PREFACE

Seeking to present a comprehensive work that discusses pivotal topics of human concern, the editors at Charles Scribner's Sons and a multidisciplinary editorial board of nineteen professors and two librarians designed the *New Dictionary of the History of Ideas (NDHI)* with an emphasis on the diverse perspectives of thinkers around the globe. This six-volume set, which contains all new and original entries, addresses topics in the fields of history, anthropology, and women's studies; philosophy and religion; politics, law and economics; area studies and ethnic studies; literature, performance, music, and the visual arts; communication studies and cultural studies; and science, engineering and medicine. The first *Dictionary of the History of Ideas* was published by Scribner's in 1973–1974 and swiftly became a landmark of scholarship on European thought primarily. The *NDHI* extends this legacy into the twenty-first century with entirely new content on Africa, Asia, Europe, Latin America, North America, and the Middle East. With many more articles than the original edition, hundreds of illustrations, as well as profusely illustrated visual entries, the *NDHI* provides an expansive cross-cultural and global outlook on the history of ideas.

The first *Dictionary of the History of Ideas* is known especially for the history of influential texts. Most significantly, while all articles of *NDHI* discuss influential texts and provide an up-to-date bibliography, there are very few articles in the *NDHI* that are primarily the history of texts. Articles may give evidence of oral communication, such as in a public debate of politicians or in a religious person sharing beliefs and sacred practices with another individual; furthermore, articles on contemporary culture analyze the impact of high technology communication such as the cinema and the Internet. Some authors evocatively describe a thinker's vision of an idea, while others reenact conversational philosophical exchanges. Articles may also depict the experiential expression of ideas in such practices as a social science survey of voter attitudes, patriotic ritual of flag-waving, or political protest.

The field of the history of ideas, in the mid-twentieth century, served as a trendsetter in establishing "interdisciplinarity" in academia, encouraging the pursuit of ideas across the borders of academic disciplines. Perhaps the greatest accomplishment of the *NDHI* is its focus on the most influential multidisciplinary practices, such as "Mysticism," "Mathematics," and "Reading," which have ancient origins, and "Representation: Mental Representation" and "Bioethics," which are creations of our own times. The *NDHI* aims to assist the reader to participate in a wide range of methods and practices of scholarly and popular inquiry.

The Organization of the *NDHI*

From "Abolitionism" and "Absolute Music" to "Zen" and "Zionism," the *NDHI* is arranged alphabetically. Following this introduction is an entry on global historiography that introduces the traditions of history-writing in specific geographical areas. The start of each volume also contains the multifaceted "Reader's Guide," a guide to help high school students, general readers, college and university students, and scholars organize their reading systematically according to their preferences: media of communication of ideas (whether visual images, oral traditions or high technology media, practices or rituals, or mainly texts), geographical area, chronological period, disciplinary or interdisciplinary field. For further reference there is an index at the close of the sixth volume.

Chronological Length and Area-Studies Breadth

The *NDHI* is designed to introduce a general audience to the main ideas and movements of global cultural history from antiquity to the twenty-first century. The chronological scope of the *NDHI* permits examination of a topic over centuries and millennia of development. For example, article

range chronologically from ideas created by humanity several millennia ago, such as “Animism” and “Textiles and Fiber Arts as Catalysts for Ideas,” to such contemporary concepts as “Computer Science,” “Critical Race Theory,” and “Media, History of.” Articles also analyze newly conceived ideas, such as “Sexual Harassment,” a recent label for an age-old phenomenon, as well ideas labeled long ago such as “Untouchability,” “Yin and Yang,” and “Cycles.”

The *NDHI* focuses not only on the ideas themselves (as tends to be the case in companions, dictionaries, and encyclopedias of philosophy), but also on the cultural environments within which those ideas arose, on the transformations and intermingling of the ideas, and on their influence far in time or place from site of origin. The editorial board, which included specialists on Africa, Asia, Europe, Latin America, the Middle East, and North America, invited hundreds of distinguished scholars from around the globe to explore the impact of ideas from their particular areas of expertise. The editorial board also utilized a variety of rubrics to ensure that the alphabetically arranged volumes contain a balance of approaches to the exchange of ideas between individuals and between peoples.

Transformations in Communication

The *NDHI* aims to explore the oral, visual, participatory, and textual processes by which communities communicated, instilled, and ritualized their ideas. A cluster of articles by area specialists on “Communication of Ideas”—which appears in the Reader’s Guide under the headings Geographical Areas and Communication of Ideas—introduces the changing means of communication across the centuries in Africa, the Americas, Asia, Europe, the Middle East, and Southeast Asia, respectively. The authors of these entries discuss the continuation of oral techniques after the emergence of literate elites, as well as the growing importance of the mass media today. The authors consider the impact of the printing press and of journalism on the distribution of ideas, and discuss the trade routes and electronic media that spread ideas from one continent to another. The cluster on “Communication of Ideas” describes the practices of religious leaders, educators, and governing officials who instill religious, disciplinary, and civic rituals and approaches into daily life. The Reader’s Guide suggests “Cinema” and “Third Cinema” as well as the visual essay “Protest, Political” as articles for further reading on communication. The *NDHI* vividly narrates and illustrates the multiple ways in which cultures communicate ideas.

Eight authors contributed to a cluster on education, focusing on the role of diverse forms of education in the transmission and transformation of ideas in Asia, China, Japan, India, Europe, Islam, and North America, respectively; there is also an article on the contemporary movement to which the *NDHI* aims to contribute, “Global Education.” One will find all these articles listed under Education in the Reader’s Guide section on Liberal Arts Disciplines. For developments in higher education, “University: Overview” concentrates on Europe and “University: Postcolonial” on Africa. “Childhood and Child Rearing” discusses the history of childhood, the education of children, and the changing views of what it means to be a child. Two related articles on “Dialogue and Dialectics” focus on the methods for student learning taught by Greek “Socratic” education and by Jewish “Talmudic” education. The practices of evaluation are the focus of “Experiment” and “Examinations Systems, China.” In “Pan-Africanism,” “Pan-Arabism,” “Pan-Asianism,” “Pan-Islamism,” and “Pan-Turkism,” five experts explain the recent rapid development, across wide geographical areas, of unifying cultural and educational movements of identity politics.

Focus on a Geographical Area or Global Chronological Period

Readers may choose to focus on the cultural and intellectual history of a specific area of the globe. For this reason, articles are categorized by geographical focus in the Reader’s Guide under the heading Geographical Areas.

Example of Area Studies. For the study of sub-Saharan Africa, the Reader’s Guide recommends the entries “Communication of Ideas: Africa and its Influence” and “Communication of Ideas: Orality and the Advent of Writing.” For anthropological approaches on sub-Saharan Africa, the reader is advised to turn to “Ethnography.” The visual arts of Africa are discussed in “Arts: Africa” and “Architecture: Africa.” For sacred texts and the practices that accompanied them, see “Islam: Africa” and “Religion and the State: Africa.” Among contemporary movements, consider “Feminism: Africa and African Diaspora” and “Postcolonial Studies.” For political philosophies and governmental practices, see “Socialisms, African” and “Democracy, Africa.” “Philosophies:

African” is a text-based history of African philosophical ideas. For African responses to external influences, see “Westernization: Africa.” For further influences of African thought on other continents, see “Black Atlantic,” “Diasporas: African Diaspora,” “Religion: African Diaspora,” and “African-American Ideas.” As one will find in looking into the index under “Africa,” as well as in the Reader’s Guide under “Africa,” many of the global entries discuss African intellectual history.

Example of Period Studies. Readers choosing to focus on a chronological period are encouraged to consider the period globally. The category Chronological Periods in the Reader’s Guide is divided into the broad periods Ancient, Dynastic, Early Modern, Modern, and Contemporary; the chronology at the back of Volume 6 shows events in the global history of ideas. For example, if one seeks out modern and contemporary intellectual discourse on politics, there are several clusters of articles by area studies specialists in the Modern and Contemporary categories. The series of articles on “Nationalism,” “Empire and Imperialism,” “Colonialism,” and “Anticolonialism” provide a multifaceted introduction to the political and cultural turmoil of the nineteenth and twentieth centuries. To consider discourse on economics, see “Economics,” “Scarcity and Abundance, Latin America,” “Capitalism,” “Consumerism,” “Work,” and the composite article “Globalization.” For an introduction to postcolonial ideas from twentieth- and twenty-first-century authors around the globe, see “Postcolonial Theory and Literature.”

Disciplines and Interdisciplinary Studies

The comprehensive entries on specific disciplines (e.g., “Historiography” and “Education”) and interdisciplinary studies (e.g., “Ecology” and “Cultural Studies”) provide cross-references to relevant articles on ideas, ideologies, movements, and methods in the A–Z volumes (the disciplines are listed in the Reader’s Guide under Liberal Arts Disciplines). Let us consider the field of religious studies.

Organization of religious studies. The world religions receive an introductory composite entry in “Religion,” which is organized globally and concerned with the transmission of religion by both text and oral tradition. Readers might consider also “Sacred Texts” and “Prophecy.” One will find composite entries on “Christianity,” “Judaism,” and “Islam,” as well as individual entries on “Buddhism,” “Hinduism,” “Jainism,” and “Pre-Columbian Civilization.” Relevant to philosophy, as well as to religion, are the articles on “Agnosticism,” “Atheism,” “Deism,” and “Confucianism.” For Asian religions, it is important to also look at “Chinese Thought,” “Japanese Philosophy, Japanese Thought,” and “Meditation, Eastern.” The practices of religion are the focus of “Ritual: Religion,” “Monasticism,” and “Fundamentalism” and are also a concern of the six-part composite on “Mysticism.” “Orthopraxy” explicitly focuses on strict rules for religious practices, in contrast to the focus on strict rules for religious belief in “Orthodoxy.” The physical locations that provide a geographical center to religious rites are the focus of the visual essay “Sacred Places.”

The reader thus might learn how religion in its multitude of variations has been spread orally, by text, by disciplined practices, and by sacred objects and sacred locations. The impact of cultural history, cultural studies, and anthropology on current practices in the history of ideas is very evident in many articles in this encyclopedia.

Oral, Visual, Experiential, and Textual Transmission of Ideas

The section titled “Communication of Ideas” in the Reader’s Guide indicates articles about oral communication, articles showing visual expression, articles discussing the spread of ideas through practices and rituals, and articles based mainly on history of important texts. The aim of this categorization is to feature the main types of historical evidence the author used in the writing of the entry.

Oral ideas. For further exploration of oral communication, one might consider “Everyday Life,” “Oral Traditions,” and “Myth.” The entry “Language, Linguistics, and Literacy” further enhances understanding of the oral traditions underlying language development. The entry “Wisdom, Human” focuses on global examples of popular wisdom traditions, in contrast to the entry “Knowledge,” which highlights the learning of books. “Theater and Performance” and “Musicology” focus on those liberal arts that rely on communication by sound waves.

Visual ideas. People often express their thoughts and their ideas visually. There are more than 400 illustrations throughout the *NDHI* to make that point, to visibly show the correspondence

between ideas expressed in images and ideas spoken or written. Readers are encouraged to thumb through the volumes and allow the images to pique their curiosity. In addition, there are fifteen special visual essays in which the images are the focus of the entry. The illustrations are offered with meaningful commentary to explain their context and analyze their content. For example, the visual essay “Gesture” shows human communication by hand and face, while the entry “Maps and the Ideas They Express” analyzes the conceptual mapping processes of diverse historical cultures. “Gender in Art” is one of several “gender” articles that together help the reader to see and understand the concerns of academic programs in Women’s Studies and Gender Studies.

Experiential ideas. Practices are explored in articles on controversial and easily misunderstood topics, such as “Ancestor Worship” and “Jihad.” Military and civic practices are discussed in “Bushido,” “Cannibalism,” “Terror,” “Nihilism,” “Civil Disobedience,” and “Nonviolence.” The political practices of “Apartheid” and “Segregation” contrast with those of “Diversity” and “Multiculturalism, Africa.” Practices related to human exploration of nature and the power of humans to influence nature are considered in “Witchcraft,” “Astrology,” and “Alchemy,” as well as in “Scientific Revolution” and “Physics.” The experiential aspects of performance arts are discussed in “Masks,” “Dance,” “Theater and Performance,” and “Tragedy and Comedy.” Authors consider music from around the globe, with attention to both performer and audience, in “Music, Anthropology of” and in the visual essay “Musical Performance and Audiences.” The experiential dimension of ideas ranges from the pain inferred in “Punishment” to the joy and reciprocity in “Gift.”

The Reader’s Guide category Communication of Ideas: Practices lists entries focused on practices and experiences, as well as on schools of thought, religions, and political movements. The combined listing encourages readers to consider how the practices overlap among those seeking to spread viewpoints and lifestyles. Schools of thought, such as “Stoicism,” “Confucianism,” and “Existentialism,” are movements of ideas, generally in the humanities; many of these have pre-modern origins and educated disciples into particular schools of thought that adapted to new times. Schools of thought are in fact schools of thought and practices, which contend with religions. Focusing on the human relationship with the divine, religions tend to create popular movements as well as new schools of thought; scholars who emphasize the pantheism of the Stoics consider Stoicism to be a religion. Political movements such as “Temperance,” “Anti-Semitism,” and “Chicano Movement” are movements of ideas in the fine arts, humanities, and social sciences expressed in socioeconomic and political movements. These movements usually have modern developments associated with ideologies.

Textual ideas. Anyone looking at this six-volume encyclopedia in which every article has a bibliography would notice that the written word is one of the major sources for the authors’ evidence and in some cases the exclusive source. Some authors selected primary source passages to quote in sidebars, which are set along side their articles. The bibliographies exhibit the primary sources—the historical texts, images, and transcriptions of oral communication—by which we become familiar with thought from ancient or faraway societies, or with the latest contemporary thought. The bibliographies also exhibit the secondary sources, recent authorities’ accounts of the topic at hand. Many *NDHI* authors are among the authorities cited in the bibliographies of other authors.

Example of political philosophy. Political philosophy is a good example of a field that traditionally has relied on interpreting major texts of history, law, and philosophy. One may learn about political philosophy from the introductory articles “Political Science” and “Power.” Or one might look at specific concepts that have been elaborated in texts for use by governments and citizens such as “Citizenship,” “Democracy,” “Sovereignty,” “Utopia,” “Liberty,” and “Justice.” Political movements that have involved personal experiential participation are well represented in “Fascism,” “Capitalism,” “Machiavellism,” and “Volunteerism, U.S.” Visual display and practices are important for “Ritual: Public Ritual,” “Public Sphere,” and “Resistance.” Oratory abounds in “Liberation Theology.”

Ideas and their accompanying practices that provoked controversies are enhanced by the cross-references in each article, guiding the reader to antonyms and to alternative scholars’ viewpoints; for example, see “Terror” as well as “Human Rights,” “Atheism” as well as “Religion,” or “Evil” as well as “Good.” Likewise, to treat independent developments, diffusion and differentiation of ideas, movements, and practices around the globe, we have provided composite articles for topics such as “Medicine” and “Marxism.”

Reader's Guide to the Liberal Arts

The entries on specific disciplines and on interdisciplinary studies are intended to introduce the reader to a field of study. These introductions to the disciplines are listed for convenience under the university liberal arts classifications of divisions or schools of Fine Arts, Humanities, Social Sciences, and Sciences. In addition, there are listings under three professions: Medicine, Law, and Engineering. The divisions or schools of a university are historically based on the exploration of related topics, as well as an apprenticeship in distinctive crafts and methodologies. We live in an age of crossing "Borders, Borderlands, and Frontiers," yet it is helpful to recognize the whereabouts of the border one is crossing. Generally, fine arts is concerned with creative artistic production; it relies on both the philosophical field of aesthetics and apprenticeship in distinctive crafts. Humanities, increasingly influenced by studies of communication and language, evaluates the traditions and texts at the foundation of distinctive cultures and fosters the expression of philosophical, religious, and literary ideas. Social sciences (or, in recognition of its humanities traits in secondary education, "Social Studies") investigates human societies from the points of view of both observer and observed to find general societal patterns and variations, and contributes to such professions as law. The sciences, seeking to understand nature, have acquired many humanities topics considered in philosophical and religious texts. Scientists analyze aspects of nature (including human perception) through the tools of theory, experiment, and mathematics, and applications of science abound in engineering and in medicine.

Aside from the major differences of academic divisions, the *NDHI* attests to contemporary trends internalized within each discipline. These trends pervade inquiry at the beginning of the twenty-first century: respect for individual creativity, heart-and-mind concern for ethical issues of human and societal relations, and honest consideration of the specific societal position of the inquirer and the inquirer's impact on the investigation.

Combining Approaches of Fine Arts, Humanities, Social Sciences, and Sciences

The multiple sections of the Reader's Guide aim to prevent the reader from treating any listing location as rigid. Each article in the *NDHI* cross-references many other articles. The growth of interdisciplinary programs reflects the increasing overlap among topics listed under the labels of Fine Arts, Humanities, Social Sciences, and Sciences. Specific disciplinary practices include the very multifaceted approaches of biology and history and interdisciplinary programs that are even more difficult to classify in one of the four classifications, such as the earth sciences of ecology and geology or the performance studies exhibited in oratory, drama, ceremony, and dance.

The Liberal Arts Disciplines category has been designed with awareness that the relationship of disciplines to one another has changed over time, and that there is a benefit to studying a topic from several angles. To help encourage cross-fertilization in the fields of knowledge, articles are often listed under the several disciplines or interdisciplinary studies to which they contribute. An important development in the *NDHI* is the listing of entries that overlap the four divisions and of entries that overlap three or two divisions; these listings are designed to help the reader understand how scholars from diverse fields have problematized subjects in new ways, contributed the results of their approaches, and thus added to the comprehension of a multifaceted topic of human concern. The reader will observe that all four divisions of Fine Arts, Humanities, Social Sciences, and Sciences are confronted with issues of "Objectivity" and "Subjectivism," topics within the rubric Multidisciplinary Practices in the Reader's Guide under Liberal Arts Disciplines and Professions.

Example of Interdisciplinary Discipline: History

We might consider the field of history, which utilizes methods of both social science and humanities and considers topics historically from all four classifications of the arts and sciences. For convenience, history is listed here as a discipline under the social sciences. As most of the articles in the *NDHI* are historical, the list of articles under the discipline history concerns historiography and interpretative methods. One will find terms such as "Hermeneutics" and "Volksgeist" and debates on historical periodization, as in "Periodization of the Arts," "Renaissance," and "Reformation," as well as "Modernity" and "Postmodernism." There are specific types of history, such as "Social History, U.S.," "Cultural History," "History, Idea of," "Iconography," and "Science, History of" ("Iconography" is also in "Visual Studies"). The discipline of the history of science appears in the Sciences, where it has numerous articles. The listing separates those articles in the

History of Science focused on the origins of modern or contemporary ideas in the physical, chemical, biological, mathematical, or earth sciences from articles focused on early ideas about nature and the human relationship with nature.

Listing of Each Article under Its Multiple Disciplines

The Liberal Arts Disciplines section of the Reader's Guide allows for duplication of entries in an attempt to provide the student with a full list of relevant articles for the discipline to which the student inquires. One would find "Narrative" and "Trope" under Literature as well as under History. The topic of "Family" is under Anthropology and Sociology and under Women's Studies and Gender Studies. The topic of "Virtual Reality" occurs under Visual Studies and Computer Science. The student and the public are encouraged to perform interdisciplinary inquiries and to freely examine ideas wherever they lead.

An Encyclopedia of, by, and for Humanity

The focus of the *NDHI* is the main ideas that humans have created, expressed, described, visualized, experienced, and proclaimed. What idea might be more important than the idea of "Humanity," yet only recently has a scholarship been accumulating on the history of the idea of "humanity" (rather than the idea of "man"). A cluster of articles treats the abstract idea and the visual imaging of "Humanity" and another cluster addresses the movements around the globe associated with the term "Humanism."

Nevertheless, there are numerous articles on movements that hierarchically categorized humans and deemphasized the commonality, as in the series of articles on "Ethnicity and Race" and on "Race and Racism," as well as in articles on "Ethnocentrism" and "Eurocentrism." Articles on "Sexuality," "Women's Studies," "Universalism," and "Essentialism" add further sophistication to inquiries into the idea of humanity (humans of diverse races, color, and ethnicities; sexes, sexualities, and gender; religions, cultures, and nationalities).

Entries on "Individualism," "Person, Idea of the," and "Personhood in African Thought" focus attention on self-definition. The bridge between studies of particularity and studies of humanity is represented in the series of articles on "Identity," particularly "Multiple Identity," brought about by trends of "Migration" and of "Globalization." The *NDHI*, available in print and electronic versions to readers of English around the globe, challenges readers within the multiplicity of their individual identities to personally identify with humanity and with humanity's more humanitarian ideals.

Charles Scribner's Sons: Continuity and Commitment

Charles Scribner's Sons published the *Dictionary of the History of Ideas: Studies of Selected Pivotal Ideas* (edited by Philip P. Wiener) in five volumes in 1973-1974 and in 2003 approved its free release online through a subsidy by the *Journal of the History of Ideas* to the University of Virginia Library Electronic Text Center (<http://www.historyofideas.org>). Readers are encouraged to utilize that resource for its outstanding entries by prominent historians of an earlier decade. In this brand-new sequel by leading contemporary scholars of cultural history, the title *Dictionary of the History of Ideas* has been retained. As in a dictionary, entries do typically begin with a definition or clarification of a concept, yet the heart of each article lies in the detailed contextual narrative of the changes of meaning over time. Each entry's bibliography further clarifies the discourse and debate concerning the concept. The treatment is therefore encyclopedic in the truest sense.

The *NDHI* is an entirely new publication with many more articles. Area specialists on Africa, the Middle East, Asia, Latin America, Europe, and North America, and specialists on women's studies and ethnic studies advised on the ideas most important to include. Seeking to present cross-cultural perspectives on the history of ideas, the new edition encourages scholarship that is gender-inclusive and global. It focuses on topics of interest today and features developments in scholarship since 1970; it appraises new thinking on some topics in the *NDHI* (communism, linguistics, physics), but mostly addresses entirely new topics (structuralism and poststructuralism, genetics, paradigm, queer theory, text/textuality). While the *DHI* entries were to a great extent the history of texts, the *NDHI* entries are generally the cultural history of ideas, utilizing the records of oral communication, visual communication, communication through practices, as well as the history of texts, in order to emphasize the impact of the idea on a wide variety of people. There are articles on disciplines and interdisciplinary studies, on multidisciplinary scholarly practices, on

genres in the fine arts, on movements, on ideas and the controversies they provoked, and on ethnic traditions. The content is appropriate for assignment in class and for educating a general public. With its generous illustrations and lively entries, the *NDHI* visibly reaches out to communicate ideas.

Acknowledgments

I have greatly appreciated the enthusiasm for and commitment to this project of the publisher Frank Menchaca of Charles Scribner's Sons, an imprint that resides within the publishing offices of Thomson Gale. Nathalie Duval and Jennifer Wisinski supervised the editorial and production staff magnificently. Nathalie Duval, John Fitzpatrick, Mark LaFlaur, and Sarah Turner were instrumental in working with me and the first members of the editorial board on the design of the project at meetings held in New York City in November 2002 and at the American Historical Association in Chicago in January 2003. Jennifer Wisinski, assisted by Scot Peacock who arranged for the illustrations, produced the volumes in Farmington Hills, Michigan, at the main offices of Thomson Gale. I would like to thank also Kelly Baiseley and Kenneth Mondschein for their communication via email to prospective authors, as well as the numerous others noted on the editorial and production staff page.

Each faculty member listed on the editorial board page contributed expertise in area studies, in a historical specialty, and in specific other disciplines and interdisciplinary studies. I thank each of my eighteen colleagues, and their universities and colleges, for the commitment, intelligence, and attention they gave to writing scopes for articles, suggesting authors, and reviewing and improving article content. Occidental College also deserves our appreciation, not only for their encouragement of my commitment to history of ideas, and the *NDHI* in particular, but also for Occidental College graduate Lisa Griffin, assistant to the editorial board. At Occidental College I have experienced first-hand the importance of recruiting a diverse community of faculty and students in order to participate in and experience a multicultural, gender-inclusive global curriculum. My research into authors, images, and bibliography for the *NDHI* took place mainly in Los Angeles: at Occidental College, at the University of California, Los Angeles, at the Getty Research Institute, and in e-mail correspondence with the editorial board and with numerous authors.

I contracted for this project in August 2002, and thanks to a very hard-working editorial board of professors and librarians, excellent authors who fulfilled our invitations, and a very efficient publisher providing clear procedures and practices for a quality production, readers may now enjoy fresh, up-to-date entries on some of the major ideas that have concerned and influenced humanity. Might these volumes help contribute to the global liberal arts appropriate for the twenty-first century!

Maryanne Cline Horowitz

HISTORIOGRAPHY

Since very early times, human beings have had some sense of the past, both their own and that of their community or people. This is something that has distinguished us from other species. Having said that, historiography in the narrower sense of “intentional attempts to recover knowledge of and represent in writing true descriptions or narratives of past events” has had a rather briefer career throughout the world, though one more complex and variegated than most accounts allow. It is not possible in the space of a brief essay such as this to convey the entire richness of the human effort to recapture the past, but an effort must be made to summarize the historiographical traditions of many different regions.

At least three major (in terms of their international scope, longevity, and influence) and a variety of minor independent traditions of historical thought and writing can be identified. The major ones are the Western (descended jointly from the classical Greek and Roman and, via the Old Testament, from the Hebraic), the Islamic (originating in the seventh century C.E.), and the Chinese. Minor ones include the various indigenous traditions of thinking about the past (not all of which involved writing), including ancient Indian, precolonial Latin American, African, and those arising in certain parts of east and Southeast Asia. The Western form (which would include modern Marxist Chinese writing) has predominated for a century or more in most of the world, but it would be a mistake to see that as either inevitable or as based on an innate intellectual superiority of method. Its hegemony springs much more from the great influence of Western colonial powers in various parts of the world during the nineteenth and early twentieth centuries, and perhaps even more from the profound effect in the last hundred years of Western, and especially North American, cultural, linguistic, and economic influences.

A consequence of the global dominance of Western academic historical practices is that not just history, but historiography, has been “written by the victors.” None of the major histories of historical writing produced in the last century addresses other historiographical traditions, undoubtedly in part owing to linguistic difficulties. This has produced a thoroughly decontextualized and celebratory grand narrative of the rise of modern method that has only been challenged in recent years. It is thus critical that any new survey of historical writing not only pay serious attention to non-Western types of historical writing (and indeed to nonliterary ways in which the past was recorded and transmitted), but that it also steer clear of assuming that these were simply inferior forms awaiting the enlightenment of modern European-American methodology.

Early Ideas of History in the Western Tradition

Arguments can certainly be made for a sense of the past in ancient Egypt, and in particular an effort to memorialize the successive dynasties of the Old, Middle, and New Kingdoms. An early specimen is the so-called Palermo stone, a fragmentary stele inscribed with king lists from predynastic times to the fifth dynasty (mid-third millennium B.C.E.); this was probably used by the much later Hellenized Egyptian Manetho in his own *Aegyptiaca*, very little of which has survived. The later Turin papyrus (c. 1300 B.C.E.) extends to the sixteenth century B.C.E. However, the lack of a written alphabet imposed limits on the capacity to convey the past; nor is it clear that Egyptian efforts at record keeping, though certainly serious, were deliberately aimed at constructing accounts of the past for the benefit of present and future generations. Elsewhere in the ancient Near East, various historical inscriptions and texts are attributable to the Hittites, Syrians, and Phoenicians. It is in Mesopotamia, however, that one finds the clearest early evidence of a deliberate human intention to write about the past.

The successive peoples that inhabited the land between the Tigris and Euphrates, especially the Sumerians, Akkadians, Babylonians, and Assyrians, generated the first type of writing in

cuneiform and developed rudimentary forms for the representation of the past, such as king lists, annals, and chronicles. The oldest extant epic, that of the Uruk king Gilgamesh, though it recounts largely legendary episodes, probably has some connection to historicity. Closer to a recognizable historical document is the Sumerian King List probably initiated in the twenty-second century B.C.E., and existing in several recensions. It stretches back into mythical antiquity but goes beyond a mere list in later times to indicate inquisitive uncertainty about the historicity of some rulers expressed in the utterance “Who was king? Who was not king?” It is also a deliberate attempt to present the historical record in a particular light, necessitated by the circumstances of the author’s own time. Various other forms of Sumero-Babylonian historical record exist, including building inscriptions, stele, and other durable media. Other genres, such as astronomical diaries, played a part in establishing a precise chronological grid against which to record events, and both the Babylonians of the second millennium and their neo-Babylonian or Chaldean successors of the middle of the first millennium were keen astronomers and devoted listmakers.

Other ancient peoples in the region authored historiographic documents of some variety. There are significant differences between these writings, but the focus of most was on maintaining a proper record of kings and their achievements—the Assyrian *Eponymous Chronicle*, for example, relays the annual military campaigns of its kings down to Sennacherib (r. 704–681 B.C.E.). While it would be foolish to impose modern Western standards of “objectivity” (themselves highly contested today) in assessing ancient forms of historical writing, subtle differences in this regard have been noted between Assyrian and Babylonian approaches. Assyrian royal annals are largely written in first-person bombastic prose, allegedly by the kings themselves. And whereas the *Synchronous History* of the Assyrians, in describing boundary disputes in the late second to early first millennium invariably blames the Babylonians, those accounts written by the Babylonians themselves are often more neutral. The neo-Babylonian and Chaldean periods produced further works such as the Babylonian Chronicle Series. The Persians, successors to Babylonian power in the sixth century B.C.E., would continue this historiographical activity, for instance in the multilingual Behistun Inscription erected by Darius I (r. 521–486 B.C.E.). The latest Babylonian work is that of Berossus, a contemporary of the Egyptian Manetho in the third century B.C.E.; nothing of Berossus’s original work has survived though it was well known in Hellenistic and Roman times.

What truly puts these writings into the realm of the historical is the evidence that successive works had to be based on what we would now call research—the examination, selection from, and collation of multiple earlier sources—rather than on any tradition of continuous record keeping. Many went beyond that to aspire to provide advice, counsel, or cautionary tales, a recurring motive through much of the global history of historical writing. One of the best-known examples of early Mesopotamian history is the Old Babylonian *Weidner Chronicle*, reaching back to early times but largely devoted to the Sargonic dynasty of Akkad in the twenty-fourth century B.C.E. This is one of the first historical works clearly designed with a didactic purpose, to recover and preserve the past for the edification of present and future, with a lesson attached, in this case the propagation of the cult of the god Marduk. The *Weidner Chronicle*’s account of Sargon I and his grandson Naram-Sin contrasts the godliness of the former with the disobedience to Marduk of the latter, with the consequence of the downfall of Akkad at the hands of Gutian barbarians. The alternation of divine favor and punishment, another frequent theme in historical writing, thus had an early start. It turned up again in the early seventh century B.C.E. when the later Assyrian defeat of Babylon was ascribed to Marduk’s displeasure at recent kings, and it appears frequently throughout the travails of the children of Israel at the hands of foreign hosts depicted in the Hebrew Bible.

The Israelites (or Jews as they later became) were the other major people in the ancient Near East to develop historiography. The Old Testament or Hebrew Bible is now known to have been the work of several hands, and much of it originates from later periods such as the Davidic kingship (tenth century B.C.E.) and the Babylonian Exile (late seventh–early sixth centuries B.C.E.). But in the early genealogies of Genesis and in the more chronological accounts of the Books of Samuel, Kings, and Chronicles, one finds both an effort to memorialize the past accurately as a written record and a strong sense of the divine destiny of the Israelites as a chosen people, a linear progress through which oscillates a recurrent cycle of triumph and misery as God chastises an erring people for disobedience, sin, or idolatry, and then delivers them from oppressors such as the Egyptians, Philistines, Assyrians, and Babylonians. The Hebrew-Judaic view of history and of time is one of the foundation stones of Christian historiography of the past two millennia. It is

an achievement all the more striking when one contrasts it with the relative dearth of Jewish secular historical writing during the millennium-and-a-half of Diaspora between Flavius Josephus (c. 37–c. 100 C.E.) and the sixteenth century when Jews, still stateless, began to rediscover the formal study of the past.

Many Western accounts of historical writing begin with the ancient Greeks rather than the Mesopotamians or the Hebrews, in part because the very word *history* is itself of Hellenic origin. The Greeks developed several different genres of writing about the past, including genealogy or mythography; ethnography; history “proper” or a continuous narrative of sequential events with their causal connections; horography, the year-by-year history of a particular city; and chronography, a system of time-reckoning. Moreover, it is in fifth-century Athens that one first encounters both the word *history* and two historians whose works have survived largely intact and who are known to us by name. Herodotus (c. 484–c. 420 B.C.E.), the first of these, certainly had his predecessors. Among these are numbered the mythographers Hesiod (fl. c. 700 B.C.E.) and (contemporary with Herodotus himself) Hellanicus of Lesbos, who was notable for his attention to the problem of reconciling multiple chronologies; and the murky ninth-century figure of Homer (to whom are ascribed the great epics the *Odyssey* and *Iliad*, first written down several centuries after the heroic events they purport to relate). More directly, these precursors also included the Ionic writer Hecataeus of Miletus (fl. c. 500 B.C.E.), one of a group of geographical writers and recounters of stories collectively known as the “logographers.” Borrowing from Hecataeus, who first distinguished between mythical, genealogical, and “historic” times, and using something of the poetic force of the Homeric epics, Herodotus linked ethnography with history, coining the term *historia* in the sense of “inquiry,” “discovery,” or, in some renderings, “inventory” (the Greek verb *historein* means “to investigate”). His focus was the recent events of the Persian Wars, the origins of which he sought to explain. Herodotus relied to a considerable degree on oral information (although the veracity of that has often been called into question from antiquity to modern times), and in his ethnographic attention to other, non-Greek peoples and their customs he is often held to be the West’s “father” of history in its broader, more inclusive, and nonpolitical sense. Herodotus’s younger contemporary Thucydides (d. c. 401 B.C.E.), in his account of a particular event over a shorter period, namely the thirty-year struggle between Athens and Sparta known as the Peloponnesian War (431–404 B.C.E.), can similarly be regarded as the progenitor of a narrower, politically focused history, though this dichotomy can be overemphasized. Thucydides also fully developed a device employed by Herodotus that would become a convention of much later historical writing, namely the semifictitious speech ascribed to a major figure (Pericles’ funeral oration being a famous example). Zealous in his efforts to represent both sides in the conflict fairly and impartially, Thucydides’ account of the arrogance and fall of Athens goes far beyond ascriptions to Olympian whims—it identifies actual and proximate causes of the Athenians’ eventual humiliation by a city regarded as its cultural inferior; the arrogance of the Athenians, their flaw, is a more fundamental cause of their downfall drawn from Greek tragedy. Finally, unlike Herodotus, Thucydides proclaimed his own intention of writing for the edification of future ages as much as for those living in his own time.

For all the importance that we now assign to these two Greek masters, history did not enjoy a high stature in the Hellenic world, in part because the Greeks were philosophically rather less interested in the past per se than in the realms of nature, ethics, and the mind. Historians nonetheless there certainly were: the authors of *Hellenika* that followed Thucydides focused, like him, on contemporary or recent history. The list of later Greek historians includes Ephorus (c. 405–330 B.C.E.), the first writer of “universal history”; the memorialist Xenophon (c. 431–c. 352 B.C.E.); Theopompus (b. c. 380 B.C.E.); Dionysius of Halicarnassus (fl. c. 20 B.C.E.); and the highly regarded Polybius (c. 200–118 B.C.E.). A Romanized Greek, Polybius is especially significant for articulating a theory of predictable constitutional cycles among three pure and three corresponding perverted forms of government and for postulating the stability of “mixed” regimes consisting of all three pure forms. This was to prove a powerful tool of historical analysis in later centuries.

It was the Romans, however, who produced the next substantial corpus of European historical writing. They were initially much influenced by Greek models, turning such genres as the horography into official *annales* kept by the *pontifex maximus*, a religious figure. The earliest Roman historians such as Quintus Fabius Pictor (fl. 225 B.C.E.) were especially affected by Greek non-annalistic history, though eventually annalistic models were to predominate in a way that had not been true in Greece. The Romans would also introduce a close association of the act of history

writing with the experienced politician or general. This became prized in later times (and was frequently used as an argument to exclude women from writing history), despite having been only sporadically evident (Thucydides and Xenophon) among the Greeks. It signaled the priority of rhetoric and experience over research, with the result that the Herodotean association of history with inquiry now slipped into a Latin notion of *historia* as a “story” in the sense of a narrative, true or not. The Romans also celebrated the laudatory and exemplary value of history, and especially the lives of great men, a concept largely absent among most of the early Greek historians.

Among mature Roman historians, the outstanding figures include Sallust (86–35 or 34 B.C.E.), who described the Catilinian conspiracy that had ominous consequences for the republic; Julius Caesar (c. 100–44 B.C.E.), memorialist of his own campaigns; and Livy (59 B.C.E.–17 C.E.), the great Augustan narrator of Rome’s history from its legendary foundation—*ab urbe condita* (c. 753 B.C.E.). “Universal” history along Ephorus’s lines, eventually an all-purpose model for many medieval and Reformation historians, would find practitioners in the Sicilian Greek Diodorus Siculus (c. 90–c. 21 B.C.E.) and, much later, the imperial pagan Ammianus Marcellinus (c. 330–395 C.E.). No extant Roman historian, however, has been more praised by subsequent ages than Cornelius Tacitus (c. 56 C.E.–120 C.E.), narrator of the reigns of the Julio-Claudian emperors in his *Annales* and of the troubles leading to the accession of the Flavians in his *Histories*. An admirer of German tribal simplicity, as compared in his *Germania* with the luxury and corruption of imperial Rome, Tacitus continued the moral-decay theme detectable in Polybius, Sallust, and Livy; he also established a common motif of later historiography, the juxtaposition of the virtuous and hardy barbarian with the decadent city-dweller. This, along with his terse style, political acuity and epigrammatic comments on events would make Tacitus’s works very popular in much later centuries.

The Romans had a strong sense of the divine destiny of their city and its expanding empire, which provided a horizon for their history writing in the way that the known world as a whole had done for the Greeks. They also injected a teleological and progressive element that was lacking in Greek historiography. Where cycles of rise and fall and the random hand of *Tyche* (fortune) appear in many of the Greek historians, history becomes more purposeful and almost providential among the Romans: Livy, much of whose history has not survived, is both the celebrant of Rome’s seemingly divine expansion and conquests over time, and among the mourners of the dissipation of its republican virtues and loss of liberty. Beginning in the first century B.C.E., a number of Romans also considered, as few Greeks had done, what we would call theoretical—or at least rhetorical—issues of historiography, including the question of what actually constituted history, what were its best models, and what pitfalls ought to be avoided in its composition. The great rhetorician and politician Marcus Tullius Cicero (106–43 B.C.E.), who had an enormous influence on the Renaissance fifteen centuries later, wrote in *De oratore* (55 B.C.E.) about the uses of history, stressing again its utilitarian function. Cicero was not himself a historian. Nor was Lucian (c. 129–after 180 C.E.), who two centuries later penned a tract on *How to Write History*, thereby initiating a historiographical-method genre that would reappear with vigor in the sixteenth century.

Early Chinese Historical Thought and Writing

The second major tradition of thinking and writing about the past is the Chinese. It has been neglected or at best patronized in many modern accounts of historical writing. Despite the triumph in the twentieth century of Western approaches to the past, Chinese historical writing has a longer continuous tradition, and it developed much earlier than the West a clear and consistent set of rules and practices for the recovery and representation of the past. History was a major category of knowledge (along with philosophy, literature, and the “classics”) from as early as the fourth century C.E., a status it would not acquire in Europe before the late seventeenth century. With some important modifications, Chinese historiography was to influence the historical thought and writing of neighboring nations such as Japan, Vietnam, and Korea. Significant Chinese thinking about the past can be dated back to ancient canonical texts such as the *I Ching* (Book of changes), which reached a definitive form about the end of the second millennium B.C.E.

Earliest Chinese thought evinced the notion that there were discernible patterns in the flow of human affairs from which one could learn to govern oneself and navigate a world of continuous change. As this suggests, Chinese thought about the past was very quickly linked to philosophy and the search for the Dao (the “path” or moral order). The first significant independent work of

history, the *Chunqiu* or *Spring and Autumn Annals*, is an account of events from 722 to 479 B.C.E. It is generally associated with the enormously influential philosopher Confucius or Master Kong (551–479 B.C.E.), though he may only have authored a commentary upon this work. Various collections such as the *Zuozhuan* and *Guoyu*, both sometimes attributed to a Confucian contemporary called Zuo Qiuming, drew on the *Chunqiu* and other early chronicles to present historical anecdotes and speeches in support of a Confucian outlook which, like the Buddhist, tended to a cyclical view of time that dominated Chinese historical thought until the nineteenth century. Other philosophical schools departed from the dominant Confucianism. The Daoists, pursuing harmony with nature and retreat from a world of cyclical but unpredictable change, did not accept that history had any discernible pattern or didactic value. The Mohists (followers of Mozi or Mo Di) and Legalists both saw discernible patterns of progress, though the latter, adherents of a totalitarian philosophy adopted by the brutal Qin dynasty (221–206 B.C.E.), asserted that such progress, enforced by state control over naturally evil individuals, made the past largely irrelevant.

The most important early figure in Chinese historical thought and writing, however, was the Han dynasty figure Sima Qian (145–86 B.C.E.). After the unification of various “Warring States” into a single empire by the violent but short-lived Qin (whose first emperor ordered an infamous book-burning and mass execution of scholars, virtually eliminating records of the conquered kingdoms), the succeeding Han emperors (206 B.C.E.–220 C.E.) created the stable conditions under which historiography could mature. Sima Qian, often known as the Grand Historian, did far more than write in his *Shiji* (Historical Records) a comprehensive account of Chinese history. He also evinced a clear sense of the historian’s purpose: to record major and minor occurrences accurately in order to counsel the present and to bestow fame on the good and infamy on evildoers. Perhaps most important, his model for the compilation of facts about the past with its clearly worked out format, a combination of year-by-year annals and individual biographical treatments, influenced the next two millennia of Chinese historical writing. No Western historian, not even Herodotus or Thucydides, can claim that kind of influence, nor does Western historical writing display the continuity of a systematic and eventually institutionalized approach to the past that is exemplified by China. Sima Qian created various categories for the representation of the past that would be developed and augmented by subsequent writers. By the time he finished the *Shiji* that his father had begun, it was nearly four times the size of Thucydides’ *Peloponnesian War*. The *Shiji* would come to be regarded as the first in a long series of twenty-four “Standard Histories” (*zhengshi*), the official history of a dynasty written under its successor dynasty. (The *Shiji* itself, since it covered both the Han and their predecessors, is an exception to the rule that Standard Histories cover only one dynasty and are written after its fall). Sima Qian would most immediately be followed by the historian of the Former or Western Han dynasty, Ban Gu (fl. 1st century C.E.) and his sister and successor, Ban Zhao; their *Hanshu* set the pattern for a history covering only a single dynasty, followed three centuries later by Fan Ye’s *Hou-Hanshu* (History of the Later or Eastern Han), which was left unfinished at its author’s beheading for political conspiracy in 445 C.E.

Over the course of the twelve centuries from the end of the Later Han to the advent of the Ming (the last indigenous Chinese dynasty) in 1368, the basic genres of historical writing were set. In addition to the Standard Histories, one finds that various works in the chronicle format (originated in the *Chunqiu*) or *Biannian shi*, and the Standard Histories themselves, following Sima Qian, continued to combine annalistic sections with biographical accounts, along with accompanying sections such as chronological tables to establish common years for events in different areas (a practice that soon spread to other parts of Asia). A particularly notable example of writing outside the *zhengshi* model is Sima Guang’s (c. 1085 C.E.) *Zizhi tongjian* (Comprehensive mirror for aid in government), which recounts history from the late fifth century B.C.E. to the tenth century C.E., a work that in turn inspired numerous commentaries. Finally, universal histories (in the mode established by Sima Qian) were also compiled, in particular during the Song dynasty (960–1279 C.E.).

Exact analogies between Chinese and Western historiography should be drawn with a high degree of caution since certain fundamental assumptions were quite different. Chronology was based in frequently changed era names (the practice used in many Asian countries until the twentieth century) rather than the single chronology *ab orbe condito* (from the founding of the world), *ab urbe condita* (from the founding of the city), or (especially since the seventeenth century), B.C. (B.C.E.) and A.D. (C.E.)—this accounts for the much earlier development of synchronous chronological tables in China than in Europe. Moreover, where “annals” in the European tradition have

usually been seen as the most rudimentary form of historical record, Chinese historiography regarded the annal as the highest form, the distillation of knowledge from other sources. Grant Hardy has further argued that the Western preference since the Renaissance for the single-voiced omniscient narrator and an internally self-consistent story fits ill with the multiple voices and often competing accounts of a single event included by Sima Qian in the *Shiji*. Perhaps most important, Western historiography places high value upon the independence of the historian from outside interference, though in fact that arms' length relationship has really only occurred in a minority of countries and in relatively recent times; official history, courtly history, and other variants have not fared well in the estimation of modern European-American historiographers.

Yet the Chinese experience testifies to the vigor and achievement of a historiographical enterprise under official sponsorship. Under the Tang dynasty (618–907), historiography became elaborately bureaucratized and even more closely linked to the official civil service; it was also “promoted” within the four categories of learning to second place, behind the classics and before philosophy and literature. Under the Tang, seven new Standard Histories were produced, and by the end of the dynasty the Bureau of Historiography had become virtually an independent arm of government, with a fully worked out system of compilation. From a set of court diaries kept during the reign of an incumbent emperor, a recording of his sayings and actions, and an administrative record, a set of “Veritable Records” (*shilu*) would be developed at the end of the reign. These in turn, after the final eclipse of the dynasty, would form the basis of the Standard History of that dynasty. The latter was intended, at least in theory, to be the official and unchallengeable truth, not subject to rival versions or interpretations. This strategy did not always succeed—a new history of the Mongol Yuan dynasty (1279–1368) was composed in 1920, over five centuries after Ming historians had written an earlier version. Some dynasties such as the Tang and “Five Dynasties” (907–960) each have two Standard Histories. It was customary to destroy the earlier sources once the Standard History had been composed, which accounts for the rarity of surviving examples of Veritable Records, those of the Ming being a notable exception. The writing of Standard Histories would continue for every dynasty up to the final composition of the *Draft History of Qing* in 1927 and its 1962 Taiwanese counterpart, which are sometimes counted as a twenty-fifth and twenty-sixth *zhengshi*. All share the annals-biography form first adumbrated by Sima Qian two millennia earlier, often accompanied (as in the *Shiji*) by other elements such as chronological tables and treatments of hereditary houses.

In addition to the Standard Histories and chronicles, a further major category of historical writing, closer to continuous narrative, was developed under the Song dynasty, the *Jishi benmo* (Histories of beginnings and ends of events). The first example, by Yuan Shu (1131–1205), was completed and published in 1174. This genre would later flourish under the Ming and Qing dynasties. Its specimens largely consisted of rearrangements of existing histories—Yuan's, for instance, built on Sima Guang's *Comprehensive Mirror*—but their attention to the cause and effect of particular occurrences was a significant development in Chinese thinking about the past.

The European Middle Ages

Following the foundation of the Eastern Roman Empire in the fourth century at Constantinople (the former Byzantium) and the establishment of Christianity as the official religion of Europe, western and eastern European historical writing evolved in rather different directions. The continuity of the Byzantine Empire for another millennium facilitated the further evolution of classical historiography written to a high standard of accuracy, primarily in Greek. It comprised both secular history—represented initially by Eutropius, Zosimus, and Procopius—and, beginning with Eusebius of Caesarea (c. 260–c. 339), ecclesiastical history.

The separation of ecclesiastical from secular history, though not absolute, proved fundamental to medieval and early modern historical writing and to later Renaissance divisions among historical genres. Late antique ecclesiastical writers, before the sixth century, included Socrates, Rufinus, Sozomen, Theodoret, and Evagrius and, as the religious inspiration suggests, their work was often highly polemical. But ecclesiastical history (borrowing wholesale the sense of divinely guided destiny immanent in Old Testament historiography and turning it into a more explicit eschatology) had a strong focus on the foundation, growth, and triumph of the Christian religion, and a steady eye toward the eventual return of Christ and the ultimate end of history. This helped its Byzantine writers to develop, quite early, an attention to precise chronology and periodization. Ecclesiastical history was also, significantly, generally devoid of set speeches, its authors preferring

to insert original documents and letters, which had not been a characteristic of most classical histories. The parallel line of Byzantine political historians and chroniclers was just as significant, though it dried up temporarily in the seventh century. A significant revival occurred in the eleventh century with Michael Constantine Psellus's memoirs of court life, and Byzantine historiography is widely regarded to have peaked in the next quarter-millennium under the Komnenian and Palaiologan dynasties. Notable authors included Anna Comnena (1083–c. 1153), one of the first great female writers of history, who composed an account of the reign of her father, the fourteenth-century emperor John VI Cantacuzenus (1292–1383), and the scholars George Pachymeres (1242–c. 1310) and Nicephorus Gregoras (c. 1295–c. 1359); Pachymeres is also significant as the earliest historical source for the rise of the Ottomans in nearby Anatolia.

Historical writing developed much less smoothly elsewhere in Europe. The collapse of the Western Roman Empire and its displacement by various barbarian kingdoms strained and obscured, but did not wholly break, the continuity with ancient models: a writer like Gildas, who recounts the last days of Roman Britain, sounds like an Old Testament prophet or a latter-day Tacitus in his moralizing criticism of British kings. The so-called Dark Ages from the fifth to the ninth centuries were no historiographic vacuum, for historians wrote significant accounts about the various Germanic peoples. Each was quite different in scope and content and each transcended the limits of annals, variously drawing on Eusebius and certain Roman and Byzantine historians. The most important of these “barbarian” works included histories of the Goths (Jordanes, summarizing a lost history by Cassiodorus), the Franks (Gregory of Tours, whose work is more accurately described as a history of his own times), the Lombards (Paul the Deacon), and the Anglo-Saxons (the Latin *Ecclesiastical History of the English People* by the early-eighth-century monk, Bede). Among these, Bede (d. 735) was arguably the greatest historian of the period. The author of several other historical works, he is also credited with first introducing into historical writing the chronological scheme whereby events were dated *anno domini*, from the birth of Jesus Christ, a system previously developed in the form of “Easter Tables” by scholars such as the sixth-century monk Dionysius Exiguus.

Even more than in the Byzantine East, Christianity proved, despite internecine theological disputes, the closest thing to a unifying force in the development of a common vocabulary and shared set of standard themes for history-writing. Eusebius had been translated into Latin. Beginning with Saint Augustine of Hippo and his disciple Orosius (active 414–418), the author of a wide-ranging and much-read universal history, the *Seven Books of History against the Pagans*, a Western scheme emerged for narrating the unfolding of the divine will through history. Accompanying it was the Neoplatonic juxtaposition of “Two Cities,” a heavenly and an earthly, a theme that would be revisited in the twelfth century by the pro-imperial Otto, bishop of Freising, (c. 1111–1158), who used it as the title of his major historical work. It was Otto who provided the classic formulation of a historical continuity argument in the *translatio imperii*, the thesis that the Roman empire had not, in fact fallen, but merely been “translated” from Rome to the Byzantine Greeks and thence, in 800, to the Frankish king Charlemagne, whose ultimate heirs were the Hohenstaufen emperors such as Otto's own nephew Frederick I, called Barbarossa. (The Ottoman conquerors of Constantinople would in turn appropriate this notion, stripped of its Christian association, in the fifteenth century).

There are several other types of medieval historical literature, of which the Norse (Norwegian and Icelandic) sagas of the twelfth to fourteenth centuries (initially an oral record but committed to writing after about 1150) present an especially interesting departure from the prose chronicle and form a link between the world of the annalist and that of the heroic poet; they are the major source for Norway's medieval past. Culminating in Snorri Sturluson's (1179–1241) compendious *Heimskringla* (History of the kings of Norway), itself a reference point for Norwegian national consciousness in much later centuries, the sagas existed alongside Latin prose works such as Saxo Grammaticus's (c. 1150–after 1216) *Gesta Danorum* (Deeds of the Danes), and vernacular chronicles such as Aelnoth's *Krönike* (c. 1120), and Sweden's series of rhymed royal chronicles. Ultimately, however, prose annals and chronicles, and the occasional verse chronicle, would prove the most common form of historical writing through much of the Middle Ages, with the constraints that year-by-year accounts (without the Chinese convention of accompanying biographies) impose on representing the past as a series of continuous events. A good vernacular instance of this would be the *Anglo-Saxon Chronicle*, initiated late in the ninth century and continued by successive writers until the mid-twelfth century.

This does not of course mean, as some later writers supposed, that historiography was simply frozen between classical antiquity and its Renaissance recovery. Historical writing matured considerably beyond simple annals during the twelfth and thirteenth centuries. Monasteries such as Saint Albans in England and Saint-Denis in France developed traditions of multigenerational continuous historical writing (the only Western analogy to the contemporary Chinese experience), in which a summary universal history was often affixed before a contemporary account, which in turn was extended forward by subsequent writers. A separate class of chronicles, more aristocratic in flavor, was influenced by earlier chivalric literature, especially the tales of King Arthur and the *chansons* of figures like Roland, and the biographical *gesta* of deeds of emperors and other rulers. The writing of aristocratic chronicles was stimulated by foreign events and especially by wars such as the ongoing Crusades in the Holy Land, generating such works as the history of the Fourth Crusade by Geoffroi de Villehardouin (c. 1150–c. 1213). Such writing appealed to both rulers and their fighting nobility and was often expressed in languages outside the learned Latin of clerical chronicles. Gabrielle Spiegel has even suggested that the aristocrats of thirteenth-century France, for instance, evolved a vernacular prose historiography in response to concerns about social change and the aggrandizement of royal power. Perhaps the most widely read aristocratic works both at that time and since have been the narrative by Jean Froissart (1333?–c. 1405) of the first phases of the Anglo-French Hundred Years' War (1337–1453) and the various vernacular Scots accounts, in verse and prose, of the Scottish wars of independence against the English. Finally, semifictional works in Latin providing elaborate accounts of the foundations of kingdoms and theories of racial descent were also produced, such as Simon of Kéza's (fl. late 13th century) *Gesta Hungarorum*, which celebrated the deeds of Attila and the supposedly ancestral Huns. The most notorious work of this sort was the *History of the Kings of Britain* by Geoffrey of Monmouth (c. 1100–1154), a major source for subsequent Arthurian literature, and already attacked as an imaginative fabrication by its author's younger contemporary, William of Newburgh (1136–c. 1198).

By the fifteenth century, in the context of the struggles of the French crown with English power and with Burgundian independence, one can discern a sharper political analysis in certain historians such as Thomas Basin (1412–1491) and especially Philippe de Commines (c. 1447–1511), who anticipates in many ways the flavor of Renaissance humanist historiography already unfolding to the east in Italy. In an unrelated but parallel development, relatively late in the European Middle Ages, the growth of towns in Italy and in northern Europe (especially Germany, the Low Countries, and England) produced a distinct vernacular tradition of urban chronicle-writing. Often developing from lists of civic officials, and written by laity, these annals recorded local events in varying degrees of detail and were an important counterpart, for the emerging middling sort of merchants and townsmen, to the more learned Latin chronicles of the monastic and secular clergy, and the aristocratic works by the likes of Villehardouin and Froissart.

The Rise and Growth of Islamic Historiography

Mention of the Crusader chroniclers brings us directly to the third great independent historiographical tradition, the Islamic. There are indigenous examples of historiography, genealogy, and oral traditions among both Arabs and Persians, such as popular stories about battles (*Ayyam*); and Julie Scott Meisami points out that the Sasanian dynasty of Persia (224 C.E.–651 C.E.) is known to have had both royal and priestly historical narratives. Islamic historiography, a highly elaborate and systematic development of historical writing and thought about the past, begins in the seventh century, its first subject being the life and deeds or expeditions (*maghazi*) of Muhammad himself, whose *Hegira* to Medina in 622 C.E. provided a firm date on which to anchor an Islamic chronology. From the very beginning, a zealous effort to record only true statements about or by the Prophet from authoritative testimony, beginning with eyewitnesses, led to careful attention to the chain of transmission (*isnad*) whereby one successive authority passed information, often orally, down to the next: a hadith or report of the words of the Prophet generally consisted of an *isnad* followed by a *matn* (the actual text).

The earliest Muslim historians, many of whose works are only known to us fragmentarily or as part of subsequent works, include Ibn al-Zubayr and his successor, al-Zuhri (d. 742), who was probably the first to combine several accounts into one continuous narrative committed to writing. They were quickly followed by the first great and fully intact biography (*sira*) of the Prophet, by Ibn Ishaq (c. 704–767), and by the more critically and chronologically rigorous treatment of al-Waqidi (747–823), who also wrote several further works on Islamic history. In the early or “for-

mative” period of Islamic historical writing (from the death of Muhammad to the early ninth century), one can identify subbranches respectively associated with the Western Arabian, Syrian, and Iraqi regions; the outstanding works of this period include the genealogical histories of al-Baladhuri (d. c. 892), the historical geography of al-Ya‘qubi (d. 897) and especially the universal chronicle of al-Tabari (c. 839–923), *Ta‘rikh al-Rusul wa al-Muluk* (History of prophets and kings), which was translated into Persian (the *lingua franca* in much of the region) during the mid-tenth century. By the advent of the Baghdad-based Abbasid dynasty in the mid-eighth century, terminology to express the idea of an account of the past had also developed. A *khabar* (plural, *akhbar*, literally “information”) was an account of the past composed for historical interest rather than to shed light on Islamic law, and often devoted to the relation of a single event. The term *Ta‘rikh*, which first appeared about 644 C.E. and is the modern Arabic word for history, was initially used to describe various sorts of writing organized chronologically (it literally means “dating”) whether by annals or by the reigns of caliphs. Both terms were used, often interchangeably, up to the mid-nineteenth century.

By the ninth century, though Islamic history was still written principally in Arabic, the religion’s learned language, Islam had ceased to be predominantly a religion of the Arabs alone. The classical period of Islamic historiography, from the tenth century to the fourteenth, would see a great deal of historical writing by ethnic Persians, particularly under the Ghaznavid dynasty of the eleventh and twelfth centuries. This succeeded a pre-Islamic Persian tradition of verse epic that culminated in the post-conquest *Shahnama* (Book of kings) by Firdawsi, which was completed in 1010 C.E. Persian Muslim historiography would also witness a departure from strict attention to the tradition of hadith and the adoption by many historians of rather more secular intellectual outlook characterized by *adab*, a moral and intellectual education for the elites beginning in the eighth century that is comparable in ambition to later European humanism. This proved liberating in the sense that it permitted departure from strict adherence to the narrowness of the *isnad*, which was never easily able to absorb foreign history; and histories written under the influence of *adab* provide more information as to the author’s intentions in writing them. Historical thought was also influenced by philosophical concerns derived from the notion of *hikmah* (judgment or wisdom) and by a concept of research or inquiry (*bahth*). The work of the tenth-century historian al-Mas‘udi reflects these tendencies and is notable both for its critical apparatus and its author’s bald assertion of the superiority of history to all other sciences. The prolific scientist and polymath al-Biruni (973–1048), much of whose life was spent in India, deployed his mathematical and philological knowledge to the resolution of calendrical and chronological conflicts between the world’s nations.

As Islam spread into other regions, including its Western European beachhead in Spain, as well as sub-Saharan Africa and India, Muslim-authored histories of those regions appeared; the earliest history of Islamic Spain dates from the tenth century and was followed by others over the next half-millennium. Muslims in this period produced a great quantity of historical writing, most of which compares very favorably with the best chroniclers of the West and exceeds it in attentiveness to detail and accuracy, for instance the great biographical dictionary of Ibn Khallikan (1211–1282) and the travel writings (themselves a major source for Muslim social history) of the peripatetic Ibn Battutah (1304–1368 or 1369). Like the European invaders, Arabs such as the Damascene mayor Ibn al Qalanisi (1073–1160) and Saladin’s minister ‘Imad al-Din (d. 1201) also wrote about the Crusades, though it has been observed that most did not regard them as anything other than the latest in a series of struggles against the infidel. Ibn al-Athir (1160–1233), another chronicler of the Crusades, wrote his world history, the *Al-Kamil fil-Ta‘rikh* in the wake of the Mongol invasions of the Muslim world during the early 1220s, an event that had a significant impact on history-writing. Half a century later, another Islamic historian, the Persian ‘Ala’ al-Din ‘Ata-Malik b. Muhammad Djuwayni (or al-Juvayni, 1226–1283) served in the capital of the Great Khan before returning to Baghdad as governor and composing an incomplete *History of the World Conqueror* about Genghis Khan. Rashid al-Din, a Persian converted from Judaism to Islam, also served Persia’s Mongol rulers until his execution in 1318; his *Complete Collection of Histories* is a vast world history especially full of details on the Mongol regime. The Mongols, a nomadic and warlike non-Muslim people who came into conflict with Islam to the West and China to the East in the course of the thirteenth century, developed their own tradition of historical writing, which includes the thirteenth-century epic known as the *Secret History of the Mongols*. There is little sign of historical writing among them for three centuries following, during a period of great internecine turmoil and division among the various descendants of the Khan, but

the early seventeenth century witnessed a revival and produced several specimens of chronicles. These included the *Altan Tobči* (Golden Summary) which begins with the death of Genghis Khan and continues to the early seventeenth century, and the collection of chronicles known as *Erdeni-yin Tobči* (Precious Summary).

At least one Muslim author, the fourteenth-century Tunisian Ibn Khaldun (1332–1406), stands as among the most significant historical thinkers of that or any age, and as the culmination of the philosophical tendencies previously observed in al-Mas'udi. Although he was the author of a long history, Ibn Khaldun has become better known for that work's prolegomenon or *Muqaddimah*, an ambitious attempt to work out the many factors underlying historical change including customs, manners, climate, and economics; it has often led to his being considered the first sociologist of history. "It should be known that history, in matter of fact, is information about human social organization, which itself is identical with world civilization." So begins the *Muqaddimah*. "It deals with such conditions affecting the nature of civilization as, for instance, savagery and sociability, group feelings, and the different ways by which one group of human beings achieves superiority over another." Ibn Khaldun's idea that individuals and groups that come to power are animated by a group spirit or *asabiyya* has counterparts in much later Western writers such as Johann Gottfried von Herder (1744–1803), while his belief that regimes once consolidated will almost inevitably become divided or corrupted and fall echoes the cyclical politics of the Greek Polybius.

Beginning in the early fifteenth century, the newly rising Islamic power, the Ottoman Turks, produced significant historical works, commencing with 'Abdu'l-vasi Celebi's (fl. 1414) account of the accession of Mehmed I, and continuing with chronicles by Asikpasazade or Asiki (1400–after 1484) and the obscure Nesri (d. c. 1520), who synthesized many of the sources up to his own time. These "chronicles of the house of Osman," many more of which remain anonymous, are distinguished by having largely been written by authors who lived through many of the events they described. The chronicles are supplemented and in some cases overlaid by other sources. These include royal calendars (starting in the 1440s) containing historical lists, and poems and oral traditional accounts reaching back to an earlier heroic age of Islamic warriors, which provide a backdrop of legend, folklore, and pseudohistory. Examples of such works include the *Iskendername* by Ahmedi (c. 1334–1413), parts of which amount to a world history, the *Danismendname* and the later, more historically specific *Dusturname* (completed 1465 and attributed to one Enveri, about whom little is known). Sultan Bayezid II (r. 1481–1512) commissioned the first two histories devoted specifically to the Ottomans, one in Persian and the other in Turkish (Persian influences were especially potent on early Ottoman literature).

In an interesting parallel with China's mandarin-dominated historical writing, as well as with the civic courtly historiography of many contemporary Italian states, the major Turkish historical works produced for the next two centuries were sponsored by the Sultan or composed by ministers or functionaries such as the grand vizier Karamani Mehmed Pasha (d. 1481), the secretary Tursun Beg (fl. 1453–1499), the chancellor Mustafa Çelebi Celalzade (c. 1490–1567), the poet and tutor to Sultan Murad, Hoca Efendi (or Sa'duddin bin Hasan Can, 1535–1599), and the provincial functionary Ibrahim Peçevi (1574–1650). The Istanbul bureaucrat Mustafa Naima (1655–1716) wrote an important history of the empire in the first half of the seventeenth century, which remains today one of the most cited sources for that period.

Renaissance and Seventeenth-Century Europe

A recurring theme in several of the traditions we have discussed is that history should be a useful guide to behavior, the past itself a vast ocean of examples from which the present could fish, often without much attention to the water itself. In the West, the classic exposition of this idea came from the Roman orator Marcus Tullius Cicero (106–43 B.C.E.), who defined history as the *magistra vitae* or mistress of life. Cicero was among the classical authors known in part during the Middle Ages but rediscovered in full by the humanists of the Renaissance, who appropriated the authors of Greece and especially Rome as their models of style, genre, and suitable content. This was true across many areas of intellectual activity from the mid-fourteenth century on, but the rediscovery of classical texts and categories would have wide-ranging effects on historical thought and writing, not least because from the mid-fifteenth century, the advent of printing permitted the easy replication of texts in large numbers. Within two centuries this would create a larger reading public for historical writing than had ever existed previously anywhere in the world.

First, more generally, a sense of remoteness from classical times and an accompanying aspiration to reconnect with them bestowed a temporal perspective that was largely (though not as completely as is often supposed) absent from much medieval writing. This took longer to mature than is usually acknowledged, but by the early seventeenth century this “sense of anachronism” is regularly discernible in various media, for instance in art and in drama: it was increasingly difficult to conceive of Julius Caesar or Alexander the Great as medieval Crusaders or Renaissance *condottieri*. A more period-specific visual sense of the past was slower to develop, though archaeological discoveries, especially the ruins of Rome and of former Roman encampments across Europe soon stimulated this too. Much more quickly, however, there developed a sense of linguistic change. The humanists of the fifteenth century were devoted above all to the restoration of Latin to its classical form after centuries of “barbarism,” though the notion that a “pure” language could be transplanted in frozen form on to a different era actually negated 1500 years of change and introduced a different sort of anachronism.

Second, the rediscovery of particular historians, and ebbs and flows in popularity among them (the notable rise of Tacitus’s popularity at the end of the sixteenth century being a good illustration), served to restore the writing of biography and history as continuous narrative, in neoclassical Latin and vernacular languages, in place of the religious and secular chronicles, annalistically organized, that had dominated for the past millennium or more. Leonardo Bruni, the early-fifteenth-century chancellor of the Florentine Republic, was one member of a long line of learned civic officials who would combine public life with scholarly activity and in particular with the writing of history. His sixteenth-century successors, far too many to enumerate, included two who were also outstanding political thinkers, Francesco Guicciardini (1483–1540) and the more famous Niccolò Machiavelli (1469–1527), both of whom wrote full-length histories. Each also authored works of political wisdom, in Machiavelli’s case drawing inspiration directly from Livy (and, more ambiguously, from Polybius and Tacitus), and yoking together examples from the recent and remote past in *The Prince* and *Discourses*. Guicciardini, his more pessimistic contemporary, had as a young man written a history of Florence; but he grew less interested than Machiavelli in pursuing the history of his city back to barbarian times than in narrating the unfolding of its and all Italy’s current troubles (the invasions by French and Spanish armies and the erosion and collapse of republican independence). Perhaps as a consequence of this Thucydidean focus on the very recent past, he was more attentive to detail (in particular the complexity of contemporary international relations among states), and, unusually for his day, more skeptical about the capacity of past examples to serve the present, owing to variations of circumstance between superficially similar historical situations. This latter point is an important insight that anticipates much later thinking on the uniqueness of discrete historical events and the incommensurability of different historical epochs, and it is no coincidence that Guicciardini eventually found a modern disciple (albeit a critical one) in the great nineteenth-century German historian Leopold von Ranke.

Third, the above-mentioned discovery of physical ruins, statuary, coins, and buildings in Italy and elsewhere nurtured an ancillary branch of historical study often referred to by the generic title “antiquarianism.” This took various forms in different countries, but beginning with Flavio Biondo (1392–1463) in the mid-fifteenth century and continuing through most of western Europe in the sixteenth and seventeenth, the antiquaries engaged in inquiries into what might be called the non-narrative past. Not bound by classical exemplars (there were no ancient antiquarian works extant except fragments of the late republican Roman Marcus Terentius Varro) they turned for a literary model to geography, as exemplified by Pliny the Elder (23–79 C.E.), rather than to history, and many of their works are thus organized by place rather than time. They were also considerably less concerned with using the past as a source of advice for the present, though a keen interest in great families and especially genealogy permitted many of these works to include extensive memorials of the great and their deeds. Among the most significant works in this genre outside Italy was William Camden’s (1551–1623) *Britannia* (1586). This was a pathbreaking account, built on extensive personal travel around Britain (and on unpublished work by the early-sixteenth-century antiquary John Leland), of Roman and medieval British antiquities. Expanded and reprinted several times over the next century, *Britannia* became a virtual *vade mecum* for subsequent generations of antiquaries and for interested country squires. Bound by classical notions of form and genre, Camden was reluctant to consider such a descriptive, non-narrative survey as “history” (unlike the later *Annales* that he wrote about the reign of Queen Elizabeth), so he defined the *Britannia* as a “chorography,” a term adopted by his many imitators in ensuing decades.

Not all of this erudite work was chorographical and peripatetic. In France, where the study of Roman legal tradition was especially sophisticated, philologists and antiquaries from Guillaume Budé in the early sixteenth century to Jacques Cujas and François Hotman a generation further on studied language and law, developing a “French school of historical study.” There was a philosophical aspect to this too, in the belief of certain writers—contrary to the view of contemporary skeptics or “pyrrhonists” that the past could indeed be restored and represented accurately. One of these, Henri de la Popelinière, even wrote a complete “History of histories, with the idea of perfect history.” Another, Jean Bodin (1530–1596), perhaps the most subtle of late-sixteenth-century European intellectuals, and a voice of secular moderation at a time of vicious religious warfare, wrote a widely read *Methodus* (Method) for the reading of history. This was intended to guide the reader through the thickets of past historians and in particular to dispel certain timeworn notions such as the “Four Monarchies” scheme of periodization, inherited from the Middle Ages and reappropriated by writers of apocalyptic literature (the notion that the return of Christ would follow the end of the four successive secular empires of Babylonians, Persians, Greeks, and Romans). Bodin was the most politically astute and philosophical among a number of writers determined to impose order on the proliferating species of writing about the past, which were threatening to bolt from their classical cages, and to offer guidance to bewildered readers. Describing the genres and forms of history according to well-defined categories, these late-sixteenth-century authors of *artes historicae* (arts of history) hearken back to Lucian’s *How to Write History* in the second century.

Historical thought and scholarship was not, of course, invariably or even mainly devoted to the recovery of knowledge for its own sake. Propaganda has always been a significant part of historical writing, both in the sense of mining the past for evidence in support of current ideologies, practices, and regimes, and the use of formal accounts of the past to disseminate such support widely. As the anthropologist Arjun Appadurai has commented, the past can be regarded as a “scarce resource,” control over which must be fought for or negotiated. We have seen a variant of this in the Chinese approach to establishing Standard Histories, and it was true in different ways in the West. Much medieval historical writing had been undertaken as propaganda for one side or the other in disputes such as the long-running papal-imperial or Anglo-French rivalries. Various Renaissance courts had employed humanists to write elegant Latin histories explicitly favorable to their regimes and intended to cast their achievements in the best possible light to ensure that their positive image would be passed down as fame to posterity. Protonationalist sentiments stimulated the propagation of elaborate national myths of descent from Trojans, Gauls and Scythians. (Making the wrong assertion about one of these peoples or their modern heirs could have serious consequences. In Sweden, newly independent of Denmark, Gustav I Vasa condemned the historian Olaus Petrei [Olof Petersson] for apparent criticism in the latter’s *En Svensk Crönika* [Swedish Chronicle]; asserting French descent from Germanic Franks as opposed to Trojans landed Nicolas Fréret in prison in 1714). Spanish historians from the time of Ferdinand II of Aragon and Isabella I of Castile to the twentieth century have periodically sought a basis for Iberian solidarity in a remote and imagined Visigothic past. In central and eastern Europe, subject ethnic groups such as Hungarians, Bohemians, Moldavians, and Croats developed historical writing in an effort to preserve and promote a sense of national identity, for instance in István Szamosközy’s (1565–1612) history of his native Transylvania, Miklós Istvánffy’s (1538–1615) treatment of Habsburg-controlled Hungary in the fifteenth and sixteenth centuries, and Pavao Ritter Vitezović’s Latin history of Dalmatia and Croatia (1666).

With the religious Reformation in Europe this polemical dimension of historical writing reached new levels as not just particular perspectives but the beginnings of what we would now call “ideology” began for the first time to splinter historical writing into conflicting camps, now able to conduct their campaigns with print, the powerful new weapon of mass instruction. Early Protestant reformers, needing to blacken the papacy and the medieval church generally as one long decline from apostolic purity, provided histories such as the *Magdeburg Centuries*, directed by the Croat reformer Matija Vlačić (Matthias Flacius), which recounted the survival of the true church over centuries of papist decay. While much of this work continued to be composed in Latin, historians were increasingly using local vernaculars in order to reach a wider domestic audience. Thus, notes P. K. Hämäläinen, sixteenth-century Finnish clerics, for instance, began for virtually the first time to write history in that tongue rather than the Latin or Swedish used in medieval annals and chronicles. The propaganda potential of such works, even in an era of restricted lay literacy, was enormous, and was maximized, in the age of religious persecution and intolerance, by a subset of

historians who focused on collecting the stories of early and more recent martyrs, as did the Englishman John Foxe, Huguenot Jean Crespin, and the Dutchman Adrian Cornelis van Haemstede. Catholic Europe responded in kind, for instance in the *Ecclesiastical Annals* of Cardinal Cesare Baronio, intended as an antidote to the Protestant version of the past. Partisanship would become virtually routine in historical writing during the religious wars across Europe and Britain during the late sixteenth and seventeenth centuries, although any individual author continued to stress his own impartiality and the bias or falsity of his opponents.

While it is easy to look back at such works and recognize their obvious slant, it would be a gross error to dismiss them as the worthless detritus of religious bigotry. Although openly hostile to alternative views, and often naively supposing (in the manner of la Popelinière or, somewhat later, England's Francis Bacon), that a correct or "perfect" version of the past was achievable, the strength of their convictions led many of these authors to undertake careful research in order to buttress their cases. Nor were the battle lines exclusively confessional, since a broad Latin republic of letters connecting Catholics and Protestants would develop through the late sixteenth and seventeenth centuries. The savagery with which two Protestant chronologers, Thomas Lydiat and Joseph Scaliger, treated each other's works, or the scorn heaped by the great English lawyer and antiquary John Selden (1584–1654) on the Protestant critics of *Historie Titbes* (1618) illustrate this point well, as do the papacy's hostile reactions to the renegade Venetian priest Paolo Sarpi (1552–1623) for his critical *History of the Council of Trent*.

Moreover, ecclesiastical erudition in the cause of belief continued to drive some of the best scholarship of the late sixteenth and seventeenth centuries, as a defense against both alternative faiths and the potentially more serious threat posed by general "pyrrhonism" or skepticism towards the possibility of recovering the past. An intense search for a firm chronology for events before and since Christ climaxed in the sophisticated work of the French Huguenot philologist Joseph Scaliger (1540–1609) and his Jesuit successor, Denis Pétau (or Dionysius Petavius, 1583–1652), as well as in more notorious attempts to fix with certitude dates such as the first day of Creation—most famously assigned by the Irish archbishop James Ussher (1581–1656) to Sunday, 23 October 4004 B.C.E. Building on this chronological corpus, the Maurists, French Benedictines at Saint-Germain-des-Prés and other houses, produced editions of church fathers, based on original sources, but their principal contribution was in the development of systematic paleography (interpretation of historical scripts and hands) and diplomatic (knowledge of the structure, layout, and conventional formulae of documents) for the analysis of sources. This is best summed up by one of their leading figures, Jean Mabillon (1632–1707), in his treatise *De re diplomatica libri VI* (Six books on diplomatics), which focused on the authenticity of medieval charters. The Bollandists—Belgian Jesuits—commenced the *Acta Sanctorum* (Acts of the saints), organized as a month-by-month calendar of feast days, in order to set the lives and deeds of the historical saints on a sounder scholarly footing. Their project continues today and significantly improved the level of source editing then practiced.

Such tendencies in evidentiary criticism could have unintended consequences in nurturing unbelief. The same skepticism that appears in earlier antiquaries' doubts about such myths as the Trojan descent, or in Jean Bodin's dismissal of the Four Monarchies periodization, soon produced doubts about the literal truth of the Old Testament as a historical source, and deistic views of rational religion. The skeptical tendency first notable in the later sixteenth century produced in the seventeenth both reactive affirmations of received traditions (the *Discourse on Universal History*, Bishop Jacques-Bénigne Bossuet's splendid effort to rehabilitate medieval world history in a Christian context being a famous example), and more thoughtful attempts to address what was now an urgent problem, the very reliability of not just specific traditions, but of *any* historical knowledge. Some of these efforts had a secular focus: Francis Bacon's (1561–1626) empirical attempt to build truths from individually verified "facts" (it was in this period that the word "fact" acquired something like its modern meaning) applied in his judgment both to the realm of the past and the realm of nature, both of which were best represented by "histories"—echoes of the old Herodotean notion of a discovery or inventory can here be heard. Bacon also enumerated the various genres of history in a manner directly derived from the sixteenth-century *artes historicae* (although his only significant effort at history-writing, on the reign of England's King Henry VII (r. 1485–1509), was a rather conventional humanist "politic" history in the style of Tacitus and Machiavelli, intended to provide advice to the crown). The French philosopher René Descartes (1596–1650) addressed the problem of knowledge from the interior to the exterior world, through deduction, but

his solution to pyrrhonism in areas like mathematics and religion did little to buttress confidence that knowledge of the past could be similarly verified. In ensuing decades, others (such as Bacon's fellow Englishmen, Edward, Lord Herbert of Cherbury, Joseph Glanvill, and William Chillingworth) sought to reaffirm the historical foundations of religious truth.

Skepticism about received knowledge, and the belief that reason (we might say "common sense") must take precedence over the revealed truth in Scripture, is perhaps most famously represented in the *Dictionnaire historique et critique* by the exiled French *érudit* Pierre Bayle (1647–1706). The *Dictionnaire*, which appeared in several editions beginning in 1697, was enormously influential in the eighteenth century, but Bayle was scarcely alone in his doubts, especially with respect to the status of scripture as a historical source. Another Frenchman, Isaac de la Peyrère, had anticipated this position in 1655 (the very time at which Archbishop Ussher was confidently working out the date of Creation), after concluding that the Old Testament chronologies were irreconcilable with the existence of non-biblical peoples. The Dutch philosopher Baruch or Benedict Spinoza (1632–1677) espoused the notion that the Pentateuch was the work not of Moses but of a much later, post-Exilic author. Churchmen were active participants in these discussions. The French priest Richard Simon (1638–1712) advanced Spinozan doubts as to Mosaic authorship in his *Histoire critique du Vieux Testament*, published at Paris in 1678 and soon seized by authorities. The English cleric Thomas Burnet (c. 1635–1715) authored works of criticism in a similar vein, two centuries of philological refinement having now been reinforced by the physical evidence of fossils, bones and other artifacts collected by the "curious," the virtuoso assemblers of cabinets of marvels during the previous century. When Burnet later suggested that Genesis could be read "metaphorically," he was quickly dismissed from the office he held at court.

Others, however, continued to build new foundations for historical knowledge (in some cases literally) from the ground up, using erudition as the key to decoding and verifying the obscurities of the past. This was not strictly a Christian perquisite. Jewish historical writing, largely a vacuum since the first century C.E., experienced its own renaissance in the sixteenth century with the Iberian exiles Solomon ibn Verga (1460–1554) of Seville and Samuel Usque (fl. 1540–1555) and the messianic world historian Joseph ha-Kohen. But it was the Mantuan-born Azariah de' Rossi (c. 1511–1578) who most resembled the great Christian antiquaries in his attention to the sources of ancient Jewish history. Azariah's *Me'or 'Einayim* (Enlightenment of the Eyes) was roundly rejected by contemporary rabbinical scholars, but it pointed ahead to the more secure revival of Jewish secular historiography in the early nineteenth century.

By 1700, there was considerable overlap between the study of the erudite side of the past (numismatics, epigraphy, papyrology, paleography, and chronology) and the natural philosophy and natural history of the day. Leading intellectuals in other arenas such as Sir Isaac Newton (1642–1727), who was keenly interested in chronology, and Gottfried Wilhelm von Leibniz (1646–1716) participated in these erudite activities and corresponded with the antiquarian *savants* of the day. The atmospheric pressure and velocity of knowledge is well captured in the letters between scholars, and in the interconnected activities of the great many European academies and societies that were founded at this time, as well as in the earliest journals that circulated knowledge in print. There was also intense activity in the area of source publication and criticism. This included both ancient materials and (with an interest not shown previously) those from the Middle Ages, such as the sources of French history begun by the Maurists as *Rerum Gallicarum et Franciscarum Scriptorum*, or the scholarship in hagiography and imperial Roman history by Louis-Sébastien Le Nain de Tillemont (1637–1698). Perhaps the outstanding examples of this Baroque source publication are provided by the works of the Modenese Lodovico Antonio Muratori (1672–1750), including the *Rerum Italicarum Scriptorum* and *Annali d'Italia*.

The tremors affecting thinking about the past, chronology, and history were undoubtedly magnified by two centuries of explorations overseas, for this was also the era of European expansion to the East and the West. The discovery of other peoples, especially primitive indigenous cultures, also complicated inherited schemes for the periodization of history and the Creation story, as la Peyrère had demonstrated. The conquistadors and the more learned clerical missionaries who followed them discovered advanced non-Christian civilizations in the Aztecs, Mayans, and Incas. Many of these had developed their own sense of the past and non-alphabetic means to represent it—the Incas used the *quipu* or knotted cords combined with memorized traditions, and Mayan glyphs record a dynastic history for the period 250–900 C.E. This was also the first period at which

Western modes of history began to spread outside their European confines and exercise influence elsewhere, as both natives and missionaries constructed chronicles of the preconquest and conquest eras. By the seventeenth century, an Indian, Felipe Guamán Poma de Ayala (fl. 1613), and a Mestizo, Garcilaso de la Vega, *El Inca* (1539–1616), both of whom were influenced by the Dominican Bartolomé de Las Casas (1474–1566), could be relatively comfortable writing history in the mode of the Spanish conquerors, as did the Texcocan Fernando de Alva Ixtlilxóchitl (1578–1650). European expansion also moved east, and other missionaries contributed histories of China and Japan in the late sixteenth and seventeenth centuries. They were uninfluenced by very different Chinese historical genres of the late Ming period. Nor, in contrast to their rapid subjugation of indigenous American traditions, did they exercise much immediate impact on the Chinese and Japanese. The great period of Western influence on Asian historical writing lay several centuries ahead.

