are moved to action or forbearance by the thought

of ancestral rewards or reprisals are those of a weak moral fiber. Those of a more solid moral aptitude adjust their conduct by a direct cognizance of the principles themselves. The same applies to moral action or inaction enforced by the “fear” of God or motivated by any sort of religious causes. Second, the notion under consideration may mean that for Africans, moral rightness or goodness is defined in terms of the will (or wills?) of the ancestors. If so, the considerations already adduced concerning the relativization of morality to the decrees of God should be more than enough to lay this to rest too.

What then, more specifically, is the foundation of morality in African thought? It is morality in the strict sense that is being considered here, that is, as defined by the golden rule. This rule, indeed, defines morality, but it does not motivate it. Why is this rule needed at all? It is because of the following. Human individuals have their own interests that they pursue or desire to pursue. But they live in society, and in that setting, the efforts of individuals in pursuit of their interests not infrequently threaten to conflict or actually conflict with varying degrees of severity, not excluding the deadly. Only the most basic ability to reflect is needed to see that in this situation it is in the interests of all concerned that a way be found for harmonizing those interests. Any principle for pursuing such a harmony of interests will inevitably involve the occasional pruning down of the interests of an individual in deference to the interests of others. But this restraint must apply to individuals impartially. The golden rule is exactly that principle.

These thoughts on the rationale of morality, strictly so called, are encapsulated in an Akan art motif depicting a freak crocodile with one stomach and two heads locked up in a fight over food. The profundity of this art construct is typical of the way in which art is used in Africa to express ethical and more generally philosophical conceptions. Its meaning will not be exhausted here, but it is crucial to note that the two heads symbolize the reality and diversity of the interests of individuals, while the common stomach represents the common interests of all and sundry. The teaching is that the conflict can be resolved only by the realization of this second-order commonality of interests. And the resolution will have to be one in which the targeted resource is shared in a manner impartially sensitive to the original interests of all the parties, that is, in accordance with the golden rule. This reflection also suggests a succinct characterization of the rationale or foundation of morals as the evenhanded pursuit of human interests, where the evenhandedness is thanks to the golden rule. The reader might like to note the rational bent of this conception of morality.

The golden rule had a similar centrality in the moral system of the seventeenth-century Ethiopian philosopher Zara Yacob (1592–1692). He was a contemporary of René Descartes who, independently of Descartes, developed a rationalistic philosophy that was if anything more radical in its insistence on reason than that of Descartes (see Sumner, p. 224 ff.). Although he laid much stress on the will of God, he self-consciously construed it as that which is in conformity with reason: “God does not order absurdities” (Sumner, 1994, p. 238).

Morality as Custom

The foregoing has been about morality as determined by the golden rule. But there are, as hinted in the opening paragraph, countless behavioral as well as institutional options that are neither prescribed nor proscribed by the golden rule. This brings us to the sphere of custom, broadly conceived. Customs are multifarious, both in nature and origin, in Africa and everywhere else. Some precipitate philosophical questions; others do not. It is in terms of custom that cultures are differentiated. And one of the most important criteria of differentiation lies in the contrast between individualism and communitarianism. It is a contrast that is also, philosophically, quite challenging.

There is a veritable consensus among students of African societies south of the Sahara that traditional African culture is communitarian. A communitarian society is one in which individuality is regarded as a construct out of community, and an individualistic society, one in which community is regarded as a construct out of individuality. The apparent sharpness of the contrast, however, is illusory. It is a matter of degree, for without individuals there is no community, and without a community there are no *human* individuals. Still, a lively concern in moral philosophy among contemporary African philosophers is to clarify and evaluate the claims of individuality in the context of African communitarianism. Kwame Gyekye, for example, stresses the importance of individuality and entitles his version of communitarianism “moderate communitarianism” (Gyekye 1997, chap. 2). Dismas Masolo (pp. 495f.) also suggests that African communitarianism, properly considered, is hospitable to individuality. The enterprise of reassessment naturally spills over into social and political philosophy (Gyekye 1995, chaps. 8, 10; Masolo).

Kwasi Wiredu

ANCIENT

Ancient Greek moral theories are concerned in the first instance with the good life for human beings, or, in a word, happiness—what it is and how we might attain it—and with the role of the virtues of character—for example, temperance, courage, and especially justice—in achieving it. Serious critical inquiry into these questions began in Athens in the fifth century B.C.E. with Socrates (469–399), peaked twice in the theories of Plato (427?–347) and Aristotle (384–322), and came to rest in the Hellenistic period (323–30) with the calmer and more austere theories of the Epicureans and Stoics.

Socrates

Our picture of Socrates derives mainly from several short, inconclusive dialogues by his disciple Plato. In these, Socrates, believing that “the unexamined life is not worth living,” typically challenges the conventional beliefs of his fellows, both ordinary people and more sophisticated thinkers, with questions about how human life should be lived. When his interlocutors prove unable to defend their opinions on such questions, Socrates offers his own, radical, positive agenda in their place. We are happy, he thought, when our souls are in the best condition—when, as he believed, we have the virtues of character, especially justice. Since we all want to be happy, we will inevitably do what is virtuous if we know what it is. Hence happiness is achieved by removing ignorance and vice from our souls and replacing them with knowledge and virtue. Socrates’ moral seriousness and courage, in discussion and in life, won favor not only with posterity but also with many of his contemporaries—but not all of them: in 399 he was tried and convicted on a charge of impiety, and put to death.

Plato

Socratic ethics insists that we will do what makes us happy if we know what that is. Often enough, however, when we (think we) know what will make us happy, we would rather do something else instead, and sometimes we do that something else. Also, Socratic ethics does not say enough about the soul to establish that justice and the other virtues bring the soul into its best condition or that we are happy when our souls are in their best condition.

In response to these concerns, Plato in the *Republic* (360 B.C.E.) distinguishes between the “rational,” “emotional,” and “appetitive” parts of the soul.

Each part is defined by desires: reason, by desires for what is best for us; emotion, by desires for honor, achievement, power, domination of others, and so on; and appetite, by desires for various kinds of physical pleasure. Plato also associates each part of the soul with goals: reason he associates with seeking after knowledge or understanding and emotion, and appetite with the various forms of emotional and physical gratification. Given these distinctions, Plato goes on to argue that our souls will be in better condition to the extent that our lives are structured and our practical activities are motivated by goals associated with reason, not goals associated with emotion and appetite.

Plato's metaphysics provides us with his account of the proper objects of understanding. According to his "theory of forms," the world that we are familiar with and the items populating it are merely "shadows" or "reflections" of a separate world of eternal and unchanging "forms," or "ideas," such as Number, Man, and Justice. By "sharing in" or "participating in" these most fundamental realities, ordinary objects are what they are and have the features they do. The desire to attain understanding of these entities should dominate our lives. Apprehending and appreciating formal reality, Plato thinks, makes us happy and makes our lives worth living.

It also makes us moral. Formal reality, Plato thinks, is so appealing—so riveting—as to cause us to lose interest altogether in emotional and physical forms of gratification. In consequence we will behave decently toward our fellows. Justice is thus the natural expression in the field of human relationships of a properly lived human life.

Aristotle

Aristotle in the *Nicomachean Ethics* (350 B.C.E.), like Plato in the *Republic*, makes knowledge or understanding central to his conception of what is good for us as human beings. He also sees the virtues as expressing knowledge or understanding in action and in a life. But the kind of knowledge he takes to be involved in the virtues and how exactly he sees the virtues give expression to them are very different from what Plato thought.

Happiness for Aristotle consists primarily in the contemplation of the eternal truths of mathematics, physics, and theology. But practical wisdom, which is deployed in living a life well, is a separate intellectual virtue for Aristotle, and the virtues of character are closely connected with it. In the case of justice, Plato thinks that I will not take what is yours because, given my compelling interest in intellectual activities, I am no longer interested in what is yours. Arguably, this is not to take you and your rights as a person seriously. Aristotle's account of justice is a useful corrective. To be just requires not that I am uninterested in what is yours, but that I am disinterested or impartial; I see what is yours as yours and what is mine as mine.

I can achieve this perspective in matters of justice, Aristotle thinks, if I assume the perspective of a judge who sees us as free and equal citizens, each with his own interests and entitlements, and decides matters between us accordingly. And if I achieve this perspective, I will behave justly toward you. Thus being just requires that I understand what it is to be a citizen on a par with other citizens and to act from that

perspective. So too with the other virtues: each involves correctly understanding the area of human reality appropriate to it and embodying that understanding in our actions and passions.

Hellenistic Theories

The most important ethical theories of the Hellenistic period are Epicureanism and Stoicism. According to the Epicureans, we are happy to the extent that we achieve a state of mind called "peace of mind" or "lack of disturbance." Disturbance is pain, and its absence is pleasure. To achieve peace of mind, we need to recognize that any fear of death or of the gods is baseless and that wronging others or pursuing physical pleasures beyond what is necessary will produce more pain than pleasure in the end. Thus knowledge as well as virtues such as justice and temperance do have value for the Epicureans, but they are valued only as means to peace of mind, not for themselves as they are for Socrates, Plato, and Aristotle.