India in the Pre-Islamic and Mughal Periods

Among indigenous forms of historical writing that differ from those of the West, none is as hard to grasp as, or more contentious than, those of pre-Islamic India. The values and style of Islamic and Chinese historiography differ from the European, but their products are nonetheless clearly recognizable as histories, and they share common concerns with matters such as chronology and the memorialization of particular facts about the past. For this reason, even the respect accorded to these traditions in most Western histories of history is often completely withheld from other modes of apprehending the past that seem much more remote. Early Indian historical writing is among these. India's very capacity to generate thought and writing about the past has often been rejected—al-Biruni commented on the Hindu lack of interest in “the historical order of things” as early as the 1020s; Edward Gibbon commented on general “Asiatic” lack of history in the eighteenth century; and the indictment was echoed by James Mill and by Georg Wilhelm Friedrich Hegel in the nineteenth century. This is a view that modern scholars of ancient India have fought hard to dispel, though from two very different directions. Some, like Romila Thapar, have argued that there is a historicity or at least historical consciousness in early Indian texts. More recently, scholars such as Vinay Lal have denied this but argued that the very notion of the importance of history is a Western imposition upon a colonized South Asia, an epistemological privileging of a category that should *not* be applied to other cultures such as the Indian. Certainly the complexity of ethnic groups and languages, and the rigidities of the caste system, did not permit anything like Western historiography to develop. Nor was there the central government apparatus that stimulated and systematized Chinese historiography, or the religious imperative underlying classical Islamic histories. It is arguable that Indian philosophy paid no special heed to history (though this was also true of the ancient Greeks) in part because the Hindu outlook is thought to have rejected the notion of individual causality and denied the significance of short-term events in favor of much longer epochs or periods. The most frequently cited exception, a twelfth-century text that actually resembles a chronological “history” is the Sanskrit-language *Rajatarangini* (c. 1148–1149) by Kalhana. This verse composition covered the history of Kashmir from remote antiquity to the author's own time and was derived from legends, oral traditions, written records, and inscriptions. Kalhana was followed by four other Sanskrit-language historians: Jonaraja (early fifteenth century), Srivara (later fifteenth century), Prajyabhatta (early sixteenth century), and Suka (early seventeenth century).

But historical forms *of some sort* assuredly did exist in ancient India, indicating a sense of the past quite different from that in the West, but scarcely the happy ignorance suggested by James Mill. Much more typical than Kalhana's work was the combined tradition known as *itihasa-purana*, which by the mid-first millennium C.E. had become an authoritative source for the ruling Brahman caste. *Itihasa* translates as “thus it was” while *purana* refers to “that which pertains to ancient times” or “old lore.” Early Indian historical tradition contains origin myths and extensive genealogical material on the descents of major families (which generally do not place the figures chronologically). There are also some biographies of individual rulers, beginning in the seventh century C.E. and peaking from the tenth to thirteenth centuries, as well as chronicles of ruling families (*Vamsavalis*, literally, “path to succession”) in inscription or textual form, of which Kalhana's text is the best example and the one most familiar in its use of multiple sources, critically evaluated. An additional category is the collection of historical narratives or *Prabandha*, which again have a biographical orientation.

Pre-Islamic India also developed other traditions of writing about the past, distinct from *itihasa-purana*, especially Buddhist and Jaina, both centered in monastic institutions; the Pali-language chronicles from Sri Lanka for instance focus on the history of a particular Buddhist order or monastery but also stray into secular history and the history of earlier times. Writings such as the *Rajavaliya*, compiled by several hands between the fourteenth and nineteenth centuries, and the *Mahavamsa*, a sixth-century work continued in the tripartite *Culavamsa* of the twelfth, fourteenth, and late eighteenth centuries, together represent a cumulative history of nearly two millennia. To India's north, in Tibet, Buddhist scholarship produced (in Tibetan and Sanskrit) the large history known as the *Deb-ther sngon-po* (*Blue Annals*, the work of the translator and compiler 'Gos lot-sa-ba gzhon-nu-dpal (1392–1491) who used and frequently simply copied earlier sources such as *mnam-thar* (lives) by religious teachers, not all of which are still extant. The chronology of this work and the names of Tibetan rulers can be verified by comparison with events described in earlier Chinese annals from the Tang dynasty. Together with the slightly earlier "History of Buddhism" by Buston (composed c. 1322), the *Blue Annals* has become the source of information for most later histories of Tibet. Apart from language variations (Pali and Tibetan as opposed to Sanskrit), South Asian Buddhist historical writing parted from the Brahmanic in at least one important respect, its dating of events from a single point, the death of the Buddha c. 483 B.C.E. (a controverted date also used by some, but not all, Buddhist-influenced countries). There is an obvious analogy with Christian and Muslim dates A.D. and A.H., and the greater sense of time that one finds in a work like Kalhana's may well be attributable to Buddhist influences, though a comparably Buddhist "era" never achieved historiographical usage in either South or East Asia.

Various regions developed historiographic forms during India's "medieval" or Muslim-ruled period, which ended in the mid-eighteenth century. In the Rajput state, Mughal-inspired official chronicles or *khyats* (some of which contained information from earlier Hindu bardic literature) first appeared in the late sixteenth century. In the early eighteenth century a king of Assam, Siva Singha, ordered a history of his predecessors to be written, and a century later, Ramram Basu, at the behest of a British missionary, authored a vernacular history of the government of Bengal. There exists also a distinct tradition of historical writing among the Maratha people of Western India, including *bakbars* (chronicles and biographies) that continued to be written into the period of British imperial governance. While the reliability of some of these works as chronological sources for the periods they depict has been questioned by modern scholars, they nevertheless constitute intentional attempts to capture the past. It is thus important to recognize that the absence of the usual Western forms of historical writing through much of this period does not entail a lack of any such activity, much less the complete absence of historical *thinking*. However, European traditions would eventually prove effective in bringing the indigenous Indian tradition to a close, following its earlier encounters with Islamic historical thought introduced by Arabic and Persian visitors and Mughal conquerors.

These previous contacts date from the eleventh century, when al-Biruni had traveled into India and reported back on its culture. The newcomers brought with them what was by then a mature Muslim historiography, and in the fourteenth-century, the Bengali official Ziya'ud-Din Barani would remark of historians that they must be truthful and provide insight into virtuous behavior but also inquire into the reasons underlying change in human affairs, injunctions that would not have arisen in the context of *itihasa-purana*. By the sixteenth century, when Mongol-descended Islamic rulers from Turkestan (the Mughals) ruled much of India, Islamic and especially Persian, cultural influences on historiography became more widespread: the Sanskrit-language Kashmir chronicles were superseded by Persian-language works such as the anonymous *Baharistan-i-Shahi* (1614), or the sixteenth-century autobiographical history of the Central Asian Mughals, *Tarikh-i-Rashidi* (comp. c. 1541–1544) by the warrior Mirza Muhammad Haidar (c. 1500–1551). The latter's cousin, the Mughal conqueror Zahir-ud-Din Muhammad, known as Babur (1483–1530), composed or dictated a detailed autobiographical history of his times, the *Baburnama*. Abu'l Fazl 'Allami (1551–1602), the minister of Babur's grandson Akbar, authored the *Akbarnama*, which brought together a variety of sources; it also contains many interesting reflections on the nature of history, which he conceived of as both rational and as a source of solace for grief in the present. At precisely the same period that court-sponsored histories were in vogue in Renaissance Europe, the same feature can be observed in Mughal India, and Akbar inaugurated with Abu'l Fazl the Persian-influenced practice of having an official historiographer write the history of the empire, a practice that was maintained until the last great Mughal emperor, or Aurangzeb 'Alamgir, in the following century. During the next two hundred years, Islam continued to dominate

historical writing in India, producing works on various regions and localities, such as Ali Muhammad Khan's mid-eighteenth-century history of Gujrat over the previous seven hundred years.

Early Japanese and Korean Historical Thought

The story of Japanese historical writing begins with the influence of China and Korea and appears to have concluded in our own time with the impact of the West. History developed considerably later in Japan than in China, and then not in the same forms, despite the frequent use of Chinese as the language of composition. Historical writing can be found in the Japanese archipelago from the seventh century C.E. The emperor Temmu had ordered compilation of a chronicle in 681 in order to correct errors in and conflicts between imperial genealogies and the traditional origin tales of various great families. The earliest extant texts are two official historical works, the *Kojiki* (Record of ancient matters, completed 712 C.E.) and *Nihon shoki* or *Nihongi* (Chronicles of Japan [Nihon], comp. 720 C.E.). These were both commissioned in 711, ostensibly by the empress Gemmei, as the preface to the *Kojiki* stated. Both texts relayed a powerful mythology of the creation of the world and the subsequent foundation of the empire by the first human monarch, Jimmu or Jinmu, a direct descendant of the sun goddess—belief in the emperor's divine ancestry would continue to be taught in twentieth-century Japanese schools. The *Nihon shoki* was composed in Chinese in an attempt to imitate Chinese historiography. The *Kojiki* was written in a commonly used mixture of Chinese and Japanese that grew unfamiliar to readers in later centuries, which led in part to the work's being neglected until the 1700s. By 901 C.E. the *Nihon shoki* had been augmented by five other Chinese-language works that with it form the Six National Histories (*Rikkokushi*).

In some ways, however, the Chinese system of historical writing, and in particular the use of the dynasty as the basic unit of the Standard History, was ill-suited to Japan. From the Japanese point of view, all emperors belonged to the same dynasty, being directly descended from the sun goddess via Jimmu—the *Kojiki* in particular stresses the continuity of the imperial line rather than the cycle of dynastic rise and decay immanent in the Chinese Standard Histories. This linealism, and a degree of resistance to Chinese cultural dominance in spite of the influence of Confucianism, ensured that while its language was initially borrowed, the edifice of Chinese historical writing was not reconstructed wholesale, even in officially sponsored chronicles such as the *Azuma kagami*, a late-thirteenth-century product of the first, Kamakura, shogunate or military government, which is presented as if it were a diary compiled as events occurred. Moreover, beginning in the eleventh century during the Heian period, a different type of history, written in Japanese, began to appear in the *Rekishi monogatari* or historical tales, which were composed by independent scholars and departed considerably from the national histories; at least one of these, the *Eiga monogatari* (c. 1100), was composed by a woman. Many works in this genre were biographically organized; a number, such as the *Gunki monogatari*, dealt principally with war and were often recited orally (not unlike the Homeric epics, which they resemble in military values) before being committed to writing. Examples include the fourteenth-century *Taiheiki* (Chronicle of great peace). Most widely read among medieval Japanese historical writings were the *Gukansho* by the priest Jien (c. 1220), the *Eiga monogatari* and the twelfth-century *Okagami* or Great Mirror.

Following several centuries of imperial decline, the Tokugawa Bakufu (1603–1868) was established whereby shoguns ruled the country on behalf of a figurehead emperor through regional *daimyo* or warlords. During this era, Japan was kept rigidly secluded from outside influences. Historical thinking achieved higher intellectual prominence to the extent that Ogyu Sorai (1667–1728) could confidently proclaim that history was “the ultimate form of scholarly knowledge.” Official history-writing in the mode of the Six National Histories continued to flourish, often tied to a particular shogunal “domain” or feudal territory—the pro-imperial *Dai Nihon Shi* (Great history of Japan, begun in 1657 and only completed in 1906) was, for example, initiated in the Mito domain. Much of this work began to depart from the imperial mythology of Jimmu since it did nothing to support the case for shogunal primacy over a puppet emperor. Among shogunal officials, Arai Hakuseki (1657–1725) stands out for his *Tokushi yoron* (Essays on history), a series of lectures on the past intended to instruct the shogun through example while making use of a wide variety of sources and largely ignoring the early origin myths. Arai painted a progressive picture of Japanese history that validated noncentralized governance; it also subordinated individual action and choice to inevitable historical trends. Two generations earlier, Hayashi Razan (1583–1657), an unabashed admirer of Chinese historical texts, had set the stage for a Neo-Confucian philosophy of history strongly allied to the shogunate. A number of private scholars were also

writing about the past, often from non-Confucian perspectives. Motoori Norinaga (1730–1801), an exponent of the “National Learning” school of history, rejected Chinese-influenced accounts of the past in favor of the earlier record of the *Kojiki*, which now achieved a status it had not enjoyed for a millennium. (Motoori conveniently overlooked the fact that it, too, was heavily indebted to Chinese histories).

Like Japan (which it in turn influenced), Korea was strongly affected by Chinese historiography through much of the premodern period. Unlike Japan, Korea had distinct dynasties, and the annals of each reign (*sillok*) are analogous to Chinese Veritable Records. The *chongsa* or dynastic histories of early Korea are similarly comparable to the Chinese Standard Histories (which in fact provide the earliest source material for Korean history). Historical records were maintained from the fourth century C.E., and a history was compiled in 600 C.E. by Yi Mun-jin of the Koguryo kingdom, but these have not survived; Korean writings may even have influenced the Japanese *Nihon shoki* in the eighth century. The earliest example still extant of Korean history-writing, compiled in the Koryo period, is Kim Pu-sik’s *Samguk Sagi* (History of three kingdoms) (1145 C.E.); this used both now-lost Korean sources and Chinese writings, and is clearly modeled on Chinese Standard Histories. The Koryo dynasty (918–1392), following earlier Tang Chinese practice, established a History Office in the tenth century; this bureaucracy was considerably expanded during the ensuing Yi or Choson dynasty (1392–1910), and in the fifteenth century a group of scholars led by Chong In-ji (1418–1450) completed the *Koryosa* (a dynastic history of the Koryo). Choson historians would eventually produce a whole series of *sillok* for each reign covering nearly five centuries up to 1863. As with the Chinese Veritable Records, *sillok* were carefully guarded so that even the reigning monarch was denied access to them in order to protect against interference. Again as with China, the presence of an official bureaucracy could not prevent alternate or private interpretations of the past from being written. A more Korean-focused tradition of historical writing also sprang from this Confucianism, for instance the thirteenth-century monk Iryon’s *Samguk Yusa* (Memorials of three kingdoms). In the eighteenth century, a school of “practical learning” or *sirhak* developed that produced such works as An Chong-bok’s distillation and analysis of Korean history, *Tongsa kangmok*, one of the first histories to be written by a private scholar independent of government support. Beginning in the late nineteenth century, both Western and Meiji Japanese historical scholarship would displace Chinese influences in Korean historiography.

Enlightenment in the West

With the close of the era of religious wars that had marked the sixteenth and much of the seventeenth century, European historiography expanded its scope considerably beyond the political and ecclesiastical topics that had predominated since the Renaissance and Reformation. This does not mean that Enlightenment historiography was a radical departure from what came previously. To the contrary, it relied very heavily on many of the historiographical accomplishments of the previous two centuries, and in particular on the enormous corpus of erudite knowledge in the form of printed documents and texts, engravings of archaeological and architectural remains, and especially the study of different legal systems. Two centuries of travel and expansion also encouraged many of the historians of the late seventeenth and eighteenth centuries to undertake a comparative approach to the study of the past.

A major goal of Enlightenment historiography may be described as the search for a synthesis and balance between erudite knowledge and philosophy. Some of the best examples show a turn away from the narration and description of political events toward the consideration of civilization, customs, and especially *moeurs* (the French word for “manners”). Having said that, it should immediately be admitted that the term *Enlightenment* is itself loaded and complex, and there exists a wide range of views of history and historical writing among the historians who subscribed to its principles. Moreover, far from every historian during the Enlightenment can be described as a practitioner of what J. G. A. Pocock has referred to as “enlightened historiography.”

Two significant Italian contemporaries stand out at the beginning. The younger, Pietro Giannone (1676–1748), was a Neapolitan jurist who authored a *Civil History of the Kingdom of Naples* (1723). This blended detailed knowledge of documents (often derived at second hand from the erudite works of earlier generations) with a focus on social history and a reform-minded and specifically anticlerical outlook that would characterize much later Enlightenment thinking. The older and ultimately—though not immediately—more important was Giambattista Vico (1668–1744), like Giannone a jurist. The influence of Vico on subsequent European thought—

by no means limited to historiography—has been profound, though it was to fall on deaf ears for a century. Vico's *Scienza Nuova* (1725; *New science*), which has aptly been called a virtual Newton's *Principia* for history, espoused an erudite synthesis of the human past—including the non-Western. Vico erected this edifice on a postulated series of cycles of progress and decline, dividing the past into a series of recurring ages: of gods, of heroes, and of men (the historical age)—there had been two such cycles (*corso e ricorso*) up to his own time. Each age was characterized by distinctive modes of speech, thought, law, and government, and all unfolded against the imagined horizon of an "Ideal Eternal History." An admirer of Plato and Tacitus, of the empiricism of Francis Bacon and the legal scholarship of the Dutchman Hugo Grotius, Vico's application of philology and jurisprudence to the study of the past both echoes the Renaissance humanists and presages the work of later anthropologists, linguists, and comparative religion scholars. His ingenious insight that myths were an expression of an earlier mode of consciousness and of a language rooted in poetry, and that they needed to be understood metaphorically, was a powerful tool. It permitted him to embrace the biblical account of man's early history rather than dismiss or query it in the manner of French skeptics such as Bayle. He also provided an apparent answer to Cartesian skepticism in the notion that men *can* understand with certainty the things that they make, which include nations and their history. For Vico, *verum* (truth) was equivalent to *factum* (that which is made—or, we might add, *done*).

The anticlericalism that appears in Giannone would be taken up by one of the period's most well-known figures, Voltaire (the pseudonym of François-Marie Arouet, 1694–1778), whose *Essai sur les mœurs et l'esprit des nations* was an overview and critique of several centuries' worth of institutions and customs, including those of non-Western civilizations such as the Chinese. Less erudite than many other historians of the era, unsympathetically critical of the errors and folly of past ages, and at times positively hostile to "pedantic" scholarship and "useless obscurities," Voltaire praised features in other civilizations while still arriving at the conclusion that Western culture represented the triumph of human reason. He nevertheless contributed to public knowledge of other past societies, often employing contemporary travel accounts as sources; and in *Le siècle de Louis XIV* (1751) he offered a brilliant if uncritical analysis of civilization during the age of Louis XIV, which he aspired to establish as a benchmark for reform in his own time. The notion that there is a cumulative progress in human events had been a recurring theme in history for centuries, though typically ascribed to a divine plan as in the Judeo-Christian eschatological view of time. In the eighteenth century, progress as an organizing principle really came into its own, with the most optimistic views being espoused by the likes of Voltaire and especially his Revolutionary-era successor, Marie-Jean Caritat, marquis de Condorcet (1743–1794). The latter, an ill-fated aristocratic philosophe, left at his death the introduction to a *Sketch for a Historical Picture of the Progress of the Human Mind*, a book that adumbrated a nine-stage history of humanity's progress, with a culminating tenth stage of reason and achievement to follow the Revolution.

In Britain, Enlightenment historiography took a rather different turn. William Robertson (1721–1793) was influenced by Voltaire (though critical of the latter's errors) in his *History of Charles V*. His fellow Scot David Hume (1711–1776)—who was better known as a historian than as a philosopher in his own time—tried to apply his own skeptical theory of causation (and an admiration of ancient historians, especially Thucydides) to England's past. Hume's multivolume *History of England from the Invasion of Julius Caesar to the Abdication of James II* struck a chord with contemporary audiences, and he is also noteworthy for having developed a "sentimental" approach to historical writing that he hoped would appeal to female readers, who found much of historical writing dry and unappealing. The outstanding figure of British historiography during the period, still read frequently today, was Edward Gibbon (1737–1794), whose *The History of the Decline and Fall of the Roman Empire* (1776–1788) was a towering masterpiece synthesizing enormous erudition in literary, numismatic, and other antiquarian sources (albeit often at second-hand) with a philosophical and critical outlook. Gibbon was the late Enlightenment heir to two thousand years of thinking about historical problems such as the relationship between empire and liberty, virtue and power, citizenship and wealth, simplicity and luxury, and the nature and reasons underlying historical decline, themes that can be traced back, in different forms, through Renaissance humanists to post-Eusebian ecclesiastical history and beyond, back to Tacitus and Sallust. Gibbon was just as much the beneficiary of a hundred more recent years of enlightened history and erudition in the different modes of Tillemont, Muratori, Giannone, Voltaire, and Robertson. Though he was by no means an anticlerical in the style of Voltaire, Gibbon has become celebrated for his famous ascription of the fall of Rome to the triumph of "barbarism and

religion,” meaning, respectively, the various migratory tribes and the Christian Church. It is less widely recognized that the majority of his famous book in fact dealt with the Eastern, Byzantine half of the empire, and thus is properly considered a work of medieval, not ancient, history.

Eastern Europe first began to develop a substantive corpus of historiography at this time, often under foreign influence. The Hungarian-Slovak pastor Mátyás Bél (Matthias Belius; 1684–1749) established the first learned society in Austria while publishing an extensive collection of the sources of Hungarian history. Russia had produced a sporadic tradition of chronicle writing, including its *Primary Chronicle* (early twelfth century) since the later Middle Ages. Beginning with the late-seventeenth-century Westernization under Peter the Great, a new national historiography emerged, first with Vasilii Nikitich Tatischev’s (1686–1750) compilation from older chronicles into a *Russian History from Most Ancient Times*, and then with two national histories by Mikhail Vasilyevich Lomonosov (1711–1765) on the earliest periods, and the seven-volume survey of Prince Mikhail Mikhailovich Shcherbatov (1733–1790). Eighteenth-century Russian historical writing reached its highest achievement just after the Napoleonic struggles in the multi-volume synthesis, based on a wide variety of sources, of Nikolai Mikhailovich Karamzin (1766–1826). Western European philological scholarship had also arrived in Russia with two Germans, Gerhard Müller and his literary assistant August Schlözer, the latter of whom edited and published the *Primary Chronicle*.

The German *Aufklärung* contribution to historical thought and writing may have had the most profound and lasting effects on the next century. In contrast to the gentlemanly tradition of a Gibbon or the journalism of a Voltaire, German historical thought and writing was intimately linked to the educational system, and especially to universities such as Göttingen. The list of achievements is considerable. Schlözer (1735–1809) returned from Russia to Göttingen and a prolific career as a historian in 1767. Johann Christoph Gatterer (1727–1799) pursued the development of a “universal history” and promoted erudite scholarship at Göttingen. Elsewhere, at Halle, Friedrich August Wolf (1759–1824) revolutionized Homeric studies and created a new term for the interdisciplinary study of antiquity, *Altertumswissenschaft*. Others worked without university appointments. Johann Winckelmann (1717–1768), a librarian at Dresden, put art history, and especially the study of Greek sculpture, on a new footing, refocusing attention away from artists’ biographies and on to changing styles and their periods. Johann Gottfried Herder (1744–1833), a schoolmaster and clerical official, anticipated the historicism and nationalism of the next century with his notion that a *Volk*, or people, exhibited cultural characteristics, the product of language, climate, and experience, that transcended political boundaries. His *Ideen zur Philosophie der Geschichte der Menschheit* (1784–1791), in some ways a synthesis of the previous century’s work, nonetheless marked a significant departure from the standard early Enlightenment rationalist view of an unchanging nature common to all humans at all times. Herder directed attention away from political and military history (the edificatory value of which he doubted) toward the “inner life” of humans discernible from art, music, and literature, an approach that would ultimately evolve into the later German idea of *Kulturgeschichte*.

Chinese Scholarship under the Qing

Allowing for its very different circumstances, China under the late Ming and succeeding Qing dynasties experienced many of the same historiographical developments as the West. One leading authority on the period, Benjamin Elman, has characterized it as a transition “from philosophy to philology,” as the Neo-Confucianism that had marked most of the previous half-millennium of Chinese historical writing, especially under the Song and Ming, was challenged and a new emphasis placed on evidentiary research—itsself anticipated by many Song scholars centuries previously. Despite the strictures and quotas on civil service careers imposed by the Manchu Qing dynasty, which by and large adopted Chinese language and cultural practices, a higher degree of professionalization occurred in the eighteenth century. Philology and ancillary disciplines such as epigraphy, paleography, manuscript collation, and phonology were developed against the backdrop of an argument within Confucianism between Qing advocates of “Han Learning” (who had a preference for the texts and methods of Han-era scholars in studying the earlier Chinese classics) and their Neo-Confucian “Song Learning” opponents—an interesting if inexact analog to the slightly earlier European *querelle* of ancients and moderns. During this period, official academies supplanted the private schools of earlier years. Ming-era survivors such as Gu Yanwu (1613–1682) epitomized the careful attention to research among a wide range of sources of the

physical as well as the textual, especially in his *Rizhilu* (Record of daily knowledge). As so often in historiography, contemporary issues proved a powerful stimulus for detailed and accurate research that could transcend polemical positions and, a century after Gu, Wang Mingsheng (1722–1798) would assert the responsibility of the historian to examine all available evidence. Together with Zhao Yi (1727–1814) and the respected teacher Qian Daxin (1728–1804), Wang was a member of a great trio of mid-Qing historical scholars who brought historical scholarship to a new level.

Western influences were increasingly felt during this period, albeit inconsistently, and indeed the parallels with Renaissance humanism three centuries earlier are striking, including the considerable expansion of woodblock printing that began late in the Ming era, the frequent exchange of correspondence among scholars, and the particularly high valuation of ancient learning. A consequence of this was that certain venerable texts were held up to the kind of critical scrutiny that Renaissance philologists had applied to forgeries like the Donation of Constantine or the pseudo-histories of Annius of Viterbo. And, as the humanism of the Renaissance had preceded the rationalist skepticism of the Enlightenment, so the Han Learning revival eventually produced a decline in the status of Confucianism. Methodologically, the “School of Evidentiary Research” (*kaozheng* or *k’ao-cheng*) as it is often called, is exemplified in works such as Yan Ruoqu’s (1636–1704) exposure of selected chapters of the *Shujing* (the “Book of Documents,” both a classic and a history) as a piece of later, post-Confucian authorship. This iconoclastic pursuit of truth had effected momentous changes in scholarship before the School itself declined in the nineteenth century. It would clear the way by the end of the Qing era in 1911 for Liang Qichao’s (1873–1929) now Western-influenced call for a “new historiography” and for his associate Xia Zengyu’s general history of China, itself affected by Western-style Japanese histories of China.

A number of other important genres of historical writing appeared during the period. Histories of institutions (*Zhi guan*), previously annexed to the Standard Histories and other works, were now presented as independent reference books. A preexisting form of local history or “gazetteer” dating back to the Song dynasty or earlier, the *Fangzhi* also proliferated, initially as a guide to local administrators who were often strangers to their region, intending to provide a complete history of all phenomena, natural and human, within a particular administrative area. Nearly one thousand Ming and five thousand Qing-era *Fangzhi* survive; although they have no exact Western counterpart, their local focus and emphasis on multiple sources bears comparison with the natural histories and “surveys” of late-seventeenth-century Britain, and, more remotely, with an outstanding German work of local history, Justus Möser’s *History of Osnabrück* (1768).

Romanticism, Historicism, and Nationalism

Möser’s *Osnabrückische Geschichte* has been praised by modern historians such as Friedrich Meinecke for its sensitivity to the uniqueness of the local community. When combined with Herder’s understanding of the cultural differences among various peoples and the integrity of the *Volk*, and with the enormous influence of a cultural icon such as Johann Wolfgang von Goethe, late-Enlightenment Germans had anticipated a number of coming trends in European historical thought. In the political aftermath of the French Revolution and Napoleonic wars, and amid the intellectual wake of the Romantic reaction to Enlightenment rationalism, the nineteenth century saw a turn away from grand theories (philosophers such as Hegel being notable exceptions) and world histories and an increased focus on the individual—especially the heroic individual—and the nation. Early-nineteenth-century French historians such as François Guizot (1787–1874) and Adolphe Thiers (1797–1877) postulated a unified past for their nation, while the more radical Jules Michelet (1798–1874) directed readers to the history of *le peuple* (the common people). Both the interest in individuals and the intuitive sympathy for the unique and distinctive contributions of past ages to modernity (the latter traceable to Herder and as far back as Vico) are hallmarks of a mode of apprehending the past that subsequent ages have called “historicism” (or, following Meinecke, “historism”).

But Romanticism had more immediate outcomes. Initially a conservative or even reactionary movement that privileged nature over reason and revalued neglected periods such as the Middle Ages, it proved adaptable for many in the next generations into a creed for the advancement of liberty and for the promotion of the rising tide of nationalism that threatened the stability of post-Napoleonic Europe. Romantic nationalism was often linked to a sense of identity built upon a shared sense of a people’s ethnic or even political past—for an example one need only think of

Lord Byron's fatal sortie into the Greek war against the Turks in 1824. The impact of nationalist historical consciousness was magnified, following the revolutions of 1848 and the return of progressive ideas in liberal or even radical political clothing, by national unification movements such as the Italian Risorgimento, and in the emerging independence of former satellites in Europe from imperial rule (already anticipated in the American Revolution sixty years previously) and that of other former colonies in North and South America.

Though there had certainly been eminent historians in newly established kingdoms like Belgium prior to their independence, sovereignty or the drive toward it provided an urgent need to establish both the shape of a national past and the capacity to write about it. Even those regions such as Bohemia that did not achieve political autonomy during the period still celebrated their separate identity and marked out a distinctive past. Thus František Palacký's (1798–1876) five-volume history of the Czech nation from earliest times to the Habsburg union of 1526 espoused a highly romantic and nationalist view of the Czech heritage, celebrating the Hussite religious reformers of the fifteenth century, for instance, as exponents of Slavic liberty against Germanic authoritarianism. European Jews, after centuries of rabbinically dominated treatments of their past, acquired a modern national history for the first time in the successive works of Isaac Marcus Jost (1793–1860) and Heinrich Graetz (1817–1891). The latter was a German whose *Geschichte der Juden* put Jewish history on a firm archival and philological basis while not losing sight of the connecting theme of endurance through centuries of exiles, persecutions, and massacres.

The pattern is similar elsewhere. In Hungary, Romantic historians such as István Horvat (1784–1846) created a popular if highly fictionalized remote past for the Hungarian people. The unsuccessful revolt of 1848–1849 was followed by nationalist histories (often authored by exiled liberals such as Mihály Horváth [1809–1878]) and by the foundation of the Historical Commission of the Hungarian Academy of Sciences (1854) and the Hungarian Historical Association (1867), as well as by the extensive publication of source material in the *Monumenta Hungariae Historica* (initiated 1857). Polish aspirations for independence and political reform are likewise reflected in the great quantity of sources published in the early nineteenth century, and in the liberal, pro-peasant multivolume history of Poland by Joachim Lelewel (1786–1861). The proto-Romantic nationalism of the historian Father Paisiy of Hilendar (1722–1773) set his native Bulgaria on a century of historical nation-building leading up to independence in 1878, at first affirming in an uncritical manner the nation's Slavic affiliations and ancient descent from remote nomadic progenitors like the Scythians—a time-honored convention going back to medieval and Renaissance theories of mythical national descent from peoples like the Trojans. Romania, which achieved independence in 1877, established a national academy shortly thereafter, and history was introduced at its newly founded universities.

In northern Europe, Norway acquired a university in 1811, just prior to its establishment (1814) of a semi-independent state in union with Sweden. Most historical activity remained for a time the work of politicians, jurists and poets, such as Henrik Wegeland (1808–1845), author of *Norges Konstitutions Historie* (1841–1843). An academic historiography first emerged in the 1830s with Peter Andreas Munch (1810–1863) and Rudolf Keyser (1803–1864); it retained the romantic outlook of earlier writers, but made significant advances in source-editing. French liberal historiography (Michelet and Guizot) as well as Darwinian-Spencerian notions of progress introduced a more positivist climate in the next generation, which was dominated by the radical proponent of complete independence, Ernst Sars (1835–1917). In Finland, academic historiography had existed since the foundation of the University of Turku in 1640, and had flourished in the Enlightenment with historians such as Henrik Gabriel Porthan (1739–1804), who had mainly written in international Latin. The new nationalist impulse (Finland became an autonomous state in 1809) ensured that vernacular-language works eventually overtook in volume those written in Swedish; the first full-length Finnish-language history of Finland would be produced by Yrjö Sakari Yrjö-Koskinen (1830–1903). Historical consciousness was further stimulated by authors such as the journalist, educator, and novelist Zacharias Topelius (1818–1898), a Finnish Sir Walter Scott, while foreign-authored histories from the south were also widely read. As in Norway, positivist historiography found an audience: England's Henry Thomas Buckle would have one of his strongest followings in Finland.

South of Finland in the Baltic region, nationalist sentiments were much slower to develop. The history of Estonia and Latvia was written almost entirely by their Baltic German intellectual elites prior to their independence in 1918, national sentiments from the 1860s producing relatively lit-

tle by way of historiography. Lithuanian historiography has been more fully documented thanks to Virgil Krapauskas, though its story is similar. Tied to Poland through much of the late medieval and early modern periods and dominated by Russia in the nineteenth century, Lithuania had actually lacked a written language prior to the late fourteenth century—early historical sources emanated from Russian, German, or Polish writers. Unlike other ethnic groups, Lithuanians thus had little by way of historiographical tradition prior to the romantic-era historian Simonas Daukantas (1793–1864), who wrote in Lithuanian and created a dubious pedigree for his people in a remote barbarian tribe. Earlier histories were rare. The “Bychovko chronicle,” the long version of a pro-Lithuanian sixteenth-century text generally known as the *Lithuanian Chronicle* was not available till 1846, when it was published by Daukantas’s contemporary, Teodor Narbutis (1784–1864). Another sixteenth-century Lithuanian chronicle, by Augustine Rotundus (c. 1520–1582), had long been lost. Daukantas had no immediate followers. As Krapauskas notes, between 1832, when the Russians closed the University of Vilnius, and the early twentieth century, Lithuania produced no academically trained historians of its own, though distinguished Poles such as Lelewel wrote about the Lithuanian past. The creation of a sense of national identity where none had existed fell to non-professionals: minor noblemen, poets and linguists, who were more interested in creating a heroic past than in following the canons of western historical scholarship; and the occasional part-time scholar like Bishop Motiejus Valančius (1801–75), whose historical work on his Samogitian diocese more closely approximates mainstream European critical historiography. Collectively, their work provided an essential ingredient for the establishment in 1918 of Lithuania’s own short-lived independence. Beginning in 1883, with the publication of the nationalist newspaper *Ausra*, Lithuanian intellectuals increasingly took an anti-Polish tack. While they traced their linguistic and cultural heritage back, rather tenuously, to the remote centuries of the once-powerful Grand Duchy of Lithuania, they repudiated connections to that state’s association with Poland in favor of a Herderian-style concept of the nation.

Russian historical writing continued to be influenced by Western European traditions in the late eighteenth and nineteenth centuries as it had in the time of Schlözer. As elsewhere, considerable activity was devoted in the post-Napoleonic era to the collection and publication of source materials, especially government documents, under the leadership of the Chancellor Nikolai P. Rumiantsev (1754–1826). An “Archeographic Commission” undertook a nationwide survey of archives and repositories analogous to Britain’s Victorian-founded Historical Manuscripts Commission. Various other archaeological and historical societies were established, such as the Russian Historical Society of Petersburg, whose *Russian Biographical Dictionary* (publication of which was interrupted by the October Revolution in 1917 and the society’s dissolution), is again a counterpart of a British publication, the *Dictionary of National Biography*. Influenced by the German classicist B. G. Niebuhr, M. T. Kachenovskii (1775–1842) adopted a highly skeptical approach to the early, Kievan period of Russian history. Hegel’s philosophy of history and the works of Friedrich Wilhelm Joseph von Schelling (1775–1854) were widely read among the intelligentsia of the 1830s and 1840s, influencing a “slavophilic” school of historians, but the general trend was toward Westernization of practical historical methodology in a “scientific” vein. The two outstanding historians of the second half of the nineteenth century were S. M. Soloviev (1820–1879) and V. O. Kliuchevskii (1841–1911). Soloviev had traveled in the West and heard lectures by the German Leopold von Ranke (see further below), as well as by Guizot and Michelet; he was personally acquainted with the great Czech Palacký. Soloviev’s prodigious *History of Russia since Ancient Times* appeared in twenty-nine annual volumes beginning in 1851, accompanied by numerous monographs. Rather like Ranke, he had a vision of history as a unified and continuous story of organic development. In the following generation Kliuchevskii, Soloviev’s pupil and successor, assigned a new prominence to the analysis of economic and social history, which would establish the groundwork for post-revolutionary Marxist historiography.

In North America, the British colonies diverged historiographically following the American Revolution. The northern colonies—the future Canada—remained firmly within the British imperial orb (despite the existence of a distinctive Francophone Catholic majority within the colony of Lower Canada, subsequently Quebec). A consciousness of Canada as a nation, historically, did not begin to mature until Confederation (1867) brought political unity and semiautonomous status within the empire, and even then Francophone historiography remained apart from its Anglophone counterpart, with recurrent sovereignty movements still building today on the belief in a historically separate Quebecois nation awaiting its rightful autonomy. To the south, the experience was very different. The prototype for a nationalist historiography had been established in

colonial-era writings that acknowledged the colonies' place in the empire but also celebrated aspects of their differences—for instance, in Puritan writings marking New England colonists as reformed “saints” who had voluntarily separated themselves from the ungodliness of the Old World. A distinctive nationalist historiography (admittedly fragmented by ideological and sectional differences for a century or more) thus emerged quite quickly following the independence of the new United States. Early postindependence American historians such as Mercy Otis Warren (1728–1814) provided a history of the Revolution emphasizing democratic values, while the biographers of major figures such as George Washington helped establish a pantheon of national heroes. Historical novels on the model of Britain's Sir Walter Scott were emulated by the likes of James Fenimore Cooper (1789–1851). Both American and world history were enormously popular among readers during the first half of the nineteenth century, but their writing remained the domain of gentlemen of leisure (and the occasional woman like Warren) or of journalists. Famous examples (both blind through most of their careers) include William Prescott (1796–1859), narrator of the Latin American conquests, and Francis Parkman (1823–1893), historian of the frontier. Internationally, the most widely recognized American historian was George Bancroft (1800–1891), a former professor turned diplomat and one of the first of his country to earn a Ph.D. from a German university, a trend that would increase in the second half of the century.

In Latin America, there had been a steady flow of historical writing in both Spanish and Portuguese areas since the conquests of the sixteenth century, a good deal of it by expatriate Spaniards such as the Jesuit historian of Paraguay, Pedro Lozano (1697–1752). The liberal values of the late Enlightenment dominated the writing of history during the nineteenth century, first in the form of constitutionalist historians who focused on the European-inherited legal institutions underlying independence, and later in a more independent and romantic kind of writing that, following Herder and Michelet, emphasized instead the importance of the spirit of the people itself in establishing well-functioning new societies in a postcolonial era: the Chilean Literary Society of the 1830s, for instance, had regular meetings in which selections from Herder and other eighteenth-century historians were read. A third and later group emulated the positivism of writers like Auguste Comte (1798–1857), Henry Thomas Buckle (1821–1862), and Herbert Spencer (1820–1903) to advocate a history that demonstrated the economic and scientific progress of the region along European industrial lines—knowledge of the past, said Vicente Fidel López in the 1840s, would allow planning for the future. The Chilean José Victorino Lastarria, who did not read Comte until the 1860s, nonetheless found in the Frenchman an endorsement of his own ideas from two decades earlier.

In Mexico, conquistadors and missionaries had documented the past since the sixteenth century, including the precolonial histories of the subjugated peoples, derived from native codices and oral information: the Franciscan Bernardino de Sahagún (d. 1590) presented his own survey in both Spanish and the Aztec Nahuatl tongue. Following independence from Spain in 1810, and during the political vicissitudes of the next hundred years, distinctive nationalist and liberal schools of history emerged. Portuguese Brazil, a nation of multiple ethnic groups, followed a similar pattern, as independence in 1822 produced a need for a national history. Early feeble efforts in this direction were transformed in 1838 by the foundation of the Instituto Histórico e Geográfico Brasileiro, which staged a competition in 1840 on the theme of how best to write a Brazilian history—a contest ironically won by the German naturalist Karl Friedrich Philip von Martius. The acknowledged founder of modern Brazilian history during this period was Francisco Adolfo de Varnhagen (1816–1878). Author of both a *General History of Brazil* and a history of Brazilian independence, Varnhagen made pioneering use of documents in European archives and opened up unstudied new subject areas, such as the relationship between Portuguese and native populations. Elsewhere in South America, as Allen Woll has shown, an intense debate concerning the proper method of history-writing followed the publication of Claude Gay's (1800–1873) political history of Chile. Gay, a French botanist, was commissioned by the Chilean government to write this work, and despite its endorsement by the respected Latin American academic and man of letters Andrés Bello, younger writers (including Bello's own one-time pupil, Lastarria) found its recitation of facts without a search for meaning unsatisfactory. Finally, there were those who sought meaning and instruction in the patriots of the South American past, drawing literary inspiration from across the Atlantic. Bartolomé Mitre (1821–1906), for instance, was initially enamored of H. T. Buckle's erudition. In the end, he gravitated toward Thomas Carlyle's “great man” interpretation of history, and Mitre's account of Argentine independence focused on the careers of its leaders, the revolutionary heroes Manuel Belgrano and José de San Martín.

The “Professionalization” of History

If the first half of the West’s nineteenth century is characterized by literary historical writing in a romantic and nationalist vein, the second half may be noted for a rapid growth in what may, with due caution, be loosely called “professionalization.” Although this too has nationalist origins, it is associated less with the “nation” in any ethnic, linguistic, or cultural sense than with the political “state” and its bureaucratic apparatus. The romantic liberalism of national independence and unity rapidly transformed itself in much of Europe into the institutional conservatism of preservation and social stability. Changes were signaled by a number of developments: the expansion of university systems and the turning of many of them by the century’s end to advanced training in historical scholarship; the systematization of public record systems in many countries; the advent of several new professional associations, frequently accompanied by a new style of high-standard periodical or journal; a further development of the longstanding trend to publish archival documents, often under government sponsorship and now with a considerably higher standard of accuracy than previously applied; and the systematic convergence of the erudite skills evolved over the previous three centuries (paleography, diplomatic, numismatics, and epigraphy) within an overarching science of the criticism of sources, for which the German term *Quellenkritik* provides the best shorthand descriptor. This is also significant as the period during which Western-style historiography first began seriously to have a lasting effect on its rival traditions in the Orient and the Middle East, starting it down a road to eventual hegemony in the twentieth-century world.

Any account of nineteenth-century professionalization must begin with a colossus: the imposing figure of the German Leopold von Ranke (1795–1886). Initially a student of ancient history and philology (which were themselves making considerable advances under the older contemporary whom Ranke admired, the philologist Barthold Georg Niebuhr), Ranke wrote a doctoral dissertation on Thucydides. He quickly expanded his interests to include the medieval and modern history of much of the world, beginning in *The Histories of the Latin and Germanic Peoples from 1494 to 1514* with the period tackled by Francesco Guicciardini three centuries earlier. Subsequent works traced the emergence of the European state system that this good German public servant much admired as the source of modern civilization and individual freedom; and with a gaze wandering steadily outward in expanding circles, his life closed with an unfinished multivolume *Weltgeschichte*. Staggeringly prolific as he was, however, Ranke is less important for any of his individual histories than for what he came to symbolize. Over his long career at the University of Berlin, which had displaced Göttingen as the epicenter of German scholarship, he thoroughly transformed the training of young historians (many of them foreigners), by focusing his research seminars on primary sources and their criticism. Among his pupils and associates, Ranke could include many of the great names of the mid- to late nineteenth century, such as Georg Waitz (1813–1886) and Heinrich von Sybel (1817–1895); the latter deserves much of the credit for having converted Ranke’s ideas into institutional form throughout Prussia and then Germany as a whole. Some of Ranke’s students, to be sure, departed from the master’s model. The Swiss historian Jacob Burckhardt (1818–1897), for instance, was an unusual apprentice whose great *Kulturgeschichte, The Civilization of the Renaissance in Italy* (1860) remains one of the most-read historical works of the entire century and is a forerunner of modern cultural history. The conservative Heinrich von Treitschke (1834–1896), who was not a student of Ranke but succeeded him in the chair of history at the University of Berlin (an opportunity Burckhardt had declined), deviated in a different direction. Treitschke’s multivolume history of early-nineteenth-century Germany (1879–1894) provided a celebration of the Bismarckian state and a script for later German imperialism—a development that Ranke, a European rather than a strict nationalist, would not have embraced.

Willingness to subject to criticism documents and texts, and the received notions that derive from them, has often been taken as a sign of secularism or impiety by contemporary critics and later admirers alike: one recalls John Selden’s experience in seventeenth-century England and the reaction to the Han Learning scholars of early Qing China, discussed above. The adulation now paid to earlier critics of Old Testament texts such as Richard Simon and Baruch Spinoza as heralds of modern secularism is not necessarily more accurate than the scorn heaped upon those scholars by conservatives of their own day. With Ranke we find a devoutly religious man, with intellectual debts to German idealist philosophers such as Johann Gottlieb Fichte, attempting to find God’s handiwork in history, as had so many historians before him, but with a focus on the mechanics of human action on the earthly stage to the degree that these could be recovered through careful criticism of sources. Ranke had a strong belief in divinely dictated progress, but also in the distinctive

value and contribution of each historical era and people, all “equal before God.” He promoted a historiography that as far as possible could tell the story of the past *wie es eigentlich gewesen*. This famous phrase translates most accurately as “the past as it essentially was”—not, as some later students thought, “the past as it actually happened.” Later admirers wrongly believed that this meant the complete avoidance of anything not based on a specific fact and the absolute repudiation of conjecture or interpretation, thereby ignoring the moral and philosophical side of Ranke’s work.

Thanks to Ranke, his immediate disciples, and the celebrated German university seminar environment, German scholarship loomed large over many of Europe’s nations in the second half of the nineteenth century and beyond; the Sorbonne historian Ernest Lavisse (1842–1922) was so impressed by Ranke’s successes that he introduced the historical seminar into French higher education. In truth, many of the methodological practices were already practiced elsewhere in Europe. The real appeal of the German approach to historiography was its emphasis on the historian’s calling as a professional (with the high status that it accorded in German society) rather than an amateur or “gentleman scholar.”

If anything, German influence was stronger outside western and central Europe than within. To the east, for instance, several generations of early-twentieth-century Romanian historians derived inspiration from Germany, including the archaeologist Vasile Pârvan (1882–1927) and the methodologist Alexandru Xenopol (1847–1920). To the north, the Dane Kristian Erslev (1852–1930) and the Norwegian Gustav Storm (1845–1903) both spent extended periods in German seminars. Although some British and French historians trained in Germany (Lord Acton [1834–1902], for instance, with the Catholic scholar Johann Joseph Ignaz von Döllinger), it was American students who most frequently flocked to Germany, returning home to staff departments of history and new graduate schools at U.S. universities. Of those historians working at American universities in the 1880s and 1890s, roughly half had spent some period of time studying in Germany, though frequently too short a period to permit them really to absorb German historical method—much less the whole philosophy behind it—in detail. The “objectivity” mantra chanted in American historiography for many decades may be ascribed in large measure to the importation of a naïve version of Rankeanism that upheld Ranke himself as an idol while largely misunderstanding the more subtle aspects of his thought. Indeed, the myth of Ranke was far more influential in America than his methods, and Gabriele Lingelbach has argued persuasively that the concrete influence of German historiography among U.S. historians at this time has been overstated. Many American scholars, such as Henry Adams, who introduced a seminar at Harvard, even held the German university system in low esteem. Again, it was the aura of the “professional” that was most appealing. Professional standards that upheld a creed of “scientific history” were policed by influential academics like J. Franklin Jameson (1859–1937), editor of the *American Historical Review* (est. 1895) and upheld by the newly founded (1884) American Historical Association. The brief assault on the supremacy of political history by James Harvey Robinson (1863–1936) and the “New Historians” before and after World War I, and the work of the Progressive historians such as Carl Becker (1873–1945) and Charles Beard (1874–1948), did not endure, but it opened the door to the advent of social history in the 1960s. Becker and Beard’s “relativist” doubts about objectivity were also rejected in the conservative search for certainties after World War II. The arrival of postmodernism has given them a new relevance in recent decades, though probably not one that either man would have welcomed.

European methods began to penetrate elsewhere in the world. Late Victorian notions of “scientific history” migrated into India during the first third of the twentieth century through British-trained Indian historians returning home to teach. In part owing to the influence of scholars such as the Sanskrit philologist Sir R. G. Bhandarkar (1837–1925), his son, D. R. Bhandarkar (1875–1950, an epigrapher and numismatist), and the Mughal-period scholar Sir Jadunath Sarkar (1870–1958), the institutional apparatus of Western historiography gradually emerged, beginning with the Historical Records Commission of 1919 and the Indian History Congress established in 1937–1938. Early attempts at multivolume histories of India were aborted, but advocates such as the novelist Kanaiyalal Maneklal Munshi promoted Hindu rediscovery of their ancestral, pre-Islamic past. Following independence in 1947, Munshi called for a new history of India which, on this occasion, under the direction of the prolific historian Ramesh Chandra Majumdar, resulted in *The History and Culture of the Indian People* (11 vols., 1951–1969). In recent decades, India has continued to produce outstanding scholars of international reputation such as the historian of early India, Romila Thapar (b. 1931), and the social historian Sumit Sarkar (b. 1939).

Perhaps the most interesting example of direct importation from the West and the profound change it could occasion is provided by Japan. Long closed to the West during the Tokugawa era, Japan rapidly opened up to international influence in the years running up to and following the Meiji Restoration of 1868, which brought an end to the age of the Bakufu. History had enjoyed considerable popularity through much of the nineteenth century, and the new regime established an official department of history and then, in 1875, an expanded Office of Historiography. Its initial purpose was to organize the compilation of the *Dainihon hennenshi*, a new history along the lines of the Six National Histories, and from a pro-Imperial perspective. A rival official history, the *Taisei Kiyo* (Outline of the Imperial Rule), to be written in Japanese, was also initiated by more conservative members of the new regime.

Following a series of renamings and reorganizations, the Office of Historiography was transferred to the Tokyo Imperial University in 1888, and a department of Japanese history founded there in the following year. Closed in 1893 when the government disapproved of its research agenda, the Historiographical Institute, as it had become, was briefly closed. It reopened in 1895, by which time the plans to write a new national history had been all but abandoned: attention now focused on the narrower mandate of recovering and publishing documents.

Any residual Chinese traditional influences on historiography were soon overwhelmed by Western scholarship, for in the meantime, the director of the office, Shigeno Yasutsugu (1827–1910) had arranged for one of Ranke's later disciples, the German Jew Ludwig Riess (1861–1928), to come to Japan in 1887 and teach at Tokyo Imperial University; he remained there until 1902. At the same time, reform-minded and pro-Western scholars such as Fukuzawa Yukichi (1835–1901), a reader of Alexis de Tocqueville, Buckle, Spencer, and Guizot, formulated a theory of civilization espousing the superiority of the West and the need for Japan to catch up with the rest of the world after centuries of isolation. Others practiced the equivalent of British "Whig history," describing the restoration as a major milestone on the road to progress. The popular historian Taguchi Ukichi, another admirer of Western liberals and social theorists, epitomized this outlook in his multivolume *Nihon kaika shoshi* (Brief history of Japanese civilization, 1877–1882). As in Europe, not everyone accepted the value of academic historiography: Yamaji Aizan (1864–1917), an outsider and popular historian highly critical of the sterility of scholarship at Tokyo Imperial, and of "dead history." Moreover, the consequences of the kind of source criticism that Riess's Japanese friends espoused were by no means always welcome, especially among conservative nationalists determined to maintain the tradition of a social and moral function in historiography. Shigeno (who was also president of the Historical Society established in 1889) was himself reviled as "Dr. Obliterator" for his attacks on historical verities. Another historian, Kume Kunitake (1839–1931) was forced to resign from his position in 1892 for using scholarly methods to undermine the historical basis of Shinto and thereby calling into question the historicity of the early myths; this in part occasioned the temporary closing of the Institute in the following year. In her authoritative study of the period, Margaret Mehl has argued (Mehl, p. 14) that in comparison with their German counterparts, scholars at the Historiographical Institute had scant influence on the national interpretation of the Japanese past.

By the end of the nineteenth century, Japanese historians had divided themselves into three formal fields: national (Japanese) history (*kokushi* or *Nihonshi*), oriental history (*Toyoshi*), and Western history (*Seiyoshi*). As the Kume affair illustrates, there was an uneasy tension in the application of what the Japanese themselves called "scientific history" to the construction of a national and Imperial-focused account of the past; in the decade leading up to World War II, the so-called "Imperial view of history" seriously constricted freedom of interpretation. Though actual incidents of government interference were not numerous, they have become well-known: for instance, the historian Tsuda Sokichi (1873–1961) was convicted in 1942 for undermining the still-revered national mythology of the *Kojiki* in work he had published nearly three decades earlier on the ancient imperial court. His doubts about the historicity of Jimmu and his immediate successors were entirely unacceptable in an aggressively militaristic state that had marked the founding emperor's 2600th anniversary in 1940 with national celebrations.

History as Philosophy and as Science

Although the general thrust of nineteenth-century historiography was toward critical scholarship and away from philosophical speculation, the period nevertheless gave birth to a number of schemes for the explanation of all of history, often by nonhistorians. Many of these had origins in German

idealism, especially Hegel's philosophy of history as the gradual self-realization of mind in history through a process of "dialectic." His views, while distinctive, had roots in earlier Enlightenment thinkers, but Hegel firmly rejected—as Herder had earlier questioned—the longstanding classical notion that history was "philosophy teaching by examples." For Hegel, history was a process and simultaneously a coherent narrative of that process, rather than a well from which useful guides to morality and behavior could endlessly be drawn.

The most significant consequence of Hegel's philosophy of history and its dialectic engine was its inversion by the socialist Karl Marx (1818–1883) into a historical materialist philosophy of economic and social change leading from primitive times, through feudal and capitalist phases, to the triumph of the proletariat. With less obvious debts to the philosophy of Ludwig Feuerbach (whom he severely criticized), the scientific positivism of Auguste Comte (whom he viewed with contempt), and more remotely to such a theorist as Vico, Marx developed his views of history piecemeal through several theoretical works, beginning with *The German Ideology* (1846). He wrote at least one work that can be considered a political history, the *18th Brumaire of Louis Napoleon* (1852). Without exception, no theory of history in modern times has had more influence, in terms of sheer numbers of adherents, especially among Marx's Soviet, Eastern European, and Chinese admirers, and the citizens of their states.

Germany also produced other versions of thought about the unfolding of history, and about the nature of the historical discipline. The historian turned theoretician Johann Gustav Droysen (1838–1908), though a believer in the possibility of improved historical knowledge, argued in his *Grundriss der Historik* and elsewhere for a less naive view of the historian's relationship to sources. Droysen placed particular emphasis on the creative role of interpretation as guided by present-day circumstances and values and the need for firm and consistent methodological rules. He was just as hard on historical positivists like Britain's H. T. Buckle for their reduction of human actions and institutions to the categories of the natural world. A further late-nineteenth-century turning away from the post-Rankean fetish of the document can be seen in Wilhelm Dilthey's (1833–1911) assertion that history is a mental act of understanding (*Verstehen*) whereby the meaning of events must be intuited from our own inner experience, not simply narrowly read from the sources. Like Droysen's, Dilthey's position was antipositivist because it assumed historical acts could be apprehended in a way that did not apply to the natural world of science, owing to our essential human similarity with historical figures. Wilhelm Windelband (1848–1915) similarly poured doubt on the modish tendency across Western Europe to see history as a "science" (in a positivist mode that went well beyond anything that Ranke would have advocated) by defending its status as an "ideographic" (representative of the unique and singular) rather than a "nomothetic" (law-generating) practice.

The notorious *Methodenstreit* or "dispute about method" set off in 1891 by Karl Lamprecht (1856–1915) presaged some of the uncertainties of the twentieth century. Critical of the neo-Rankeans of his day, but more sympathetic to positivism than Droysen or Dilthey, Lamprecht cast doubt on the usefulness of history conceived as the account of leaders and particular events, as opposed to larger groups, and invoked the need for an alliance with the incipient social sciences, including psychology. Though roundly denounced at the time, Lamprecht was not without adherents. His students included the leading Romanian historian of the next generation, Nicolae Iorga (1871–1940), and he was seen by a number of East German historians, following World War II, as having provided an "alternative to Ranke" (Chickering, p. xiii). At the same time, Lamprecht's historically minded contemporaries, the philosopher Georg Simmel (1858–1918), the political economist Max Weber (1864–1920), and a French former history student, Émile Durkheim (1858–1917), were pushing the study of the past toward the emerging discipline of sociology, which has enjoyed a steady if troubled relationship with its parent discipline in the century since.

German philosophy and German practice were powerful, and traveled well, but were not in the end omnipotent. The great French ancient historian of the mid-nineteenth century, Numa Denis Fustel de Coulanges (1830–1889), remained quite immune to Niebuhrian *Altertumswissenschaft*. In Britain, which has never highly valued speculative history (Arnold Toynbee being a notable, and oft-criticized, twentieth-century exception), little attention was paid to the philosophy of history. More surprisingly, even the reception of German scholarship and pedagogy was at best mixed. It was perhaps most influential in the area of the history of law, which enjoyed its

closest association with history since the days of John Selden in the seventeenth century. The legal historical scholarship of earlier jurists such as Friedrich Carl von Savigny (1779–1861) on Roman civil law proved useful in the historical debate at the turn of the century regarding the origins of English law and of medieval land-holding practices. Lawyers played a similar role in Germany, Britain, and the United States in related arguments about the degree to which medieval villeinage (and by extension, more modern Anglo-American institutions) was descended principally from Roman colonial origins, as suggested by the lawyer Frederic Seebohm (1833–1912), in pioneering work on agrarian and economic history, or from Anglo-Saxon freemen whose liberties were disrupted before and after the Norman Conquest, as maintained by another lawyer-historian, the émigré Russian Sir Paul Vinogradoff (1854–1925). This was an old debate, going back to the seventeenth century, but it was now investigated through a much wider array of sources. Perhaps the greatest British historian of the beginning of the twentieth century was also a lawyer. The Cambridge scholar Frederic William Maitland (1850–1906), who in 1887 founded the Selden Society to publish medieval legal documents, held a professorship of law rather than history, continuing the long connection between those disciplines that had produced the sixteenth-century French *érudits*, Vico, and Maitland's immediate model, Savigny.

In other contexts, German practices were less influential. England evolved independently a system for training historians (still based on the individual tutorial and without, as yet, the American emphasis on the Ph.D.), a professional journal in the *English Historical Review*, and a series of systematic publications or calendarings of documents such as the *State Papers* and the *Rolls Series* of chronicles, the last-mentioned essentially a counterpart to the German *Monumenta Germaniae Historica*. The most widely read historians, however, remained those of a more literary bent, outside the universities, such as Thomas Babington Macaulay (1800–1859) and the positivist speculator on the history of civilization, Buckle. Despite the eventual impact of educational reformers such as Cambridge's Sir John Seeley (1834–1895) on the curriculum, the British university until near the end of the century occupied a much less important role in historical scholarship than in either Germany or the United States. Celebrated historians such as the medievalist William Stubbs (1825–1901), the exponent of Teutonism Edward Augustus Freeman (1823–1892), and the Reformation historian James Anthony Froude (1818–1894), spent significant periods of their careers in church, journalism, or government rather than in a university setting (Stubbs resigned the Regius professorship of history at Oxford to become a bishop; Freeman became his successor after several unsuccessful attempts at a chair; Froude abandoned the university early in his career and only returned as Freeman's successor late in life, after most of his work had been written). The author of scholarly and popular works on this history of the English people, John Richard Green (1837–1883), was a sickly parish curate turned Episcopal librarian, and never held a university appointment at all.

German historical thought was under duress from other directions in the years leading up to World War I. The historical agency of “spirit,” “providence,” “mind,” and even God, so important for Hegel's or Ranke's predecessors and contemporaries, was fading fast in the age of the iconoclastic philosopher Friedrich Nietzsche (1844–1900), of Marxism, and of modern science. The nineteenth century ended on a quasi-positivist or at least “scientific” note with a variety of “method” books. Ernst Bernheim's (1850–1942) massive *Lehrbuch der historischen Methode: Mit Nachweis der wichtigsten Quellen und Hilfsmittel zum Studium der Geschichte* (1889), which was quickly translated into languages such as Japanese, confidently avowed that many facts of history could be known with certainty, though he conceived that others could only be surmised as “probable.” This trend toward a rather narrow preoccupation with method was also observable in fin-de-siècle France. Earlier French historians such as Jules Michelet and Edgar Quinet (1803–1875) had indeed been affected by speculative philosophy, the latter by Herder and the former by Vico (for whose rediscovery Michelet was largely responsible); the Hebraist and religious scholar Ernest Renan (1823–1892), who developed his own Herderesque theory of nationhood as a “spirit,” also flirted with materialism as a substitute for shaken faith. But as in Germany, this was increasingly a minority position. The apparatus of modern French historiography was established with the founding of the famous graduate research center, the *École pratique des Hautes Études*, in 1868 and of the major journal, *Revue historique* in 1876. Perhaps the most naïve expression of the evidentiary positivism at the root of scientific history—a belief in the methodological improbability and rock-solid documentary foundation of historical knowledge, without the Comtean reduction of all human knowledge to the natural sciences—can be found in a more concise French counterpart to Bernheim. A hugely successful manual on method, the *Introduction aux études historiques*

(1897) by Charles Victor Langlois (1863–1929) and Charles Seignobos (1854–1942) was soon translated or adapted into several other languages. The apparent confidence of some historians in the canons of historical method—soon to be seriously shaken—is best captured in the famous declaration of the Cambridge professor J. B. Bury (1861–1927) that history was a “science . . . nothing more and nothing less.”

The later nineteenth century also witnessed something else not seen before historiographically, namely the far greater involvement of women in historical writing in Europe and North America. Women had been readers of history for three centuries or more, and there had been a handful of notable female historians such as Ban Zhao, Anna Comnena, Catharine Sawbridge Macaulay (1731–1791), and Mercy Otis Warren, as well as numerous women authors of popular histories and biographies such as England’s Agnes Strickland (1796–1874) in the mid-1800s; Germaine de Staël (1766–1817) offered an iconic figure of female “genius” and historical imagination outside the realm of scholarly research. J. R. Green’s widow and collaborator, Alice Stopford Green (1847–1929), outlived her husband by nearly half a century, during which time she published several works on Irish history in her own right. Mary Anne Everett Wood (later Green; 1818–1895) abandoned an early career as a Strickland-like biographer of princesses to spend her life as a full-time editor of documents at England’s Public Record Office. With their admission to some universities women began to make even more significant contributions to scholarship: one of the most formidable economic historians of the first half of the twentieth century, Eileen Power (1889–1940) would proceed from Girton (a women’s college at Cambridge) to postgraduate study at the *École des Chartes*. In the United States, late-nineteenth-century feminists such as Elizabeth Cady Stanton, Susan B. Anthony, and Matilda Joslyn Gage compiled a *History of Woman Suffrage*, while Mary Ritter Beard (1876–1958) published what became the most important English-language survey of female agency and power, *Woman as Force in History* (1946). With all that, the career barriers to women in academic historiography remained daunting until at least the 1970s; the American Historical Association elected only one female president in its first hundred years of existence, although a number have been chosen since then.

Twentieth-Century Developments and New Paths

Historiography has changed enormously during the past hundred years, in ways that merit much fuller treatment than can be afforded here. This final section will be devoted to exploring some of these, including significant transformations in European-American and East Asian historical writing, and developments in other parts of the globe (for instance Africa and Southeast Asia) not treated in earlier sections. It is not the case—contrary to views once confidently held—that these regions had no forms of historiography prior to the arrival of Western imperial powers (any more than this is true of China or Japan). For convenience, however, the earlier history of historical writing in these understudied areas is included in the present section.

The African Past. In order to appreciate twentieth-century African historiography, it is first necessary to examine earlier forms of history on the continent. It was once commonplace to assert that Africa had no past prior to colonial times—it was one of those regions, like the New World or India, that Hegel dismissed as “without history,” a pronouncement that the late Hugh Trevor-Roper (1914–2003) notoriously repeated in the 1960s. In recent decades, this myth has been exploded, largely owing to the considerable efforts of historians to recover and compare oral traditions and to establish reasonably reliable chronologies of events, but also because of growing knowledge of the existence of writing outside Islamic North Africa before the arrival of Europeans. Poetry and folk tales from many regions have been demonstrated to possess a sense of the past and of historical events, with or without the presence of literacy. The oral tales of the Dinka of southern Sudan, for example, frequently begin with the standard assertion, “This is an ancient event.” In some regions hieroglyphics also preserved a record of the early past. Writing was introduced not by European colonizers, but by Arab and Berber invaders in the centuries following the rise of Islam, and a number of west African non-Arabic writing systems appeared in later centuries.

The Islamic influence was especially strong in the north, the region known as Maghreb, Ibn Khaldun’s *Muqaddimah* being its most famous historiographical product. Many indigenous tongues were represented with Arabic script (a practice known as *adjami*), for instance those of the Hausa of Sudan and the nomadic Fulani who conquered much of the Hausa territory in the nineteenth century. Historiographically, the Hausa were especially influenced by the *Ta’rikh al-*

khulafa (History of the caliphs) by the prolific Jalal al-Din al-Suyuti (1445–1505): as late as the early twentieth century, for instance, Abubakar dan Atiku's *Chronicle of Sokoto* imitated the form and style of al-Suyuti. The Hausa also evolved a courtly tradition of contemporary historical writing, exemplified in Ahmad b. Fartua of Bornu's chronicle of the reign of the Sultan Idris III (1570–1602). In more recent times, Hausa communities have developed local chronicles written in either Hausa or Arabic and have focused on maintaining chronological lists of rulers; that of the town of Kano, to give one example, goes back to a legendary founder and ends with a late-nineteenth-century emir, Mahammadu Bello.

In East Africa, *Kitāb al-Sulwa fi-akhbar Kilwa* (The history of the town of Kilwa, in modern Tanzania) was recounted in an anonymous early-sixteenth-century work commissioned by the Sultan Muhammad b. al-Husayn. Royal chronicles in the ancient Ethiopian Ge'ez tongue first appear in the thirteenth century (at the very same time that secular chronicle writing was increasing in medieval Europe) and continue (sometimes in Amharic) into the twentieth. Other Ethiopian historical literature in Amharic appears in the sixteenth century, such as the *History of the Galla*, composed in the 1590s. Further south, the language of Swahili includes a preponderance of narrative poems (*utendi*), of which the earliest written example, *Utendi wa Tambuk* (1728), is a historical epic set during the life of Muhammed. At the other end of the Sahara, west African kingdoms developed an Arabic-language historical literature, such as the *Ta'rikh-as-Sudan* (Chronicle of the blacks) by 'Abd al-Rahman al-Sa'di (fl. 1596–1656) and *Ta'rikh al-Fattash* (Chronicle of the researcher), initiated by Mahmud al-Ka'ti of Timbuktu, which was completed by a descendant about 1665.

Modern Western-style historical writing per se appears first in nineteenth-century colonial times—not a great deal later than its establishment in Europe. Initially, Western historical writing was largely the domain of the colonizers, especially missionaries, who were concerned to integrate African schoolchildren into a Christian and European past. There were some notable indigenous exceptions, such as Samuel Johnson (1846–1901), the Yoruba son of a Sierra Leone freedman who returned to his parents' home in Nigeria as a missionary. Johnson, strongly affected by classical historians such as Xenophon, authored a *History of the Yorubas from the Earliest Times to the Beginning of the British Protectorate* (published posthumously in 1921). This was based largely on Yorubaland oral historical narratives (*itàn*) and eyewitness accounts, in addition to colonial documents; Johnson's purpose, as he announced at the start of his book, was to ensure “that the history of our fatherland might not be lost in oblivion, especially as our old sires are fast dying out.” Carl Christian Reindorf (1834–1917), another African cleric, used both oral and written evidence for his 1895 *History of the Gold Coast and Asante*, and the Buganda (part of Uganda) politician Sir Apolo Kagwa (c. 1869–1927) provided an orally based history of *The Kings of Buganda* (1901). In the West Central African territory of the Bamum (modern Cameroon), its local sultan, Njoya (c. 1880–1933), created his own ideographic script, modeled on European writing, and then commissioned the writing of a 548-page manuscript on the history and customs of his people.

All of these works were ethnically based, that is devoted to recovering and telling the past of a particular tribe. Unsurprisingly, given the clerical careers of most authors except Kagwa, they were also Christian-influenced, and most were heavily reliant on European sources, as was the somewhat later work of the Xhosa missionary John H. Soga, *The Southeastern Bantu* (1930). In the areas colonized by Germans, such as Tanganyika (part of modern Tanzania), Swahili historical works in Roman script, as well as verse chronicles in *adjami* appeared in the early twentieth century, beginning with Abdallah bin Hemedi 'Ajjemy's (c. 1835–1912) *Habari za Wakilindi* (Chronicles of the Kilindi, completed in 1906); this was an extensive record of the Kilindi dynasty that ruled the area in the nineteenth century, derived from oral traditions of the Shambala, a non-Swahili-speaking tribe. A reminder that the traffic between spoken tradition and written history can run in both directions is provided by Kenya's *Chronicle of the Kings of Pate*. The original manuscript of this work, which covers the town's history from the thirteenth to the late nineteenth century, was destroyed in 1890, but knowledge of its contents was so vivid that several writers were able to produce new written versions in the decades thereafter.

In South Africa, an indigenous black African oral tradition included Xhosa oral narratives, a subset of which, *amibali* (sing. *ibali*), dealt specifically with historical events and genealogical details. These were marginalized in the late nineteenth century by the “Settler School” of white historians and by white imperially focused historians (principally British though including the

occasional Afrikaner like Henry Cloete). Both of these groups advanced a negative view of the subordinated black culture. The earliest examples of colonial historical writing, in English, Dutch, or Afrikaans, appeared in the first third of the nineteenth century, but the Settler School really only consolidated with the work of the Canadian-born George McCall Theal (1837–1919), who, ironically, had compiled one of the earliest collections of Xhosa narratives. Although criticized for defects of scholarship such as a refusal to cite his sources and a reluctance to do more than recount events without analysis—like many of his contemporaries, he was not a professional historian—Theal proved hugely influential on subsequent historiography. The racist theme of European supremacy in his eleven-volume *History of South Africa* would be accentuated in the distinctive Afrikaner nationalist tradition after 1910, albeit with the center of gravity provided by events such as the Great Trek (the 1830s migration northward of Afrikaners in search of freedom from British Cape colony rule) rather than British imperial expansion.

The almost total neglect or disparagement of the black population continued into the apartheid era. Liberal historians such as W. M. Macmillan and C. W. de Kiewiet, beginning in the 1920s, began to integrate black and white experience, and to attend to social and economic history; they evinced concern for the treatment of indigenous blacks while maintaining the assumption of European civilized superiority. The writing of missionary-trained black historians, such as Soga, of the first half of the century, was notably inclined to a favorable view of the British. In the 1970s, however, more radical scholars, many of them Marxists, advanced a more serious attack on past historiography, likening colonialism and its apartheid aftermath to the class system. The works of British Marxist historians such as Eric Hobsbawm and E. P. Thompson and of the American Eugene Genovese seemed transplantable to Africa. Social theories such as André Gunder-Frank's "underdevelopment" thesis (originally developed with Latin America in mind) were similarly adapted by Africanists.

European-American historiography on Africa began in the nineteenth century—the celebrated American historian and civil rights activist W. E. B. DuBois (1868–1963) had provided inspiration for an early generation of black American scholars. Most early efforts were devoted to countering racist assumptions about the inferiority of Africans. These in turn were often derived from the so-called "Hamitic hypothesis" (the Bible-derived view that Africans were descended from Ham, son of Noah, or alternatively that only the "civilized" cultures of Egypt and North Africa sprung from European peoples such as the Phoenicians). It was not until after World War II, however, that the subject began to make its way, slowly, on to mainstream history curricula. Beginning in the late 1940s with the retreat of the European colonial powers and the establishment of independent nations in ensuing decades, a deeper interest in exploring their own past quickly emerged among African populations, stimulated by reaction to decades of education in an alien imperial historiography. With this came an urgent need to recast the historical record and to recover evidence of many lost precolonial civilizations. At the same time, European intellectuals' (especially British, Belgian, and French) own discomfort with the Eurocentrism of previous scholarship provided for the intensive academic study of African history, an innovation that had spread to North America by the 1960s. Foundational research was done at the School of Oriental and African Studies (SOAS) in London by scholars such as Roland Oliver (cofounder in 1960 of the *Journal of African History*), by the American economic historian Philip Curtin, and by the Belgian Jan Vansina (an authority on oral tradition). Francophone scholars have been as influential as Anglophones, in particular the Parisian social historian, Catherine Coquery-Vidrovitch (b. 1935). But African historiography has not been the sole creation of interested Europeans. African universities have, despite the instabilities of politics and civil war in many areas, trained their own scholars and sent many others overseas for doctoral training (South Africa has been rather exceptional in having a number of powerful research-intensive universities). The pioneering Nigerian historian Kenneth Onwuka Dike (1917–1983) studied at Durham, Aberdeen, and London, and SOAS alone has produced several African-born scholars, including the Ghanaian Albert Adu Boahen (b. 1932). Boahen in turn participated in the important early summary work of postcolonial historical writing, the UNESCO *General History of Africa*, directed by a "scientific committee" two-thirds of whom were Africans and written by over three hundred authors including the Kenyans Ali Mazrui (b. 1933) and Bethwell Allan Ogot (b. 1933), Joseph Ki-Zerbo (b. 1922) of Burkina Faso (formerly Upper Volta), and the Nigerian J. F. A. Ajayi (b. 1929). Francophone African historians had until recently an especially close relationship with French universities, notes Matthias Middell, though African history generally is less prominent within France than in the English-speaking world.

African historiography has also proved a fertile field for the application of various interdisciplinary approaches, including archaeology and linguistics. In particular, it has welcomed the application of social science theories such as “modernization,” “dependency,” and the above-mentioned “underdevelopment.” It has also provided a forum for Marxist concepts such as “modes of production” and “capital”; the work of Walter Rodney (a black radical historian assassinated in Guyana in 1980) has been especially significant in this regard. At the same time, the early focus on political history and the establishment of chronology has been displaced to a considerable degree by an interest in social, economic, and cultural issues, reflecting historiographic trends elsewhere in the world. In recent decades, “Africa” has proved too unwieldy an umbrella term, and the field has segmented into thematic subfields such as slavery and gender; postmodernism has also begun to make itself felt as the colonial and early postcolonial periods are revisited by a fresh generation. The popularity of African history has waned somewhat among North American students, but it remains firmly established as an area of research, sometimes conjoined with Afro-American studies.

China, Japan, and Korea. Western historiographical practices, often derived at second hand via Japan, began to influence late Qing scholars by the end of the nineteenth century. Chinese historical analysis had long been inclined to cyclical views of history as a series of alternating periods of order and disorder, throughout which individual dynasties rose and fell. In the face of rapid change, historians would turn instead to an explanation of the past as linear development over a series of periods. Liang Qichao, as Luke Kwong has shown, built on the previous generation’s works and on the thought of Britain’s Thomas Huxley in developing a five-stage, progressive theory of history (though he would express doubts as to progress and insist on the need for both cyclical and linear views). Liang and Zhang Taiyan advocated a general history (*tongshi*) based on Western practices (largely absorbed through Japanese and Chinese translations). Liang’s own *Xin shixue* (New history) appeared in 1902, citing Edward Gibbon as an exemplary model. A few years further on, in the wake of the republican overthrow of the Qing, and the “May Fourth” New Culture movement that began in 1919, American-style academic history arrived with the translation of the Columbia University historian James Harvey Robinson’s (1863–1936) *The New History* (advocating a broader inquiry into the past that went beyond politics) into Chinese by one of his admirers, He Bingsong (1890–1946). He, who had studied at Wisconsin and Princeton, also adapted Langlois and Seignobos into Chinese as a work on the writing of general history, *Tongshi xinyi* (1928). Another American-trained historian, Hu Shi (1891–1962) authored a history of Chinese philosophy, while Gu Jiegang (1895–1980) published a popular school textbook situating China in world history. At the same time, other Chinese scholars who were German-trained were introducing the very Rankean type of historical writing of which Robinson’s New Historians had been critical, a fine distinction that seems to have mattered little to the Chinese readers of both.

The early twentieth century would see some extensive reconsideration of the Chinese past. Archaeology produced alternative sources such as oracle bone inscriptions for the study of the most ancient dynasties, especially the Shang. Gu Jiegang authored a fundamental reevaluation of ancient Chinese history that was so strong in its dismissal of some received myths that his works were declared unsuitable for students in the late 1920s. In the 1930s an extensive debate arose over the periodization of Chinese history; the outcome of this “Social History Controversy” was the adaptation of the Chinese past into European and especially Marxist period categories such as “feudalism.” Even more than May Fourth scholarship, early Chinese Marxist historical thought, initially derived from Russian sources, produced a fundamental break with the Confucian didactic and moralizing practices that had dominated two-and-a-half millennia of history writing.

With the advent of the People’s Republic after the chaotic period of the Japanese occupation and the ensuing Communist-Nationalist civil war, Marxist historiography became state-sponsored orthodoxy. Fan Wenlan (1893–1969), whose *Zhongguo Tongshi* (General history of China) is a landmark of Chinese Marxist history, had been a Communist since the 1920s and was eventually appointed to head the Institute of Modern History—his close relationship with Chairman Mao Zedong probably saved his life during the Cultural Revolution. Early historiographical efforts were often Soviet-inspired, with textbooks translated directly from Russian. Beginning in the early 1950s and continuing into the 1970s, the focus of scholarship was the history of the peasantry and of capitalism, with the triumph of Communism depicted as inevitable. “Party” historiography became a significant subject in its own right, the texts produced by scholars carefully controlled and

orchestrated from above in a manner that makes the bureaucrat-historians of the Tang era seem positively independent by comparison.

Since 1949, historians at various times have suffered persecution for heterodox statements, while within the Communist Party itself, different factions have sought historical support for contending political positions. The Great Leap Forward (1959–1961) opened a rift among older and younger Marxist scholars and pressured academic historians toward a militant repudiation of “feudal” or “bourgeois” dynastic history, along with the construction of general histories on Marxist principles, and purged of reference to former dynasties, emperors, and events. This was accompanied by directives to subordinate past to present, history to theory, in a simplistic manner resisted by moderate academics such as Beijing University’s Jian Bozan (1898–1968). The Cultural Revolution had an even more terrible impact a few years later, virtually beginning with an attack on the respected historian of the Ming era, Wu Han (1909–1969), who would die in prison. Wu was the first of many historians whose careers were destroyed in these years, including Jian Bozan, who was hounded into suicide (both Jian’s and Wu’s reputations were subsequently rehabilitated under Deng Xiaoping). Following Mao’s death in 1976, the extremist Gang of Four even appealed to the memory of the despotic first Qin emperor in support of autocracy, while liberal critics looked to the ancient Zhou dynasty (eleventh to third centuries B.C.E.) for a model of democratic city-states along the lines of fifth-century Athens. Since the 1980s, entire eras have been rehabilitated, though a Party resolution of 1981 attempted to cut off ongoing historical discussions of the Maoist period in the name of unity. In the last quarter of the twentieth century, Chinese historiography opened up again to the West, and many Chinese academicians have been trained in Western graduate schools and Western books translated into Chinese. This liberalization has largely continued, despite brief setbacks such as the 1989 Tiananmen Square reaction.

The Westernization of Japanese historiography in the late nineteenth century has been recounted above. The early twentieth century saw a considerable expansion of this trend after World War I, with Marxist and social science influences gathering momentum in the 1920s and 1930s; economic history of Japan was practiced by scholars such as Honjo Eijiro (1888–1973) and Otsubuka Hisao (1907–1996), and local history by Yanagita Kunio (1875–1962). Extensive publication of sources also occurred. As we have seen, the period of the late 1930s and the war years marked a disastrous period for historiography, either silencing or co-opting those on the left. During the American occupation and after, Marxist interpretations would rebound, and an enormous effort was directed in the first postwar decades to the support of democracy by identifying the historic weaknesses in the imperial system that had brought the country to the brink of destruction: Maruyama Masao’s (1914–1996) studies of Japanese political thought, for instance, exposed the roots of “ultranationalism” and fascism. The 1960s would see a reaction against “elitist” history (including the Marxist version) and the creation of a “people’s history” (*Minsushi*). Although national devotion to the imperial past has never disappeared entirely, much of postwar Japanese scholarship reflects historiographical trends elsewhere, including the awareness of Eurocentrism. Since the 1970s, the same multiplication of subfields experienced in the West has also occurred in Japan.

Modern Korean historiography acquired a Western face through the intermediary of Meiji Japan, and Japanese scholarship dominated the study of Korea in the early twentieth century, during the period of occupation (1910–1945). One of the early consequences was a reactive rewriting of early Korean history on liberal, progressivist, and nationalist rather than dynastic lines by historians such as Sin Ch’ae-ho (1880–1936) and Ch’oe Nam-sŏn (1890–1957). Beginning in the 1930s and culminating in his acquisition of political influence in the north following World War II, the Marxist Paek Nam-un (1895–1974) featured prominently in the construction of a historical materialist past that integrated Korea within Marxist periodization. When Soviet de-Stalinization spread to allied countries in the mid-1950s, strictly deterministic materialism began to fall from favor among a younger generation of historians; beginning in the late 1960s, traditional international Marxism was largely abandoned in favor of a nationalist historiography of “self-reliance” (*Juch’ŏ*) devoted especially to celebration of the personality and family of Kim Il Sung. To the south, in the Republic of Korea, a central thrust of historiography since World War II has been to dispel foreign and especially Japanese views of Korea as backward and servile. The most influential recent members of the nationalist school have been specialists on ancient history, who have used archaeology as well as history to promote the notion of the Koreans as an independent and homogeneous ethnic group (*minjok*). According to this view, which continues to be taught

in school curricula, the Korean people and state can be traced back over four millennia to a mythic ancestor and state founder, Tan'gun (whose importance was first championed by Sin Ch'ae-ho in the 1930s), their unity having successfully endured generations of suffering from Chinese and Japanese oppressors. The various parallels with the oppression theme of European Romantic-era nationalist historical writing (Poland's Lelewel and Bulgaria's Paisiy, for instance), with modern Jewish historiography since Heinrich Graetz, and with the earlier foundation myths of late medieval and Renaissance Europe, would be worth further exploration.

South East Asia. Our account has so far neglected much of Asia outside India, the Middle East, China, and Japan. Yet there exists a variety of historiographical traditions in other parts of the continent that deserve mention and which for ease of reference are summarized here in one section devoted to Southeast Asia. The region as a whole has been studied extensively by Western scholars (in particular Dutch, British, and French) since colonial times, but we will address our attention to select indigenous forms of history writing, and to those authors the Thai-American historian Thongchai Winichakul usefully calls “home” scholars. In nearly every part of Southeast Asia, local forms of history have arisen, most of which have been influenced at some point by Islamic, Chinese, or Western ideas. The perceptions of the past in most Southeast Asian countries are complicated by the multitude of languages and by the thorny heritage of regional conquests and foreign colonization; they are virtually invisible in standard histories of historical writing, even those that pay heed to China and Islam.

From the perspective of the West, it is often easy to lump subregions such as Indochina together and assume that proximity will have produced similar cultural developments. This can be a mistake, as the examples of Cambodia and Vietnam illustrate. Cambodia, despite over a millennium of literacy, developed relatively little that could be called historiography prior to the establishment of French colonial rule since the *pangsavatar* (sometimes rendered as *bangsavatar*), or chronicle texts of the medieval period, did not survive; there are a few specimens from the nineteenth century such as the 1818 *Nong Chronicle*, which covers the years 1414–1800 and refers to an earlier chronicle that had by then been lost. Late exemplars of this form survive from the end of the colonial regime, under King Sisowath Monivong (d. 1941) and his grandson Norodom Sihanouk. Such histories or palace chronicles (*rajabangsavatar*) as did exist were generally deemed unpublishable regalia, and the royal monopoly discouraged scholarship prior to the country's independence. Much of the earlier material they contain is of questionable accuracy and may in fact have been copied wholesale from Thai chronicles. The major work from the early twentieth century is the *Tiounn Chronicle* (so-named for Monivong's principal minister, who directed its compilation) composed from 1903 to 1907 and then from 1928 to 1934, which was based on a range of earlier materials. Under the French, European methods were introduced, but Cambodian history was given low curricular priority; the brief and terrible rule of the Khmer Rouge in the late 1970s would pronounce an “end to 2000 years of history.”

In contrast, Vietnam has a much longer and richer experience of historical writing dating back nearly a millennium, with a great deal of genealogical activity occurring at the family level from the fifteenth century. Much of the early historical writing was Chinese-influenced (either Confucian or Buddhist) and written in now-archaic Sino-Vietnamese characters. Although successive Chinese invasions and domestic struggles are thought to have destroyed many early sources, an interest in the past extended down to local communities and clans that scrupulously maintained genealogical and biographical information (*gia pha*). Chinese-style dynastic histories or imperial annals, the *Chanb-Su*, record major events reign by reign, and were intended to celebrate the current ruling house, often at the expense of its predecessor. Vietnamese kings strenuously enforced an “authentic history” during the precolonial period. The most noteworthy distinctive historical texts include the *Viet su luoc* (Historical annals of Viet) from the fourteenth century, itself based on a thirteenth-century text by Le Van Hu'u, and the 1479 *Dai Viet su ky toan thu* (Complete historical annals of Great Viet) by Ngo Si Lien.

The eighteenth and nineteenth centuries also produced major historical works, such as Le Quy Don's (c. 1726–1784) *Dai Viet thong su* (Complete history of Dai Viet, also known as the complete history of the Le Dynasty). Traditional Vietnamese historiography would survive the advent of Europeans, especially the French, from the mid-nineteenth century, although it was subject to official censorship: a popular general history was Tran Tron Kim's (1882–1953) *Viet-nam su-luoc* (1929–1930). However, French scholars working on the area (and French-educated Vietnamese

returning home) gradually succeeded in introducing Western models of historiography during the 1900s, along with potent concepts such as nationalism and Marxism, with formidable effects on the country's subsequent development. The advent of the printing press in turn gave history a much wider public currency. Patriotic and anti-French historians like Phan Boi Chau (1867–1940), one of many Vietnamese intellectuals either jailed or exiled from 1908 until the 1920s, abandoned dynastic history and adopted Western historical categories, together with a concept of progress and social development derived from Sino-Japanese interpreters of Darwin and Spencer. The flurry of publishing in the 1920s, 1930s, and 1940s included a significant proportion of historical and biographical books and pamphlets, and Ho Chi Minh himself, after his 1941 return to Vietnam, authored a poetic history of the country. New histories, written by Vietnamese, followed the French withdrawal in the 1950s and signaled a further turn in scholarly historiography in the partitioned country. During the extended period of war prior to 1975, state-enforced Marxist interpretations in the north were met with equally fervent anticommunist historiography in the south, seriously constraining the range of topics that could be addressed. Since the introduction of an official policy of “renovation” in the late 1980s, some liberalization has occurred, including better exchanges of information with the rest of the world. However, an official history, subordinate to political ends, is still conveyed in textbooks, and certain subjects remain proscribed.

Myanmar (Burma before 1989) and Thailand (Siam prior to 1939) also have distinctive historiographies although there are some common points in Tai-language areas of Burma. The study of Burmese historiography is complicated by the powerful influence of myths and stories upon historical writing during relatively recent times rather than in older indigenous sources. Research by Michael Aung-Thwin has demonstrated that a number of so-called historical events rest not on primary sources but on “retroactive myths” or misinterpretations, principally of modern and colonial rather than ancient and indigenous creation. Early Burmese sources include nonroyal historical records, generally concerning particular kingdoms, places, or towns and known as *thamaing*, which is also the modern Burmese word for history. Monastic chronicles such as the *Padaeng Chronicle* recount the arrival of Theravada Buddhism in the Shan states bordering on Siam and Laos during the fifteenth century and the establishment of the Padaeng Vat (Red Forest monastery) itself. The *Jengtung State Chronicle* begins with a legendary or semilegendary section before covering the history of that Shan state from the fourteenth to the early twentieth centuries. Much Burmese historical writing is devoted to specific dynasties and particular kings, in particular the prose chronicles collectively called *Yazawin* (literally, “genealogies of kings”), which are based on written and oral sources and employ literary devices not unlike the classical set speech. According to Aung-Thwin, the *Yazawin* date back at least as far as 1520, when the monk Shin Thilawuntha produced his *Yazawinkyaw* (Celebrated chronicle of kings); only a few such chronicles are extant.

The great age of Burmese historical writing was the eighteenth century, beginning with the *Mahayazawingyi* written by the wealthy independent author U Kala (the first Burmese history thought to be sole-authored) during the first quarter of the eighteenth century. U Kala was followed in the late eighteenth century by an anonymous work, probably by a monk, the *New Pagan Chronicle*, devoted to the Pagan dynasty (1044 C.E.–1287 C.E.). The *Twinthin Myanma Yazawinbit* (The new history of Myanma, or Burma), written at the end of the eighteenth century by Twinthintawun Mahasithu, was the first to use inscriptions to verify facts in earlier chronicles such as U Kala's and to expand the meaning of *Yazawin* beyond the deeds of kings. This practice was not maintained in a series of nineteenth-century writings, generally under official sponsorship, which reverted to the older meaning. These included the *Hmannan Mahayazawindawgyi* (Great royal chronicle of the Glass Palace, so named after the meeting place of its authors), the collective work of a group of selected intellectuals. Essentially an updated version of U Kala's *Mahayazawingyi*, the Glass Palace chronicle was extended in subsequent chronicles up to 1905. These works focused almost entirely on royalty and were intended to present a clear and uncontested record of events accompanied by moral lessons—the *Maniyadanabon* of the late-eighteenth-century monk Shin Sandalinka is a repository of historical examples illustrating pragmatic political principles worthy of Machiavelli.

From 1947 to the 1960s, nationalist histories predominated in Burmese writing, accompanied by a few scholarly local histories and by an increase in biographical writing. The Burma Historical Commission was created in 1955, but has yet to generate the official national history with which it was charged. As Ni Ni Myint observes, *thamaing* displaced *yazawin* as the preferred term for a new kind of non-dynastic history in the years following World War II.

To the southeast, in Thailand, the premodern Siamese elite, who valued history from a very early period, produced historical poetry (for example, the fifteenth-century *Yuan Pài* or “Defeat of the Yuan”), and generated an extensive series of chronicles in various forms. The Buddhist-oriented *tamnan* (stories or legends), often written in Pali, the learned language of South Asian Buddhist culture, were composed from the fifteenth to the twentieth century. Thai-language *phongsawadan* (annals or dynastic chronicles) superseded them in the seventeenth century. The earliest and best, if briefest, example of the latter—which are more secular in interest though they still reflect Buddhist values—is the *Luang Prasert* (also spelled *Prasoet*) chronicle of Ayutthaya (or Ayudhya), the Siamese capital and associated dynasty destroyed by the Burmese in 1767. This work covers Siamese history from the fourteenth century and was composed about 1680; its name derives not from its author, who is unknown, but from its manuscript owner. Subsequent recensions of the chronicles of Ayutthaya, written in the late eighteenth century, extend its history to that time. Chronicle-writing was at its peak during a prolonged period of struggles with Siam’s neighbors, especially Burma, from 1760 to 1828.

The kings of the Chakri dynasty continued to support historical writing. King Rama I (d. 1809) commanded the revision of a number of *phongsawadan*, and his famous later successor, the Buddhist monk-turned-monarch Rama IV or Mongkut ([d. 1868] of *Anna and the King of Siam*) authorized the definitive Royal Autograph edition of the chronicles of Ayutthaya. Keenly interested in history, Mongkut also pursued the study of epigraphy. He and his heir, Rama V (d. 1910), commissioned the last in this tradition, a series of chronicles of his four Chakri predecessors by their long-serving administrator Chaophraya Thiphakorawong (1813–1870). Outside Bangkok, a particularly vigorous tradition of local chronicle-writing developed in northern Thai communities and subsidiary kingdoms. That of Chiang Mai (capital of the old kingdom of Lan Na), the work of an anonymous author who borrowed selectively and carefully from earlier sources, recounts its history from the thirteenth to the nineteenth century. Usually written on palm-leaf manuscripts or bark-paper, these chronicles peaked in the early nineteenth century, although there are well-known later examples such as the *Nan Chronicle*, compiled in 1894 by Saenluang Ratchasomphan, an official of the Nan king. Similar chronicles were written in Tai-language regions of Burma and what is now Laos.

Western non-chronicle histories and school textbooks first began to appear in the late 1920s. At the same time, the introduction of printing expanded the circulation of historical works, including many from abroad, among the Thai learned class. History-teaching at a university level also commenced in the 1920s, at which time a Westernized Thai historiography (*prawatsat*) emerged. A tradition of royalist-nationalist historiography was established by Mongkut’s younger son Prince Damrong Rajanubhab (1862–1943). A prolific author and educational reformer, Damrong was also an admirer of Ranke and Western scholarship in general. His historical work embodied a use of source criticism while retaining the dynastic focus of the older *phongsawadan*. The long-serving Thai official Luang Wichit Wathakan (1898–1962) developed the nationalist view of the past in a twelve-volume history, *Prawattisat Sakon*, which appeared opportunely in 1931, just before the overthrow of the monarchy. This veered away from dynastic history in favor of an account of the Thai nation. At the other end of the ideological spectrum, left-wing historiography has been represented in recent decades by a number of economic historians who have built on a seminal study of Thai “feudalism” by Jit Phumisak (1930–1966), a Marxist who was killed while fighting with a guerilla movement. The 1973 overthrow of Thailand’s military regime, and the recurrent instability of the next two decades, opened up historical scholarship to a range of new interpretations and to sources far beyond the traditional chronicles. Although the royalist-nationalist tradition established by Damrong has remained intact (especially in school textbooks), it has been challenged in recent years by scholars such as Nidhi Eoseewong, in works of local history, and through mass media such as television and magazines.

Malay-language historical genres, long influenced by Indian, Persian, and Arabic sources, have been well studied though most of their exemplars remain in manuscript. Originating in oral traditions, the first Malay writings about the past tended to be a mix of history and fiction intended principally for didactic purposes and to be orally performed rather than read in silence. The earliest surviving historical work is the *Hikayat Raja-Raja Pasai*, which dates from the later fourteenth to the very early sixteenth centuries and begins with the reign of a thirteenth-century Sumatran ruler, Malik al-Sâlih. The quantity of verifiable material proliferates somewhat after the seventeenth century. Islamic ideas of historiography, present from two centuries earlier, can be observed

more clearly from that point on. The chronological fixity and sense of causality in histories after this date distinguish them from other varieties of Malay literature, though these too contain historical material, most of which is of courtly origin and is organized around dynasties, often beginning with an origin myth. The best-known Malay historical work is the *Sulalat'us-Salatin* (Genealogy of kings) which exists in plural versions, the earliest of which dates from 1612 and which may be a revision of a sixteenth-century text. It is most often attributed to an early editor, the obscure prime minister of the kingdom of Johor, Tun Seri Lanang, and was extended forward by subsequent writers. This work is more often known by the title *Sejarah Melayu* (rendered rather misleadingly as “Malay Annals”) and reaches back several centuries. As with other such “palace” chronicles, its function is not to establish accurate dates in the Western style but to make a case, in this instance for the descent of the fifteenth-century Malaccan sultanate, predecessor of the Johor empire, from Iskandar Zulkarnain (Alexander the Great). The *Hikayat Marong Mahawangsa* (or *Kedah Annals*), from the Thai-influenced northwest Malay peninsula, is a didactic text relaying the arrival and triumph of Islam in that area, and its events are much less verifiable from external sources than those in the *Sejarah Melayu*. Other *Hikayats* vary considerably in the degree to which they contain verifiable historical events as opposed to myths and legends, and modern Malay scholars such as Sir Richard Winstedt subdivided them formally into historical and romance categories. (This now seems an artificial division, and we must once again guard against applying modern Western divisions of fact and fiction to other cultures’ perceptions of their pasts. The anthropologist Shelly Errington has even commented that genres like the *hikayat* ought not be considered history at all since they appear not to arise from “an impulse to write history,” cannot be assumed to relate events in chronological order, and rarely contain events that can be explicitly identified as having occurred). Examples include an anonymous eighteenth-century chronicle, the *Hikayat Negeri Johor*, which covers events in parts of the Malay peninsula since 1672, and the *Hikayat Bandjar*, a product of the south Borneo coastal Malay kingdom of Bandjar.

Modern Malay historical writing began in the early twentieth century, when *tawarikh* (a modern, Muslim-derived term for history) was introduced into schools and a distinction made between it and the more literary content of the *hikayats* (though it maintained the preoccupation with dynasties and political elites). Abdul Hadi bin Haji Hasan published the three-volume *Sejarah Alam Melayu*, the first modern national history, during the 1920s, and a significant number of state and local histories appeared in the years leading up to and following Malaysia’s acquisition of statehood in 1957. More recently, academic historiography has expanded considerably in Malaysia owing to the mandatory study of history in secondary schools since 1987.

Though it shares the Malay language with Malaysia as its modern lingua franca, the case of Indonesia is especially complex, because of its many constituent peoples and languages. Javanese historiographical forms, for instance, include the genre known as *babad*, historical poems generally relating the foundation and subsequent history of Java, or the relation of a particular event, usually a war. These *babad*, also featured in the literature of Java’s neighbor, Bali, were often composed by court poets. They are generally of recent (eighteenth-century and after) origin, and scholars differ on the degree to which they may be relied upon for factual accuracy—though it has been argued that the Western dichotomy between fact and fiction is simply irrelevant since the concept of fiction does not exist, only a notion of degrees of veracity. Examples include the *Babad Tanah Jawi* (Chronicle of the land of Java), a group of texts covering the era from mythical times to the late eighteenth century, *Babad ing Sakhala* (written 1738), a two-thousand-line verse chronicle running from 1478 to 1720, and *Babad Jaka Tingkir*, a mid-nineteenth-century account in seven thousand lines of events that occurred in the sixteenth century, drawn in part from Dutch texts. There are also much earlier Javanese works like the fourteenth-century poem by Mpu Prapanca, the *Desawarnana* and the fifteenth-century (approx.) *Pararaton* (Book of kings), which covers thirteenth-century events.

In northern Sumatra, historical narratives imported from Malay and other languages circulated orally before being written down in verse forms; the eighteenth-century Acehese-language epic *Hikajat Pötjoet Moehamat* describes an earlier civil war, and provides an indigenous history quite in contrast to the official versions of successive Dutch and Indonesian rulers. Oral traditional historical narratives, or *tutui teteek* (“true tales”), circulated widely on the southeast Indonesian island of Roti, as did oral dynastic genealogies of the Rotinese lord or *manek*; many of these traditions have been independently verified by reference to Dutch colonial documents. On Sulawesi, Bugis, and Makasar, historical works date from the seventeenth century and include chronicles or nar-

ratives called *attoriolong* (Bugis for “that which concerns people of the past”) which use lengths of reigns and elapsed times rather than dates to fix chronology.

As these few examples illustrate, a proper survey of Indonesia’s historiography must examine several distinctive literatures and traditions. The construction of a national sense of the past in the face of multiple ethnicities has been no less daunting than the establishment of the nation itself. In the first half of the twentieth century, Dutch-trained Indonesian historians concentrated on providing a background to support aspirations for Indonesian national independence. With the backing of Japanese occupiers at war with Western colonial powers, a nationalist-anticolonial historiography was introduced during the early 1940s. This was largely the work of the nationalist leader and future president Sukarno, the textbook writer Sanusi Pane (1905–1968), and especially the lawyer Muhammad Yamin (1903–1962). Yamin, an admirer of the Malay Tun Seri Lanang and a reader of the French historian Ernest Renan, popularized a romantic vision of history centered on Java. A number of academics such as Muhammad Ali criticized the nationalist bent in historiography in the late 1950s and early 1960s, but it acquired new teeth with the advent of the Suharto regime after 1965. A more militaristic official nationalist history emerged under the direction of the historian, soldier, and minister of education, Nugroho Notokusanto; a virulently anticommunist and “patriotic” multivolume history of Indonesia prepared in the 1970s, *Sejarah Nasional Indonesia*, was an uneasy amalgam of official history with the work of university-based historians. During Suharto’s “New Order,” the nationalist tradition was strictly enforced on schools, even in outlying and problematic territories such as East Timor. Since Suharto’s 1998 resignation, nationalist historiography has been openly challenged by a number of alternative visions of the past, including those representing different localities and submerged ethnic groups such as the Acehnese.

To the northeast of Borneo lie the Philippine islands. Long under Spanish and then American rule, the peoples of the Philippines adapted early on to the historical interests of the conquerors, to the great detriment of pre-existing historical memory. Tagalog *awits* or metrical poems include the *Historia famosa ni Bernardo Carpio*, a romance derived from older stories of medieval Spanish-Moorish conflict. Having largely eradicated precolonial forms of literature, Spanish missionaries used the *awit* as a tool of colonization; the *awits* became so familiar in both written and oral form that, Reynaldo C. Ileto notes, the average Filipino by the nineteenth century “knew more about Emperor Charlemagne, the Seven Peers of France and the destruction of Troy than of pre-Spanish Philippine rajahs and the destruction of Manila by the conquistadores” (Ileto in Reid and Marr, p. 381). Ironically, the chivalric and heroic figures in the *awits* would prove inspirational to Tagalogs dreaming of emancipation from Spanish rule at the end of the nineteenth century, as they transformed the legendary Spaniard Bernardo into a nationalist hero.

According to John N. Schumacher, there appears not to have been any formal historiography in the Philippines prior to the Spanish, despite the existence of writing. The first post-Conquest example is the *Sucesos de las Islas Filipinas*, written by the Spanish official and unsuccessful warrior Antonio de Morga (1559–1636) and published in Mexico in 1609—the only early history to be written by a layman. Throughout the seventeenth and eighteenth centuries, the various resident religious orders produced chronicles largely focused on their own missionary activities. As with the *awits*, however, western histories proved eventually an incitement to nationalism, particularly in the hands of young Filipino secular priests sent back to Europe for higher education in the 1860s. Published work on Filipino folklore and customs began to appear, along with previously unpublished chronicles put out in the *Biblioteca Historica Filipina* series in the 1880s; the journalist Isabelo de los Reyes would establish a Filipino identity in a number of historically-oriented newspaper articles and books. A more sophisticated appeal to history would emerge from José Rizal (1861–1896), who had visited Germany and become aware of western historical methods. During an exile in London in 1887–1888, he provided a carefully annotated edition of Morga’s work, stressing the achievements of pre-Spanish Filipinos and their moral decline under foreign rule. In this form, Rizal’s views would both contribute to revolutionary sentiment following his execution, and ultimately to the continuation of historical study through the ensuing decades of American rule.

This very short survey of a small selection of Southeast Asian historical traditions is far from exhaustive (we have said nothing of the South Sea Islands, for example, where a great deal of ethnographic work on historical memory has been done in recent years by anthropologists), but

it provides a warning against assuming that history is exclusively the perquisite of Western nations, or even of highly bureaucratized Asian countries like Imperial China. It is perhaps worth offering the further cautionary observation that the types of recent political repression of historians, and attempts by governments to enforce a particular perspective on the past, are conversely not restricted to Indochinese totalitarian regimes or island military dictatorships (nor to older authorities like the Catholic Church and the ancient Qin emperors). In the world's largest democracy, India, the advent in 1998 of the BJP-led government (defeated in elections as this essay was going to press) posed a serious threat to historiography and historical pedagogy as the Hindu nationalist regime undertook measures that included the excision of material in school textbooks (a measure publicly condemned by historians such as Sumit Sarkar) and the encouragement of attacks upon distinguished scholars such as Romila Thapar who were deemed to hold disloyal views of the nation's past. Other examples can be found in the West, such as the controversy in the United States in 1995 over an exhibition to commemorate the fiftieth anniversary of the dropping of the Hiroshima atomic bomb, the virulent public reaction in Canada to a 1991 television series perceived as critical of the Canadian forces during World War II, or the ongoing "history wars" in Australia, turning in 2004 on sharp right-left disagreements over the past treatment of the aboriginal population by colonists and imperial authorities. Even more odious monthly additions to the list of historians suffering persecution of one sort or another across the globe make for uncomfortable reading.

The Middle East. After an eighteenth-century decline in Ottoman historical writing, and the temporary displacement of Arabic by Turkish as the dominant elite language of much of the Islamic world, Islamic historiography written in Arabic began to recover in the mid-nineteenth century. This occurred in the wake both of European expansion into the Middle East and Africa and of reforms within the Ottoman Empire itself, which gave rise to incipient Arab nationalism. Many areas had enjoyed some autonomy from Istanbul for a century, with the result that there were already some examples of Arabic-language histories focused on pan-Arab national identity. This was true in Tunisia and Lebanon as well as in Morocco, which historically lay outside Ottoman control. Arab intellectuals in the second half of the nineteenth century began to write histories as continuous narratives, rather than annals, devoted to establishing national pasts, which now also included the pre-Islamic periods. Older pan-Islamic cultural and religious impulses remained as important as newer Arab nationalism, as Muslims confronted the dilemma of how to coexist with Western infidel powers, and as modern Islamic thought, influenced by Western science and technology, itself began to take shape in the hands of activist-reformers like Sayyid Jamal al-Din Afghani (1838–1897), the author of a history of Afghanistan.

During this period, efforts were made to print historical sources, and a number of learned societies were founded with historical interests. The Egyptian 'Abd al-Rahman al-Djibarti (1753–1825) anticipated this revival of historiography with his compelling account of the French occupation of Egypt, and a philosophy of history that echoed Ibn Khaldun's. Al-Djibarti's countryman Rifa'ah Rafi' al-Tahtawi (1801–1873), who had spent five years in Paris, became the channel through which modern European historiography began to enter the Arab world. He translated several French works into Arabic and authored a history of ancient Egypt that consciously emulated modern rather than classical Islamic historical forms; he was also instrumental in reforming the Egyptian school curriculum, which by the 1870s routinely included history. During the era of British rule in Egypt, the influential politician Mustafa Kamil further encouraged nationalist views of his country's past; this trend cut across and in many ways contradicted the Islamic views of most historical writing in the previous millennium.

Most of the historians in this period tended to be non-academics: the Syrian Ilyas Matar (1857–1910) was an Ottoman official, physician, and lawyer, and his compatriot Jurji Yanni (1856–1941) an Orthodox Christian journalist and intellectual. The Lebanese-Egyptian Jurji Zaydan (1861–1914) was a journalist and a prolific author of historical novels in addition to a multivolume history of Islamic civilization (1902–1906). Academic historiography began slowly in the post-Ottoman era starting in the 1920s, initially in the hands of North American- and European-trained scholars, thus extending the dominance of Western-style academic history over the Islamic world's long distinct historiographic traditions. Asad Rustum, a historian of Syria, published an Arabic-language manual on Western historical method in 1939, largely drawn from Langlois and Seignobos's famous textbook, a work that was already fast losing ground in its homeland in the face of the emerging *Annaliste* (see below) historical revolution. A Lebanese Maronite, Philip Hitti,

published a survey of *Lebanon in History* in 1957; more recently, Kamal Salibi (b. 1929) has revised the history of Lebanon and made a close study of its earlier, medieval historiography.

In Turkey itself, the collapse of the Ottoman regime and the institution of Kemal Atatürk's republic in 1923 occasioned a significant rupture with the recent past and with the longer tradition of Ottoman official historiography whose last great representative, Ahmed Cevdet Pasa (1822–1895), a remote disciple of Ibn Khaldun, had produced an enormous annalistic account of events from 1774 to 1826 (continued by Cevdet Pasa's successor Ahmed Lutfi up to the 1860s). Western scholarly methods had, however, begun to appear in Turkey, along with European texts, in the mid-nineteenth century; at the same time, new historical genres such as memoirs also appeared. The study of numismatics and sigillography arrived in Turkey about the same time, and the newer methods began to influence reference books, school texts, and popular histories. The Faculty of Letters at the University of Istanbul, established in 1900, became a training ground for historians, and institutions such as the Imperial Museum of Antiquities (1891, now the Archaeological Museums) provided the infrastructure.

These developments provided a backdrop to the writings of the first generation of republican historians. Unsympathetic to the decay of the later Ottoman Empire in the previous two hundred years, the republicans nevertheless embraced the successes of the empire's glory days from the thirteenth to the seventeenth centuries. As Cemal Kafadar notes, the founder of modern Turkish historiography, Mehmet Fuat Köprülü (1890–1966), began to articulate this vision in the 1930s in a series of lectures at the Sorbonne, soon published as *The Origins of the Ottoman Empire* in French and Turkish. Köprülü focused on Osman (the eponymous founder of the Ottoman house) and the rise of the Turks in thirteenth-century Anatolia; his theories would be elaborated and revised by the Austrian Paul Wittek (1894–1978). The task of this generation of historians, sorting out legend from fact, and balancing ethnicity, religion, and other influences, is in some ways redolent of the romantic nationalist historiographies of the early and middle years of the nineteenth century and, more remotely, of Renaissance debates about national origins, albeit now approached with the tools of modern scholarship. The new work, to which non-Turks such as Wittek and the Greek George Arnakis (a severe critic of Köprülü) contributed, was carried out against a long-standing Western European historiography of the Ottomans dating back to the Englishmen Richard Knolles (c. 1550–1610) and Paul Rycaut (1628–1700) and including more recently the early-nineteenth-century Viennese Joseph von Hammer-Purgstall (1774–1856), and the American Herbert Gibbons (1880–1934). The opening of Ottoman archives in the 1940s redirected scholarship in newer directions of social and economic history, and since the mid-twentieth century, Turkey has continued to produce academic historians such as the left-leaning economic historian Mustafa Akdağ (1913–1972) and his critic, the distinguished historian Halil İnalcik (b. 1916), a student of Köprülü.

As in other regions, since the 1960s social and economic history have emerged in the Middle East as serious rivals to an older, politically focused narrative history. Islamic-focused women's history (which can be traced back to entries on women in an older form, the biographical dictionary or *tabaqat*) has also developed, with newer feminist approaches strongest in Egypt; the male-oriented and restrictive practices of the Muslim fundamentalist regimes have themselves become the subject of study. As Judith E. Tucker notes, recent feminist historians of Islam, some working outside the region, have restored women to roles of significant influence in the longer Muslim past, for instance in Leila Ahmed's *Women and Gender in Islam* and numerous works by the Moroccan sociologist Fatima Mernissi, such as *Women and Islam* (1991). Recent collections of essays such as Guity Nashat and Lois Beck's *Women in Iran from the Rise of Islam to 1800* have also explored the historical place of women in Islamic societies from very early times.

Europe and the Americas. The myriad developments of Western historiography over the past century could easily merit an article in their own right, but since they are readily accessible in other works, the principal developments will only be summarized briefly here. Broadly speaking, the trends outlined for the nineteenth century continued into the first half of the twentieth, though the Einstein-Planck challenges to Newtonian physics, closely followed by the horrors of World War I and the end of the old empires, severely shook whatever remained of the late-nineteenth-century faith in progress and in science. The pessimism following the war's unprecedented slaughter produced some gems of *Kulturgeschichte*, built on the themes of civilization's decadence and decline, such as the Dutch historian Johan Huizinga's (1872–1945) brilliant and Burckhardtian

aesthetic excavation of *The Autumn of the Middle Ages* (1919), which could be read as an allegory for pre-war cultural decadence. A longer and much less subtle example is the German Oswald Spengler's (1880–1936) multivolume speculative analysis of distinctive cultures through history. Harkening back to Nietzsche, and at least superficially anticipatory of Nazism, *The Decline of the West* was a work of reactionary generalization and extreme intellectual relativism; largely completed before the beginning of World War I, it appeared to great fanfare just at its end. Among other things, Spengler's *Decline* would help to inspire the very different (if equally speculative and relativist) British take on comparative civilizations, Arnold Toynbee's (1889–1975) *A Study of History* (12 vols., 1934–1961), which its author began in earnest in 1920, after reading Spengler.

Meanwhile, academic reactions to strict scientific history in the more narrow, positivist sense, echoing Dilthey's earlier qualifications, can be seen in the enormously influential Italian philosopher and historian, Benedetto Croce (1866–1952). Like Dilthey, Croce rejected both Rankean historical method and scientific positivism, arguing instead the autonomy of history from science, and the inseparability of history and life—records and documents only have significance insofar as living humans can reflect upon them and, indeed, relive them; conversely, we only make sense of life by thinking historically. A pronounced antifascist, he also held to a view of “history as the story of liberty.” Croce's views appealed to many, including his younger British contemporary, the archaeologist turned philosopher R. G. Collingwood (1889–1943). Collingwood's posthumously published *The Idea of History* advanced the notion that “all history—is the history of thought” and suggested that the historian must empathize with his or her subjects, enter into the “interior” of a historical event (the thought of the agent behind the event), and mentally “re-enact” it in order to retell it. His book remains very widely read, and its concept of historical imagination has come back into vogue with the advent of postmodernism in the past twenty years. The Brazilian-born Spanish literary scholar and historian, Américo Castro (1885–1972) echoed both Collingwood and the American Carl Becker in his assertion that “To write history demands a historian willing (and able) to enter into the living consciousness of others through the door of his own life and consciousness” (p. 305). Castro, who fled to the United States following the Spanish Civil War further reflected historicist sentiments in his views upon the inseparability of a people and its history, and of the relationship between individual and general histories. In a very different focus on the human interior, the later works of Sigmund Freud, especially *Moses and Monotheism* (1939), applied his own psychoanalytic theories and clinical experience to the “diagnosis” of history. The process of civilization Freud envisaged as an endless struggle of love and hate, sex and death, arising from primal patricide, and carried forward by leader-figures such as Moses in conflict with the mobs whom they dominated—the irony of the similarity in this regard between a Viennese Jew and aspects of the thought of both Nietzsche and Hitler is difficult to escape. The European scholarly tradition had without doubt put some distance between itself and Ranke's history *wie es eigentlich gewesen*.

If irrationalism, skepticism, and pessimism were the dominant chords struck in Western Europe and, to a lesser degree, in North America, the dissonant sound from further east came in the form of Marxism. Just prior to the Bolshevik Revolution, Kliuchevskii's former pupil, Mikhail Nikolaevich Pokrovskii (1868–1932), developed a Marxist version of Russian history in his multivolume study *History of Russia from the Earliest Times to the Rise of Commercial Capitalism* (1910–1914; English trans. 1931). This was endorsed by Lenin and for a time Pokrovskii was the dominant force in early Soviet historiography; after his death, however, he was condemned by Stalin and abandoned by Party historians for his lack of nationalist sentiment. Initial tolerance of intellectual autonomy in the 1920s gave way to rigid Party control in the 1930s, and the state would have an overbearing influence on history-writing from the purges of scholars in the 1930s to the collapse of the Soviet Union seven decades later. This control spread far beyond the borders of the USSR to include the various Soviet satellite states and Warsaw Pact allies in Romania, Poland, Bulgaria, East Germany, Hungary and Czechoslovakia.

Without state sanctions to support it, academic Marxism never attained a dominant position in the West, but had a profound influence nonetheless through the 1980s. Marxist, socialist, or left-leaning historiography began to appear in the Western democracies relatively early in the twentieth century; the leading Norwegian historian of the first half of the twentieth century, Halvdan Koht (1873–1965), for instance was an early self-avowed Marxist. The attraction of Marxism increased in the aftermath of the financial collapse of 1929 and the ensuing Great Depression, which seemed to bear out Marx's views of the inevitable collapse of capitalism. The dalliance of many

interwar British and some American intellectuals with communism provided the earliest examples of historiography that, in the 1960s, would evolve into Labor history, “radical history,” and what is sometimes called “history from below.” Several classics of late twentieth-century historical writing such as E. P. Thompson’s (1924–1993) *The Making of the English Working Class* (1963) and Georges Lefebvre’s (1874–1959) many books on the French revolution were written from an explicitly Marxist, albeit more humanistic, perspective that emphasized the daily lives of the history’s underclasses. A modified version of Marxism articulated by the Italian socialist Antonio Gramsci (1891–1937), with its concept of cultural “hegemony,” has retained an influence in much non-Marxist historical scholarship and literary history.

A very different creation of the interwar period was what has become known as the *Annales* school in France, so called after the journal that began publication in 1929 at the University of Strasbourg under the guidance of Marc Bloch (1886–1944) and Lucien Febvre (1878–1956), two French scholars much influenced by the earlier work of the sociologist Durkheim and the geographer Henri Berr, and with close ties to the Belgian medievalist Henri Pirenne (1862–1935). The journal and the “school” (rather a misnomer, albeit useful as a shorthand) have evolved considerably through successive generations but remain an influential force in France and much admired elsewhere, particularly in North America. The *Annalistes*’ repudiation of the political history of previous decades—Febvre condemned Charles Seignobos for an obsession with events—in favor of an *histoire totale* that examined geography, climate, economy, and agricultural and trade patterns, as well as manners, still seems fresh after seventy-five years. It is, however, a further reminder of the recurrent swing of the pendulum of European historiographical taste between the social and the political, the broad and the particular, dating back to the Enlightenment—and beyond, as far back as Herodotus and Thucydides.

The *Annales* historians also advocated a new *modus vivendi* between history and the social sciences, with Fernand Braudel (1902–1985) calling for the subjugation of *histoire événementielle* (short-term human actions, for instance in the political world) to the study of longer periods of social, material, and economic *conjonctures* and the much slower geographical and climatological changes that occurred over the *longue durée* of centuries; the classic expression of this layered periodization is Braudel’s own study of *The Mediterranean and the Mediterranean World in the Age of Philip II*. The statistical tendencies of many members of Braudel’s generation of *Annalistes* are most clearly evident in the work of Pierre Chaunu (whose history of Seville and the Atlantic established a subgenre often called “serial history” because of its attention to establishing continuous series of historical data on such matters as food prices). Intellectual historians such as Robert Mandrou and François Furet pioneered a quantitative approach to the history of *mentalités*, opening up what has since evolved into *histoire du livre*, the history of the book. In more recent decades, however, the *Annales* historians have veered away from quantification to the study of *mentalités* in Bloch and Febvre’s mode, with considerably more emphasis being placed on individual and collective beliefs, and on life experienced in local settings. The “microhistory” genre of the late 1970s, 1980s, and 1990s, including works like Emmanuel Le Roy Ladurie’s *Montaillou: The Promised Land of Error* (a study of a medieval Cathar village) and Carlo Ginzburg’s *The Cheese and the Worms: The Cosmos of a Sixteenth Century Miller*, has proved highly saleable in the academic and even popular book market and has spawned numerous European and North American imitators.

If any word most characterizes twentieth-century and especially post-1945 historiography, it would have to be *fragmentation* (a more optimistic descriptor might be *diversity*). Historians are now political, military, family, gender, women’s, economic, social, environmental, intellectual or cultural, and the expansion of university history departments especially in the 1960s has encouraged a high degree of subspecialization, together with a proliferation of journals and book series (which the relatively recent introduction of the Internet shows no sign of slowing down given its capacity to offer cheap alternatives to conventional print). Although Marxism has by and large faded from most North American history departments, social history has been maintained, albeit now often dissolved into various components. Among these, women’s history and its offshoot, the history of gender (now including masculinity studies) have perhaps been the most successful in reshaping the recent agenda of the entire discipline. The history of particular ethnicities and religions or sexual orientations has also become more firmly established in departments and often in specialty journals. Interdisciplinary approaches to history began seriously in the 1960s with historians looking to the social sciences, especially sociology and economics, for the theoretical

underpinnings that appeared to be lacking from history itself (it is remarkable how often in the history of historical writing a great cataclysm has been followed by a search for new certitudes, a pronounced skepticism toward old ones, or both in combination). Among the more interesting if controversial experiments one must include psychohistory (best represented by Erik H. Erikson). Equally debatable has been the use of “counterfactuals” (the supposition that events in history occurred in ways other than they actually did, and the attempt to model mathematically a hypothetical projected course of events from that alternate starting point), especially in the “Cliometric” or New Economic History of American academics such as Robert W. Fogel. In the 1980s and 1990s, as the stock of sociology and economics began to fall in the judgment of historians, many turned instead to the work of cultural anthropologists such as Clifford Geertz, Marshall Sahlins, and Victor Turner. (In contrast, social scientists, as Eric H. Monkkonen and others have argued, maintain a steadfast claim to the appropriation of history across their various disciplines, without necessarily intending by “history” the discipline that historians actually practice). Meanwhile, the “history of ideas” has been transformed at one end into cultural history (including most recently the history of the book), and at the other into the pursuit of the meaning of terms and of texts in their linguistic and/or social contexts. The latter stream is in turn divisible into a so-called Cambridge School of the history of political thought, associated with Quentin Skinner in Britain and J. G. A. Pocock in the United States, the *Begriffsgeschichte* (history of political and social concepts) approach associated with the German Reinhart Koselleck, and the “New Historicist” and “cultural materialist” movements in literary criticism.

One trend that began in the mid-1970s but has roots in literary theory and in continental philosophy (especially the French figures Michel Foucault and Jacques Derrida, and the Germans Hans-Georg Gadamer, Martin Heidegger and, more remotely, Friedrich Nietzsche) is the so-called linguistic turn in historiography, often identified with the broader theoretical shift known as postmodernism. Influenced by cultural theorists such as Roland Barthes, Foucault, Jacques Lacan, and Paul Ricoeur, and by the prewar German intellectual Walter Benjamin, postmodernism also draws extensively, if often superficially, from cultural anthropology. The thrust of this has been seriously to challenge conventional boundaries between history and literature, leading American exponents of this view being the Americans Hayden White and Dominick LaCapra. It has also, as the historical theorist F. R. Ankersmit suggests, had the effect of “de-disciplining” and “privatizing” history—restoring the individual author, as opposed to the institutional structures erected in the nineteenth and twentieth centuries, to the center of historical writing. In its most extreme version (which is articulated less frequently than postmodernism’s most severe critics would have us believe), it hearkens back to Renaissance pyrrhonism in its radical denial of the fixity of any historical meaning, the existence of any external reality beyond language (there are only infinite floating “signifiers,” and no definable or recoverable “signifieds”), and the impossibility of making “true” statements about the past. The position derived from this—that any version of history is no more or less valid than another—while seemingly liberal, also opens the door to the legitimation of morally repugnant positions such as Holocaust denial. This issue has come to the fore in recent years through a number of celebrated cases, most notoriously the 1990s libel suit brought by Holocaust denier David Irving against the American historian Deborah Lipstadt, who had charged him with gross fabrication and distortion of evidence to support his theories. A spectacle followed around the globe. The trial involved the historian Richard Evans and a team of graduate students scrutinizing David Irving’s research intensively, the consequences of which were the utter demolition of his arguments and an overwhelming legal victory in the year 2000 for Lipstadt and her publisher.

It is tempting to dismiss much postmodern theorizing, historiographically, as chaotic and intellectually anarchistic nonsense, perhaps even a sign of fin-de-siècle cultural decadence. There has recently been an extreme conservative reaction to it, epitomized in the work of the late British historian Sir Geoffrey Elton, and in the critiques of those who lament the loss of any sense of master-narrative. But the postmodern trend has been highly influential in academic settings (especially literature departments); and, while still a minority influence in history departments, it has found a receptive audience among historians of gender and many social and cultural historians for whom it has provided a set of codes and categories to replace those once derived from Marxism. While some of its arguments are virtually self-discrediting, postmodernism has at least provided a salutary reminder to all historians (if one were really needed) that, Ranke notwithstanding, documents and texts never “speak for themselves” but are interpreted by historians, and, more important, that even the most “neutral” document was ultimately the creation of a human being driven by the assumptions, social pressures, and linguistic conventions of his or her own time.

Few historians would now endorse the French ancient historian Fustel de Coulanges' optimistic admonition to group of applauding students that it was not he who spoke to them but "history, who speaks through me."

A related variant, postcolonial studies, often associated with the literary theorists Edward Said (1935–2003), Gayatri Spivak, and Homi K. Bhabha, has refocused scholarship concerned with former colonies such as India on the subjected masses rather than on the imperial rulers and their indigenous elite allies or political successors. The Subaltern School of Indian historiography (the term derives from Marx and from Antonio Gramsci's theory of hegemony) founded by Ranajit Guha is a prominent example, the academic foundation against which it rebels having been established with the rapid increase of university history departments following independence in 1947, and the development of social-science-influenced South Asian studies. Guha in particular has argued that the Renaissance assignment of non-Europeans to the realm of "peoples without history" was compounded by the subsequent imposition of Enlightenment ideas upon the various colonized areas of the world, in particular the notion that statehood, as well as writing, was essential for a people to achieve historical standing. The colonizers, using their control of language, education, and writing, subjected the Indian past, for example, to Western (and especially Hegelian) notions of "world-history," limited by European standards of chronology and narrative. In other words, they imposed a kind of imperial "dominance without hegemony" over a nation's true sense of its own history. "History" in the Western sense (projected backwards onto indigenous *itihasa* in an effort to make these seem protohistorical) thus permanently completed the displacement, commenced by the Persian-influenced histories of the Mughal era, of the ancient tradition and "old lore," as well as the sense of everyday experience, embodied in the poetic myths contained in *purana* and in epics such as the Ramayana. Vinay Lal, a critic of Subaltern Studies has adopted an even more radical position, asserting that the accommodation of Indian scholars to the very value of history, not simply adoption of its Western forms, is an acceptance of servitude. Sumit Sarkar, an early participant in the Subaltern project, has criticized it for a growing loss of focus on the very groups it was designed to rescue from oblivion and for its swing in the direction of cultural studies, while endorsing a microhistorical approach analogous to the practice of Europeans such as Carlo Ginzburg.

The Latin American experience reflects both European and, more recently, North American trends, while some of its historical concerns have for decades anticipated the very issues raised in the 1960s by European Marxists such as E. P. Thompson and Eric Hobsbawm, and more recently in South Asia by Subaltern scholars. Academic historiography was firmly established with the foundation of public archives at the end of the nineteenth century, and the creation of history departments at universities. The longest-standing graduate programs date back to the 1950s and include El Colegio de México, Universidad Nacional Autónoma de México, Universidad San Marcos in Lima, and the Universidad de Chile, but a significant proportion of academics with doctorates have acquired them abroad at European (especially Oxford, Cambridge, and Madrid) and major American universities, many of which (the University of Texas and the University of California, Berkeley, for example) have first-rate library collections and strong graduate programs in Latin American studies.

By the end of the nineteenth century, the liberalism and positivism that had marked the first decades of postindependence historiography were under duress, in part owing to a growing alienation from America and Europe. The Mexican Revolution of 1910–1920, with its populist and agrarian origins, suggested that the historical role of Latin American masses and especially indigenous and mestizo populations had been seriously underestimated; moreover, the political and economic success of many of the liberal states had been mixed at best. Efforts turned to revisiting the history of Central and South America from a less Eurocentric perspective. Historians and ethnohistorians began to pay special attention to the role of the indigenous peoples and to the ethnic intermixture of populations that had produced a distinctive set of postcolonial societies. The kinds of anthropological excavation of native perceptions of the past applied in the South Pacific have also been employed in Latin America in recent decades. Some of the features of African historiography can also be observed here, in particular the application of Marxist and social science paradigms such as "dependency" and "modernization" theory. And, as with India, an anti-imperialist scholarship has developed (encouraged by the ideologically controversial five hundredth anniversary celebrations of Columbus's 1492 expedition) that insists on the role of European and especially Iberian colonizers in the "invention" of historical categories such as "America."

Conclusion

This article has necessarily been selective, summary, and in places even cursory, in its treatment of the history of history around the planet. While the differences between various forms of historical writing—and different traditions—have deliberately been emphasized, some connecting points also exist. There has been a close relationship between the historical record and the exercise of power for much of the past four thousand years, power being taken in the ethnic, social, and economic as well as narrowly political sense. This is perhaps another way of putting the old saw, mentioned at the very beginning of the essay, that “history is written by the victors,” although in fact it has just as often been written by the losers (consider Thucydides, the Indian Felipe Guamán Poma de Ayala, or the poet and historian John Milton, a failed revolutionary) and those bewildered by the specter of sudden or unwelcome change. There has been an ongoing, dialectic, and much-changing relationship between literature, legend, myth, and history, and firm and categorical divisions between these are by no means the hallmark of all historical cultures. One may also observe the recurrent influence of various forms of present-day self-identification in the construction of pasts, ranging from the Greek city-states through Renaissance debates about racial origins, through Spanish discussions of Visigothic foundations, to the competing global nationalisms of the nineteenth and twentieth centuries. Now as then, current problems and perspectives often drive the most intense and searching investigation of the past: Where French and Spanish invasions of Italy drove Machiavelli and Guicciardini to the past for explanation, similar calamities inspired many of the chroniclers of Burma and Thailand in the late eighteenth and early nineteenth centuries. Where the Reformation ignited a European debate over the history of the church, modern German historians have had to wrestle since 1945 with the problem of the country’s aggressive twentieth-century past and the horror of the Holocaust.

At the start of the twenty-first century, there is a high degree of disintegration and remarkably little consensus as to what a “proper” historical method is, what phenomena constitute legitimate subjects of historical inquiry or whether any historical narrative merits “privileging” (a favored term of literary criticism) as true—or at least more true—over any other. But in facing our own postmodern confusion, we would be entirely wrong to project a nostalgic, supposititious, and comfortable uniformity of opinion onto the historical thought of earlier times. Let us in closing recall the differences between Babylonian, Assyrian, and Hebrew historical writing; Thucydides’ quick departure from the model established by Herodotus; the contemporary medieval critics of Geoffrey of Monmouth’s invented British past; the Qing evidentiary debates; the pyrrhonist challenge to historical knowledge in early modern Europe; and the German quarrels about method in the late nineteenth century. These are but a few reminders that there have always been many mansions in the house of history and an almost infinite number of windows, each providing a fresh perspective on to the past.

READER'S GUIDE

This Reader's Guide was compiled by the editors to provide a systematic outline of the contents of the New Dictionary of the History of Ideas, thereby offering teachers, scholars, and the general reader a way to organize their reading according to their preferences. The Reader's Guide is divided into four sections: Communication of Ideas, Geographical Areas, Chronological Periods, and Liberal Arts Disciplines and Professions, as indicated in the outline below.

COMMUNICATION OF IDEAS

Introduction to History of Communication of Ideas

Communication Media

GEOGRAPHICAL AREAS

Global Entries

Africa

Asia

Europe

Middle East

North America

Latin and South America

CHRONOLOGICAL PERIODS

Ancient

Dynastic (400 C.E.–1400 C.E.)

Early Modern (1400–1800 C.E.)

Modern (1800–1945)

Contemporary

LIBERAL ARTS DISCIPLINES AND PROFESSIONS

Fine Arts

Humanities

Social Sciences

Sciences

Professions

Multidisciplinary Practices

Especially Interdisciplinary Entries

COMMUNICATION OF IDEAS

This category is the newest aspect of the *New Dictionary of the History of Ideas*; cultural studies, communications studies, and cultural history are moving the disciplines in this direction.

Introduction to History of Communication of Ideas

The following entries focus on the media humans have used to communicate with one another.

- Absolute Music
- Aesthetics: Asia
- Architecture: Overview
- Architecture: Asia
- Arts: Overview
- Astronomy, Pre-Columbian and Latin American
- Bilingualism and Multilingualism
- Borders, Borderlands, and Frontiers, Global
- Calendar
- Cinema
- City, The: The City as a Cultural Center
- City, The: The City as Political Center
- Communication of Ideas: Africa and Its Influence
- Communication of Ideas: Asia and Its Influence
- Communication of Ideas: Europe and Its Influence
- Communication of Ideas: Middle East and Abroad
- Communication of Ideas: Orality and Advent of Writing
- Communication of Ideas: Southeast Asia
- Communication of Ideas: The Americas and Their Influence
- Consumerism
- Cultural Revivals
- Cultural Studies
- Dance
- Diffusion, Cultural
- Dress
- Dualism
- Education: Asia, Traditional and Modern
- Education: Global Education
- Emotions

Communication Media

This is a listing of the types of historical evidence the author used in writing the entry. While entries in the original Dictionary of the History of Ideas were to a great extent the history of texts, the entries in the New Dictionary of the History of Ideas are generally the cultural history of ideas, making use of the records of oral communication, visual communication, and communication through practices, as well as the history of texts, in order to show the impact of the idea on a wide variety of people.

ORAL

The selective list below contains the entries that give the most coverage to historical examples of the oral transmission and transformation of ideas.

Civil Disobedience
Civil Society: Europe and the United States
Communication of Ideas: Orality and Advent of Writing
Cosmopolitanism
Cultural Capital
Determinism
Dialogue and Dialectics: Socratic
Dialogue and Dialectics: Talmudic
Dream
Emotions
Empire and Imperialism: Europe
Equality: Overview
Etiquette
Fascism
Harmony
Magic
Masks
Media, History of
Millenarianism: Latin America and Native North America

Music, Anthropology of
Musical Performance and Audiences
Musicology
Nomadism
Oral Traditions: Overview
Oral Traditions: Telling, Sharing
Populism: United States
Psychoanalysis
Public Sphere
Republicanism: Republic
Rhetoric: Overview
Ritual: Public Ritual
Ritual: Religion
Slavery
Theater and Performance
Tragedy and Comedy
Trope
Wisdom, Human

TEXTUAL

Every entry in the *New Dictionary of the History of Ideas* used texts. The following is a list of entries that focused mainly on the history of a succession of texts. Each academic discipline has a succession of major authors with whom later practitioners of the discipline build upon and respond to creatively. The historian of a discipline—such as the history of political philosophy, literary history, or the history of science—considers the responses of thinkers and practitioners of a discipline to the major earlier texts in the discipline. In tracing the origin, development, and transformation of an idea, the historian of ideas considers thinkers' responses to texts from a variety of disciplines.

LIBERAL ARTS DISCIPLINES AND PROFESSIONS

This section is in accord with the university divisions of the Liberal Arts into Fine Arts, Humanities, Social Sciences, and Sciences and the graduate programs of the professions of Law, Medicine, and Engineering. The sample of Interdisciplinary Programs are listed under their most common university grouping. For example, Fine Arts includes Performance Arts; Social Sciences includes Women's Studies and Gender Studies, as well as Ethnic Studies; Sciences includes Ecology and Geology, as well as Computer Sciences; Humanities includes programs of Communication, Language, and Linguistics. Meanwhile, the growth of interdisciplinary programs reflects the increasing overlap between studies listed under the labels of Fine Arts, Humanities, Social Sciences, and Sciences. A discipline or interdisciplinary program only appears once, but an entry may appear under the several disciplines and interdisciplinary programs that influenced the scholarship of the article. Titles that appear in bold indicate entries that are especially suited as an introduction to the discipline.

Under the category Multidisciplinary Practices, there are entries on the many methods, techniques, theories, and approaches that have spread across the disciplines. The Multidisciplinary Practices help explain the contemporary trend of interdisciplinarity for which the history of ideas has long been known. At the end of this Reader's Guide is a listing of a number of entries that overlap three of the four divisions and a listing of entries that overlap all four divisions.

Especially Interdisciplinary Entries

The most interdisciplinary entries synthesized knowledge by using the methods and focusing on the topics of practitioners of several disciplines. Very few entries listed below are in only one division. Common pairs for the history of ideas are social sciences and humanities, social sciences and sciences, and humanities and sciences. In the early twenty-first century there is generally a recognition of the common overlap of the social sciences with the humanities; social scientists may take ethical and literary factors into consideration and humanists may incorporate societal contexts into their work. The presence of psychology in the sciences, as well as the quantitative nature of some social sciences work, creates an overlap of social sciences with sciences. Another interesting overlap is between humanities and sciences—topics that in antiquity were treated as philosophy or religion are now investigated by those following scientific methods.

A

ABOLITIONISM. Historical studies of the ideas that gave rise to abolitionism, whether in the Caribbean, Latin and South America, Africa, or the United States, have provided analyses that are variously political, economic, social, demographic, or religious in focus. This entry examines the political, religious, and economic ideas surrounding abolitionism to illustrate that these factors were often intertwined. The role of ideas, ideologies, movements, tactics, and personalities are examined to demonstrate the complexity of this social movement in terms of gender, race, socioeconomic background of the participants, and time and location of the movement.

Political Ideas

The early abolitionist movement in the United States and Great Britain during the late eighteenth century was guided by the ideas of the Age of Enlightenment, the French and American revolutions, and Christian morality. The concept that individuals were created equal and had the right to life, liberty, and the pursuit of happiness led them to advocate abolitionism. The slave revolt in Saint-Domingue (Haiti) in 1791 led by Toussaint Louverture was based on these ideas of universal liberty and freedom. The importance of the Haitian revolution to the idea of abolitionism is important because it demonstrated that slavery could be abolished quickly and violently and that a gradual approach using persuasion and rationality might not be the answer. Moreover, the revolution radically transformed this former French possession, providing the slaves with full emancipation and political control. Although a visible antislavery movement did not emerge in Brazil until 1850, the political movement for abolitionism there can be traced to the early nineteenth century, infused with ideas from the Haitian, American, and French revolutions. The abolition of slavery in the British West Indies during the nineteenth century grew out of a liberal political reform agenda that sought to provide better treatment for slaves with the view that emancipation would occur gradually. Slave uprisings in Martinique, Cuba, Tortola, Trinidad, Grenada, and Dominica convinced colonial authorities that slavery needed to be reevaluated. For example, in Barbados, after slavery was abolished in 1834 the government instituted an apprenticeship program of six (unpaid) years for field workers and four years for household servants. Jamaica freed its slaves in 1833, and Antigua and Bermuda provided slaves with full emancipation in 1834; as in Barbados, apprenticeship programs served as a transitional institution for several years after emancipation. However, colonial offices throughout the Caribbean dealt with the former slaves in a harsh manner, inflicting punishment for various minor offenses, extending the apprenticeship period, and sending house servants into the fields to labor.

Colonization

The ideas of abolitionism were linked to missionary, colonial, and commercial motives and ideologies of the French, British, and Americans. Quakers in the antislavery movement in the United States worked to settle slaves in Africa based on religious beliefs that slaves had the right to be free and that these political ideas only could be achieved through colonization in Liberia and Sierra Leone. The political ideas of justice, equality before the law, liberty, and the rule of law were meant to serve as the foundations of the colonies. It was equally important politically to utilize former slaves and re-captives in this endeavor to prove that people of African descent were capable of understanding laws, social responsibility, and the dignity of labor. The belief that people of African descent were inherently inferior to whites and could not be assimilated into a white society led many to advocate colonization. The connection between French abolitionism and colonization on the African continent were intimately linked according to some scholars. It has been argued that when the French government abolished slavery in 1848, it was merely replaced with colonization, starting with Algeria; therefore the master-slave relationship continued to leave the African in an inferior, subordinate position, and the French continued to gain from its economic exploitation of land and labor. The same argument can be made for Great Britain following its abolition of slavery, especially in Sierra Leone. Former slaves and recaptured Africans who ended up in Sierra Leone, along with indigenous Africans, were not viewed as having the same claim to citizenship and sovereignty as the British—otherwise the former slaves and recaptured Africans would not have been colonized. In sum, some Europeans advocated abolitionism, but they did not support full citizenship, equality, and freedom for Africans, and whenever and wherever the slave trade ended, missionaries and commercial enterprises entered the African continent with the backing of the colonial state.

Religious Ideas

The religious ideas that fueled abolitionism in the eighteenth and nineteenth centuries, especially in the United States and Great Britain, were firmly rooted in the Christian belief that all people are equal in the eyes of God; therefore, the practice of one person owning another was against Christianity. The doctrine of a divine sovereignty that made people accountable only to God was utilized. Under slavery, the slave was accountable to her or his owner and not to God. Another religious idea that served as a catalyst during the 1820s and 1830s included evangelicalism and revivalism, which supported the belief that slave owners and others associated with slavery and its institutions could

Engraving of slave revolt, Saint-Domingue, from a contemporary German report. The 1791 uprising resulted in personal freedom and political control for Haiti's slave population and paved the way for subsequent abolitionist and reform movements in other countries. THE GRANGER COLLECTION

experience personal salvation through instant conversion. The idea of “come-outism” is important in evangelicalism and abolitionism, adopted by American abolitionists who publicly took a stand against slavery by withdrawing from any institution, especially churches, that did not recognize the sinfulness of slavery.

Economic Ideas

Although religious ideas were important to abolitionism in the United States and Great Britain and for colonization, they were not as significant in South American, Latin American, and Caribbean abolitionism, which contained more economic and political ideas. This could be due to the fact that abolitionism operated in these regions within the colonial framework, and abolitionists were often fighting on several fronts—to achieve independence, achieve freedom for the slaves, and achieve citizenship and other rights for free people of African descent. Throughout most of the nineteenth century, abolitionism in Cuba and Puerto Rico was hampered by the civil war and the revolution in Spain. Abolitionists had to contend with the economic interests of Spain, Cuba, and Puerto Rico—mainly wealthy slave owners who were vehemently opposed to the abolition of slavery, especially in Cuba, which had a large slave population vital to its sugar industry in the western part of the island. Puerto Rico had a much smaller slave population, and by 1835 slavery was virtually nonexistent. In addition, the United States had significant economic investments that it wanted to protect in Cuba and Puerto Rico. But at the same time, there were American abolitionists who demanded an end to slavery in colonies controlled by Spain.

The debate among modern historians between the role of economics and the role of humanitarianism in abolishing slavery in British slaveholding colonies in the Caribbean was sparked by Eric Williams's *Capitalism and Slavery* (1944). According to Williams, capitalism, and not Christian humanitarianism, was the driving force to end slavery because the emerging capitalist system that evolved from the Industrial Revolution demanded free trade and more productive labor than slaves provided. Rational business practices were needed, including a literate workforce. The failing British West Indian plantation economies could not compete with industrial capitalism. This deviated sharply from the British imperial historiography that placed moral humanitarianism as the catalyst for abolitionism. However, Williams's analysis of abolitionism was subsequently rejected by several historians, most notably Roger Anstey and Seymour Drescher, who argued that slavery continued to be economically viable in the United States and Brazil, along with capitalism. They contended that in the late eighteenth century slavery and the slave trade were important to the British economy at the same time that abolitionism began. Still others have contended that abolitionism was a social movement that involved a variety of actors and organizations all grounded in the popular culture and trends of the time in their respective societies. Within the American context, this changing historiography over time includes: historians who supported the humanitarian view of abolitionists (that is, the belief that they were guided by moral and religious values); historians who downplayed the moral aspect and emphasized economic factors; historians who viewed abolitionists as one-sided fanatics who led the country into a needless civil war; and, during the 1960s, historians who again portrayed abolitionists in a more positive light as people who were committed to a just and social cause. Additionally, other scholars—most prominently W. E. B. Du Bois, Eugene Genovese, and Herbert Aptheker—have given agency to the slaves themselves in bringing about emancipation.

The idea of free labor was another economic idea behind abolitionism in the Caribbean, South America, and Latin America, primarily the commercialization of agriculture, which made slave labor economically outdated. The urban-based abolitionist movement in Brazil responded to economic changes that included greater integration into the global economy, an increase in the urban population, expansion of its infrastructure, and creation of new industries and businesses in both rural and urban areas. As a result of these changes, a more liberal form of economics developed that supported free labor instead of slave labor. Moreover, as people became urbanized, traveled outside the country, and learned more about world developments, the institution of slavery seemed backward and made Brazilians appear uncivilized and out of step with a world that was developing new ideas based on science and rationality. Abolitionism in Puerto Rico, Brazil, Cuba, and other Caribbean islands did not mean immediate emancipation accompanied by full citizenship rights; rather, as outlined above, the practice of apprenticeships was employed to compensate slave owners. It was feared that ex-slaves would not be willing to work for wages, the economies would plummet, and a race war would ensue. The aim was to make a gradual transition from slavery to freedom that would not destabilize society.

Tactics, Organizations, and Individuals in the Americas

In discussing abolitionism in the United States and Great Britain, it is important to divide the movement into periods because the tactics, organizations, and individuals the movement attracted evolved in response to changing religious and political ideas. Following the Revolutionary War, the Quakers in Pennsylvania were in the forefront of the abolitionist movement; their tactics and organizations reflected the elite status of their members (wealthy white men) and their belief in gradual abolitionism. They believed that slavery could be gradually abolished by pressuring government representatives to enact laws and statutes against slavery, providing legal aid to runaway slaves, petitioning the federal government to end the importation of slaves and halt the westward expansion of slavery, and pressuring state governments to grant slaves rights.

The Quakers were active in Great Britain as well. In 1783 they formed the London Committee to Abolish the Slave Trade. In 1787 they joined the Evangelical Christians led by William Wilberforce and Thomas Clarkson to form the Society for the Abolition of the Slave Trade. They led petition drives and lobbied the government, and in 1807 the British slave trade was abolished. The goal in Britain now shifted to gradual abolition and then to immediate abolition. In 1823 Clarkson, Wilberforce, and Thomas Fowell Buxton formed the British Anti-Slavery Society after British West Indian plantation owners were reluctant to abolish slavery, and in 1833 the Emancipation Act (which applied to the British colonies but not to Great Britain itself) was passed. In France, Jacques-Pierre Brissot formed the Society of the Friends of Blacks in 1788, and in 1834 the French Society for the Abolition of Slavery was established. In the Netherlands, the Réveil movement associated with the Dutch Reform Church was formed in the 1840s after British Quakers convinced them that slavery was against the Bible. The Spanish Abolition Society was founded in Madrid in 1865. The major actors in abolitionism throughout the Caribbean and Latin and South America were the slaves and free people of African descent who staged revolts, work stoppages, and insurrections, and ran away. Significant slave uprisings occurred in the nineteenth century in Brazil in Bahia, Minas Gerais, Espírito Santo, Rio de Janeiro, and São Paulo. Slave revolts and desertions from the plantations led to the emergence of immediatism and the formation in 1880 of the Brazilian Anti-Slavery Society (Joaquim Nabuco was elected president), which started as a small group of abolitionists based in major urban areas. This movement grew in size to include people from various educational and social backgrounds. Other antislavery organizations in Brazil included the Cearense Liberator Society, Bahian Liberator Society, and Abolitionist Confederation.

People of African descent played a critical role in U.S. abolitionism before and after the movement became integrated; some of these include Richard Allen, Prince Hall, James Forten, Harriet Jacobs, and Mary Shadd Carey. Upstate New York had a major community of activists who believed in immediatism, among them Frederick Douglass, Sojourner Truth, Harriet Tubman, Austin Steward, and Thomas James. Because they were kept out of the first wave of abolitionism, they were forced to establish their own organizations, newspapers,

educational institutions, and churches. They realized early on the importance of using moralism and emotionalism as tactics, and the print media served as the vehicle. Some of those who had escaped slavery wrote and published their narratives, lectured, and helped slaves to escape, and many traveled to Europe to gain support (Frederick Douglass, Nathaniel Paul, Robert Purvis, William Wells Brown, Alexander Crummell, and Ellen and William Craft). People of African descent in both abolitionist periods advocated full emancipation and rights for the enslaved and free.

The role of women of African descent in the abolitionist movement was important and different because they had to deal with issues of race, sex, and class within the antislavery movement and the white women's movement. These women included Grace Bustill Douglass, an educator and founder of the Philadelphia Female Anti-Slavery Society, and her daughter Sarah Douglass; Frances Ellen Watkins Harper, who was a teacher and poet; Maria Miller Stewart, Sarah Forten, and Eliza Dixon Day. These women helped to recruit members to the movement, gave public lectures, raised funds, and organized rallies and events.

Abolitionism and Feminism

The history of feminism in the United States is very directly linked to the abolitionist movement. Black and white women in northern cities in the United States were very active in various religious and benevolent organizations before they joined the abolitionist movement in the 1830s. The administrative and leadership skills and experience they had gained in these organizations were then utilized in the abolitionist movement. It is clear why black women were involved in the struggle to end slavery; however, white women from the working class to the upper middle class saw a correlation between the oppression of slaves and their oppression as women in terms of their legal status, which defined them as the property of their husbands and as their inferiors in society. Women found an outlet in the abolitionist movement for expressing their ideas toward marriage, divorce, and domestic violence. Men made up most of the leadership in abolitionist organizations, and their treatment of female members convinced many of these women that both slaves and women needed to be emancipated. Some abolitionist organizations did not allow African-Americans to join, while others curtailed the participation of women, especially in public speaking, voting, and business decisions. Many of these women continued their efforts to transform society through social movements by working on women's rights in the campaign for suffrage and property rights, along with the rights to file lawsuits, obtain a divorce, and obtain custody of children. The intersection of abolitionism and women's rights influenced the ideas and work of Sarah and Angelina Grimké, Abigail Kelley Foster, Lucretia Mott, and Elizabeth Cady Stanton. The Grimké sisters, who were Quakers, believed they had been called to do God's work in the antislavery movement. Moreover, the linkages between abolition and women's rights in the work of black women abolitionists such as Sojourner Truth cannot be overstated. They were fighting for a double victory—one to end slavery and the other to end discrimination based on gender.

Sojourner Truth (c. 1797–1883). Born into slavery in upstate New York, Isabella Van Wagener gained her freedom when the state abolished the practice in 1827. In the early 1840s she took the name Sojourner Truth and began touring the country to advocate abolition. ARCHIVE PHOTOS, INC.

Tactics, Organizations, and Individuals in Africa

Following the end of the Revolutionary War, many slaves and free people of African descent, as well as some American and British whites, began to question the slaves' future, especially in terms of achieving full citizenship rights and economic independence. Colonization was used as a strategy to end slavery, and Freetown in Sierra Leone was established as a colony in 1787. The American Colonization Society was formed in 1816, followed by the colonization of Liberia in 1847. Individuals of African descent who advocated colonization included Paul Cuffee, who was independently wealthy and free. He made two trips to Sierra Leone with financial backing from the British government—one in 1811 to inquire about the feasibility of African emigration and another in 1815 when he took thirty-eight free Africans with him. Others who shared these beliefs included Joseph Brown Russwurm, Martin Delany, Edward Blyden, and Thomas Peters from Nova Scotia, Canada, who petitioned the British government for assistance. They believed that human dignity, justice, hard work, and the rule of law could be put into practice in the new settlements and that this would prove that these outcasts and marginalized individuals could be given a second chance in life. These philosophical ideas were often intertwined with religious ideas that appealed to ex-slaves because they espoused the importance of God's authority and individual freedom that allowed them to employ petitions, preaching, and the print media as tactics. In addition, a number of Africans, people of African descent, Europeans, and Americans believed that worldwide emancipation would not be

achieved as long as there remained a supply and demand for slaves. Therefore, to contain slavery at its source, the campaign against slavery had to shift from the West to the African continent. To do this, Africans, former slaves, and re-captives were mobilized to advance the idea that if slavery were to end, the antislavery movement had to be based on the African continent and Africans and people of African descent on the continent had to be in the forefront of the antislavery movement.

Cassandra R. Veney

ABSOLUTE MUSIC. "Absolute music" is an idea that took root in the writings of early German Romantics such as Wilhelm Heinrich Wackenroder (1773–1798), Ludwig Tieck (1773–1853), and E. T. A. Hoffmann (1776–1822) beginning at the turn of the nineteenth century, and came to dominate musical aesthetics over much of the next two centuries, frequently invoked to argue for music's elevation to a position above the other arts. The term is often allied with such terms as "abstract music," referring to the separation of music from other considerations, and "formalism," referring to the logic

Ludwig van Beethoven (1770–1827). During the eighteenth and nineteenth centuries, the concept of absolute music—exemplified by the works of composers such as Beethoven—played an important role in the development of a nationalistic movement in Germany. THE LIBRARY OF CONGRESS

whereby music makes sense without any accompanying words, drama, or dance. It is most often contrasted with “program music,” whose full sense and purpose depend on a variety of narrative, literary, pictorial, dramatic, or other explanatory bases. In truth, however, the term is much richer, and historically more significant, than these associations would indicate.

The elevation of music to the highest of the arts entailed a shift in the perceived relationship of art to the world around us. As “art for art’s sake” and similar sentiments gained ground in the nineteenth century, music became prized for its very separation from the real world, its lack of precise representational meaning. The symphony became the focal point for a new valorization of music, especially as it developed in the German lands at the hands of Haydn, Mozart, and Beethoven. Beyond its presumed purity, music’s removal from the here and now made it seem a perfect vehicle for expressing the Romantics’ sense of “infinite longing,” which Hoffmann, in an 1810 essay on Beethoven’s Fifth Symphony (1808), called the “essence of Romanticism.” Within this formulation, music could be allied with the sublime, the unattainable, the infinite, and the ineffable, while at the same time expressing and probing profound inner states. Through music, one’s soul could connect, through “longing” or some other deep feeling, to something beyond the everyday world. In this way, as the German musicologist Carl Dahlhaus argues, music could be understood as “absolute” in

two senses, both through its purity, its “absolute” separateness from the reality we can see and touch, and through its capacity to connect us to the “absolute” in the philosophical sense, after Georg Wilhelm Friedrich Hegel (1770–1831).

Beethoven and German Influence

The evolution of the concept proceeded in conjunction with the German Idealist philosophical tradition and figured prominently in the development of German nationalism, as well. Immanuel Kant and Hegel provided the underpinnings, and Arthur Schopenhauer (1788–1860), Richard Wagner (1813–1883), and Friedrich Nietzsche (1844–1900) developed a more specifically musico-philosophical edifice. Ironically, however, while it was Wagner who coined the term “absolute music” around mid-century and thereby embedded it securely within Idealist philosophy, he did so in order to argue against its validity, claiming that music, which he equated with “woman” (thus, essentially sensuous and inchoate), could not flourish in isolation, needing the masculine “poet” (by nature seminal and rational) to thrive. Already, Beethoven’s works, especially his symphonies, were being touted in the second quarter of the century as both the best representative of pure music and the cornerstone of a German musical tradition that represented the highest expression within the highest of the arts, an emblem and indispensable part of what it meant to be German. This elevation of Beethoven was accomplished largely through the writings of Adolf Bernhard Marx (1795–1866), who laid much of the groundwork for formal analysis through his descriptions of sonata form, the basic formal principle for not only Beethoven’s instrumental music, but also of his immediate forebears and principal descendants.

In his landmark *On the Musically Beautiful* (1853), Eduard Hanslick (1825–1904), without using the term “absolute music,” attempted to refute Wagner’s arguments against pure music, arguing that music’s form was identical to its content (thereby effectively divorcing music even from emotion) and claiming for it an eminently masculine rationality based on formalist musical logic. A variety of methods for analyzing music were developed over the century or so following Hanslick’s short book, most notably by Hugo Riemann (1849–1919), an advocate of functional harmonic analysis and phrase-structure analysis; Heinrich Schenker (1868–1935), who introduced layered reductive voice-leading analysis; and Rudolph Réti (1885–1957), who relied on motivic analysis. Since all these systems were developed in large part to validate the logic of Beethoven’s instrumental music, and since Beethoven had become both the figurehead of German music and a supposed universal, the concept of “absolute music” that these methods helped reinforce consolidated the position of German music as the standard of musical value.

Crosscurrents: Program Music and Modernism

From the beginning, there was much resistance to the idea that music is best understood as separate from what soon became known as the “extramusical.” Opera and similar forms, of course, balanced musical logic with and against dramatic necessities (although Wagner argued that Italian opera was essentially “absolute” in its dependence on musical formula). Songs of various types were intimately tied to their texts. Most

significantly opposed to the new concept was the idea of “program music”—instrumental music that relied on a programmatic explanation to orient an audience to its meanings—launched by Hector Berlioz (1803–1869) in the years following Beethoven’s death in 1827. The tradition of program music, to some extent also rooted in Beethoven (especially in his Sixth Symphony, known as the “Pastoral” Symphony, 1808), was continued by Franz Liszt (1811–1886) in his symphonic poems and programmatic symphonies, implicitly disavowed by Johannes Brahms (1833–1897) and Anton Bruckner (1824–1896), but taken up again by both Gustav Mahler (1860–1911) in his first symphonies and Richard Strauss (1864–1949) in his tone poems and programmatic symphonies, beginning in the mid-1880s and continuing through the turn of the twentieth century. Nevertheless, although programmatic music is most readily identified, in musical terms, according to its departures from “musical logic,” there is substantial overlap in the two categories as well, so that they should not simply be viewed as opposite types. Thus, even a programmatic work had to make musical sense and could depend on an underlying sense of music’s absoluteness, while many “absolute” works conveyed implicit programmatic content through their engagement with familiar musical gestures and topics.

During the twentieth century, especially with the advent of high modernism, music’s separateness from other discourses became in some cases more pronounced (by the insistence on sometimes arcane musical logic over what most audiences still perceive as “natural”) and in others virtually eliminated (as when programmatic rationales demanded extreme expressive or descriptive modes at the expense of musical logic). While the latter possibility played a large part in the development of musical modernism, it also led at each turn to the development of new “systems,” such as the concept of *Klangfarbenmelodie* (tone-color melody) proposed by Arnold Schoenberg (1874–1951) in 1911 and the twelve-tone system that he created ten years after that (also known as serialism, which was later developed further by applying it to other elements besides pitch, such as rhythm, meter, and dynamics). In consequence, the former possibility, advancing the principle of music’s absoluteness, was often seen as more fundamental. Thus, in the Soviet Union during the 1930s and 1940s, the charge of “formalism” was used against composers such as Dmitry Shostakovich (1906–1975) when their music was perceived to be too modern. While this charge has been described as little more than a tool for exercising political control, its basis has much in common with Wagner’s insistence on music’s subordination to an exterior logic, and it is based in part on the premise that musical modernism extends the idea of “absolute” music.

Late Twentieth- and Early Twenty-First-Century Perspectives

The last few decades of the twentieth century and the start of the twenty-first century have seen renewed and often highly skeptical interest in the claims of music’s absoluteness alongside an increasingly entrenched advocacy, the latter reinforced by the growth of musical analysis as a discipline. Carl Dahlhaus has historicized the concept, grounding it in Germanic philosophical and musical thought. Many have argued persuasively

that the idea is fundamentally a fiction, that music is always referential to a variety of contexts, some historical and others acquired through reception. Most of these arguments have focused either on a consideration of musical narrative (i.e., the way that music may be understood to tell stories (Anthony Newcomb, Lawrence Kramer, and Susan McClary) or on musical semiotics, of how music has continued to develop an evolving system of referential gestures redolent of the older “doctrine of the affections” (Jean-Jacques Nattiez, Leonard Ratner, and Wye Allanbrook). If “absolute music” has indeed been a fiction, it has been a useful one from many perspectives, helping to enable the experience of music as a uniquely powerful art medium. Under the aegis of its absoluteness, which renders its shapes and gestures officially neutral, music has been capable of reinforcing—but with full deniability—a full array of values and ideas, and of projecting, within its “meaningless” interplay of definiteness and vagueness, phantasmal versions of a re-imagined reality.

AESTHETICS.

This entry includes three subentries:

- Africa*
- Asia*
- Europe and the Americas*

AFRICA

Africa has more than two thousand languages, representing several thousand cultures, each with its own system of logic. No single aesthetic philosophy characterizes the continent, and

any concept of a coherent “Africa” is arbitrary, given such extraordinary diversity. Furthermore, a given culture may possess several aesthetic discourses, as may any artistic genre. Globalization complicates matters even more, for one cannot discuss the aesthetics of contemporary African artists without considering transnational paradigms and hybrid visions.

Given such complexities, how can one propose any comprehensive notion of African aesthetics? One may consider key aesthetic concepts of a particular group, such as the Yoruba peoples of Nigeria, to demonstrate the specificity of aesthetics. Other revealing themes are aesthetic experiences crossing the boundaries of “traditional” African societies; the efficacy, concealment, and revelations of African arts; a common aesthetic of accumulation and process; and the performativity and polysemy of African expression. Finally, colonial and postcolonial aesthetic encounters are relevant to a discussion of how changing aesthetics shape present concerns.

Aesthetic Discourse

Aesthetics comes from the Greek word for “sense of perception” and can be defined only within particular cultural systems. Cultural insiders must be consulted to ascertain how and why aesthetic concepts come to hold value. African aesthetic concepts reach into moral and spiritual realms. Linguistic exploration of African aesthetic terms finds that words for beauty and goodness often intersect, as Susan Vogel has noted among the Baule peoples of Côte d’Ivoire and others have discerned among the Lega and Songye of the Congo and the Igbo, Edo, and Ibibio of Nigeria, among others. External perfection and internal moral excellence are linked, as are physical perfection and ideal social order. An anti-aesthetic is also common, as in certain satirical masquerades among the Mende of Sierra Leone and the beauty-beast performances of the Igbo and Ibibio of Nigeria.

Most Western knowledge of African aesthetics is derived from research by African scholars and the few ethnographic studies that have carefully examined aesthetic discourse. The most profound knowledge concerns the Yoruba peoples of Nigeria. Yoruba philosophy reveals how and why their varied arts look and do things the ways they do. A compelling concept of Yoruba aesthetics is *ashe*, or life force, possessed and conveyed by all art forms, from visual to narrative to performative. Furthermore, *ashe* provides a tangible contact with the Orisha deities of the Yoruba spiritual pantheon.

Ashe is intrinsically related to the essential nature of creativity called *iwa*, perceptible to those who have “walked with the ancestors” and thus acquired critical and discerning eyes. Important to *iwa* are *oju-inu*, an “inner eye” or the artist’s insight, and *oju-ona*, the external harmony of artworks. For the Yoruba, the beauty of objects, performances, or texts lies not only in what catches the eye but also in the *ashe* derived from the work’s completeness. From these elements one can then discern the artwork’s *iwa*, or essential nature, and finally its *ewa*, or beauty.

Another critical concept of Yoruba aesthetics is *ara*, the “evocative power” of visual, verbal, musical, and performance

arts associated with the ability to amaze (Roberts and Roberts, p. 27). *Ara* bespeaks creativity through departure from norms. Yoruba artists are explorers, and their works reflect new understandings. As the Yoruba philosopher Olabiyi Yai states, art is always “unfinished and generative” (p. 107). Yoruba visual and verbal arts are also linked through *ori*, individuality, and *iyato*, difference and originality, and Yai argues for a definition of art that is “an invitation to infinite . . . difference and departure, and not a summation for sameness and imitation” (p. 113). The tradition-creativity binary posed for so many cultures is thereby dissolved, and “innovation is implied in the Yoruba idea of tradition” (p. 113).

Cross-Cultural Thematics

Through *ashe*, Yoruba arts are highly efficacious—that is, objects *work* and transform peoples’ lives. For many African cultures, how an object looks is related to the way it works, according to strict aesthetic specifications, for protection, healing, communication, mediation, or empowerment. Like aesthetics more generally, each culture has its own concepts of efficacy. For Bantu-speaking peoples of central, eastern, and southern Africa, a power called *nkisi* is manifest in sculpture and other expression, while for Mande-speaking peoples of western Africa, secret and instrumental knowledge is called *nyama*. For African Muslim mystics, *baraka* is a blessing energy emanating from saintly tombs, written and spoken verses, and visual forms. All these terms imply a power-knowledge relationship inhering in works of art, enabling their effectiveness and capacity.

As is true for many other African philosophies, Yoruba aesthetics also privilege knowledge that is allusive, indirect, and enigmatic. Patterns in textiles and scarification; designs on ceramics, houses, and sculpture; graphic inscriptions on walls, masks, and the body; and verbal arts such as proverbs, epics, and songs communicate messages of cultural significance. These can be highly esoteric and understood only by the initiated. For example, geometric patterns on Bamana *bogolanfini* textiles from Mali encode women’s herbal medicinal recipes. In other cases, patterns connote resistance, as did the surreptitious painting of African National Congress colors on homes by southern African women during apartheid.

Another characteristic of many African aesthetic systems is that objects, narratives, songs, and performances are interpreted by audiences in many different ways through intentional semantic variability. African artworks are semantically loaded texts abounding in exegetic richness. For example, among Luba peoples of the southeastern Democratic Republic of the Congo, thrones and staffs embody beauty and royal authority but are also mnemonic devices stimulating the making of history. Polysemy is also the product of a processual and accumulative aesthetic. The process of making art is often more valuable than the final products, and such dynamism is the essence of aesthetic experience. Once created, objects may have ephemeral usage before being destroyed or progressing to the next phases in layered histories.

Aesthetics on the Move

Recent study of African aesthetics includes two critically important thrusts: popular urban arts and diasporic art forms of

the black Atlantic, and an Indian Ocean world linking eastern Africa with South Asia. Again, aesthetic principles of urban arts are contingent upon local use and intent. For instance, urban paintings by the late Congolese artist Tshibumba Kanda Matulu reflect an aesthetic inspired by European comic books while addressing issues of critical historical and political importance. Ghanaian urban arts reflect a vibrant immediacy stemming from subjects of daily life—from soccer to hairstyles to music and film—whereas arts of urban Senegal conform to the aesthetics of a very particular mystical Islam realized through mass-produced images and inspired by photography. As Karin Barber notes, African popular arts fall between the cracks of “traditional” and “elite” or “modern” art. The hybridized forms of Africa’s dynamic popular urban arts reflect not only constant absorption of ideas from the outside but also long-standing adaptive processes through which Africans have always been innovative players in world forums.

Similar dynamism can be witnessed in Africa’s diasporic traditions. Much research, in particular that of Robert Farris Thompson, has shown that some of the most powerful aesthetic carryovers from west Africa to the black Atlantic are based on deeply embedded linguistic concepts such as an “aesthetic of the cool.” Thompson illuminates the origins of slang, gestures, and attitudes by demonstrating how certain aesthetic categories in the African Americas merge moral philosophy, right living, and artistic quality.

One cannot discuss African aesthetics without addressing the effects of colonialism and postcolonialism and modernist and postmodernist expressive trends of the last century. Encounters and entanglements fostered by the colonial experience in Africa have produced complex issues of appropriation and commodification: compelling research reveals close association between aesthetic norms and capitalist incentives (Phillips and Steiner). This has been noticeable since the colonial conquests of the nineteenth century but earlier as well in Portuguese influence upon the late-fifteenth-century kingdoms of Benin in Nigeria and Kongo in Angola and the impact of Christianity in Ethiopia from the fourth century C.E. African styles were adapted to meet changing economic and political circumstances, with a most compelling case among the Mangbetu people of the northeastern Democratic Republic of the Congo and Zaire, whose aesthetics shifted to a European “naturalism” to meet foreign expectations.

Similar dynamics are found on a global scale in the early twenty-first century. Those who study contemporary African arts define modernisms both discrepant from and overlapping with European models. In the early twentieth century, expatriate teachers opened fine arts schools in a number of African cities, introducing new techniques and aesthetics. Often these synthesized existing frameworks produced hybrid forms, as in the workshop of Ulli Beier in Nigeria.

It is safe to say, though, that the most exciting time to study African aesthetics may be the present, for artistic landscapes are extending in many new ways. Scholar-curators such as Okwui Enwezor, artistic director of Documenta 11 in 2002 and the Second Johannesburg Biennale in 1997, and Salah Hassan, editor of *Nka: Journal of Contemporary African Art*,

are transcending the boundaries of aesthetic discourse by introducing riveting work of emerging artists. Africa is a continent of richness, resilience, and diasporic energies because of how its traditions adapt to new circumstances. Whether in the domains of the most traditional rural art forms, such as masquerade or shrines, or in tourist arts, colonial encounters, early workshops, and art movements, African arts defy easy categorization; they simply do not sit still, nor have they ever. Across their huge diversities, African aesthetics can only be appreciated for their very multiplicity and systems of representation that they uphold, accommodate, and transform.

ASIA

Culturally, Asia encompasses an enormous range of cultural diversity, with philosophical traditions going back 2,500 years. And aesthetics is the philosophical study of art and the elaboration of criteria of value in arts and in nature, as well as how these two notions overlap with the study of nature and being human. In many Asian traditions value focuses on human well-being. In Daoism and Shintoism—and arguably Buddhism and Confucianism—divinity is not transcendent but immanent. Here human beings are at one with divinity and/or the natural world. The division of the various intellectual disciplines is the product of human histories; they developed differently in Asia. For example, throughout Asia there is little dichotomization of mind and body, of spiritual and material. As a result, aesthetic ideas and practices operate very differently, overlapping with the religious in India, helping to constitute the ethical and sociopolitical in East Asia.