The Stoics identified happiness with a state of mind called "absence of passion" or "spiritual peace." We can achieve this by coming to understand and identify with the impartial moral order of the universe and living "according to nature." This means living in ways that express our nature as rational beings. Crucial to such a life are the virtues, since they are all forms of knowledge; for example, justice is knowledge of what we owe to other people. Such knowledge is of a piece and is all or nothing; if we attain it, we will become calm and indifferent to such ills as poverty, pain, and even enslavement and death. Thus, although the Stoics' conception of happiness resembles that of the Epicureans, their view of virtue and its relation to happiness is closer to the views of Socrates, Plato, and Aristotle.

Charles M. Young

MEDIEVAL AND RENAISSANCE

Moral philosophy in the medieval West derived from two main sources: Christianity and classical ethics. The attempt to reconcile these different traditions and develop a viable synthesis of the two was a central concern of moral philosophy throughout the period.

Christianity and Classical Ethics in the Medieval West

Starting with the early church fathers, Christian thinkers took differing views of the proper relationship between their moral system and that of the pagan philosophers of antiquity. On the one hand, St. Ambrose (c. 340–397), in *De officiis ministrorum* (On the duties of the ministry), was prepared to adapt the Stoic-inspired account of virtue set out in Cicero's (106–43 B.C.E.) *De officiis* (On duties) to the needs of Christians seeking eternal bliss in the afterlife. On the other hand, St. Augustine (354–430), another doctor of the church, denied that Christians could learn anything from pagans about either virtue in the present life or happiness in the next, both of which were gifts of God's grace.

Ambrose's conviction that the ancient framework of ethical theory could be extended and modified to accommodate Christianity found wide resonance in thinkers from the Iberian bishop St. Martin of Braga (c. 520–580), who wrote influential moral tracts closely based on the writings of the Roman Stoic Seneca (4 B.C.E.–65 C.E.), to the Cistercian abbot Ailred of Rievaulx (1109–1166), whose treatise *De spiritali amicitia* (On spiritual friendship) is modeled on Cicero's *De amicitia* (On friendship).

The uncompromising position of Augustine was echoed by monastic moralists such as Abbot Rupert of Deutz (c. 1076–c. 1129), who rejected pagan philosophers out of hand on the ground that they had no knowledge of spiritual or heavenly values. The first medieval philosopher to put forward a serious challenge to Augustine's characterization of virtues as gifts of divine grace was Peter Abelard (1079–1142). Drawing on Cicero and on Boethius's (c. 480–c. 524) commentary on Aristotle's (384–322 B.C.E.) *Categories*, he defined natural virtues as fixed dispositions that were acquired by the exercise of human powers and that could be transformed into Christian virtues by being directed toward God. Abelard was nevertheless acutely aware that while Seneca, the pagan philosopher he most admired, held that virtue must be sought for its own

sake, Christians believed that virtue should be pursued in the hope of a greater reward: happiness in the future life.

It was precisely this issue that made Aristotelian ethics, with its this-worldly orientation, particularly problematic for medieval Christians. In the *Nicomachean Ethics*, which began to be available in Latin translation at the end of the twelfth century, Aristotle declared that humankind's supreme good was a happiness that consisted of philosophical contemplation in the present life—a view that was clearly incompatible with the Christian belief that humanity's highest and ultimate goal was everlasting bliss in the afterlife. A solution to the problem was found in the mid-thirteenth century by scholastic philosophers at the University of Paris. Building on a distinction originally made by the French theologian William of Auxerre (d. 1231), they maintained that the subject of Aristotle's treatise was imperfect happiness, a natural state attainable in the present life by human powers, while perfect happiness or beatitude, a supernatural state attainable in the next life through grace, was the subject of theological, not philosophical, inquiry.

This position was further developed by the Dominican theologian and philosopher Thomas Aquinas (c. 1225–1274), who carved out a legitimate area of investigation for moral philosophy: the examination of the limited happiness that can be achieved by man through the naturally acquired virtues described by Aristotle, whereas theology was concerned with the unlimited heavenly beatitude produced by divinely infused virtues. This formulation, which established that Aristotelian moral philosophy, though vastly inferior to Christian theology, was nonetheless fundamentally in agreement with it, made it possible for university professors from the late Middle Ages to the end of the Renaissance and beyond to base the teaching of ethics firmly on the doctrines of Aristotle.

Islam, Judaism, and Classical Ethics

As in the Christian West, medieval Islamic and Jewish moral philosophy devoted considerable effort to reconciling scriptural precepts and values with those deriving from the classical ethics inherited from Greece. Muslim moral philosophers, rather than drawing a clear distinction between the imperfect happiness of the present life and the perfect beatitude of the hereafter in the manner of their Christian counterparts, emphasized the harmony between religion and philosophy (or *falsafah* from the Greek term *philosophia*) by pointing out that both were based on a proper understanding of the universe and mankind's place within it. Ethics was linked to theoretical knowledge, acquired by rational means, which led individuals toward the ultimate goal of attaining happiness in this life or the next. The Spanish Muslim philosopher Ibn Rushd (1126–1198), who produced comprehensive commentaries on the Aristotelian corpus that circulated widely in the West under his Latinized name Averroës, held that the path to happiness was an intellectual ascent to the contemplation of ever higher beings, culminating in the contemplation of the first cause and temporary union with the source of intellectual understanding. This account of happiness, which had no need for divine revelation or life after death, apparently gained adherents among Latin Averroists at the University of Paris in the late thirteenth century, since the doctrine "that happiness

is to be had in this life and not in another” was among the 219 propositions condemned by the bishop of Paris in 1277.

Jewish moral philosophy was also concerned with establishing the proper relationship between religious and philosophical ethics. Moses Maimonides (1135–1204), the most influential of medieval Jewish philosophers, held that faith and reason were not in conflict and therefore, attempted to ground the basic principles of Aristotelian ethics in Jewish tradition, modifying them according to its needs. Maimonides, like Islamic moral philosophers, had a highly intellectualist conception of ethical perfection, in relation to which moral perfection played a merely subsidiary and preparatory role. A different trend in ethics, however, arose in conjunction with Kabbalah, a form of Jewish mysticism. Kabbalists such as Moses ben Jacob Cordovero (1522–1570) regarded moral perfection as the road to mystical union with aspects of the deity and believed that the moral behavior of individuals had an impact on the cosmic struggle between good and evil.

The Renaissance Recovery of Ancient Moral Philosophy

Although Aristotelianism dominated ethics in the West well into the seventeenth century, the Renaissance witnessed the recovery of other ancient traditions of moral philosophy. As had happened with Aristotle’s ethical thought in the Middle Ages, the acceptability of these revived philosophies was largely conditioned by their compatibility with Christianity. The Florentine priest and philosopher Marsilio Ficino (1433–1499), who played the key role in the fifteenth-century revival of Platonism, stressed the extent to which the doctrines of Plato, unlike those of his student Aristotle, were in accord with Christianity. Ficino demonstrated this agreement most successfully in relation to moral philosophy through his influential theory of Platonic love, in which Plato’s intellectual ascent from physical beauty to the realm of Ideas was interpreted as a spiritual journey whose final destination was God.

Stoic ethics inspired admiration from many Renaissance thinkers on account of its high-minded principle that virtue alone was sufficient for the good life. Yet its stern moral demands, which included a complete eradication of the emotions, provoked an equal amount of criticism for requiring a superhuman strength that surpassed even the powers of Christ, who had given way to both anger and sorrow. This ambivalent attitude toward Stoic moral philosophy was not overcome until the late sixteenth century, when a new brand of Stoicism, more accommodated to Christianity, was promoted by the Flemish humanist Justus Lipsius (1547–1606). The Spaniard Francisco de Quevedo (1580–1645) attempted to carry forward Lipsius’s program of Christianizing Stoicism by claiming that the ultimate source of the philosophy of patient resignation recommended by the Greek Stoic Epictetus (c. 55–135) was the Book of Job. The recovery of Stoic moral philosophy, with its belief that human beings through their reason can comprehend and participate in the rational order of nature, contributed to renewed interest in natural-law theory.

Compared to Platonism and Stoicism, Epicurean moral philosophy made very few inroads into Renaissance thought.

Epicurus’s doctrine that pleasure was the supreme good, misinterpreted since antiquity as an endorsement of sensual indulgence, combined with his rejection of divine providence and immortality, rendered his philosophy unacceptable to Christians. Not surprisingly, serious attempts to adapt Epicureanism to Christianity were rare. When the Italian humanist Lorenzo Valla (1407–1457) transferred the earthly pleasures of Epicurus to the heavenly ones enjoyed by the virtuous in the next life, his aim was less to rehabilitate the ancient philosophy than to reassess Christian theology. Similarly, the Dutch humanist Desiderius Erasmus (1466?–1536), by maintaining that Christ was the true Epicurean, since his disciples led the most pleasurable life, sought to highlight the ethical dimension of Christian piety.

The first Renaissance thinker to tap the ethical potential of Pyrrhonian skepticism, which held that it was impossible to attain certain knowledge, was the French essayist Michel de Montaigne (1533–1592). Adopting the motto *Que sais-je?* (What do I know?), he deployed skeptical arguments to undermine any claims to moral knowledge, in the hope of deflating human presumption, which he regarded as the root of all evil. The recovery of skepticism was part and parcel of the Renaissance movement to revive ancient philosophical traditions. Yet it presented epistemological challenges that in the following era would turn moral philosophy from a discipline based on classical and Christian authority to one founded on principles that had been rationally deduced from self-evident axioms.