Philosophy in the West is thinking, and thinking is done in language. Not so in Asia, where in every tradition the arts are as important as language in grasping ideas. The Japanese Buddhist priest Kukai (774–835) summed up the teachings of his Chinese master Huiguo thus:

The abbot informed me that the Esoteric scriptures are so abstruse that their meaning cannot be conveyed except through art. For this reason he ordered the court artist Li Chen and about a dozen other painters to execute ten scrolls of the Womb and Diamond Mandalas. . . . He also ordered the bronzesmith Chao Wu to cast fifteen ritual implements.” (Tsunoda, p. 141)

Understanding Asian aesthetics thus presupposes bodily experience. For this reason, direct experience with aesthetic values—whether through Japanese tea ceremony or in a Japanese garden—is as crucial to wisdom in the Asian sense as intellectual mastery. This means that for any discussion to do full justice to Asian aesthetics, it must take into consideration the contributions of the arts.

Asian aesthetics has begun to influence European-American philosophy, and both have begun to recognize the importance of situating aesthetics historically and within the contexts of colonialism, cultural hegemony, “race” studies, economics, power, gender politics, and the diasporas.

Buddhism

Early Theravada Buddhism records the importance of aesthetic (Pali, *Samvega*) and distinguishes different kinds of reactions to beauty analogous to reactions to diversity. The Lotus Sutra of Mahayana Buddhism introduced the idea of paradise and encouraged the production of visuals and sounds in honor of the Buddha as meritorious; this later developed into the ideas that art could clarify reality and could make such abstract concepts more concrete. It also provides the earliest example of taking children’s art seriously. Thus began the interest of Mahayana Buddhism in art.

The Japanese priest Kukai (774–835) brought the Shingon Sect of esoteric Buddhism to Japan. Shingon recognized four

main categories of art: (1) painting and sculpture, including mandala painting; (2) music and literature; (3) gestures and acts, including hand positions called *mudras*, ritual, and dance (much of which was ritual); and (4) the implements of civilization and religion.

Kukai was the first Japanese to develop the theoretical dimensions of the visual arts. “For Kukai whatever was beautiful partook of the nature of Buddha. Nature, art and religion were one” (De Bary, 1958, p. 138). This was true of other Japanese Buddhists as well. Summarizing the Shingon view of art, Kukai wrote, “In truth, the esoteric doctrines are so profound as to defy their enunciation in writing. With the help of painting, however, their obscurities may be understood” (Tsunoda, pp. 137–138).

Pure Land Buddhism (10th–13th century) brought enlightenment to the masses through chanting, dancing and singing, and paintings of paradise and hell—practices reflecting new views on enlightenment and who could attain it. The priest Ippen (1239–1289) insisted that the grace of Amida was not confined to the Pure Land Sect or even to Buddhist temples but was everywhere, even in Shinto shrines. Along with this popularization of religion occurred a concurrent popularization of Buddhist art.

The Zen Sect has the most influential aesthetic tradition of all the Buddhist sects. Zen arts attest to the central values of “simplicity, the spirituality of the ordinary, and genuineness of heart,” focusing on the maker’s mind and the process rather than a final product (Kasulis, 1998, pp. 357–371; Suzuki). Painters with a few rough brush strokes convey the mind of the monk and enlightenment itself. In flower arrangement, oddly shaped twigs (only odd numbers are used) convey the simple beauty of the uniquely ordinary. The haiku poet uses a few words to evoke an idea that the reader completes. The gardener helps the rocks find where they want to be and where they fit naturally. In calligraphy, misshapen, oddly arranged characters convey with apparently childlike simplicity a renewed childlike view of the world. In cooking, the Abbot Dogen (1200–1253) insisted monks present the freshest foods beautifully to make meatless menus enticing. Zen arts set up relationships among artist(s), audience, materials, and the environment, as well as express and provoke enlightened mind (Bullen; Kasulis). Zen also countered any distinction between “fine” and “applied” arts and aesthetics, and strengthened, especially for Samurai warriors, the intimate relationship between the arts and martial training.

China

China has a diverse and ancient tradition in aesthetics. Early in the tradition, art was integrally related with metaphysics, social and political philosophy, and ethics. At this stage in the tradition, aesthetics had primacy over rational discourse (Hall and Ames, 1987).

For Confucius (551–479 B.C.E.), ceremony and music, “conducted with style like an artistic performance,” define the behavior of the Confucian gentleman (Graham, p. 11). Music (*yue*) comprises instrumental music, song, and dance, primarily

those of the sacred rites and ceremony (*li*). They both arise from and produce harmony, and, by transforming the heart, transform human relations—and therefore government. For Confucius, “all government can be reduced to ceremony” (Graham, p. 13). The Mohists, in contrast, “condemned music . . . (reconstruing morality) as a set of abstract principles” (Graham, p. 259). Xunzi (300–237 B.C.E.) and his followers developed Confucius’s idea that music was beneficial (or harmful if the wrong kind) into a general theory of the moral efficacy of music. Xunzi was the first to elaborate on the relation between music and ceremony. His “Discourse on Music” begins, “Music is joy, what the authentic man inevitably refuses to do without” (Graham, p. 260). Training in music, therefore, was crucial to education and government. On this view, the sovereign could use music and ritual to enlighten his people and thereby govern well. Yet by 530 C.E. poet-critic Xiao Tong liberated aesthetics from ethics, writing that his selection for his literary anthology had been guided only by aesthetic merit, not moral considerations.

From the fifth century to the present aesthetics was dominated by the arts of the literati class—calligraphy, painting, and poetry, set in the context of natural landscapes or gardens—appreciated in the setting of natural landscapes and gardens. Three characteristics define literati arts: its amateur status as the product of scholar-officials, its function as an expressive outlet, and its style (Bush, 1971, p. 1).

The transition from political-ceremonial aesthetics to literati aesthetics of personal expression is seen in an essay attributed to the scholar Wang Wei (c. 415–443), who situated landscape painting in relation to ceremony and the cosmos:

[According to Wang Wei,] Paintings must correspond to the *ba gua* [the eight trigrams of geomancy], meaning that just as the *ba gua* are a symbolic diagram of the workings of the universe, so must landscape painting be a symbolic language through which the painter may express not a relative, particularized aspect of nature seen at a given moment from a given view point, but a general truth, beyond time and place. Though Wang Wei . . . is full of wonder at the artist’s mysterious power of pictorial compression, he insists that painting is more than the exercise of skill; “the spirit must also exercise control over it; for this is the essence of painting.” (Sullivan, p. 97)

Slightly later, Xie He (fl. 479–501) outlined six principles for judging paintings and painters that have never been superseded: (1) animation through spirit consonance (*qi yun*), (2) structural method (literally *bone means*) in the use of the brush, (3) fidelity to the object in portraying forms, (4) conformity to kind in applying colors, (5) proper planning in placing elements, (6) in copying, perpetuating the ancient models (Soper; Sakanishi; Sullivan, p. 95; Wen). Although Chinese interpretations of principles 3 to 6 diverge, they are roughly equivalent to naturalism, coloring, composition, and training.

Michael Sullivan (p. 96) explains principle 1 as follows:

Qi is that cosmic spirit (literally, breath or vapor) that vitalizes all things, that gives life and growth to the trees,

movement to the water, energy to human beings, and that is exhaled by the mountains as clouds and mist. The artist must attune himself to this cosmic spirit and let it infuse him with energy so that in a moment of inspiration—and no word could be more appropriate—he may become the vehicle for its expression. *Qi* infuses all things, [with] no distinction between animate and inanimate. Seen in this light, the third, fourth and fifth principles involve more than mere visual accuracy; for, as the living forms of nature are the visible manifestations of the workings of the *qi*, only by representing them faithfully can the artist express his awareness of the cosmic principle in action. (Sullivan, 1999, p. 96; Wen, 1963)

During the Southern Song Dynasty (1127–1279), philosophers undertook an intellectual defense of Confucianism against the challenges of Buddhism and Daoism in the Song Synthesis. In the field of aesthetics, this culminated in a synthesis integrating literati arts with ethics, mysticism, and education in the classics that continued till the end of the Qing Dynasty in 1911 (Chan; De Bary, 1960, chaps. 17–19; Koller and Koller, chaps. 21–22; Black).

Mao Zedong (1893–1976) overturned the elitist literati emphasis on the classics and the value of the past. During the Republican Period (1912–1949), Lu Xun (1881–1936)—writer, activist, and founder of the Creative Print Movement—had urged artists to use art in the service of revolution (based on European ideologies). In his 1942 *Talks at the Yan’an Conference on Literature and Art* (the foundation for Communist Chinese aesthetics until 1979), Mao adapted Lu’s thinking to his revolution, acknowledging Lu as a source. Mao argued that the history of art was a product of political-economic structures that must be rejected: Bronze Age art was the product of a slave-based society, while from Han (140 B.C.E.–220 C.E.) to the twentieth century China was feudally unified under an emperor, from whom all value stemmed (McDougall). Yet Mao Zedong adapted aspects of literati aesthetics to revolutionary Communist purposes, including the use of images and texts to teach virtues and a belief in the power of art to transform the human heart and thereby political reality. In 1958 a print by Niu Wen integrated poetry into visual art—a literati concept dating from at least the Song—and peasants were adding poetry to their village murals. By the early 1960s even landscape painting in traditional media (*guo hua*) was adapted to Communist purposes: Huang Peimo’s landscape print *A Distant Source and a Long Stream* (1973) incorporates the deliberate literati archaism and treatment of “empty” space literati aesthetics.

But Mao focused on the masses—both as audience and as agents of their own transformation. This required the masses to be “the sole and inexhaustible source” of subject matter, and it required a new style depicting the masses as inspiring heroes, not as agonized victims (as in Lu Xun’s writings). During this time, setting the framework for aesthetic understanding and debate were praise and criticism in government-published reviews of artworks that the government established as models of art; deviation was dangerous. The impact of Jiang Qing

(1914?–1991), Mao's wife and deputy director of the Cultural Revolution (1966–1976), is seen in her principles for “model operas” (1961–1965), codified to reform opera and all the visual arts, and in the feminist content of visual art during the Cultural Revolution (1966–1976).

In 1953 Zhou Yang iterated Mao's advocacy of socialist realism, but declared the enrichment of Chinese tradition to be the objective of using foreign art and aesthetics. He concluded by advocating “free competition of various artistic forms” (Soviet and Chinese) and stated that Mao Zedong's guiding principle was “Let a hundred flowers bloom and a hundred schools contend.”

The debates over retention of traditional aesthetics and the inclusion of foreign components within Chinese arts continue in the early twenty-first century. Debates focus on the Chinese appropriation and critique of universalizing Euro-American paradigms and meta-narratives, “culture as leisure,” and the resurgence of Mao fever and neo-nationalism.

India

Despite the philosophical diversity within India, there is a surprising degree of consensus about the nature and importance of aesthetics and aesthetic pleasure (*rasa*). Like truth and goodness, *rasa* belongs to reason (*buddhi*); its relation to truth remains a major vein of speculation. Although the specific role that *rasa* plays in the human psyche depends on the metaphysical premises of a given philosophy—whether dualistic or nondualistic, etc.—*rasa* is a highly valued, central part of human experience. It encompasses sexuality, but also takes its place among the spiritual disciplines.

The second basic concept of Indian aesthetics is *kama*, the pursuit of love and enjoyment. *Kama* includes refined aesthetic pleasure, sexual pleasure, and love of the divine (the human search for transcendence). The epitome of *kama* is found in the love of the divine Krishna and Radha, his consort, and in their dance, called the *rasa-lila* (the “playful dance of the god”)—a recurring theme in painting, poetry, and drama. The most famous text of the science of *kama*, Vatsyayana's *Kama Sutra* (Aphorisms of love) lists sixty-four arts and sciences in which a cultured person or courtesan was educated (Embree, p. 256).

Bharata Muni's *Natya Sastra* (Treatise on dramaturgy) (written sometime between the 2nd century B.C.E. and the 2nd century C.E.), the first written theory of drama, claims that when humanity began to suffer from pride and the joyful life became full of suffering, the god Brahma created drama—with its attendants music, poetry, and dance—to uplift humanity morally and spiritually by means of aesthetics (*rasa*) (Bharata, 2003).

From Bharata on, emotion (*rasa*, meaning “flavor” or “relish”) is recognized as the heart of drama and all art. *Rasa* thus came to mean the feeling that a poet conveys to a sympathetic reader, aesthetic taste, or aesthetic rapture (Gupta). *Rasa*, the aesthetic rapture accompanying the appreciation of dance and drama, is mentioned in the Upanishads, and some claim that it is even comparable to “the realization of ultimate reality”

(Tripurari, p. 10). The differences between aesthetic *rasa* and Brahman realization of the form of the Absolute became important philosophical issues. Krishna's *rasa-lila* (his love dance with Radha) provides one answer to these problems and leads to philosophical development of kinds of love (Tripurari, p. 37). This dance, first described in the *Bhagavata Purana* (tenth century?) and set in verse in the twelfth century, inspires poetry and paintings (together called *ragamala*); it forms the kernel for the devotional aesthetic called *bhakti rasa* popular in Vedanti [Tripurari].

Dating from the thirteenth century, the *ragamala* (garland of *ragas*) are painting albums, often with poems, based on *ragas*, the secular musical modes associated with particular feelings/flavors (*rasa*). The paintings depict male or female human heroes or divinities, identified by name and an emblem, in love scenes coordinated with time of day, season, and aesthetic mode, and sometimes a color, deity, planet, or animal. Although conceived within the framework of Hinduism, the *rasa-lila* reaches well beyond it: the Moghuls, who were Muslim, also commissioned pictures of the *rasa-lila*.

Music in India has a similarly long aesthetic tradition. The *Samaveda* treats it as a divine art. Indian philosophers have been particularly interested in the aesthetics of sound (Malik), music and dance (Mittal; Iravati), and chant and storytelling (Kaushal).

Japan

Japanese aesthetics is unique among non-Western traditions in the degree to which it has permeated international awareness. It did this not only through the arts but also by introducing its extensive aesthetic vocabulary—*wabi* (a taste for the simple), *sabi* (quiet simplicity), *shibui* (subdued), *iki* (stylish, elegant), *yugen* (rich or deep beauty), etc. (for explanations, see Miner et al., pt. 4). Saito has reinterpreted *sabi* and *wabi* in terms of an “aesthetics of insufficiency.” This vocabulary has often been interpreted as referring to an “eternal” Japanese spirit, but in fact it has undergone continuous expansion and reinterpretation since medieval times. The political uses served by both the aesthetics and their mythologizing interpretations comprises an important part of Japanese aesthetics in the early twenty-first century. Saito, for instance, reinterprets *sabi* and *wabi* in terms of an “aesthetics of insufficiency.” Perhaps the most important area of current Japanese aesthetics develops the implications of the experience of being bombed and its aftermath(s), which seems to demand utterly new ways of “understanding.”

Several dichotomies are used to organize thinking about the arts in Japan, including the polarities between feminine and masculine, and between native and foreign (originally Chinese; since 1868, American or Western). The earliest Japanese writing on aesthetics, by Kukai (774–835), was deliberately permeated by Chinese Buddhist philosophy. But a native Shinto aesthetic was evident a century earlier in the *Manyoshu* (Collection of ten thousand leaves), an anthology of folk songs and poems. Within the anthology, poems by Kakinomoto no Hitomaro (c. 658–c. 708) exemplify a Shinto aesthetic in which there is a “total unity of world and people, time and

nature, public and private motivations” (Miner et al., p. 176). Concern over what constitutes as Shinto or native aesthetic, often phrased in terms of what is “uniquely Japanese,” continues through Kamo no Mabuchi (1697–1769) and Motoori Norinaga (1730–1801) to the novelists Tanizaki Jun’ichiro and Kawabata Yasunari in the twentieth century, and Emiko Ohunki-Tierney in the twenty-first.

The single most influential figure in the history of Japanese aesthetics (according to Japanese specialists from the twelfth century on) was undoubtedly the Heian poet and diarist Murasaki Shikibu (c. 973–c. 1014). Her explications of the philosophy of literature and painting in her novel *The Tale of Genji* became famous (Tsunoda, vol. 1, pp. 176–179). *Genji* discusses the aesthetics of gardens, calligraphy, nature (especially the moon and the seasons), paper and wrapping, incense, color, fashion, and music; it presents the aesthetic concepts *miyabi* (courtly elegance) and *mono no aware* (awareness of the pathos of things). It exemplifies quintessential Japanese values including the “aesthetics of indirection,” ambiguity, elusiveness, allusion and it developed Buddhist impermanence into an aesthetic virtue.

Subsequent critics extolled *Genji*. An ability to comment intelligently on it became necessary for establishing cultural credentials, although as a woman Murasaki also provoked anxiety. The literary and national-learning scholar Motoori Norinaga (1730–1801) developed the political and social dimensions of the expression frequently found in *Genji* of “the pathos of things” (*mono no aware*) and identified it as fundamental to Japanese culture and national identity (Miner, pp. 95–96; Nishimura). Heian women writers possessed a distinctive sensibility because they wrote in the vernacular rather than Chinese as men did; this allowed them to create their work within a native aesthetic distinct from that of male writers writing in Chinese (Keene).

Murasaki’s contemporary Sei Shonagon (b. c. 967) presented an aesthetics of everyday life (as well as discoursing on more standard topics) in her *Pillow Book*, one of the three great “prose miscellanies” (*zuihitsu*). Her format was used by other medieval aesthetic recluses, notably Kamo no Chomei (1153–1216), *waka* poet and man of letters. His *Hojoki* (Account of my hut) displays an aesthetic distance that typifies this genre.

Fujiwara Shunzei (1114–1204) and Fujiwara Teika (1162–1241)—father and son poets, critics, and anthologists—devised new conceptions of literature and were the first to discern a history of poetry in Japan (Miner et al.). They assessed such matters as the temporalities of *The Tale of Genji* and ways of handling allusion. Shunzei advocated the aesthetic concepts *yugen* and *sabi*, relating them to Buddhist and Shinto values, and outlined a theory of effect in poetry that utilizes the poem’s general configuration (*sugata*), diction (*kotoba*), and spirit (*kokoro*). Teika also wrote instructions to inspire poets.

Saigyō (1118–1190), a poet from a warrior family who became a Shingon priest, wrote a travel diary, a collection with poems on war, and another with poems on Yoshino’s cherry blossoms that “assisted in the gradual shift from the plum to the cherry as the ideal Japanese flower” (Miner et al., p. 223). He helped popularize the aesthetic recluse’s ideal of seclusion

from the world, poetry, and travel. Matsuo Bashō (1644–1695)—poet, critic, diarist, and traveler—brought the lowly and the commonplace into the subject matter and vocabulary for poetry and introduced new elements of humor (Tsunoda).

In theater, Zeami (1363–1443), playwright and theater critic, established a critical vocabulary and aesthetics for No: *yugen*, *monomane* (imitation), *ka* or *hana* (flower)—an allusion both to the transmission of his father’s art and to the traditional aesthetics of Japanese poetry. Chikamatsu Monzaemon (1653–1725), a puppet-theater playwright whose works were adapted for the Kabuki stage, addressed the problem of realism in theater (Tsunoda). Kabuki (like most Asian theater) aims at presentation of an explicitly theatrical reality, unlike Western theater, which aims at representation of everyday life.

Tea ceremony aesthetics of simplicity and austerity creates an appreciation of the ordinary and alternative modes of sociality. Based on Zen, it introduces mindfulness into everyday life.

Several genres of gardens developed distinct aesthetics, specializing in allusion and reference (*katsura*); Zen-like mindfulness, simplicity and austerity, and/or relationships to nature, especially to the seasons, to natural landscape.

By the early twentieth century novelists such as Natsume Soseki, Tanizaki Junichiro, and Kawabata Yasunari explored through fiction ideas from Western aesthetics, such as Kant’s disinterest. Akutagawa’s famous short story “The Hell Screen” (1973) is an instantiation—and an exploration of the ramifications for human life—of the view that realism must be based on experience; the artist can only paint what he or she knows.

Korea

Korea’s contributions to aesthetics and the arts have often been misascribed to China and Japan. The best known are the Choson-Dynasty (1392–1910) debates based on Confucian literati aesthetics (and ethics) that led to the abandonment of elaborate Koryŏ-period (918–1392) incised and inlaid ceramics in favor of simpler forms. Current studies attend especially to the distinctive aesthetics of the many native and folk traditions.

EUROPE AND THE AMERICAS

Aesthetics is a branch of philosophy concerned with aesthetic experience and the fundamental principles of art and criticism. It is distinct from the history of art and the practice of art criticism, although its own history follows a path parallel to both. It is not an empirical study of the psychology or sociology of art, nor is it the same as *aestheticism*, which names a particular attitude to aesthetic matters, exemplified by the fin-de-siècle "art for art's sake" movement. There is no need to be an "aesthete" to engage in aesthetics. In what follows, a brief history of the subject will be outlined from its eighteenth-century foundations, back through earlier anticipations from the classical period, and on to the modern legacy. Then an analytical survey of contemporary trends and current issues will be offered.

Eighteenth-Century Foundations

Aesthetics in the European tradition, conceived as philosophical inquiry into the experience of beauty, acquired its name and essential nature in the eighteenth century, even though cognate concerns had been debated in Europe for two millennia before that. The term *aesthetics*, from the Greek *aesthēsis* (perception), was coined, in roughly its modern sense, in 1735 by Alexander Baumgarten (1714–1762), a German philosopher who sought to develop a "science of sensitive cognition." Baumgarten's unfinished book *Aesthetica* was the first to bear this new term in its title. In fact the term took some time to catch on and was not established in Great Britain, for example, until the 1830s. Immanuel Kant (1724–1804), perhaps the most influential of all aestheticians, was slow to adopt the new usage, remarking in the second edition of his *Critique of Pure Reason* (1787) that "The Germans are the only people who currently make use of the word 'aesthetic' in order to signify what others call the critique of taste." In that same passage Kant lambastes what he describes as "the abortive attempt made by Baumgarten . . . to bring the critical treatment of the beautiful under rational principles." But whatever its name—*aesthetics* or *critique of taste*—a distinctive inquiry gathered pace through the eighteenth century and came to define what is now universally acknowledged as the field of aesthetics. What are the characteristics of this new inquiry?

Judgments of taste. Several developments in the eighteenth century form the foundations of modern European aesthetics.

One is a growing interest in judgments of taste, notably how attributions of beauty are grounded. Is beauty an objective quality of nature itself or is it merely a projection of the mind? An important impetus for this debate was the writing of Anthony Ashley Cooper (1671–1713), third earl of Shaftesbury, whose Neoplatonist work *Characteristics of Men, Manners, Opinions, Times* (1711) presents the view that beauty, like goodness, resides in the harmony of the natural world, as created by God, and that humans can immediately discern such beauty (or goodness) by an “inward eye” or “moral sense.” Furthermore, the enjoyment of beauty has a disinterested quality distinct from the desire of possession. The Scottish philosopher Francis Hutcheson (1694–1746), in *An Inquiry into the Original of Our Ideas of Beauty and Virtue* (1725), adopted the notion of “moral sense,” including the concomitant sense of beauty, and sought in detail to show how beauty, grounded in “uniformity amidst variety,” could be the object of intersubjectively valid judgments. David Hume’s (1711–1776) influential essay “Of the Standard of Taste,” first published in his *Four Dissertations* (1757), gives explicit focus to “taste” as a capacity for judging beauty, and while emphasizing that beauty “is no quality in things themselves,” nevertheless finds a “standard of taste” in the joint verdict of qualified judges. Hume’s focus is on taste in cultural matters, especially poetry, rather than natural beauty, but judgments about art and nature were seldom at this stage differentiated. In Kant’s definitive contribution to aesthetics, the first part of his *Critique of Judgment* (1790), we find many of the threads of the previous debates subtly interwoven. Kant proposes, in contrast to Shaftesbury and Hutcheson, a clear divide between moral and aesthetic judgments, highlighting the role of disinterestedness in the latter; he steers a path between the avowed subjectivity of beauty and the justifiable aspiration of universality in judgments about beauty; and he distinguishes natural beauty from the beauty of art. For Kant a “pure judgment of taste” rests on a universally communicable, disinterested pleasure in the appearance of an object apart from any conceptualization of that object.

The sublime. A second feature that characterizes the birth of modern aesthetics in the eighteenth century is also closely associated with Kant. This is the interest given to the sublime in addition to the beautiful. Kant’s account of the sublime, in the *Critique of Judgment*, as well as in *Observations on the Feeling of the Beautiful and Sublime* (1763), is again definitive. The sublime rests on the vastness and overwhelming power of nature and the awe that these inspire in humans. Thunder and lightning, hurricanes and volcanoes, towering mountains and crashing waterfalls are judged sublime and induce a mix of fear and pleasure. Kant’s own discussion is complex, distinguishing the “mathematical sublime” (vastness) and the “dynamical sublime” (power), and relating response to the sublime with reflection on the greatness of reason as “a faculty of the mind surpassing every standard of Sense.” The pleasure of the sublime derives from awareness that, in spite of physical frailty in the face of terrifying nature, humans remain superior as rational and moral beings. Interest in the sublime did not originate in the eighteenth century, and discussions often referred back to the literary treatise *On the Sublime*, attributed to “Longinus” from the first century C.E., although the principal

focus in that work is not the awesomeness of nature so much as the sublime style in rhetoric. Edmund Burke’s (1729–1797) *Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful* (1757) was an important precursor to Kant’s discussion and developed the idea that aesthetic responses stemmed from universal predispositions in human nature.

Fine arts. A third relevant factor in the foundations of aesthetics was the emergence of a conception of the fine arts (*beaux arts*) as belonging to a single category. The seminal work was *Les beaux arts réduits à un même principe* (1746; *Fine arts reduced to a single principle*) by Abbé Charles Batteux (1713–1780). This work listed the fine arts, whose aim is pleasure, as music, poetry, painting, sculpture, and dance. In another category, those arts that combine pleasure and usefulness, he puts eloquence and architecture, while theater is deemed a combination of all the arts. The “single principle” is “the imitation of beautiful nature.” Few followed Batteux in stressing imitation as the definitive element in art, but by the time of Kant’s discussion in the *Critique of Judgment*, the notion of the fine arts was taken for granted. Kant himself offered a quite different common principle of fine art—that of genius—anticipating an aesthetic conception associated with Romanticism. Genius, for Kant, is “a talent for producing that for which no definite rule can be given” and fine art, he insists, “is only possible as a product of genius.”

Conditions in eighteenth-century Europe seemed entirely conducive to the flourishing of aesthetics as an inquiry into the principles of beauty and the fine arts. Marxist historians offer a partial explanation in terms of the rise of a confident and prosperous middle class with the time and inclination to indulge a love of beauty and the display of “sensibility,” “refinement,” and taste. Notions of individuality and subjectivity, central to Enlightenment thought, developed in this century, as did notions of a common human nature on which universal judgments of value might be grounded. It should be emphasized, though, that many aspects of aesthetic inquiry long predate the eighteenth century. A summary survey of these is necessary to map out any adequate history of aesthetics, prior to exploring the legacy of the nineteenth and twentieth centuries.

Classical Anticipations

Both Plato (c. 428–348 or 347 B.C.E.) and Aristotle (384–322 B.C.E.) have extensive and influential discussions of art and beauty, and there is a clear sense that in many cases they were contributing to debates already well established in ancient Greek culture. Plato, for example, famously refers to the “ancient quarrel” between poetry and philosophy. When Batteux, as we have seen, uses the term *imitation* to characterize a feature common to the fine arts he is self-consciously evoking the notion of *mimesis*, central to ancient Greek thought about the arts. The precise meaning of *mimesis*, sometimes translated as “imitation,” sometimes “representation,” is disputed. Undoubtedly Plato often uses the term with negative connotations, as when, in the *Timaeus*, he refers to poets as a “tribe of imitators.” In book ten of the *Republic*, Plato gives an unflattering account of a painter, whose picture of a bed is twice removed from reality being a mere “imitation” of

a carpenter's bed, which itself is a copy of an ideal form. Plato's constant worry about mimetic art, especially poetry, was that it dealt in appearance or illusion, thus being both epistemologically and morally suspect. It was the Neoplatonist Plotinus (205–270 C.E.), writing over five hundred years later, in the *Enneads*, who showed how Plato's metaphysics of forms could be reconciled with a positive conception of artistic mimesis. Plotinus argued that art, by directly imitating the forms themselves, could aspire to an even greater beauty than that found in nature and thus achieve the highest truthfulness.

This debate about the truth of art resonates through the centuries. Plato's pupil Aristotle addressed the matter in his treatise *Poetics*, a discussion of the nature and status of poetic tragedy that has become one of the seminal texts in Western aesthetics. For Aristotle the desire to imitate is both natural and a source of pleasure. Tragedy is an imitation of action and attains, according to Aristotle, thereby contradicting Plato, a status somewhat akin to philosophy in presenting universal truths about what "such and such a kind of man will probably or necessarily say or do." Aristotle went on to argue that mimesis in tragedy had other values as well, including the pleasurable stirring of emotion, notably pity and fear, leading to an ultimate purgation (*katharsis*) or cleansing. The perplexing problem of what makes the viewing of tragedy a pleasurable experience is the subject of a subtle essay by David Hume, "Of Tragedy" (1757).

Although the ancient Greek philosophers had much to say about each of the individual art forms—drama, poetry, music, painting, and sculpture—it seems they possessed no concept equivalent to *fine art*. The term *technē* is sometimes translated as "art" but is closer to "craft" in the modern sense, denoting a specialized skill. For Plato the highest "art" is the statecraft taught to the young guardians in the Republic, which intriguingly he sometimes compares to painting, coloring sculpture, or writing a tragedy. Perhaps, though, the main reason for locating the origins of modern aesthetics in the eighteenth century rather than in ancient Greek philosophy is that there is no systematic attempt in the latter to address interconnected issues about the role of beauty and the arts in human experience. Both Plato and Aristotle write about beauty (*to kalon*) and, although disagreeing on its metaphysical status, broadly agree on the marks of beauty: "measure and proportion" (Plato), "order and symmetry and definiteness" (Aristotle). But such observations are integrated into more general discussions, and neither philosopher felt the need for a distinctive branch of philosophy given over to aesthetic concerns.

In subsequent centuries, up to the eighteenth century, a similar story could be told of isolated, sometimes brilliant, sometimes hugely influential, contributions, but there was no sustained attempt (as epitomized by Kant's *Critique of Judgment*) to establish a philosophy of the beautiful. Often the legacy of debates from the Greeks is in evidence, few more so than Plato's attack on poetry. A deep ambivalence is manifest throughout the history of the Christian Church from the early church fathers through the Middle Ages toward secular poetry and in particular drama. Plato's concerns about the falsehood

and seductiveness of poetry and its antipathy to reason found an analogue in Christian thought in the profane and the sacred. Periodic defenses of poetry were not uncommon. Sir Philip Sidney's (1554–1586) *Defense of Poesie* (1595) takes on the Puritans and is an eloquent argument for the educative and edificatory benefits of poetry. Curiously, in spite of the extraordinary flourishing of the arts in the European Renaissance, the two hundred years between 1400 and 1600 saw little sustained philosophical debate about the arts or beauty. Treatises on individual arts by the likes of Leon Battista Alberti (1404–1472), Leonardo da Vinci (1452–1519), and Albrecht Dürer (1471–1528) were concerned more with theoretical questions about aim and technique than with abstract philosophical investigation. These would not standardly be classified as works in aesthetics, in the stricter sense that emerged after Baumgarten.

The Growth of Modern Aesthetics

A striking development in aesthetics after the eighteenth century was a gradual shift of interest from inquiries into beauty per se and "judgments of taste" to specifically the philosophy of art. Nineteenth- (and late-eighteenth-) century aesthetics was largely dominated by German philosophers, including Johann Christoph Friedrich von Schiller (1759–1805), Friedrich Wilhelm Joseph von Schelling (1775–1854), and Arthur Schopenhauer (1788–1860). A way of writing about art developed that was distinctively philosophical and that contrasted with explorations of art, however theoretical, by artists themselves. Nowhere is this better exemplified than in the magisterial *Lectures on Fine Art*, given in the 1820s by the paramount German aesthetician Georg Friedrich Wilhelm Hegel (1770–1831), a work comparable in importance and influence to Kant's *Critique of Judgment*. Hegel afforded art a central place in his metaphysical system of absolute idealism, locating it, along with religion and philosophy, as one of the modes of "absolute spirit" whereby the mind comes to know itself. Hegel retold the history of art in terms of changing relations between spiritual content (*idea*) and sensuous medium: in symbolic art, characterized by Egyptian and Indian art, the medium dominates the idea; in classical art, from ancient Greece, idea and medium are in perfect balance; in romantic art, from Christian art onward, the idea reaches its ascendancy, manifesting "infinite subjectivity." Hegel proposed a hierarchy of individual arts, from architecture to poetry, and suggested, somewhat obscurely, that the capacity for further development had been exhausted (the "death of art").

Hegel showed par excellence how a philosophy of art could be fully integrated into wider philosophical speculation, and increasingly in the history of aesthetics theories of the arts (or of beauty more generally) would come to be discriminated in terms of the philosophical frameworks within which they are couched. Idealism, either Kantian or Hegelian, had a major impact well into the twentieth century, notably in works like the Italian Benedetto Croce's *Estetica come scienze dell'espressione e linguistica generale* (1902; Aesthetics as science of expression and general linguistics) and the English Robin George Collingwood's *Principles of Art* (1937). Both Collingwood and Croce identified the true work of art not with its physical manifestation but

with an inner state of mind seeking expression. Other philosophical outlooks produced their own distinctive aesthetic theories. Phenomenologists, such as Roman Ingarden (1893–1970) and Mikel Dufrenne (1910–1995), give attention to the properties of an “aesthetic object” in relation to the acts of consciousness of artist and audience. John Dewey (1859–1952), the American pragmatist philosopher, in one of the most important contributions to twentieth-century aesthetics, *Art As Experience* (1934), stresses the origin of art in the everyday world of human action. For Marxist aestheticians, the context in which art must be explained is social and economic, a complete rejection of the premises of the idealist. Contemporary analytical aesthetics, that is, aesthetics influenced by the developments of logic and conceptual analysis in the early to middle parts of the twentieth century, gives less focus to the social or psychological aspects of art as to questions about what kind of entities art works are and what kinds of properties they possess.

Contemporary Trends and Issues

Increasingly from the latter half of the twentieth century into the twenty-first century aesthetics grew in stature as an established branch of philosophy in both the Anglo-American (analytic) and European (Continental) schools of philosophy. The subject was widely taught in universities and learned societies devoted to the subject—the American Society for Aesthetics and societies from the individual European nations—had strong support. Aesthetics was well integrated into mainstream philosophical inquiry with aestheticians drawing on work in, for example, philosophy of language, philosophy of mind, ethics, epistemology, and metaphysics. Indeed the borrowings go both ways, as sometimes technical work in aesthetics—on fictionality, aesthetic properties, ontology of art, interpretation, narrative—has contributed to an advance of understanding in other philosophical fields.

Twenty-first-century concerns in aesthetics might be seen as falling into two broad areas: philosophy of art, on the one hand, and on the other the investigation of aesthetic experience more generally, including experience of the natural world. Philosophy of art encompasses theoretical questions about the nature of art itself, how works of art are distinguished from other artifacts, what values art embodies, and also the special qualities of individual art forms, not only the traditional “fine arts” but other arts such as film, photography, and “mass art.” Inquiries into aesthetic experience go beyond the experience of art and investigate human responses to beauty and other aesthetic qualities wherever they are manifested.

Philosophy of art. When analytic philosophers began to turn their attention to aesthetics in the 1940s, one of their early concerns was to analyze the concept of *art* itself. The idea of providing a definition of art, one that covered all art forms, had not been a central preoccupation of aesthetics in previous centuries. Leo Tolstoy in *What Is Art?* (1898) had proposed that art involves the transmission of feeling from artist to audience; and other kinds of “expression” views, ultimately deriving from romantic conceptions of art, were developed by Croce and Collingwood. More often than not, those who sought an “essence” for art had, implicitly if not explicitly, one particular art form in mind, for example, painting or poetry. Thus the

idea that art is essentially a “representation,” a descendent of classical “mimetic” theories, foundered on “nonrepresentational” arts, including music and all abstract art. Clive Bell’s claim in *Art* (1914) that what is essential to art is “significant form” and the arousing of “aesthetic emotion” was more convincing about modernist painting, which he championed, than about the realist novel. Analytic philosophers felt the need to go back to basics. Could there be any property that all forms of art—painting, music, literature, sculpture, dance, drama—had in common, a property possession of which was both necessary and sufficient for something to be art?

Initially many philosophers were skeptical that art has such an “essence” and indeed that the concept of art lent itself to strict definition. In an influential paper from 1956, “The Role of Theory in Aesthetics,” Morris Weitz (1916–1981) argued that there could be no definition of art because “art” is an “open concept,” allowing for radically new kinds of instantiation. Weitz was one of the first philosophers to recognize the difficulty posed for philosophy of art by the rapid proliferation of art movements in the twentieth century, from modernism to dadaism. If the “readymades” (a urinal, a snow shovel, a bottle rack, etc.) of the avant-garde artist Marcel Duchamp (1887–1968) could count as art, then traditional conceptions would have to be revised. Weitz proposed that all that binds together the disparate products called “art” are loosely connected “family resemblances,” a notion drawn from Ludwig Wittgenstein’s *Philosophical Investigations* (1953).

However, not all philosophers agreed with Weitz’s anti-essentialism, and a swing back toward essentialist accounts was evident in the final quarter of the twentieth century. What is distinctive about these developments is that rather than seeking some *intrinsic* property shared by all works of art—such as “beauty,” “form,” “representation,” “expression”—they highlighted *extrinsic* or *relational* properties of a social, historical, or “institutional” kind. The American philosopher Arthur Danto (b. 1924) was one of the first to develop this line of thought, suggesting that what makes something art is not what it *looks* like but what role it plays in an “artworld.” This is a striking repudiation of a long-standing premise that art must engage aesthetic perception. Following Danto, “institutional” definitions were proposed whereby an object becomes art only by virtue of having that status conferred on it by an institution or artworld or “art circle,” consisting of a loose-knit community of artists, critics, and art appreciators. There is no suggestion that each putative work comes before a panel of experts for authentication but only that there is an essentially social aspect to the existence of art. A related species of art theory makes explicit a historical dimension to art. According to these accounts, to acquire the status of art, an object must be connected in some way with works previously accepted as art: for example, they must be intended to be regarded in ways that earlier works were regarded, or there must be some narrative that links the present with the past.

The immense variety of art forms poses a problem not just for definition but for the more metaphysical question of what *kinds* of entities art works are. It is common to postulate a deep divide between those works that are unique physical

objects, like paintings, carved sculptures, or buildings, and those that allow for multiple instances, like musical and literary works, films, prints, and photographs. While a painting can be destroyed in a fire, it is less easy to see how a symphony might be destroyed (it could, for example, survive the loss of the original score). There is considerable philosophical interest in pursuing the right “ontology” for art, that is, the mode of existence for different kinds of works. Some philosophers are anxious to present a unitary view, in contrast to the binary one just outlined, and it has been suggested that a painting might in principle also be a “type” with multiple instances, the original canvas being no more significant than an original score. Others have argued that the true identity of any work rests not in the final product but in the complex performance that brought it about. This theory recognizes that facts about a work’s provenance are vitally relevant both to what the work is and how it should be appreciated.

A significant trend in contemporary philosophy of art has been to focus on particular art forms. There are recognized branches of aesthetics now labeled philosophy of music, philosophy of literature, philosophy of film, and so on. This tendency has brought aesthetics closer to critics and practitioners within the arts. Often, distinctive issues arise within these more narrowly defined areas. For example, philosophers of music have asked how music can express emotion; whether profundity is possible in music; whether musical works are created or discovered; and what it is to understand music, without assuming that musical understanding is the same as understanding literature or painting. In an important book, *The Aesthetics of Music* (1997), Roger Scruton has argued that music is nonrepresentational, requires a special kind of “intentional” understanding, and yields in its essential musical features only to metaphorical description.

In the philosophy of literature much attention has been given to fictionality, drawing on work in the philosophy of language. How is fictional discourse distinct from nonfictional? Can works of imaginative or fictional literature be bearers of truth (a question familiar from Plato and Aristotle)? One especially persistent problem concerns emotional responses to fiction: on the assumption that to feel, for example, fear and pity, one must believe that the objects of the emotions are real, how can an audience respond in this way (as Aristotle requires for tragedy) when it is known that the objects are mere fictions? Yet another important debate about literature—which extends to all the arts—concerns criteria for interpretation. Is the critic’s role to recover an artist’s intention or is meaning a product of cultural and literary convention?

In the philosophy of the visual arts, a fundamental question is how depiction in two dimensions can represent three-dimensional objects in space. The preliminary thought that pictures must resemble their subject in order to depict them is both difficult to make precise (in some respects anything resembles anything) and open to counterexamples, in the form of caricatures, cubist portraits, and symbolic representations (for example, Christ depicted as a lamb). Some philosophers reject resemblance altogether as an explanation of pictures, preferring to stress the conventional, quasi-linguistic nature of

representation. Kendall Walton, in his influential *Mimesis As Make-Believe* (1990), argues that viewers of pictures play a “game of make-believe” in which they make believe they see objects depicted when in fact they see only paint and canvas. Others have followed Richard Wollheim in supposing that depiction can be explained as a species of “seeing-in” or “seeing-as.” Philosophical explorations of the visual arts have extended to include film and photography, and developments in the aesthetics of film have challenged theoretical approaches based on Marxism and psychoanalysis.

Across all the arts, the issue of what makes art in itself valuable and what criteria are available for evaluating particular works has posed a perennial conundrum. Some aestheticians see value judgments as relative, culture-bound, or “ideological” and have sought to play down their significance. Others have connected the value of art with the very conception of art itself. If art is mimesis, then good art is judged for how well it holds a “mirror to nature,” but if art is expression then it is judged for the depth and sincerity of the artist’s vision. In a subtle treatment of the question, *Values of Art* (1995), Malcolm Budd argues that the value of a work of art as a work of art is the intrinsic value of the experience the work offers. This is a noninstrumental value, and “experience” is left sufficiently wide to include traditional cognitive values such as moral insight.

There are important currents of thought in contemporary aesthetics that are different from, even opposed to, those based in analytic philosophy. The notion of the “death of the author,” promoted by Roland Barthes (1915–1980) and Michel Foucault (1926–1984), has been influential not merely for its impact on literary criticism but also as part of a general post-structuralist skepticism about meaning and subjectivity. In rejecting the notion of a unified autonomous self as the origin of meaning and emphasizing “intertextuality” and the priority of writing over speaking, poststructuralists like Jacques Derrida (b. 1930) present a direct challenge to what they view as the “logocentrism,” or focus on logic and reasoning, of analytic philosophers. Another challenge to core assumptions of traditional aesthetics comes from feminist aesthetics, a growing and influential development in the subject. There are many different, sometimes conflicting, strands to feminist approaches, but central ideas include a reshaping of the artistic canon to include more works by women; an emphasis on gendered responses to art in opposition to notions of universal aesthetic experience; a relocating of art production into its social and personal contexts and a tendency to downplay formalist approaches and concomitant conceptions like “disinterestness”; and the promotion of revised criteria for art evaluation. Marxists, like feminists, roundly reject the notion that art exists in a realm of pure experience or pleasure. Aestheticians like Theodor Adorno (1903–1969), of the Frankfurt School, follow general Marxist precepts in attributing to art deeply social meanings, either reinforcing or resisting prevailing ideologies. Aesthetics itself has been challenged as a set of interests and values inescapably imbued with (bourgeois) ideology.

Aesthetic Experience and Aesthetic Qualities

Aesthetics, as noted earlier, is not always concerned with art. The core of Kant’s theory of aesthetic judgment had little to

do with art but rather with the special kind of pleasure taken in the appearance of things (of any kind). There are longstanding debates over whether there exists a distinctive “aesthetic attitude” or “aesthetic experience” associated with contemplating an object “for its own sake,” without interest or desire. The psychologist Edward Bullough (1880–1934) introduced the idea of *psychical distance* to explain aesthetic response, giving the illustration of someone fogbound at sea enraptured by the beauty of the swirling fog quite apart from the imminent dangers it presents. While recognizing some such phenomenon, philosophers have challenged the idea of an aesthetic attitude either as too narrow to do justice to the many interests, including moral and political ones, properly brought to art appreciation, or even as a “myth,” reducible to other factors.

Setting aside difficulties in how to characterize the psychology of aesthetic appreciation, philosophers have raised questions about the kind of qualities sought in aesthetic experience. Are there distinctive aesthetic qualities? If so, what makes them different from nonaesthetic, physical, structural, or perceptual qualities? The English philosopher Frank Sibley (1923–1996) initiated the contemporary debate and was one of the first to broaden the scope of the inquiry beyond the limited focus on qualities like beauty and the sublime. Words that identify aesthetic qualities, he suggested, include: *unified, balanced, integrated, lifeless, serene, somber, dynamic, powerful, vivid, delicate, moving, trite, sentimental, tragic*, and many more. Some are purely evaluative, some have a descriptive element. Such qualities “emerge” from, but are not logically determined by, nonaesthetic properties like color, configuration, or material constitution. They require “taste” for their apprehension and might be missed by nondiscerning perceivers. A revived form of eighteenth-century debates about the objectivity of beauty addresses the question whether a “realist” or “antirealist” theory of aesthetic qualities is most apt. Those defending the former often postulate specially qualified observers whose judgments are normative.

The most striking reaffirmation that there is more to aesthetics than just philosophy of art comes in the recent renewed interest in the aesthetics of nature and its offshoot “environmental aesthetics.” The dominance of philosophy of art in aesthetics (since Hegel) had distorting effects on philosophical understanding of the appreciation of nature. For one thing, art had become a paradigm for all aesthetic experience, and natural objects or landscapes were viewed as essentially *like* works of art. Even in the eighteenth century there is evidence of such a conception with the pleasure taken in landscaped gardens, scenic views, “prospects,” the “picturesque.” Pioneers in the new aesthetics of nature, including Ronald Hepburn and Allen Carlson, insist that appreciation of nature is *sui generis*. Nature, after all, does not come “framed” or designed by an artist, nor is it static. For Carlson a “true” or appropriate appreciation of the natural world, as it is in itself, does not rest on a merely intuitive response or “innocent eye” but should be informed by knowledge—drawn from geology, biology, and ecology—about the natural processes that brought about the objects perceived. What gives a mountain range its distinctive appearance? Why do landscapes look as they do? To explain our response to the appearance we must go deeper than mere

appearance. The advantage of Carlson’s view is that it relates aesthetics to practical and informed decisions about environmental planning, and it connects to ethical concerns about ecological preservation. But other philosophers prefer a more subjectivist conception and dismiss as too prescriptive the idea of “appropriate” or “inappropriate” responses to nature.

Of course not all environments are “natural,” just as not all “nature” is void of human intervention. Environmental aesthetics goes beyond the aesthetics of nature by considering environments of all kinds, man-made or wilderness, urban or rural. It is hard to see how norms for aesthetic appreciation for such a variety of environments might be established, although extensions of Carlson’s “cognitive” approach have been proposed. Also, it is not clear exactly where the bounds lie between a genuinely aesthetic response to an environment and other more or less pleasurable responses, such as “feeling at home” or sensing a relaxed atmosphere.

Aesthetics has an immensely broad scope both in the objects of its inquiry—from the fine arts to a forest wilderness—and in its methods and underlying principles. A concern for beauty resides deeply in human nature, and inquiring into its sources and characteristics occupies a central place in philosophy. There is, as briefly outlined, a long and rich tradition of debate in Western intellectual history that seeks to explore and clarify the aesthetic dimension of human experience. That tradition continues strongly to this day.

AFRICA, IDEA OF. The idea of "Africa" is an exceedingly complex one with multiple genealogies and meanings, which make any extrapolations of "African" identity in the singular or plural, any explorations of what makes Africa "Africa," quite difficult. Both Africans and non-Africans have conceived "Africa" differently in various historical and geographical contexts, especially in contemporary times. The descriptions, meanings, images, and discourses of Africa have changed over time as the continent's boundaries—geographical, historical, cultural, and representational—have shifted according to the prevailing conceptions and configurations of global racial identities and power, and African nationalism, including Pan-Africanism. At the beginning of the twenty-first century, the maps and meanings of "Africa" and "Africanness" are being reconfigured by both the processes of contemporary globalization and the projects of African integration.

Discourses about the "idea of Africa" can be framed in various ways. One common approach is to distinguish between Eurocentric and Afrocentric paradigms, between ideas and conceptions of what constitutes "Africa" derived from European as opposed to African perspectives. The difficulty with this method is that it assumes homogeneity within each paradigm and it inscribes an epistemic division between the two approaches that are otherwise deeply implicated with each other. There are other possible typological or taxonomic descriptions of Africa. One can think of religious, ecological, linguistic, and even ethnic taxonomies. This article has chosen

four typologies that seem best able to capture a wide range of constructions of Africa: the racial, representational, geographical, and historical conceptions. As with the Eurocentric–Afrocentric dichotomy, there are no discursive Chinese walls separating the four typologies, nor do they exhaust other possible categorizations, but they do have heuristic value.

Origins of the Name *Africa*

The historical origins of the name *Africa* are in dispute. At least seven origins have been suggested: (1) it is a Roman name for what the Greeks called "Libya," itself perhaps a Latinization of the name of the Berber tribe Aourigha (perhaps pronounced "Afarika"); (2) it is derived from two Phoenician terms either referring to corn or fruit (*pharika*), meaning land of corn or fruit; (3) it comes from a Phoenician root *faraqa*, meaning separation or diaspora; a similar root is apparently found in some African languages such as Bambara; (4) it is drawn from the Latin adjective *aprica* (sunny) or the Greek *aprikē* (free from cold); (5) it might even stem from Sanskrit and Hindi in which the root *Apara* or *Africa* denotes that which, in geographical terms, comes "after"—to the west—in which case Africa is the western continent; (6) it is the name of a Yemenite chief named Africus who invaded North Africa in the second millennium B.C.E. and founded a town called Afrikyah; or (7) it springs from "Afer" who was a grandson of Abraham and a companion of Hercules (Ki-Zerbo; Spivak).

Clearly, there is little agreement on the sources and original meanings of the word *Africa*. The foreignness of the name once prompted Wole Soyinka to demand that it be dropped, and as an act of self-definition he proposed the adoption of terms for *Africa* and *African* rooted in an indigenous language, preferably *Abibirim* and *Abibiman* from Akan. It appears the term *Africa* was used widely from Roman times to refer initially to North Africa, originally called by the Greek or Egyptian word *Libya*, before it was extended to the whole continent from the end of the first century of the common era. The Arabic term *Ifriqiya* most probably represents a transliteration of the word *Africa*. In this sense, then, Africa was a European construct—as much as Europe itself was a construct inflicted by the idea of Africa (and Asia)—whose cartographic application was both gradual and contradictory in that as the name embraced the rest of the continent it increasingly came to be divorced from its original North African coding and became increasingly confined to the regions referred to in Eurocentric and sometimes Afrocentric conceptual mapping as "sub-Saharan Africa," seen as the pristine locus of the "real" Africa or what the German philosopher Georg Wilhelm Friedrich Hegel (1770–1831) called "Africa proper."

The divorce of North Africa may have started with the Arab invasions of the region in the seventh century, but got its epistemic and ideological imprimatur with the emergence of Eurocentricism following the rise of modern Europe, which for Africa entailed, initially and destructively, the Atlantic slave trade, out of which came the forced migration—the largest in human history—of millions of Africans and the formation of African diasporas in the Americas, diasporas that appropriated and popularized the name Africa and through whom Africa became increasingly racialized. For example, the adoption of

“black” as the preferred name of African-Americans from the 1960s, in place of “Negro,” simply reinforced the relabeling of Africa as “black,” a tag that simultaneously rejected and reinscribed the old pejorative appellation of the “dark continent.” For the French, *Afrique noire* served to distinguish the west and central African colonies from the fictive overseas provinces of metropolitan France in North Africa, especially Algeria.

Far less clear is when the appropriation of Africa, as a self-defining identity, occurred in the various regions and among the innumerable societies that make up this vast continent, the second largest in the world. Such an archaeological project has not been undertaken, partly because it is a daunting task to untangle the interpellations and intersections of political and cultural identities for Africa’s peoples—ethnic, national, continental, and global—and partly because African intellectuals, whether nationalist or postcolonial, have been preoccupied with denouncing or deconstructing Eurocentrism.

The Racialization of Africa

The conflation of Africa with “sub-Saharan Africa,” “Africa south of the Sahara” or “Black Africa” so common in discourses about Africa, within and without the continent, ultimately offers us a racialized view of Africa, Africa as the “black” continent. It rests on the metaphysics of difference, a quest for the civilizational and cultural ontology of blackness. For Georg Wilhelm Friedrich Hegel (1770–1831) and his descendants, as Olufemi Taiwo calls purveyors of contemporary Eurocentrism, Africa is the ultimate “undeveloped, unhistorical” other of Europe. Hegel’s “Africa proper” is, in his words, the “land of childhood,” from which North Africa and especially Egypt is excised and attached to Europe, and where history, philosophy, and culture are “enveloped in the dark mantle of night” because its inhabitants, “the Negro exhibits the natural man in his completely wild and untamed state” (Hegel, pp. 91, 93).

Hegel’s ghost still stalks African studies and definitions of Africa. According to some this fragmentation of Africa in African studies has been unproductive intellectually, leaving aside its ideological motivations and effects. To quote John Hunwick:

The compartmentalization of Africa into zones that are treated as ‘Middle East’ and ‘Africa’ is a legacy of Orientalism and colonialism. North Africa, including Egypt, is usually seen as forming part of the Middle East, though Middle East experts are not generally keen to venture farther west than the confines of Egypt. Northwestern Africa—the Maghreb—is generally regarded as peripheral to Middle Eastern Studies and extraneous to African studies. Even the Sahara has been generally viewed as something of a no-go area (especially among anglophone scholars), while the Sudan and Mauritania (which are impossible to label as either ‘sub-Saharan’ or ‘Middle Eastern’) remain in limbo. Northwestern Africa (from Morocco to Libya), despite the area’s close and enduring relationship with West Africa, has been excluded from the concerns of most Africanists. (p. xiii)

This truncated characterization and racialization of Africa is of course not confined to Western scholars. Many African scholars also subscribe to it, as is so evident from their publications on Africa that often omit North Africa. Unlike Hegel and the Eurocentrists, however, African scholars seek to invest, not divest, sub-Saharan Africa with history and intellectual agency. The epistemological fixation with black Africa is so insidious that few remark on it, and when they do they tend to invoke cultural unity for sub-Saharan Africa in which “culture” largely serves as a proxy for race given the fact of cultural diversities within sub-Saharan Africa itself and the cultural affinities between some societies in this region, say the Sahel, with those of North Africa. Take language and religion, two critical attributes of culture: historically the Hausa of West Africa had more in common with their Berber and Arab neighbors to the North than with the Zulu of South Africa. The former traded with each other for centuries, shared religion (Islam) and a script (Arabic), and their languages are part of the Afro-Asiatic family. But this familiar material, moral, and mental universe does not count in the ontology of Africanness confined to the sub-Saharan region.

The separation of North Africa is sometimes based on the question of consciousness and self-representation. It is said people in North Africa perceive themselves to be part of the Arab world and therefore should not be considered a part of Africa. This ignores the simple fact that the vast majority of Arabs actually live in Africa, so that at a minimum Africa has to be considered an Afro-Arab continent. There is no doubt that North Africans have multiple identities and extracontinental affiliations, but so do people in so-called sub-Saharan Africa—ethnic, national, religious, gender, sexual, racial, and so on—in which the identity “African” may not be the primary one. Indeed, the African diaspora was African long before the communities they left behind on the continent developed a consciousness of being African.

Behind these conflicting definitions of Africa, about which regions to include and exclude, lie complex ideological and historical processes that need to be taken into account, for example, the relative decline from the sixteenth century of the trans-Saharan economy following the rise of the Atlantic economy. Another powerful development setting North and West Africa apart, it has been suggested, was the development of an autonomous Sufi Saharan/Sahelian Islam, independent from the North African impulse. Even more crucial, for our purposes, is the need to distinguish between historical knowledge on the one hand, and ideas or imaginings of Africa as intellectual and ideological projects on the other and to ask: who is defining Africa and for what purpose, whose ideas and imaginings predominate, and why? In this regard, it is important to underline the role of institutions from academic institutions to international organizations in this endeavor, to examine both scholarly and popular ideas of Africa and their discursive, spatial, and temporal articulations.

Adebayo Olukoshi and Francis Nyamnjoh remind us that to most ordinary people in Africa, to be African goes beyond making ontological, let alone epistemological, claims. It is a complex and constantly changing and challenging existential and ethical reality.

For the masses of Africans, Africa is above all a lived reality, one that is constantly shaped and reshaped by their toil and sweat as subjected and devalued humanity, even as they struggle to live in dignity and to transform their societies progressively. For these people, the fact of their Africanity is neither in question nor a question. And the least they would expect from concerned scholars is to refrain from adding onto their burdens in the name of a type of scholarship which, in being ahistorical, also trivializes their collective experiences and memories (pp. 1–2).

Representational Discourses of Africa

The notion that there is no racial essence that characterizes Africa and Africans because identities are socially constructed or invented and constantly changing has been the central message of scholars using postcolonial theory. V. Y. Mudimbe's seminal work has sought to map out this discursive process. In *The Invention of Africa* (1988), he interrogates the construction of Africa through Eurocentric categories and conceptual systems, from anthropology and missionary discourses to philosophy, an order of knowledge constituted in the sociohistorical context of colonialism, which produced enduring dichotomies between Europe and Africa, investing the latter's societies, cultures, and bodies with the representational marginalities or even pathologies of alterity (otherness).

In *The Idea of Africa* (1994), he seeks to demonstrate that conquering Western narratives, beginning with Greek stories about Africa, through the colonial library to contemporary postmodernist discourses, have radically silenced or converted African discourses. African intellectuals, he argues, have been reacting to this ethnocentric epistemological order, itself subject to the mutations of Western material, methodological, and moral grids, with varying degrees of epistemic domestication and defiance, in the process of which Africa's identity and difference have been affirmed, denied, inverted, and reconstituted.

For some thinkers one of the most important aspects of Africa's representation lies not in its invention per se, a phenomenon that is by no means confined to the continent, but in the fact that Africa is always represented and performed as a reality or a fiction in relation to something else, mostly Europe (white); Africa is always the Dark Continent (black). The question is precisely what makes the representation of Africa so distinctive and different from the representation of other continents: it is that Africa is always represented and imagined, in ways that Asia, for example, is not necessarily, in relation to master references—Europe, whiteness, Christianity, literacy, development, technology (the comparative and colonizing tropes mutate continuously)—mirrors that reflect, indeed refract Africa in peculiar ways, reducing the continent to particular (negative) images of “lack” and “becoming,” lacking and becoming “Europe.” In short, Africa more than any other continent is the quintessential representational other of Europe; from the moment (historically understood) that the two continents became entangled with each other, the grammar of their self-definitions became distorted mirror images of the other.

From this angle it can be seen why Eurocentric and Afrocentric representations of Africa are so deeply implicated with

each other, why the inclusion or exclusion of North Africa is so crucial to both of them, why their discursive possessiveness centers on Egypt. At stake is the civilizing authority and antiquity of Africa. The contemporary debate about the Africanness, and for some the “blackness,” of ancient Egypt was launched by Cheikh Anta Diop's provocative book, *The African Origin of Civilization: Myth or Reality* (1974). Afrocentric scholars in the United States led by African American scholar Molefi Asante, who coined the term *Afrocentricity*, picked up and popularized Diop's ideas.

But it was not until a European American scholar, Martin Bernal, published his tome *Black Athena* (1987, 1991), affirming the “blackness” of the ancient Egyptians and their enormous contributions to Greek civilization—the cradle of Western civilization—that Afrocentric claims received attention in the mainstream American and international academic media. Among those who were outraged was the classicist Mary Lefkowitz who vehemently attacked Bernal and the Afrocentric movement as a whole for its alleged “myths.”

For many African scholars the debate about the race of the ancient Egyptians seemed rooted more in American preoccupations with race than African history as such. To some of them blackness is less about race and more about representation, a sign not of submission to the Hegelian and colonialist schema of inferior difference, but of subversion and struggle against it. They see black identity as the result of political, social, and cultural negotiations, cooperation, transactions, differences between self and the other that goes beyond skin color; it is about the common experience of pain, exploitation, and suffering shared by an oppressed people and is deployed as a powerful symbol of subversion, struggle, and self-affirmation. It was in this sense that the term *black* was extended to “coloreds” (people of mixed race, Indians, and people of Asian descent) in South Africa in the 1970s and 1980s, and used to refer to people of African and Asian descent in Britain.

Others denounce the use of *race* altogether as a biological determinism that should have no place in Africanist scholarship while affirming the possibilities of (forging) a common African identity. Kwame Anthony Appiah is perhaps the most renowned proponent of this critique in his book *In My Father's House* (1992). Appiah is unsparing in his attack on the dangerous fictions of race and racist thinking and takes direct aim at some of the icons of Pan-Africanism, including W. E. B. DuBois (1868–1963). He seeks to demolish essentialist conceptions of Africa and demonstrate that Africa is not a primordial fixture, but an invented reality, and Africans are not molded from the same clay of racial and cultural homogeneity. This is a celebration of the diversity, complexity, richness, hybridity, and contingency of African identities and social and cultural life, mounted to challenge the totalizing narratives of both African nationalism and European imperialism with their dualistic and polarized representations of Africa and African identities and culture.

Critics of Appiah and Mudimbe and other postcolonial and postmodern African scholars such as Achille Mbembe, who also dismiss “nationalist” or what they sometimes refer to as “nativist” definitions of African identities, have pointed out

that despite these writers' celebratory analyses of the plurality and social construction of African identities, their work is not always sufficiently historicized and is trapped in the "colonial library"—Western episteme—and virtually ignores the "Islamic library"—African writings in Arabic and Arabic script—which would radically shift their conceptions of African thought and ideas of self-representation.

These shortcomings are readily evident in Appiah's book, for example, when he compares the different roles of religion and the modes of thought in what he calls the traditional oral cultures of Africa and the industrialized literate cultures of the West. The comparisons drip with a fundamental tension rooted in a binary conception of African "orality" and European "literacy." This is a problematic formulation, not only because he draws his African examples largely from one culture, Asante, but the conflation of orality with Africa and literacy with Europe is simply false if the "Islamic library" is taken into account. Also, the framing of "traditional" Africa versus "modern" Europe locks both Africa and Europe in a temporal binary that effectively dehistoricizes each. The irony, then, is that despite his best intentions Appiah ends up with an essentialized Africa with an ontological essence—lacking the supposedly European attributes of literacy—and a racialized one as well in that his analysis is confined to sub-Saharan Africa.

Geographical Conceptions of Africa

If we dispense with the racial conceptions of Africa, we are left with geographical and historical notions, Africa as a spatio-temporal construct that is at once a process, product, and a project of a complex and contradictory historical geography. The concept of historical geography, sitting at the intersection of two disciplines, has allowed scholars to combine the spatial and temporal interests of geography and history, to understand that the physical environment and human agency are mutually constitutive, that people's creativity and thought produce places as much as places produce people's cultures and identities, in short, that landscapes are not only important aspects of culture, they are products of historical processes.

Whereas nobody denies that a geographical entity called "Africa" exists, for some this is merely a cartographic reality not a cultural one, an exercise in mapping devoid of experiential meaning for the peoples that have lived within the continent's porous borders. They would be right, some contend, if the argument were that Africa's peoples have always been conscious of living in a place called "Africa." Clearly, they have not, no more than people who in the twenty-first century are called "Asians" or "Europeans" have always had such a spatial consciousness. Historically, local spatial identities, encapsulated and articulated in ethnic, regional, and national terms, have been far more important, while broader (continental) spatial imaginaries have tended to develop as the processes of globalization, understood here to mean the expanding circuits of transregional connectedness, have grown in extensity and intensity.

Thus, in Africa, as elsewhere in the world, there is a hierarchy of spatial identities that are interwoven and interactive in complex ways engendering multiple cultural identities. Space and the spatial stage contextualize cultures, economies,

and politics, and invent and inscribe places and landscapes with ethical, symbolic, and aesthetic meanings. "Space" is created," argues Doreen Massey, "out of the vast intricacies, the incredible complexities, of the interlocking and the non-interlocking, and the networks of relations at every scale from local to global" (pp. 155–156). Space, then, is not a static and passive template of social existence, but an active, constitutive force of the social's very composition and construction.

Seen in this way, then, the multiple mappings of Africa are indeed to be expected. The numerous peoples and societies that have carved out a place of their own across this vast continent have, in a sense, been creating their little Africas, each laying their bricks of African identity across the huge and intricate cartographic, cognitive, and cultural construct known as "Africa." Therefore, a geographical conception of Africa does not need the existence of racial solidarity or the invention of cultural homogeneity. But this is not an empty cartographic vessel either in so far as the diverse cultures and identities that have emerged and have yet to emerge have been and will continue to be shaped by the mapping and materiality of Africa as an ever changing spatial entity and social construct.

The map of Africa, as with all maps, entails many things. Maps are not simply representations of the geographical world. A map is, as David Woodward and Malcom Lewis argue in their massive global history of cartography, simultaneously a cognitive system, a material culture, and a social construction. They speak of "cognitive or mental cartography," "performance or ritual cartography," and "material or artifactual cartography." Recent studies on indigenous cartography in Africa demonstrate that all three have been employed by Africa's various peoples to map, name, and claim their landscapes, stretched over varying scales of expansiveness.

In the nineteenth century, many European explorers solicited and used some of these maps to produce their own maps, which shows cross-cultural intelligibility between African and European maps. To quote Thomas Bassett: "Notwithstanding broad epistemological divides separating Europeans from various African cultural groups, it appears Europeans had little difficulty in reading these maps. Solicited maps demonstrate that Africans had the spatial competence and requisite sign systems to produce maps spontaneously. . . . Indeed, there is evidence that [these] maps were influential in shaping the form and content of European maps of the continent" (p. 37).

Quite clearly African maps influenced European mapmaking in the nineteenth and twentieth centuries in several ways. They enabled European explorers to construct or correct their maps, and were essential for topological determinations, and place-names, which were widely transcribed onto European maps. In turn, European influences also became increasingly discernible in African mapmaking in terms of the materials used, the northerly orientation of some maps (e.g., Ras Makonnen's famous map of Ethiopia of 1899), and the methods employed in their construction (e.g., Cameroonian King Njoya's topographic survey from 1912 to 1916).

For more than fifteen hundred years maps of Africa produced in northern Africa, southern Europe, and western Asia

had reproduced the maps made by Ptolemy in Alexandria in the second century B.C.E., only “altering them slightly to suit their needs” (Mbodji, p. 44). The creation of new and more accurate maps of continental Africa began with the emergence of “scientific” cartography and the beginnings of European global voyages and conquests in the fifteenth and sixteenth centuries, although it was not until the mid-nineteenth century that the broad external and internal contours of the continent were finally filled out as we know them today. The European mapping of Africa was implicated with imperialism both directly and indirectly, directly in that mapmaking facilitated the voyages of exploration and colonization, and indirectly insofar as it was part of the ideological architecture of inscribing European nationalisms at home and forging collective European grandeur globally: from Gerardus Mercator’s (1512–1594) projection, still widely used in the twenty-first century, tiny Europe was inflated in size and massive Africa was dwarfed. It was almost as if Africa’s civilizational diminution had to be accompanied by a cartographic one.

Upon this shriveled “blank darkness” Europe sought to write its cartographic and epistemic will by dividing the continent into colonies, themselves further splintered into allegedly primordial and antagonistic ethnic enclaves, a cognitive mapping sanctioned by the structuralist-functionalist paradigms of anthropology, the premier colonial science. But against the “tribalization” of Africa and African cultures and identities by the colonial administration and colonial anthropology, which were contested by local circuits of exchange, movement, and interaction so that borders served not simply as points of separation and struggle but often as places of convocation and conviviality, there emerged the countervailing elite paradigms, politics and projections of Pan-Africanism, the progenitor of the numerous territorial nationalisms in Africa.

As an ideological, intellectual, and institutional formation Pan-Africanism embodied within itself conflicting tendencies and imaginaries of Africa, premised on racial, spatial, and ideological constructs. While there always existed different versions of Pan-Africanism premised on diverse spatial conceptions of Africa (for example, trans-Atlantic Pan-Africanism embraced the African diaspora in the Americas), the one that received lasting institutional expression for independent African states was continental Pan-Africanism, which was sanctified in 1963 with the formation of the Organization of African Unity (OAU). In 2001 the African Union (AU), a more ambitious project of continental unification, succeeded the OAU.

The formation of the OAU and later the AU entailed a remapping of Africa, the creation and consumption of new national, regional, and continental maps that were produced, performed, and internalized everywhere from schools, the media, and academic and political conferences, to international forums where regional blocs assumed representational identities. In short, “Africa” the map and the place was becoming increasingly “Africa” the idea and the consciousness, buttressed by an intricate web of hundreds of continental institutions covering an ever expanding range of spheres from politics, the economy, environment, health, education, and culture, to technical cooperation and the prosaic world of leisure involving

competitive games and sports and forms of popular entertainment.

By the beginning of the twenty-first century, “Africa” was perhaps more “African” than it had ever been in its history, that is to say, more interconnected through licit and illicit flows of commodities, capital, ideas, and people, not to mention multilateral conflicts and ecological and health panics, and more conscious of its collective identity in the global panorama and hierarchy of regional identities. The historical geography of Africa had been stretched and deepened despite, on the one hand the centrifugal push of spatial and social identities within the continent itself (some of which degenerated into destructive conflicts including civil wars, massive migrations, and state collapse), and on the other the centripetal pull of contemporary globalization and its “glocalization” effects—its tendency to simultaneously internationalize and localize identities and cultures—and the enduring seductions of extracontinental alliances for some regions and countries.

Historical Conceptions of Africa

From the discussion above it is evident that Africa and African identities can be conceived both as states of being and of becoming. In other words, “Africa” is a dynamic historical process, a messy spatio-temporal configuration of agency, structure, and contextuality that is subject to change, which is not always easy to perceive or predict. Africa, in this sense, has emerged out of the complex histories of the continent’s peoples. Indeed, African historians have been in the forefront of constructing Africa as a coherent and complex object of study, investing the continent with a distinctive civilizational identity. They were among the first to take up the Eurocentric lie that Africa was a continent and Africans were a people “without history,” an indictment intended to devalue their humanity.

The pivotal and central role of historians is precisely to propose a space, an axis to locate and make sense of the human experience, politically, socially, culturally, and economically. Needless to say, there are different types of African historians in terms of their training and institutional locations and methodological and theoretical orientations. Academic historians compete with “traditional” and popular historians in public historical discourse, so that there are continuous contestations about space, communities, and histories. But academic historians have tended to dominate in the production of the history of the postcolonial nation and the continental imaginary called Africa.

Once the dominant tendency was to produce linear and celebratory narratives of the nation and the continent, in which colonialism was reduced to a parenthesis or an episode, then the various subalterns wearing the identities of class, gender, or generation joined the historians’ parade, before the postal turn (poststructural, postmodern, and postcolonial theories) that sought to reveal the fictionality of the whole enterprise, that the past is largely imagined, constructed, or invented. The better historians had always seen and constructed history as a series of messy, multiple, complex, and often conflicting processes and discourses about the past, produced simultaneously at local, national, and transnational levels, themselves

connected and constructed in intricate and contradictory and ever changing ways.

By the end of the twentieth century, academic historians had produced a phenomenal amount of scholarship, invented and refined methodologies of research, and excavated the histories of African politics, societies, economies, cultures, and environments from the onerous weight of Eurocentric derision and Afrocentric romanticism. The publication of the UNESCO (1981–1993) and Cambridge (1977–1985) histories of Africa marked the apotheosis of this spectacular scholarly achievement. To be sure, there is much one can criticize about African historiography methodologically and theoretically, but the fact remains historians have written extensively on the development and invention of African cultural traditions and identities over time that make it possible to research, write, and teach about “African” history as a distinctive field, even if complexly connected to other histories, especially of “Europe.”

Despite their prodigious production since independence, African historians, not to mention scholars from other disciplines, have not generally been anxious to propose the defining characteristics of Africa, the essential elements that constitute its development as an idea and a historical geography. The most renowned model is the one proposed by Ali Mazrui, the notion of the “triple heritage,” that the African world is constituted by the confluence of three civilizations: the indigenous (traditional), Western (Christianity), and Arabic (Islam).

The three forces apparently exhibit enormous variations in their spatial and temporal manifestations, some are more dominant in certain regions, countries, and societies, and one could add here among certain classes and genders and at certain times, than in others. But the journey in Mazrui’s gnosis seems not to be toward the harmonious and universal synthesis of the Negritude writers and philosophers, who posited a duality between Africa and Europe, reason and emotion, materialism and morality, humanity and nature, out of whose dialectical encounters and reconciliation a universal civilization would be forged. Rather it is toward a triumphant resurgence and reclamation of Africa’s cultural spaces by tradition and Islam.

Mazrui did not invent the trilateralist view of Africa and its cultures and identities, that contemporary Africa contained an allegedly uneasy mixture of traditional, Western, and Islamic values and practices. The idea can be traced back to the 1887 work of Edward Blyden (1832–1912), the great nineteenth-century Liberian intellectual, for whom the modern “African personality,” as he called it, was formed and would flourish out of the organic integration of the best elements from indigenous culture, Islam, and European science and Christianity. Kwame Nkrumah (1909–1972), the Pan-African activist and intellectual and Ghana’s first president, elaborated on Blyden’s notion of the “African personality” in his concept of consciencism, a cultural and cognitive synthesis between the humanistic and socialist ethos of “traditional” Africa, the acquisitive capitalist values and redemptive Christian hopes of the “West,” and the holistic secular and spiritual precepts of Islam. Forged out of this crucible, the “African personality”

would emerge, modern, assured, and liberated, ready to take its rightful place in the world.

Nkrumah has been faulted for not giving the traditional and Islamic legacies the kind of serious analysis accorded the Western one in his book *Consciencism* (1964). Part of some critics’ unease with Nkrumah’s schema is based on doubts that there indeed exists an exclusive and distinctive African traditional culture or a homogeneous African cultural universe. The same critique has been leveled against Mazrui, who has been attacked for what some regard as his evident partiality to Islam as the more benevolent force than the European-Christian and indigenous parts of the triad. In his withering critique of Mazrui’s television series, *The Africans: A Triple Heritage*, Soyinka accused Mazrui of denigrating indigenous religions and cultures, a charge Mazrui vigorously denied (Mazrui and Mutunga).

The Mazrui-Soyinka debate over Mazrui’s television series underscores the unresolved issues and stakes in contemporary definitions of Africa and Africanness. As noted with reference to Appiah above, both Soyinka and Mazrui do not historicize the moral, societal, and cultural values that constitute African identities. Their ethnographic notions of tradition are problematic; they ignore the sedimentations of exchanges, adaptations, inventions, and changes that the traditions in question, whether seen positively or negatively, have undergone. Often forgotten in these debates are several basic questions, such as how foreign, indeed, are Christianity and Islam to Africa, if we can restrict ourselves to the religious dimensions of the triple heritage for a moment. As histories of both religions clearly indicate, Christianity and Islam were implanted in certain parts of Africa almost at their inception and Africans made significant doctrinal contributions to both religions long before they were introduced to many parts of Europe and Asia where they are considered “indigenous,” “traditional,” or at least their “foreign” pedigree is not always emphasized.

This is to suggest that while the notion of the “triple heritage” highlights the diverse sources of African identities and cultures and seeks to clarify the complex streams that have flowed into their making, it flirts with an essentialized and almost ahistorical notion of a primordial Africa, a “real Africa,” that somehow exists alongside external cultural diffusions, a narrative that is quite reminiscent of the misguided searches for a Hegelian “Africa proper.” The inadequacies of the Blyden-Nkrumah-Mazrui cultural typologies do not mean that all attempts at creating such schemas are mistaken or doomed. Typologies or conceptual categories are essential to intellectual analysis; they are intended to clarify complex social phenomena. Difficulties often arise when the categories cease to be explanatory devices sensitive to human agency, social structure, and spatiotemporal contexts and begin to wallow in their own transcendental magnificence.

Conclusion

It is quite evident that there is no agreement on what “Africa” means, let alone how to define African identities beyond what can only be provisional and partial conceptualizations and categorizations. Yet, we all believe we know what “Africa” is, what

it must be, but when we think we have finally seen it, felt it, touched it, captured and tamed it with our terms of endearment, aversion, or indifference it suddenly melts away into a mirage beyond the assured and unilateral classifications of race, representation, geography, or history. Perhaps wisdom lies in accepting the simple proposition that Africa is indeed many things, a mélange of peoples, places, practices, processes, projects, and possibilities that are both unique and common in their configuration over time and space.

Africa is, in short, a critical site of the human drama, the original homeland, as modern archaeology and genetics tell us, of humanity and it continues to be the continent that hundreds of millions of people in all their marvelous and sometimes bewildering complexities, colors, and cultures still call home. Who can claim the right to divine who belongs or does not belong to its porous boundaries and the histories and memories etched on and eked out of its variegated landscapes? The idea of "Africa," it would seem, will continue to elude any definitive conceptualization that is premised on exclusive claims of race, geography, or history because it is a phenomenon that is always in a state of becoming.

AFRICAN-AMERICAN IDEAS. For four hundred years, African-Americans have been engaged in a fierce struggle, a struggle for freedom, justice and equality, empowerment and self-determination, or social transformation, depending on one's ideology and its discourses. The lived African-American experience, in its class, gender, generational, and regional specificity, and the struggle against black racial oppression in the form of black social movements, are the soil from which African-American political and social thought are produced. Different social movements—abolition, the nineteenth-century Great Black March West (1879–1910), the protective leagues during the nadir (1877–1917), the New Negro Movement of the early 1900s, the Depression-era struggles, and the civil rights and black power movements of the 1960s—have developed distinct goals and objectives and consequently have evolved quite different strategies, ideologies, and discourses. Contrary to popular opinion, African-American political thought has always been a roiling sea of competing ideological currents. Political scientist Robert C. Smith described ideology as “the enduring dilemma of black politics” because of its variety and vibrancy. The tradition of viewing African-American history through the lens of historical debate underscores the diverse and dynamic character of African-American political discourse. For instance, it is popular to compare and contrast the ideas of Frederick Douglass (1817–1895) and Martin R. Delany (1812–1885), W. E. B. DuBois (1868–1963) and Booker T. Washington (1856–1915), and Marcus Garvey (1887–1940), Ida Wells-Barrett (1862–1931) and Margaret Murray Washington (1863–1953) or, more recently, Martin Luther King (1929–1968) and Malcolm X (1925–1965).

In the popular imagination, African-American political thought has been reduced to two ideological streams, black nationalism and integrationism. Harold Cruse, author of the influential but flawed *Crisis of the Negro Intellectual*, crystallized this binary framework into a Manichean perspective that characterized African-American history as primarily a conflict between proponents of these two ideologies. Cruse did not invent this conceptualization—August Meier had previously asserted it—but he made it the dominant interpretative schema in black political philosophy.

The binary framework has been challenged on two fundamental premises. One group has sought to complicate the categories of black ideologies. Anthropologist Leith Mullings, historian Manning Marable, and political scientists Robert C. Smith and Michael C. Dawson, among others, have offered more comprehensive frameworks. Adding radicalism to nationalism and integrationism, Smith conceives of three major African-American ideologies: black nationalism, integrationism, and radicalism. Mullings and Marable discern three “strategic

visions” in black political thought, which they term *inclusion*, *black nationalism*, and *transformation*. Interestingly, Mullings, Marable, and Smith would acknowledge conservatism as a distinct political perspective; yet, because they do not view it as politically salient before the 1990s, they have not conceptualized it as a major ideology among African-Americans. Dawson's framework, in contrast, includes black conservatism among the six “historically important” black ideologies he identifies: black nationalism, black liberalism, including three streams, black feminism, and black radicalism.

Taking a very different approach, sociologist John Brown Childs eschews the conventional debates over ideology to identify two worldviews, which he argues constitute the “coherent systematic approach” that undergirds political ideologies. Seeking to uncover the “conceptual currents” beneath strategic conflicts among social justice activists, Childs identifies two irreconcilable worldviews, the vanguard and mutuality perspectives. According to Childs, vanguard approaches posit an elite that possesses knowledge of the “way,” which they bestow upon the ignorant and impose on the defiant. In contrast, mutuality approaches advocate praxis built on sociohistorical correspondence, communication, diversity, cooperation, (self-) transformation, and openness, and reject notions of a leading group. Despite the potency of Brown's insights, most scholars of black history and politics have continued to chart African-American social movements and individual activist intellectuals via their ideologies, rather than their worldview or organizing approach.

African-American Ideologies

Several ideologies salient among African-Americans require explication. Here, *ideology* is considered as a systematic theory of society composed of a relatively coherent set of interdependent concepts and values that adherents construct into historical narratives and contemporary discourses to articulate their interpretation of a social groups' economic, political, social interests, and cultural beliefs to rationalize particular public policies. The emergence and salience of African-American ideologies are conditioned by three broad factors: the sociohistorical context, the contemporary discursive matrix, and the black intellectual tradition. It is important to contextualize African-American ideologies historically because they develop during particular historical moments, and their discourses are designed to resolve or, at least, to respond to historically specific problems. Moreover, sociohistorical context not only shapes the emergence of specific ideologies, it also conditions the form and salience an ideology takes at a particular moment. African-American history can usefully be considered as a succession of different racial formations. Black racial formations represent African-Americans' distinct position within the U.S. political economy, polity, and civil society during particular historical periods.

African-American history can be divided into four periods: (1) slavery, 1619–1865; (2) the plantation economy, 1865–1960s; (3) proletarian and urbanization, 1940s–1979; and (4) the new nadir, from 1980 on.

Within the realm of ideation, African-American political thought evidences the dynamic interplay between African-American discourses and the dominant and emergent ideas

circulating during particular historical periods. Contemporary events and discourses present in the United States and the world establish the contemporary examples and discursive matrix with which these African-American ideological discourses engage. Perhaps more pertinent, however, is knowledge of past debates among the black counterpublic and how previous black intellectual traditions have influenced historically specific policy formulations.

Because racial oppression is a system constructed around a matrix of domination, discrimination, and degradation, an appraisal of African-American political and social thought reveals that black activist intellectuals have mainly engaged two issue clusters: those that revolve around questions of *identity* and those concerning questions of *liberation*: “Who are we?” and “What is our present situation, and what should be done about it?” During slavery, the system of racial oppression attempted to destroy African identities, ethnic memories and cultural practices, and the collective and personal identities that derived from them. Since slavery it has sought to make African-Americans nonpersons, requiring, therefore, the search for and (re)assertion of new identities woven from the residue of African survivals and self-interested adaptations, a process that transcends the limits of what is derisively called “identity politics.” Identity questions for oppressed racialized communities are fundamental to the pursuit of liberation. These overarching questions about identity, the present situation, and what should be done to create conditions of freedom, self-determination, and social transformation have elicited different answers from different groups of black activist intellectuals.

Allowing for terminological differences, most scholars of black history and politics would agree that African-American activist intellectuals have justified their political action via an interpretative repertoire drawn from one of the following five interrelated ideological approaches: (1) autonomic, (2) incorporative, (3) black conservatism, (4) black radicalism, and (5) black feminism.

Black Nationalist Ideologies

Black nationalist, or *autonomic*, strategies are the oldest ideological approaches developed by African-Americans. The slave revolts, especially those before the nineteenth century, that aimed to create maroon societies modeled after remembrances of African social organizational patterns perhaps best reflect the anteriority of black nationalism among African-American ideologies. Autonomic approaches are also the most varied and complicated of African-American ideologies, but they can be divided into two broad categories: *protonationalism* and *separatism*. Protonationalism refers to strategic visions that emphasize autonomy in the realm of civil society, the desire to reside in semiautonomous towns and regions, and the preference for preserving distinct cultural practices. Richard Allen’s (1760–1831) creation of the African Episcopal Methodist Church in 1794 and W. E. B. DuBois’s call for blacks to build on their group strengths in the 1930s or the 1960s era campaigns for “community control” of African-American communities are examples of protonationalism.

Separatism has a more delimited terrain, encompassing emigration and efforts to create an independent African-American

nation-state within the United States, such as Martin R. Delany’s and others’ proposals to emigrate to Africa, Canada, or South America during the 1840s and 1850s; Marcus Garvey’s 1920s plan to repatriate to Liberia; or the Republic of New Africa’s 1960s desire to create an African-American nation-state in the U.S. South.

Autonomic discourses are shaped by their sociohistorical context; they tend to surge and ebb in relationship to the economic and political position of blacks in U.S. society. As a rule, black nationalism swells during sustained economic downturns. Autonomic philosophies are also sensitive to the interplay of dominant and emerging ideologies. This is particularly true regarding questions of cultural difference. For instance, between 1850 and 1925, the era historian Wilson Moses terms the golden age of black nationalism, nationalists were ambivalent toward African culture and rejected Africanisms or cultural carryovers. Like the social Darwinists of the day, they often viewed Africans and African-Americans as “underdeveloped” or even “backward,” although they usually ascribed environmental or religious, rather than genetic, causes. Consequently, they preferred European-American high culture. To a large extent, black power, the protonationalism that developed during the “turbulent sixties” (1955–1975) was predicated on *Africanization*, the adoption of actual or imagined African cultural values and practices.

Evidence from several years of the National Black Politics Study from 1979 to 1992 suggests that proto-black nationalism remained the predominant perspective of the majority of African-American people in the late twentieth century. For instance, political scientists Darren W. Davis and Ronald Brown discovered that 84 percent of African-Americans believed blacks should buy from black-owned businesses; 83.3 percent believed blacks should be self-reliant; 73.8 percent wanted blacks to control their communities’ economics; and 68.3 percent believed blacks should govern their communities. Another 70.7 percent thought black children should learn an African language, and 56.5 percent advocated participating only in all-black organizations.

African-American Liberalism

Liberalism is the second oldest black ideology. Scholars often insert “liberal” as an adjective to describe the political values associated with the incorporativist perspective in order to distinguish this set of discourses from conservative and radical approaches, which also advocate incorporation into U.S. society, albeit for radicals into a fundamentally transformed society. And some variants of nationalism and feminism are decidedly liberal in their political social perspectives. Here *incorporative* should be understood as synonymous with *liberal pluralism*.

Smith has argued that liberalism, or incorporativism, is not so much an ideology as a strategy. Applying the logic Anthony Bogues used regarding Quobna Cugoano’s *Thoughts and Sentiments on the Evil of Slavery* to the work of Douglass, DuBois, Charles Johnson, Alain LeRoy Locke (1886–1954), Martin Luther King, Jr., Thurgood Marshall (1908–1993), Mary Frances Berry (b. 1938), and Lani Guiner (b. 1950), among

others, illuminates how their critiques of U.S. society stretched the boundaries of liberal pluralism and provided alternative theories of American democracy.

Incorporative approaches advocate structural integration into the U.S. state and political economy, arguing that the inclusion of African-Americans in traditionally white institutions *in and of itself* constitutes a significant transformation. This is the view that undergirded the legal strategy Charles Hamilton Houston (1895–1950) designed for the National Association for the Advancement of Colored People (NAACP) during the 1930s and of the civil rights movement of the 1960s.

Incorporativists are more ambivalent toward inclusion in European-American civil society: they tend to oppose restrictions barring access to traditionally white institutions, but usually oppose dismantling African-American institutions. For instance, Martin Luther King, Jr. never imagined the dissolution of the black church. Historically a few incorporativists, such as Frederick Douglass, have advocated biological assimilation as well as structural integration. Incorporative approaches generally encourage acceptance of bourgeois European-American cultural values and practices, viewing them as quintessentially “modern,” even though privately many incorporativists often continue to practice the styles and idioms of African-American culture.

While tension exists between the core components of white liberalism and black incorporativism, particularly regarding individualism and notions of equality—equal opportunity versus equality of results—incorporativists generally share their white colleagues’ views on the power of knowledge, the value of diversity, and economic enterprise. Incorporativists are also skeptical of American liberalism’s assertions of pluralism, especially the assertion that the U.S. state is neutral regarding racial and ethnic disputes. Although incorporativists are often critical of the practice of American liberalism, they tend to accept most of its values.

African-American Radicalism

Perhaps more than any other ideology, black radicalism is sensitive to the sociohistorical context. During the slavery period, the radical black perspective advocated the immediate destruction of slavery and the extension of full civil rights to black people. After slavery, as most African-Americans were being incorporated into the semicapitalist plantation economy, things became more complex. Confronting sharecropping, black radicalism required more than the advocacy of black landownership. Circumstances required that black radicals develop a critique of the capitalist system that maintained the plantation economy. Whereas during slavery Frederick Douglass and Martin R. Delany were radicals, during Reconstruction and the first nadir (1877–1917) Douglass became the quintessential black liberal while Delany descended into conservatism. This hypersensitivity to sociohistorical context derives from the general premises of radicalism: transformation of the fundamental structural and ideological elements of a society. Black radicalism has consisted of philosophies and practices that sought the essential transformation of the system of racial oppression and the social system that institutionalized it.

Peter H. Clark, the first modern black radical, joined the Socialist Party in 1877, during the first nadir. Ironically, Clark’s reasons for leaving the socialists probably affected the construction of black radicalism more than his reasons for joining. (Clark left the Socialist Party because it did not confront the specificity of race and racial oppression, preferring to view race as subordinate to class.) The outlines of a distinct black radical perspective, however, did not appear until after World War I, after Hubert H. Harrison (1900–1945), Cyril V. Briggs (1888–1966), and the African Blood Brotherhood (c. 1920s) examined the state of African peoples and the relationship of black and white radicals in the United States. Black radicalism was a unique effort to merge and remake classical Marxist theory and black nationalism into a race-conscious socialist theory. Although Ralph Bunche (1904–1971) and Abram Harris (1899–1963) were radical blacks during the 1930s, unlike W. E. B. DuBois, Langston Hughes (1902–1967), Claudia Jones (1915–1964), and C. L. R. James (1901–1989), their ideas might be too orthodox to be considered foundational for black radicalism. Black radicals, according to Anthony Bogues, are either *heretics* or *prophets*.

Heretics, usually highly educated in European-American radicalism, use subjugated knowledge from black experiences to challenge white radical orthodoxies and to rework them into theories that can accommodate black experiences and perspectives. Bogues’s prophets come from the realm of religion. They are often undereducated by U.S. standards. They tap subjugated knowledge from sources outside the mainstream academy: the Bible, the Koran, particularly esoteric interpretations of both. In addition to derived religious sources, prophets articulate, in Hobsbawm’s terms, an *inherent* ideology, one drawn from the murkier repositories of African survivals and popular culture. Noble Drew Ali (1866–1929) and the Moorish Science Temple, Elijah Muhammad (1897–1975) and the Nation of Islam, and Prince Asiel Ben Israel and the Original Black Hebrew Israelite Nation represent this type of black radicalism. (Note that, by this author’s criterion—opposition to the dominant mode of production—they would not be considered black radicals.)

In more recent times, Huey P. Newton (1942–1989) and the Black Panther Party (1960s), especially their theory of intercommunalism, the Revolutionary Action Movement (late 1960s), and the League of Revolutionary Black Workers (late 1960s) have represented the black radical perspective. Since the late twentieth century, the Black Radical Congress has represented this ideological tendency.

Black Feminism

Like modern black radicalism, black feminism is of comparatively recent origins, although its roots reach back into the nineteenth century. The earliest foreshadowings of this ideology are found in the slave-era speeches and writings of Maria Stewart (1803–1879), Sojourner Truth (c. 1797–1883), and Frances Ellen Watkins (1825–1911). The ideas that would ultimately become the ideology of black feminism developed to a large extent during the first nadir through the speeches, writing, and practices of Ida Wells-Barnett, Mary Church Terrell (1863–1954), and Anna Julia Cooper (1859–1964). While

black women activists, especially women associated with the U.S. Communist Party, such as Esther Cooper Jackson and Claudia Jones, engaged in practices and advocated philosophies that amounted to black feminism, the theory was not formally visible until the 1960s.

According to Linda Burnham, contemporary black feminism, with its emphasis on the simultaneity of overlapping oppressions—race, class, gender, sexuality—is a product of the transition from the civil rights to the black power movement. She locates the origin of this iteration of black feminism with the Student Nonviolent Coordinating Committee's (SNCC) Black Women's Liberation Committee and later the Third World Women's Alliance, in both of which Frances Beal (1900–1987) played a leading role. This stream of black feminism has become a core component of contemporary black radicalism. It can be sharply contrasted with another stream of black feminism, *womanism*, as articulated by Clenora Hudson-Weems, which is more correctly viewed as a tributary of conservative black nationalism.

African-American Conservatism

Black conservatism has a long history and includes a large number of prominent African-Americans. Nevertheless, it has never become a salient ideology for a significant number. Jupiter Hammond (1711–c. 1800) during the slave period, William Hooper Council (1848–1909) during the first nadir, George Schuyler (1895–1977) during the 1940s and 1950s, as well as A. G. Gaston (1892–1996) during the 1960s, represented conservative ideologies. However, none of these individuals shared the virulent antiblack positions of contemporary black conservatives. Black neoconservatives differ from previous generations of black conservatives in that they are often alienated from the black community and divorced from its institutional networks, especially political organizations.

Black conservatism articulates better with its mainstream equivalent than do the other black ideologies. Conservative approaches are premised on white American cultural values, particularly notions of individualism, which advocate *colorblind* individual incorporation into the U.S. political economy, polity, and mainstream white civil society. According to psychologist William Cross, Jr., race and the history and continuing practice of racial oppression are either denied or viewed as not salient by black neoconservatives in constructing their identities. Twenty-first-century black neoconservatives, Thelma Duggin, Clarence Thomas, Gwen Daye Richardson, and Ward Connerly, share the assumptions, interpretations, and goals of the leading white neoconservatives. Black neoconservatives blame the dislocations endemic to poverty on welfare and government subsidies. They claim the Great Society programs, instituted in the 1960s by President Lyndon Johnson, created a “culture of dependency” among the black poor. According to this perspective, instead of providing a social safety net, the Great Society created dependent personalities and an antiachievement culture in the black community. Perhaps more fundamental than the adoption of European-American cultural values is their reduction of African-American culture to a composite of pathological behaviors. Conservatives, including autonomic conservatives, generally reject the African cultural survival thesis.

Summary

The five major ideological expressions of social thought by which African-Americans have sought to reconstruct their racial/ethnic identity, to contemplate the structures, ideologies, and functions of racial oppression, and to envision a future free from that oppression constitute an extraordinarily complex body of evolving political theory. All are shaped by dynamic interaction with their sociohistorical experiences and the dominant and emerging ideologies and discourses in U.S. society and the world, especially pan-African ideas and the black intellectual tradition.

AFROCENTRICITY. Afrocentricity is a theory that emerged in the early 1980s in the United States within the academic context of African-American studies. Afrocentricity was articulated by Molefi Kete Asante, a professor of African-American studies at Temple University and creator of the first Ph.D. program in African-American studies in the nation, in three major essays published between 1980 and 1990.

Like most theories, Afrocentricity has come to be associated with different thrusts, some of which may even be contradictory or incompatible with the original definition of Afrocentricity. However, at its core, Afrocentricity is a theory concerned with African epistemological relevance, also referred to as centeredness or location. The ultimate goal of Afrocentricity is the liberation of African people from the grips of Eurocentrism. The primary and indispensable mechanism to achieve this goal is the fostering of African intellectual agency.

Historical and Intellectual Context

African-American studies academic units came into existence as a result of great political pressure on European institutions of higher learning in a demand for space for the African voice and experience in the late 1960s, during the Black Power movement. No longer satisfied to be culturally disenfranchised and to feel alienated from the classroom (Asante, 1990),

African-American students and community activists brought to the fore of the discussion the question of educational relevance for black people, arguing for a culturally inclusive and sensitive curriculum apt to produce scholars in tune with and committed to the betterment of their communities (Karenga). One of the major characteristics of black studies, therefore, has been a dual concern for academic matters and the life conditions of African-Americans, with African-American studies scholars expected to be scholar-activists.

However, if the political mandate of African-American scholars is clear, their intellectual mission has, on the other hand, been clouded with conceptual confusion since the very beginning. Particularly vexing has been the issue of the relationship between African-American studies and the Western academe, with much debate over the status of African-American studies as a full-fledged independent discipline, or rather a field of studies, devoted to the Black experience and yet operating within the confines of Western intellectual thought. At the core of this issue, however, lies the question of Eurocentrism, with the degree to which one seems willing to challenge European intellectual hegemony determining one's position in the debate over the intellectual status of African-American studies.

Eurocentrism is understood as the interpretation of all reality from the Western perspective, especially as it emerged during the European Age of the Enlightenment. That perspective developed both internally, with the development of a metaparadigm specific and relevant to Europe; and externally, in opposition to "others," especially African people. Hence there are at least four assumptions of that European metaparadigm that have played a major and negative role as far as black people are concerned: (1) all human beings evolve along the same line; (2) the European experience is universal; (3) Europeans are superior; and (4) "others" are defined by their experiences with Europeans. In other words, the European metaparadigm rests among other things on the belief in the superiority and universality of the European experience.

Indeed, in that linear and evolutionary schema of thought, the West claims that when it talks about itself, it is also ipso facto talking about all human beings. The history of all women, men, and children in the world supposedly naturally coincides with that of Europeans. The latter are thus implicitly or explicitly held to be the universal norm by which African intellectual, cultural, and social "progress" will be evaluated. However, if all human beings share a common essence, it is also obvious that they have not all reached the same stage of development. Indeed, it is rather clear, from reading European writers, that Europe precedes the rest of humankind, and time after time it is suggested that Africans must emulate Europeans in order to put an end to their inferior condition.

The expected outcome of such emulation has been a process of mental *conversion* (Mudimbe, 1988), predicated upon the belief that only through a careful imitation of Europeans would Africans improve their lot. While the ontological reduction of the colonized had been well understood as a necessary part of colonialism, the implications of the conversion process, on the other hand, had not been fully appreciated. This may be

precisely because the early African critiques of European colonialism (e.g., Frantz Fanon) still functioned within a fundamentally European conceptual framework, such as Marxism. Hence what was challenged was not Western modernity *per se*, but its abusive practices. Europe's tacit advancement of its own culture as some "no-man's cultural land"—its implicit claims to cultural neutrality and universality—was rarely questioned for it was not construed as problematic.

Such an approach, which was to be expected during those early days, would not allow one to understand the colonization process as the systematic imposition of the European worldview, grounded in a specific time and place yet parading as universal, on people whose cultural and historical experiences were quite different.

Afrocentric Organizing Principle and Concepts

Europe's attempted occupation of practically all human space resulted in Africans being considerably removed from their own cultural base to be relegated to footnote status, to the periphery, the margin of the European experience and consciousness. This mental disenfranchisement is held responsible for Africans often not existing on their own cultural and historical terms but on borrowed European ones. Africans are *dislocated* and, having lost sight of themselves in the midst of social decay, find it exceedingly difficult to orient themselves in a positive and constructive manner, a most difficult plight. *Relocation* is the remedy suggested by Afrocentricity. Only when Africans become *centered*, that is, when they consciously and systematically adopt ways, attitudes, and behaviors that are germane to their own cultural traditions and historical reality, can they hope to achieve freedom. In other words, African freedom is predicated upon the conscious activation of one's Africanness, that is, ultimately, with the exercise by African people of their own *agency*.

Afrocentricity further stresses agency as an African cultural imperative. Indeed, in African culture, ancestral traditions must be preserved and transmitted out of respect for one's personal and collective ancestors. Asante therefore defines Afrocentricity as "a frame of reference" generated by Africans themselves, based on African cosmology, axiology, aesthetic, and epistemology: "Afrocentricity is the study of the ideas and events from the standpoint of Africans as the key players rather than victims. This theory becomes, by virtue of an authentic relationship to the centrality of our own reality, a fundamentally empirical project" (1991, p. 172). Asante further insists that while one may argue over the meaning of Africanness, one cannot argue, as an Afrocentrist, over "the centrality of African ideals and values" for African people (1990, p. 6), thus identifying the notion of cultural, and more specifically, epistemological centeredness as *the Afrocentric organizing principle*. In addition to this major principle, Afrocentricity includes a set of unquestioned propositions that it inherited from its intellectual and ideological antecedents, namely, Garveyism, the negritude movement, Fanonism, Kawaida, and Cheikh Anta Diop's historiography. Those propositions can be listed as follows: African people must be conceived as agents and victors; a Pan-African perspective is essential; a deep commitment to African people and Africa is necessary; there exists an African cultural matrix common to all African people with different

surface manifestations; culture is primary and all-inclusive; Africans must reconnect with African culture for genuine African freedom to be; African cultural rebirth is necessary; the colonizer within the African psyche must be killed; and finally, Nile Valley civilizations (in particular, ancient Egypt, or Kemet) are the foundation of African culture and will serve as a model upon which to elaborate new bodies of thought and action relevant to African contemporary needs. Those principles, which are primary both chronologically and logically, function very much as Afrocentricity's premises.

Afrocentricity as the African-American Studies Metaparadigm

The implications of Afrocentricity for African-American studies have been considerable. Indeed, Asante argues that only when African-American studies scholars center themselves mentally and intellectually in the African cultural and historical experience will genuine African-American studies come into existence. Until then, Asante maintains, Eurocentric studies of African people and phenomena will continue to parade as African-American studies, with the latter existing only as a subfield of European studies. First, Afrocentricity insists, it must be realized that any idea, concept, or theory, no matter how "neutral" it claims to be, is nonetheless a product of a particular cultural and historical matrix. As such, it carries specific cultural assumptions, often of a metaphysical nature. Hence to embrace a European theory or idea is not as innocent an academic exercise as it may seem. In fact, it is Afrocentricity's contention that unless African scholars are willing to reexamine the process of their own intellectual conversion, which takes place under the guise of "formal education," they will continue to be the easy prey of European intellectual hegemony. What is suggested, instead, is that African intellectuals must consciously and systematically relocate themselves in their own cultural and historical matrix, from which they must draw the criteria by which they evaluate the African experience. Their work must be informed by "centrism," that is, "the groundedness of observation and behavior in one's own historical experiences" (Asante, 1990, p. 12). *Africology* is the discipline to which those who study African people and phenomena from an Afrocentric perspective belong.

Thus it can be said that Afrocentricity emerged as a new paradigm to challenge the Eurocentric paradigm responsible for the intellectual disenfranchisement and the making invisible of African people, even to themselves in many cases.

In that respect, Afrocentricity therefore presents itself as *the African-American studies metaparadigm*. As such, it includes three major aspects: cognitive, structural, and functional. The cognitive aspect involves the metaphysical foundations—such as the organizing principle and set of presuppositions that were outlined above, a methodology, methods, concepts, and theories. The structural aspect refers to the existence of an Afrocentric intellectual community, such as is found at Temple University. Finally, the structural aspect of the Afrocentric paradigm refers to the ability of the latter to activate African people's consciousness and to bring them closer to freedom, the ultimate goal of Afrocentricity. Hence Asante concludes that what can be called *the discipline of African-American*

studies itself is intimately linked to the development of Afrocentricity and the establishment in the late eighties of the Temple doctoral program, the first Ph.D. program in African-American studies in the United States.

The Temple Ph.D. program in Africology was immediately successful, as hundreds of national and international applicants sought admission in order to be a part of the Afrocentric epistemological watershed. Although the program has suffered serious setbacks since its inception, there can be little doubt about its influence on African-American studies. Over four hundred dissertations employing the Afrocentric paradigm have been defended, at Temple and at other institutions. Indeed, the Temple Ph.D. program opened the path for the creation of other African-American studies Ph.D. programs in the United States in subsequent years.

Afrocentricity and Its Critics

As could be expected, however, Afrocentricity's growing paradigmatic ascendancy over African-American studies also prompted serious critiques, which fall within five broad categories. First, critics have disagreed with some of Afrocentricity's premises, in particular the notion of an African essence that undergirds the notion of *center*. This criticism is often heard in poststructuralist circles, since the very idea of a *center* is antithetical to the poststructuralist paradigm. Often associated with this criticism is the additional claim that in its search for Africanness, Afrocentricity does not allow for cultural change. In fact, some argue, Afrocentricity's inability to deal adequately with cultural change prevents it from understanding that being African today also means being at least partly European as a result of colonization and widespread Westernization. Afrocentricity, then, is perceived as too restrictive and incapable of grasping the dialectical complexity of modern African identities. While he denies being an "immutabilist," Asante's response has been that Africans need a place to stand in order to challenge oppressive White structures and systems of knowledge and therefore cannot afford postmodern, evanescent, fluid selves. In any case, any discourse on identity is necessarily essentialist. Afrocentrists also point out that far from denying the Westernization of many Africans' consciousness, they recognize it as a destructive force that must be circumvented.

Second, some have taken issue with Afrocentricity's main category, culture. Black feminists and black neo-Marxists advance gender and social class, respectively, as the primary contradiction in African-American life. With regard to feminism, however, Afrocentric scholars who tackle gender issues question the relevance of feminist philosophical and political assumptions for African people, including African women. Concerning the question of class, while it is quite feasible and necessary to articulate an Afrocentric economic theory, Afrocentricity maintains that race/culture remains the most socially relevant category in American society.

Third, Afrocentricity has also been criticized for making untenable historical claims, especially in relation to ancient Egypt. This argument, probably the most publicized, has stemmed from European classicists who, having subscribed to the Greek Miracle theory, became disturbed by two related developments associated with the spread of Afrocentricity: first,

credit was being taken away from Europe for the great civilizations of the Nile Valley (in particular, Egypt); and second, as a consequence the original intellectual achievements of Greece itself were revisited and diminished. For instance, it was pointed out that many Greek philosophers had studied for long periods of time in ancient Africa, and were in reality indebted to their African teachers for many of their ideas. Therefore many European scholars in the United States and Europe proceeded to refute those "Afrocentric" claims. However, it must be noted that the debate over the racial identity of the early Egyptians predates the emergence of Afrocentricity by several decades and is not, therefore, an issue germane to Afrocentricity *per se*. It must be more correctly understood within the context of Diopian historiography, which places Egypt at the beginning, both chronologically and conceptually, of African civilization. In fact, several of the scholars associated with this thrust, such as Martin Bernal, have never claimed to be Afrocentric.

Fourth, Afrocentricity has also been criticized for intellectual bad faith because of wrong attributions and associations. For instance, Afrocentricity has been associated with biological-deterministic arguments (such as that around melanin) that were never part of its premises.

Finally, criticism of an ideological nature has been voiced. In one instance, Afrocentricity has been blamed as reversed Eurocentrism. Some scholars contend that Afrocentricity merely seeks to replace one geopolitical hegemonic center, Europe, with another hegemonic one, Africa. However, as even a cursory reading of Asante's texts would reveal, Afrocentricity is fundamentally nonhegemonic and welcomes the existence of a multiplicity of cultural centers. It is precisely that position that allowed Afrocentricity to challenge Eurocentrism in the first place. Some have also contended that Afrocentricity undermines the very fabric of American society. By emphasizing the Africans' prerogative to be *human as Africans*, Afrocentricity is said to threaten the unity of American society, including the American academe. However, Afrocentrists remark that the unspoken fear is not so much about a shattered national unity (which, given racism, could have never truly existed) but about the threat that Afrocentricity poses to Europe's self-serving monopoly over reason.

While Afrocentricity continues to exercise a significant influence in the United States, it has also been receiving increased attention in Europe and Africa, where a vigorous intellectual movement has emerged informed by Afrocentric tenets and referred to as the "African Renaissance," thus creating the possibility for Afrocentricity to be transformed into a Pan-African school of thought in the years to come.

AFROPESSIMISM. Afropessimism refers to the perception of sub-Saharan Africa as a region too riddled with problems for good governance and economic development. The term gained currency in the 1980s, when many Africanists in Western creditor countries believed that there was no hope for consolidating democracy and achieving sustainable economic development in the region. The earliest use in print of the word was in a 1988 article from the Xinhua News Agency in which Michel Aurillac, France’s minister of cooperation, criticized the prevailing pessimism in the West about Africa’s economic development and cautioned against what he referred to as an “Afro-pessimism” on the part of some creditors.

Depiction

Many writers have given different expressions to the phenomenon of Afropessimism. Attempts to explain the concept include both cogent studies (Ayittey, 1992, 1998; Jackson and Rosberg; Kaplan, 1994) and polemical and shallow travelogues (Richburg). In general, one virtue of Afropessimist writings is that they do not whitewash Africa’s problems. Further, they correctly refuse to excuse the outrages of some African dictators on the basis of political ideology or racial identity. In particular they refuse to use colonial exploitation to mask postcolonial kleptocracy, the personalization of state power, and the politics of prebendalism. The writers mentioned above (excepting Richburg and Kaplan) do not reject the hope that Africa can develop or that it is capable of overcoming its political and economic problems. In this sense they are not themselves pessimistic about the future of Africa but rather are simply describing the phenomenon of Afropessimism. The real Afropessimists are writers who call for abandoning, or worse,

recolonizing the continent (Johnson; Kaplan, 1992, 1994; Michaels; Hitchens). While generally the writers in the first group merely denounce postcolonial African leadership by pointing out its weaknesses, those in the latter tend to conclude that Africans are incapable of self-rule.

However, a common characteristic of the two modes of Afropessimist writings is imbalance. They all tend to highlight the horrors of a few African countries and ignore the advances of many other countries at various times. The unscientific establishment of doomsday conclusions about Africa characteristic of studies in this genre (see, in particular, Richberg) are usually not warranted by the limited sample of African countries discussed in the narratives. The unintended result is that Africa is given a blanket negative portrayal. (There are, by contrast, prominent works that for the most part decry Africa’s image in the West—see, for instance, Hammond and Jablow; Hawk.) The resultant foreboding and ominous image in Western media and the academy weakens the continent in the global competition for foreign investment and tourism (see Onwujiwe, 1996). This is an economic effect of Afropessimism.

African Rebirth

Still, the conditions that merit pessimism for the future of Africa are not manufactured by Afropessimists; such conditions are empirically verifiable. Since the end of the Cold War, important African leaders such as Presidents Thabo Mbeki of South Africa, Olusegun Obasanjo of Nigeria, and Maître Abdoulaye Wade of Senegal have come to recognize this and have resolved to do something about it. As a result, there has been an honest effort on the continent to address the important issues of good political, economic, and corporate governance and the professionalization of the army in order to diminish chances for destabilizing military coups. These efforts had led the Organization of African Unity (OAU) to found a new institution, the New Partnership for Africa’s Development (NEPAD), charged with the responsibility to provide a vision and strategic framework for Africa’s renewal. NEPAD attempts to provide African interventions with regard to issues of relative underdevelopment and marginalization. NEPAD’s formation and other historic African transformative actions have been referred to as African renaissance.

Impact

In the donor countries of the West in the 1980s, Afropessimists were found in the government, media, and academia. The prevailing view that votes for Africa’s stabilization and development were a waste of scarce resources was fanned by conservative politicians, bureaucrats, journalists, and scholars. This quickly led to an era of strained relationships between Western donor countries and African recipient countries in the late 1980s and early 1990s. Donor countries complained that progress was being slowed by bad governance, corruption, and mismanagement of funds, creating disillusionment and donor (or aid) fatigue. African countries in turn complained of unfulfilled promises and unwarranted intrusiveness in domestic policies by donors. The net result was a reduction in the volume of development aid from Western to African countries.

Explanations

Two explanations have been put forth for the conditions that produced the phenomenon of Afropessimism. One is the apparent inability of postcolonial African leaders to practice good governance. Since the 1960s, when most countries in Africa south of the Sahara regained political independence from European colonialists, the standard of living in Africa has fallen below expectations. The achievement of political self-rule naturally came with raised expectations of the good life for Africans who had been subjected to exploitation and subjugation by colonial tyranny. In the exuberance of the freedom moment, the new indigenous leaders of Africa promised their fellow citizens a brighter future. However, by the 1980s, more than twenty years after independence, the African condition (especially for the masses) had fallen far below the continent's potential. For the most part, bad leadership was responsible for the disappointing performance. Independence ushered in an era of political instability, military dictatorships, and gross mismanagement of natural resources by very corrupt African leaders. By the 1980s all these conspired to drive down the standard of living in most African countries, forcing an otherwise resource-rich continent to become severely dependent on foreign aid and foreign debt.

Another school of thought locates the source of Africa's social and economic downfall on the international political environment. According to this school, Africa regained self-rule during the era of the Cold War, when the relationship between the countries in the Eastern bloc led by the Soviet Union and countries of the Western bloc led by the United States was marked by a state of military competition and political tension. The rivalry stopped short of actual war between the two superpowers, but it forced Africa to become a surrogate terrain for the hot war between the two camps. In the process, African countries, most of them weak and dependent on the Western or Eastern ideological blocs, became little more than client states. Under this new dispensation, Africans lost the power to choose their own leaders. Africa's dependent dictators owed their offices to the economic and military support of Cold War powers. For the most part they put the interests of the foreign powers on which they were dependent ahead of their own national interests. This situation, which was as exploitative and impoverishing as colonialism, became known as neocolonialism and is blamed for the postcolonial impoverishment of Africans that fueled the fires of Afropessimism in the 1980s. Consequently, with the end of the Cold War, some Africanists came to believe that if the detrimental international conditions it imposed were ultimately reversed, then conditions in Africa would improve through good governance. Those who believe in this are known as Afro-optimists. Challenging the view that sub-Saharan Africa has only regressed since independence, they advance examples of postcolonial triumphs achieved by Africa's political leadership despite the prevailing problems identified by Afropessimists. They argue that the energy and perseverance of African peoples portend hope for the future of the continent.

A Middle Ground

The truth about Africa's impoverishment lies somewhere between the analyses of Afropessimists and Afro-optimists. There

is no doubt that corrupt and uncourageous leadership has been the bane of socioeconomic development of sub-Saharan Africa in the postcolonial period. These leaders stunted democratic processes with force in order to preserve a system of one-person rule with no accountability. They awarded overpriced contracts to foreign companies in exchange for large kickbacks deposited in personal accounts in foreign banks. Their conspicuous consumption, cult of personality, nepotism, and naked abuse of political power encouraged a culture of greed, military coups, and instability, which reduced Africa's competitiveness for foreign investment. Governments borrowed billions in the name of the nation and cronies squandered the money, thereby saddling the people with debt.

It is also true that in the same period, global political and economic policies reinforced the legacy of colonialism and exacerbated Africa's problems of self-rule. Apartheid South Africa sponsored destabilizing wars in the southern African region, and a cycle of Cold War-surrogate wars and conflicts ravaged Angola and Mozambique. These wars claimed millions of African lives and devastated the economies of the warring countries. Economic adjustment policies of the World Bank forced African countries to cut spending in health, education, and infrastructure in order to save money to service foreign debts. Low international prices of commodities produced by Africans caused African countries to lose about \$50 billion in the 1980s and early 1990s, the same period of the most virulent Afropessimism. These externally induced problems combined with internal inefficiencies to stunt Africa's political and economic growth and give rise to Afropessimism. However, by the turn of the twenty-first century sub-Saharan Africa's fortunes seemed to have turned markedly for the better.

AGNOSTICISM. The heyday of agnosticism was in Victorian Britain between the 1860s and the 1890s. Its leading exponents were Herbert Spencer (1820–1903), Thomas Henry Huxley (1825–1895) (who coined the term), Leslie Stephen (1832–1904), John Tyndall (1820–1893), and William Kingdon Clifford (1845–1879). This group all shared a disillusionment with orthodox Christianity; an opposition to the dominance of British science and education by the Anglican establishment; belief in the theory of evolution and in the importance of science more broadly; and an aspiration to replace dogmatism and superstition with a freethinking, scientific, and ethical religion (see Lightman, 1987, 1989, 2002; Pyle; Turner, 1974, 1993). While agnosticism may have been an antitheological and secularist movement, it was certainly not antireligious. The Victorian agnostics were intensely moralistic people who had a deep sense of the spiritual, especially as evoked by the wonders of the natural world.

The Philosophical Sources of Agnosticism

The term *agnosticism*, as it is used in common parlance, normally refers to a neutral or undecided position on the question of the existence of God. It is shorthand for a rejection of religious faith on the one hand and of outright atheism on the other. The philosophical sources and Victorian expositions of agnosticism, however, reveal it to signify a much broader set of arguments about the limits of human knowledge, whether religious or scientific.

Bernard Lightman’s definitive study, *The Origins of Agnosticism* (1987), places particular emphasis on the concept’s Kantian origins. It is true that Kantian views about the limits of speculative reason, the relativity of knowledge, and the active role of the categories of the mind in constituting that knowledge formed an important part of agnosticism. Lightman argues convincingly for the influence of two writers in particular—William Hamilton (1788–1856) and Henry Longueville Mansel (1820–1871)—on later Victorian agnostics. Hamilton was a Scottish metaphysician who, as well as seeing himself as a defender of the Scottish “common sense” philosophy of Thomas Reid (1710–1796) and Dugald Stewart (1753–1828), was probably the most

important expositor of Kantian philosophy in Britain in the first half of the nineteenth century.

Mansel drew heavily on Hamilton’s particular version of Kantianism in his controversial 1858 Bampton Lectures, entitled *The Limits of Religious Thought*. In these lectures, Mansel argued that speculative reason on its own led to all sorts of contradictions if allowed free rein in the area of theology. His conclusion was that only relative knowledge was possible and that the absolute (or the *unconditioned*, to use Hamilton’s term) was not knowable through the faculties of sense and reason. Mansel’s conclusion was that in the realm of theology, final authority must rest with revelation rather than reason. While Mansel believed that he had used Kant’s philosophy constructively—to demonstrate the necessity of revelation and the authority of the Bible—critics from all sides felt that his arguments constituted, in effect, a complete capitulation in the face of rationalism and modern science and a retreat into an extreme form of fideism.

The idea that Kantian philosophy was at the heart of agnosticism needs to be qualified in a couple of ways (as Lightman himself acknowledges). First, Hamilton and Mansel were far from being simply followers of Kant. They tried to make use of his ideas for their own polemical purposes and certainly did not agree with or reproduce his entire system. The attempt to use philosophy to undermine reason in the realm of theology and establish the necessity and authority of revelation is certainly not “Kantian” in the sense of being a teaching of Kant. Second, a recognition of the influence of Kant on Victorian agnostics should not obscure the very important contributions of David Hume (1711–1776), to whom Kant himself famously acknowledged an important debt, and of other philosophers in the Scottish tradition. These included Reid and Stewart, in whose footsteps Hamilton was following, as well as Hamilton’s principal philosophical antagonist, the empiricist John Stuart Mill (1806–1873). The agnostic philosophy of Thomas Huxley, for instance, was based on a teaching central to the Scottish school, namely that “mind” and “matter” were merely shorthand terms for unknown realities that underlie the world of experience (which is the only domain in which we can have knowledge).

Victorian Agnosticism

Herbert Spencer’s *First Principles* (1862) laid the groundwork for the hugely ambitious, multivolume *Synthetic Philosophy*, finally completed in 1896, which articulated Spencer’s vision of how philosophy, biology, sociology, ethics, religion, and society itself needed to be reconceptualized and transformed in the light of the doctrine of evolution (see Peel). The first part of the *First Principles*, entitled “The Unknowable,” was considered the Bible of agnosticism for the rest of the Victorian period. Spencer argued that science and religion could be reconciled if they recognized that both, ultimately, were concerned with realities whose foundations were beyond the grasp of human knowledge. However, while science could get on with measuring, analyzing, and interpreting observable phenomena, nothing was left for theologians but total silence in the face of the unknowable. There was no role for revelation in Spencer’s proposed scientific and agnostic religion, and Mansel’s conservative critics saw

THOMAS HUXLEY AND THE COINING OF *AGNOSTIC*

Thomas Henry Huxley (1825–1895) rose to prominence in Victorian Britain as a man of science and a brilliant and combative essayist. His polemical defenses of the theory of evolution against its theological detractors, especially in a legendary debate with Samuel Wilberforce (1805–1873), the bishop of Oxford, in 1860, earned him the nickname “Darwin’s Bulldog.” His writings covered topics in philosophy and politics as well as natural science—he was a passionate advocate of better and more widely accessible state education, especially in the sciences. His writings, which included a book on the philosophy of Hume, also reveal the depth and breadth of his learning in the areas of philosophy, religion, and theology. The following excerpt from his 1889 essay “Agnosticism” is Huxley’s own account of how and why he had come to coin the term *agnostic* some twenty years earlier.

When I reached intellectual maturity and began to ask myself whether I was an atheist, a theist, or a pantheist; a materialist or an idealist; Christian or a freethinker; I found that the more I learned and reflected, the less ready was the answer; until, at last, I came to the conclusion that I had neither art nor part with any of these denominations, except the last. The one thing in which most of these good people were agreed was the one thing in which I differed from them. They were quite sure they had attained a certain “gnosis,”—had, more or less successfully, solved the problem of existence; while I was quite sure I had not, and had a pretty strong conviction that the problem was insoluble. And, with Hume and Kant on my side, I could not think myself presumptuous in holding fast by that opinion. Like Dante,

Nel mezzo del cammin di nostra vita
Mi ritrovai per una selva oscura,
but, unlike Dante, I cannot add,
Che la diritta via era smarrita.

On the contrary, I had, and have, the firmest conviction that I never left the “verace via”—the straight road; and that this road led

nowhere else but into the dark depths of a wild and tangled forest. And though I have found leopards and lions in the path; though I have made abundant acquaintance with the hungry wolf, that “with privy paw devours apace and nothing said,” as another great poet says of the ravening beast; and though no friendly spectre has even yet offered his guidance, I was, and am, minded to go straight on, until I either come out on the other side of the wood, or find there is no other side to it, at least, none attainable by me.

This was my situation when I had the good fortune to find a place among the members of that remarkable confraternity of antagonists, long since deceased, but of green and pious memory, the Metaphysical Society. Every variety of philosophical and theological opinion was represented there, and expressed itself with entire openness; most of my colleagues were *-ists* of one sort or another; and, however kind and friendly they might be, I, the man without a rag of a label to cover himself with, could not fail to have some of the uneasy feelings which must have beset the historical fox when, after leaving the trap in which his tail remained, he presented himself to his normally elongated companions. So I took thought, and invented what I conceived to be the appropriate title of “agnostic.” It came into my head as suggestively antithetic to the “gnostic” of Church history, who professed to know so much about the very things of which I was ignorant; and I took the earliest opportunity of parading it at our Society, to show that I, too, had a tail, like the other foxes. To my great satisfaction, the term took; and when the *Spectator* had stood godfather to it, any suspicion in the minds of respectable people, that a knowledge of its parentage might have awakened was, of course, completely lulled.

in Spencer's system exactly the conclusions they had feared would follow from Mansel's teachings on the impotence of human reason in the theological realm.

Although Spencer was later generally considered to be the leading representative of agnosticism, the terms *agnostic* and *agnosticism* did not themselves come into use until about ten years after the publication of the *First Principles*. The terms gained currency through their use by Spencer but also by the theologian and journalist R. H. Hutton, the editor of the *Spectator* in the 1870s, and the lapsed Anglican minister Leslie Stephen, who, after leaving the Church of England, wrote *An Agnostic's Apology* (1876).

Although he made some use of the term in his writings from the 1870s onward, it was only in 1889 that Thomas Huxley revealed himself as the inventor of the terms *agnostic* and *agnosticism* and explained how and why he had come to coin them (Lightman, 2002). One of Huxley's earlier essays that gained him much attention (and much criticism) was entitled "On the Physical Basis of Life" (reprinted in *Collected Essays*, vol. 1). This essay, based on a lecture delivered in Edinburgh in 1868, just a year before he coined the term *agnostic*, is one of the most helpful illustrations of the essence of Huxley's agnosticism. Although the essay was criticized for espousing a materialistic view of life (the idea that all living things are made up of the same substance—"protoplasm"), in fact it defended a nescient or radically empiricist understanding of science as producing nothing more than a set of symbols with which to describe and organize observable phenomena. Huxley rejected materialism on the grounds that it was impossible for empirical science to determine anything at all about the nature of any putative substance or substances underlying the phenomena or of any supposed laws or causes. "In itself," Huxley said, "it is of little moment whether we express the phenomena of matter in terms of spirit; or the phenomena of spirit in terms of matter: matter may be regarded as a form of thought, thought may be regarded as a property of matter—each statement has a certain relative truth" (1893–1894, vol. 1, p. 164). (The materialistic terminology was to be preferred, however, for the pragmatic reason that it connected with other areas of scientific investigation, which were expressed in the same terms, and for the reason that spiritualistic terminology was entirely barren.) Huxley denied that this was a "new philosophy" and especially that it was the invention of the positivist Auguste Comte (1798–1857), as some supposed. Comte, he said, lacked entirely "the vigour of thought and the exquisite clearness of style" of the true author of this philosophy, "the man whom I make bold to term the most acute thinker of the eighteenth century—even though that century produced Kant" (1893–1894, vol. 1, p. 158). The man Huxley had in mind, of course, was Hume.

The closing pages of "On the Physical Basis of Life," then, show several important things about Huxley's agnosticism. They show that Huxley felt the need for a new label—*agnostic*—not in order to distance himself from Christianity (everyone already knew he was an opponent of theological orthodoxy) but primarily in order to repudiate the labels *materialist*, *atheist*, and *positivist*. They also show that Huxley considered Hume to be at least as important as Kant, if not more

important, in the historical pedigree of agnosticism. And finally, they show that agnosticism involved admitting ignorance about the fundamental nature of the physical universe as well as about the existence and attributes of the divine.

Agnosticism in the Twentieth Century

The scientific and religious creed of agnosticism died with Leslie Stephen in 1904. However, the philosophical and theological questions around which it was based, especially about the relationship between the observable and the unobservable, persisted into the twentieth century (although not generally under the banner of agnosticism).

The logical positivism of the earlier twentieth century, along with more recent antirealist philosophies of science (such as Bas van Fraassen's "constructive empiricism" as developed in his 1980 book, *The Scientific Image*), have contained some of the radically empiricist elements of agnosticism as endorsed by Huxley (and derived from Hume and Mill). These philosophers have insisted that all true knowledge must be grounded in experience and that since we cannot have direct experience of unobservable substances, entities, laws, or causes, we must treat them as, at best, useful fictions that serve as shorthand for empirical generalizations. Logical positivists dismissed all "metaphysical" discourse, which claimed to describe underlying realities, as meaningless. In this they agreed both with Comtean positivists and with agnostics.

In the realm of religion and theology, the problems that were central to the agnostics—especially the difficulty of reconciling religion and morality with a scientific worldview—continued to occupy religious thinkers (see Dixon). Some, such as Thomas Huxley's grandson Julian Sorell Huxley (1887–1975), put forward "evolutionary humanism" as a scientific religion based on reason and morality but without revelation. Others took a similar approach but while remaining within the Christian tradition. Don Cupitt, for instance, in books such as *Taking Leave of God* (1980) and *The Sea of Faith* (1984), adopted a "nonrealist" metaphysics and articulated a post-theological version of the Christian religion. For Cupitt, himself a minister in the Church of England, the claims of Christian theology should not be taken to refer to unseen supernatural realities, such as a personal God, but to be expressions of human values and aspirations.

So scientists seeking to give expression to a religious impulse while retaining their intellectual integrity along with theologians looking for an interpretation of the gospel that will resonate in a secular and scientific world have both continued the religious project that the Victorian agnostics had begun.

Europe and the Middle East

CHINA

Chinese alchemy is based on doctrinal principles, first set out in the founding texts of Daoism, concerning the relation between the domains of the Absolute and the relative, or the Dao and the "ten thousand things" (*wanwu*). Its teachings and

practices focus on the idea of the elixir, frequently referred to as the Golden Elixir (*jindan*), the Reverted Elixir (*huandan*), or the Medicine (*yao*). Lexical analysis shows that the semantic field of the term *dan* (elixir) evolves from a root-meaning of "essence"; its connotations include the reality, principle, or true nature of an entity, or its most basic and significant element or property. The purport of alchemy as a doctrine is to illustrate the nature of this underlying "authentic principle" and to explicate its relation to change and multiplicity.

In the associated practices, compounding the elixir has two primary meanings. In the first sense, the elixir is obtained by heating its ingredients in a crucible. This practice, as well as the branch of alchemy that is associated with it, is known as *waidan*, or "external alchemy" (literally, "outer elixir"). In the second sense, the ingredients of the elixir are the primary components of the cosmos and the human being, and the entire process takes place within the practitioner. This second form of practice (which incorporates some aspects of Daoist meditation methods and of physiological techniques of self-cultivation), as well as the corresponding branch of the alchemical tradition, is known as *neidan*, or "inner alchemy" (literally, "inner elixir"). The Chinese alchemical tradition has therefore three main aspects, namely a doctrinal level and two paradigmatic forms of practice, respectively based on the refining of an "outer" or an "inner" elixir.

The Elixir in External Alchemy

Although the first allusions to alchemy in China date from the second century B.C.E., the combination of doctrines and practices involving the compounding of an elixir, which is necessary to define alchemy as such and to distinguish it from proto-chemistry, is not clearly attested to in extant sources until the third century C.E. The first identifiable tradition, known as Taiqing (Great Clarity; Pregadio, 2005), developed from that time in Jiangnan, the region south of the lower Yangzi River that was also crucial for the history of Daoism during the Six Dynasties (third to sixth centuries). The Taiqing scriptures consist of descriptions of methods for compounding elixirs and of benefits gained from their performance and contain virtually no statements regarding their doctrinal foundations. The emphasis given to certain aspects of the practice and the terminology used in those descriptions, however, show that the central act of the alchemical process consists in causing matter to revert to its state of "essence" (*jing*), or *prima materia*. The main role in this task is played by the crucible, whose function is to provide a medium equivalent to the inchoate state (*hundun*) prior to the formation of the cosmos. In that medium, under the action of fire, the ingredients of the elixir are transmuted, or "reverted" (*huan*), to their original state. A seventh-century commentary to one of the Taiqing scriptures equates this refined matter with the "essence" that, as stated in the *Daode jing* (Scripture of the Way and Its Virtue), gives birth to the world of multiplicity: "Indistinct! Vague! But within it there is something. Dark! Obscure! But within it there is an essence."

In the Taiqing texts, compounding the elixir constitutes the central part of a larger process consisting of several stages, each of which is marked by the performance of rites and ceremonies.

Receiving the scriptures and the oral instructions, building the laboratory, kindling the fire, and ingesting the elixir all require offering pledges to one's master and to the gods, observing rules on seclusion and purification, performing ceremonies to delimit and protect the ritual area, and making invocations to the highest deities. Ingesting the elixir is said to confer transcendence and admission into the celestial bureaucracy. Additionally the elixir grants healing from illnesses and protection from demons, spirits, and several other disturbances. To provide these supplementary benefits, the elixir does not need to be ingested and may simply be kept in one's hand or carried at one's belt as a powerful apotropaic talisman.

The methods of the *Taiqing* texts are characterized by the use of a large number of ingredients. Sources attached to later *waidan* traditions instead describe different varieties of a single exemplary method, consisting of the refining of mercury (Yin) from cinnabar (Yang), its addition to sulfur (Yang), and its further refining. This process, typically repeated seven or nine times, yields an elixir that is deemed to embody the qualities of pure Yang (*chunyang*)—that is, the state of oneness before its differentiation into Yin and Yang.

Role of Cosmology

The doctrinal aspects of alchemy are the main focus of many sources dating from the Tang period (seventh to tenth centuries) onward. These sources formulate their teachings and practices by borrowing the language and the abstract emblems of correlative cosmology, a comprehensive system designed to explicate the nature and properties of different domains—primarily the cosmos and the human being—and the relations that occur among them. The main work that reflects these changes and provides them with textual authority is the *Zhouyi cantong qi* (Token of the Agreement of the Three According to the *Book of Changes*; the “three” mentioned in the title are, according to some commentaries, Daoism, cosmology, and alchemy). Virtually the entire alchemical tradition from the Tang period onward acknowledges this text as its most important scriptural source. Despite this, the *Cantong qi* does not primarily deal with either *waidan* or *neidan* and only occasionally alludes to both of them. Its main purpose is to illustrate the nonduality of the Dao and the cosmos; the task of explicating the details of this doctrinal view, and of applying it to *waidan* and *neidan*, is left to the commentaries and to a large number of related texts.

The emblems of correlative cosmology—typically arranged in patterns that include Yin and Yang, the five agents (*wuxing*), the eight trigrams and the sixty-four hexagrams of the *Book of Changes* (*Yijing*), and so forth—play two main roles closely related to each other. First, they illustrate the relation between unity, duality, and the various other stages of the propagation of Original Pneuma (*yuanyang*) into the “ten thousand things.” In this function, cosmological emblems serve to show how space, time, multiplicity, and change are related to the spacelessness, timelessness, nonduality, and constancy of the Dao. For instance, the *Cantong qi* describes the five agents (which define, in particular, the main spatial and temporal coordinates of the cosmos) as unfolding from the center, which contains them all, runs through them, and “endows them with its efficacy.” In their second role, the emblems of the cosmological system are

used to formulate the relation of the alchemical practice to the doctrinal principles. For instance, the trigrams of the *Book of Changes* illustrate how the alchemical process consists in extracting the pre-cosmic Real Yin (*zhenyin*) and Real Yang (*zhenyang*) from Yang and Yin as they appear in the cosmos, respectively, and in joining them to produce an elixir that represents their original oneness (Pregadio, 2000, pp. 182–184).

In the traditions based on the *Cantong qi*, alchemy is primarily a figurative language to represent doctrinal principles. The *waidan* process loses its ritual features, and the compounding of the elixir is based on two emblematic metals, mercury and lead. The refined states of these metals—respectively obtained from cinnabar and from native lead—represent Yin and Yang in their original, pre-cosmic state, and their conjunction produces an elixir whose properties are said to be equivalent to Pure Yang. The central role played by cosmology in these *waidan* traditions is reflected in two works related to the *Cantong qi*, which respectively state that “compounding the Great Elixir is not a matter of ingredients, but always of the Five Agents,” and even that “you do not use ingredients, you use the Five Agents.”

Doctrines and Practices of Inner Alchemy

Besides a new variety of *waidan*, the *Cantong qi* also influenced the formation of *neidan* (Robinet, 1989, 1995), whose earliest extant texts date from the first half of the eighth century. The authors of several *neidan* treatises refer to their teachings as the Way of the Golden Elixir (*jindan zhi dao*). Their doctrines essentially consist of a reformulation of those enunciated in the early Daoist texts, integrated with language and images drawn from the system of correlative cosmology according to the model provided by the *Cantong qi*. The respective functions of these two major components of the alchemical discourse are clearly distinguished in the doctrinal treatises. Their authors point out that the alchemical teachings can only be understood in the light of those of the *Daode jing* (which they consider to be “the origin of the Way of the Golden Elixir”) and that correlative cosmology provides “images” (*xiang*) that serve, as stated by Li Daochun (fl. 1288–1292), “to give form to the Formless by the word, and thus manifest the authentic and absolute Dao” (*Zhonghe ji*, chapter 3; see Robinet, 1995, p. 75). The alchemical discourse therefore has its roots in metaphysical principles; it uses the language and images of correlative cosmology to explicate the nature of the cosmos and its ultimate unity with the absolute principle that generates and regulates it. Its final purpose, however, is to transcend the cosmic domain, so that the use of images and metaphors involves explaining their relative value and temporary function.

The status attributed to doctrines and practices reflects this view. Some authors emphasize that the inner elixir is possessed by every human being and is a representation of one's own innate realized state. Liu Yiming (1737–1821) expresses this notion as follows:

Human beings receive this Golden Elixir from Heaven. . . . Golden Elixir is another name for one's fundamental nature, formed out of primeval inchoateness [*buncheng*, a term derived from the *Daode jing*]. There is no other

Golden Elixir outside one's fundamental nature. Every human being has this Golden Elixir complete in oneself: it is entirely achieved in everybody. It is neither more in a sage, nor less in an ordinary person. It is the seed of Immortals and Buddhas, and the root of worthies and sages. (*Wuzhen zhizhi*, chapter 1)

Borrowing terms from the *Cantong qi*, which in turn draws them from the *Daode jing*, Liu Yiming calls "superior virtue" (*shangde*) the immediate realization of the original "celestial reality" (*tianzhen*), which is never affected by the change and impermanence that dominate in the cosmos, and "inferior virtue" (*xiade*), the performance of the alchemical process in order to "return to the Dao." He states, however, that the latter way, when it achieves fruition, "becomes a road leading to the same goal as superior virtue" (*Cantong zhizhi*, "Jing," chapter 2).

While the *neidan* practices are codified in ways that differ, sometimes noticeably, from each other, the notion of "inversion" (*ni*) is common to all of them (Robinet, 1992). In the most common codification, the practice is framed as the reintegration of each of the primary components of being, namely essence, pneuma, and spirit (*jing*, *qi*, and *shen*), into the one that precedes it in the ontological hierarchy, culminating in the "reversion" (*huan*) to the state of nonbeing (*wu*) or emptiness (*kong*). The typical formulation of this process is "refining essence and transmuting it into pneuma," "refining pneuma and transmuting it into spirit," and "refining spirit and returning to Emptiness." Li Daochun relates these stages to the passage of the *Daode jing* that states: "The Dao generates the One, the One generates the Two, the Two generate the Three, the Three generate the ten thousand things." According to this passage, the Dao first generates Oneness, which harbors the complementary principles of Yin and Yang. After Yin and Yang differentiate from each other, they rejoin and generate the "Three," which represents the One at the level of the particular entities. The "ten thousand things" are the totality of the entities produced by the continuous reiteration of this process. In Li Daochun's explication, the three stages of the *neidan* practice consist in reverting from the "ten thousand things" to emptiness, or the Dao. In this way, the gradual process that characterizes inner alchemy as a practice is equivalent to the instantaneous realization of the nonduality of the Absolute and the relative.

Just as *waidan* draws many of its basic methods from pharmacology, so *neidan* too shares a significant portion of its notions and methods with classical Chinese medicine and with other bodies of practices, such as meditation and the methods for "nourishing life" (*yangsheng*). What distinguishes alchemy from these related traditions is its unique view of the elixir and a material or immaterial entity that represents the original state of being and the attainment of that state.

Fabrizio Pregadio

EUROPE AND THE MIDDLE EAST

To a modern observer, *alchemy* likely connotes only the transmutation of base metals into gold, or perhaps a more metaphorical transformation of the soul. In its roughly two-thousand-year history, however, alchemy's practices and ideas have ranged much more broadly, encompassing everything from the production of dyes, medicines, precious metals, and gemstones to assaying techniques, matter theory, and spiritual practices linking the manipulation of matter to changes in the alchemist's soul. Although all of these dimensions were present from alchemy's beginnings, practitioners have chosen to highlight particular facets of their art at different times. Any definition of alchemy, therefore, must be both sensitive to its historical permutations and broad enough to include each of its chemical, pharmacological, metallurgical, and spiritual components. To be more precise, one may speak of technical or practical alchemy, spiritual alchemy, natural philosophical alchemy, transmutational alchemy, and medical alchemy (often referred to as iatrochemistry or *chimiatria*). This essay offers an overview of alchemy's changing meaning over its rich and long history.

Practical Origins in Hellenistic Egypt

Although alchemy's roots undoubtedly extend as far back as metallurgy itself, the textual record dates to the first centuries C.E. in the Egyptian city of Alexandria. Immersed in an extraordinary mix of cultures and traditions, Alexandrian alchemists blended Greek matter theory and philosophy, Neoplatonism, Gnosticism, Babylonian astrology, Egyptian mythology, mystery cults, and craft recipes for making cosmetics, beer, precious stones, and gold. Because the few extant texts from this period were written in Greek, this initial period is typically known as Greek alchemy.

The oldest text documenting early alchemy is the *Physika kai mystika* (Of natural and mystical things), purportedly written by the Greek natural philosopher Democritus but likely written by Bolos of Mendes (third century B.C.E.). The *Physika kai mystika* and other similar texts (such as two anonymous Egyptian papyri known as the Leiden Papyrus X and the Stockholm Papyrus) focus on the kind of practical knowledge that would continue to engage alchemists for centuries, providing instructions for how to manufacture and “multiply” gold and silver, as well as how to produce chemically other valuable gemstones, pearls, and dyes. The works of a female alchemist from Hellenistic Egypt named Maria the Jewess (fl. 250 C.E.) contain the oldest descriptions of some of alchemy's most important apparatus, namely alchemical furnaces and stills.

Theoretical Foundations in Antiquity

Such practical alchemical work received theoretical justification in part from Greek natural philosophy. Although Aristotle (384–322 B.C.E) did not write about alchemy per se, he provided a theory of matter that made it possible to conceptualize the transmutation of metals. Aristotle posited the notion that all things were composed of the same formless, passive matter (*materia prima*), which was then transformed into a specific substance by an active, shaping form. For alchemical theory, Aristotle's crucial notion was that, because the four elements—earth, fire, water, and air—were composed of the same basic matter, they could be transmuted into one another by altering their forms. Through the application of heat, for example, water could be transmuted into “air” (steam). From this, alchemists developed the idea of isolating the *materia prima* in metals and transmuting one into another through the use of an agent known as the philosophers' stone or elixir.

The rich cultural resources of the Hellenistic world further developed alchemy's theoretical foundations. From Stoic matter theory, pneuma, or spirits, replaced Aristotelian forms as the active defining force of matter. From Babylonian astrological traditions alchemists adopted the identification of the seven metals (gold, silver, mercury, copper, iron, tin, and lead) with the seven planets (sun, moon, Mercury, Venus, Mars, Jupiter, and Saturn) and the division of both metals and planets into male and female. Finally, the central transmutational process of reducing metals to their *materia prima* before recreating them as gold or silver drew on ideas presented in the Egyptian myth of Isis and Osiris, in which Osiris was killed and dismembered before Isis brought him back to life.

A collection of texts written in the first centuries C.E. known as the *Hermetica* were attributed to Hermes Trismegistos, a

figure identified with the Egyptian god Thoth, the mythical creator of the arts and sciences. Although alchemy was only one topic among many in the *Hermetica*, in the European Middle Ages Hermes came to be known as the legendary first alchemist and alchemy as the “hermetic art.” The *Hermetica* ranged in content from medical, astrological, and magical treatises to much more theosophical ruminations on the redemption of the spirit through gnosis.

This association in the *Hermetica* between practical alchemy and spiritual gnosis found its way into alchemical theory through later authors. The link between spiritual and practical goals of transmutational alchemy is particularly evident in the work of the Alexandrian Zosimos of Panopolis (fl. 300 C.E.; later Latinized as Rosinus). In his compilation of older alchemical writings known as the *Cheirokmeta*, Zosimos wove his practical alchemy into a mystical theoretical framework that would prove just as enduring as alchemy's more technical concerns. Full of secretive language, dream sequences, and allegories, Zosimos's texts describe alchemical processes metaphorically—as sexual generation, for instance—and highlight the role of spirits in transforming matter. With a clear debt to Gnosticism, Zosimos established an enduring connection between practical laboratory work and spiritual perfection.

Medieval Arabic Alchemy

When Islamic empires expanded into centers of Hellenistic culture in the seventh century, Muslim natural philosophers and physicians inherited the Greek alchemical tradition. From the eighth to the tenth centuries, scholars in intellectual centers like Baghdad synthesized the basic elements of the Greek alchemical tradition. The anonymous editor of the *Turba philosophorum* (Crowd of philosophers; c. 900), for instance, assembled excerpts from various Greek alchemical authors into a virtual conversation. Alchemists writing in Arabic also elaborated on the Greek theoretical foundation, contributing a number of key concepts to alchemical matter theory and medicine. The word *alchemy*, a combination of the Arabic definite article *al* with the Greek word *chemeia*, or *chymeia* (likely derived from the word for smelting metals, *cheein*), represents this fusion of Greek and Arabic scholarship, while continued use of Arabic alchemical terms such as *alkalai*, *alcohol*, *alembic*, and *elixir* (*al-iksir*) highlights the legacy of Arabic scholarship.

The translation of Greek alchemical texts into Arabic also underscores a central problem in the history of alchemy: pseudonymous texts. In the first centuries C.E., alchemical texts appeared purportedly authored by figures such as Plato, Socrates, Aristotle, and Cleopatra. Because Arabic and later European translators did not identify these pseudonyms as such, these prominent ancient figures entered the alchemical corpus as legitimate alchemical authors. The authorship of Arabic texts has been equally difficult for scholars to decipher. One of the more influential medieval Arabic texts, for instance, contains a dialogue between King Khalid ibn Yazid (c. 660–704) and a Christian hermit living in Jerusalem, Morienus. Although it is unclear whether Khalid and Morienus actually wrote this text, both figures remained prominent personages in the medieval alchemical tradition.

A collection of thousands of texts dating to the eighth and tenth centuries known in Latin as the *Corpus Gabirianum* and attributed to Jabir ibn Hayaan (c. 721–c. 815) contained fundamental contributions to the medieval Arabic alchemical corpus. Among the innovations of the *Corpus* was the concept of a tripartite division of all things into soul, spirit, and body, a division that would play a central role in European alchemical thought of the sixteenth century. The *Corpus* also introduced the sulfur-mercury theory, which its author had adopted from the ninth-century author Balinus (pseudo-Apollonius of Tyana). This variation on Aristotle's forms and the Stoic pneuma stated that all matter was formed by two qualities, sulfur and mercury, the balance of which existed in varying degrees in different metals. Using the elixir (or philosophers' stone) to shift the balance between these two principles, the alchemist could transmute one metal into another. The *Corpus* also posited that the elixir could be made of plant or animal substances as well as mineral, and that it could be used both as a panacea in medicine and in transmutation. Just as the elixir "cured" base metals of their impurities by transmuting them into silver or gold, so too could it "cure" sick people of their illnesses.

The Persian physician and philosopher Abu Bakr Muhammad ibn Zachariya al-Razi, known in Latin as Rhazes (c. 865–between 923 and 935) is best known for setting out a systematic summary of the "state of the field" of alchemy. Al-Razi added a third quality, salt, to the sulfur-mercury theory, and divided the chemical world into animal, vegetable, and mineral realms. Al-Razi's texts show that he was clearly a practicing alchemist, describing experiments, apparatus, and ingredients, as well as the standard steps of the "great work" of making the elixir.

Although both al-Razi and the *Corpus Gabirianum* provided theoretical justifications of the notion of transmutation, not all Arabic-speaking philosophers supported this idea. The physician Abdallah ibn Sina (Latinized as Avicenna; 980–1037) famously inveighed against the possibility of transmutation in his *Kitab al-shifa* (Book of the remedy), articulating an argument that would prove widely influential in the Latin Middle Ages.

The Latin Middle Ages

In the twelfth century, Europeans such as Gerard of Cremona, Daniel of Morley, and Robert of Ketton began to translate more than seventy Arabic texts into Latin, introducing Europeans for the first time to the alchemical corpus and the Arabic term *al-kimiya*, which became the Latin *alquimia*, *alkimia*, *alchimia*, or *alchemia*. By the end of the century, translations from Morienus, the *Corpus Gabirianum*, and al-Razi, as well as a host of other spurious alchemical texts, acquainted Europeans with the central figures, techniques, and ideas of the Greek and Arabic alchemical traditions. A vibrant European technical literature emerged, dealing with alchemical techniques for dye-making, distilling, metallurgy, mineralogy, and, of course, the transmutation of metals.

Alongside this practical literature, European alchemists writing in Latin also continued to develop the theoretical founda-

tions of their art. Around 1250 the prominent philosopher Albertus Magnus (c. 1200–1280) legitimated scholarly interest in alchemy when he praised alchemists' ability to imitate nature in his *De mineralibus* (On minerals). The late-thirteenth-century *Summa perfectionis magisterii* of Pseudo-Geber (or "the Latin Geber," likely the Italian Franciscan Paul of Taranto) replaced the mercury-sulfur theory with the "mercury alone" theory, which stated that mercury was the fundamental component of metals, while sulfur was a pollutant. Drawing on Aristotle, medieval natural philosophy, and medical theory, Pseudo-Geber also articulated a corpuscular theory of matter, positing that all matter is composed of small particles.

In the thirteenth century a debate emerged around alchemy's legitimacy and its relationship to other fields of knowledge. The central issue was whether alchemy, as a form of human art or technology, was capable of successfully imitating or even surpassing nature. Responding initially to ibn Sina's famous rejection of transmutation (often given greater authority by its erroneous attribution to Aristotle), scholars such as Roger Bacon (c. 1220–1292) and Paul of Taranto forcefully argued that true alchemists could indeed use their knowledge of metals to affect real transmutations. In the late thirteenth and fourteenth centuries Thomas Aquinas, Giles of Rome (Aegidius Romanus), and the inquisitor Nicholas Eymeric formulated theological objections to alchemy, arguing that the power to transmute species was reserved for God alone. This religious critique reached its peak around 1317 with Pope John XXII's condemnation of those alchemists who "promise that which they do not produce." Although this papal bull's primary target was alchemical counterfeiting of metals, it sanctioned the increasingly vociferous backlash against alchemists' claims of power over nature. Still, alchemy continued to flourish in the fourteenth century, as evidenced by the popularity of the Franciscan Johannes de Rupescissa's treatise on the quintessence, or inner essence, of all matter, and a spate of alchemical texts spuriously propagated in the fourteenth century under the name of the thirteenth-century Catalan physician Ramon Lull.

Renaissance Europe

The fifteenth-century rediscovery of the ancient Hermetic corpus and a concurrent revival of Neoplatonism introduced learned Europeans to ancient connections among alchemy, gnosis, and magic. Alchemy's renewed associations with magic and nature's occult forces broadened the primarily technical and natural philosophical discussions of alchemy of the Middle Ages. Hermetic philosophers began to reenvision themselves as operators who might use knowledge of nature to manipulate their world.

At the same time, alchemy's practical utility gained prominence in the sixteenth century, primarily through the work of the Swiss physician and alchemist Paracelsus (1493–1541) and his followers. Although he did not deny the possibility of alchemical transmutation, Paracelsus focused mainly on alchemy's medical applications, advocating a new kind of alchemical medicine, known as *chimiatria* or iatrochemistry, in which practitioners used alchemical distillation and extraction

to isolate the quintessence of matter for medicinal purposes. These powerful (and often controversial) new alchemical drugs were designed to attack the specific disease, in contrast to traditional humoral medicine, which sought to treat the balance of humors within the body as a whole. On the theoretical level, Paracelsus also offered a new understanding of matter, complementing the ancient four elements with the *tria principia* or *tria prima*, adding salt to the two medieval principles of matter (sulfur and mercury). By refining alchemical matter theory and resituating medicine on a new foundation of alchemy, Paracelsus and his followers gave the ancient art a new prominence both in the study of nature and in the practice of medicine.

Transmutation remained a prominent goal for many alchemists, particularly the consumers of a burgeoning trade in printed alchemical books. By the sixteenth century, alchemy had burst the bounds of the world of scholarship and found a much wider audience in Europe. In particular, alchemy's central image of purification and ennoblement resonated with religious reformers such as Desiderius Erasmus, Martin Luther, and the German mystic Jakob Böhme, all of whom drew on alchemical metaphors and imagery in their writings. Alchemical authors also made explicit connections between alchemy and Christianity. Heinrich Khunrath (1560–1605), for instance, specifically articulated such connections, comparing the healing power of the philosophers' stone to the redemptive powers of Christ in the *Ampitheatrum sapientiae aeternae solis verae* of 1595.

Urban readers, literate artisans, and learned ladies also took an interest in alchemy, consuming popular vernacular alchemical literature that tended to focus on the practical benefits of the art, particularly the production of precious metals, gemstones, and medicines. Many self-trained alchemists ultimately found employment among Europe's courts, where many princes generously supported practical and theoretical alchemical work. Faced with an increasingly crowded field of practitioners and no traditional markers of authority such as university degrees, licenses, or guilds, those who consumed alchemical knowledge and products struggled to make their own decisions about what constituted legitimate alchemy. With such a wide variety of people both seeking out knowledge and claiming to be alchemists, new debates emerged in the sixteenth century about what true alchemy was and who could legitimately claim to practice it.

The Scientific Revolution and Beyond

Although it has been assumed that alchemy was inconsistent with new ideas about nature associated with the scientific revolution or that the promoters of the "new science" rejected alchemy, historians now refuse simple narratives associating the scientific revolution with the decline of alchemy. During the seventeenth century, alchemy continued to be a vibrant field of natural philosophical inquiry; most prominent natural philosophers took a mixed view of it. Francis Bacon (1561–1626), for instance, condemned alchemists' tendency toward secrecy, contrasting it with the openness and cooperation that he advocated in reforming the pursuit of natural knowledge. Still, he looked to alchemy as an important source of knowledge about matter and medicine.

Historians have shown that Robert Boyle (1627–1691) and Isaac Newton (1642–1727) were both deeply involved with alchemy both in theory and practice, often in startlingly productive ways. Boyle, for instance, believed in the possibility of transmutation and worked on it for decades, seeking out the knowledge and skills of numerous adepts. Boyle's corpuscular matter theory, for which he is often hailed as a crucial figure in the history of chemistry, bolstered his belief in transmutation and the philosophers' stone. Scholars have shown that Isaac Newton was an avid student of alchemy as well, likely devoting more time to alchemical study and experiments in his lifetime than to physics. Although historians still have a great deal to understand about the exact purpose of Newton's alchemical studies, they clearly played a crucial role in his larger project of understanding God and nature.

By the end of the seventeenth century, alchemy was associated with new medicines, natural magic, ancient wisdom, and popular recipes for making gold as well as the innovations of the scientific revolution. Over the course of the eighteenth century, however, the alchemist's purview came to be more limited. Influenced by Antoine Lavoisier's (1743–1794) efforts to resituate chemical natural philosophy on a foundation of quantitative analysis of matter, a new kind of chemist emerged. Whereas the terms *alchemy* and *chemistry* were used synonymously until the end of the seventeenth century, in the eighteenth century scholars increasingly sought to separate the two, restricting *alchemy* to gold making and spiritual alchemy (activities that natural philosophers began to exclude from science), while also redefining alchemy's scientific and technical dimensions as *chemistry*. As a result, alchemy increasingly lost its long-standing association with science in the eighteenth century, retaining only its ancient links to mysticism and transmutation.

Alchemy continued to flourish among communities of occultists and Romantic natural philosophers in the late eighteenth, nineteenth, and twentieth centuries. Johann Wolfgang von Goethe (1749–1832), for instance, had an enduring interest in alchemy, viewing it as a secret key to the relationships between humans, God, and the cosmos. Nineteenth-century occultists picked up a theosophical thread in the writings of earlier authors such as Paracelsus, Valentin Weigel (1533–1588), Jakob Böhme (1575–1624), and Emanuel Swedenborg (1688–1772), incorporating alchemical study and images into the activities of secret societies. Finally, in the early twentieth century, the psychologist Carl Gustav Jung identified similarities between alchemical symbols and the dreams of his patients, positing that alchemists' descriptions of transmutation were a metaphor for the development of the individual. This view of alchemy, which interprets alchemy as a symbol for deeper psychological processes, has endured in the popular imagination into the twenty-first century.

ALGEBRAS. The word *algebra* refers to a theory, usually mathematical, which is dominated by the use of words (often abbreviated), signs, and symbols to represent the objects under study (such as numbers), means of their combination (such as addition), and relationships between them (such as inequalities or equations). An algebra cannot be characterized solely as the determination of unknowns, for then most mathematics is algebra.

For a long time the only known algebra, which was and is widely taught at school, represented numbers and/or geometrical magnitudes, and was principally concerned with solving polynomial equations; this might be called "common algebra."

But especially during the nineteenth century other algebras were developed.

The discussion below uses a distinction between three modes of algebraic mathematics that was made in 1837 by the great nineteenth-century Irish algebraist W. R. Hamilton (1805–1865): (1) The "practical" is an algebra of some kind, but it only provides a useful set of abbreviations or signs for quantities and operations; (2) In the "theological" mode the algebra furnishes the epistemological basis for the theory involved, which may belong to another branch of mathematics (for example, mechanics); (3) In the "philological" mode the algebra furnishes in some essential way the formal language of the theory.

Lack of space prevents much discussion of the motivations and applications of algebras. The most important were geometries, the differential and integral calculus, and algebraic number theory.

Not Distant Origins?

Several branches of mathematics must have primeval, unknown, origins: for example, arithmetic, geometry, trigonometry, and mechanics. But algebra is not one of them. While Mesopotamian and other ancient cultures show evidence of methods of determining numerical quantities, the means required need only arithmetical calculations; no symbolism is evident, or needed. Concerning the Greeks, the *Elements* of Euclid (fourth century B.C.E.), a discourse on plane and solid geometry with some arithmetic, was often regarded as "geometric algebra"; that is, the theories thought out in algebraic terms. While it can easily be so rendered, this reading has been discredited as historical. For one reason among many, in algebra one takes the square on length a to be a times a but Euclid worked with geometrical magnitudes such as lines, and never multiplied them together. The only extant Greek case of algebraization is the number theory of Diophantus of Alexandria (fl. c. 250 C.E.), who did use symbols for unknowns and means of their combination; however, others did not take up his system.

A similar judgment applies to ancient Chinese ways of solving systems of linear equations. While their brilliant collection of rules can be rendered in terms of the modern manipulation of matrices, they did not create matrix theory.

The Arabic Innovations

Common algebra is a theory of manipulating symbols representing constant and unknown numbers and geometrical magnitudes, and especially of expressing polynomial equations and finding roots by an algorithm that produces a formula. Its founders were the Arabs (that is, mathematicians usually writing in Arabic) from the ninth century, the main culture of the world outside the Far East. Some of the inspiration came from interpreting various Greek or Indian authors, including Euclid. The pioneer was Al-Khwarizmi (fl. c. 800–847) with his work *Al-jabr wa'l-muqabala*, known in English as the *Algebra*, and over the next five centuries followers elaborated his theory.

The problems often came from elsewhere, such as commerce or geometry; solutions usually involved the roots of

Postage stamp bearing the likeness of Al-Khwarizmi. The early-ninth-century Arab librarian and astronomer was a pioneer in the field of mathematics, setting forth theories that were expanded upon for centuries. The term *algebra* was first derived from his groundbreaking work *Al-jabr wa'l-muqabala*. KEITH BAUMAN, TNA ASSOCIATES, FRANKLIN, MICHIGAN

polynomial equations. Algebra was seen as an extension of arithmetic, working with unknowns in the same way as arithmetic works with knowns. The Arabic manner of expression was verbal: the word *shay* denoted the unknown, *mal* its square, *ka'b* its cube, *mal mal* for the fourth power, and so on. Arabs also adopted and adapted the Indian place-value system of numerals, including 0 for zero, that is called Hindu-Arabic. They were suspicious of negative numbers, as not being *pukka* quantities.

European Developments to the Seventeenth Century

Common algebra came into an awakening Europe during the thirteenth century. Among the various sources involved, Latin translations of some Arab authors were important. A significant homegrown source was the Italian Leonardo Fibonacci, who rendered the theory into Latin, with *res*, *census*, and *cubus* denoting the unknown and its powers. He and some translators of Arabic texts also adopted the Indian system of numerals. Communities developed, initially of Italian *abbacists* and later of German *Rechenmeister*, practicing arithmetic and common algebra with applications—some for a living.

The title of al-Khwarizmi's book included the word *al-jabr*, which named the operation of adding terms to each side of an equation when necessary so that all of them were positive. Maybe following his successor Thabit ibn Qurra (836–901), in the sixteenth century Europeans took this word to refer to the entire subject. Its theoretical side principally tackled properties of polynomial equations, especially finding their roots. An early authority was Girolamo Cardano (1501–1576), with his *Ars magna* (1545); successors include François Viète (1540–1601) with *In artem analyticam isagoge* (1591), who applied algebra to both geometry and trigonometry. The Europeans gradually replaced the words for unknowns, their powers, means of combination (including taking roots), and relationships by symbols, either letters of the alphabet or special signs. Apart from the finally chosen symbols for the arithmetic numerals, no system became definitive.

In his book *Algebra* (1572), Rafael Bombelli (1526–1572) gave an extensive treatment on the theory of equations as then known, and puzzled over the mystery that the formula for the (positive) roots of a cubic equation with real coefficients could use complex numbers to determine them even if they were real; for example (one of his), given

$$x^3 = 15x + 4 / \text{root } x = (2 + \sqrt{-1}) + (2 - \sqrt{-1}) = 4.$$

The formula involved had been found early in the century by Scipione del Ferro (1465–1526), and controversially published later by Cardano. It could be adapted to solve the quartic equation, but no formula was found for the quintic.

Developments with Equations from Descartes to Abel

René Descartes's (1596–1650) *Géométrie* (1637) was an important publication in the history algebra. While its title shows his main concern, in it he introduced analytic geometry, representing constants and also variable geometric magnitudes by letters. He even found an algebraic means of determining the normal to a curve. Both this method and the representation of variables were to help in the creation of the calculus by Isaac Newton (1642–1727) in the 1660s and Gottfried Wilhelm Leibniz (1647–1716) a decade later.

During the seventeenth century algebra came to be a staple part of mathematics, with textbooks beginning to be published. The binomial theorem was studied, with Newton extending it to non-integral exponents; and functions were given algebraic expression, including as power series. Algebraic number theory developed further, especially with Pierre de Fermat (1601–1665). Negative and complex numbers found friends, including Newton and Leonhard Euler (1707–1783); but some anxiety continued, especially in Britain.

The theory of polynomial equations and their roots remained prominent. In particular, in Descartes's time "the fundamental theorem of algebra" (a later name) was recognized though not proved: that for any positive integer n a polynomial equation of degree n has n roots, real and/or complex. The Italian mathematician J. L. Lagrange (1736–1813) and others tried to prove it during the eighteenth century, but the real breakthrough came from 1799 by the (young) C. F. Gauss (1777–1855), who was to produce three more difficult and

not always rigorous proofs in 1816 and 1850. He and others also interpreted complex numbers geometrically instead of algebraically, a reading that gradually became popular.

Another major question concerning equations was finding the roots of a quintic: Lagrange tried various procedures, some elaborated by his compatriot Italian Paolo Ruffini (1765–1822). The suspicion developed that there was no algebraic formula for the roots: the young Norwegian Niels Henrik Abel (1802–1829) showed its correctness in 1826 with a proof that was independent of Lagrange’s procedures.

Lagrange was the leading algebraist of the time: from the 1770s he not only worked on problems in algebra but also tried philologically to algebraize other branches of mathematics. He based the calculus upon an infinite power series (the Taylor series); however, his assumption was to be refuted by Augustin-Louis Cauchy (1789–1857) and W. R. Hamilton (1805–1865). He also grounded mechanics upon principles such as that of “least action” because they could be formulated exclusively in algebraic terms: while much mechanics was encompassed, Newtonian and energy mechanics were more pliable in many contexts.

The Nineteenth Century: From Algebra to Algebras

Lagrange’s algebraic ambitions inspired some new algebras from the late eighteenth century onward. The names used below are modern.

Firstly, in differential operators, the process of differentiating a function in the calculus was symbolized by D , with the converse operation of integration taken as $1/D$, with 1 denoting the identity operation; similarly, finite differencing was symbolized by Δ , with summation taken as $1/\Delta$. Much success followed, especially in solving differential and difference equations, though the workings of the method remained mysterious. One earnest practitioner from the 1840s was George Boole (1815–1864), who then imitated it to form another one, today called Boolean algebra, to found logic.

Secondly, in functional equations, the “object” was the function f itself (“sine of,” say) rather than its values. In this context F.-J. Servois (1767–1847) individuated two properties in 1814: “commutative” ($fg = gf$) and “distributive” ($f(g + h) = fg + fh$); they were to be important also in several other algebras.

As part of his effort to extend Lagrange’s algebraization of applied mathematics, Hamilton introduced another new algebra in 1843. He enlarged complex numbers into quaternions q with four units $1, i, j$ and k :

$$q := a + ib + jc + kd, \text{ where } i^2 = j^2 = k^2 = ijk = -1; \\ \text{and } ij = k \text{ and } ji = -k$$

and similar properties. He also individuated the property of associativity (his word), where $i(jk) = (ij)k$.

At that time the German Hermann Grassmann (1809–1877) published *Ausdehnungslehre* (1844), a very general algebra for expressing relationships between geometrical magnitudes. It was capable of several other readings also; for example, later

his brother Robert adapted it to rediscover parts of Boolean algebra. Reception of the Grassmanns was much slower than for Hamilton; but by the 1880s their theories were gaining much attention, with quaternions extended to, for example, the eight-unit “octaves,” and boasting a supporting “International Association.” However, the American J. W. Gibbs (1839–1903) was decomposing quaternions into separate theories of vector algebra and of vector analysis, and this revision came to prevail among mathematicians and physicists.

Another collection of algebras developed to refine means of handling systems of linear equations. The first step (1840s) was to introduce determinants, especially to express the formulae for the roots of systems of linear equations. The more profound move of inventing matrices as a manner of expressing and manipulating systems themselves dates from the 1860s. The Englishmen J. J. Sylvester (1814–1897) and Arthur Cayley (1821–1895) played important roles in developing matrices (Sylvester’s word). An important inspiration was their study of quantics, homogeneous polynomials of some degree in any finite number of variables: the task was to find algebraic expressions that preserved their form under linear transformation of those variables. They and other figures also contributed to the important theory of the “latent roots and vectors” (Sylvester again) of matrices. Determinants and matrices together are known today as linear algebra; the analysis of quantics is part of invariant theory.

On polynomial equations, Lagrange’s study of properties of functions of their roots led especially from the 1840s to a theory of substitution groups with Cauchy and others, where the operation of replacing one root by another one was treated as new algebra. Abel’s even younger French contemporary Évariste Galois (1811–1832) found some remarkable properties of substitutions around 1830.

This theory of substitutions gradually generalized to group theory. In its abstract form, as pioneered by the German Richard Dedekind (1831–1916) in the 1850s, the theory was based upon a given collection of laws obeyed by objects that were not specified: substitutions provided one interpretation, but many others were found, such as their philological intrusion into projective and (non-)Euclidean geometries. The steady accumulation of these applications increased the importance of group theory.

Other algebras also appeared; for example, one to express the basic properties of probability theory. In analysis the Norwegian Sophus Lie (1842–1899) developed in the 1880s a theory of “infinitesimal transformations” as linear differential operators on functions, and formed it as an algebra that is now named after him, including a group version; it has become an important subject in its own right.

Consolidation and Extensions in the Twentieth Century

At the end of the nineteenth century some major review works appeared. The German David Hilbert (1862–1943) published in 1897 a long report on algebraic number theory. The next year the Englishman Alfred North Whitehead (1861–1947)

put out a detailed summary of several of them in his large book *A Treatise on Universal Algebra*, inspired by Grassmann but covering also Boole's logic, aspects of geometries, linear algebra, vectors, and parts of applied mathematics; an abandoned sequel was to have included quaternions. His title, taken from Sylvester, was not happy: no algebra is universal in the sense of embracing all others, and Whitehead did not offer one.