MODERN

The moral philosophy of the modern period traditionally included ethics as well as natural-law theories of rights and the normative foundations of state authority. Nowadays, the term *moral philosophy* tends to be used mainly with reference to ethics proper, while modern natural-law theories and their history are often treated under the headings of political philosophy and philosophy of law. In keeping with this convention, the following summaries concentrate mainly on developments in ethics since 1600.

Seventeenth Century

Modern Western philosophy emerged in conjunction with the religious, political, and social upheavals that characterized the Reformation period and the first half of the seventeenth century. Early modern moral philosophy reflected the need to reassess the ways that European thinkers had viewed moral knowledge, the human good and the nature of moral value, and the relation between God's will and the principles of human conduct. The extent to which seventeenth-century moral thought represents a break with late medieval and Renaissance views is controversial. But by the early 1600s modern conceptions of the character and goals of the theory of morals differed significantly from their historical antecedents. Hugo Grotius (1583–1645) provided an alternative to Scholastic natural-law theory as well as a response to the skeptical views on moral knowledge put forward by sixteenth-century thinkers like Michel de Montaigne (1533–1592). Grotius took a broadly empirical approach to the question of universal natural law by considering the features of human nature that make law-governed cooperation between individuals both possible and necessary. When presenting the basic precepts of human conduct, Grotius tended to focus on the self-interested individual. While Grotius accepted that humans are naturally sociable, he did not ground his natural jurisprudence in a rich, substantive conception of the good life or the chief good for human beings. Rather, he offered key elements of a theory of natural rights. Grotius regarded natural rights as subjective qualities of the human individual that must be respected by morally viable forms of human association. Subsequent

modern natural-law theories were generally in keeping with Grotius's minimalist conception of the good as well as with the Grotian idea of rights.

Thomas Hobbes (1588–1679) combined a denial of natural sociability with an egoistic view of human motives. His works on moral philosophy were interpreted as providing a naturalistic account of obligation, an account based on the fundamental good (the self-preservation) of the separate agent. An important problem linked to Grotius's and Hobbes's moral thought was the relationship between the laws of nature and God. Samuel von Pufendorf (1632–1694) made the will of God the ultimate source of such laws, and made God's power to punish and reward the ultimate ground of our obligation to obey them. This voluntarist view of morality as obedience to the will of a superior generated the systematic theory of duties and rights found in Pufendorf's immensely influential works. A similar view underlies the treatment of moral ideas given by John Locke (1632–1704). Locke combined a hedonistic explanation of the origins of our ideas of moral good and evil with a voluntarist conception of the relationship between law and the sanctioning power of a superior.

The voluntarist view of morality was a primary target of early modern perfectionist philosophers. Baruch Spinoza (1632–1677) held that the world is not the separate creation of God but a natural whole completely determined by eternal truths and laws knowable by reason. The philosophically informed agent's moral task is not to *obey* God's commands. Rather, the task is to understand divine law as the expression of eternal truths and thus to grasp the object of law as the supreme good. The true knowledge and love of God represents the highest state of human perfection. Striving to know this good through reason, the agent transcends selfish motivation and narrow self-interest. Nicolas Malebranche (1638–1715) viewed the world as having causal order through continual divine intervention. According to Malebranche, we are wholly dependent on God, and morality is obedience to God. This obedience, however, does not involve blind or even self-interested acceptance of divine commandments. Obedience requires that we understand God's order, and our intellectual apprehension of this order moves us to act from love in accordance with God's will. Repudiating the central tenets of voluntarist morality, Gottfried Wilhelm von Leibniz (1646–1716) based his moral system on the supposition that all actions must have a sufficient reason, a supposition linked to the notions of divine omniscience and metaphysical perfection. While many possible worlds are conceivable, God's perfection and infallibility guarantee that he chose optimally, thus creating the best of all possible worlds. Humans act morally when they act from the habit of loving or willing the good; and they act in this way when they learn to act on their knowledge of the world's perfection. The ethics of Christian von Wolff (1679–1754) were generally in keeping with the Leibnizian perfectionist view, although Wolff modified Leibniz's metaphysical tenets in a variety of ways.

Eighteenth Century

A characteristic component of eighteenth-century sentimental ethics was the rejection of the rationalist accounts of

moral knowledge and motivation that supported theoretical views like those just summarized. Sentimentalist thinkers held that our awareness of moral good and evil, our ability to judge actions and character traits, and our motives for action depend on our capacity to be affected by feelings that are common to all human beings. The notion of a moral sense thus often figured prominently in the sentimentalists' portrayals of the source of our feelings of moral approval and disapproval. Contrary to the theorists of natural law discussed above, these theorists of moral sensibility tended not to regard concepts of law, obligation, and duty as primary ethical notions. Anthony Ashley Cooper, better known as the earl of Shaftesbury (1671–1713), understood virtue in terms of actions that give rise to feelings of approbation, actions that in turn show evidence of an agent's self-ordered affective harmony with respect to the feelings that move him to act. According to Francis Hutcheson (1694–1746), human moral sensibility is naturally structured in such a way that we approve of actions and character traits to the extent that they exhibit benevolent inclination as their motivating condition. Hutcheson formulated a theory of virtue in which universally benevolent inclination features as the morally best of motives. While David Hume (1711–1776) did not follow Hutcheson in maintaining that benevolent inclination supplied the only genuinely moral basis for action, he advanced a secular science of morality founded on the analysis of the moral sentiments and the human capacity for sympathy. Making use of the systematic superstructure of modern natural-law accounts of duties and rights, Hume constructed a comprehensive theory of the virtues revolving around the distinction between the "natural" virtues (such as compassion and generosity) and convention-dependent "artificial" virtues (such as justice). Jean-Jacques Rousseau (1712–1778) and Adam Smith (1723–1790) published highly influential treatises that further articulated the view that human morality has its grounds in the sensuous dimension of our nature.

A further type of approach was furnished by ethical theories that assumed egoistic explanations of moral motivation, typically in conjunction with hedonistic accounts of the good and proto-utilitarian principles requiring the maximal promotion of human happiness. These theories were often rooted in the Augustinian view of the sinfulness and corruption of human nature that was presupposed not only by Lutheran and Calvinist moral theology but also by French Jansenist ethical thought. Interweaving the Augustinian view with themes drawn from Hobbes's anthropology, Pierre Nicole (1625–1695) maintained that, although virtuous action is at bottom the result of self-interested passion, such selfish action has beneficial consequences for society as a whole. Bernard de Mandeville (1670–1733), writing in English, radicalized this line of thinking to the point of rupture with traditional religious conceptions of vice and sinfulness. While Mandeville's theory of morals scandalized his immediate contemporaries, the connection between selfish motivation and general utility came to be regarded with increasing favor during the eighteenth century. That connection provides a crucial element of the moral philosophies of Claude-Adrien Helvétius (1715–1771) and Paul-Henri-Dietrich d'Holbach (1723–1789), both of whom were important influences on the full-fledged utilitarian ethics of Jeremy Bentham (1748–1832). Bentham argued that the

general happiness, to be promoted through actions and governmental policies, must be understood quantitatively in terms of the favorable balance of pleasure over pain, as experienced by separate individuals in the pursuit of their particular ends.

Immanuel Kant (1724–1804) sought the grounds of morality in concepts and principles of practical reason that could be established independently of facts about the sensuous dimension of human nature. Kant's major works on moral philosophy aimed to give an account of the fundamental moral law as a supreme formal principle of duty, which he called the categorical imperative. Kant thought of the categorical imperative as an objectively valid principle by which an agent can determine the moral content of subjective practical principles called maxims. Maxims conforming to the universality requirements expressed by the categorical imperative supply laws of practical reason that specify particular duties. The categorical imperative, however, is much more than just an abstract and legalistic formal principle of duty. For it requires the individual agent to make it *her* maxim to act in such a way that the maxims of her actions can be willed as universal laws, thus making the principle of duty itself the sufficient incentive for action, independently of inclination and sentiment. The rationally legislating human agent gives laws of duty to herself in conformity with the idea that every human will *can* be a will that legislates universally through all its maxims. Such is the Kantian idea of rational self-legislation as autonomy of the will. In keeping with this idea, Kant asserted that morality is "the relation of actions to the autonomy of the will, that is, to a possible giving of universal law through its maxims."

Nineteenth Century

Kant's theory of autonomy and his treatments of the universal principles of rational willing were of determinative significance for the idealist philosophy of Georg Wilhelm Friedrich Hegel (1770–1831). Yet Hegel considered the Kantian method of grounding ethics strictly in the analysis of the formal aspects of rational self-legislation to be fundamentally incomplete. According to Hegel, that method could not overcome its "empty formalism" because it was unable to take proper account of the human agent's embeddedness in historically conditioned societal settings. Hegel's work on moral philosophy reflects the concern to understand both the form and the content of modern morality in its systematic connections with, on the one side, abstract principles of property law, contractual relations, and legal wrongdoing and, on the other side, the concrete norms governing the historically given institutional structures of the bourgeois family, civil society, and the political state.

An important characteristic of nineteenth-century British ethics is the opposition between utilitarian and intuitionist theories. Intuitionists maintained that we have the rational capacity to apprehend self-evident moral principles and that we can be moved to act by virtue of our intuitive grasp of these principles. Intuitionist accounts of morality were formulated on terrain already well prepared by thinkers like Samuel Clarke (1675–1729), Joseph Butler (1692–1752), Richard Price (1723–1791), and Thomas Reid (1710–1796). William Whewell (1794–1866) may be taken as the representative

figure for nineteenth-century intuitionism in Britain. John Stuart Mill (1806–1873) defended utilitarianism against its intuitionist detractors. His theory of happiness, however, rejects Bentham's purely quantitative version of hedonism. Mill emphasized the distinction between higher and lower pleasures, and he argued that higher pleasures are better than the lower ones. Henry Sidgwick (1838–1900) investigated egoism, intuitionism, and hedonistic utilitarianism in relation to the principles that underlie intuitive commonsense morality. While Sidgwick took a utilitarian position, he concluded that the standardly accepted antithesis between utilitarianism and intuitionism was spurious since self-evident moral principles are required in order to provide a rational foundation for utilitarian ethics.

Friedrich Nietzsche (1844–1900), who was to have a decisive impact above all on Continental European ethical thought during the twentieth century, devoted much of his writing to a frontal criticism of Western moral philosophy. Rejecting the universality claims of modern thinkers like Kant, Nietzsche focused on historically existing moralities and treated them naturalistically as the outcome of society's development. He was concerned to uncover the psychological underpinnings of our attributions of value and to articulate a "genealogy" of morals that supports a fundamental reevaluation of values. Nietzsche regarded modern morality as the result of the creation and imposition of value by the weak, by those who have always struggled against the "master" morality of the strong and noble. Nietzsche emphasized the necessity of overcoming the roots of modern morality, hence the life-affirming will to go "beyond good and evil."

Twentieth Century

Offering an alternative to neo-Kantian ethics and prevalent strains of utilitarian ethics, the emergence of systematic value theory represented an important trend in German and Austrian academic philosophy during the late nineteenth century and the early decades of the twentieth century. The pivotal thinkers in this regard, Franz Brentano (1838–1917) and Max Scheler (1874–1928), held that ethics must be based on the investigation of objective and intrinsic values that are apprehended through the emotions. Brentano's theory of the intrinsically good and bad focused on the implications of the analogical relationship between the intellectual operations of judgment and our emotive attitudes (such as love and hate) toward intentional objects. Stressing the objectivity of values as intentional objects of feeling, Scheler investigated the a priori structures of emotive experience. Scheler devoted much of his work to the detailed phenomenological description of particular emotions such as resentment, love, and sympathy, often in opposition to Nietzsche's moral psychological claims.

Influenced by Brentano, and disavowing the Kantian and neo-Hegelian proclivities of many of his contemporaries, George Edward Moore (1873–1958) held that the fundamental object of ethics was the "good," understood as an intuitively apprehensible, simple, and indefinable property. Moore criticized theories that conceive of the good as something specifiable in terms of natural properties (such as pleasure). Moore held that such theories commit the "naturalistic

fallacy," and his criticism of naturalism in ethics fed into the rise of an analytic tradition that was prevalent in Anglo-American philosophy throughout the twentieth century. Analytic ethical theorists characteristically concentrated on "metaethical" issues such as the meaning of moral terms and the justification of moral judgments. They generally kept these issues separate from the examination of substantive proposals concerning ethical values and the norms of conduct and character. Normative ethics, as distinguished from metaethics, was predominantly utilitarian until the later decades of the 1900s. This situation changed dramatically with John Rawls (1921–2002). Drawing on aspects of modern natural-law theory, but also on Kantian as well as on certain features of intuitionist ethics, Rawls's contractarian theory of justice furnished a clear alternative to the various types of utilitarian approach taken by twentieth-century thinkers. The publication of Rawls's theory of justice represents, in effect, the beginning of the international renaissance of normative ethics that has characterized moral philosophy since the 1970s.

The revival of virtue ethics has been an important factor in Anglo-American philosophy since the 1970s. Criticizing especially Kantian and utilitarian moral thought, virtue ethicists have often located the sources of their theoretical projects in Aristotle and Thomas Aquinas. But eighteenth-century sentimentalists thinkers have also had significant impact on recent virtue ethics. Reflecting the demand that ethics should have relevance beyond the confines of academia, the late twentieth century also witnessed the proliferation of fields in professional and applied ethics as philosophers became increasingly concerned with social and political issues such as the environment, war, medical and business practices, and questions of race and gender. Feminist ethics, which benefited from the expanded scope of practical ethical inquiry, has become a central area of contemporary research. Feminist philosophers have aimed to reconstruct traditional moral philosophy by insisting that ethics should finally take proper account of women's experience and the historically given structures of female subordination. The emancipatory impetus of North American feminist ethics has often been supported by the reception of Continental thought, especially by work stemming from the phenomenological and existentialist tradition, from broadly Marxist schools of social criticism, and from structuralist and poststructuralist philosophy.

PHILOSOPHY AND RELIGION IN WESTERN THOUGHT.

Before Socrates, speculative thinkers addressed in several ways what would be identified as religious matters in the twenty-first century. Some of them criticized what they deemed to be implausible features of conventional religion: thus Xenophanes of Colophon (c. 560–c. 478 B.C.E.) attacked both the immorality and the anthropomorphism of the poets' depiction of the gods, while Democritus of Abdera (fifth century B.C.E.) provided explanations of the causes of events that were opposed to ideas of divine intention or arguments from design. Several early philosophers further advanced an understanding of the concept of divinity in terms that were opposed to ordinary religious experience. Their efforts were often caricatured by the public imagination as instances of impiety. It is revealing that Aristophanes (c. 450–c. 388 B.C.E.) in his play *The Clouds* depicted philosophers as promoters of irreligion, and Socrates (c. 470–399 B.C.E.) at his trial was accused of being “completely godless” (*to parapan atheos*).

With the work of Plato (c. 428–348 or 347 B.C.E.) and Aristotle (384–322 B.C.E.), these strategies for addressing the claims of religion were consolidated in ways that did much to determine future discussion. Plato's Socrates defends traditional mythology and participates in civic rituals. He recounts to Phaedrus the myth about Boreas and Orithyia and admonishes those who seek to explain its point naturalistically, and his famous last words to Crito request that a ritual sacrifice be made on his behalf. More formally, however, Plato's dialogues repeatedly turn on a rejection of doubts about the divine (see *Laws*, book 10), and he provides several arguments against those who deny the existence, nature, or providence of the gods. His most enduring representation of divine action is the account in the *Timaeus* of the Demiurge who creates the universe out of a benevolent motive.

In the works of Aristotle, criticisms of popular misconceptions of divinity and genuine moments of piety are combined. More important for later thinking about theology, however, are Aristotle's arguments for the existence of a divine prime mover of the universe and his account of that entity. At the end of *Physics* (book 8) and in *Metaphysics* (book 12), he argues that the impossibility of an infinite regress in motion requires that there be a fully actualized entity who causes all other motions by being the universal object of desire. In the *Metaphysics*, Aristotle describes the life of this being as one of “thinking of thinking” (*noesis noeseos*). Beyond this highly suggestive passage and

a few allusions elsewhere, the Aristotelian corpus affords researchers no explicit description of a divine agent.

After the deaths of Plato and Aristotle, their followers widely disseminated their theologies throughout the ancient world and engaged in dialogue with some of the teachings of Stoicism. The Stoic analysis of pain and misadventure was facilitated by a doctrine of divine providence. The Stoics were also very capable natural scientists, and this led to their promulgation of many theories about the origin of the universe. Such physical processes, however, were held to be orchestrated by a divine mind, a mind that could find expression in the civic gods of traditional religion. These three schools—the Platonic, the Aristotelian, and the Stoic—all disputed at great length with the Epicureans, for whom the gods' interventions in human affairs were nothing but a series of malicious fictions. What “gods” the Epicureans did permit were always characterized in terms that made them fully physical and natural, subject to the same laws of generation and corruption, pleasure and tranquility, that conditioned human life. An illustration of the dialectic between these competing views, as well as a resistance to Epicurean doctrines, can be found in Cicero's (106–43 B.C.E.) *On the Nature of the Gods* (book 1).

The Early Christian and Medieval Periods

The course of ancient speculation about divine matters was dramatically altered as early as the first century of the common era by the pagan world's contact with Judaism and subsequently Christianity. The intellectual directions of these faiths were also shaped as a result of coming into contact with ancient philosophy. In pagan thought, the contact produced a renewed interest in the representation of the divine nature. In Judaism and Christianity, it produced an energetic effort to present the claims of revelation in philosophically coherent ways. The renewed interest among the pagans is most evident in Neoplatonism, a school that included Plotinus (205–270), Porphyry (c. 234–c. 305), Iamblichus (c. 250–c. 330), and Proclus (410?–485). The new effort of speculation about divine matters can be seen, albeit in a different guise, in Jewish thinkers such as Philo Judaeus of Alexandria (first century C.E.) and among Christian thinkers such as Clement of Alexandria (150–between 211 and 215) and Origen (185?–254?). It led not only to philosophical explorations of Scripture but also to the development of a view within Christian circles that the “best” philosophy was to be found in Scripture.

After 400, philosophy became fully subsumed within the three monotheistic religions—Judaism, Christianity, and then Islam. Throughout the thousand years from the fifth to the fifteenth century, the largest part of speculative talent in the West was devoted to considering questions about the God of the Scriptures or revelation. Very few philosophers neglected the issues raised by the confrontation of ancient philosophy with the monotheistic religions, as can be observed in the writings of Arab thinkers such as al-Kindi (fl. ninth century), Avicenna (Ibn Sina; 980–1037), and Averroës (Ibn Rushd; 1126–1198).