Elsewhere, group theory rose further in status, to be joined by other abstract algebras, such as rings, fields (already recognized by Abel and Galois in their studies of polynomial equations), ideals, integral domains, and lattices, each inspired by applications. German-speaking mathematicians were especially prominent, as was the rising new mathematical nationality, the Americans. Building upon the teaching of Emmy Noether (1882–1935) and Emil Artin (1898–1962), B. L. van der Waerden's (1903–1996) book *Modern Algebra* became a standard text for abstract algebras and several applications, from the first (1930–1931) of its many editions.

This abstract approach solved the mystery of the need for complex numbers when finding real roots of real polynomial equations. The key notion is closure: an algebra A is closed relative to an operation O on its objects a , or to a means of combining a and b , if Oa and $a \cdot b$ always belong to A . Now finding roots involved the operations of taking square, cube, . . . roots and complex but not real numbers are closed relative to them.

One of the most striking features of mathematics in the twentieth century was the massive development of topology. Algebraic topology and topological groups are two of its parts, and algebras of various kinds have informed several others. Both (abstract) algebras and topology featured strongly in the formalization of pure mathematics expounded mainly after World War II by a team of French mathematicians writing under the collective name "Bourbaki."

Reflections

The proliferation of algebras has been nonstop: the classification of mathematics in the early twenty-first century devotes twelve of its sixty-three sections of mathematics to algebras, and they are also present in many other branches, including computer science and cryptography. The presence or absence in an algebra of properties such as commutativity, distributivity, and associativity is routinely emphasized, and (dis)analogies between algebras noted. Meta-properties such as duality (given a theorem about $+$ and \cdot , say, there is also one about \cdot and $+$) have long been exploited, and theologically imitated elsewhere in mathematics. A massive project, recently completed, is the complete classification of finite simple groups. Textbooks abound, especially on linear and abstract algebras.

Abstract algebras bring out the importance of structures in mathematics. A notable metamathematical elaboration, due among others to the American Saunders MacLane (b. 1909), is category theory: a category is a collection of mathematical objects (such as fields or sets) with mappings (such as isomorphisms) between them, and different kinds of category are studied and compared.

Yet this story of widespread success should be somewhat tempered. For example, linear algebra is one of the most widely taught branches of mathematics at undergraduate level; yet such teaching developed appreciably only from the 1930s, and textbooks date in quantity from twenty years later. Further, algebras have not always established their own theological foundations. In particular, operator algebras have been grounded elsewhere in mathematics: even Boole never fixed the foundations of the D -operator algebra, and a similar one proposed from the 1880s by the Englishman Oliver Heaviside (1850–1925) came to be based by others in the Laplace transform, which belongs to complex-variable analysis. However, a revised version of it was proposed in 1950 by the Polish theorist Jan Mikusinski (1913–1987), drawing upon ring theory—that is, one algebra helped another. Algebras have many fans.

ALIENATION. The notion of alienation is a very unusual one because it is at once an attempt to explain a widespread feeling—a very subjective, somewhat indefinable feeling—and a critique of the nature of any society that regularly produces it.

This was not always so. The feeling that one is not at home in the world, the sense of estrangement from one's surrounding, oneself, and other people, appears to be as old as history; for most world religions (Buddhism, most strains of Christianity and Daoism, Sufi strands in Islam) this feeling was seen mainly as reflecting a profound insight into the truth of the human condition. Hermits, monks, and meditators often actively valued or cultivated feelings of alienation as a way to something higher. Calvinism came closer to the modern conception in seeing feelings of isolation and emptiness as a sign of humanity's fall from grace, but it was really only in the nineteenth century that the modern understanding of the term came into being. This conception was closely tied to the experience of living in a vast, impersonal, industrial city. Feelings of alienation were particularly prone to strike those who in earlier generations might have been considered likely victims of melancholia: intellectuals, artists, and youth. The effects were much the same: depression, anxiety, hopelessness, suicide.

One might distinguish two main strains in the modern alienation literature: one that stressed the experience itself as an unavoidable (though possibly ameliorable) effect of the impersonal, bureaucratized nature of modern life, entailing the loss of any ability to use that experience to attain some deeper, more genuine truth about the world—since with the death of God and traditional structures of authority, most of these truths were considered definitively lost. The other, drawing on older theological traditions, saw alienation as the key to the true, hidden nature of the modern (i.e., capitalist, industrial)

order itself, showing it to be an intolerable situation that could be resolved only by overthrowing that order and replacing it with something profoundly different.

The first tradition can be found in social thinkers such as Alexis de Tocqueville, Émile Durkheim, or Max Weber; novelists such as Fyodor Dostoyevsky or Franz Kafka; and philosophers such as Søren Kierkegaard or Friedrich Nietzsche. Here alienation is the darker underside of all the positive values of modernity, the experience of those sundered from all previous sources of meaning: community, hierarchy, the sacred. It is the point where individualism becomes isolation, freedom becomes rootlessness, egalitarianism becomes the destruction of all value, rationality, an iron cage.

Probably the most famous formulation within this genre was Émile Durkheim's (1858–1917) notion of anomie. Observing that suicide rates tend to go up during times of both economic boom and economic collapse, Durkheim concluded that this could only be because both booms and busts threw ordinary people's expectations so completely in disarray that they ended up in a state of lacking norms, unable to determine what they had a right to expect or even want from life and unable to imagine a time when they could. This kind of analysis could lead either to a resigned pessimism, the assumption (favored by social conservatives) that public life in modern society can never really be anything but alienated, or to a liberal approach that saw alienation as a form of deviance or lack of proper integration that policymakers should ideally be able to ameliorate or even overcome.

The other tradition can be traced to Georg Wilhelm Friedrich Hegel (1770–1831), who drew heavily on theological sources. For Hegel, "alienation" was a technical term, a necessary moment in the process whereby Spirit (which for Hegel was simultaneously God, Mind, Spirit, and Human Self-Consciousness) would achieve true self-knowledge. Human history involved the same story: Mind would project itself out into the world, creating, say, Law, or Art, or Science, or Government; it would then confront its creations as something alien to it and strange; then, finally, coming to understand that these alienated forms are really aspects of itself, would reincorporate them and come to a richer self-conception as a result.

Karl Marx (1818–1883) remained true to this dialectical approach but concentrated on the material creativity of work, emphasizing that under capitalism, not only the products of one's labor but one's labor itself, one's very capacity to create—and for Marx, this is one's very humanity—becomes a commodity that can be bought and sold and hence appears to the worker as an "alien force." Insofar as Marx shares Hegel's optimism, and sees this dilemma as opening the way to a new, revolutionary society, all this is much in line with the older, theological conception in which alienation, however painful, is a realization about the truth of one's relation to the world, so that understanding this becomes the key to transcending it. Twentieth-century Marxists, though, have not been so uniformly optimistic.

While Marxist regimes officially claimed to have eliminated the problem of alienation in their own societies, Western

Marxism, starting with György Lukács (1885–1971) and climaxing with the Frankfurt School, forced to explain the lack of revolutionary change in industrial democracies, gradually became a prolonged meditation on the varied forms of alienation (reification, objectification, fetishism, etc.) in modern life. This emphasis set the tone for an outpouring of literature on the subject in the mid-twentieth century, not all of it Marxist.

France in the 1950s and early 1960s saw the emergence of a particularly rich body of alienation theory, ranging from the Existentialism of Jean-Paul Sartre and Albert Camus, which attempted to formulate an ethics for the isolated individual, to a variety of Marxist approaches, of which the most extravagant—and influential—was developed by the Situationist International, whose members saw modern consumer society as a gigantic “spectacle,” a vast apparatus composed of not only media images but market logic, the rule of experts, and the nature of the commodity form, all combining together to render individuals passive and isolated spectators of their own lives. Like many of the radical art movements from which they emerged, the Situationists were dedicated to imagining ways to revolutionize everyday life itself as a way of overcoming the “living death” of capitalist alienation.

After the failed insurrection of May 1968 in France, this literature on alienation rapidly disappeared in the face of post-structuralist critiques that argued it was impossible to talk about a human subject alienated from society or from itself because the subject was itself an effect of discourse and hence a social construct. Over the course of the 1970s and 1980s, these critiques spread outside France and the theme of alienation has, as a result, largely disappeared from intellectual debate in the early twenty-first century.

There are two main exceptions. First, in its radical, redemptive form, the idea of alienation has remained alive in artistic and revolutionary circles largely outside the academy. Situationism, for example, is still very much at the center of the (increasingly international) anarchist and punk scenes, both of which are largely rebellions against the meaninglessness and alienation of “mainstream” urban, industrial, or postindustrial life. These themes have suddenly reemerged to public attention with the rise of the “antiglobalization” movement, though they have still found almost no echo in the academy.

Second, in its more liberal, ameliorative form, the idea of alienation became ensconced in certain branches of sociology and hence reemerged in what is increasingly called “postmodern” alienation theory. When American sociologists started taking up the theme of alienation systematically in the 1950s and 1960s, they began by making it into a factor that could be quantified. Various questionnaires and techniques of tabulating an individual’s degree of alienation were developed; surveys then revealed, not entirely surprisingly, that aside from students, those who scored highest for alienation were, precisely, aliens, immigrants, or else members of minority groups already defined as marginal to mainstream American life. Over the course of the 1990s and the early twenty-first century, this sociological work has converged with an interest in identity and identity-based social movements to yield a new, “postmodern” body of alienation theory.

On the individual level, alienation is said to occur when there is a clash between one’s own self-definition and the identity assigned one by a larger society. Alienation thus becomes the subjective manner in which various forms of oppression (racism, sexism, ageism, etc.) are actually experienced and internalized by their victims. As a result, where the older revolutionary conception sees alienation as essential to the fundamentally violent, antihuman nature of “the mainstream,” postmodern theories now once again see alienation as a measure of exclusion from the mainstream. On the social level, the postmodern conception of alienation is said to be caused by a surfeit rather than a lack of freedom; a notion that appears almost impossible to distinguish from what were, in the late nineteenth century, called “modern” concepts of alienation. So far, these two traditions have barely come into contact with each other—except, perhaps, in recent environmentalist ideas about “alienation from nature.” How or whether they will make contact remains an open question.

David Graeber

ALTRUISM. The term *altruism* was coined by the French philosopher and sociologist Auguste Comte (1798–1857). Derived from the Italian word *altrui*, meaning “to others” or “of others,” “altruism” was introduced as an antonym for “egoism” to refer to the totality of other-regarding instincts in humans. The new terms *altruism*, *altruist*, and *altruistic* provided nineteenth-century thinkers with a controversial new conceptual framework within which to discuss ancient philosophical, religious, and ethical questions. In the earlier idiom of Enlightenment moralism, these had been expressed as questions about the relationship between particular self-serving passions and benevolent moral sentiments or between the principle of self-love and the authority of the conscience. It was in this earlier idiom that writers such as Thomas Hobbes and Bernard Mandeville expressed their view that all human action was ultimately driven by self-interest and that their critics, including Francis Hutcheson and Joseph Butler, expressed the contrary view that benevolence was as fundamental a principle of human action as self-interest. The conceptual history of “altruism” proper began in the 1850s and has generated its own particular set of scientific, religious, and philosophical questions.

“Altruism” and “altruistic” have been used to refer to at least three different sorts of things: intentions, actions, and ideologies. These three sorts of usage can be grouped under the headings of “psychological altruism,” “behavioral altruism,” and “ethical altruism.” Psychological altruism is any set of inclinations or intentional motivation to help others for their own sakes. Behavioral altruism is defined in terms of consequences rather than intentions: it refers to any action that benefits others (normally with the additional condition that there is some cost to the agent). “Evolutionary altruism” or “biological altruism” is a form of behavioral altruism, since it is defined solely in terms of consequences rather than intentions: it refers to any behavior that reduces the fitness of the organism performing it and increases the fitness of another organism (see Dawkins; Sober and Wilson). Finally, ethical altruism is an ideology stating that the happiness of others should be the principal goal of one’s actions. (Ethical egoism, by contrast, states that what the individual should seek above all else is his or her own happiness.)

A frequent cause of confusion has been equivocation between the first two of these three possible meanings—between claims about psychology and claims about behavior. The claim that there is no such thing as true altruism, for example, might be intended to convey the view that, psychologically, no one’s motives are ever entirely forgetful of self, since we know that we will receive approval and pleasure as a result of our charitable actions. The reply might be that true altruism certainly exists because many people engage in charitable activities at a cost to themselves, but by shifting from the psychological to the behavioral perspective on altruism, this reply fails to rebut the initial claim. Such conceptual confusion and disagreement over the meaning of altruism marked discussions of it from the outset and persist to this day. (Blum provides one useful and concise discussion of some of the definitional and conceptual issues.)

Discussions of altruism also have revolved around fundamental empirical, ethical, and political questions. What are the real roots of human altruism? Are they biological, psychological, social, or cultural? Is altruism really the highest moral good? Are we morally obliged to extend our altruism to strangers just as much as to family and friends? Should we even behave altruistically toward nonhuman animals? In what ways can societies be arranged in order to maximize the amount of altruism? Are the best societies, in any case, really those in which altruism is maximized?

Comte and Sociology

The term *altruism* was coined, in French (*altruisme*), by Auguste Comte (1798–1857) in the first volume of his *Système de politique positive* (1851–1854; *System of positive polity*). The first uses in English followed in the 1850s and 1860s in works by British thinkers sympathetic to Comte, including George Eliot, G. H. Lewes, and John Stuart Mill (see Dixon, 2005). In the Comtean system, “altruism” stood for the totality of other-regarding sentiments. The new cerebral science of phrenology, Comte said, proved that altruistic sentiments were innate. He heralded this as one of the most important discoveries of modern science and contrasted it with what he presented as the Christian view, namely that human beings

are, by nature, entirely selfish (because of the taint of original sin). Comte’s hope was that through the institution of a new humanistic religion based on a scientific understanding of human nature and society, civilized nations would develop to a stage where altruistic sentiments prevailed over egoistic ones. Working out how to bring such a society about, Comte taught, was the greatest problem facing humanity. In his view, one of the keys to increased altruism was a recognition of the fact that women, because of their maternal instincts, were more altruistic than men. They therefore should have supreme moral and religious authority (although only within the domestic sphere). Thus the Religion of Humanity, as he called it, encouraged a particular emphasis on feminine moral virtues and the great sanctity of motherhood (see Wright).

Another important Comtean coinage with which altruism was initially closely associated was “sociology”—the new science of society. Two of the most significant nineteenth-century theoretical treatments of altruism, other than Comte’s own, were also produced by pioneering sociologists, namely Herbert Spencer (1820–1903) and Émile Durkheim (1858–1917). Durkheim, who drew on the sociological theories of both Comte and Spencer while making much greater and more sophisticated use of empirical data than either of them, made a distinction between egoistic, altruistic, and anomic types of suicide in his 1897 study of the subject. Egoistic suicide was most widespread in developed, Western nations (especially strongly Protestant ones), Durkheim said, as a result of the highly developed sense of individual autonomy such nations encouraged. Altruistic suicide, on the other hand, was particularly prevalent among primitive peoples, who had an excessive sense of social integration. The main sorts of altruistic suicide with which Durkheim was concerned were the suicides of men on the threshold of old age or stricken with sickness, suicides of women on their husbands’ deaths, and the suicides of followers or servants on the death of their chief (Durkheim, book 2, chapter 4).

Darwin, Spencer, and Evolution

Charles Darwin did not use the term “altruism,” preferring to use older terms with which he was familiar from his reading of moral philosophy in the 1830s and 1840s, such as “benevolence,” “sympathy,” and “moral sense” (see Darwin; Richards). In his *Descent of Man* (1871), Darwin famously developed a group-selection explanation for the apparent self-sacrificing behavior of neuter insects. According to this view, communities of insects that happen to contain self-sacrificers benefit in the struggle for existence at the expense of communities made up of more selfish individuals with which they are in competition. As a result, contrary to the popular caricature of Darwinian nature as dominated by selfishness and competition, Darwin actually argued that benevolence and cooperation are entirely natural—that they are deeply embedded in our biology. The problem of how to account for altruistic behavior, especially in insects, continued to puzzle biologists (see Lustig) and became a central topic in the new discipline of “sociobiology” founded by the entomologist E. O. Wilson in the 1970s.

In the English-speaking world of the later nineteenth century, however, it was Herbert Spencer (1820–1903) rather

than Charles Darwin (1809–1882) who was celebrated as the leading exponent of the philosophy of evolution. Spencer was also one of the writers most responsible for the spread of the language of altruism (and sociology) from the 1870s onward (see Dixon, 2004). Spencer acknowledged that he had borrowed these terms from Comte. In his *Principles of Psychology* (second edition of 1870–1872) and *Data of Ethics* (1879), he developed his theory of how altruistic instincts could evolve and be inherited and how they would increase as social evolution progressed. He denied, however, that by doing so he endorsed Comte's views on philosophy, science, or religion. Indeed, although Spencer agreed with Comte that altruism would increase as societies evolved further, his vision of the ideal future society was in many ways the opposite of the Comtean vision. Whereas Comte envisaged a hierarchical and, in effect, totalitarian society in which individuals sacrificed personal freedom in the interests of order and progress, Spencer hoped for a society in which individual freedoms (and responsibilities) were maximized (see Richards). Spencer's hope was that people would increasingly act in altruistic ways spontaneously and voluntarily, without state intervention. Although Spencer had a very elevated reputation and a wide sphere of influence in Britain and America in the 1860s and 1870s, the scientific rejection of his belief in the heritability of acquired moral and intellectual characteristics, along with the rise of a political consensus in favor of some kind of state provision of welfare, rendered much of his thought untenable by the early twentieth century.

Utilitarianism

Utilitarianism, as discussed by its most distinguished nineteenth-century advocate, John Stuart Mill (1806–1873), was based on the view that a good act was one that would increase the general prevalence of pleasure over pain in the whole of society. It could thus be construed as a form of ethical altruism. In *Auguste Comte and Positivism* (1865), however, Mill made clear that his utilitarianism did not imply a one-sided commitment to altruism. He believed that a commitment to the general happiness was quite consistent with each individual living a happy life, and he criticized Comte for advocating an extreme sort of altruism. According to Mill's utilitarian principles, Comte's idea of happiness for all, procured by the painful self-sacrifice of each, was a contradiction; a sufficient gratification of "egoistic propensities" was a necessary part of a happy life and was even favorable to the development of benevolent affections toward others. Later in the nineteenth century Henry Sidgwick further developed the utilitarian tradition of philosophical ethics (see Schneewind). In his celebrated *Methods of Ethics* (1874 and several subsequent editions), Sidgwick tried to establish the proper extent of individual altruism and to show how such behavior could be encouraged while also recognizing the legitimate, independent demands of self-interest.

Christianity and Unbelief

At its inception, the concept of altruism resonated widely in a Victorian culture saturated with moral and religious earnestness (see Collini). Some were attracted to Comtean positivism and its worship of humanity as an eminently respectable form of unbelief, one that combined a commitment to the sciences

with a continuing religious sense and with the strong social conscience that the positivist ideology of altruism involved (see Wright). On the other hand, some who were committed to a Christian view of morality and society saw in Comtean altruism a concept of the love of others that was detached both from an understanding of appropriate self-love and from the necessity of a love of God. There were also those who saw in humanistic celebrations of altruism simply a secularized version of the Christian ideology of service to others (see Dixon, 2004, 2005). This last view was held by both proponents and opponents of Christianity. Among the latter, one of the most trenchant was Friedrich Nietzsche (1844–1900). In Nietzsche's vision, Christianity was at the root of all ideologies of altruism, self-sacrifice, and pity—in short, of the "slave morality" that was the exact opposite of the assertive and aristocratic ideals he celebrated (see Nietzsche and the introduction by Ansell-Pearson).

From the twentieth century onward, once the origins of altruism in Comte's atheistic philosophy had largely been forgotten, it was much more common to encounter the assumption that altruism was a term that encapsulated the heart of Christian teaching. The French philosopher Jacques Maritain (1882–1973), however, continued to press the point that Comte's extreme and atheistical concept of altruism differed significantly from Christian love, whether human or divine. The difference between Christian love and altruism that Maritain insisted upon could be summarized as the difference between loving one's neighbor *as oneself* and loving one's neighbor *instead of oneself* (see Maritain). Nonetheless, some Christian writers still consider altruism to be virtually identical to Christian love, or agape.

Socialism and Economics

The 1880s saw a downturn in the economic prosperity of Britain and its empire. The results of this included waning confidence in the inevitability of social and economic progress and increased public awareness of the plight of the urban poor. The economic orthodoxy of *laissez-faire*, which emphasized the freedom and autonomy of the individual and had accompanied the optimism and success of the earlier Victorian period, also increasingly came into question. A renewed interest in altruism was now evident, not only in philosophy and religion but also in economics. A central assumption of classical political economy was that man had benevolent as well as selfish instincts, but when it came to economic activity, the rigorous application of self-interest was the most rational principle. This assumption was now subjected to more serious examination (see Pearson). Altruism became associated with political creeds of cooperation and collectivism. One commune in the United States was even named "Altruria" in recognition of the importance of altruism to this new movement. The concept of altruism was thus redefined as an ideology, in a way that brought it closer to communism than either the Comtean positivism or the Spencerian individualism with which it had earlier been associated. Altruism, for these groups, was a radical and universal denial of self in the pursuit of harmonious and egalitarian community living. In the later twentieth century, the viability of the assumption of self-interest in economics would again be called into question (see Mansbridge; Monroe).

First Half of the Twentieth Century

The closing decades of the nineteenth century, as well as seeing a new interest in “altruism” as an economic and political doctrine, witnessed an accelerated professionalization of intellectual discussions of the subject. Whereas writers like Lewes, Eliot, Mill, and Spencer had pursued their intellectual projects outside the universities (they were, to use Collini’s phrase, “public moralists”), it was increasingly the case by the turn of the twentieth century that rigorous academic discussions of moral philosophy, economics, psychology, and sociology were conducted by university-based experts. The resultant discussions were thus both more detached from public political life and more fragmented. In the first half of the twentieth century the influence of the ethos of logical positivism meant that those working in the human and social sciences were inclined to avoid or even to deny the meaningfulness of questions with ethical and religious overtones. G. E. Moore claimed (in his 1903 work *Principia ethica*) that any system of ethics that tried to draw moral conclusions on the basis of a scientific account of human nature and society (as the systems of both Comte and Spencer had done) committed the “naturalistic fallacy.” (See Maienschein and Ruse’s collection of essays investigating the possibility of founding ethics on biology.) Finally, the success of the neo-Darwinian synthesis in biology and the rejection of the doctrine of the inheritance of acquired characteristics seemed to undermine earlier theories of the gradual evolution of greater altruism. All that was left was a starkly amoral vision of nature as the domain of competition and natural selection. All of these factors meant that even though philosophers, sociologists, and economists continued to discuss concepts of altruism, the first fifty or sixty years of the twentieth century saw a reduction of academic interest in the subject.

Social Psychology, Sociobiology, and Altruism since the 1960s

Scientific research into altruism has markedly increased since the 1960s. During the 1970s, “helping behavior” and the problem of the “unresponsive bystander” were among the most popular topics in social psychology (see Howard and Pillavin; Latané and Darley; Wispé). Later C. Daniel Batson stimulated considerable discussion among social psychologists with a series of experiments trying to establish the genuinely altruistic motivation of some helping behavior, explaining it as the product of empathy (see Batson). Others have preferred more egoistic hypotheses, such as the theory that helping behavior is undertaken in order to alleviate the helper’s own distress at the suffering of the person to be helped.

In the field of evolutionary biology, 1975 saw the publication of E. O. Wilson’s controversial *Sociobiology*, which set out to explain all social phenomena in terms of underlying biological mechanisms. The following year Richard Dawkins’s highly successful popular science book *The Selfish Gene* was published. It was based on mathematical models developed by William D. Hamilton to explain altruistic behaviors in terms of their benefits to genetically related individuals. Absolutely central to both these books was the puzzle of how self-sacrificing individuals could ever have been successful in the merciless struggle for existence. In short, how could Darwinian

evolution produce altruism? Dawkins’s straightforward answer was that it could not. According to Dawkins, human beings and other animals are blind robots programmed by their “selfish genes,” and any actions that on the surface seem to be examples of “altruism” are in fact driven by the interests of the genes. The existence of apparently altruistic impulses could thus be explained by the fact that an individual who acts in the interests of close relatives (who have many of the same genes) is increasing the chances of copies of the individual’s genes persisting into the next generation. Since there is no genuine altruism in nature, Dawkins concluded, the most we can do is to try to teach our children altruism in the hope that they can succeed in rebelling against their genetic inheritance.

Scientific, philosophical, and theological critiques of Dawkins’s ideas have been abundant. Some have argued that the idea that genes can have “interests” or be described as “selfish” is misleadingly anthropomorphic. Dawkins has replied that these are only metaphors, but ones that help to communicate the fact that the real business of evolution goes on at the genetic level. But others have questioned whether it has really been established that selection operates exclusively, or even primarily, at the genetic level rather than at the level of individuals, groups, or species (see Sober and Wilson). And many commentators have found the view of human nature implicit in *The Selfish Gene* to be unacceptably cynical, fatalistic, and pessimistic.

Since the 1990s, although academic discussions have now moved on from the agenda set by sociobiology and *The Selfish Gene*, the topic of “altruism” has continued to attract a great deal of attention from a wide range of disciplines, including theology, philosophy, evolutionary biology, economics, social psychology, and sociology (see Batson; Mansbridge; Monroe; and for a particularly helpful collection, Post et al.). The same central questions about what science, religion, and philosophy each have to contribute to an understanding of human altruism, and about their ethical and political implications, continue to be vigorously debated.

AMBIGUITY. By instinct humans yearn for reassurance and certainties and dream of an orderly universe where the reasoning process corresponds to external reality. This attitude is reflected by the assumption, authoritatively legitimized by Aristotle (384–322 B.C.E.), that no responsible statement can exhibit internal contradictions. In his *Categories*, Aristotle states that the essential character of a substance seems to be its ability to host opposites. At any instant, however, one can assign either a quality or its opposite to a substance: According to Aristotle, "Nobody can be simultaneously sick and healthy. Similarly, nothing is at the same time white and black. No object exists simultaneously hosting opposites." No alternatives exist besides these two; any third possibility is excluded: *tertium non datur*.

Ambiguity

According to Aristotle, the substitution of opposite qualities hosted by a substance during a transformation has a discontinuous character. His logic seems to imply a step-by-step flow of time and rules out the intervention of a critical situation where opposite qualities can smoothly cooperate and compete together in the same substance. This schematizes evolution as a quasi-static change of objects rather than a continuous course of events.

Aristotle's conception is reflected in the rigid aesthetic canons of the art of antiquity. For instance, in Myron's *Discobolus* (The discus thrower), fifth century B.C.E., Museo nazionale, Rome, time seems to be frozen in the act of launching the discus. Furthermore, throughout two millennia, the *tertium non datur* has influenced Mediterranean culture.

It is only during the twentieth century that, thanks to an attentive evaluation of the nature of time and the adoption of a probabilistic approach to the evolution of natural systems, ambiguity, meaning the coexistence or confluence of two or more incompatible aspects in the same reality, has acquired a non-negative connotation in the Western world.

Probability, Uncertainty, and the Arrow of Time

In the 1680s Isaac Newton's concept of absolute, mathematical time depicted a uniform flow deprived of any psychological aspect, including a propensity to flow only toward the future. In the 1700s Pierre-Simon Laplace's rigid, deterministic viewpoint left no space to uncertainties and contradictions.

In the 1820s, however, Nicolas-Léonard-Sadi Carnot's second principle of thermodynamics and Rudolf Clausius's principle of the increase of entropy or disorder in isolated systems attached a directional arrow to time from past to future. In the 1900s Albert Einstein's theory of relativity assigned time an additional role in the fourth dimension of physical space known as the space-time continuum. In the 1920s the

Roman copy of *Discobolus* by Myron, created 2nd century B.C.E. The concept of arrested motion, as seen in Myron's sculpture of a discus thrower, illustrates the substitution of opposite qualities that can sometimes characterize ambiguity. © DAGLI ORTI/CORBIS

probabilistic approach and Werner Karl Heisenberg's uncertainty principle of quantum mechanics brought an end to certainties. In the 1960s, the irreversible thermodynamics of nonlinear systems removed from equilibrium by fluxes of energy, matter, and information regarded time as the creator of spatial, temporal, or functional structural order. These systems include the mind.

Most likely the above breakthroughs in the *Weltanschauung* (worldview), relevant for an analysis ennobling ambiguity, played a role in focusing the attention of eminent philosophers—Immanuel Kant, Georg Wilhelm Friedrich Hegel, Arthur Schopenhauer, Friedrich Nietzsche, Henri-Louis Bergson, and Jean-Paul Sartre, among them—on the dynamics of the processes of transformation rather than on Aristotle's statics of the objects.

Even closer correlations can be conjectured between the scientific and artistic milieus. Look at, for example, Claude Monet's *Waterloo Bridge, Effect of Fog* (1903, Hermitage State Museum). While looking at this painting, the observer, driven by curiosity, correlates his or her sensory stimuli, assembling them in an interiorized pattern. While this mental pattern develops, the fog on the Thames seems to lift slowly, until a critical state is reached where the bridge, the boats on the river, and the urban background merge into the meaning of the painting. This critical state, at a boundary sharing foggy

and meaningless scenery and, at the same time, a meaningful picture, is loaded with ambiguity.

The mental process just described can be viewed as a metaphor of Jean Piaget's statement, "The intelligence organizes the world while it organizes itself." This aphorism leads to self-referentiality. Contextually, ambiguity sneaks in: "Concerning what one cannot talk about, it's necessary to be silent," Ludwig Wittgenstein writes, and yet he talks—and is "silent"—at the same time.

Should one agree in interpreting ambiguity as equivocalness, self-referentiality would make the language totally ambiguous. Rome? A city, a town, and a four-letter word. Again with reference to the above breakthroughs, think of a cubist portrait by Picasso. Its perception lends itself ambiguously to several reconstructions of percepts—front figure, profile, and so forth—and recalls the process of measurement of a quantum structure: a process whose result allows us to access, with different probabilities, the several possible basic modes of being (or behaving) characteristic of the structure.

Similar considerations hold for the ambiguous representation of the fourth dimension on a two-dimensional canvas, seen in several futurist de-structured paintings and in Marcel Duchamp's *Nude Descending a Staircase, No. 2* (1912, Philadelphia Museum of Art), an organization of kinetic elements expressing the space-time continuum through the abstract representation of movement.

The Dynamics of Ambiguity

Open systems, far removed from (thermodynamic) equilibrium by intense fluxes of resources—such as matter, energy, and information—exceeding certain critical thresholds, undergo dynamic instabilities resulting in the emergence of spatial, temporal, or functional order. These instabilities exhibit a critical region where the transformation has not yet occurred and yet, at the same time, has already occurred. This region hosts ambiguity, an ambiguity that can be captured at the critical state marking the onset of convective motions in an initially still fluid heated from below (for example, think to the critical state of the formation of the Giants Causeway, the hexagonal volcanic rocks of Northern Ireland), at the starting of a chromatic chemical clock during the Belousov-Zhabotinsky autocatalytic reactions, or at the arising of a synchronized, ordered applause from a stochastic clapping when the audience in an auditorium, driven by enthusiasm, demands an encore from the soloist.

Dynamic instabilities occur under special critical conditions in nature and in society. They also occur during perception, not seldom but continuously and systematically. Their outcome, at the critical state of the perceptive process, is the emergence of visual thinking.

Vivid examples of ambiguity in the mind can be experienced while looking at an ambiguous structure such as *Fragment of Psychoplastic Structure* (1963, collection of the author). This figure may be conceived as a visual metaphor for a diatomic hydrogen molecule formed by two identical atoms. It helps to visualize both the two lower energy modes of being

three-dimensional space and assign its central region to the right- or to the left-hand cubic modulus. Thereafter, visual thinking cannot get stuck in either of these positions: soon an endless sequence of approximately periodic perceptive alternations of right/left/right prospects sets in.

As anticipated, the process of perception, leading to the dynamics of visual thinking, turns out to resemble closely the process of measurement of a homonuclear diatomic molecule according to quantum mechanics. Both processes share ambiguity.

Ambiguity as a Permanent Cultural Value

In conclusion, complex concepts of quantum physics and the structure of matter are intimately connected with optical illusions, paradoxes, and ambiguity, features usually attributed to the world of art rather than to science. Both art and science are produced, emotionally and rationally, by our thinking. And our thinking proceeds chaotically, on the jagged watershed of a permanent cultural value: ambiguity.

(the so-called stationary states) of this molecule and its resonant behavior during a spectroscopic observation of it.

At first this figure, by construction, could be envisaged superficially as a two-dimensional structure exhibiting a center of symmetry. Keep looking at it as passively as possible. Its central region around the center of symmetry could be described in two ways: (1) as belonging 50 percent to the modulus at left and 50 percent to the modulus at right and, paradoxically, (2) as belonging neither to the modulus at left nor to the modulus at right. These two descriptions, though quite acceptable if considered separately, are incompatible if attributed to the same reality simultaneously, as they should be in this case. Indeed, we react instinctively to the absurdity of the situation and hasten to remove the ambiguity built into the figure by letting the two-dimensional figure invade the

AMERICA. America is one of the greatest political-philosophical symbols in world history. It is equal in importance to Athens representing philosophy, Jerusalem representing biblical religion, Rome representing both its pagan and Catholic manifestations, and Mecca representing the home of Islam. But what is meant by *America*? When people refer to it are they signifying the precise measurements of the landmass that incorporates the territory from Canada's Ellesmere Island above the magnetic pole in the north to Tierra del Fuego off the tip of Argentina in the south? Do they want to call

attention to the area that in the year 2000 was home to forty-five countries and territories with 900 million people, where dozens of languages are spoken, and where can be found people of almost every ethnic origin, religion, and social and economic class? It is unlikely that they are referring to these basic facts. Facts and figures do not begin to touch what *America* represents symbolically. Throughout its history, *America* has stood for two different, almost opposite, things. First, it stands for natural man, the Indians, who are said to represent the world's beginning. Second, it stands for the United States, the great political experiment based on natural rights, which has evoked inspiration and fear and envy. It inspires such strong feelings because the United States is often perceived as the world's future. *America* thus represents both the world's origins and its endpoint. This essay attempts to shed light on the "idea" of *America* by tracing its genealogy from America's discovery by Western man until the twenty-first century.

The Indians

From 1492 until the American Revolution, and in some sense continuing into the twenty-first century, *America* evoked the image of Indians. Archaeologists believe that the American continent was first inhabited by human beings who walked from Siberia to Alaska over the Bering Strait on a frozen land bridge about 30,000 to 40,000 years ago. However, what the Indians represent in the global imagination is a fairly static image informed by media portrayals that starkly depict the Indians either as barbaric savages or as noble stewards of the land living in harmony with nature. These images have a long genealogy.

First attempts to explain America. Although the Americas were undoubtedly visited by the Vikings around the year 1000, the "discovery" of America is attributed to Christopher Columbus, whose voyage to America in 1492 captured the European imagination. Ironically, to Columbus's dying day, he insisted that what he had found was part of Asia. Thus, perceptions of America have been mistaken from the very beginning. (Sixteenth-century mapmakers, recognizing Columbus's mistake, named the New World not after him, but after Amerigo Vespucci—hence the name *America*—whom they credited as the first to realize that the New World was its own continent.)

The Indians of America were misrepresented from the very beginning and ever since their discovery. Not only did Columbus believe America was someplace else—hence the name Indians—but his description of its inhabitants was fanciful, too. He claimed to discover cannibals, Cyclopes, Amazons, Sirens, dog-faced peoples, people with no hair, and people with tails. These bizarre claims were suggested to him by centuries of fanciful tales passed on through medieval times by supposedly reliable authorities. In short, Columbus claimed to find what he was looking for. This began a pattern of preformed opinions dictating what is supposedly found in America. He saw the land as potential wealth and its people as possible converts or slaves. For him, as for most of the early conquistadores and missionaries, the Indians had no independent status, no integrity of their own. They were just to be used.

The Spanish Renaissance philosophers who first reflected on the discovery of the Indians did little better in appreciating

them. Two positions dominated the Spanish debates. The first position, arguing that the Indians did not possess the faculty of reason, went so far as to argue that the Indians were the concrete embodiment of Aristotle's natural slave. According to this view, the Indians could be incorporated into Europe's traditional Christian-Aristotelian worldview but only in its lowest place. God created the Indians as naturally inferior, the argument went, so it was just and right that the Spanish subjugate them. The second view saw the Indians as rational—as evidenced by their languages, economics, and politics—but as underdeveloped and needing Spanish tutelage. Because they were human, the Indians had to be governed by consent—not their formal, explicit consent, but rather what they would consent to after they came to understand the natural law, which of course the Spanish thought they possessed. In short, because the Spanish were so confident in their worldview, it never occurred to them that they might be incorrect or possess only a partial truth. Their cultural confidence led them to reject the Americans as barbaric.

America as the home of natural man. In 1580 the French philosopher Michel de Montaigne (1533–1592) began a path-breaking new way of thinking about the Indians. A skeptic and a keen observer of human diversity, Montaigne argued that "each man calls barbarism whatever is not his own practice; for indeed it seems we have no other test of truth and reason than the example and pattern of the opinions and customs of the country we live in." Unlike the Spanish, Montaigne doubts the standards of his own place and time. In his famous essay "Of Cannibals" (*Essays*) he describes Indian society as the best society that ever was, real or imagined, because they are "still very close to their original naturalness" and thus live in a "state of purity" according to "*les loix naturelles*." He claims their society, held together with "little artifice and human sorder," is as pure and natural as a society can be. His account claims that these Indians do fight and eat their captives, but he says they do so not for economic gain but as a kind of aristocratic struggle for mastery. He describes their warfare as "wholly noble" and "as excusable and beautiful as this human disease can be." This is the origin of the image of the noble savage.

Montaigne knows, however, that his account of the Indians' tranquility and bliss is fictitious. He concedes the barbarous horror of some of their actions, writing, "I am not sorry that we notice the barbarous horror of [their] acts, but I am heartily sorry that, judging their faults rightly, we should be so blind to our own." Here Montaigne reveals his true intentions in describing the Indians: he uses them as an image with which to expose the horrors and cruelty of his own world. This usage of the Indians as a countercultural marker was to become the norm. While Montaigne's account of the Indians is in the end neither anthropologically accurate nor fully desirable, he is the first to misrepresent the Indians in a positive fashion.

After Montaigne, no major philosopher in Europe doubted the Indians' naturalness. To the contrary, the Indians came to represent natural man par excellence. From Montaigne until the end of the Enlightenment, every major philosopher agreed

with John Locke's (1632–1704) famous statement that “in the beginning all the world was America” (*Second Treatise of Government*). America represented Europe's past. In ending one debate, however, Montaigne began a new one. While every major thinker agreed that the Indians represented mankind's natural state, debate arose over the interpretation of the natural state: was it a brutishness to overcome or an innocence to recapture?

Among these philosophers the debate evolved in a single direction. Thomas Hobbes (1588–1679) first argued that mankind's natural state is a horrible state of war to be avoided at all costs. Locke and Charles-Louis de Secondat, baron de Montesquieu (1689–1755), countered that the state of nature is pacific but undesirable. Jean-Jacques Rousseau (1712–1778), François Marie Arouet de Voltaire (1694–1778), and Denis Diderot (1713–1784) later praised the Indians as naturally good and happy, in contrast to European artificiality and corruption. These varied representations, it should be noted, do not correspond to any changes in Indian societies, nor do they respond to new information about the Indians. In truth, the available evidence was barely consulted at all by any of the great thinkers. Rather, these philosophers clearly used their descriptions of the Indians as support for their own ends. As dissatisfaction with Europe increased, so did praise of the Indians grow as an alternative, more desirable and more natural, way of living.

In sum, contemporaneous representations of the American Indians really reflect Europe's own debates, not the reality of America. They have left the legacies of brutishness and of the noble savage, which remain in the twenty-first century. But there is another legacy of these debates. In using the Indians of America to promote their own visions of freedom and legitimate institutions, the philosophers set in motion a train of thought and actions that would lead to revolution. The first of these revolutions took place in America and led to the founding of the United States.

The United States

When people speak about America, they usually are referring not to the Indians, nor to the hemisphere as a whole, but to the United States of America (USA), the world's most powerful nation since World War II. The global obsession with American power revolves around four axes: cultural, economic, political, and military. American popular culture (e.g., blue jeans, rock and roll and jazz music, cinema and television programming, McDonald's restaurants, and Disneyland) is both highly prized for its energy, ease, accessibility, and speed and condemned as an unwanted cultural intrusion that threatens to swamp indigenous ways. Economically, America has for centuries represented the possibility of riches beyond belief (“streets paved with gold”), and as such has been the goal of tens and tens of millions of immigrants. But since the United States became the world's dominant economic power, its material wealth has become both envied and resented. Politically, America has been lauded as a uniquely favorable place (what the American colonist John Winthrop called a “city on a hill”) for the promise of freedom that it offers, and it has been condemned, as in the eyes of the Iranian revolutionary, the Ayatollah Khomeini, as

“the great Satan” for what are perceived to be its heathen and materialistic ways. Militarily, the United States has since World War II been the strongest country on earth, and since the collapse of the Soviet Union, it is universally cited as the world's only superpower. This power is sometimes feared and envied by those without it. Moreover, people throughout the globe paradoxically call for the United States to use its power when they want it to do something and condemn the United States as arrogant when it uses it for a cause of which they disapprove.

These perceptions of the United States are neither new nor unmediated reactions to perceived facts. Each of these praises and complaints can be traced back almost to the founding of the United States itself. Thus, they cannot be explained merely as a reaction to a particular political administration or to the rise of American power. Deeper phenomena are at play.

First reactions to the United States. The United States was formed in a rebellion from England in 1776. Its revolution was the first successful modern revolution in that it was inspired and justified (at least in part) by philosophical doctrine. The United States' Declaration of Independence invokes philosophy when it argues that “all men are created equal” and endowed with “inalienable rights” such as the rights to “life, liberty, and the pursuit of happiness.” Government exists only to secure these rights, and any government that does not secure them is deemed illegitimate. The founders of the United States wrote a Constitution to secure these rights based on limited government and the separation of public and private spheres. At a time when no country on earth was based on the consent of the governed, the success of American democracy proved to the modern world that democratic and representative government could exist.

The relationship between the Old and New Worlds (and the two images of America) is intertwined and reciprocal. The American Revolution marked the first major step in the collapse of the European empires founded after Columbus discovered the New World. This revolution was inspired in part by the European philosophical doctrines based on natural rights, which had themselves been partly inspired by the original inhabitants of America. Ironically, the political experiment in the name of natural rights then helped destroy the “natural” people who helped inspire the United States' philosophical forefathers. The American Revolution then helped inspire the French Revolutionaries and other lovers of liberty throughout the world. The complex nature of this relationship is seen in the following quotation from the essay “On the Influence of the American Revolution on Europe” by the French philosopher Marie-Jean Caritat, marquis de Condorcet (1743–1794):

“The human race had lost its rights. Montesquieu found them and restored them to us” (Voltaire). It is not enough, however, that these rights be written in the philosophers' works and engraved in the heart of virtuous men. It is also necessary that the ignorant or feeble man be able to read them in the example of a great people.

America has given us this example. Its Declaration of Independence is a simple and sublime exposition of

these rights, so sacred and so long forgotten. Among no nation have they been so well known, or preserved in such perfect integrity.

The reciprocal relationship is evident: it moves from Montesquieu and Voltaire, who had been partially inspired by America's original inhabitants, to the Declaration of Independence then back to Condorcet, who authored France's Constitution of 1793.

Condorcet's praise of America was typical of the Enlightenment philosophes. Immediate reaction to the American Revolution by Enlightenment thinkers was one of enthusiastic praise. In his popular pamphlet entitled "Observations on the Importance of the American Revolution and the Means of Making it a Benefit of the World," Richard Price (1723–1791) writes, "I see the revolution in favor of universal liberty which has taken place in America; a revolution which opens a new prospect in human affairs, and begins a new era in the history of mankind." Given the unprecedented liberties guaranteed in America, Price is hopeful, nay certain, that liberty will soon spread throughout the world, if unchecked by tyrannical governments. He says the revolution will "raise the species higher" and compares its effect to "opening a new sense." Indeed, he goes so far as to suggest that "next to the introduction of Christianity among mankind, the American revolution may prove the most important step in the progressive course of human improvement." So many hopes has he pinned on America that "perhaps there never existed a people on whose wisdom and virtue more depended; or to whom a station of more importance in the plan of Providence has been assigned." Similarly, Anne-Robert-Jacques Turgot (1727–1781), whose brief stint as finance minister in France marked the last serious attempt at reform before the French Revolution, says in a "Letter to Price" that America is "the *hope* of the world" and should "become a *model* to it."

The Enlightenment thinkers did not think America was perfect. Slavery was America's greatest flaw. They understood the difficulties in eradicating this execrable institution and argued that America would be judged by the manner of eliminating it as circumstances allowed.

The great strengths of America, however, more than outweighed its imperfections. Enlightenment leaders praised the numerous liberties in the United States, including freedom of the press, speech, conscience, and religion. Moreover, America was seen as an inspiration for the world. As Condorcet writes, it is an example "so useful to all the nations who can contemplate it"; "it teaches them that these rights are everywhere the same"; "the example of a free people submitting peacefully to military, as to civil, laws will doubtless have the power to cure us." Europe developed these Enlightenment ideas, but due to its powerfully entrenched institutions, it could not act on them. The Enlightenment philosophes, however, thought that the example of America would inspire the deeds that their words could not. In fact, they were right. The American Revolution inspired the French Revolutionaries in 1789, and it has continued to inspire revolutionaries throughout the world.

Nineteenth-century views of the United States.

Nineteenth-century views of the United States are seen through the lens of the French Revolution. After the French Revolution devolved into terror, anarchy, and despotism, no major thinker ever again unqualifiedly praised the American Revolution. This is peculiar. Thinkers might have said that the French got it wrong, the Americans right, so let us praise the Americans and further intensify the study of it. Instead, they let the horrors of the French Revolution color their understanding of the American. This shows once again how the perceptions of America were based more on European dynamics than on the reality of America itself.

Despite the failure of the French Revolution, the existence of the United States, coupled with the Enlightenment belief in progress, led to a general feeling that the United States was the future. If the French proved that the path to the future was not simple and smooth, the perception of what the future was to be like, as embodied in the United States, was also ambivalent. Interest in the United States was heightened because everyone had a stake in the future, which the United States seemed to represent.

In the aftermath of the French Revolution, criticism arose about the United States. The substance of this criticism was similar across the ideological spectrum of the nineteenth century and is familiar to anyone aware of contemporary critiques of the United States. What America had become and what critics thought Europe would become—democratic—was regarded as a mixed blessing. The greatest representative of this ambivalence is Alexis de Tocqueville (1805–1859), the great French thinker and statesman. According to Tocqueville, democratic government is inefficient, meandering, and petty. But it has its advantages. It gets more done by energizing the people to do things themselves: "it does that which the most skillful government often cannot do: it spreads throughout the body social a restless activity, superabundant force, and energy never found elsewhere, which, however little favored by circumstance, can do wonders. Those are its true advantages" (*Democracy in America*). Democracy is not conducive, however, to refinement, elevated manners, poetry, glory, or heroic virtues. All of the main political theorists of the nineteenth century agreed with this ambivalent assessment of America—and of the budding liberalism of Europe.

America was seen as epitomizing the self-interested individualism of the new commercial society and as representing the centralization of power by the new middle-class regime. As such, four criticisms were repeatedly leveled at it. First, America was said to embody the disorder caused by collapsing institutions. The authority of all previous standards—experience, age, birth, genius, talent, and virtue—was undercut in America. Second, America represented a growing obsession with money. It was because of this that all other standards of human value were ignored. Third, America represented unchecked equality. The new type of man preferred equality to liberty, as Tocqueville and John Stuart Mill (1806–1873) warned. Finally, the new form of government represented the power of the majority, the "tyranny of the majority" in Tocqueville's famous phrase. This stifled creativity and

individuality. It guaranteed that society would be geared to the mediocre middle at the expense of individual refinement, the cultivation of culture, and the emergence of spiritual sublimity and greatness. These are essentially the same charges leveled against the United States in the late twentieth and early twenty-first centuries by traditional authorities in Africa, Asia, and the Middle East, by the educated elites in Europe and elsewhere, and by the antimodern radicals, such as the Ayatollah Khomeini, Hizbollah, and Al Qaeda.

Twentieth-century views of the United States. The main twentieth-century critiques of America, such as those by Oswald Spengler (1880–1936) and Martin Heidegger (1889–1976) on the right and by the Frankfurt School on the left, argue that America is overly technological and materialistic. Thus, America, once described as the home of nature, became the place where nature is most obscured. Twentieth-century thinkers did not agree on the origins of America's technological morass. For example, the Frankfurt School saw technology as the result of capitalism, whereas Heidegger attributed it to a particular metaphysical way of being. The characteristics that they lamented in America's overtechnicalization, however, are similar. They lament the mechanization of society and the way it alienates human beings from their deeper essences. They deplored the monotonization and leveling of the world and the resulting loss of individuality. They decried the way technology kills the spirit and prevents the attainment of the highest human developments. In short, their substantive list of complaints is very similar to those made during the nineteenth century; but whereas the nineteenth-century thinkers attributed the problems to an array of social, political, and economic factors, twentieth-century thinkers blamed them on technology.

Beyond the technological blame, there is another important divergence between nineteenth- and twentieth-century thinkers' assessments of America. Whereas nineteenth-century thinkers like Tocqueville saw Russia, as well as the United States, as an emerging power, they almost all greatly preferred the American model to the Russian. This was not true in the twentieth century. Many figures on the left, such as Jean-Paul Sartre (1905–1980) and Simone de Beauvoir (1908–1986), ideologically committed to communism, lauded Soviet approaches and condemned American ones. Even among the anticommunist right, many considered the United States and the Soviet Union to be equally bad. Heidegger, for example, says that America and Russia "are metaphysically the same." An abstraction from politics that allows such comparisons is regrettable, but in Heidegger's case it is even worse. While formally arguing that the United States and Russia are the same, when he needs a shorthand label for the phenomena that he describes as a "*Katastrophe*," he calls it "Americanization," not Russianization, implying that the former is closer to the core of the problem.

Critical Reflections

According to its representations, *America* has moved from representing Europe's past to representing Europe's future and from the epitome of nature to the epitome of technology, polar opposite views. Four points might be noted, however, that

raise questions about the validity of these representations. First, descriptions of America have been fantastical from the beginning. They are inaccurate and often intentionally so. Second, although twentieth-century thinkers blame the United States for the technologization of the world, it is apparent that the technological attitude long predates the founding of the United States. Columbus and the conquistadores neither saw the New World for what it was nor had any desire to do so. Rather, they sought to exploit resources and people, and this is the essence of the technological attitude, the attitude that some claim began only with the United States. Third, twentieth-century thinkers miss the mark in blaming America for problems that have to do with modernity itself. Because the United States was created from scratch by colonists with minimal feudal baggage, the United States emerged as perhaps the purest embodiment of modern values. But there are multinational corporations in Europe and other countries around the world, and most people wherever they live in the world desire the standard of living and freedom that the United States—and many modern countries—have. So while there is a certain justification for seeing the United States as embodying modernity, it is not modernity's sole embodiment.

Fourth, there is a fundamental continuity in the views about America. The Indians have been described as on the one hand, naïve, innocent, childlike, and simple, and on the other as brutish, vulgar, shallow, stupid, and lacking spirituality. These are essentially the same charges that Europe and the world leveled at the United States throughout the nineteenth and twentieth centuries. The United States might be all of these things, although probably not more than most countries and possibly less so than many. But the fact that ways of life as opposite as those of the Indians and the United States are described in fundamentally the same terms indicates a problem in the substantive nature of the representations.

As an epilogue, it is worth noting briefly a postmodern view of America. Postmodern thinkers reject the idea of there being any humanly knowable truth and choose to play with images, which they claim is all we are left with. The French postmodern thinker Jean Baudrillard has done this with the United States. In a book entitled *America* (1986; English translation published in 1988), Baudrillard writes contradictorily, "For me there is no truth of America" and, "I knew all about this nuclear form, this future catastrophe when I was still in Paris, of course." He also mixes all of the main images of America, describing the United States both as "the original version of Modernity" and as "the only remaining primitive society." For him, America is the "Primitive society of the future." He combines five hundred years of images of America in a clever fashion.

Alan Mitchell Levine

AMERICANIZATION, U.S. *Americanization* refers to processes of “becoming American,” and to organized efforts to encourage the transformation of immigrants into “Americans.” The term was in informal use in the United States in the mid-nineteenth century, but it is most prominently associated with the movement of that name during the 1910s and early 1920s. The term is often used interchangeably with *assimilation*.

The “problem” of Americanization arises because American national identity must be constructed in the absence of primordial ethnic mythology, and in the face of exceptional diversity. There is general recognition that the United States is a “civic nation,” rather than an “ethnic nation,” in which devotion to “founding principles” is the source of national identity and community. The creedal nature of American identity carries the implication that anyone may “become American” by committing himself or herself to the nation’s founding principles, and to their expression in distinctively American symbols and ways of living. However, the propositional nature of American identity carries with it the question of who is capable of the necessary understanding of, and commitment to,

American principles, and to the ways of living that they are taken to imply. That seed of doubt has led Americans to scrutinize cultural differences, ethnic consociation, and race as potential indicators of the lack of qualification for trusted membership in the polity, and to insist on outward demonstrations of Americanization by those considered for membership.

American National Identity and Ideologies of Americanization

The definition of American identity in ideological terms was elaborated in the early postindependence period. While the extent to which a new American people would emerge from the fusion of diverse strands of Europeans, as Michel-Guillaume-Jean de Crèvecoeur’s (1735–1813) famous “Letter from an American Farmer” rhapsodized, was questionable, what was firmly established was the association of American identity with individual “transformation.”

Americanization in the nineteenth century. Nineteenth-century Americans expected life in the United States to transform European newcomers into culturally compatible neighbors. While not directing specific “Americanization” efforts toward immigrants, American communities placed faith, in particular, in the common schools to be “culture factories” in which to inculcate principles of republican virtue, and to cultivate American habits and identities. A general pattern of acceptance of diversity and confidence in the workings of America’s natural “melting pot” was not obtained until the 1890s.

The 1890s represent a crucial turning point that intensified the salience of ethnicity as an element of national identity, gave rise to the “Americanization movement,” and, ultimately, resulted in long-lasting restrictions on immigration. A massive influx of new immigrants, primarily from southern and eastern Europe, combined with the perception of the frontier having closed, accelerated industrialization, rural emigration, recurring economic distress, perceptions of urban disorder and disorganization, labor conflict, and radical political agitation diminished Americans’ faith in the naturally absorptive powers of American life and in a laissez-faire approach to immigrant absorption. So, too, did the development of a distinctively racialist ideology that identified Anglo-Saxon descent with authentic American identity and placed the new immigrants into inferior classifications.

Americanization in the first quarter of the twentieth century. The resulting effort to “Americanize” immigrant newcomers was part of the Progressive movement’s broader efforts to construct a modern and cohesive social order, and also part of a new purifying national effort to cultivate patriotism among all Americans. As World War I approached, the priorities of immigrant adjustment would yield to the priority of coercively assuring loyalty through insistence on naturalization, quick acquisition and sole use of English, and adherence to “American” cultural norms.

Well before the official birth of the “Americanization movement” in 1915, educators began to grapple with what they determined were the needs of the increasing number of foreign-born adults and their children. Settlement houses and other agencies

Immigrants in Americanization class. In the early 1900s, citizenship classes such as those conducted by the U.S. Bureau of Naturalization often sought to teach immigrants not only basic civic facts about America, but also how the newcomers could be more “American” in their everyday life. © CORBIS

like the YMCA initiated programs and activities intended to familiarize immigrants with the language and cultural practices of the United States and to smooth the transition from “immigrant” to “American.” Public schools began to adopt distinctive curricular, extracurricular, and disciplinary innovations intended to “Americanize” the children of immigrants. These included, among other measures, kindergartens, instruction in hygiene, manners, and the conduct of daily life, home visitations, and special classes for teaching English. During this phase of “humanitarian” Americanization, professionals sought to integrate immigrants into American life without harshly and rapidly stripping them of their homeland ties and concerns or of their culturally distinct languages, values, beliefs, and customary ways.

The Americanization movement that followed was multifaceted and involved professional, popular, and political elements. Its participants were not of one mind, and some shifted their viewpoints and priorities over time. It is the coercive and strident activities of campaigns of the World War I period against “hyphenation,” and, then, for “100 Percent Americanism” that have left the lasting image of the Americanization movement, and account for its repudiation in the 1920s.

According to John Higham, the Americanization movement represented “nothing less than an alteration in the whole texture of nationalist thought.” One-Hundred Percent Americanism demanded “universal conformity organized through total national loyalty.” The new spirit of nationalism required complete identification with country so as to “permeate and stabilize the rest of [the individual’s] thinking and behavior” (1970, pp. 204–205). In this vein, citizenship classes included lessons not only on civic duties like voting, but also on “American” ways of performing routine tasks like cooking and cleaning, child rearing, and personal hygiene. “Becoming an American, immigrants were taught, involved making yourself over entirely” (McClymer, p. 109).

Perhaps highest on the Americanizers’ agendas for remaking immigrants into Americans was conversion by immigrants from home-language to the use of English. For the most extreme among the “English First” crusaders, language was foremost a matter of loyalty. Professional Americanizers, however, emphasized that only a common language could guarantee the “community of interest” required for national unity. Among professional Americanizers, English was deemed necessary to

facilitate the widespread social intercourse and participation that they so ardently championed.

Historians have not often been kind to the Americanization movement of the 1890–1925 period. Robert Carlson has labeled the Americanization movement a “Quest for Conformity” that demanded an unfair exchange, and, in general, was psychologically damaging to its putative beneficiaries. Gary Gerstle identifies the Americanization movement with coercive nation-building that almost destroyed German Americans as an ethnic group, limited the identities that Americans could adopt, and hardened the racial color-line. John Higham, while recognizing the mixed impulses of the movement, interprets the movement as fundamentally an episode in American nativism.

Not all historians, however, have viewed the Americanization movement in unrelentingly negative terms. The circumstances to which the Americanizers were responding were, given their perspectives, threatening and challenging. In the face of the massive immigration from parts of the world that heretofore had not been large sources of emigration to America, worries over whether democracy could function in the absence of a common language, common culture, and common commitment, were, in Robert Wiebe’s judgment, reasonable. Stephan Brumberg is critical of academic critics of the Americanization movement who fail to appreciate the immigrant’s real needs for structure and direction in an alien, threatening, perplexing, and dehumanizing environment. Moreover, the vocabulary of Americanization, with its proclamations of American symbols and ideals celebrating liberty, democracy, and equal opportunity, could be adopted by immigrant and American workers alike, to help forge an American working-class consciousness in opposition to the rule of capitalist elites.

While most historians have evaluated the Americanization movement by what it did to immigrants, Michael Olneck has questioned the proximate effects of Americanization and has argued that perhaps the largest significance of the movement was to create new “public meanings” rather than to have changed immigrants. Most significantly, the Americanization movement defined subsidiary identities as incompatible with “American” identity, delegitimated collective identities, relegated ethnic identities to the “background,” and demarcated a supraethnic, shared public terrain of “American life” into which all were expected to “enter,” as well as symbolically represented the abstract autonomous individual as the constitutive element of American society.

Americanization between 1930 and 1965. During the 1920s occasional voices were raised against the project of a homogeneous America, and by the 1930s an ideology of “cultural pluralism” gained currency. With the rise of fascism in Europe, concerns over ethnic, racial, and religious tensions in the United States, the ongoing social and political incorporation of second-generation Americans, scholarly discovery of persistent ethnicity in the cities, and anthropological refutations of racialist doctrines, ideas of America as encompassing a potentially harmonious diversity consistent with assimilation took hold, and were reinforced during the mass mobilization for World War II. Cultural diversity would be tolerated within the context of shared national ideas and sentiments that

ensured civic harmony and cooperation. Cultural pluralism in this form represented a powerful reaffirmation of American ideology as a basis of national identity.

Pluralism in the 1950s was “predicated on consensus around the American value system despite seeming to place a premium verbally on diversity” (Gleason, p. 62). Subsequently, American universalistic egalitarian and individualistic civic ideals appeared to triumph in passage of the Civil Rights Act of 1964 and the Immigration Reform Act and Voting Rights Act of 1965. The triumph, in the view of some, was short-lived.

Americanization after 1965. The emergence and legitimacy of Black Power and other ethnic nationalisms in the mid-1960s, anti-Vietnam War critiques and mass protests, and the adoption of policies encouraging ethnic identification, recognition, and rights, was seen by some to have replaced civic nationalism with a strong version of cultural pluralism, later to be termed *multiculturalism*. In the process, *assimilation* joined the already discredited term *Americanization* as a term of opprobrium.

However, reactions against multiculturalism have occasioned calls for the revival of a civic ideology of American identity, and some have attempted to revive a modern ideal of Americanization. Significantly, academic and journalistic critics of multiculturalism rarely claim to seek a return to the demands for homogeneity characteristic of the Americanization movement period, nor do they urge an end to ethnicity. John Higham advocates “pluralistic integration,” in which individual rights and needs for group solidarity are balanced, as are universalistic principles and particularistic needs. David Hollinger propounds a model of “postethnic cosmopolitanism,” which prefers voluntary to prescribed affiliations, appreciates multiple identities and communities of broad scope, and accepts the formation of new groups as part of the normal life of a democratic society. Peter Salins commends “Assimilation, American Style” that requires citizens to accept English as the national language, take pride in American identity, and believe in America’s liberal and democratic egalitarian principles, and to live by a Protestant ethic of self-reliance, hard work, and moral rectitude, but does not demand cultural homogeneity. Even John Miller, who protests “The Unmaking of Americans” and the undermining of an earlier assimilation ethic by multiculturalism, argues not that racial and ethnic identities should be suppressed, but only that their expression remain confined to the private sphere. In its 1997 recommendations, the United States Commission on Immigration Reform recommended “taking back” the word *Americanization*, since it is “our word” that was “stolen” by racists and xenophobes in the 1920s. The Commission defined *Americanization* in ways that are consistent with the ideal of civic nationality. “Americanization,” the Commission wrote, “is the process of integration by which immigrants become part of our communities and by which our communities and the nation learn from and adapt to their presence,” and is “the cultivation of a shared commitment to the American values of liberty, democracy and equal opportunity” (p. 26). “The United States,” the Commission continued,

is a nation founded on the proposition that each individual is born with certain rights and that the purpose

of government is to secure these rights. The United States admits immigrants as individuals. . . . As long as the United States continues to emphasize the rights of individuals over those of groups, we need not fear that the diversity brought by immigrants will lead to ethnic division or disunity. (pp. 28–29)

Whether or not subsequent government action is as attentive as the Commission tried to be to the “cosmopolitan” elements in defining American identity is debatable, but government policies certainly evidence an ongoing commitment to Americanization. In 2001 the Congress replaced the Bilingual Education Act with the English Language Acquisition Act, which included replacing the United States Department of Education’s Office of Bilingual Education and Minority Language Affairs with an Office of English Language Acquisition. In 2003 Congress established the “Office of Citizenship” in the United States Department of Homeland Security. The Office of Citizenship is meant to work to revive and emphasize “the common civic identity and shared values that are essential to citizenship,” according to a government fact sheet. And, despite apparent commitments to multiculturalism in the public schools, actual formal and informal practices, particularly those emphasizing the rapid acquisition of English, suggest that schools continue to regard “Americanization” as a priority, even if they do not use that term. What remains absent from the schools is the civics education component of Americanization that predominated during the 1910s.

Conclusion

At the juncture of the early twenty-first century, those made uneasy by America’s increasing ethnic and linguistic diversity called, through such efforts as attempting to legislate an “official” status for English, for a kind of revived Americanization movement. While a majority supported proposals to make English the “official” language, acceptance of diversity nevertheless appeared embedded in expressed attitudes, and public-opinion studies strongly supported the conclusion that Americans’ “. . . preference for an inclusive nationalism coexists with the widespread acceptance of pluralism in cultural practices” (Citrin et al., p. 266). A “cosmopolitan liberal” view of American identity and polity appeared to predominate over either a multiculturalist or nativist view, and so we would expect coercive Americanization crusades to remain a thing of the past.

Michael R. Olneck

ANALYTICAL PHILOSOPHY. It was only in the 1960s that the phrase “analytical philosophy” came into frequent use as a way of describing the kind of philosophy characteristic of much English-language philosophy of the twentieth century. But occasional references to “analytical” (or “analytic”) philosophy as a new kind of philosophy can be found much earlier, where it is primarily used to introduce a contrast with “speculative philosophy.” The thought here is that whereas traditional philosophers have attempted by means of speculative arguments to provide knowledge of a kind that is not otherwise possible, “analytic” philosophers aim to use methods of philosophical analysis to deepen the understanding of things that are already known—for example, concerning the past or concerning mathematics. In doing so analytic philosophers will seek to clarify the significance of essentially uncontentious historical or mathematical truths and to explain the possibility of our knowledge of them. This program does not require that analytic philosophers deny the possibility of speculative philosophy; but many did so, most famously those associated with the Vienna Circle such as Rudolph Carnap (1891–1970), who held that “all statements whatever that assert something are of an empirical nature and belong to factual science” and went to claim that, for philosophy, “What remains is not statements, nor a theory, nor a system, but only a method: the method of logical analysis” (1932; 1959, p. 77).

Methods of philosophical analysis are in fact as old as philosophy, as in Socrates’ dialectic. The method was especially prominent in the theory of ideas characteristic of seventeenth- and eighteenth-century philosophy, which involved the analysis of complex ideas into simple ones. One of Immanuel Kant’s (1724–1804) insights was to recognize the priority of

complete judgments over ideas, or concepts, and this led him to hold that analytic methods of inquiry were subordinate to the elucidation of synthetic unities, such as the unity of consciousness. Kant's successors in the tradition of German idealism took this subordination much further as they sought to articulate the internal relations that hold together ever more encompassing "organic wholes" such as the state and the universe. For them, analysis was only ever a preliminary stage of inquiry, a kind of falsification to be transcended once a relevant organic whole and its relationships had been identified.

Moore

A good place to mark the start of analytical philosophy is therefore with the young G. E. Moore's (1873–1958) emphatic denunciation of this idealist philosophy. Moore rejected internal relations and organic wholes, and in their place he gives priority to individual judgments, or propositions, and their constituent concepts. Since he holds that true propositions are real structures that do not represent facts, but constitute them, it follows that an analysis of a proposition into its constituent concepts is equally an analysis of a fact into its elements: as he puts it "A thing becomes intelligible first when it is analysed into its constituent concepts" (1899; 1993, p. 8). Thus in Moore's early work a method of conceptual analysis is employed to identify the basic properties of things. This is manifest in Moore's *Principia Ethica* (1903), where Moore famously argues that goodness is the basic ethical property and thus that ethical theory is the theory of the good. It should be observed, however, that Moore's method of analysis does not specify the content of his theory of the good, even though this is also supposed to be a priori. Moore's method of metaethical analysis is therefore combined with an appeal to intuitive reflection concerning synthetic a priori ethical truths; and one of the issues that has remained a matter of debate is just what contribution conceptual analysis has to offer to ethical theory.

Russell, Frege, Wittgenstein

The decisive development that gave a distinctive character to analytical philosophy was that whereby the young Bertrand Russell (1872–1970), freshly converted from idealism by Moore, used his new logical theories to enhance the possibilities for philosophical analysis. For what is special about analytical philosophy is the preeminence given to logical analysis. In Russell's early work this development is manifest in his "theory of descriptions," whereby he uses his logical theory to provide an analysis of propositions in which particular things are described. Russell argued that he was thereby able to resolve long-standing metaphysical puzzles about existence and identity, and equally to show how it is possible for us to have knowledge ("by description") of things of which we have no direct experience. Indeed as Russell became increasingly adept at developing and applying his logical theory, he came to think that its use was really the only proper way of doing philosophy. Thus in 1914 he gave some lectures that included one with the title "Logic as the Essence of Philosophy," and he here declares: "every philosophical problem, when it is subjected to the necessary analysis and purification, is found either to be not really philosophical at all, or else to be, in the sense in which we are using the word, logical" (1914, p. 33).

Russell here describes his method as "the logical-analytic method of philosophy" (p. v) and he goes on to add that the first clear example of this method is provided by Gottlob Frege's (1848–1925) writings. Russell has in mind here Frege's development in 1879 of a radically new logical theory (first order predicate logic, as we would now call it) in his *Begriffsschrift* ("Concept-script"). Although Frege does not here apply his logic to philosophical debates, he does offer it as "a useful tool for the philosopher" who seeks to "break the domination of the word over the human spirit by laying bare the misconceptions that through the use of language almost unavoidably arise concerning the relations between concepts" (1879; 1970, p. 7). This contrast between the new logical "concept-script" and the apparent structure of ordinary language brings to the surface a concern with the proper understanding of language that is characteristic of analytical philosophy. The relationship between logic and ordinary language remains a contested matter, but the identification of "logical form" is one enduring strand of analytical philosophy, as in Donald Davidson's theories of action and causation.

As indicated, Russell looked back to Frege when describing his "logical-analytic method of philosophy"; but in truth Russell's philosophy also contained much more besides, in particular a problematic emphasis on the priority of the things that are presented in experience, the things that we "know by acquaintance." One of the achievements of Ludwig Wittgenstein (1889–1951), who had studied with Russell and through him made contact with Frege, was to set aside this aspect of Russell's philosophy and present a purified logical-analytic method in his *Tractatus Logico-Philosophicus* (1922). Wittgenstein maintains here that "Philosophy is not one of the natural sciences"; instead "Philosophy aims at the logical clarification of thoughts. Philosophy is not a body of doctrine but an activity" (4.111–112). There is a sharp disagreement here with Russell, whose philosophy certainly does offer "a body of doctrine" based on his theory of knowledge by acquaintance. By contrast Wittgenstein holds that one should be able to demonstrate to anyone who seeks to advance a philosophical proposition that in doing so they have fallen into talking nonsense (6.53).

The Vienna Circle

Whether Wittgenstein altogether succeeds in explaining his own position without convicting himself of nonsense remains debated. But there is a different element in his position that requires attention: the thesis that logic has a special a priori status because it articulates the rules that make language possible. This thesis is often associated with the claim that logic is "analytic" because logical truth depends only on the definition of logical vocabulary. In fact there is a distinction here: it is one thing to hold that logic is a priori because it is integral to language, it is another to hold that logic is "analytic" in the sense that it is just true by definition. But this distinction was not drawn by the members of the Vienna Circle whose "logical empiricism" constitutes the next phase in the development of analytical philosophy. As indicated by the passage cited earlier from Carnap, a leading member of this group, their starting point was an empiricist presumption that the

understanding of language is rooted in perceptual experience; but they recognized that ordinary experience does not exhibit the complex laws and structures of which the natural sciences speak. So they invoked logic to make the connections between observation and theory. In order to remain true to their empiricism, therefore, they emphasized the “analyticity” of logic, such that logic was not to be thought of as a body of abstract nonempirical doctrine but simply a way of working out the conventions of language.

Ordinary Language Philosophy

Although there was much disagreement among the logical empiricists their position constituted an immensely influential antimetaphysical paradigm for mid-twentieth-century philosophers, especially after the rise of the Nazis had led to the emigration of the leading philosophers of the group from Central Europe to the United States. While traditional philosophers complained, quite rightly, that the antimetaphysical rhetoric of the position concealed its own metaphysical assumptions, two other lines of criticism were especially important for the subsequent development of analytical philosophy. In Britain, especially after 1945, the logical empiricists’ emphasis on logical analysis was felt to be excessively restrictive. It was argued by the defenders of “ordinary language philosophy” such as J. L. Austin and Peter Strawson that formal logic does not adequately capture the complex conceptual structures of our thought and language, and thus that a much more heterogeneous and informal approach to conceptual analysis is required. This work led to the development of a variety of approaches to the study of language, especially speech act theory, which treats speech as a kind of action and therefore conceives of its meaning in the light of the things speakers *do* by means of their speech acts (for example, making a promise or naming a child). At much the same time Wittgenstein’s later *Philosophical Investigations* (1953) were published, with a similar emphasis on the need to understand our ordinary “language-games” instead of relying on formal logic to capture the structure of thought. One of the most challenging features of Wittgenstein’s later investigations was his critical discussion of psychological concepts, and this, together with other work, has helped to direct recent analytical philosophers at least as much to the philosophy of mind as to the philosophy of language.

Quine

The other main criticism of logical empiricism came from the American philosopher Willard Van Orman Quine (1908–2000), who argued that the logical empiricists had been mistaken in regarding logic as “analytic”—that is, true by definition. Quine argued that logic is of the same type as other beliefs: it is an element of the web of belief through which we make sense of our experience as experience of an objective world. Hence logic is not analytic, since it concerns the world, and it is not a priori, since it is revisable in the light of experience. Quine’s arguments remain disputed, but his work has certainly helped to encourage philosophers to address broader disputes in the natural sciences and other areas. There is no enclosed domain for a priori logical and conceptual analysis. Some critics, most notably Richard Rorty, argue that it follows that there is now nothing worth calling “analytical philosophy.” But these claims

are exaggerated. Although Quine was a critic of the analyticity of logic, he was a distinguished logician and used logical analysis throughout his philosophy; so his practice shows that analytical philosophy does not depend on the analyticity of logic. Second, although Quine’s arguments call into question the “linguistic” conception of the a priori as analyticity it is widely accepted that some distinction between the a priori and the empirical has to be made if we are to be able to reason coherently; and as long as that distinction is in place, analytical philosophers can draw on it to characterize the significance of their conclusions. Analytical philosophy today, therefore, continues the tradition captured by Russell and Wittgenstein at the beginning of the twentieth century. It is not “a body of doctrine,” it is a “method,” typically “logical-analytic,” but often informal, of using reasoning to capture and criticize conceptual structures. As such one finds it regularly employed across the whole spectrum of contemporary philosophical debate, by feminists and political philosophers as much as by metaphysicians and epistemologists.

Analytical and Continental Philosophy

Throughout much of the twentieth century analytical philosophy was very different from the approach to philosophy characteristic of “continental” philosophers such as Edmund Husserl, Martin Heidegger, Jean-Paul Sartre, and Maurice Merleau-Ponty. One reason for this was simply their ignorance of logic, which excluded them from any serious understanding of analytical philosophy. Conversely analytical philosophers, by and large, remained uncomprehending of the phenomenological project of recovering the basic structures of intentionality. By the end of the twentieth century, however, with translations of all the main works involved into the relevant languages, a much greater degree of mutual comprehension has been achieved. As a result, while continental philosophers such as Jacques Derrida have sought to appropriate analytical techniques such as speech-act analysis, analytical philosophers have turned their attention to the theme of intentionality, though sometimes with conclusions far removed from those of continental philosophers. Thus the situation is now one of dialogue despite profound disagreements.

Thomas Baldwin

ANARCHISM. The term *anarchy* comes from an ancient Greek word meaning “without a leader or ruler.” However, proponents of anarchism have most often used the term to refer to a natural state of society in which people are not governed by submission to human-made laws or to any external authority. Anarchism is above all a moral doctrine concerned with maximizing the personal freedom of individuals in society. To achieve this end, leading anarchist social theorists have tended to offer critical analyses of (1) the state and its institutional framework; (2) economics; and (3) religion. Anarchist hostility to the state is reflected in the rejection of the view popularized by contract theorists that a government’s sovereignty is legitimated by the consent of its subjects. Anarchists contend that no contractual arrangement among human beings justifies the establishment of a ruling body (government) that subordinates individuals to its authority. From their observations of the historical development of the state, anarchist thinkers such as Pierre-Joseph Proudhon (1809–1865) and Peter Kropotkin (1842–1921) concluded that all forms of government have been used as instruments for establishing monopolies that favor the propertied and privileged. Anarchists also argue that the all-encompassing authority of the state allows it to exercise undue influence over the lives of its citizens. It is further maintained by anarchists that the state, using laws and the organs of power at its disposal, can control not only citizens’ public and private behavior but also their economic lives. As such, the state, in all its forms, is condemned as an unnecessary evil.

From an economic standpoint, most anarchists have identified themselves as members of the anticapitalist socialist movement. In common with socialists, anarchists see capitalism as a system ruled by elites, one that exploits the working or productive members of society economically and represses them culturally and spiritually. Accordingly, anarchists argue

that the emancipation of the worker will only be achieved by completely destroying the pillars of capitalism.

Anarchists differ as to what form of economic arrangements should replace capitalism. Collectivists and mutualists insist that private ownership of the fruits of individuals' labor is desirable, while anarchist communists maintain that individual freedom can only be achieved in a society where all material goods and natural resources are placed under common ownership. Still another group of anarchists known as individualists have advocated a system of "labor for labor" exchange, which they believe could operate in accordance with natural market forces.

Anticlericalism is another important dimension of anarchist thinking. Though most anarchists are materialists, they are not opposed to spirituality per se: indeed anarcho-pacifists such as Leo Tolstoy (1828–1910) were self-identified as Christians. Rather, anarchists condemn organized religion, which they see as an agent of cultural repression. They have, for example, attacked the Catholic Church among other religious institutions on the grounds that it has historically served as a means of empowering church government and not of enriching the spiritual lives of its adherents. Anarchists further contend that the church has consistently acted as an ally of secular governments and therefore forms part of the general system of state repression that operates against the common person.

Because the heyday of anarchism as an ideological movement was during the nineteenth and early twentieth centuries, the focus here will be on the core beliefs of key anarchist theorists in this period. Thus a discussion of other, less historically significant anarchist strands such as pacifism and individualism will be mentioned only in passing. The impact that classical anarchist theory has had on recent political and social movements will be summarized in the concluding section.

Anarchist Principles in Context

The ideas associated with modern anarchism can be traced to the period of the French Revolution (1789–1799), although they did not crystallize into a formal political doctrine until the middle part of the nineteenth century. The first book that offered the clearest intimation of the anarchist conception of society was William Godwin's *An Enquiry concerning Political Justice and Its Influence upon General Virtue and Happiness* (London, 1793). In this, Godwin identifies the state as the main source of all social ills. In order for humans to live freely and harmoniously, Godwin advocates the establishment of a stateless society in which individuals are no longer subject to the economic exploitation of others. Despite its antistatist message, the ideas found in Godwin's magnum opus belong to a tradition of British political radicalism that cannot be classified as anarchist. In fact his work had its greatest influence on the liberal thinkers of his age as well as on Robert Owen, John Gray, and other early socialist reformers.

Of far greater significance to the development of modern anarchist ideology is the French social philosopher Pierre-Joseph Proudhon, whose indictment of private property

under capitalism was made famous in his book *What is Property?* (1840). Proudhon's main contributions to the anarchist view of society lay in his theories of mutualism and federalism. In the former he argued that the exploitative capitalist system could be undermined by creating economic organizations such as the People's Bank, an institution of mutual credit meant to restore the equilibrium between what individuals produce and what they consume. Because he believed that concentrating political power in the hands of the state militated against the economic forms he was proposing, Proudhon argued for a society in which power radiated from the bottom upward and was distributed along federal or regional lines.

Though he himself never belonged to any party or political organization, Proudhon's writings inspired a substantial following among freethinkers, liberal intellectuals, and workers across Europe, particularly in France and Spain. One of his most famous disciples was the Russian anarchist Mikhail Bakunin (1814–1876). Like Proudhon, Bakunin was an eclectic thinker who was constantly revising and reformulating his views on society. More so than Proudhon, who did not believe that the transition to an anarchist society demanded violent and sweeping changes, Bakunin gave both physical and ideological expression to the view that revolutionary upheaval was a necessary and unavoidable process of social development, a view summed up in his oft-quoted dictum, "The urge to destroy is also a creative urge." At the core of his creed was collectivism, by which he meant that the land and means of production should be collectively owned and that future society should be organized around voluntary associations—such as peasant communes or trade unions—that were not regulated or controlled by any form of government. Too impatient to set forth a systematic exegesis of his antiauthoritarian beliefs, Bakunin tended to express his concepts in tracts that could be used by revolutionary bodies (for example, the Alliance of Social Democracy) with which he was associated. Indeed Bakunin's most enduring legacy to anarchism resides in his conception of revolutionary transformation. According to him, the dispossessed and most repressed elements of society—particularly the working classes and peasantry in economically backward countries such as Spain, Italy, and Russia—were by nature revolutionary and only needed proper leadership to rise up against their oppressors. Because he adamantly rejected the Marxian notion that conquering political power was a precondition for overthrowing capitalism, Bakunin was convinced that the exploited masses should be led into revolt by a small and dedicated group of individuals who were acting in their interests. It was his belief that revolution could not be achieved until the state was completely abolished, which brought him into conflict with Karl Marx and his followers, who insisted that a "dictatorship of the proletariat" was a necessary phase in the transition to a stateless society (communism).

Bakunin's antipolitical conception of revolutionary change as well as his forceful repudiation of the authoritarian communist principles embodied in the Marxism of his day drove a wedge between his adherents in the First International (1864–1876) and those of Karl Marx, thus establishing a divide in the European socialist movement that would never be bridged.

However, not all anarchists were hostile toward the idea of communism. Another Russian aristocrat turned revolutionary, Peter Kropotkin, developed over the course of his lifetime a sociological theory of anarchism that combined the antiauthoritarian beliefs espoused by his predecessors in the anarchist movement with those of communism. Unlike Proudhon and Bakunin, both of whom believed in the right of individual possession of products produced from one's labor, Kropotkin advocated an economic system based on the communal ownership of all goods and services that operated on the socialist principle "from each according to his abilities, to each according to his needs." By distributing society's wealth and resources in this way, Kropotkin and other anarchist communists believed that everyone, including those who were unproductive, would be able to live in relative abundance.

Kropotkin's greatest contributions to anarchist theory, however, were his attempts to present anarchism as an empirically verifiable worldview, one that was based on "a mechanical explanation of world phenomena, embracing the whole of nature." Following in the positivist tradition laid down by Auguste Comte (1798–1857), Herbert Spencer (1820–1903), and other forerunners of modern social science, Kropotkin believed that the study of society was analogous to that of the world of nature. In *Modern Science and Anarchism* (1912), for example, Kropotkin contends that the anarchist method of sociological enquiry is that of the exact natural sciences. "Its aim," he says, "is to construct a synthetic philosophy comprehending in one generalization all the phenomena of nature—and therefore also the life of societies." In developing his views on human nature, Kropotkin went farther in extending the analogy between society and the natural world. Like the Social Darwinists of his era, Kropotkin maintained that all human behavior was a reflection of our biological condition. But while most Social Darwinists argued that a "tooth and nail" impulse in the struggle for existence was the dominant natural law governing the evolution of human behavior, Kropotkin insisted that the instinct of cooperation was an even more important factor in this process. According to him, it is the species in nature that shows the greatest tendency toward mutual aid—not cutthroat competition—that is the one most likely to survive and flourish over time. By arguing in this way, Kropotkin was attempting to demonstrate that anarchism was a highly evolved state of human nature but one that could not be obtained until the state and other coercive institutions were completely abolished.

The relationship between anarchism and violence. The efforts of Kropotkin and other anarchist thinkers to define anarchism as a rational and practicable doctrine were overshadowed by the negative publicity generated by the violence-prone elements of the movement. Beginning with the assassination of Tsar Alexander II in 1881 and continuing up to the turn of the century, when the American president William McKinley was murdered in 1901 by a lone gunman, anarchists everywhere were viewed as sociopaths who terrorized society by throwing bombs and assassinating heads of state. The fact that not all of these public outrages were committed by anarchists (Alexander II was killed by nihilists) or individuals who were representative of the movement as a whole did little to dispel

the exceedingly negative image of anarchists that was being projected by the popular press and government authorities.