In many Latin works the conversion or ascent of philosophy to faith is the central theme, as can be witnessed in the *Confessions* of St. Augustine of Hippo (354–430). For other

late antique and early medieval thinkers, philosophy served as a prolegomenon to faith grasped and expressed as sacred doctrine (*sacra doctrina*). In Boethius's (c. 480–524) *Consolation of Philosophy*, the figure of philosophy reminds Boethius of virtues without which his faith cannot be restored. One of the more enduring models of reflection on divine matters was presented by Anselm of Canterbury (1033 or 1034–1109) in his *Proslogion*. Building on the intellectual heritage of Augustine, he uses the phrase *fides quaerens intellectum*—faith seeking understanding. This strategy can clearly be seen at work in Anselm's so-called “ontological argument” in the *Proslogion* 2 and 54. It can be argued that one does much better justice to Anselm's intentions if one views the argument not as a demonstration of the existence of God but as a systematic investigation into God's mode of existence. As a person seeking understanding (*fidelis quaerens intellectum*), Anselm begins from a faith that provides the conceptual parameters of his philosophical reflection and then attempts to win his way through to a better understanding of the divine nature.

In terms loosely contiguous with Anselm's project, other medieval authors clarified the relation between philosophy and theology by insisting that philosophy must be studied thoroughly before proceeding to theology. Different examples of this tendency can be found in thinkers as diverse as the Christian Bonaventure (c. 1217–1274), in his *Itinerarium*, and the Jewish polymath Moses ben Maimon (Maimonides; 1135–1204). In a similar spirit, the Oxford philosopher and natural scientist Roger Bacon (c. 1220–1292) argued that nothing could be known about God without a prior study of languages, mathematics, optics, experiential science, and moral philosophy.

When arriving at the zenith of Scholastic speculation on God in the last quarter of the thirteenth and the first half of the fourteenth century, one finds a profound illustration of the range and diversity of the engagement of Christian theologians with the Aristotelian inheritance in the works of Thomas Aquinas (c. 1224–1274), John Duns Scotus (c. 1266–1308), and William of Ockham (c. 1285–?1349). For Aquinas, theology (*theologia*) employs, improves, and then perfects the best of ancient philosophy. He extended great deference to pagan philosophers, especially Aristotle, but whenever he spoke in his own voice he systematically transformed most of the Aristotelian doctrines he discussed, often in directions quite opposed to Aristotle's original intentions. Duns Scotus, on the other hand, began by candidly refusing to accommodate Aristotle, but what is called his “Augustinianism” is nothing but a mélange of the theological legacy from Augustine, the philosophical deposit of Neoplatonism, Scotus's reaction to the work of his contemporaries (in particular Henry of Ghent [c. 1217–1293]), and a model of Aristotelianism derived from reading Aristotle refracted through the glass of Latin Averroism. William of Ockham saw fit to repudiate some of the central features of the Aristotelianism espoused by his forebears, but he repeatedly sought to use Aristotle's work to support his own philosophical views and aspired to be perceived as a faithful Aristotelian.

The Early Modern Period

The medieval requirement of *fides quaerens intellectum* carried forward into the early modern period. Yet its legacy was

complicated in three distinct ways. First, the Christian reform movements of the Reformation were often sharply critical of the use of philosophy in any discussion of God and his creation. This criticism varied in intensity from one reforming group to another and often coexisted with humanist learning and philosophical erudition. For example, both Martin Luther (1483–1546) and John Calvin (1509–1564) frequently mocked Aristotle, and by implication much of the Scholastic tradition of philosophical theology. But more commonly, their criticisms of philosophy arose from claims about the opposition of philosophy to the Gospels, or from a vivid conviction of the impotence of “sinful” human reason, or from a confidence that God would teach what was needed in human affairs by “inspiration” and would do so not only for the prince, philosopher, and prelate but also for the common ploughboy. That said, it is telling that in the years immediately after the schism with Rome, the speculative theology of Lutheran and Reformed traditions is characterized by a return to the resources of the Aristotelian metaphysics and Scholastic argument in order to make sense of their distinctive theological claims. This can be observed in the writings of Philipp Melancthon (1497–1560) and Théodore de Bèze (1519–1605).

The second complication in the relations of philosophy to theological issues arose from fierce disputes over the conclusions of the *nova scientia*, or “new science.” The condemnation of Galileo Galilei (1564–1642) is one well-known example. Opposition to the metaphysical implications of the new science in certain religious quarters made many philosophers cautious in expressing their views. It thus becomes tricky to construe the exact nature of their theological allegiances. On the surface, the work of René Descartes (1596–1650), for example, appears to display a scrupulous Catholic orthodoxy accompanied by frequent protestations of obedience to the *magisterium* (or “teaching authority”) of the Roman Church. But Descartes was also extremely reticent and somewhat guarded about many of his cosmological views, and he continually did his very best to ensure that his publications would not provoke theological controversy. Likewise, Baruch Spinoza (1632–1677) littered his *Tractatus theologico-politicus* (anonymously published in 1670) with misdirections in order to increase the likelihood that the reader would miss his heterodox interpretation of Scripture.

The final complication arose from a more pronounced ambivalence concerning the status or even utility of advancing rational arguments for the existence of God. Thinkers such as Blaise Pascal (1623–1662) argued that the universe is characterized by a fundamental ambiguity and that arguments for the existence of God were inconclusive. On this basis, he argued that individuals ought instead to ground their religious practices in a volitional choice by which they would make themselves firmly assent to the teaching and doctrines of the church. Without such a decision, he argued, one's faith would be without foundation. This tendency, however, was opposed by a strong support for a posteriori arguments in support of “natural religion,” the claim being that it is only by means of impartial human reason that the truths of revelation can be authenticated and defended. The consequence of this move was to usher in the view that religious belief was irrational

unless buttressed by a prior philosophical justification. Of course, this left open the distinct possibility that reason might in the end disprove belief in God.

By themselves, these complications could not undo the ancient engagement of philosophy with speculation about divine matters, nor could they sever the ancient dependence of religious thought upon established modes of philosophical discourse. The overwhelming majority of early modern philosophers affirmed the existence and activity of a God, and most aligned themselves with one Christian denomination or another. John Locke (1632–1704) and George Berkeley (1685–1753) were both Anglicans. Nicolas Malebranche (1638–1715), Antoine Arnauld (1612–1694), and Pascal all published works that reflected their own distinctive brands of Roman Catholicism. Gottfried Wilhelm von Leibniz (1646–1716), while a Lutheran, distinguished himself in a period woefully characterized by religious conflict by advancing for ecumenicalism. Jonathan Edwards (1703–1758) forcefully expounded the Puritan notion of the utter dependence of all things on God. Of all the philosophers of the period, only Thomas Hobbes (1588–1679) appears a heterodox theist.

The Eighteenth and Nineteenth Centuries

If many of the central figures of the European Enlightenment were trenchant critics of established religion, they often enough professed views about a divine origin or general governance of the created order. This is true of Denis Diderot (1713–1784), Voltaire (1694–1778), and Jean-Jacques Rousseau (1712–1778). The most important works of this time regarding religion are David Hume's (1711–1776) *Natural History of Religion* (1757) and *Dialogues concerning Natural Religion* (1779, but first written in the 1750s). The former deals with the causes of religion, as it originates in human nature and society, while the latter examines the reasons or putative grounds for believing in a God or gods. The force of Hume's work resided in his claim that the culminative arguments of natural religion do not establish the existence of any deity that could be the proper object of religious belief. If revelation cannot be authenticated by reason, it might seem that the only answer that can be given to the question "Why does anyone believe in God or gods?" is that such practices have a natural origin. An investigation of these causes is the subject of the *Natural History of Religion*. Central to Hume's argument there is the provocative contention that the source of a belief in deities is to be found in numerous human pathologies that derive from a fear of the unknown.

It was not only Hume who fired a successful broadside at the theistic tradition of Western philosophy. Immanuel Kant (1724–1804) sought to refute the questionable metaphysical assumptions he believed inherent in the traditional "speculative proofs" for the existence of God, by demonstrating the incoherence of the ontological argument, the cosmological proof, and the argument from design. The effect of Kant's onslaught was to undermine not only the substance of these arguments but also trust in their philosophical efficacy. After him, philosophers such as Georg Wilhelm Friedrich Hegel (1770–1831) chose to construct a metaphysico-religious view of "Absolute Spirit," a highly suggestive concept that draws on pantheistic

ideas of the identity of the universe and God, together with theistic ideas concerning the necessary "self-consciousness" of God. The peculiarity of Hegel's view lies in his notion that the mind of God becomes actual only via the minds of his creatures.

While Kant and Hegel by no means excluded religious topics or even religious sentiments from their work, many of their subsequent readers appropriated only the negative conclusion that could be distilled from their critique of traditional theism. Thus it is unsurprising that they were followed either by fideistic thinkers such as Søren Kierkegaard (1813–1855) or else resolutely antitheistic thinkers, of whom Ludwig Feuerbach (1804–1872), Arthur Schopenhauer (1788–1860), Karl Marx (1818–1883), Friedrich Nietzsche (1844–1900), and Sigmund Freud (1856–1939) were the most influential. This atheistic legacy was prosecuted still further in the twentieth century by luminaries of the Continental tradition such as Martin Heidegger (1889–1976) and Jean-Paul Sartre (1905–1980), whose philosophical systems leave no room for God.

The Twentieth Century

Only in the twentieth century did it become commonplace for philosophers in the West to engage with the central concerns of their subject without so much as raising questions about God. A collective penchant for empiricism in both Britain and America prompted Rudolph Carnap (1891–1970) and A. J. Ayer (1910–1989) to argue that all religious claims are meaningless. Other influential philosophers such as Willard Van Orman Quine (1908–2000) essayed a metaphysics and epistemology that disqualified many of the assumptions on which a theistic philosophy could be based. It was only with the move away from strict verificationism and the development of a greater pluralism in so-called "analytic philosophy" that religious topics reappeared in philosophical thought. The work of Ludwig Wittgenstein (1889–1951), while by no means concordant with earlier traditions of metaphysics, was believed by many of his followers to have a broadly theological outlook whereby religious practices and belief could be shown to have dignity and purpose, as well as a discursive integrity that insulated them from the critiques of Hume and Kant.

In the final decades of the twentieth century, philosophers such as Alvin Plantinga in the United States and Richard Swinburne in Great Britain set about the task of applying the rigorous standards of analytic philosophy to the discussion of traditional theological subjects. The effect of their work was to increase the institutional profile of the subject known in the early 2000s as "the philosophy of religion" in professional philosophy. In many senses, this subdiscipline provides the main conceptual forum in which philosophers can debate the claims of the Western theistic tradition.

Notwithstanding the reemergence of the philosophy of religion, it is important to stress that philosophy has become a secular discipline in most Western countries. Yet the fact that it is practiced by philosophers with little or no faith or indeed historical understanding of religion does not negate the fact that throughout the ages philosophy has been closely connected to religion and speculative theology. While the impulse to philosophize and to reflect on ourselves and the world around us

may or may not have its origins in a protoreligious sentiment or disposition, the very nature of philosophical reflection will always dispose itself to intrude upon matters connected with religion and concepts of divinity. Even in this godless age, it is to be expected that the uneasy and, at times, vicarious relationship between philosophy and religion will continue.

PHILOSOPHY OF MIND.

This entry includes two subentries:

Overview
Ancient and Medieval

OVERVIEW

Issues related to the mind are an important component in contemporary philosophy. While colleagues in psychology,

neuroscience, and cognitive ethology do empirical scientific studies of the mind, philosophers tend to focus on more general questions: What is the nature of mind, such as it may be found in *any* creature or thing? Philosophers tend to concentrate on questions such as: How is mind related to body? and How are we to understand the nature of such operations of mind as believing, knowing, perceiving, thinking, willing, understanding, and the like? Philosophers ask as well about the nature of self, of consciousness, and of the relation of these to the capacity for language.

Early Ideas

It is generally agreed that the question What is mind?—with all its modern connotations—is not found in ancient texts. The question first emerges clearly in the philosophical work of René Descartes (1596–1650). For centuries, psychological and philosophical inquiry proceeded together. The term *psychology* has its roots in the Greek term *psyche*, which has come to be translated as *soul*. In very early texts *psyche* is associated with breath, the loss of which is thought to result either in unconsciousness or death. In the work of Plato (c. 428–348 or 347 B.C.E.), the soul is taken to be simple and immortal. It is the soul—and in particular that rational part of soul, *nous*—that apprehends the Forms, and, in life, controls the body's passions. It is with Aristotle (384–322 B.C.E.) and his more biological orientation that the study of *psychology* is launched (although it is not until the late nineteenth century that the discipline is fully defined). In Aristotle we find the idea of the soul as the form of a living body, a form that has different aspects in plants, in nonrational animals, and in human animals.

Descartes's Legacy

The contemporary study of mind was given its shape by the seventeenth century philosopher René Descartes. In his *Meditations on First Philosophy*, Descartes begins with questions about what he can know. He carefully peels away from all that he has taken to be true anything that can be doubted. Descartes claims to reach the limits of doubt when he considers that, although he can doubt the existence of his body, he cannot doubt the existence of his mind. Descartes interestingly (and importantly) conducts the entire of his *Meditations* in the first person singular. He then presents the conclusion of his doubt thus: “*I am, I exist*, is necessarily true whenever it is put forward by me or conceived in my mind.” (In another of his works, he formulates the conclusion thus: “I think, therefore I am.”) This conclusion then launches him onto an examination of what he (this *I*) is. He considers, and rejects, the suggestion that he is a body (he can, after all, doubt the belief that his body exists). Thinking, however, is “inseparable from me.” Descartes concludes that he is a thinking thing, “a thing that doubts, understands, affirms, denies, is willing, is unwilling, and also imagines and has sense perception.” Descartes interestingly considers sense perception and points out that, although the objects of sight and sound may not exist, it is still indubitable that one has certain visual and auditory perceptions—that one *seems* to see and *seems* to hear. By the end of the *Meditations*, Descartes has set the stage in the philosophy of mind for the ensuing generations: Mind and body are distinct, each with a different essential nature. The world

can seem exactly as it is to a mind, while the bodies to which we take them to correspond may not exist; our world could be the result of the machinations of an evil demon. This is the metaphysical and epistemological position that Descartes bequeathed to future generations of philosophers.

This Cartesian philosophy of mind contains several key aspects. First, it establishes the position known as Cartesian, or substantial, dualism (mind and body are distinct substances). Second, it sets up the possibility of various kinds of skepticism concerning not only the external world, but also the existence of other minds. Third, it sets forth the mind as an arena that is private to the thinker, and—as far as what one *seems* to perceive—an arena whose contents are infallible and incorrigible. Fourth, it includes in the term *thought* (Latin *cogitatio*) not only understanding, willing, imagination, and the like, but also feeling. Fifth, it represents a deliberate rejection of the ancient way of thinking about the soul. Descartes holds that mind is not part of the soul but the “thinking soul in its entirety.” The result of this shift is significant. Whereas the ancients allowed souls to all living organisms, with mind restricted to human animals, Descartes holds that the soul or mind is to be found only in human animals. All nonhuman living creatures are, accordingly, mere mechanisms. Interestingly, Descartes views the human body as a mere machine, albeit one to which God has endowed a mind or soul.

Philosophy and Psychology

The study of mind, from these Cartesian roots, can be seen to take two identifiable paths (although these paths were not clearly distinguished for some considerable time). One path is through philosophy, where questions concerning mind remain closely connected with other philosophical issues such as the nature of the self, the mind’s knowledge of the world, and the nature of perception, belief, memory, and the emotions. The other path leads from philosophy to the development of psychology. The work of the British empiricists (John Locke [1632–1704], George Berkeley [1685–1753], David Hume [1711–1776])—in particular their sensationalism and associationism—was taken up in the eighteenth and nineteenth century and developed into a more empirical study of mind. This new study of mind gained momentum both in Great Britain (with associationalists such as David Hartley [1705–1757], James Mill [1773–1836] and John Stuart Mill [1806–1873], and Alexander Bain [1818–1903], as well as with the more Darwinian-inspired work of Sir Francis Galton [1822–1911], James Ward [1843–1925], and G. F. Stout [1806–1944]), in France (with the work of Etienne Bonnot de Condillac [1715–1780] and Claude-Adrien Helvétius [1715–1771]), and in Germany (with the work of Ernst Heinrich Weber [1795–1878], Gustav Theodor Fechner [1801–1887], Friedrich Beneke [1798–1854], Hermann von Helmholtz [1821–1894], Wilhelm Wundt [1832–1920], and others).

This study transferred to the United States in the very early twentieth century, where it gave rise (by way of revolt against associationalism) to the highly influential school of behaviorism under the direction of J. B. Watson (1878–1958) and B.F. Skinner (1904–1990). Behaviorism was a rejection of much of Descartes’s legacy—of his dualism, as well as of his

use of an introspective method in the study of mind. Behaviorists favored a physicalism rooted in the study of responses to stimuli in the environment. Behaviorist doctrines are to be found in both psychological and philosophical studies of the mind at this time. From around the middle of the twentieth century, behaviorist doctrine came under heavy attack. The American linguist Noam Chomsky published an influential review of Skinner’s work in which he pointed out that it is not possible to come up with a reduction of, say, a belief in terms of behavior without mentioning other mental states such as desire. The elements of the mind work *together* to produce behavior. The hope of finding a behaviorist reduction of mind seemed doomed.

With the demise of behaviorism came a renewed interest in mentalist causes and the rise of cognitive psychology. An interaction between philosophy and cognitive psychology emerged in the mid- to late twentieth century in the form of the philosophy of psychology, the study of conceptual issues in psychology using many of the methodological tools of the philosopher. The philosophy of psychology is firmly grounded in empirical studies of the mind. Questions concerning the nature of mental representation, mental imagery, what it is to have a concept, and whether there are innate ideas figure high on the agenda of these philosophers of psychology. Also around this time, there developed a multidisciplinary approach to the study of mind, *cognitive science*, encompassing philosophy, cognitive psychology, neuroscience, linguistics, and computer science. What these practitioners from different areas of study share is a belief that the workings of the mind can be modeled on the workings of a computer—that the mind is an information processing system and a representational device. Cognitive science incorporates work that stretches from artificial intelligence (AI) to parallel distributed processing (PDP or connectionist networks). It has been fueled by work such as Chomsky’s on generative grammar in linguistics, the work of the American philosopher Jerry Fodor on the language of thought in philosophy and psychology, and the work of the psychologist David Marr on visual processing. The American philosopher John Searle, with a thought experiment called “the Chinese Room,” has played the gadfly to much of the work in cognitive science. What Searle questions is the very idea that a computer program, a mere syntactic engine, can be identical to a mind, a semantic engine. In effect, we are back trying to understand the relationship of mind to body.