The violent practices that were now associated with anarchism were largely the product of an ill-defined tactic known as "propaganda by the deed," a direct-action policy advocated by some anarchists from the late 1870s on. That violent and even criminal deeds were necessary to advance the anarchist movement appealed especially to a small number of disaffected idealists who were convinced that the only way to intimidate the ruling classes and overturn the capitalist system was to disrupt the daily routines of bourgeois society. Killing public figures close to the centers of political and religious power was one way of doing this. Bombing cafés, robbing banks, and destroying churches and similar hierarchical institutions were also seen as justifiable means to a revolutionary end.

A number of the perpetrators of "propaganda by the deed" were influenced by a highly individualistic strain of anarchist thought that became popular among *déclassé* intellectuals and artists around the turn of the twentieth century. A seminal figure in the individualist branch of anarchist thinking was the German philosopher Max Stirner (1806–1856). In his *The Ego and His Own* (1845), Stirner espoused a philosophy that was premised on the belief that all freedom is essentially derived from self-liberation. Because he identified the "ego" or "self" as the sole moral compass of humankind, he condemned government, religion, and any other formal institution that threatened one's personal freedom. It was his abiding concern with the individual's uniqueness and not his views as a social reformer that made Stirner attractive to certain segments of the anarchist community at the end of the nineteenth century. This was particularly true not just of the devotees of violence in Europe but also of the nonrevolutionary individualist anarchists in the United States. For example, the foremost representative of this strand of anarchism in the United States, Benjamin R. Tucker (1854–1939), took from Stirner's philosophy the view that self-interest or egoistic desire was needed to preserve the "sovereignty of the individual."

Spiritual anarchism and anarcho-syndicalism. Parallel to the terrorist acts committed at this time, the Christian pacifist Leo Tolstoy (1828–1910) was developing an antiauthoritarian current of thinking that, in its broadest sense, can be regarded as belonging to the anarchist tradition. Tolstoy promoted a form of religious anarchism that was based on the "law of supreme love" as defined by his personal (anti-doctrinal) reading of the Scriptures. Though he did not see himself as an anarchist, he nevertheless believed that in order for men and women to live in a morally coherent world it was necessary to destroy the state and its institutions. Because of his rejection of the use of force and violence, Tolstoy and his followers advocated civil disobedience, or nonviolent resistance, as a means of achieving the stateless and communally based society they envisioned.

It was also around this time that anarchist doctrine experienced another significant metamorphosis. From the late 1890s until the 1930s, anarchist activity was increasingly centered in working-class cultural and economic organizations,

and the tactics and strategy of the movement were grounded in the theory of revolutionary syndicalism. While not wholly abandoning the use of violence, the anarcho-syndicalists believed that, against the organized forces of big government and monopoly capitalism, the revolutionary élan of the workers could be most effectively channeled through trade union organizations. Using tactics such as the general strike, which was meant to paralyze the economy by linking shutdowns in different industries, the anarcho-syndicalists believed that it would be possible to create the general conditions for a complete collapse of capitalism and the state. Anarcho-syndicalism became an important force in the labor movements in parts of Latin America (Mexico, Argentina) and in European countries such as Italy, France, and Spain. Its greatest impact was felt in Spain. During the Second Republic (1931–1936) and continuing through the civil war period (1936–1939), anarcho-syndicalism developed into a powerful mass movement. At its peak the anarcho-syndicalist organizations known as the CNT-FAI (National Confederation of Workers and Federation of Iberian Anarchists) counted more than 1.5 million adherents. Their influence over the course of events during the civil war was most dramatically illustrated by the fact that they set up and ran thousands of industrial and agricultural collectives throughout the Republican zone. The triumph of Franco's Nationalist forces in 1939, followed by the outbreak of another global world war that same year, sounded the death knell for anarcho-syndicalism not only in Spain but in other Western European countries as well.

It deserves mention here that, by the time World War II began, anarchism's reach extended across the globe. Besides taking root in the Americas, the doctrine had penetrated parts of East Asia and even the subcontinent. In both China and Japan, for example, Western anarchist ideas influenced leading social thinkers such as Mao Zedong and labor organizers who were seeking to establish socialism in those countries. However, the emergence of authoritarian and totalitarian regimes of both the right and left in the 1930s and late 1940s effectively quashed the libertarian tendencies that had been developing up to then. It would take another forty years before anarchist ideas would be resurrected by tiny protest groups (mostly in Japan) that wanted to express their cultural and intellectual dissatisfaction with the status quo.

Contemporary Anarchism

While the Spanish Civil War, World War II (1939–1945), and the rise of totalitarian communist regimes after 1949 were events that effectively ended the further development of the historical anarchist movement, anarchist ideas and sensibilities were not as easily repressed. The political and cultural protest movements of the 1960s and 1970s in Europe and the Americas saw a resurgence of interest in anarchism. Feminists, ecologists, student radicals, pacifists, and others who were eager to question the prevailing social and moral preconceptions of modern society held by both the left and the right were drawn above all to the doctrine's iconoclasm. At this time, elements from a variety of nonlibertarian groups—the Situationists in France, for example—freely borrowed anarchist ideas in developing their own ideological positions.

Anarchism has also been enriched by the thinking of some of the twentieth century's leading philosophers, political activists, artists, and intellectuals. Bertrand Russell, Herbert Read, Mahatma Gandhi, Martin Buber, Albert Camus, Michel Foucault, Paul Goodman, Lewis Mumford, and Noam Chomsky are among the notable figures who have been associated with anarchist beliefs and values.

From the late twentieth century on, anarchism has continued to branch out in different directions. Anarchist ideas have been influential in the development of radical feminism and the Green and antiglobalist movements that have spread across Europe and the Americas. Contemporary anarcho-feminism has its roots in the writings and activism of historically important figures like Emma Goldman, Voltairine de Cleyre, and Federica Montseny. Goldman was among the first female anarchists to emphasize that the emancipation of women in society must begin with psychological change within women themselves. By calling on women to struggle against the repressive and hierarchical structures that dominated their personal lives, Goldman anticipated late-twentieth-century anarcho-feminists, who have insisted that the "personal is political" and have developed a radical critique of everyday life. Anarchist principles also have been adopted by some of the more radical ecological movements of postindustrial societies. Libertarian social ecologists such as Murray Bookchin have attempted to extend the traditional anarchist demand to emancipate society from government rule to our natural environment, calling for an end to human beings' dominating and exploitative relationship with nature.

Perhaps because of its shock value in an age crowded by political neologisms, the anarchist label has also been applied to groups that do not properly belong to the anarchist tradition. For example, the term "anarcho-capitalism" is sometimes used to refer to libertarian economic and social thinkers such as Ayn Rand, David Friedman, and other pro-capitalists who hold strong antistatist views. But even though they share the anarchist's contempt for state authority, their commitment to free enterprise and laissez-faire principles places them completely at odds with classical anarchist thinking and practice.

Ever since the Cold War ended in 1991, small groups of anarchists around the world have been in the forefront of the antiglobalization movement. Like their predecessors, modern anarchist activists seek to expose the adverse power relationships that affect our daily lives. They are particularly concerned with the impact that the global expansion of corporate leviathans has had on society, not least because of the seemingly unlimited ways in which this advanced form of capitalism can manipulate and control the lives of individuals. While a few anarchist groups still resort to direct-action methods to get their revolutionary message across, a growing number are turning to advanced technologies like the Internet to promote their cause. In short, whether one admires or abhors anarchist principles, it cannot be denied that anarchism offers a critical perspective of authority that appears to be endlessly relevant to those who want to sharpen their awareness of the boundaries of personal freedom.

ANCESTOR WORSHIP. Ancestor worship is the reverent devotion expressed by descendants for their deceased forebears through a culturally prescribed set of rituals and observances. The prominence of ancestors as a focus of worship within a broader religious tradition is common in many parts of the world, including Asia, Africa, and Native America, but there are few unifying characteristics cross-culturally. Commonalities include:

Only those deceased of appropriate relationship to the living and who have undergone the necessary *rites de passage* are worshiped.

Those that are worshiped usually are recognized by name or title, often a special posthumous one.

Services to the ancestors frequently include offerings and libations.

That ancestor worship is related to the animistic belief in a spirit or soul surviving the body after death, as proposed by early anthropologist Edward Burnett Tylor (1832–1917), is reasonable, since it is this spirit essence of the ancestor that is believed to continue its relationship with descendants. That ancestor worship is related to the earliest stage of religious expression among humans, however, as Tylor's theory further suggested, is certainly debatable. Other controversies in the study of ancestor worship include whether practices in honor of the deceased constitute actual worship; the extent to which linear versus collateral relatives comprise the worshiping group; the ways in which the living are influenced by the dead; and the individual, family, kin group, or regional variability in practice that can be present in a single cultural tradition.

Ancestors in Africa and Asia

In his work among the Tallensi of Ghana, Meyer Fortes emphasizes the significance of ancestor worship to patrilineage unification and lineage or segment differentiation. In particular, the father–oldest surviving son relationship is emphasized, the latter having the primary responsibility for performing the appropriate rituals and service. In general, placement of an African ancestral shrine and the performance of its services can also relate to and influence descendants' genealogical position and seniority.

In China, Daoist, Confucian, Buddhist, and folk concepts have contributed to the practice of ancestor worship in which heads of patrilineages are emphasized but other patrilineal relatives are included. There are three prominent sites for ancestor worship: family shrines, lineage halls, and tombs or graveyards of relatives. Proper placement and orientation of the latter will take geomancy (*feng-shui*) into account. Physical remains of the deceased are laid to rest in the tomb/graveyard, which serves as the site of public rituals; ancestral tablets represent the deceased in shrine and temple, in which their spirits are housed, and for which more private and personal observances are made. While the ancestors wield significant authority and influence in the lives of their living descendants, the latter care for and look after their ancestors—for example, by burning paper money at New Year's to contribute to their ancestors' bounty or prosperity.

Man with mummified remains of ancestor. In certain cultures, ancestors are seen as intermediaries between people and the gods, and it is believed that their involvement in the day-to-day happenings of the family does not end with death. © CHRIS RAINIER/CORBIS

Japanese ancestors are also emphasized on the father's side, and their worship is primarily related to Buddhist beliefs and practices. The deceased receive a posthumous or "Buddhist" name, which is written on a tablet and kept in the family's *butsudan* or Buddhist altar; Buddhist funerary services help purify the corpse from the polluting influences of death. Other services include "death day" memorial services for up to fifty years, New Year's and Bon (or Obon) celebrations, and household prayers. While tradition maintains a differentiation between stem and branch families and a main ancestral altar in the stem house, more modern practice has individual families establishing their own *butsudan* with the death of a household member. Proper care for the ancestors and observance of appropriate services, offerings, and prayers are believed not only to help the ancestors be restful and in peace, but also to result in blessings and good fortune for the descendants.

Among the Inca

In his early chronicle of Inca customs, Felipe Guaman Poma de Ayala pictures a mummy with feathered headdress and fine raiment carried on a litter as illustration of November or *aya marçay quilla* (Quechua for "the month of the dead"). He describes how during the holiday of the dead the deceased were removed from their crypts, adorned with clothing and feathers, given food—through burnt offerings—and drink, and carried dancing and walking through the streets and plazas, then laid to rest with various offerings. Such activities occurred

primarily in the worship of royal mummies, as an extension of the concept of the divine nature of the Inca king. While Inca beliefs included the departure of the soul from the body at death, royal bodies were mummified, served burnt offerings and drinks, and cared for by official attendants. Royal ancestors participated in affairs of state—counseling living rulers and contributing to their decision making, and, either in the guise of their mummified remains or as idols making formal appearances and visitations, receiving obeisance from their living subjects. Such beliefs were common in the Andes, as ancestral idols of subject peoples were held in Cuzco, the Inca capital, as a control mechanism.

Andean and Inca ancestor worship extended beyond that of royalty, and was probably common among all classes in the pre-Columbian era. Padre Bernabé Cobo attests that when the soul departed from the body, members of the deceased's *ayllu* (a corporate kin group) and family took and cared for the body, providing the veneration and care that was possible according to the family's means and status. The bodies were kept in relatives' houses, tombs, or shrines and were regularly paid tribute through sacrifice and prayer. This nonroyal worship was performed only by those descended in a direct line, and usually only by the children and possibly grandchildren of the deceased. Such worship was held to directly affect descendants' vitality and fortune, while its lack or disrespect to the ancestors could result in ill health or other maladies.

Ancestral Ambivalence

Ancestor worship is most likely to be practiced in a society with strong lineages or other consanguineal corporate groups whose continuity, standing, and control of resources extends over generations, and one in which there are strong beliefs in an active spirit world. In such contexts the appropriately related and ritually defined deceased continue to be interactive lineage and family members, cared for and revered by the living and in turn contributing to the prosperity of their succeeding generations as sources of or mediators with divine power. In general, ancestors who are worshiped are perceived as guardian or authority figures who are difficult to please, whose degree of influence on the living usually decreases with increasing genealogical distance from descendants. The power of the ancestors is therefore ambivalent: as likely to punish as to reward, they offer security and comfort while also contributing to uncertainty in an equivocal cosmos.

ANIMISM. Animism has had a long and important history in anthropology and outside it, as an intellectual concept with important implications not only for the study of religion, but also for the political struggles of indigenous peoples around the world. The anthropological study of animism has been a two-edged sword for indigenous people. It has brought their religious concepts, and thus their rich intellectual and spiritual lives, to the attention of the world, demonstrating the intrinsic value of their cultures. But to the extent that the apparent contrast between monotheistic and animistic religions has been exaggerated and used to create an artificial hierarchy of religious thought, it has also been used against them, to denigrate their beliefs and their intellectual capacities, and thus to deny them full equality with their colonizers.

Concepts

The concept of animism first appeared explicitly in Victorian British anthropology in *Primitive Culture* (1871), by Sir Edward Burnett Tylor (later published as *Religion in Primitive Culture*, 1958). His writings are preceded historically by those of the Greek Lucretius (c. 96–c. 55 B.C.E.) and the Roman Marcus Tullius Cicero (106–43 B.C.E.), among many others. “The doctrine of human and other souls” or “the doctrine of spiritual beings” constitutes the essence of Tylor’s theory. The doctrine of souls is based on the foundational doctrine of “psychic unity,” which affirms that all people, everywhere, for all time (or at least the past fifty thousand years or so), have the same capacity to comprehend all phenomena in the known, observed, and imagined universe by use of their own cultural symbols and languages. Tylor regards *Spiritualism* as a modern cult that lacks panhuman motivations of animism.

The idea of animism is that in all cultural systems people experience phenomena—such as dreams, visions, sudden insights, out-of-body experiences, near-death experiences, and trances—that simultaneously conjoin perceptions of being “elsewhere” with the knowledge of being “here.” Some thinkers explain this experience through a belief in the human soul, which they envision as distinct from but inextricably attached to the body until death do they part, so that animistic belief in the soul becomes part of every cultural system.

Robert Ranulph Marett (1866–1943), Tylor’s successor at Oxford, introduced the concept of *animatism* to that of *animism*, extending the idea of an animating spirit similar to the soul to include many different forces in nature and culture (*The Threshold of Religion*, 1909). Such force is what makes a tree grow from a seed, the rain fall, or the sun shine—that which brings fertility and fecundity to the earth. Loss of such force results in death. People are in awe of such forces as manifest in volcanoes and earthquakes and especially in inert corpses. Out of the observations and awe of force in nature comes the universality of the sacral basis for religious experience, which Marett argued was prior to animism. Animism

African man beside animist figure (sculpted from mud and bone and covered with feathers), Burkina Faso, c. 1979. Many indigenous cultures believe in spiritual beings, a concept first defined as animism by Sir Edward Burnett Tylor in 1871. Tylor proposed that animism derived from an attempt to explain certain phenomenon such as trances, dreams, and visions. © CHARLES LENARS/CORBIS

and animatism are often not clearly distinguished, as many of Marett’s ideas have been blended through time in philosophical and religious literature with those of Tylor and many others.

The Canelos Quichua native people of Amazonian Ecuador illustrate concepts of animism and animatism. Souls and spirits are ubiquitous and even spirits have souls. Those who interact intensively with the souls are the male shamans and the female potters, both of whom influence the conceptual system of one another through mutual symbol revelation. For example, when a shaman in trance dimly “sees” an approaching colorful, noisy spirit, a woman quietly, from the darkened recesses of the room, clarifies his emerging vision and names the actual spirit.

Human souls are acquired through both mother and father. Spirit essences are hierarchized into four essential tiers, easily represented as spheres encompassing one another. Sungui, the master spirit of the rain forest and hydrosphere,

is the apotheosis of androgynous power. This male and female spirit takes many corporeal forms, the most prominent being the giant anaconda. This spiritual superpower must be controlled or it will overwhelm and inundate the world; Amasanga, master spirit of the rain forest, controls the power of Sungui. The corporeal representative of this androgynous being is the great black jaguar. In turn, rainforest dynamics are controlled by Nungüi, a strictly feminine spirit, master of garden soil and pottery clay, whose corporeality is manifest in the deadly black coral snake with a mouth too small to bite humans. The inner sphere is the human household, wherein the souls and spirits come together in a special system of human knowledge, vision, and imagery. Power flows downward through the spheres, and control of power is exercised upward from inner to outer spheres.

Cultural Implications

In Tylor's original formulation, animism was an argument for the universality of human intellectual and spiritual worlds. The universality of concepts of souls, and hence the universality of religion, is a major contribution of Tylor, one that endures into the twenty-first century. Like the Canelos Quichua, humans everywhere, in one way or another, and with very great differences, conceptualize into cultural systems the spiritual dimensions of life, as well as the corporeal aspects of quotidian existence. With this concept of universalism of fundamental religious thought, Victorian England and the rest of the English-lettered world was exposed to cultural relativism.

What constitutes human difference in economy, society, psychology, and religion, then, is cultural, not biological. Although people are very "different" from one another, across space and through time, their mental capacities—cognitive, emotional, and imaginative—are not. As Clifford Geertz puts it: "The doctrine of the psychic unity of mankind, which so far as I am aware, is not seriously questioned by any reputable anthropologist, is but the direct contradictory of the primitive mentality argument" (p. 62).

Tylor, however, very much the Victorian gentleman, began his quest for the bases of animism with what he called the "lower races," whom he also labeled "savages," "rude, non-religious tribes," and "tribes very low in the scale of humanity," among other such figures of speech that link evolutionary biology and culture, thereby enforcing the "primitive mentality argument" later expanded by Lucien Lévi-Bruhl in *Les fonctions mentales dans les sociétés inférieures* (1910; translated in 1996 as *How Natives Think*). The Victorian contradiction of enlightened cultural relativity, attached to a scalar view of humans as evolving from the "lower races" to the "civilized nations," leads to the racist paradox that a few civilizations evolved while the rest of the world's people "remained" animist. Animism, by this reasoning, is evidence of low-level "relics." This contradiction became canonized by the sixteenth century through the emergence of Western modernity and mercantilist capitalism and remains strong in twenty-first-century Western cosmology.

It is, however, a fallacy. Every religious system, including the monotheistic religions such as Christianity and Islam, include representations of the supernatural with strong animistic dimensions. Despite religious scholars' assertions to the

contrary, members of monotheistic religions nonetheless act at times as though there are spiritual beings detached from corporeal beings, manifest concern over the fate of their immortal souls, and make these beliefs part of their traditions, such as the jinn of Middle Eastern folklore, or of the dominant religion itself.

Nonetheless, the enduring Victorian contradiction between cultural relativity and social evolution continues to cast a shadow over the religious beliefs of indigenous peoples, leading many of the world's people with rich beliefs in spirits and noncorporeal essences of animate and inanimate things—but without a "high god" organizer—to resent the concept *animist* because of its connotation of savagery. Among the Canelos Quichua, for example, spokespeople to the outside world often express considerable resentment at the use of the word.

By the same token, animist symbolism does more than establish a template for understanding quotidian life and the universe. It also undergirds the ideological struggles of indigenous people to establish a place and space in nation-state life. In Amazonian Ecuador, for example, animistic concepts were utilized during political uprisings in 1990 and 1992, and again in 2000, when indigenous people rose up as one mighty body to claim—in part successfully—their territory and their rights. Animism as a concept is very powerful in its relativistic dimensions, but is destructive when used to place people in a universal or particular evolutionary scheme that ranges from primitive to civilized.

ANTHROPOLOGY. As an academic discipline, anthropology is somewhat less than two centuries old, but speculations, if not rigorous scientific theories, about where we human beings came from and how to account for the physical and cultural differences that distinguish our communities and nations from one another probably began during prehistory.

In the United States (but not in most other academic settings, for example, in Europe or Asia), the discipline is conventionally divided into four main subfields: biological (or physical) anthropology, archaeology, linguistics, and sociocultural anthropology. The history and current state of each subfield will be discussed in this entry, as well as how they have

influenced one another during the last two-hundred-odd years. Although they will be described separately, the four subfields form the *logos* of *anthropos*, the broad science that studies the human species.

The concept that unites these four subfields is *culture*. The earliest systematic formulation of the anthropological concept of culture was articulated by Sir Edward Burnett Tylor (1832–1917) in the first sentence of his pioneering book, *Primitive Culture* (1871): “Culture, or Civilization, taken in its wide ethnographic sense, is that complex whole which includes knowledge, belief, art, morals, law custom, and any other capabilities and habits acquired by man as a member of society.” This entry will use an updated version of Tylor’s definition put forth by Daniel G. Bates and Elliot M. Fratkin: “Culture, broadly defined, is a system of shared beliefs, values, customs, and material objects that members of a society use to cope with their world and with one another, and that are transmitted from generation to generation through learning” (1999, p. 5). The work of biological anthropologists seeks—among other things—to discover how, when, and why our remote ancestors evolved the physiological capacity for culture; archaeologists attempt to trace the evolution of culture and seek to reconstruct the nature of prehistoric (as well as historic and contemporary) cultures from the material objects they left behind; linguists describe the principal symbolic system—language—through which cultural learning occurs; and socio-cultural anthropologists are concerned with the nature of culture per se and the myriad factors that shaped (and continue to shape) its contemporary manifestations.

Biological Anthropology

The advent of geology and the study of fossil sequences in the late eighteenth and early nineteenth centuries by pioneer geologists such as James Hutton (1726–1797) and Sir Charles Lyell (1797–1875) who laid the groundwork for the study of human evolution. Two major events in the 1850s loom large in the history of this most basic of the subfields: (1) the accidental discovery in 1856 of the first premodern human being, the prototype of the Neanderthals, in a quarry near Düsseldorf, Germany, and (2) Charles Darwin’s (1809–1882) theory of “natural selection,” articulated in *On the Origin of Species* (1859). This theory gave scholars who wanted to study the course of human evolution systematically a theoretical framework for determining how one species evolved over time into another.

The human fossil evidence in Europe, and eventually throughout the Old World, from Africa to China and Indonesia, mounted rapidly, and by the early twentieth century anthropologists had developed several models of human evolution. At first, there appeared to have been two successive species of genus *Homo*: *Homo sapiens*, including all modern human beings as well as our immediate precursors, the Neanderthals, and the far older *Pithecanthropus erectus*, the earliest example of which was found near Solo on the island of Java in 1895. It had become clear that the human species was at least several hundred thousand years old. As the twentieth century unfolded, new and even older hominid fossils were discovered, primarily in Southern and Eastern Africa, and both

the dates and descriptions of hominid evolution changed markedly. The 1925 discovery of *Australopithecus africanus* in South Africa by Raymond Dart (1893–1988) pushed the origin of the hominids back at least a million years and added a new, pre-*Homo* genus, *Australopithecus*, or “Southern Ape-Man.”

It is impossible here to outline the sequence of major fossil discoveries in Africa and elsewhere that have been made since 1925. The names of anthropologists responsible for these finds include the late Louis S. B. Leakey (1903–1972) and Mary Leakey (1913–1996), who, in the late 1950s and early 1960s, discovered a number of extremely important protohominids at Olduvai Gorge in northeast Tanzania. In 1974 Donald Johanson discovered “Lucy,” an extremely early Australopithecine that lived in what is now southeastern Ethiopia around 3.1 million years ago, the prototype of *Australopithecus afarensis*. In 1994 fossil evidence of an even older genus and species of protohominids, *Ardipithecus ramidus*, more than a million years older than “Lucy” (c. 4.5 million years old), was found in the same region of Africa, and in the last several years fossil fragments found in East Africa push the origin of hominids even farther back, perhaps as much as 5.5 million years. Moreover, it is now suspected that hominid bipedalism evolved as early as 4.5 to 5 million years ago; by freeing our forelimbs, it affected the evolution of the capacity for culture profoundly by enabling our ancestors to use and make tools.

Of course, this did not happen overnight. The earliest evidence for the presence of crude tools, again in East Africa, dates from around 2.5 million years ago. By this time, the earliest species of our genus, *Homo habilis*, had evolved, followed by *Homo ergaster* (c. 1.9–1.5 million years ago), and then *Homo erectus*, which dominated the Old World from c. 1.5 million to about 200,000 years ago, when it began to be replaced, at least in Europe—*Homo erectus* appears to have lingered longer in parts of Asia—by the Neanderthals. They, in turn, were eventually displaced by our own immediate ancestors, anatomically modern hominids (*Homo sapiens*), who are now thought to have evolved around 130,000 years ago near the southern tip of Africa. By 27,000 years ago, *Homo sapiens* had replaced all other hominid species everywhere. Some biological anthropologists still subscribe to the “multiregional hypothesis” that human beings became “modern” simultaneously in several parts of the Old World, from Africa to Europe and East Asia about 40,000 to 50,000 years ago, but consensus in the profession supports the “out of Africa” model, strengthened by the absence of any evidence that Neanderthal mitochondrial DNA exists in modern European populations.

A significant element in this evolutionary journey was the development of our brains to the point that we were able not only to make crude stone tools but to envelope ourselves and the world around us in what cultural anthropologist Clifford Geertz has called “webs of significance,” the capacity for culture. At the same time, it has become abundantly clear that, since the emergence of anatomically modern hominids, no appreciable differences in the capacity for culture have emerged among the several modern human physical types, what are still sometimes erroneously called “races,” and that the behavioral

and technological differences that separate contemporary human communities are cultural rather than biological. One of the most important contributions of biological anthropology to general knowledge has been to dispel the pernicious myths of racial superiority and inferiority.

In addition to tracing the course of human evolution, many biological anthropologists specialize in the comparative study of chimpanzees (e.g., Jane Goodall), gorillas (e.g., the late Dian Fossey [1932–1985]), and other nonhuman primates, hoping to throw additional light on human behavior and the extent to which it is grounded in our primate heritage. Such studies provide a better understanding of the profound biological changes in our ancestors during the last five million years, changes that culminated in *Homo sapiens*.

While biological anthropology is best known for the study of ancient humans and other primates, other branches of the field also make significant contributions. Forensic anthropologists assist law enforcement agencies in gathering and interpreting evidence in cases of homicide, massacres, and genocides; other biological anthropologists study the interaction of culture and biology as it affects our health, longevity, and well-being. Such researchers work on a range of topics including the spread of AIDS (autoimmune deficiency syndrome) and other communicable diseases; the relationship between health and social problems such as poverty, racism, and inequality; stress and rapid social change; diet and maternal well-being; and the long-term effects of violence and warfare. There is a close relationship between this type of biologically focused anthropology and the work of medical anthropologists, cultural anthropologists who study the social contexts of medical practice.

Archaeology

Archaeology's roots lie in the early eighteenth century, when the landed gentry in Britain and elsewhere in Europe began to acquire stone, bronze, and iron implements for display, but it was not until late in that century that serious excavations began, largely inspired by discoveries at Pompeii and Herculaneum.

Two major events in the 1830s moved the fledgling discipline of archaeology to a new level. One was Jacques Boucher de Perthes's (1788–1868) discovery in 1838, near Abbeville, France, of a crude lithic (stone) technology that predated the gentlemen's displayed objects by well over 100,000 years. The second was the Danish scholar Christian Thomsen's (1788–1865) articulation of the "three-age system"—still a fundamental archaeological concept: the Stone, Bronze, and Iron Ages, which appeared in 1836 in the Catalogue of the Danish National Museum's collection (Thomsen was its first curator). Because stone artifacts typically came from the lowest levels of a trench or pit, while bronze objects came from the middle levels, and iron objects were typically found closest to the surface, Thomsen realized that this reflected a universal temporal sequence.

A generation later, in another important book, *Prehistoric Times* (1865), Sir John Lubbock (1834–1913), later Lord

Avebury, not only coined the term *prehistory*, but also divided Thomsen's Stone Age into two successive stages, the Paleolithic, or Old Stone Age, and the Neolithic, or New Stone Age. Subsequent archaeologists added the term *Mesolithic* to refer to the transitional period at the end of the Ice Age between the Paleolithic and the Neolithic, which saw the beginnings of settled life, agriculture, and animal husbandry.

By the early twentieth century, archaeology was an established scholarly discipline. In subsequent decades, archaeologists sought to discover sequences, or stages, in the evolution of culture per se and to reconstruct the trajectory of cultural development in specific regions, such as the ancient Near East, Mexico, the American Southwest, Peru, Africa, India, Oceania, East Asia, and Southeast Asia. In the late twentieth and early twenty-first centuries, a split occurred between *processual* and *postprocessual* archaeologists. Processual archaeology starts from the assumption that all human communities are themselves systems, and need to be viewed as such. Processual archaeologists are primarily concerned with the processes whereby ancient peoples adapted to their ecosystems, and how these processes changed over time as the ecosystems changed. Postprocessual archaeology, on the other hand, focuses on reconstructing the daily lives of the people who lived in prehistoric communities, how their societies were organized, the nature of their religious beliefs and worldviews, their socioeconomic hierarchies, and other elements of culture that sociocultural anthropologists study in living communities. Postprocessualists, for the most part, see themselves as cultural anthropologists who work with artifacts rather than living informants.

Out of processual and postprocessual archaeology have developed branches of contemporary archaeology: urban archaeology, which looks at the nature of urban life in premodern cities, and industrial archaeology, which attempts to reconstruct what life was like for the majority of people in early industrial towns in the Midlands of England, parts of New England, and elsewhere in the emerging industrial regions of Europe and America in the late eighteenth and early nineteenth centuries. A similar approach has been applied to reconstructing the lives of enslaved Africans and African-Americans on antebellum plantations in the Caribbean and the American South, as well as of African-Americans in the urban northeast.

Other trends in contemporary archaeology include a focus on the lives of women, ordinary people, and the poor, rather than the "great men" of history. Scientific developments that make it possible to recover detailed data about diet, farming systems, and other aspects of everyday life have provided the technical impetus for these new research areas. While the study of the most ancient manifestations of human culture, such as the rise of agriculture or the state, remains important to archaeologists, an increasing number have turned to historical projects in which documents and archives and working with historians complement the material remains retrieved during excavations. Such projects promise new insights into many aspects of human history, including medieval Europe, colonial Latin America, and early settlements in the United States.

Linguistics

Linguists study the primary medium by which culture is transmitted, language. The discipline of linguistics—at first called philology—dates from approximately the same period that biological anthropology and archaeology began, the late eighteenth century. Sir William Jones (1746–1794), a jurist and student of Asian languages assigned to the British East India Company’s outpost at modern-day Calcutta, is generally credited with founding the discipline. In 1786, in the course of a speech to the Bengal Asiatic Society, of which he was the founder and president, Jones outlined, for the first time, the family-tree model of linguistic relationships, focusing on what would soon be called the Indo-European language family.

Within a generation, comparative philology (now called historical, or diachronic, linguistics) was an established discipline. Scholars such as Jacob Grimm (1785–1863), Franz Bopp (1791–1867), and August Schleicher (1821–1868) had reconstructed what appeared to be the Proto-Indo-European lexicon. Eventually, other language families, such as Sino-Tibetan (Chinese, Tibetan, Thai, Burmese, etc.) and Hamito-Semitic (Ancient Egyptian, Hebrew, Babylonian, Arabic, and other Near Eastern languages), also began to be studied from this perspective. Franz Boas (1858–1942), in addition to being a pioneer sociocultural anthropologist, was also among the first to apply the comparative method to the study of Native American languages.

In the early decades of that century, thanks primarily to the efforts of a brilliant Swiss linguist, Ferdinand de Saussure (1857–1913), a new structural approach to the study of language emerged, one that emphasized synchronic studies rather than the historical focus that had dominated during the previous century. De Saussure made a basic distinction between what he called *la langue*, the basic rules that govern the grammar of a given language, and *la parole*, the specific speech patterns that occur at any given instant. The linguist’s job is to elicit the nature of *la langue* by recording and analyzing examples of *la parole*. This approach soon led to two concepts that still dominate anthropological linguistics: the *phoneme* and *morpheme*. A phoneme is a minimal sound feature of a language that signals a difference in meaning; a morpheme is an ordered arrangement of such speech sounds that carries an indivisible meaning. Thus, the sounds represented by the English letters *d*, *o*, and *g* are phonemes, while the word *dog* is a morpheme. Combining the same phonemes in reverse order produces a wholly different morpheme, *god*. Structural linguists are also concerned with syntax, the arrangement of morphemes into phrases and sentences, and semantics, how meanings are structured by morphemes and their forms and their position and function in sentences. *Grammar* is the entirety of a language’s phonological, morphological, syntactic, and semantic rules that enable humans to communicate and transmit culture.

In the course of the last few decades, linguists have debated the extent to which there are universal, innate features that form the fundamental structure of all human languages. The U.S. linguist Noam Chomsky has argued in favor of this proposition. In *Syntactic Structures* (1957), Chomsky suggested

that all human beings have the innate ability to generate every possible sentence in their language. This approach to the study of language is called transformational-generative grammar (TG). However, not all linguists accept this model. A great many hold that, like culture, language is infinitely variable and that there are no proven universal features.

The relationship between language and culture has also been a major concern among linguists, especially anthropological linguists. Two pioneers in the study of this relationship were Edward Sapir (1884–1939) and his student Benjamin Lee Whorf (1897–1941), who suggested that there was an intrinsic connection between the fundamental features of a culture and the structure of its language. For example, as Whorf pointed out, the Hopi Indian language does not mark verb tense, a feature that Whorf said is reflected in the absence of a linear time concept in Hopi culture. All events are intrinsically linked to one another, and life simply unfolds. Although by no means universally accepted by contemporary anthropologists—some critics object that his approach is tautological and that there is no evidence to support the priority of language over culture—the Sapir-Whorf Hypothesis continues to influence anthropological thinking.

Early in the twentieth century, after the publication of books such as Sapir’s *Language* (1921) and Leonard Bloomfield’s (1887–1949) book of the same title (1933), linguistics developed into a separate discipline dedicated to the scientific study of language, with connections to the related fields of cognitive science and cognitive psychology, as well as some aspects of computer science (artificial intelligence, machine translation), after the publication of Chomsky’s *Syntactic Structures*. The development of TG grammar produced an explosion of research in both synchronic and diachronic linguistics that continues to extend our understanding of language and mind and how we communicate.

Anthropological linguistics exists as a separate but related discipline that emphasizes the relationship between language and culture, but adopts a more holistic and, often, humanistic approach than, for example, cognitive psychology. Anthropological linguists study a variety of language practices, ranging from the relationship between language and music within specific cultures to children’s use of language in play. A major focus that distinguishes linguistic anthropology from other branches of linguistics is its focus on questions of politics, power, and social inequality, as these aspects of culture affect language. The study of language ideologies emphasizes the different statuses of certain language practices, in contexts ranging from a bank officer turning down a loan applicant, to political speeches, to bilingual and bicultural contexts (for example, the study of “Spanglish,” forms of language developed by Americans who speak both Spanish and English), to the controversies about varieties of English spoken by African Americans.

Sociocultural Anthropology

Sociocultural anthropology, the subfield concerned with culture per se, especially in its many contemporary ethnographic manifestations, commands the attention of the majority of

professional anthropologists. Although there are some excellent examples of ethnographic description in antiquity—Herodotus’s (484?–425 B.C.E.) account of the ancient Scythians in Book 4 of his *History* (c. 440 B.C.E.) and Cornelius Tacitus’s (55? B.C.E.–after 117 C.E.) detailed account of ancient Germanic-speaking culture, *Germania* (c. 98 C.E.)—like the other principal subfields of anthropology, sociocultural anthropology began to take shape in the early nineteenth century and is closely linked to colonialism. As Europeans (or people of European heritage) expanded into India, Southeast Asia, Africa, and Oceania, as well as across North America, they found themselves confronting—and eventually dominating—what they called “primitive” cultures. These encounters led to two fundamental questions that dominate anthropology: (1) Why do cultures differ? and (2) Why are some cultures technologically “simple” societies, while others developed more complex, technologically sophisticated societies? Accounting for the differences found among cultures is problematic. For example, while, in some regions, humans live in small-scale societies with very basic technologies and low population densities—what early anthropologists, influenced by colonialism and scientific racism, called “primitive”—in other places, such as the Valley of Mexico, people began millennia ago to develop complex, energy-intensive agricultural technologies that enabled them to congregate in great numbers, build enormous cities and finance the construction of elaborate buildings and works of art, and, in general, to develop what are called “civilizations.”

This second question has especially been the province of archaeologists, but it underlies cultural anthropology as well. At its best, cultural anthropology has steadfastly argued for the value of the small-scale and the more environmentally wise “primitive” as culturally significant. At its worst, it has functioned as the “handmaiden of imperialism,” either overtly, as when British anthropologists worked for the colonial enterprise in Africa, or indirectly, as purveyors of “exotica” that reinforce the prejudices of urbanites and racial elites regarding the “savagery” of foreigners or of native populations and minorities closer to home.

It is thus no accident that the first great theoretical paradigm in sociocultural anthropology was *unilineal evolutionism*, the idea that all cultures can be ranked along a grand scale that culminated, of course, with nineteenth-century European and American industrial civilization, the “best of all possible worlds.” Darwin’s *The Origin of Species* reinforced this approach to the assessment of cultural differences, in particular the concept of “natural selection.” Unilineal evolutionism was predicated on two fundamental axioms: (1) the idea of *progress*, that the direction of cultural evolution is everywhere from “primitive” to “civilized” and (2) the idea of *psychic unity*, that all human beings, irrespective of their environment or specific history, will necessarily think the same thoughts and, therefore, progress through the *same* series of evolutionary stages. Sir Edward Burnett Tylor, who was the first anthropologist to define the concept of culture, was a major contributor to unilineal evolutionism, suggesting a three-stage model for the evolution of religion: animism (a belief that all phenomena are “animated” by unique spirit beings), polytheism, and monotheism, which, he held, is a prime characteristic of advanced civilizations.

The most influential unilineal evolutionist was Lewis Henry Morgan (1818–1881), a successful American lawyer who practiced anthropology as an avocation. In *Ancient Society* (1877), Morgan posited a three-stage model for the evolution of culture: savagery, barbarism, and civilization. The first two stages, which he labeled, collectively, *societas* (society), as opposed to *civitas* (civilization), were each subdivided into three successive substages: lower, middle, and upper. His prime criterion for assigning cultures to one or another of these stages was the character and complexity of their technology. Because they lacked the bow and arrow, a prime technological criterion, Morgan assigned the ancient Hawaiians to “Middle Savagery,” despite the fact that they practiced agriculture and had a highly complex social organization.

Although Morgan’s emphasis on material culture—tools, weapons, and other artifacts—had a significant influence on a later school of sociocultural anthropology, cultural materialism, he also pioneered the study of kinship systems. By the 1890s, however, the unilineal evolutionists’ rigid adherence to paradigms based on incomplete and questionable ethnographic data (largely collected by missionaries, traders, colonial administrators, and so forth) was called into question by a new generation of anthropologists who had spent time in the field. (Most of the unilineal evolutionists were “armchair scholars,” although both Tylor and Morgan did have some field experience in their youth, the former in Mexico and the latter among the Seneca, an Iroquois tribe that lived near his home in upstate New York.)

In the United States, the chief critic of what was then called the comparative method in anthropology was Franz Boas, the most influential American anthropologist. A rigorous, scientifically trained German-born scholar, he later switched to anthropology and did extensive fieldwork among the Baffin Island (Canada) Eskimo (or Inuit), as well as the Native Americans of British Columbia. He and other critics of the unilineal approach, many of whom were his students, such as Alfred Louis Kroeber (1876–1960) and Robert Lowie (1883–1957), also called into question unilineal evolutionism’s fundamental axioms, seriously questioning whether “progress” was in fact universal or lineal and whether it was possible to rank all human cultures according to a *single* evolutionary scheme. Finally, the Boasians attacked the concept of “psychic unity,” suggesting that all cultures are inherently different from one another and that they should be assessed on their own merits and not comparatively. This approach, which stressed empirical field research over “armchair” theorizing, came to be known as historical particularism, and emphasized cultural relativism and diffusion rather than rigid evolutionary sequences. Anthropologists were enjoined to reconstruct the culture-history of particular tribes and societies, but *not* the evolution of culture per se. Emphasis was also placed on what has been called “salvage ethnography,” gathering ethnographic data before the simpler cultures of the world were overwhelmed by Western culture.

Boas left another important legacy: his work as a public intellectual who used his scholarly knowledge to educate the American public about racial equality. For Boas, who had experienced anti-Semitism in his native Germany, this kind of

work on the part of intellectuals was crucial if America was to realize its democratic ideals. He inspired many of his students, including Ruth Benedict (1887–1948) and Margaret Mead (1901–1978), to their own forms of public work by his example. He also influenced several important African and Native American intellectuals who left anthropology for other pursuits, most notably the novelist Zora Neale Hurston (1891–1960), as well as the Brazilian sociologist Gilberto Freyre (1900–1987), who credits Boas's influence in the preface to his controversial books on race in Brazilian culture.

In Britain, the empirical reaction to Morgan, Tylor, and their colleagues took a different turn. Most early-twentieth-century British anthropologists, such as Bronislaw K. Malinowski (1884–1942), a Polish scholar who immigrated to England to complete his studies, and A. R. Radcliffe-Brown (1881–1955), were largely ahistorical; that is, they advocated a structural–functional, rather than historical, approach to the study of cultures. Their emphasis was primarily, if not in some cases wholly, on the here and now, on the social organization of living human communities and how the elements thereof were functionally interrelated to form integrated wholes. Malinowski, who spent four years (1915–1918) studying the culture of the Trobriand Islanders (near New Guinea), also focused on how social institutions function to serve basic human needs, such as shelter, reproduction, and nourishment. Radcliffe-Brown, who did field work in the Andaman Islands, South Africa, and Australia, drew liberally on the ideas of the French sociologist Émile Durkheim (1858–1917) in his attempts to discover what he called the “social laws” and “structural principles” that govern social organization everywhere. Among them, Boas, Malinowski, and Radcliffe-Brown trained or influenced at least two generations of sociocultural anthropologists on both sides of the Atlantic, from the early 1900s to the threshold of World War II, and, in Radcliffe-Brown's case, for a decade afterward as well.

However, beginning in the late 1930s, a reaction to the essentially antitheoretical stance of the Boasians began to take shape, based on the assumption that all cultures are necessarily adapted to the ecological circumstances in which they exist. The leading advocate of “cultural ecology” was Julian H. Steward (1902–1972), whose book *Theory of Culture Change* (1955) had a major impact on the discipline. Other scholars, such as Leslie A. White (1900–1975) and British archaeologist V. Gordon Childe (1892–1957), drawing on the Marxist assumption that the “means of production” is everywhere crucial in determining the nature of society, emphasized the primacy of material culture. (Indeed, White consistently described himself as a disciple of Lewis Henry Morgan, whose work had, in turn, influenced Marx's collaborator Friedrich Engels [1820–1895].) These early “neo-evolutionists” of the mid-twentieth century all acknowledged a debt to Marx, but the new materialism in anthropology soon split into two camps: one that emphasized historical materialism, political economy, and the study of imperialism and inequality, and another that repudiated Marx and focused on questions of ecological adaptation and evolution. The former include Eric Wolf, Sidney Mintz, Eleanor Leacock, and John Murra. Mintz's study of the history of sugar and Wolf's timely

comparative project on *Peasant Wars of the Twentieth Century* (1999), published in response to U.S. involvement in Vietnam, remain two classic studies from this school. Among the anti-Marxists, the best-known is the late Marvin R. Harris, whose provocative books for the general public argue that apparently “irrational” religious behavior, such as the Hindu refusal to eat meat or Jewish dietary law, can be attributed to biological needs unknown to practitioners.

Neo-evolutionism was not the only post-Boasian development in sociocultural anthropology. Also in the late 1930s, a number of American anthropologists, among them Margaret Mead, Ruth Benedict, and Ralph Linton, drew selectively on Freud and other early twentieth-century psychologists and developed the “culture and personality” school, which emphasized the interface among individual personalities and the cultures they share, as well as the “infant disciplines”—weaning and toilet training—and their effects on both the formation of individual personality structures and the nature of particular cultures. Early and harsh toilet training was held to produce “anal” personalities and authoritarian cultures, whereas relaxed attitudes toward sphincter control and related processes produce relaxed social systems. At the start of the twenty-first century this school has few proponents, but psychological anthropology remains a recognized branch of sociocultural anthropology.

In the 1950s, linguistics began to influence an increasing number of anthropologists. If the cultural ecologists and materialists had come to conceive of culture as essentially an adaptive system, their linguistically oriented colleagues were concerned with cognitive systems and shared symbols, with how people attach meaning to the world around them. Initially known as “ethnoscience,” this approach has come to be called “cognitive anthropology.” Closely related to it are two other approaches also concerned with meaning. One of them, closely identified with the eminent French anthropologist Claude Lévi-Strauss, is *structuralism*. Extremely influential outside of anthropology, especially in France, this school focused on underlying structures of thought based on binary oppositions, like the binary mathematical code used by computers. From simple pairs such as *hot/cold* or *up/down*, cultures construct elaborate systems of myth and meaning that shape everything from cooking to kinship, as well as providing answers to questions about life and death. When initially published, his partially autobiographical *Tristes tropiques* (1955; *The sad tropics*) in which he recounts his flight from Nazi Germany to find refuge among the tribes of Amazonian Brazil, was perhaps more influential than his dense and difficult works of structural analysis. Later, however, it was criticized for its portrayal of Native Americans as seemingly “outside of history.”

In America, a different school of anthropology, “symbolic anthropology,” would ultimately prove more influential than structuralism. This approach, which draws on the same linguistic and cognitive models as structuralism, emphasizes emotion and affect in addition to cognition, and looks back to traditional anthropological studies of magico-religious belief systems, especially Durkheim's work. Among the more important contributors to symbolic anthropology have been

the British scholars Victor W. Turner and Mary Douglas, and the American anthropologist Clifford Geertz. Turner's study of the multivalent symbolic meanings of the "milk-tree" in the life of the Ndembu of northwestern Zambia—its milklike sap stands for everything from semen to mothers' milk—remains a classic. In it, he borrows from Arnold van Gennep's (1873–1957) classic work, *Les rites de passage* (1909; *The Rites of Passage*), the concept of the "transition" stage in a rite of passage, which Turner rechristened "liminality." Douglas studied the symbolic opposition between what she calls "purity and danger," as exemplified in her brilliant analysis of the food taboos in the Old Testament, which, she argues, reflect a fear of anomalous animals, like the pig, which is neither a browser nor a ruminant. Geertz, who has done extensive fieldwork in Indonesia and Morocco, is famous for his in-depth analysis of the symbolism of cockfighting in Bali, as well as for the concept of "webs of significance," the idea that all human beings are necessarily bound together by intricate symbolic "webs" in terms of which they collectively confront external reality.

In the last two decades, sociocultural anthropology has seen the emergence of the "post-isms": postcolonialism, which examines the impact of neoliberal capitalism on recently decolonized states; poststructuralism, which critiques the work of Lévi-Strauss and other classic structuralists; and, most importantly, postmodernism, a manifestation of a broader intellectual movement in architecture, literature, cinema, and the arts predicated in fair measure on the theories of French scholars Jacques Derrida and Michel Foucault. Postmodernists question the validity of externally imposed orders, as well as linear analysis and "essentialist" interpretations, and assert that anthropologists should "deconstruct" the cultures they are attempting to understand. Moreover, postmodern ethnographies often focus as much on the ethnographers as they do the communities they have studied, as any cultural account must necessarily include the impact of the investigator on the investigated, and vice versa. This element in postmodernism has been criticized a great deal, especially by materialists such as Sidney Mintz. Among the more prominent postmodernist anthropologists are Stephen A. Tyler, Vincent Crapanzano, and James A. Boon.

In recent years, sociocultural anthropologists—from a variety of perspectives—have been concerned with globalization, transnational communities, such as the African, Indian, and Chinese diasporas, and borderlands, in which the inhabitants freely share culture traits that are otherwise, for the most part, extremely different and seemingly contradictory and integrate them into new, "hybrid" cultures. There has also been increased concern with feminism, especially what has been labeled "third-wave feminism," and with the heretofore often neglected roles women play in shaping cultural norms, as well as the inequality that persists almost everywhere between the sexes. Finally, gay and lesbian, as well as transsexual, studies form a significant element of contemporary sociocultural anthropology, leading to a major reassessment of the concept of "gender" and the extent to which it is socially constructed rather than innate.

This brief overview of the history and current state of the discipline of anthropology, primarily in the United States, has necessarily omitted mention of many specific developments

and schools of thought, for example, the *Kulturkreis*, or "culture-circle" school, centered on Father Wilhelm Schmidt (1868–1954), that took shape in Vienna in the early years of the last century; the impact of Sir James G. Frazer's (1854–1941) *The Golden Bough* (1890), which seduced Malinowski into completing his studies in England; and the single-diffusionist ideas of G. Elliot Smith (1871–1937). A great many important contributors, to say nothing of specific topical and regional specialties, such as urban anthropology, esthetic anthropology, East Asian anthropology, African anthropology, and so on, have been slighted. Nevertheless, this discussion provides a general description of what anthropology, in its several major dimensions, is about, how it got that way, and the overwhelming importance of the concept of culture to the discipline.

AFRICA

In post–World War II history, *decolonization* is a term generally employed to describe and explain the struggle for, and attainment of, freedom from colonial rule by most countries in Asia and Africa. This attainment was marked by a transfer of

power; national political elites assumed the administrative responsibilities and duties previously discharged by the colonial authorities. Thus, new sovereign nations were born.

Steadfast struggle through political parties and related movements, in the pursuit of decolonization, marked the era of nationalism in Africa. Nationalism was the indispensable vehicle utilized to achieve the desired goal of decolonization.

It is important to point out that the study and analysis of nationalism in Asia and Africa has been affected by the scholarly and ideological controversies that still surround the “national question,” nationality, and nationalism. While the power and influence of nationalism is undisputed, Benedict Anderson points out that the terms *nation*, *nationality*, and *nationalism* have all “proved notoriously difficult to define, let alone to analyze.” Many scholars, especially in the West, have continued to look at nationalism as an anachronism and therefore as a concept that is not a revealing tool of analysis. Part of the explanation for this scholarly disillusionment is the ill repute nationalism acquired during the era of Nazism and fascism in Europe, when it came to be associated with intolerance and a reactionary chauvinism that was “at odds with the proper destiny of man.”

The study of nationalism has also been a source of intellectual and ideological frustration to Marxists, who have traditionally been troubled by its “chameleon qualities.” Nationalism “takes many different forms, is supported by many different groups and has different political effects.” Unlike Marxism, which places much emphasis on a society’s class structure, economics, and “form of economic organization,” nationalism is basically political and cultural. This explains in part why Marxism and nationalism have had a “difficult dialogue” over the years.

In Asia and Africa, post–World War II nationalism was, above all, a “revolt against the West” (Barracough), its chief characteristic “resistance to alien domination.” This resistance, which led to decolonization, ultimately created a multitude of nations out of lands that had had “little or no national consciousness.” It is fair to conclude that in order to comprehend the centrality and diversity of nationalism in postwar Asian and African history, “European modalities” may not be strictly relevant.

Aims and Objectives

Political freedom from colonial rule was viewed by nationalists and their supporters as the instrument to redress the economic and social neglect and injustices of the colonial era. Kwame Nkrumah of Ghana urged fellow nationalists throughout Africa to “seek first the political kingdom and all else would be added unto” them. There could be no meaningful social and economic progress without political independence. Nationalist activists and their followers expected an improvement in their living conditions. This desire and expectation to live in dignity partly explains the political support given by the masses to the nationalists and nationalism.

In India, Jawaharlal Nehru (1889–1964) argued emphatically that without political freedom, Indians would have no

power to shape their destiny. They would remain “hopeless victims of external forces” that oppressed and exploited them.

In semicolonial China, Mao Zedong (1893–1976) also saw the critical value of national political freedom from external domination. Without this freedom, there could be no advancement of his revolutionary social and economic program. It would have been futile to dream of building a communist society without a nation in which to construct it.

Nationalism identified exploitation as the primary economic mission of colonialism—exploitation of the colonized people and their labor and resources. In Africa, the expansion of cash crop production, land alienation, mineral exploitation, and even limited manufacturing toward the end of colonial rule enriched the Western capitalist countries, and not Africans. In the struggle for decolonization, there was a general outcry by the nationalists against this exploitation. The colonial economic record in Asia, and especially in India, provided nationalists with rich evidence of exploitation. There was the familiar example of British investment in railways that remained quite profitable to the investors but did little for Indian economic advancement. Colonialism had deemphasized the production of food crops while actively promoting the growing of cotton, jute, indigo, and opium, which fetched high prices overseas. The profits that accrued from these exports and other British capital were, to a large extent, invested in “white settler countries,” such as Canada, Australia, and New Zealand, and not in India. In addition, European powers did not encourage, nor support, the industrialization of their colonies. In India, this aggravated economic and social problems on the eve of decolonization.

Socially and culturally, colonialism was a racist system. The era of “modern” nineteenth-century imperialism was also the era of scientific racism. Colonialism, mediated through racism and racist policies, limited and even forbade meaningful cross-cultural dialogue between colonizer and colonized. Throughout most of Africa and Asia, racism was “not an incidental detail, but . . . a consubstantial part of colonialism.” Harsh, brutal, and deliberately discriminatory treatment at the hands of European colonizers was the constant, painful reminder to Africans and Asians that they were a colonized and humiliated people. All nationalists, irrespective of ideological differences, were generally agreed that such treatment was indefensible; it must be ended.

The Development of Nationalism

The development of nationalism was not uniform throughout the countries of Asia and Africa. The majority of nationalist movements, however, roughly followed a distinct pattern. First, there were local protest movements; some were culturally based, while others were created by the local elite to protest against local and specific grievances, usually economic. Second, there was the crucial period of mass nationalism. In most countries of Asia and Africa, this occurred after World War II. In Africa, this rough pattern applies to all the countries that attained their political independence before 1975. The same is true in Asia, except for those countries that secured their freedom after protracted armed struggle led by communist parties.

This constitutes what can be characterized as the first and dominant phase of African and Asian nationalism.

The second phase applies in Africa to the former Portuguese colonies of Guinea-Bissau, Angola, and Mozambique, in addition to Zimbabwe, South Africa, and Namibia. In Asia, it applies to China and Vietnam, even though their wars of liberation had achieved key victories before 1975. In almost every case, political independence in the second phase was achieved after protracted guerrilla warfare. Liberation movements in China, Vietnam, and former Portuguese colonies in Africa moved to be more precise in their definition of national liberation and societal development. Further, they adopted a Marxist ideology as a guide to their struggle, much more deliberately and consistently than had the majority of the nationalist movements in the first phase. Although the nationalist movements in the second phase did not undertake to pursue identical policies, they nonetheless embarked on a far more detailed socioeconomic analysis of colonial and imperial domination.

In Africa, these Marxist-leaning movements were influenced by the revolutionary thought of Frantz Fanon (1925–1961). In his most famous book, *The Wretched of the Earth* (*Les damnés de la terre*, 1961; Eng. trans., 1963), Fanon argued passionately that true decolonization must be the product of violence. Colonialism, “created and maintained by violence,” could be truly uprooted only through “mass participation in violent decolonization.” This violence was to be the product of an organized revolutionary movement composed of urban intellectuals and peasants. Fanon also argued that revolutionary violence against the colonialists was “a cleansing force” for individual participants: “it frees the native from his inferiority complex and his despair and inaction.” The meaning and implications of this observation continue to generate ideological and intellectual controversy. Still, it should be said that Fanon’s formulation was not a “lyrical celebration of violence” (see L. Adele Jinadu) but rather a strategy to be employed by the colonized in pursuit of true liberation.

After World War II, European powers were not eager to liquidate their empires in Asia and Africa. Although drastically weakened by the war, neither Britain nor France (the major imperial powers) seemed anxious to grant political independence to their colonies. Indeed, the dominant postcolonial policies seemed to favor reassertion of imperial authority. To this end, France fought costly wars in Vietnam and Algeria as it tried unsuccessfully to suppress nationalism. Britain fought against a determined anticolonial movement in Malaya, as well as against the Mau Mau nationalist peasant revolt in Kenya. Even in those colonies where there was little or no armed resistance, European powers were quick to employ brutal force to try to stem the tide of nationalism.

Colonial administrators routinely dismissed the legitimacy of Asian and African nationalism. Any stirring of nationalism was seen as an alien, artificial, almost inappropriate creation, imposed by Asian or African elites on unwilling or otherwise ignorant masses. This was a disastrously mistaken claim and belief. It would have been impossible for nationalist activists to achieve any success without the sustained and spirited support

of those masses. The ideological strife of the Cold War, however, led many colonial administrators to mistakenly view nationalist agitation as the unfolding of a global communist conspiracy.

In the end, imperial maneuvers, brutal force, and concessions failed to derail the drive toward decolonization. In the political climate of the postwar years, imperial powers were forced to see that there could be no compromise between direct imperial domination and the basic, nonnegotiable demands of nationalism.

On balance, it is fair to conclude that internal factors in each colony proved the chief determinant in the nature of the struggle for, and attainment of, political independence. Nationalist and revolutionary movements were essentially local in inspiration and objectives. These movements were not “exportable commodities,” says Amílcar Cabral, but rather were “determined and conditioned by the historical reality of each people.” This underscores the vitality and integrity of Asian and African nationalism and amply demonstrates (in Geoffrey Barraclough’s words) that “the will, the courage, the determination, and the deep human motivation” that propelled it forward “owed little, if anything, to Western example.”

After Political Independence: The Struggle Continues

The attainment of political independence by Asian and African countries left several questions unresolved. There was the question of ideology in the postcolonial period. In many countries, successful nationalist movements were essentially coalition parties, representing several ideological positions and tendencies. In Indonesia, President Sukarno (1901–1970) argued that the nationalist movement must be inclusive, and hence he saw “nothing to prevent Nationalists from working together with Moslems and Marxists.” This expedient inclusiveness began to unravel in the postcolonial period. On this matter, it is vital to remember that these ideological questions were debated against the backdrop of the Cold War, which had an indelible impact not only on the texture of decolonization the imperial powers were willing to entertain but also on internal postcolonial ideological tensions.

Closely related is that decolonization did not lead to economic freedom or even sustained economic growth and development in most Asian and African countries. What happened? Asian and African countries rarely, if ever, inherited vibrant, varied, and integrated national economies. What they inherited, says Basil Davidson (1974), was a colonial economic system that for centuries had “developed little save the raw materials needed in the Atlantic world.” In Africa, the imperial powers both before and after independence imposed “an institutionalized relationship between Africans and Europeans,” which facilitated the exploitation of Africans and their resources. As in Asian countries, this system has proved to be very difficult to change. The consequences have been economic stagnation, often regression, and widespread poverty.

These economic problems have seriously compromised the essence of the political freedom won after so much sacrifice and determination. Yet in many of these countries, as in Latin America, the ruling elite lead opulent lifestyles amid grinding

and widespread poverty. This cannot be taken as an indicator of economic development and social progress; it is the product of corruption, patronage, and oppression. Only “true decolonization,” according to Fanon, could prevent the rise of an African national bourgeois eager to strike a self-serving compromise with Western imperialism. The critical point to remember is that in Africa, as in Asia, the inherited “economies remained externally oriented” and did not “provide the basis for a strong national economy.”

The essence of decolonization has also been frequently compromised by the demands and expectations of foreign aid. For Asian and African countries, such aid has been an almost permanent feature of postcolonial history, but has not led to economic independence and progress; quite often, poverty and economic stagnation have persisted. Since the 1950s, aid from the West to African, Asian, and other developing countries has been guided by shifting political and economic paradigms. These have included import substitution, population control, and expansion of exports. “Structural adjustment” in support of globalization is the paradigm that currently guides the dispensation of Western aid. Still, poverty and poor economic performance have persisted in most Asian and African countries.

The formulation and implementation of these development fashions clearly indicate that a conscious effort has been made to sidestep tackling the fundamental and exploitative relationship between imperial powers and former colonies. The result, as described by Mahbub ul-Haq, is that a “poverty curtain” now exists, dividing the world into “two unequal humanities—one embarrassingly rich and the other desperately poor.”

The struggle also continues in cultural affairs—a struggle over respect for Asian and African cultures. Culture is intricately linked to dignity and identity. Dignity, and with it cultural pride, are especially important for a people whose past has been dominated by alien rule and culture, and colonialism was hostile to the vibrant growth and assertion of local culture. This hostility was clearly evident in the propagation of racial stereotypes demeaning to Asians and Africans, characterizations and beliefs that are, sadly, not yet dead. A matter of critical importance to the people in former colonies is the survival of their cultures in the age of globalization, which has facilitated the rapidly expanding marketing of Western entertainment. Films, music, and general attitudes toward lifestyle promote a sort of global homogenization that is Western-derived and -controlled. This has not stimulated the survival or growth of local cultures and values. World culture is thought to be threatened if diversity is lost.

In the postcolonial period, culture has once again been invoked in the West as lying behind the poverty of developing countries. The cultures, values, and attitudes of most Asian, African, and Latin American countries, not their colonial legacy or even their underdevelopment by the West, are said to be at the root of their poverty; their traditional cultures are seen to inescapably impede progress. This is in contrast to Western societies, whose cultural values both inspire and facilitate progress. In the United States, key proponents of this “cultural factor” include Samuel P. Huntington and Lawrence E. Harrison.

The principal contentions advanced in arguing the cultural factor are not new. They formed an integral part of imperialism’s theory and practice in Asia and Africa in the nineteenth century. They now mark the resurrection of a theory of development that has a distinct imperial lineage—cultural imperialism. As in the past, this theory avoids embracing history in its formulation and analysis. Perhaps even more crucial, it avoids discussing the origin and management of the current Western-dominated international political economy. There is no serious attempt made to analyze how this economy makes it particularly difficult for the majority of Asian and African countries to reap the economic and social benefits of decolonization.

The controversial and emotional question of language has emerged as critical in discussions of decolonization. What should be the language of creativity in African and Asian countries newly liberated from Western imperial rule? Many writers in these societies have agonized over this matter, concerned that the continued use of European tongues in literature and sometimes as the national language constitutes “linguistic imperialism.”

In Africa, the foremost critic of what is called linguistic imperialism is Ngugi wa Thiong’o, Kenya’s most eminent writer. In a 1991 interview, Ngugi emphasized the reality that a “very tiny minority, the tip of every nationality, speak French or English or Portuguese.” Since most Africans speak their native languages, an African author who writes in a European language (rather than creating literature in an African language, which would then be translated into other African languages) essentially shuts off the huge majority and instead addresses fellow members of the elite. This is inherently undemocratic and is unlikely to serve as the cornerstone of a national literary tradition. Further, Ngugi holds that “African thought, literary thought, is imprisoned in foreign languages” and that African thinkers and writers, “even at their most radical, even at their most revolutionary are alienated from the majority.” To Ngugi and his supporters, the language question, “is the key, not the only one, but definitely a very, very important key to the decolonization process.”

LATIN AMERICA

Over the past five hundred years, Latin America has experienced three and possibly four periods of colonization, all of which gave rise to anticolonial movements. The first period symbolically began with Christopher Columbus's arrival in the Americas on 12 October 1492, launching three centuries of Spanish, Portuguese, and British colonial control over the hemisphere, with the French, Dutch, Danish, and other European powers competing for slices of the action in the Caribbean. In most of Latin America, this period came to an end with the wars of independence from about 1810 to 1825. Political independence ushered in a second period (known as

neocolonialism), in which the countries of Latin America were still subject to foreign economic control—this time largely by the British. During the third period, corresponding to the twentieth century, this economic dependency shifted from the British to the United States, and anticolonial responses increasingly assumed anti-imperialistic characteristics. The twenty-first century arguably introduced a fourth period of neocolonialism, in which Latin America has become subject to control through the maquiladora system to transnational capital not necessarily rooted in one country and in which the export commodity is labor rather than raw materials.

Independence

The Latin American movement most closely associated with anticolonialism corresponds to the period at the beginning of the nineteenth century during which most of the region gained its political independence from European colonial powers. This "postcolonial era began before many territories became colonial," Robert Young notes, and "before some European imperial powers, such as Germany and Italy, had even become nations themselves" (p. 193). As in the United States, independence represented a shift of economic wealth and political power from a colonial elite to a domestic elite. In Latin America, this was expressed as a struggle between *peninsulares* (those born on the Iberian peninsula, i.e., Spain and Portugal) and *creoles* (those born in the New World). Independence did not result in any corresponding shift in social relations, nor did it result in the abolition of slavery or more rights for women. In fact, without the paternalistic protection of the European crowns the position of peasants and Indians actually worsened.

The 1780 Tupac Amaru uprising in the South American Andes is one of the largest, earliest, and most significant anticolonial movements in the history of Latin America. The leader of this uprising, José Gabriel Condorcanqui (d. 1781), a descendant of the Incas, first attempted to petition for the rights of his people through legal channels. When legal attempts failed, he took the name of the last Inca ruler (Tupac Amaru) and led an uprising that quickly spread throughout the southern Andes. The insurgents sacked Spanish haciendas and *obrajes* (textile mills), driven by messianic dreams of a renewed Inca empire that would free the indigenous peoples from hunger, injustice, oppression, and exploitation. The Spanish captured Tupac Amaru and other leaders of the uprising six months later and executed them in Cuzco, the former capital of the Inca empire. This did not end the rebellion but shifted its focus south to Bolivia, where under the leadership of Aymara people it entered a more radical, violent, and explicitly anticolonial phase. In this phase, the insurgents captured and held the city of La Paz for several months and threatened the silver mines at Potosí—a direct challenge to Spanish wealth and power. The Spanish finally captured and executed the leaders and the uprising eventually collapsed. This revolt has sometimes been seen as a forward-looking antecedent to the successful creole independence movements that came forty years later and sometimes as a reactionary messianic movement that sought to return to the time of the Inca empire. Sinclair Thomson positions these uprisings in the context of local struggles against abusive colonial practices and for self-determination

Christopher Columbus coming ashore at San Salvador. Columbus's arrival in the New World in 1492 gave rise to the first period of colonization of Latin America. Spain, Portugal, and Britain proceeded to control the region, which didn't achieve independence until the early nineteenth century. © BETTMANN/CORBIS

and equality. Although the uprising ultimately failed, it reveals a widening gap between the colonial elites and the subaltern masses, as well as a refusal of indigenous peoples to passively accept their marginalized role in society.

The Haitian slave revolt provides another stark contrast to the creole independence movements and in essence underscores the lack of a compelling anticolonial discourse in those events. Haiti was a French colony, and its production of sugar, cotton, and indigo made it one of the most important colonies in the world. Soaring sugar profits for French planters in the eighteenth century led to a dramatic increase in the number of African slaves they imported to work the plantations. By the end of the century, about 80 percent of the Haitian people were overworked and underfed slaves. Nevertheless, Haitian independence movements began in 1789 not as a slave revolt but from the small elite class of planters, who had been influenced by the French Revolution's rhetoric of "liberty, equality, fraternity." For the planters, liberty meant home rule and freedom from French tariff structures. The whites armed the slaves to fight the French, but instead, under the

leadership of Toussaint L'Ouverture (1743–1803), slaves took advantage of the opportunity to revolt and destroyed the old society. The result was perhaps one of the few true social revolutions the world has ever seen, in which members of a mass movement completely obliterated the *ancien régime* and claimed power for itself. By the time Jean-Jacques Dessalines declared Haitian independence in 1804, the sugar economy had disappeared, having been displaced by subsistence agriculture. The example of a black slave republic sent a terrifying chill through creole elites, which had begun to agitate for independence elsewhere in Latin America. The only other independent country in the hemisphere, the United States, refused to recognize the Haitian government. The dangers exemplified by the first successful anticolonial movement in Latin America put the brakes on other independence movements, delaying their completion by perhaps a generation.

Neocolonialism

By the 1820s, most of Latin America had gained political independence from its colonial masters. With Iberian mercantile restrictions gone, northern European (and particularly British)

capital flooded the region. As critics have noted, a legacy of colonization was a blocking of moves toward industrialization, which would have represented little gain for colonial powers. This trend continued with the British (and later the United States) extracting raw materials from and importing finished goods into the region. The infrastructure, such as the railroad systems, was designed to transport products from mines and plantations to seaports rather than to integrate a country. The economic benefits of this trade accrued to foreign powers, with wages and living standards remaining depressed as resources were drained away from the domestic economy. Neocolonialism also led to cultural shifts. For example, predominantly Catholic Latin American countries implemented freedom of religion in order to encourage foreign investment from Protestant powers. Despite formal independence, external economic forces determined many of the domestic policies in Latin America. This irony has come to be known as neocolonialism.

Nineteenth-century examples of neocolonialism include the export of Peruvian guano and Chilean nitrates, which fueled an agricultural boom in Europe. Neocolonialism, and Latin America's subsequent falling behind relative to economic growth in northern industrial economies, was not inevitable nor was it the only possible option. In *The Poverty of Progress*, E. Bradford Burns points to Paraguay as a viable example of autonomous economic development. The country's leaders eliminated large estates and emphasized domestic food production, and they restricted foreign penetration of the economy. Rapid economic development without outside foreign development alarmed the elitist governments in the neighboring countries of Argentina, Brazil, and Uruguay, who feared the model Paraguay offered to the poor in their own countries. Their opposition led to the War of the Triple Alliance (1864–1870), which devastated Paraguay and destroyed this alternative model to neocolonialism.

The concept of formally independent countries that remained economically dependent on outside powers first was articulated in Marxist circles in the 1920s, though the term *neocolonialism* was not introduced until the 1960s. It has always been closely associated with anti-imperialism, as was demonstrated at the 1966 Tricontinental Conference in Havana, Cuba, which linked anticolonial struggles in Asia, Africa, and Latin America. Although U.S. neocolonial control is largely a twentieth-century phenomenon, it is rooted in the 1823 Monroe Doctrine, which declared Latin America to be part of the U.S. imperial sphere of influence.

Anti-Imperialism

When the Haitian sugar economy collapsed with the slave revolt at the end of the eighteenth century, much of this production shifted to the neighboring island of Cuba. As a result, while other colonial economies stagnated, leading to elite discontent with European rule, the Cuban economy took off, undercutting any impetus for a serious anticolonial movement. As a result, the island remained a Spanish colony until the end of the nineteenth century. José Martí (1853–1895) perhaps best represents Cuban anticolonial movements. Born to *peninsular* parents (his father was a Spanish official), he was a teenage rebel who was exiled to Spain for his political activities and later

worked in the United States as a journalist. He was killed in battle on 19 May 1895, when he returned to the island to join the anticolonial struggle. Much of Martí's ideology emerged out of the context of nineteenth-century liberalism, but his contact with radical movements in the United States also imbued his anticolonialism with aspects of social revolution. Rather than seeking to merely change one elite for another, as had happened when colonialism ended in most other American republics, he wanted true social changes. He was an anti-imperialist and a revolutionary nationalist who worked against economic dependency as well as for political independence. Martí, like Venezuelan independence leader Simón Bolívar (1783–1830) before him and Argentine-born guerrilla leader Ernesto "Che" Guevara (1928–1967) after him, called for a unified America to confront the common problems left by a legacy of European colonization.

After Martí's death, with Cuba on the verge of gaining its independence in 1898, the United States intervened in order to control the economic wealth of the colony for its own benefit and to prevent the establishment of another black republic on the Haitian model. Disguising its efforts as altruism, the U.S. Senate passed the Teller Amendment, which declared that the United States would not recolonize the island. Although this legislation thwarted the imperial intent of the United States to annex the island, the 1901 Platt Amendment declared "that the government of Cuba consents that the United States may exercise the right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property and individual liberty" (Bevans, pp. 116–117). This led to a unique colonial situation, in which Cuba had a civilian government but not one that could be called a democracy. The island became an extension of Miami, and U.S. intervention promoted and perpetuated corruption, violence, and economic stagnation. This set the stage for the successful 1959 Cuban Revolution, which freed the country from economic colonization, much as independence in 1898 had freed it from Spain's political colonization. After the triumph of the revolution, Cuba became a global leader in postcolonial anti-imperialist struggles.

Although the Teller Amendment prohibited the annexation of Cuba to the United States, the legislation stood mute on Spain's few remaining colonial possessions in the Caribbean. Most importantly, this led the United States to occupy the island of Puerto Rico, a territory it continues to hold in the twenty-first century. In fact, after Namibia was freed from South African control in the 1980s, Puerto Rico became the sole remaining item on the agenda of the United Nations's decolonization committee, although anticolonial struggles continue elsewhere, notably in French Polynesia. For the United States, Puerto Rico remains an unresolved and seemingly irresolvable colonial question. In the early twenty-first century the island is an *Estado Libre Asociado* (literally, Associated Free State, but defined by the United States as a commonwealth), which means that it is an unincorporated territory that belongs to, but is not part of, the United States. This leaves Puerto Rico subject to the whims of the United States, and its residents with few legal avenues through which to address offenses committed against them. As an example of the colonial relationship, residents on the island were made

U.S. citizens during World War I so that they could be drafted to fight in Europe, but even in the early twenty-first century they do not have the right to political representation in Washington. However, the economic advantages of their status, including the ability to migrate freely to the United States to work, create a situation where only a small percentage of Puerto Ricans favor independence for the island, but resentment at the island's colonial status is nonetheless widespread and deeply felt.

Anticolonial sentiments in Puerto Rico flourished during the second half of the twentieth century, and in part gained a focus around political campaigns to halt U.S. naval bombing practice at Vieques Island. In 1941, with World War II on the horizon, the United States military acquired most of the land at Vieques as an extension of the Roosevelt Roads Naval Station in order to develop a base like Pearl Harbor for its Atlantic fleet. Noise from bombs and low-flying airplanes engaged in practice maneuvers disturbed inhabitants and disrupted the fishing economy. The later use of napalm, depleted uranium, and other experimental weapons left the area heavily contaminated. The imperialist nature of the military's occupation of Vieques quickly gave rise to popular sentiments against the navy's presence and calls for them to leave. Finally, on 19 April 1999, two off-target bombs destroyed an observation post, killing David Sanes Rodríguez, a local civilian employee. This triggered a massive civil disobedience campaign that finally forced the navy to leave Vieques on 1 May 2003. Independence leaders such as Pedro Albizu Campos and Rubén Berríos Martínez provided leadership to the campaigns, seeing Vieques as an important part of an anticolonial and anti-imperialist struggle. Their slogan became "Today Vieques, tomorrow Puerto Rico."

Non-Spanish Caribbean

European colonization of the Caribbean began with Columbus's arrival in 1492, and the region was so highly valued that it remained under the control of various European empires longer than any other part of the hemisphere. Spain maintained—and then lost—control over the largest and most populous islands of Cuba, Hispaniola, and Puerto Rico, known as the Greater Antilles. Other European powers, including the British, French, and Dutch, intruded into the Spanish domain and established a significant presence, particularly on the smaller islands, known as the Lesser Antilles, where descendants of African slaves and Asian indentured workers imported to replace the decimated indigenous population led many of the anticolonial movements.

As they did in Africa and Asia, modern nationalist anticolonial movements in much of the Caribbean emerged in the aftermath of World War II, with its emphasis on the values of democracy and self-determination. As Cary Fraser argues, independence movements in the Caribbean must be understood in the context of these broader decolonization efforts. During the second half of the twentieth century, some of the islands gained their independence, although the British, French, and Dutch still retained colonial control over several smaller islands. Many of the residents benefited economically from access to European welfare systems, which dampened anticolonial agitation.

Even after independence, many of the colonies maintained close relationships with their mother countries, leaving imprints on their political culture that marked them as significantly different from Latin America. For example, the former British colonies remained part of the Commonwealth and retained the British queen as their monarch.

As the European empires collapsed, U.S. economic, political, and ideological interests gained increased hegemony over the Caribbean. Tourism and providing tax havens for foreign banks and corporations became the area's primary roles in the global economy. An example of the United States' ambiguous commitment to self-determination and its growing neocolonial control was its successful efforts to unseat Cheddi Jagan and his People's Progressive Party from the presidency of British Guiana in the early 1960s. United States opposition to Jagan, who was influenced by Marxist ideology and maintained friendly ties with the communist world, indicated that the Caribbean (as well as Latin America in general) would remain within the U.S. sphere of influence.

MIDDLE EAST

Between the early nineteenth century and the outbreak of World War I, much of the area between Morocco and what is now Turkey came under different forms of European colonial rule. Thus France began the conquest of Algeria in 1830, took over Tunisia in 1881, and (in partnership with Spain) took over Morocco in 1912. Britain occupied Egypt in 1882, formalizing the occupation by the declaration of a protectorate in 1914, and Italy began its conquest of Libya in 1911.

Ottoman Empire and the Mandate System

With the exception of Morocco, the entire region either had been or still was in the early twentieth century at least nominally part of the Ottoman Empire, a multiethnic geopolitical unit that had been in existence since the late thirteenth century and that came to an end in the 1920s. Although it is misleading to regard the Ottomans as an imperial power, it is nevertheless the case that in spite of the Tanzimat reforms of the nineteenth century, which were generally intended to extend full citizenship to all subjects of the empire, the largely Christian provinces in southeastern Europe had become independent states in the course of the nineteenth century as a consequence of more or less bitter struggles to assert their various ethnolinguistic identities. In contrast, regardless of their ethnicity, the overwhelmingly Muslim population of the Arab provinces continued to regard the (Turkish) Ottomans as the natural defenders of Islam, with the result that most of the Middle East was barely affected by Arab nationalism until the early twentieth century.

On the coasts of the Arabian Peninsula, Britain's concern with keeping the route to India safe and open led to a series of treaties with various local rulers between the 1820s and 1916, under which the rulers generally agreed not to grant or dispose of any part of their territories to any power except Britain. In 1839, Britain annexed Aden and turned it into a naval base. Exclusive treaties were signed with the tribal rulers of the interior, and in 1937 the area was divided into the port and its immediate hinterland (Aden Colony) and the more remote rural/tribal areas (Aden Protectorate). Principally because of their remoteness and their apparent lack of strategic importance, central Arabia and northern Yemen were never colonized.

After the collapse of the Ottoman Empire at the end of the First World War, the empire's remaining Arab provinces were assigned by the newly created League of Nations to Britain and France as mandates, with Britain taking responsibility for Iraq, Palestine, and Transjordan, and France taking responsibility for Lebanon and Syria. The guiding principle of the mandate system was that the states concerned should remain under the tutelage of the mandatory power until such time as they were able to "stand alone," a period that, although not specified, was still understood to be finite. The mandate period was relatively short-lived, ending with the creation of Israel from the former Palestine mandate in 1948.

Islam and Anticolonialism

A number of factors are crucial to understanding the various manifestations of anticolonialism in the Arab world in the nineteenth and twentieth centuries. In the first place, the colonial period coincided with several movements of Islamic renewal; the same phenomenon can also be observed in the Indian subcontinent, West Africa, Central Asia, and Southeast Asia. Some movements clearly were, or became, reactions to colonialism, but one of the most influential, the Wahhabis in the center of the Arabian peninsula, both predated colonialism in the region and originated in an area relatively distant from any direct colonial activity. In the late eighteenth and nineteenth centuries, such renewal or reform movements

spread out over a wide geographical area. Some, such as the Sanusi jihad, based in Saharan Libya, later the backbone of resistance to Italian colonization, exhibited an organizational structure similar to that of the Sufi orders, based on a network of lodges; others were urban-based, often around traditional centers of Islamic learning, while yet others were millenarian. Thus in the 1880s, the Sudanese Mahdi preached that he was the divinely appointed regenerator of Islam and consciously imitated the life and career of the Prophet. The renewal movements were by no means always sympathetic to, or even tolerant of, one another. Muhammad al-Mahdi al-Sanusi (1844–1902), for example, was at pains to point out that the Mahdi was not entitled to claim either the leadership of the universal Islamic community or a transcendental relationship with the Prophet Muhammad, and Wahhabism (if not checked by more prudent political considerations) has often exhibited considerable intolerance toward other manifestations of Islam.

The reform movements fed into anticolonialism in a number of ways. One of their effects was to draw a battle line between those rulers and elites in the Islamic world who were prepared to make accommodations to European colonizers and those sections of the community who were not. Thus 'Abd al-Qadir (1808–1883), the early leader of the resistance to the French, was quick to make use of a fatwa (legal opinion) obtained from the Mufti of Fez stating that those Muslims who cooperated with non-Muslims against other Muslims could be considered apostate and thus could be killed or enslaved if captured. Later in the nineteenth century, Ba Ahmad, the chamberlain of the Moroccan sultan 'Abd al-'Aziz (r. 1894–1908), believed his only recourse was to buy off or otherwise accommodate the French, who were making incursions into southern Morocco from both Algeria and Senegal. This policy alienated many influential religious and tribal leaders, who were bitterly opposed to the Commander of the Faithful giving up "the lands of Islam" to foreign invaders; some of them considered that this made him illegitimate and transferred their allegiance to a more combative leader.

The Economic Impact of Colonialism

An important effect of colonialism was to hasten the disintegration of long-established social and economic relations and to substitute the often harsher dictates of the market. The pre-colonial world was no egalitarian paradise, but, for example, the confiscation or purchase of land in colonial Algeria and mandatory Palestine and the formation of large landed estates in Syria and Iraq as a result of the establishment of regimes of private property under the mandates often resulted in cultivators either being driven off the land or being reduced from free peasants to serfs. Being far more incorporated into the world market than they had been before, with the concomitant pressure to cultivate cash crops, forced peasant households to migrate to slum settlements on the edges of the major cities where they faced an uncertain and often near-destitute existence.

Resistance to Colonialism

Twentieth-century resistance to colonialism inevitably partook of the general experience of its time, including assertions of national and ethnic identity, which were given added meaning

and purpose in the face of alien colonizing. The press, the radio, and political parties and clubs provided new opportunities for disseminating the ideologies of anticolonialism. To these must be added the example first of Germany in the 1930s—a previously fragmented state that had turned its recent unification into a means of challenging the old colonizers, Britain and France; and for much of the 1940s, 1950s, and 1960s the Soviet Union as a new form of social and economic organization, under which a previously feudal regime was being transformed into an egalitarian welfare state. Such visions were especially attractive to those who had not experienced the realities of daily life under such regimes.

Algeria

Provided a certain flexibility is adopted, it is possible to identify the major templates of anticolonial resistance, which vary according to the nature of the colonizing process. The Algerian case is probably the most extreme because of the extent of the devastation caused by the colonization process over a period of some 130 years. In the months after the conquest of the city of Algiers in July 1830, the French military began to encourage the settlement of French *colons* in the city's rural hinterland. At the time, Algeria was, if only nominally, an Ottoman province and had no developed political structures. Local leaders in the west of the country turned first to the Moroccan sultan, but the French warned him not to interfere. The leaders then turned to the Sufi orders, the only bodies with an organizational structure, and Muhi al-Din, the leader of the Qadiriyya order, and his shrewd and energetic son 'Abd al-Qadir were asked to lead a tribal jihad against the French.