Identity Theory, Eliminativism, Functionalism, and Anomalous Monism

Attempts to get a grip on mind and to understand its relationship to body proliferated in the twentieth century. In the 1950s, J. J. C. Smart and U. T. Place advocated a form of identity theory. As these physicalists (or materialists) put it, consciousness is a brain process just as lightening is electrical discharge or water is H₂O. This identity was famously challenged by the American philosopher Saul Kripke who, with his “Cartesian intuitions,” argued that such an identity could only be maintained if it could be explained why it seemed to one that there could be a brain process in the absence of experience and experience in the absence of the brain process.

Alternative accounts of mind were proposed. One highly influential account, functionalism, took its cue from the development of information processing and computer technology, with its important distinction between the level of implemented software and that of implementing hardware. According to functionalism, mental states are the upshot of various causal impacts from the world, and they, in their turn, typically cause certain behavior as well as other mental states. Functionalism was hailed as an advance on both behaviorism and physicalism. Unlike behaviorism, functionalism is committed to internal, causal states. Unlike physicalism, functionalism is defined as a relation among states, thus leaving open the possibility that what realizes this function may vary from individual to individual. In the words of one early exponent, the American philosopher Hilary Putnam, our brains could be made up of gray matter or Swiss cheese; what matters is the functional organization of the system. Another important proposal for the understanding of mind came from the work of another American philosopher, Donald Davidson, who aimed to reconcile the irreducibility of mind with a commitment to monism. Davidson's anomalous monism draws a distinction between type and token identity theories. Earlier identity theorists—for example, Place and Smart—aimed to identify types of mental states with types of physical states (e.g., pain with c-fiber firing); Davidson insisted that only token mental states could be identified with token physical states (e.g., my pain at noon on 3 January 2004 with a state of my brain on that date at that time). Ontological monism (all that there is, is physical) can now be combined with conceptual dualism (mental concepts are distinct from, and cannot be reduced to, physical concepts). The principle of rationality governs the mental realm, but not the physical. With this distinction Davidson hoped to reconcile our culture of materialism/physicalism with an understanding of those characteristics of mind that make us free and moral agents.

By the turn of the twentieth century, it had become clear that talk of “the mind” is too broad and that there may be issues to do with experience and sensation that are distinct from those that arise in connection with such mental states as believing, desiring, and the like (the so-called propositional attitudes). It was thought that, while functionalism, for example, might provide a plausible account of belief, it encountered real difficulties when it came to accounting for experience. This thought was reinforced with the work of the American philosopher Thomas Nagel, who pointed out that human beings—as well as other animals such as bats—enjoy conscious experiences: there is something it is like to *be* that organism, something it is like *for* that organism. Nagel labels this the “subjective character of experience” and he argues that it is hard to see how this subjectivity could be captured in an objective science of the brain. Nagel, like Descartes before him, wants to understand just how the working of the grey matter that constitutes our brain could possibly explain the way the world seems to us—explain the dazzle of fireworks or the taste of chocolate. The philosopher Colin McGinn has argued that there is a very simple explanation here, but it is not one our human minds will ever be able to comprehend. Those working in the scientific study of mind have vigorously rejected this mysterianism. One empirically oriented American philosopher, Daniel

Dennett, claims to be able to reconcile our view of ourselves as rational, free, and conscious agents with a belief in the completeness of science by arguing that the former constitutes an ineliminable level of description of our behavior. Others, like the American philosophers Paul and Patricia Churchland, argue that psychological concepts such as belief, desires, and so on produce no definable brain activity and therefore these concepts should form no part of a completed science of mind.

The study of mind extends from philosophy to psychology and has expanded more recently to include neurophysiology, as well as cognitive ethology. The race is on to look ever more closely at the workings of the brain and at the behavior of all animals. On the one hand there is the age-old fascination with the idea of man as a machine, while on the other there is the hope that by understanding the fine-tuning of behavior we will find evidence that we share mentality with non-human animals.

Ludwig Wittgenstein

The Cartesian legacy is strong and everywhere apparent in discussions of the mind. It received a penetrating critique in the early part of the twentieth century, however, in the later work of Ludwig Wittgenstein (1889–1951), such as his *Philosophical Investigations*. Wittgenstein can be taken to have rejected the introspective method as well as the dualism of Cartesianism, and for this reason is sometimes said to be a behaviorist of sorts. It is, however, best to avoid this comparison. What Wittgenstein urges is that when we study the mind, we need to accept and understand the fact that the mind has both a first and a third person aspect; that is, each one of us knows the mind both from the “inside” as a subject and from the “outside” as the observer of other subjects. For Wittgenstein, the study of mind needs to be taken to be the study of the concept of mind, a concept that has application to oneself as well as to others. Wittgenstein's private language argument is interpreted as a critique of the very idea that one can make sense of the application of mental states to oneself in the absence of the acquisition of a concept—an acquisition that takes place through the use of language and in a social setting. Through the interaction with others, the child comes to understand that pain, for instance, is something that happens when, for example, one encounters sharp objects and reacts with a cry. The child's nature is such as to respond to its environment in certain ways; this nature and this response form the basis of the child's use of language and contribute to the development of the child's concepts. In this way the child develops concepts that have application both to the child and to others. With its constant reminder of the role that others play in the way we understand the mind, Wittgenstein's work offers a fundamental alternative to Cartesian individualism.

Conclusion

The study of mind in the early 2000s has been invigorated through the study of disorders of the mind. Appreciating the ways in which mind can break down can add to our understanding of what it is that we are studying. The mind is at once most intimately familiar to each of us and at the same time most mysterious and elusive to our understanding. While

the human mind retains its preeminence, it is a real question whether it represents something continuous or discontinuous with what we find in other animals, and in machines. While materialism is the dominant culture, we must not forget the observations of Descartes and others that make it difficult to understand just how a mere body can produce the various activities we associate with mind. The history of mind is the history of our attempt to explain how our experiences, perceptions, thoughts, emotions, and the like can be fully understood in relation to the world of flesh and blood.

Anita Avramides

ANCIENT AND MEDIEVAL

The mind is a modern notion. But like many modern notions, it did not emerge from nowhere. What contemporary philosophers mean when they talk about the mind is part of a long tradition, stretching back through the Middle Ages to Greek and Roman antiquity.

The mind in its modern sense is best understood in opposition to the body, the extended, flesh-and-blood entity that it seems to inhabit and move at will. It was René Descartes (1596–1650) who popularized the idea that humans are two things, mind and body, and who argued further that the mind is a completely separable and immaterial substance capable of surviving the death of the body. The influence of Cartesian dualism can be seen in the fact that even in the twenty-first century, competing viewpoints tend to be defined in terms of it.

Although dualism in its strongest form originated with Descartes, there are some similarities with earlier accounts.

Descartes might even have been inspired by them. Unfortunately, this has proved to be a stumbling block for many modern scholars, who, because their thinking has been shaped by the Cartesian paradigm, cannot help but see earlier philosophers as proto-Cartesians or read their works as contributing to the solution of Cartesian problems. While this makes for interesting reading, it does a disservice to ancient and medieval authors because it refuses to understand what they were trying to do on its own terms. But Descartes's agenda differs from Plato's, which is different again from that of Aristotle, Epicurus, Chrysippus, Plotinus, Augustine, Thomas Aquinas, and John Buridan.

Ancient Greek and Roman Views

The main precursor of the modern concept of mind is the ancient Greek notion of soul (*psyche*), which was originally used to mark the difference between things that are alive and things that are dead. Conceptually, it was related to breath (*pneuma*), and was thought to come in degrees corresponding to different states of consciousness. Thus, a dead man was said to have lost his *psyche* entirely, whereas a sleeping or fainting man has lost enough of it to lose consciousness, though that too would bring him a step closer to death. The soul is composed of extremely light and tenuous matter, variously identified with pure and "breathable" elements such as air (as by the philosophers Thales [c. 625–c. 547 B.C.E.] and Anaximenes [570?–500? B.C.E.]) or fire (by Heraclitus [c. 540–480 B.C.E.]). Most pre-Socratic thinkers would have understood the expression "he breathed his last" literally, and seen the dying gasps of a Homeric warrior, say, as the exhalation of his soul. If *psyche* could exist in a disembodied state—and it is doubtful whether most early Greek philosophers thought that it could—it would have been as a shadowy or ephemeral form, like the denizens of Hades.

With Plato (c. 428–348 or 347 B.C.E.), philosophers began to ask more sophisticated questions about how one can feel, think, possess knowledge, and choose rightly. Plato's strategy here was to divide the soul in terms of its capacities, producing the first faculty psychology in the western tradition.

In his earlier writings, Plato came closer than any other ancient or medieval philosopher to advancing a dualist account like that of Descartes. In the *Phaedo*, he took immortality to be an essential feature of the soul, so that "mortal soul" is a contradiction in terms. Thus, "when death comes to a man, the mortal part of him dies, but the immortal part retires at the approach of death and escapes unharmed and indestructible" (106e). But a soul immortal by definition has more in common with what is cosmic and divine than with anything in the visible realm—such as its own body, for example—which is why Plato shows little interest in exploring its everyday operations. The soul's union with the body is not its natural state; in fact, the whole point of philosophy is to prepare the soul for its release from the "prison" of the body (80c–84b).

Plato is more forthcoming in his later works, where the concept of the soul plays a major role in his explanation of moral conflict and human action. From the fact that one can be affected by two or more desires simultaneously, he infers

that the soul cannot be unitary, since it is impossible for the same thing to act in opposite ways at the same time (there are obvious affinities here with the logical principle of non-contradiction, which Plato learned from Socrates [c. 470–399 B.C.E.]). Accordingly, in the *Republic* he identifies three distinct parts of the soul—reason (*nous*), passion (*thumos*), and appetite (*epithumia*)—and posits these as the source of conflicting desires (IV, 439d–e). Reason rules over the soul with wisdom, but opposed to it is appetite, the irrational part of the soul “with which it loves, hungers, thirsts, and feels the flutter and titillation of other desires” (439d). Reason and appetite would remain in unending combat but for the intervention of passion, the “spirited” part of the soul that helps reason subdue appetite. Plato has in mind here the experience of steeling our resolve, when we angrily force ourselves to do something we don’t want to do because reason has judged it to be the best course of action. What is important about this model, however, is the elevation of rationality to the dominant position in the soul, and conversely, the denigration of appetite as an irrational force that threatens to destroy our well-being. In the *Phaedrus*, Plato likens reason to a charioteer trying to control two horses: a good horse (passion), who “needs no whip” because he is driven by the command of reason alone, and a bad horse (appetite), who is hard to control and who would run the chariot into the ditch if left unchecked (253d–254e). Plato saw no redeeming value for the emotions in human moral life, though anger, at least, could sometimes be placed in the service of reason.

Aristotle (384–322 B.C.E.) took the study of the soul in a less speculative direction. He wrote an entire treatise on the soul—*Peri psyche*, or *De anima* in its Latin translation—that views the soul as a natural phenomenon. The soul is defined as “an actuality of the first kind of a natural organized body” (412b4): that which makes the body alive and capable of performing its characteristic functions. Aristotle divides these into vegetative powers, concerned with nutrition and growth; sensory powers (that is, vision, hearing, taste, smell, and touch, as well as the internal senses of imagination and memory); and intellectual powers (understanding, assertion, and discursive thinking). In his broader taxonomy of life forms, these correspond to the souls of plants, brute animals, and human beings, respectively, with the higher forms subsuming the powers of those lower in the hierarchy (so brute animals are capable of nutrition and sensation but not understanding, whereas human beings exhibit all three capacities). Only the third capacity is relevant to the modern conception of mind, though it should be noted that this is far from being a dualist conception. Aristotle’s intellect is a perfection of the organic unity of body and soul, and although he concedes that the activity of thinking is “separable, impassible, and unmixed” (430a17), thinking cannot occur without sensory images.

The Hellenistic period was a time of great philosophical activity, but unfortunately, most of the primary sources have been lost. Thankfully, scholars have managed to piece together some of what was said from fragments of texts and reports in the work of other philosophers. Three figures and their representative schools were especially important. Epicurus (341–270 B.C.E.) revitalized the materialist doctrine of earlier atomists such as

Democritus (470–360 B.C.E.), arguing that the soul is composed of extremely light and mobile atoms (thereby accounting for the spontaneity of sensation), whose unpredictable “swerves” are the source of human free choice. Particular features of living things result from the blending of soul atoms, of which there are four different types, each with its own psychological effect: fiery (bodily heat), air-like (rest), wind-like (movement), and a fourth, nameless atom responsible for sensation. The soul is also quickly dispersed at death, its atoms moving on to rain invisibly through the cosmos until joining together with other atoms to make new things. This led Epicurus to argue that “that most frightful of evils, death, is nothing to us, seeing that when we exist death is not present, and when death is present we do not exist” (*Letter to Menoeceus*, 124–25; Long and Sedley, 24A). Death is literally nothing to an Epicurean, though whether this is sufficient to dispel the fear of death remains an open question.

The Stoics were another Hellenistic school with a materialistic conception of the soul, though their theory was highly nuanced and more teleologically sophisticated than even Aristotle’s. Rejecting the tripartite accounts of Plato and Aristotle, they held that the soul is unitary. As Chrysippus of Soli (c. 280–206 B.C.E.), one of the leading Stoics, explained, the soul is a mixture of air and fire (*pneuma*) whose “parts flow from their seat in the heart, as if from the source of a spring, and spread through the whole body. They continually fill all the limbs with vital breath, and rule and control them with countless different powers—nutrition, growth, locomotion, sensation, impulse to action” (Calcidius, *Commentary on Plato’s Timaeus*, 220; Long and Sedley, 53G). Because their *pneuma* exists in a certain tension, animal souls can register sense impressions and initiate impulses (*hormē*), or move towards what they desire. Humans are higher still because they are capable of assenting to (or rejecting) these impressions. Assent is just rational impulse, “a movement of thought towards something in the sphere of action” (Stobaeus, 2.86, 17–87, 6; Long and Sedley, 53Q). Thus, words are sounds arising through our vocal apparatus from impulses in the heart, so that on the Stoic view, “language is sent out imprinted, and stamped as it were, by the conceptions present in thought” (Galen, *On Hippocrates’ and Plato’s Doctrines*, 2.5, 9–13; Long and Sedley, 53U).

Plato’s teachings were refined throughout the Hellenistic period, culminating in the movement that later came to be known as Neoplatonism. Its foremost practitioner was Plotinus (205–270 C.E.), who offered an original synthesis of the Platonic and Aristotelian perspectives, advancing the former as the model of intelligible reality and the latter of sensible reality. There are three principles in his metaphysical system: the One, the utterly transcendent and unknowable source of everything in the universe; Intelligence or Mind (*nous*), which is where all eternal and necessary truths are actively thought; and Soul, which is the discursive manifestation of Mind’s activity in lesser beings throughout the cosmos. Intellectual thinking is a quasi-mystical act through which we move beyond ourselves and our particular bodily circumstances to grasp eternal principles: “We are not separated from the One, not distant from it, even though bodily nature has closed about us and drawn us to itself” (*Enneads*, VI, 9.ix). From the Stoics,

Plotinus borrows the concept of “seminal reasons,” or patterns implanted in Soul by Mind, which Soul then uses to produce the sensible world. This idea was later picked up by Christian thinkers such as St. Augustine of Hippo (354–430), who explains providence in terms of seminal reasons existing eternally in the mind of God.

Medieval Views

Two main factors shaped medieval thinking about the mind or soul. The first is religious doctrine. The idea that God freely created the world from nothing is absent from ancient Greek philosophy, but more or less definitive of medieval philosophy in all three monotheistic traditions: Christian, Islamic, and Jewish. In the Western or Christian tradition, it was expressed in terms of providence, the idea that creation is a product of God’s wisdom and goodness, and that this is manifested in the orderly structure of the universe all the way down to its smallest details. Needless to say, it would have struck an ancient Greek philosopher as absurd that something could be made from nothing, or that a divinity—especially an omnipotent divinity—would care what happens to beings less powerful than it. But such doctrines changed the way the mind was understood, granting pride of place to the human soul and human modes of cognition. Since humans are made in God’s image (Gen. 1:26), their own nature must in some way reflect the divine.

The second factor is simply physical access to ancient texts, which became more and more difficult in the West until direct knowledge of most Greek sources was lost for nearly six centuries. Philosophical psychology was especially hard hit, as none of the works mentioned above was available after the sixth century, and eventually only Aristotle’s *De anima* was recovered in a form that could have any direct influence. This meant that medieval thinkers had to learn about ancient theories indirectly, via textbook summaries and discussions by early Church fathers who were trained in or otherwise influenced by pagan schools of philosophy. Platonic, Epicurean, Stoic, and Neo-Platonist doctrines went underground, as it were, and sometimes came to be defended by philosophers who were unaware of their true origins.

Augustine is the most important medieval philosopher in the sense that his teachings set the agenda in Western thought for the next millennium, including the kinds of questions that were asked about the soul. For Augustine, the human mind is the foremost expression of the truth of *Genesis* 1:26, and the doctrine of the Trinity provides the mode of resemblance. Just as God is three persons (Father, Son, and Spirit) in one being, so the mind is three aspects or activities in one substance: “Since then these three, memory, understanding, will, are not three lives but one life, nor three minds but one mind, it follows certainly that neither are they three substances but one substance” (*De trinitate* X, 11.18). It is possible that Descartes was influenced by Augustine’s use of the Latin term *mens* or “mind” here (*anima* was used for the souls of living things more generally), except that Augustinian *mens* always has a dense layer of Neo-Platonic and Christian associations attached to it that would have certainly made Descartes cringe. Augustine also thought that because it is immediately present to

itself, the mind knows itself and that in knowing itself, it knows God as well. There are remarkable similarities between Augustine’s argument that a man who knows he is alive cannot be deceived about this fact (from *De trinitate* XV, 12.21), and Descartes’s more famous anti-skeptical argument, the “I think; therefore, I am,” of his *Meditations* II.