Between 1832 and 1844 'Abd al-Qadir managed to keep the French at bay with an army of about ten thousand. Initially, he achieved this by making agreements with the French recognizing his authority over certain parts of the country, but by the 1840s the French had decided on a policy of total subjugation and 'Abd al-Qadir, defeated at Isly in 1844, eventually surrendered in 1847. By this time the European population had reached over 100,000, living mostly in the larger towns. In the 1840s, the French had begun a policy of wholesale land confiscation and appropriation, and a number of local risings took place in protest. The settlers had influential allies in Paris, and throughout the nineteenth century the indigenous population faced the gradual erosion of most of their rights. The last major act of resistance until the war of 1954 to 1962 was the rebellion in Kabylia in 1870 to 1871, led by Muhammad al-Muqrani. For a while, al-Muqrani's army of some 200,000 controlled much of eastern Algeria, but it was no match for the better equipped French troops. After the defeat of al-Muqrani's rebellion (he was killed in battle in May 1871) the local communities involved were fined heavily and lost most of their tribal lands.

The Algerian national movement was slow to develop in the twentieth century. The tribal aristocracy had been defeated and no former indigenous governing class or emerging business bourgeoisie existed (as they did in, for example, Morocco, Tunisia, Syria, and Lebanon). Some Algerians felt that France had brought them into the modern world and wanted to become more French—that is, to enjoy the same rights as the

French in Algeria without having to give up their Islamic identity. This tendency, generally called assimilationist, was represented by Ferhat Abbas, who sought to become a member of the French Chamber of Deputies. The first strictly nationalist movement, the *Étoile Nord-Africaine* (later the *Parti du Peuple Algérien*), which initially had links to the French Communist Party, was founded by Messali Hadj in 1926, recruiting among Algerian workers in France. Yet another tendency was represented by Ahmad Ibn Badis (1889–1940), who sought to reform Algerian popular Islam through the Association of 'Ulama', asserting the Muslim nature of Algeria.

From the 1930s onwards, rapid urbanization fuelled Algerian resistance to France. By the end of World War II there was some hope on the part of moderates both in France and Algeria that compromises could be worked out that might deflect violent nationalism, but the Algerian European community's dogged insistence on maintaining its privileges meant that these hopes soon evaporated. Ferhat Abbas's movement soon became insignificant. Ibn Badis's death meant that the Association of 'Ulama' lacked influence, leaving Messali Hadj dominating the field, with supporters among Algerian workers in France as well as in Algeria. However, his organization was regarded as too moderate, and a splinter group, the *Organisation Secrète*, seceded from it in the mid-1940s. Its members included such major revolutionary figures as Ahmed Ben Bella, Ait Ahmad, Murad Didouche, Mohammed Boudiaf, and Belkacem Krim. This group subsequently launched the Algerian Revolution, or war of national liberation, on 1 November 1954. The war lasted until 1962, when Algeria became independent; over the eight years, between 1 million and 1.5 million Algerians and 27,000 French were killed. The war proved intensely divisive, especially as more Algerian Muslims fought as soldiers or *harkis* on the French side than in the Algerian army.

Tunisia, Egypt, and Morocco

In the case of Tunisia, Egypt, and Morocco, the decision of Britain and France to take over the reins of government (in 1881, 1882, and 1912) was at least partly precipitated by local opposition to the draconian financial measures that the European powers had forced local governments to impose in order to repay the debts they had contracted on the various European money markets. The ruler of Tunisia, Ahmad Bey (1837–1855), made strenuous efforts both to modernize Tunisia and to assert its independence from Istanbul, and he had been substantially aided by France in the latter objective. By the time of his death, Tunisia had a modern army and a modern navy; the Bey's brother-in-law, who survived him by nearly twenty years, was a modernizing finance minister and prime minister, and an Italian family provided the state's foreign ministers until 1878. In 1861, much to the discomfiture of Muhammad al-Sadiq Bey (1859–1882), Tunisia adopted a constitution and a modern (that is, generally secular) legal system under which the Bey's prerogatives were quite limited.

These reforms were better received in the outside world and among the sizeable local European community than within Tunisia, where a rural rising against the new legal system and the new taxes was put down with considerable brutality in 1864.

As happened in Egypt at much the same time, the contracting of substantial foreign debts (generally used to build the infrastructures that made the reforms possible or to pay the European consultants—officers, engineers, and so forth—in charge of putting them into effect) and the general mismanagement and corruption associated with the loans meant that the country found itself increasingly at the mercy of its foreign creditors. Tunisia declared bankruptcy in 1869 and Egypt in 1876. The sterling efforts of the reformer Khayr al-Din (c. 1825–1889) to balance the budget were no match for French colonial ambitions, which eventually forced the Bey to accept a protectorate under the terms of the Treaty of Bardo in May 1881. By 1892, four-fifths of cultivated lands were in French hands.

The situation in Egypt was similar; the additional taxes imposed as a result of British and French administration of the public debt, initiated in 1876 essentially to ensure that the bond-holders got their money back, eventually gave rise to a nationalist movement. Many of its members had the additional grievance that the government of Egypt was conducted by foreigners, that is, a Turco-Circassian aristocracy consisting of the descendants of the viceroy Muhammad ‘Ali (1780–1848) and their courtiers, in which native Egyptians constantly encountered a glass ceiling. Another interesting component of the rebellion led by Ahmad ‘Urabi (1839–1911) between 1879 and 1882 was the emphasis on restoring Egypt fully to the Ottoman Empire. Although relatively large numbers of foreigners resided in Egypt, they were generally neither settlers nor *colons* in the French North African sense: most were not bureaucrats or farmers and had not lived there for generations; they resided mostly in the cities and engaged in commerce or in service occupations. In addition, most of them were not citizens of the occupying power.

In spite of a succession of strong rulers for much of the nineteenth century, Morocco was also unable to avoid colonial penetration, first economic (imports of tea, sugar, candles, and cotton cloth; exports of wool, cereals, and ostrich feathers) and then military. The first major confrontation between locals and Europeans occurred in 1859 to 1860, when Spain besieged Tetouan. A month later, Spain demanded an indemnity as the price of withdrawal, and although the terms were punitive half the indemnity was paid within two years. This involved great hardship, particularly the imposition of non-traditional agricultural taxation, which caused considerable unrest. A massive devaluation of the currency took place, as did a near-universal switch to foreign coinage. Like Tunisia and Egypt, Morocco gradually moved from a state of general economic self-sufficiency to dependence on the world market. Morocco gradually became dependent on foreign loans and declared bankruptcy in 1903. Largely to preempt German colonial efforts, France and Britain signed the Entente Cordiale in 1904, under which Britain recognized France’s pre-eminence in Morocco and France formally accepted the British occupation of Egypt. Franco-Spanish occupation of Morocco was formalized in 1912.

Independence

Some of the anticolonial movements of the twentieth century were urban-based mass movements, often led by charismatic

leaders, perhaps most notably Habib Bourguiba of Tunisia, who led the Neo-Destour Party between 1954 and Tunisian independence in 1956 and who remained his country’s leader until 1987. Allal al-Fassi, leader of the Istiqlal party, might have played a similar role in the history of Morocco. However, in 1953 the French exiled the sultan, Muhammad V, to Madagascar, and as a result the rallying cry of the national movement became the sultan’s return from exile, which led in its turn to the sultan/king retaining his position as ruler after Morocco’s independence in October 1956 and the virtual eclipse of the secular political parties.

In Egypt, a kind of independence was achieved in 1936, but the national movement went through two stages. In the first stage, some but not all powers were handed over to local elites. This arrangement involved some form of power-sharing with the former colonial power, which became increasingly intolerable to wide sections of the population. However, given the balance of forces, it was not possible to break these links by democratic means—that is, by voting in a political party or coalition that would be able to end the relationship. Thus a second stage was necessary, in which a determined group within the military seized power, destroying in the process the fairly rudimentary institutions of parliamentary government that the colonial powers had put in place. In this way, first General Mohamad Neguib (1901–1984) and then Gamel Abdel-Nasser (1918–1970) took power in 1952. Iraq went through a similar process, and ‘Abd al-Karim Qasim took power in 1958. A similar but more complex process took place in Syria, although the old social classes still ruling in 1961 had long severed any links they may have had with France.

Palestine

The final and highly anomalous case of anticolonialism in the Middle East is Palestine, unique among its neighbors in that it was a settler state. The text of the Palestine mandate included the terms of the Balfour Declaration (1917), in which Britain as mandatory power undertook to facilitate the setting up of a “national home for the Jewish people.” In 1922, there were 93,000 Jews in Palestine and about 700,000 Arabs; in 1936, there were 380,000 Jews and 983,000 Arabs; and in 1946, about 600,000 Jews and 1.3 million Arabs; thus the Jewish population increased from 13 percent to 31 percent over a period of twenty-four years. Anticolonialism took different forms, principally through opposition by both Arabs and Zionists to British policy, which they tried to combat in different ways, and Arab opposition to Zionism. The Palestine rebellion of 1936 to 1939 was mostly a peasant insurrection against colonial rule and the settlers; in 1947 to 1948, the Zionists fought and won against an assortment of Arab armies and the poorly organized Palestinian resistance forces; the colonial power had long indicated that it would withdraw.

Opposition to colonial rule and colonial settlement was fairly widespread throughout the nineteenth and twentieth centuries and took a variety of different forms, rural and urban, organized and spontaneous, religious and political, showing greater or lesser degrees of coherence. In any colonial situation, a wide spectrum of responses existed, with resistance at one end, acquiescence in the middle, and collaboration at

the other end. Some members of the colonized population rebelled and some collaborated, but the majority acquiesced, at least for most of the time. In the nationalist historiography of the colonial period, the struggle for colonial freedom or national independence is often characterized in a way that shows the brave freedom fighters ranged against the brutal colonial authorities. The “achievements” of colonialism have long been open to question, and the divisions and chaos of the post-colonial world make the value of the legacy more questionable as time passes. Nevertheless, it is also important to understand the complexity and multifaceted nature of anticolonialism: the intrigues; the competing and often warring factions; the venality and corruption of many of them. For national maturity, and increasingly for national reconciliation, it will be necessary that such uncomfortable truths are boldly confronted rather than wilfully ignored.

SOUTHEAST ASIA

Anticolonialism in Southeast Asia has been considered from a wide range of perspectives, resulting in deliberation over its character and place in the region's history. Generally, anticolonialism refers to one type of Southeast Asian response to the encounter with Euro-American colonialism. One might then describe anticolonialism as including everything from the personalities, institutions, and resistance movements that arose in direct response to the establishment of colonies in Southeast Asia, to the growth of literary expressions, rituals, history,

and popular culture that emerged within that historical context. More specifically, anticolonialism has also come to represent the ways in which colonized peoples protested, resisted, or expressed dissatisfaction with changes imposed by colonial authorities.

Because of the nature and history of colonialism in Southeast Asia (which occurred over four centuries involving different actors, intensities, locations, and agendas), expressions of anticolonialism in the region tend to reflect the circumstances and characteristics particular to each locality. So the study of anticolonial movements in the Spanish colonies was understood in the context of a “Philippine history” that was different from the historical context in which colonialism (and anticolonialism) would be examined in the case of nineteenth-century Myanmar (then known as Burma), whose history and colonial experience under the British had unfolded in quite a different manner. At the same time, scholars have also done extensive comparative work, demonstrating similarities in the way Southeast Asians articulated protest. In this regard, scholars have concentrated on the different forms of anticolonial expression in order to demonstrate variation and coherency in Southeast Asian cultural history. As a result, a distinctive and uniform “Southeast Asian” response to colonialism has yet to be clearly defined.

Categories and Features of Anticolonialism

In order to make sense of the variety of ways in which Southeast Asians responded to colonialism, expressions of protest and resistance might be approached under three general categories: traditional, synthesis, and radical movements. Although problematic in terminology, traditional movements represent those initial “knee-jerk” reactions to the immediate military and pacification operations of the colonial powers that preceded the establishment of administrative governments. These movements were generally led by elites of the traditional order, using the vocabulary and symbols of leadership to which their followers would associate with precolonial authority. Designed to resurrect the institutions and social networks that were dismantled by the encroaching Europeans, ex-princes, ministers, and priests (or monks) rallied their immediate followers to resist colonial encroachment at locations of significant religious, political, and cultural importance. Because these movements were based on patron–client, village, and locally defined networks of relations, these outbreaks of resistance were limited in scale. These types of responses were generally found throughout the region but were more locally oriented and unsuccessful in realizing the return of precolonial sociopolitical orders.

The second category of anticolonialism, which includes those expressions that exemplify a synthesis of indigenous and European ideals, refers generally to the types of programs championed by educated indigenous elites who wanted to initiate change and reform through the colonial system, using the vocabulary and procedures adopted from European education. These forms of protest were undertaken after colonial administrative and social institutions had already been entrenched in local soil, producing a generation of social reformers who saw the means for change within the apparatus and mechanics of

the colonial system but who hoped to localize Western ideals of civil society and individualism through traditional symbols and belief systems. Unlike earlier responses that aimed to return to precolonial orders, these programs sought to initiate social reform within the parameters of colonial law and convention. Many who initiated such reforms were challenged by the inability to connect with rural populations, whose concerns, experiences, and conceptions of the world were much different from their more urbanized, Western-educated counterparts.

The third type of anticolonial response, which were more radical than the earlier “East-West” attempts to synthesize, describes the initiatives of younger, educated urban students and activists who sought complete independence from colonial authorities using the organizational and sometimes ideological blueprints inherited from Europe, Japan, and America. In contrast to the generation of educated elites who hoped to initiate social reform through the system, the leaders of these movements aimed to uproot the colonial powers using the language of anticolonial nationalism in order to replace the system. Based in cities but able to penetrate the countryside, these movements attempted to bridge the rural–urban gap by making the colonial experience itself the common inspiration to launch popular movements toward independence.

These three categories of analysis offer a preliminary structure to distinguish the different types of social and political protest that might be considered “anticolonial,” while they also take into account the sociopolitical changes that occurred within Southeast Asian colonial society during the late nineteenth and early twentieth centuries as it affected local populations and communities. While anticolonial sentiment developed along these general lines, differences in the methods and natures of the colonial administrations, and the periods in which they were implemented, account for the variations and departures from the stages within this scheme.

One common feature that binds the scholarly understanding of anticolonialism in the region is that it was mainly directed toward institutions, individuals, and policies that had come to represent the way in which colonial authority threatened or affected the lifestyle, worldviews, or identities of local peoples. Symbols of the colonial state (such as infrastructural edifices, district offices, and administrators) were common targets for anticolonial protest, though local indigenous elites who were deemed collaborators or at least sympathetic to the colonial authorities were often subjected to distrust, scorn, and sometimes violence as well. Attacks on local headmen outnumbered attacks on British officials during the initial outbreak of the Saya San Rebellion in Burma in 1930, as these British-appointed headmen were perceived as acting on behalf of the newly formed British village administration.

While rebellions, riots, marches, and boycotts are all illustrative of more obvious forms of resistance, anticolonialism was expressed in a variety of other modes, harnessing local forms of public expression and media to articulate displeasure or disagreement with policies and pressures imposed by the colonial state. The growth of print culture alongside local theater, religious festivals, and other cultural outlets enabled

anticolonialism to be articulated in a wide range of forms, much of which contributed to the scholarly understanding of culture, peasants, and nationalism in Southeast Asia. While these contexts represent more recent scholarly approaches to thinking about anticolonialism, the earliest versions of the idea can be found in the writings of colonial scholar-officials.

Colonial Origins of the Idea

The earliest traces of “anticolonialism” can be found in the documents compiled by scholar-officials working within the various colonial administrations. Specifically, political officers who accompanied the initial military campaigns of conquest and later those within the civil service were among the first to interpret and write about the wide range of responses to colonial operations in the region. Many of these accounts speak of anticolonial resistance as brief interludes or disturbances, mere interruptions to the social order established by the authorities. Within official reports, gazetteers, manuals, and censuses, administrators organized, defined, and made sense of these outbreaks, thereby creating the very categories and perspectives under which “resistance” and “anticolonialism” would eventually be considered. Throughout the region, officials identified key cultural markers such as protective tattooing, charms, and astronomical symbols as part of the “traditional” uniform of resistance, which combined superstitious beliefs and religion in order to appeal to the masses who participated in these movements. Other features included the rebuilding of royal palaces and religious edifices in mountain strongholds that were said to represent cosmological and spiritual power. Case studies demonstrate these similarities in the early *minlaung* (prince) movements of Burma (1885–1890s), the “save-the-emperor” movements of northern Vietnam (1885–1896), and the Java War (1825–1830). Characteristics of anticolonial resistance were first identified, labeled, and codified by officials whose jobs were to affirm colonial policies as much as they were supposed to collect and interpret the societies they were charged with administering.

More importantly, colonial officials were interested in establishing the causal factors for these disturbances and wrote their reports accordingly, influencing scholars who would later use these sources, their approaches, and their descriptions for their own studies. Reports often stated that these brief instances of violence resulted from irrationality, superstition, gullibility, false prophets, religious fanaticism, and other inherent cultural traits that predictably would endure if not for colonial intervention. It was no surprise that initial pockets of resistance that faced the Dutch in Java, the British in Lower Burma, and the French in Vietnam would be considered akin both in character and origin to the anticolonial rebellions in the early twentieth century, though the circumstances would be considerably different. Thus, officials were charged with finding and naming examples of what was “anticolonial” in Southeast Asia partly in hopes of establishing the difference between traditional Asia and modern Europe. In this manner, the idea of anticolonialism began to take shape along a binary framing that placed Southeast Asians and Europeans at opposite ends, structuring the way in which protest, resistance, and revolt would be studied in the years to come.

Nationalism and the Idea of Anticolonialism

With the exception of the Vietnamese and to a lesser extent the Indonesians (who had to endure the return of the colonial powers following World War II), the eventual exit of the European powers from the political scene created an important intellectual vacuum within which scholars of the former colonies could operate. Many of these “home” scholars sought to repair, renovate, or even remove the histories produced under colonial tutelage. Heeding the needs of nationhood, Southeast Asian scholars, many of whom were trained in European schools, began readdressing the histories that were written for them by colonial historians by writing from the perspective of the nation. Where rebels, political activists, and influential religious figures were once marginalized and condemned by colonial historians, they were now transformed into “national” heroes who contributed to the fruition and emergence of the nation-state. Figures such as Java’s Dipanogoro (c. 1785–1855), the Philippines’ José Rizal (1861–1896), Burma’s Saya San (d. 1931), and Vietnam’s Tran Van Tra (1918–1996) became part of a common history of the nation and struggle that contributed to the imagining of the nation. Moreover, the rebellions and incidents first identified by colonial officials as being important were appropriated by home scholars for their narratives, intent on recasting the perspective in which they had originally been presented. So “anticolonial” movements became seen as independence movements, affecting the way in which protest and resistance was interpreted. For instance, the tone of the scholarship and the analysis of the movements were sympathetic rather than critical, shifting the movements’ role and importance in history to demonstrate a national consciousness that was growing during colonial rule. Earlier elements of resistance that colonial writers had highlighted in order to establish the “backward” nature of political expression (such as tattooing, religious symbols, and language) were played down by nationalist historians in favor of more “objective” economic and political origins, although the interest and focus in causal factors as prescribed by colonial documents was nevertheless maintained. Local conceptions of protest and revolt were unintentionally deemed irrelevant, because nationalist scholars were keen on writing a modern narrative of the new nation. The shape and scope of anticolonialism had not changed, only its interpretation and coloring.

While these adjustments were being made by home scholars writing through the lens of the nation, scholars in the West began to reconsider anticolonialism within the context of nation as well, choosing to consider indigenous expressions of protest and revolt (which were ironically being played down by their counterparts in Southeast Asia) as evidence of proto-nationalism. As a result, the major rebellions and revolts (which continued to dominate the attention of scholars) that had taken on a religious or culturally specific character were deemed important to study under the rubric of “Asian” nationalism, which seemed to make these once dismissed ideological influences important and relevant to scholarly study. Consequently, disturbances and outbreaks of violence that demonstrated religious overtones drew attention on the grounds that they were early expressions of nationalism and therefore warranted closer scrutiny. The Saya San Rebellion (1930–1932) in Burma, which made use of Buddhist ideas in its program, was now being considered as a “Buddhist” protonationalist movement,

suggesting that religion and other Southeast Asian ideological sources were important to understanding the growth and expression of Asian nationalism. Similarly, Dipanogoro’s rebellion in Java represented an Islamic nationalism that would precede movements in the twentieth century, while the Filipino revolt launched in 1896 by Andres Bonifacio (1863–1897), which alluded to Christian ideas, seemed to forecast the origins of a national consciousness.

Autonomous History and the Idea of Anticolonialism

In the early 1960s, shifts within Southeast Asian studies began promoting research that sought an alternative approach to the ways in which Southeast Asian culture and history had been conceptualized by earlier scholars. Following the call of John Smail to produce histories of Southeast Asia that were not bound to the European narratives, chronologies, and categories of analysis, scholars began directing their attention to writing about and studying what they perceived as indigenous history, which had finally attained its “autonomy” from the priorities and perspective of European-centered history. This trend affected the way in which anticolonialism came to be understood, in that Southeast Asian conceptions of resistance and protest were now being studied for what they revealed about the region’s cultural heritage and conceptions of the world. Where scholars might have considered how revolts inspired by Islamic, Buddhist, or Christian ideas operated under the rubric of nationalism, emphasis was now directed toward understanding how these mentalities revealed something about the very nature of Southeast Asian culture.

This new direction in thinking led scholars to write some of the most important works about anticolonialism and Southeast Asian culture. For example, Reynaldo C. Ileto, author of the seminal work *Payson and Revolution*, studied the ways in which Filipino-Catholic conceptions of rebellion were articulated through the imagery, scenes, and narratives associated with the Passion story of Christ. It inspired a new interest in millenarianism, or the idea of the coming millennium (or end of the world/cycle), and its relation to religious anticolonial movements. Historians such as Emanuel Sarkisyanz demonstrated how Buddhist conceptions about the end of the world framed the way Burmese made sense of the rapid social and economic changes occurring around them and how the notion of a future Buddha was associated with leaders promising a return to precolonial social norms. Michael Adas would take this paradigm and extend it comparatively within the region and beyond, showing in his *Prophets of Rebellion* that anticolonial movements were forged by the charismatic leadership of men who used religious notions of the millennium in order to gain popular support among the peasantry. Most importantly, these studies and many others began using the idea of anticolonialism in order to flesh out what were perceived as indigenous conceptions of the Southeast Asian world.

Peasant Studies and the Idea of Anticolonialism

With the shift toward an “autonomous” reading of anticolonialism came a connected interest in focusing on peasant society and consciousness. Pathbreaking works, such as James C. Scott’s *The Moral Economy of the Peasant*, applied models for

studying peasants to the anticolonial movements of the 1930s (the Saya San Rebellion in British Burma and the Nghe-Tinh Uprising in French Vietnam) in order to understand not just how “Southeast Asians” might have articulated and understood revolt but also in what specific ways peasants would have expressed and made sense of the new colonial order. The work of Scott and others suggested that the economic conditions of the 1930s directly challenged the peasantry’s locally defined threshold for subsistence, resulting in the widespread rebellions and resistance that occurred throughout the region. Peasant studies tended to also concentrate on economic causal factors, leading scholars to suggest possible connections between the anticolonial rhetoric and new communist influences that were slowly becoming a part of these and other nationalist movements to come. Yet peasant studies also led to the emerging interest in “everyday” forms of resistance and “avoidance” protest that focused on how peasants and communities may have expressed anticolonial sentiment on a daily basis as opposed to the larger and less frequent rebellions that officials and scholars had grown accustomed to study. Anticolonial behavior could be expressed by sabotage, flight, the dragging of one’s feet, and other forms of self-preservation and protest that were directed against authority and/or the colonial state. In a fundamental way, the influence of peasant studies upon the idea of anticolonialism challenged for the first time some of the categories and foci of colonial officials by momentarily shifting attention away from the major rebellions and revolts to the everyday behavior of Southeast Asians. The breadth of scholarship generated by this focus continues to influence the field in the early twenty-first century, by which time the focus on the peasantry had broadened to include minority groups, women, and ethnicities involved in challenges to the state and its apparatus.

Postcolonial Studies and Anticolonialism

Scholars in the early twenty-first century have returned to the idea of anticolonialism, armed with new perspectives and interdisciplinary approaches. As colonialism continues to challenge scholars, many in the academe have been inspired by suggestions that “knowledge” and “power” are closely connected, which have resulted in studies attempting to show how “knowledge” about Southeast Asia reveals something about the contexts in which it was produced. Invariably, attention has returned to those early colonial official-scholars who first began collecting, cataloguing, inventorying, and labeling what they considered Southeast Asia to be. Following Edward Said’s critique of Oriental knowledge production, scholars have demonstrated not only that this construction of Southeast Asian culture by colonial administrators represented European images of the “Orient” but that it also represented an underlying “power” to say what was and what was not “Southeast Asia.” Applying these approaches to the study of resistance and protest, it has become clear that the very categories that define resistance, the rebel, the criminal, and anticolonialism itself were produced in particular contexts that reveal as much about the colonizer as they reveal something about the perceptions of anticolonialism. Research directed at prisons, anticolonial legislation/law, and criminality have become the focus of study in order to demonstrate how colonial administrations

defined Southeast Asian anticolonialism to fit, serve, and respond to the needs of counterinsurgency policies and the maintenance of colonial order. Where once anticolonialism shed light on forms of Southeast Asian culture, it is now redirected to the forms of colonial knowledge and counterinsurgency.

ANTIFEMINISM. Since they became widely used in the late nineteenth century, both *feminism* and *antifeminism* have been hotly contested words, an indication of their politically charged complexity. Activists and thinkers in both camps have sought to control the field of discourse by defining their opponents, while resisting definition themselves. Each camp has adapted to circumstances that change with each victory or setback. The increasing global exchange of ideas and strategies

has produced new local feminisms and antifeminisms. The problem of definition is further complicated by retrospective debates about the relative feminism and antifeminism of historical figures and traditions. Even among self-proclaimed feminists and antifeminists at any given time and place, great philosophical and programmatic diversity is the rule. Under these circumstances, all definitions must be provisional.

Defining Feminism and Antifeminism

Historically and conceptually, feminism precedes antifeminism, which arises as a reaction against and repudiation of feminism and can only be defined on that basis. The definition of *feminism* offered by the historian Linda Gordon has the requisite balance of precision and suppleness to serve as a starting point: “Feminism is a critique of male supremacy, formed and offered in the light of a will to change it, which in turn assumes a conviction that it is changeable” (quoted in Cott, pp. 4–5). Antifeminism, then, repudiates critiques of male supremacy and resists efforts to eliminate it (often accompanied by dismissal of the idea that change is possible). Note that this definition of *antifeminism* limits its reference to reactions against critiques of gender-based hierarchies and efforts to relieve the oppression of women. In this way, antifeminism is distinguished from the related concepts of male chauvinism, sexism, misogyny, patriarchy, and androcentrism, all of which can exist in the absence of feminism.

The origins of modern feminism and antifeminism are primarily found in the European Enlightenment. Among the earliest and most influential works of Enlightenment feminism was Mary Wollstonecraft’s (1759–1797) *A Vindication of the Rights of Women* (1792). Her innovation was to include women in the Enlightenment ideal of autonomous individualism and to extend the critique of rule by divine right to men’s subordination of women. Initially, *A Vindication of the Rights of Women* was praised in the majority of publications that took notice and largely ignored by more conservative journals. The disclosure of Wollstonecraft’s transgressive sexual history in a memoir posthumously published by her husband then brought increased attention from conservative commentators who, in their denunciations, pioneered a common tactic of antifeminist discourse by linking her ideas to her behavior and then labeling both “immoral.”

In a pattern that continues to the present, much of early antifeminism was both an authentic manifestation of opposition to the dismantling of male supremacy and an effective weapon against women and men seeking larger transformations in social, religious, moral, economic, and political relations. Wollstonecraft and the generations of feminists she inspired have most often been affiliated with radical movements such as abolition, free love, Jacobinism, Perfectionism, Communism, temperance, transcendentalism, antimilitarism, and other less-than-popular causes. These associations have provoked and shaped antifeminist reactions. For example, the anticommunist movements following the world wars utilized often tenuous connections between feminists and communists to condemn both. Near the end of the twentieth century, the U.S. radio personality Rush Limbaugh created the term *feminazi* as an all-encompassing epithet to discredit liberal activist

women. In practice, the two functions of antifeminism, as a means and as an end, have complemented and enhanced one another.

Feminism, Antifeminism, and Difference

At the core of the antifeminist program is the preservation (or reestablishment) of social, economic, and political differences based on gender. The most basic tenet of antifeminism is that the differences between men and women are such that inequalities of treatment and status are desirable or necessary. While the antifeminist position has been clear, feminists have been divided in their approaches to the nature and ramifications of gender differences. Individualist, liberal, or equality feminists have asserted an androgynous view of society and have sought to banish gender differentiation from social, political, and economic structures. In this view, equality is achieved by equal treatment without regard to gender. Difference, social, or relational feminists recognize gender differences (both biological and socially constructed) as of continuing significance, and base their claims for equity (in part) on these differences. The argument from difference emphasizes that utility and justice demand that, because men and women are different, women’s interests cannot be represented by men and, therefore, women need to have the opportunity to participate fully in society. Difference feminists have been open, to varying degrees, to differential treatment of men and women in cases where gendered physical or other characteristics are such that equivalence appears more tenable than absolute equality. In practice, many feminists have employed both approaches, basing their opposition to male supremacy on universal human rights as well as uniquely female characteristics or experiences.

Equality feminism and difference feminism have aroused overlapping versions of antifeminism. The antifeminist reactions to equality feminism have mostly been of two types: exclusion and ridicule. By appealing to religion, tradition, science, and nature, antifeminists sought to exclude women from the Enlightenment category of autonomous individuals who should be granted rights. In this view, women lacked the rational capacity and independent nature required of members of society. As the mounting evidence of women’s accomplishments and capabilities has made it increasingly difficult to directly dispute women’s intelligence and rationality, opponents of equality feminism have turned to the other approach: exaggeration and ridicule. In one example, opponents of the Equal Rights Amendment in the United States equated equal rights for women with mandatory unisex toilet facilities in their successful campaign against ratification.

Ridicule has also been employed against difference feminism, often as part of a larger critique of the “feminization” of society. Because antifeminists and difference feminists share a belief in gender differentiation, their disagreements have centered on the nature of this differentiation, claims to superiority of one gender or the other, and appropriate spheres of participation. Although there is a strain of antifeminism that associates women with dangerous, uncontrolled sexuality, most antifeminists and difference feminists have held a common vision of women as more nurturing and less aggressive than men. Extreme antifeminists have presented this difference as

absolute and unalterable, not a matter of degree or environment. On this basis, they have asserted that women are unfit for professions and pursuits demanding an aggressive intellect or personality and, more generally, for the rough-and-tumble of the public spheres of politics and business.

Equality feminists and some difference feminists have countered that gender characteristics vary greatly within each sex, are largely the product of education and opportunity, and that differences will lessen if males and females are treated equally. Other difference feminists, especially those associated with maternalist versions of feminism, have diagnosed the failings of the public sphere as symptoms of aggressive male dominance and prescribed female activism and influence as the cure. Expanded female influence has brought backlash protests against “momism” and the “softening” of individuals, institutions, and cultures informing the men’s movement activities of Robert Bly (b. 1926) and others. Complaints about momism and “feminization” expose the antifeminist dimensions of ideas such as republican or national motherhood that celebrate women’s abilities and contributions within the circumscribed private realm of the family, simultaneously seeking to limit women’s participation in the larger society. When these boundaries have been stretched or broken, the reactionary ridicule has been based on the supposed inappropriateness of female-identified qualities in a shifting array of arenas ranging from education, governance, and the law (primarily in the late nineteenth and early twentieth centuries), to (in the twentieth century) science, police work, and the military.

Nature, Science, Religion, and Antifeminism

Antifeminists have appealed to both religious and scientific authority in defending male supremacy as “natural.” The Abrahamic monotheisms (Judaism, Christianity, and Islam), like many of the world’s religions, contain contradictions: they grew from liberatory roots but were shaped by the hierarchical and patriarchal environments of the societies they matured in. This is manifested in restrictions on women’s actions, movement, contacts, dress, and worship as well as general dictates mandating female obedience. Feminists, ranging from the United States’ Matilda Joslyn Gage (1826–1898) in the nineteenth century to Morocco’s Fatima Mernissi (b. 1940) in the twenty-first, have identified established religion as a primary source of women’s oppression while simultaneously providing feminist interpretations of cardinal religious texts to claim the liberatory traditions for women.

Established religions tend toward antifeminism because they have a vested interest in preserving the status quo. In contrast, religious fundamentalists are generally reactionary outsiders, opposing secular authority as well as conservative and liberal religious practices. Although much scholarship and most popular images portray fundamentalist movements as inherently antifeminist, other scholars and women within these movements have identified ways in which women have used fundamentalism to increase their power and freedom, if not actually to overthrow the male supremacy deeply encoded in most religious traditions. The historical record reveals that fundamentalist regimes, from Puritan Massachusetts to Afghanistan under the Taliban, have imposed severe restrictions on women,

indicating that the feminist potential of religious fundamentalism is limited in practice.

As religion has aided antifeminist appeals to tradition, science and social science have provided more modern justifications for the subjection of women. Scientific antifeminism begins and ends with the assertion that “biology is destiny.” Charles Darwin (1809–1882), the pioneer of evolutionary theory, believed that the female’s primary role and the focus of her evolutionary adaptations was reproduction. The influential nineteenth-century social philosopher and social scientist Herbert Spencer (1820–1903) held an even dimmer view of women’s evolution, asserting that women had not taken part of the final step in human development, the acquisition of the ability to reason. Other scientists and pseudoscientists measured brain size, head bumps, musculature, and other characteristics to delineate women’s supposed inferiority.

The belief that women had primarily (if not exclusively) evolved for reproduction was used to caution against their education and participation in almost all activities not directly connected to procreation and nurture. In this view, women who pursued other avenues were going against their nature, risking serious illness and damage to their reproductive capacity. At a time when “race suicide” anxiety was common among Northern and Western Europeans and the colonial project was underway, antifeminists depicted women’s neglect of their reproductive nature as a selfish betrayal of their race and nation. The common diagnoses of “hysteria” given to a variety of mental, emotional, and physical symptoms drew on this analysis in that the “disease” was confined to women’s child-bearing years and was often portrayed as a product of women’s inferior, childlike nature. Sigmund Freud (1856–1939), the founder of psychology, extended the (pseudo)scientific discourse on female inferiority by positing a phallogocentric view of human nature. These versions of scientific antifeminism have fallen from favor, although echoes of them can still be discerned in discussions of gender difference. More common early in the twenty-first century are utilitarian social science arguments, offering anecdotal and statistical evidence that women who choose not to be wives and mothers are unhappy, that the children of working mothers are damaged, and that society suffers when women pursue any path but motherhood. Intellectual antifeminism in academia ranges from wholesale dismissal of feminist work to less obvious discrimination in publishing and career advancement.

Antifeminism, Patriarchy, Reproduction, and Sexuality

Feminists and antifeminists have staked claims to a range of positions on sexuality and reproduction. It is important to begin with the observation that control of female reproductive labor was the historic object of the establishment of patriarchal forms of male superiority around the globe. In the vast majority of societies, feminism has targeted some form of patriarchal relations, or their vestiges in industrial or industrializing societies. For this reason, control of female reproduction and sexuality have been major antifeminist themes and goals. Patriarchal practices as varied as patrilineal inheritance of property and female genital mutilation have been targeted by

feminists and defended by antifeminists. Early feminist activists challenged direct legal manifestations of patriarchy by agitating for married women's property laws, maternal guardianship rights, and the liberalization of divorce statutes. Feminist success, real and perceived, led to a counter "men's rights" movement in the late twentieth century, largely concerned with the divorce-related issues of alimony, child support, and paternal custody rights.

Although not directly addressing reproductive issues, the struggle for political rights and educational and vocational opportunities sought to provide women with alternatives to patriarchal dependency. In each of these cases, antifeminists claimed that the resulting reforms would render women physically and temperamentally unfit for reproduction and motherhood. In the late nineteenth century, Margaret Sanger (1883–1966) and other birth-control advocates addressed reproduction directly in their promotion of contraception as a means to increase women's autonomy. The battles over access to contraception, like the continuing conflicts over abortion rights, divided women's rights advocates to some degree. At base, contraception and abortion are about control of reproduction, but a complex mélange of issues including religion, freedom of speech, medical authority, and female sexual pleasure have shaped the debates.

In these and other contexts, the antifeminist depictions of female sexuality have been multifaceted. Early feminists were often said to be *unsexed*. The exact meaning of this term varies greatly, but it was never used in a positive manner. The related concept of the "masculine woman" is clearer and equally negative in intent. The rhetoric associating feminists with lesbians—accurately and inaccurately—has been a mainstay of antifeminism. This trope has long coexisted with other conflicting stereotypes of feminists as antisex prudes and free-loving (heterosexual) libertines. Although all three have been present throughout the history of antifeminism, their relative popularity has gone through cycles. Perhaps due to the influence of Wollstonecraft, the depiction of feminism as a gateway to sexual license enjoyed an early popularity, but most feminists of the late nineteenth and early twentieth centuries actively espoused respectability. This, in concert with their involvement in the temperance movement and campaigns for social purity, inspired caricatures of feminists as antisexual. The emergence of the "New Woman" and the flapper ideals in the early twentieth century brought back complaints about the loose (heterosexual and homosexual) morals of feminists. The visibility of lesbians in the women's liberation movements of the 1970s inspired new attacks on feminists as sexually deviant "man-haters." In the late twentieth and early twenty-first centuries all three antifeminist tactics have been common. Prominent women with progressive politics are regularly the subjects of whispering campaigns about their homosexuality. In works such as Katie Roiphe's best-selling *The Morning After*, feminism is blamed for creating a puritanical climate of sexual fear, yet it is commonplace for religious activists to condemn feminists for "undermining" the morals of society. Leading antifeminist Phyllis Schlafly has exploited all three: equating feminism with lesbianism, blaming feminists for creating an overly sexualized culture, and taking them to task for their

work against rape and pornography. The inconsistency in the antifeminist stance on sexuality is both a reflection of the diversity of feminism and a product of political expediency.

Colonialism, Anticolonialism, and Globalization

The colonial project of the eighteenth, nineteenth, and twentieth centuries was freighted with gender ideologies. One important aspect involved attempts to remake the gender relations of the colonized peoples in the image of Western male supremacy. The diverse societies subjected to colonization had developed unique systems of gender, some more egalitarian than Western norms, some less so. An unintended consequence of the colonial project was the contradictory spread of Western feminist ideas. Just as the official policies were based on a lack of understanding of the traditions and needs of the colonized people, Western feminism betrayed a narrowness of vision and arrogance that created distrust, even among those women who were the intended beneficiaries. This distrust and these misunderstandings continue to plague relations among feminists, creating schisms that have been exploited by antifeminists.

Anticolonial movements provided new but often fleeting opportunities for feminists. In many nations, the flux of revolutionary times combined with the need for the widest possible support created revolutionary nationalist movements open to expansive roles for women, if not always feminist ideas. Women's labor and leadership were celebrated, but in a manner that reinforced traditional images of women as wives and mothers, not as revolutionaries on their own terms, and the success of nationalist movements has often brought a backlash against the feminist women who were once comrades-in-arms. In strategic appeals, former revolutionaries and other local authorities have branded feminism as a Western influence. Feminists in the developing world have increasingly rejected Western models in order to create their own ideologies that are both truer to their experiences and less vulnerable to condemnation on nationalistic and anti-Western grounds.

ANTI-SEMITISM.

This entry includes two subentries:

Overview

Islamic Anti-Semitism

OVERVIEW

Anti-Semitism is that hatred of the Jews that defines them as a threat to humankind. The most important contemporary quarrel about anti-Semitism is the issue of its very nature. While some scholars have been insisting for decades that there is no continuing phenomenon of anti-Semitism, arguing on the contrary that “Jew hatred” has reinvented itself many times, others adhere to the contrary opinion, seeing a direct line connecting pre-Christian to modern forms of anti-Semitism.

Origins

Throughout the ages, many peoples have fought one another in the hope of conquering the wealth and land of others, but the antagonists do not usually declare that the existence of their enemy is a danger to the future of all of humankind. Anti-Semitism began in the third century before the beginning of the Christian era. It was defined by Manetho (3rd century B.C.E.), an Egyptian priest who had been substantially influenced by Hellenistic culture. Manetho asserted that the Jews are the enemies of the human race and that it is necessary to remove the Jews from human society. Indeed, a line may be drawn straight from this pre-Christian anti-Semitism of Manetho through the Christian anti-Semitism of ancient and medieval times, to the modern era, when the hatred of Jews was redefined but not essentially changed by secular ideologies.

Manetho's main contention, an obvious rebuttal to the biblical account of the exodus of the Jews from Egypt, is that the Jews did not leave Egypt as the victors in a revolt against the pharaoh who oppressed them. On the contrary, the Jews were expelled from Egypt because they were lepers and, on the side, engaged in nefarious and destructive acts. The Egyptians threw them out into the desert because the Jews endangered the existing civilization of Egypt. They were, in fact, a threat to all

other civilizations, as well. The Jews were therefore not like the Hittites, a powerful enemy with whom the Egyptians kept fighting but who were never regarded as a unique and fundamental threat to society. According to Manetho, the Jews ought to be expelled into the desert or quarantined wherever they appeared or, if these means failed, society as a whole had the right to defend itself by destroying the Jews. Thus, Manetho's “Jew hatred” was not a simple justification of a violent and vehement conflict.

There is a fundamental parallel between some anti-Semitic assessments of the Jews and the angriest descriptions in the Bible of the dangers posed by idolatry. This competing faith must be totally isolated and the idol worshippers must be walled off from the Jewish society, or utterly destroyed. So, in earliest times, the enemies of the Jews had no monopoly on the idea that a competing faith or way of life might be defined as so dangerous as not to merit the right to survive.

The Roman Empire

The basic “Jew hatred” as defined by Manetho was expanded by a number of Greek or Roman writers, historians, and statesmen. To be sure, not all Hellenistic literature in its two languages, Greek and Latin, was dominated by anti-Semitism. Some writers admired the steadfastness of the Jews and their continuing search for righteousness and social justice—but the majority of the Hellenistic creative forces were arrayed against the Jews.

Within a century or so, the issues came to a head over the large number of Gentiles who became converts, or who wanted to become converts, to Judaism. The Pharisees insisted that all converts to Judaism were joining “a new and godly commonwealth” (Baron, 1983, vol. 1, p. 181). This definition offered by Philo Judaeus (c. 13 B.C.E.—between 45 and 50 C.E.), the leading Jewish intellectual figure of the first century B.C.E., was accepted to mean that a new convert was classified as a child who was now newly born as a Jew. This conversion meant that he disavowed his previous family, for according to Philo, such proselytes “have left their country, their kinfolk and their friends and their relations for sacred virtue and holiness” (Baron, 1983, vol. 1, p. 181). A generation later Cornelius Tacitus (c. 56–c. 120 C.E.) made the same point but he expressed it in the language of a pronounced distemper with the Jews. Once they became converts to Judaism, they “despised the gods, disowned their own country and regard their parents, children and brothers as of little account” (Baron, 1983, vol. 5, p. 182). As the Jews became more numerous and more powerful throughout the Roman Empire, Tacitus considered the Jews as subversive because they were the enemies of the three main pillars of society: religion, country, and family (Baron, 1983, vol. 5, p. 194).

In this outlook Tacitus was following the Stoic philosopher Lucius Annaeus Seneca (14 B.C.E.–65 C.E.): “The customs of that most criminal nation have gained such strength that they are now received in all lands. The conquered have given laws to the conquerors” (Baron, 1983, vol. 5, p. 191; quoted from *De superstitione* by Augustine in his *City of God*, 6:11). The same point had been argued by Marcus Tullius Cicero

(106–43 B.C.E.), the supreme orator of Rome, a generation earlier:

Even while Jerusalem was standing and the Jews were at peace with us, the practice of their sacred rites was at variance with the glory of our empire, the dignity of our name, the customs of our ancestors. But now it is even more so, when that nation by its armed resistance has shown what it thinks of our rule. (Baron, 1983, vol. 5, p. 192: quoting Cicero's defense in *Pro Flacco*, 28:69)

But the best summary of the anti-Semitism that recurs in major Hellenistic figures is present in the Book of Esther, the biblical account of the victory of the Jews over Haman, their archenemy in the Persian Court. This book was probably composed in the third century B.C.E. or perhaps even a bit later. Haman's arguments against the Jews are addressed to King Ahasuerus:

"There is a certain people, scattered and dispersed among the other peoples in all the provinces of your realm, whose laws are different from those of any other people and who do not obey the king's laws; and it is not in Your Majesty's interest to tolerate them. If it please Your Majesty, let an edict be drawn for their destruction, and I will pay ten thousand talents of silver to the stewards for deposit in the royal treasury." Thereupon the king removed his signet ring from his hand and gave it to Haman son of Hammedatha the Agagite, the foe of the Jews. (Esther 3:8–10)

In these brief verses the essential, classic doctrine of anti-Semitism is summarized: the Jews are different from everybody else; their very existence is an assault on the accepted standards of religion and good conduct. It would be best for the Persian Empire if the Jews were utterly removed. Anti-Semitism has now been defined as the doctrine by which all of the rest of human society can defend itself against the arrogance of Jewish monotheism.

Nonetheless, the question remained very much alive in the consciousness of the Roman Empire in the first century: What is one to do with the Jews? Clearly they would not obey the laws that Rome imposed on all of its own people. Jews refused to participate in civic celebrations because these invariably required worship of the gods and especially of the Roman emperors as gods. The Roman rulers in Alexandria, and even more in Judea, made allowances for the peculiar stubbornness of the Jews, but there were recurring clashes between Jews and the Roman authorities. These issues could not be resolved through negotiation between Jews and imperial officials. On the contrary, the Jews themselves had to find room for living in the larger society. So their traditions had to be changed.

By the middle of the second century after the suppression of the last great Jewish revolt under Bar Kokhba (131–135), the leading rabbis no longer expected a restoration of the Temple in Jerusalem and of Jewish sovereignty in the Holy Land. They made peace with the notion that the Messiah

would come at some future date and redeem the Jews from exile and powerlessness, but the date was unknown and unpredictable. The Jews had to make peace with the notion that they would live as a minority among other religions.

The capital of Palestine was de facto in Caesarea, the port city from which the Roman Empire controlled all of its various subjects in Palestine. Rabbinic Judaism also had its headquarters in Caesarea, where the court of its religious leadership, headed by the descendants of Hillel, was situated. The leader in the last years of the first century and the beginning years of the second century C.E. was Rabban Gamaliel II. He regularly made use of the public bathhouse in Acre, even though entering that building required that he walk under an arch that was adorned at its apex by an image of the goddess Aphrodite. Gamaliel's critics regarded his use of the bathhouse as a form of worship of the pagan goddess. He responded that, of course, he intended no such conduct. The image of the goddess served a purely civic function at the entrance of the bathhouse, which was a facility that belonged equally to all the citizens of the region, including Jews.

Rabban Gamaliel II defended his conduct as religiously neutral, but soon those who defined rabbinic law went further. Later rabbis ruled that Jews were commanded to visit the sick even among the idolaters, to bury their dead together with the Jewish dead, and to support their poor among the Jewish poor. In the Middle Ages, these rabbinic rules were summarized by Moses Ben Maimon (Maimonides; 1135–1204) in his *Code of Jewish Law*, in the section on political law in what is written in the *Hilkhot Melakhim* (10:12). All of this was to be done "for the sake of peace" because it was written in Scripture that "God is good to everyone and His mercy extended to all of His creatures." It was said further that "its ways [that is, the ways of Torah] are the ways of grace and all its paths are peace." To be sure, these are not the only rabbinic opinions. There are many counterviews in the Talmud that Jews must maintain distance from non-Jews, but the more giving rulings suggest that Jews were looking for ways of accommodating themselves to a society that they had little hope of controlling or of converting to the Jewish faith.

Nonetheless, despite the rulings of the more liberal rabbis, the distance between Jews and non-Jews remained. These descendants of the Pharisees could never give up the notion that their religion was God's true teaching and that, at some unpredictable moment, the whole world would come to Mount Zion to be received and converted to the one true faith, the monotheism that Abraham had once proclaimed.

Christianity and Anti-Semitism

How could the Jewish religion be redefined so that it became a possible and even quickly accessible faith for all of humankind? The answer was devised by the first two or three generations of those who had adhered to the person and teaching of an itinerant Jewish preacher, Jesus of Nazareth. Despite centuries of thought and scholarly research, what Jesus himself believed is still not clear. The weight of the evidence is that Jesus regarded himself as a Jew who had come to wrest the leadership of his people from the priests who dominated

in the affairs of the Temple and the Pharisees who had seized the initiative in defining the laws by which Jews were urged to live. In a few decades after his crucifixion, the religious leadership passed to a much more radical Jewish thinker, Saul of Tarsus (St. Paul; d. between 62 and 68 C.E.), who opened Judaism to all the non-Jews of the world without requiring that they accept the rituals and all the many restrictions that the rabbis had defined.

In its very beginnings Christianity could not choose the path that had been suggested by Manetho and elaborated by the pagan Hellenists, that Jews were by their very nature beyond redemption. On the contrary, Saul of Tarsus asserted in Romans 9 that Christianity was a shoot grafted on to the tree of Jesse, that is, that Christianity was the true offshoot of Judaism—if only the Jews would accept the truth of their religion as it was now being expounded by those of them who had become Christian believers.

Even more fundamentally, Christianity could not present itself as a universal religion that was setting out to convert the whole world. It demanded only that those who joined it should include themselves in the transforming faith in Jesus, who had died for sins of humankind. How could anyone be excluded from this transforming faith and the salvation that it offered each individual? And yet, as the church fathers saw with bitter dismay, the Jews did not behave according to the Christian theological plan. Jesus had been born among them, but the Jews were obdurate. Their majority refused to accept the truth that appeared among them. To the church fathers, it was unthinkable that the divine message was unclear or, worse still, that the Jews understood the message but rejected it.

By the middle of the second century, church fathers such as Saint Justin (Justin Martyr, c. 100–c. 165), writing in Greek, and half a century later, Tertullian (c. 155 or 160–after 220 C.E.), writing in Latin, were critical of the Jews for not having accepted Christ. Within a hundred years, especially after Emperor Constantine (ruled 306–337) proclaimed Christianity the state religion of Rome, later church fathers were offering an explanation for the obduracy of the Jews: they were too strongly in the grip of Satan, who had commandeered the synagogues and instructed the rabbis; the Jews could not see the truth of Christianity because they were now led by the enemy of God, the supreme anti-Christ. They were referred to as the “Synagogue of Satan” in *Revelations* 2:9 and 3:9. Two things could be done: Jews could be persecuted as the enemies of truth or the effort to convert them could be redoubled, over and over again, to persuade them to abandon their wrong-headedness. In this very early Christian explanation that the Jews were now “the synagogue of Satan” their otherness was explained, and the path was prepared that could lead to pronouncing the Jews to be totally dangerous to the rest of humankind—and all of this on the basis of Christian theology. Manetho had decided that the Jews were dangerous to the health of humankind because they were lepers; the earliest church fathers defined a different metaphor—the Jews were a threat to the souls of men and women because they were Satan’s disciples in leading them away from divine truth. Thus,

the Christian relationship to Jews was defined as a paradox: the culmination of the triumph of the new faith would be in its conversion of the Jews, but the tasks of achieving this glorious time would be enormously difficult, because it involved direct war with Satan himself.

Early Christianity found a compromise between the two alternatives—that the Jews had to survive until they accepted Jesus and that they were by their very nature the hopelessly wicked “synagogue of Satan”—by asserting both alternatives: the Jews could not be totally obliterated, for there would be no one left to represent them at the end of days when they would finally accept the Christian truth, but society had to be defended against the Jews or it would be hopelessly corrupted. Further elucidations of this basic paradox included the permission to keep Jews alive by allowing them to perform pariah tasks that were forbidden to Christians, such as lending money at interest, but the notion that those who had condemned Christ deserved the most severe punishment was never abandoned.

Since living Jews were the enemies of truth, they could be blamed for everything that went wrong in society. So, early in the fifteenth century, when Europe was swept by the Black Plague, which killed perhaps a quarter of the population, it seemed self-evident that this scourge was brought on the Christian majority by the small Jewish minority, which was full of hate and anger. It also seemed self-evident that the possessions of the Jews had been acquired by deception and by stealing from the Christians. It was, therefore, logical and even lawful to treat them like a kind of sponge; whatever possessions they had could be confiscated by the ruling power. In the course of the Middle Ages, there was hardly a place in Europe that had not expelled the Jews and forced them to leave without any resources with which to live. Nonetheless, the myth remained that in the divine plan Jews or at least some of them needed to be kept alive so their acceptance of the true Christianity would be the dramatic act that would point to the end of days. Some historians call this medieval version of hatred of Jews “anti-Judaism” rather than “anti-Semitism.” It was only late in the Middle Ages that Christian anti-Semitism came close to completing its ideological journey by asserting that the Jews were hopelessly dangerous always, even after they might convert to Christianity.

Conversos

The largest Jewish community in Europe in the fourteenth and fifteenth centuries existed on the Iberian Peninsula, the southern half of which was then controlled and ruled by Muslim states and the central and northern half by Christians. Jews were a significant minority in both these regions of Spain. They were especially important to the Christians who wanted to force them to convert and thus strengthen the Christian majority in the region. At the end of the fourteenth century, the Christians did succeed in forcing Jews to convert by the tens of thousands. In a century or so, the number of such converts grew until the climax in 1492, when the combined kingdom of Aragon and Castile, under the joint rule of Ferdinand and Isabella, confronted the Jews with a stark choice: either convert to Christianity or leave the land of their Christian

majesties. A quarter million Jews then still remained in all the lands of Christian Spain; the larger half accepted conversion, and the rest left, hoping to find some refuge in places where Jews were allowed to live openly, or semiopenly, as Jews.

There were many forces that led to this decree of conversion or expulsion, but the economic motive was dominant. Many of the Jews in Spain had made their way into the middle class and even beyond, so their Christian competitors presumed that the increasingly prominent Jewish role in Iberian commerce could be ended by forcing them to become Christians. The Jews would redistribute themselves in such fashion that they would no longer be dominant in trade and commerce. None of this happened. On the contrary, the “new Christians” used their new privileges to become not only more major figures in banking and the ownership of land; they also intermarried, quite rapidly, with high figures in the nobility and rose to predominant positions in the state, the army, and even in the Church. Some Jews thought it would be safer to move to the Spanish colonies in the New World. In the middle of the seventeenth century, Spain had developed its rule in South America through the viceroyalty of Lima in Peru. At one moment in those years the viceroy and the archbishop were both descendants, at least in part, of “new Christians,” and so, Lima was known mockingly as *La Juderia*. The Inquisition redoubled its efforts in Peru and Mexico, the main centers of Spanish rule, to suppress Marranos (that is, new Christians who actually or supposedly practiced Judaism in secret).

But the “new Christians” remained powerful. The way had to be found to make these converts from Judaism into second-class citizens or worse. At the beginning of the fifteenth century the doctrine was invented of *Limpieza de Sangre* (purity of blood). It first became law in Toledo in 1449 and restrictions were widely adopted: those who could not prove that all four of their grandparents were “old Christians” were denied roles in government or in the Church. The taint that Jewish blood now brought with it was not different from Manetho’s insistence nearly two thousand years earlier that Jews were lepers and thus infectious beings. Anti-Semitism had changed on the surface, but its basic thrust had remained the same. The Jews are a lasting danger to the majority.

Modern Anti-Semitism

The major shift in the definition of anti-Semitism occurred in the eighteenth and nineteenth centuries, when Christianity was largely pushed aside among educated Europeans by the doctrines of the Enlightenment. The dominant cliché since the eighteenth century has been that the Enlightenment ushered in the age of equality of all religions and ethnic identities. This is largely true, but the most ideological wing of the Enlightenment asserted its own version of *Limpieza de Sangre*. The dominant figure in European letters in the second half of the eighteenth century was Voltaire (1694–1778). He paid some lip service to the notion that all people could be perfected including perhaps even the hardest case of all, some Jews, but his basic position was that the Jews were born with fanaticism in their hearts as Bretons were born with blond hair. It was not strange for Voltaire to assert such a view because he had

Le Petit Journal illustration of Alfred Dreyfus being stripped of his rank (1895). Dreyfus, a French army captain of Jewish descent, was accused of selling military secrets to the Germans. He was not exonerated and released from incarceration until 1906. © LEONARD DE SELVA/CORBIS

himself defined negroes as not human beings; they were an intermediate stage between humans and monkeys. Voltaire and those who followed after him, such as Paul-Henri-Dietrich d’Holbach (1723–1789) and, to some degree, Denis Diderot (1713–1784), thus solved the problem of what to do about the Jews by declaring it to be a question of how to defend the bulk of humanity against a dangerous infection that was carried by people who looked human but really were alien.

This notion appeared during the debates of the era of the French Revolution in the writings and decisions of the most radical Jacobins who asserted, both in Paris and in eastern France, that giving the Jews equality was simply to make it more possible for them to realize their nefarious plots under more respectable cover. In the next half century or so, after the revolutionary era, some of the greatest figures of the European left (such as Pierre-Joseph Proudhon, Charles Fourier, and even Karl Marx) argued, often quoting Voltaire, that the Jews were a danger and that the Jews themselves had to be saved from their Jewish identity for their own sake and for the sake of humankind.

This doctrine of many of the radical Enlightenment thinkers was appropriated by the nationalists who took over European literature and political thought in the middle years of the nineteenth century. Their image of a nation was that it represented the purity of an older culture, and therefore, aliens who had not shared in that history had no role. Jews were certainly viewed as aliens from Asia who did not belong within any of the European nations. With variations, this doctrine became part of the thinking of the pan-Germans and the pan-Slavs, and of other European nationalists.

Toward the end of the nineteenth century at least three versions of anti-Semitism were very virulent in Europe. In tsarist Russia where some six million Jews, at least half of those in the world at the time, lived, the dominant form of anti-Semitism was based on many centuries of Christian hatred. In the last fifty years of its existence, the absolute rule of the tsars found it useful to deflect the angers of the poor by blaming the Jews as the source of all the troubles in Russia. In 1881–1882, pogroms swept through the realm and a mass migration of Jews fled the kingdom. Most of these refugees went west to America, but some were the first founders of the new Zionist settlement in Palestine. But even in tsarist Russia, where the ruling class and especially the tsars themselves were believing Christians of the old school, other, more modern forms of anti-Semitism contributed to the persecution of the Jews. Many of the archenemies of the tsarist regime nonetheless blamed the Jews. The new revolutionaries saw the uprising of the poor against the Jews as a movement to be supported because the Jews—so the revolutionaries argued—were the capitalist

oppressors of the poor of Russia. By the last decades of the nineteenth century, pan-Slavism was also gaining strength and importance in eastern Europe and especially in Russia. The essential doctrine of this movement was that the Slavs had been chosen by history, and probably by God himself, to be the superior people of all of humankind. Obviously, the ancient Jewish claim to closeness had long been nullified, and those who would maintain this claim were troublemakers, or worse.

These various assaults on the Jews were given prominence, and special bitterness, in the last years of the century by the appearance of the book *The Protocols of the Elders of Zion*. This book was, of course, a forgery that was concocted by agents of the tsarist secret police probably working in Paris, which was then the intellectual capital of Europe. In the *Protocols* all the forms of anti-Semitism were combined: Jewish capitalists and Jewish revolutionaries were actually engaged—so the authors of the *Protocols* maintained—in a joint endeavor to undermine the civilization and culture of the European majority. The capitalist, Lord Rothschild, and the socialist Jews, who were trying to assassinate the tsar, pretended to hate each other, but this was not the truth. They were really partners in the immemorial Jewish enterprise, to undermine society in order to control it. The ultimate battle in the world was between those who would defend the majority culture and their immemorial enemies, the Jews. The *Protocols* have been repeatedly discredited as a fantasy, but this book has been reprinted in a variety of languages and continues to be read and believed by anti-Semites all over the world, including the newest recruits to the “great hatred” in the Muslim world and in Japan.

The essence of post-Christian anti-Semitism was a restatement of pre-Christian Hellenistic Jew hatred. In the middle of the eighteenth century, a second-level scholar and leader of the Enlightenment in France, the Count Jean-Baptiste de Mirabaud, had published a book of citations from Greek and Latin authors (*Opinion des anciens sur les Juifs*, 1769) in which the Jews were denounced as alien to European society and a danger to its future. This theme was carried forward in the next century and the one thereafter, to naturalize anti-Semitism in the rhetoric of both pre-Christian and post-Christian times. To be sure these attacks also derived some nourishment from Christian theology but this was not the essence of modern anti-Semitism. It was not necessary to denounce the Jews as Christ-killers; the charge of leprosy in various permutations was more than enough.

Nazi Anti-Semitism

The heyday of anti-Semitism, its ultimate climax, came with the rise of Nazism. Adolf Hitler and those who followed him were certain that they were engaged in a great and unavoidable task, the defense of European civilization against all forms of subversion by the Jews. Hitler's ultimate vision of the world was that it was poised on the verge of an ultimate war in which the Jews had to be destroyed. There was no longer any pretense that some Jews might be redeemable: this was now a war to the death. The results are well known. The overwhelming majority of the Jewish population of Europe, to the number of six million men, women, and children, were systematically murdered. The rest were saved only because Hitler and his allies lost the war. Nonetheless, the Nazis did not entirely lose their fierce war with the Jews.

The assault in the 1940s destroyed the most creative elements of the world Jewish community in the middle of the twentieth century. It changed the face of Europe, which was no longer a main center of Jewish life and creativity. More subtly, the emphasis within Jewish life has for the last half century been more on fighting off the attempt to destroy the Jews than it has centered on recreating the religious and cultural values that were destroyed. In the early twenty-first century those concerns were only beginning to be at the center of Jewish endeavors. Thus, Hitler's greatest success was to make of the Jews a people much more frightened for its future than it had been in the previous century.

After the victory in 1945 in World War II, Jews—and people of good will everywhere—thought that anti-Semitism would fade away. But anti-Semitism has not disappeared and in some parts of the world it is even more powerful than ever before. Society as a whole has not yet accepted the idea that those who will not play by its conventional rules are nonetheless entitled to a life of freedom and dignity. The question that was posed more than three thousand years ago, whether the Jews had a right to survive in a society that did not agree with the premises on which much of Jewish religion and culture is based, is still very much open. Will the societies that remember their pasts as Christians and Muslims make room for Jews? We cannot yet be sure.

ISLAMIC ANTI-SEMITISM

Anti-Semitism became in the late twentieth century an integral part of Islamic and, particularly, Arab cultural discourse. Like other modern intellectual and political movements, such as nationalism, socialism, and fascism, anti-Semitism is a European import of fairly recent vintage into the Muslim world.

Traditional Islamic Attitudes

As in the case of Christianity, fundamental Islamic attitudes toward Jews and Judaism go back to the historical circumstances surrounding the founding of the new faith and are sanctioned by scripture and tradition. Jews figure into traditional Islam's theological worldview, and Jews lived as a subject population under Muslim rule, sometimes under better, sometimes under worse conditions. However, because Islam did not begin as a sect within Judaism or claim to be *verus* Israel (or the "true" Israel), as did Christianity, the Koran and later theological writings (with the exception of the Sira, or canonical biography of the Prophet Muhammad) do not exhibit anything comparable to the overwhelming preoccupation with the Jews that one finds in the New Testament, patristic literature, and later Christian theological writings.

Traditional Islamic thought had its own store of negative stereotypes of Jews. According to the Koran (Sura 2:61), "wretchedness and baseness were stamped upon them, and they were visited with wrath from Allah." The Koran, exegetical,

Edition of *Mein Kampf* translated into Arabic. In the late nineteenth century, anti-Semitic tracts and books began to appear, many of which were translations of existing works. and hagiographic literature brand the Jews of Medina as having been the principal opponents of the Prophet along with the idolaters and as a treacherous lot. But they were also people who had received a genuine divine revelation, like the Christians and Zoroastrians, and like the latter deserved tolerance as long as they accepted the status of humble tributary *dhimmis* ("protected peoples"). Though the image of Jews was on the whole even more negative and condescending than that of Christians, they shared the same legal status within the traditional Islamic social system, and throughout most of the fourteen hundred years of Islamic history were rarely singled out for greater discrimination than other non-Muslims. The relatively rare instances of specifically anti-Jewish violence often occurred when a Jew was perceived to have egregiously transgressed the boundaries of proper conduct by rising too high in the bureaucracy. Anti-Jewish rioting only became a more frequent phenomenon in the twentieth century in the Arab parts of the Muslim world with the anti-Jewish sentiments generated by Zionism and European colonialism.

Introduction of European Anti-Semitic Ideas in the Nineteenth Century

Modern anti-Semitic ideas made their first appearance in the Middle East among the Arabic-speaking Christians of Syria, who maintained commercial, educational, and cultural ties with the European nations making ever stronger inroads into the region during the nineteenth century. French merchants and missionaries seem to have played a principal role in this process. The classic European notion of the blood libel gained widespread circulation in the Levant after the notorious Damascus Affair of 1840 when the French consul, Count Benoît Ulysse de Ratti-Menton, accused the Damascene Jewish community of having kidnapped and murdered a Capuchin friar for the Passover ritual. The case became an international cause célèbre, and for several months Ratti-Menton received support

from the local Muslim authorities. The memory of the Damascus Affair was preserved by local Christians, but for a long time thereafter, anti-Semitic ideas, whether of the medieval or modern, post-Enlightenment varieties, made little or no headway among the vast majority of Arab and non-Arab Muslims. Anti-Semitic articles appeared occasionally in the late-nineteenth-century Syrian and Egyptian Arabic press in which Christians were prominent. Arabic anti-Semitic books and pamphlets also made their appearance at this time. Again, these were mainly by Christian authors and were frequently translations or adaptations of European works such as August Rohling's *The Talmudic Jew*, which was published in Egypt in 1899 under the title *al-Kanz al-Marsud fi Qawā'id al-Talmud* (The guarded treasure of the principles of the Talmud). These early works laid the foundations for a very extensive literature in the twentieth century when the attitudes of the Muslim majority toward Jews became radically altered. Rohling's *The Talmudic Jew* has enjoyed enduring popularity in Arabic, has been reprinted a number of times, and has inspired numerous other books, as for example, Muhammad abri's *al-Talmud: Shari'at al-Yahud* (The Talmud: The religious law of the Jews).

Evolution of Islamic Anti-Semitism in the Twentieth Century

The Axis gained widespread sympathy in the Islamic world during the 1930s and 1940s because they were the enemies of the Western colonial powers and Western democratic values. Turkish, Arab, and Iranian nationalists admired German militarism. Nazi and Fascist propaganda helped familiarize educated Muslims with the vocabulary of modern anti-Semitism. *Mein Kampf* appeared in an Arabic translation in 1935 with its anti-Arab statements expunged. However, most of the Arabic literature that imitates Nazi Jew-baiting tracts dates from the postwar period.

No work has had a more profound impact upon modern Muslim anti-Semitism than the *Protocols of the Elders of Zion*, written in Paris at the end of the nineteenth century for the tsarist secret police and allegedly the secret minutes of a Jewish conspiracy for world domination. Although it was already being cited by Arab nationalists in Iraq and Palestine in the early 1920s, the complete text first appeared in Cairo in 1925 as *Mu'amarat al-yahudiyya 'ala'l-Shu'ub* (The Jewish conspiracy against the nations), translated by Antun Yamin, a Lebanese Maronite. This was the first of a long line of Arabic editions and translations, and the book has been a continual bestseller throughout the entire Arab and Muslim world. The *Protocols* have been quoted, praised, and recommended by politicians, academics, and religious leaders. The principal idea of the *Protocols* about an international Zionist-Jewish conspiracy is repeated in everything from television series to religious literature and has become a fundamental tenet of the Islamic fundamentalist worldview, both Sunni and Shiite. Ayatollah Khomeini, for example, writes in his *Vilayet-i Faqih: Hukumat-i Islami* (1971; The trusteeship of the jurisconsult: Islamic governance) that the true aim of the Jews "is to establish a world Jewish government." This and other notions from the *Protocols* may be found in the writings of Moroccan Islamist Sheikh Abdessalam Yassine, the Tunisian theologian Rached

Ghannouchi, and in the publications of the Muslim Brotherhood, Hamas, Hizbollah, al-Jama'at al-Islamiyya, and Al Qaeda.

Contemporary Islamists cite proof texts from the Koran and hadith to corroborate the *Protocols*. The widely disseminated writings of the Egyptian philosopher Sayyid Qub probably played an influential role in the spread of this harmonization of the *Protocols* and Islamic traditional texts.

The numerous humiliating defeats of Arab armies at the hands of tiny Israel, the strong relationship between the Jewish State and the United States, and the general social, technological, and political weakness of the Islamic world as a whole, despite the great oil wealth of some Islamic nations, have all contributed to the credence given by many Muslims to the notion of the invisible hand of a Zionist-Jewish cabal as depicted in the *Protocols*.

Though less a general belief among contemporary Muslims than the Jewish conspiracy for world domination, the blood libel has come to have wide circulation in the late twentieth and early twenty-first centuries, especially in the Arab world. Even ostensibly scholarly treatments of Judaism such as 'Ala 'Abd al-Wahid Wafi's *al-Yahudiyya wa'l-Yahud* (1970; Judaism and the Jews) and Hasan Zaza in his *al-Fikr al-Dini al-Isra'ili: At-waruhu wa Madhabihuhu* (1971; Israelite religious thought: Its phases and schools) present the blood libel as fact. Zaza devotes a learned discussion to the blood libel observing that such a practice is forbidden by Jewish law, but then notes that the accusation has followed the Jews throughout history, that people often act contrarily to their religious teachings, and finally cites the confessions of one of the accused murderers in the Damascus Affair as proof of the veracity of charge. Blood libel stories appear from time to time in the mainstream Arabic press as both features and news items. Syrian defense minister Mustafa Tlas has written one of the best selling books promoting the blood libel, *Fatir Sahyun* (The matzah of Zion). The book went into eight editions between 1983 and 2002, with the last alone selling over twenty thousand copies. As with the conspiracy of the *Protocols*, blood libel stories have been featured in Arabic television dramatizations during the nights of Ramadan in 2003.

APARTHEID. *Apartheid*, an Afrikaans word meaning "apartness," describes an ideology of racial segregation that served as the basis for white domination of the South African state from 1948 to 1994. Apartheid represented the codification of the racial segregation that had been practiced in South Africa from the time of the Cape Colony's founding by the Dutch East India Company in 1652. Its emergence in 1948 was antithetical to the decolonization process begun in sub-Saharan Africa after World War II. Widely perceived internationally as one of the most abhorrent human rights issues from the 1970s to the 1990s, apartheid conjured up images of white privilege and black marginalization implemented by a police state that strictly enforced black subordination.

Historical Background

The Dutch East India Company occupied the Cape Colony uninterruptedly from 1652 until the British takeover in 1795. The company's conflict with the indigenous Khoisan was exacerbated by its granting of farmland to company members who had completed their term of service. The Khoisan, who became indentured servants, were landless by the time of the British occupation. Slaves were imported from Asia and elsewhere in Africa throughout the eighteenth century. Briefly restored to Dutch rule in 1803, the colony was again brought under British control in 1806. Two events to which Dutch settlers reacted negatively were the British abolition of the slave trade in 1806 and of slavery in 1833. The latter precipitated the Great Trek, in which many Dutch (Afrikaner) farmers migrated outside the Cape Colony.

A "mineral revolution," financed by British capital, began in South Africa with the discovery of diamonds in Kimberley in 1868 and gold in Johannesburg in 1886. Later the British victory in the Boer War (1899–1902) brought the Transvaal and the Orange Free State under British rule. Natal was already a British colony. Collectively the four colonies formed the Union of South Africa in 1910.

Afrikaners, who suffered military defeat in the war, displayed intense anti-British sentiment as many of their farms were destroyed and their wives and children placed in concentration camps, resulting in a high mortality rate. Their efforts to increase their population contributed to proletarianization, precipitating their migration to cities for employment. They often became squatters alongside poor blacks. In 1928–1932 the Carnegie Corporation conducted a study of the "poor white problem" and made recommendations for improving the status of working-class Afrikaners. During that period, Afrikaans, a Dutch variant, became a written language. Members of the emerging Afrikaner bourgeoisie opened the first Afrikaner bank and insurance company.

Rise of Afrikaner Nationalism

After the Boer War, two Afrikaner generals, Jan Smuts and Louis Botha, sought conciliation with the British in forming the South African Party. Supporters also included enfranchised blacks. The South African Party defeated the Unionist Party in the 1910 elections. Cognizant of eroding political rights, members of the black educated elite formed the South African Native National Congress (later the African National Congress) in 1912. Racist legislation enacted during this period of "fusion" included the

1913 Land Act, which prohibited a type of sharecropping called farming-on-the-half, in which black sharecroppers negotiated with white farmers to farm part of the latter’s land. Furthermore, blacks could not own land outside of designated areas.

Another Afrikaner general, J. B. M. Hertzog, led dissidents against a South African alliance with the British in World War I. A schism developed between Smuts and Hertzog over South African involvement in World War II, signaling the end of fusion. It was then that Hertzog advocated a South African republic outside the British Commonwealth. Further racist legislation included:

The Urban Areas Act of 1923, which legislated urban racial segregation, discouraging blacks from becoming town-rooted.

The Industrial Reconciliation Act of 1926, which introduced job protections for poor whites.

The 1936 Land Act, which reinforced the 1913 Land Act and designated homelands as areas for African land ownership.

A 1936 decree that struck Africans in the Cape Province from the common voters’ roll.

The historian T. Dunbar Moodie has suggested that Afrikaner nationalism was a civil religion representing the integration of key symbolic elements. These include major events in Afrikaner history, the Afrikaans language, and Dutch Calvinism. From Moodie’s perspective, Afrikaners viewed their history in terms of a repeating suffering-and-death cycle at the hands of the British through major events such as the Great Trek and the Boer War. The Broederbond, a secret society composed of Afrikaner professionals, formed the Federation of Afrikaner Cultural Organizations (FAK), affiliating cultural and language associations as well as church councils, youth groups, and scientific study circles in 1929.

When the National Party came to power in 1948, many laws were passed to segregate the population, one of which banned blacks and Indians from using the same public facilities as whites. © IAN BERRY/MAGNUM PHOTOS

Black Resistance

Black activism increased after World War II in South Africa as elsewhere in Africa. When A. B. Xuma became president-general of the African National Congress (ANC) in 1940, he attempted to unify the organization ideologically, regulate its finances, and conduct a propaganda campaign. A major schism developed when Xuma and a few middle-class members advocated negotiation through African representative bodies, while more militant members leaned toward the Communist Party and more assertive political activism.

In the mid-1940s a group of young professionals, including Nelson Mandela and Robert Sobukwe, banded together to form the ANC Youth League. They made overtures to Coloured and Indian political organizations in their call for majority rule. Coloureds were descendants of “miscegenation” that occurred in the Cape after the Dutch East India Company’s occupation. Indians were recruited as indentured servants to work on Natal’s sugar plantations in the 1860s.

Apartheid Legislation

After the National Party victory in 1948, a battery of laws was enacted to strictly segregate South African society by race, ethnicity, and class. The Prohibition of Mixed Marriages Act of 1949 outlawed marriages between whites and blacks. The Population Registration Act of 1950 required that each adult South African be classified by ethnic group as follows: white (Afrikaners and English), Coloured (mixed race, Asian [mostly Indian]), and African (Xhosa, Zulu, Ndebele, Swazi, Basotho, Batswana, Bapedi, Venda, and Tsonga). In 1951 South Africa’s “African” population was approximately 8.5 million, nearly four-fifths of the entire population.

The Group Areas Act of 1950 enforced the residential segregation of Coloureds and Indians. These groups could not use public facilities outside residential boundaries.

The Suppression of Communism Act of 1950 forced the disbandment of the South African Communist Party and a

diplomatic break with the Soviet Union. The Bantu Authorities Act of 1951 abolished the Natives Representative Council, replacing it with indirect rule. The Natives (Abolition of Passes and Coordination of Documents) Act of 1952 required the assignment of detailed reference books to all pass holders detailing their background, employment, and residential rights outside the reserves.

Parliament also passed the Bantu Education Act of 1953, providing for state control of African schools, which had mostly been founded by missionary societies, at the primary, secondary, and tertiary levels. The Ministry of Native Affairs planned a curriculum to prepare the “Bantu” (South African blacks) to occupy a servile position in South African society. Undocumented Africans were removed from urban areas to rural homelands under the provisions of the Native Resettlement Act of 1954. Cape Coloureds were removed from the common voters’ roll in the Cape Province in 1956.

When Hendrik F. Verwoerd, minister of native affairs from 1950, became prime minister in 1958, he continued to initiate apartheid legislation compatible with his views regarding “separate development.” The Promotion of Bantu Self-Government Act of 1959 provided for the creation of eight national units for African self-government supposedly reflective of African ethnic groupings. Since urban blacks had no political representation, it devolved upon chiefs to act as roving ambassadors between African subjects in the urban areas and those resident in homelands. Homelands or reserve areas represented 13.7 percent of the land.

The Bantu Homelands Act of 1970 required that all Africans be given exclusive citizenship in a homeland, disregarding place of birth and current residence. In 1972 Zululand and Bophuthatswana were granted self-governing status, while Transkei, self-governing since 1963, was given more autonomy as the model homeland. Transkei’s “independence” in 1976 was followed by Bophuthatswana in 1977, Venda in 1979, and Ciskei in 1981.

The Western Cape was declared a Coloured labor preference area in the 1950s. Indians, granted citizenship in 1963, experienced racial discrimination in residential and trading rights.

Gender Issues

Helen Suzman (1993), a long-term antiapartheid member of parliament (MP), observed that in 1953, her first year, there were actually four women in parliament. Two were fellow United Party members, and one was a member of the Liberal Party. Suzman, a liberal, dealt primarily with racial issues, although she also advocated equal rights for women regarding marriage, divorce, abortion, and employment. White women had been enfranchised in 1930 to counter the nonwhite male vote. In general racial and gender issues were not intertwined. However, in 1955 liberal white women founded the Black Sash to protest the proposed disenfranchisement of Coloured men. Members argued for respect for the South African constitution. In the 1970s the Black Sash set up “advice offices” in major cities to assist blacks with problems regarding “influx

NELSON MANDELA

Nelson Mandela. Mandela was elected South Africa's first black president in 1994 after having spent over twenty years in prison. A well-known political activist, Mandela was arrested in 1962 and charged shortly thereafter with sabotage and conspiring against the government. © DAVID TURNLEY/CORBIS

Nelson Rolihlahla Mandela, South Africa's first black president, was born on 18 July 1918, to Chief Gadla Henry Mphakanyiswa, of Thembu royalty, and Noselkeni Fanny in the Eastern Cape village of Mveso, Transkei. After his father's death when Mandela was nine, the acting tribal chief, Jongintaba, assumed Mandela's guardianship. Mandela had access to the best education a black youth could have, attending Clarksbury Boarding Institute, Healdtown College, and University College of Fort Hare. He eventually left Transkei to avoid an arranged marriage and moved to Johannesburg.

Mandela became politicized while living in Alexandra Township by attending African National Congress (ANC) and South African Communist Party (SACP) meetings. After receiving his B.A. in 1942, he entered law school at the University of Witwatersrand. His autobiography, *Long Walk to Freedom*, includes many names

famous in the antiapartheid struggle—Walter Sisulu, A. B. Xuma, George Bizos, Bram Fischer, Robert Sobukwe, Joe Slovo, Ruth First, Oliver Tambo, and Z. K. Matthews.

Viewing the ANC leadership as too conservative, Mandela in 1943 became a founding member of the ANC Youth League, which sought to motivate the leadership to action. Shocked by the National Party victory in 1948, he and other leaders of the ANC organized a "defiance campaign," employing a variety of passive-resistance tactics against apartheid legislation. Because of these activities, ANC activists were put under government surveillance, and Mandela was eventually served with a two-year banning order (1953–1955). A banning order restricted an individual to a magisterial district. He or she was expected to report regularly to the police and was under constant police surveillance. A banned individual could not be quoted in the press, could

(continued on the next page)

NELSON MANDELA

(continued from previous page)

not work, and could not meet with more than one person at a time.

Mandela and 155 other ANC leaders were arrested during the defiance campaign. In 1956 ninety-one people were accused, and sixty-one charges were dropped due to lack of evidence (Saunders; Davenport). Thirty people were tried for treason, and all but one were acquitted, including Mandela, in 1961.

After the treason trial and the banning of the ANC and PAC, Mandela went underground in the newly formed military wing of the ANC, Umkhonto we Sizwe (Spear of the Nation), as chair of the high command. This office planned sabotage, guerrilla warfare, and open revolution. Mandela based his underground operations at a farm in the Johannesburg suburb of Rivonia. Upon his return from the Pan-African Freedom Movement of East and Central Africa meeting in Ethiopia, he was arrested near Pietermaritzburg and charged with inciting a strike and leaving the country without a passport. He received a three-year prison sentence for the former charge and a two-year sentence for the latter. While in prison, he discovered that many members of the ANC high command were arrested in Rivonia in July 1963. They were charged under the Sabotage Act of 1962, with the onus being on the accused to prove their innocence. The state had requested the death penalty. The accused were given life imprisonment on 12 June 1964. International pressure had a great impact on sparing their lives. The nine-month trial ended in June 1963 with Mandela sentenced to life imprisonment. Mandela was incarcerated on Robben Island, off Cape Town, for nearly three decades. In his

autobiography he wrote of this experience, remarking about the degree to which apartheid permeated every aspect of life in South Africa, even for those in prison, where clothing and food were differentiated according to a prisoner's race.

There were a number of attempts to free Mandela, including a major campaign in 1980. He was transferred to Pollsmoor Prison in 1982 and to Victor Vester Prison in Paarl in 1988. During this time he was allowed increasing contact with his wife, Winnie Mandela, and their two daughters. Mandela began negotiations with the South African government for his freedom and the end of apartheid while at Pollsmoor. That continued in earnest at Victor Vester Prison in May 1988. Government representatives preferred to negotiate with Mandela alone and vetoed his request to discuss the first meeting with his ANC comrades. Mandela outlined the negotiated issues as "the armed struggle, the ANC's alliance with the Communist Party, the goal of majority rule, and the idea of racial reconciliation." The government representatives were concerned that the ANC might attempt "blanket nationalization of the South African economy" as stated in the ANC's Freedom Charter. The secret talks occurred against the backdrop of internal protests by the United Democratic Alliance and the Mass Democratic Movement, a state of emergency, and international economic sanctions.

The ANC, PAC, and SACP were legalized on 2 February 1990, and Nelson Mandela was released from Victor Vester Prison on 11 February 1990. When elected president in 1994, Mandela sought to create a "Rainbow Nation," and the ANC collaborated with other political parties to form a "Government of National Unity."

control, unemployment, contracts, housing, and pensions" (Saunders).

Black women were particularly discriminated against with influx control and pass laws, extended to women in 1956. Influx control was a policy designed to direct the flow of black labor to "white" urban areas for employment and to rural

farms. With the Nationalist victory in 1948, influx control regulations were enhanced. Pass laws regulated document requirements for black people. Jacklyn Cock examined their status as domestic servants in suburban white households. In *Maids and Madams*, Cock reports on a study of 800,000 black domestic servants. She examines their status as workers and mothers and their dependency relationships with their white

HENDRIK FRENCH VERWOERD

Hendrik Frensch Verwoerd, often considered the architect of apartheid, was born in Amsterdam on 8 September 1901, six months before his parents moved to Wynberg, near Cape Town, South Africa. As a lay missionary in South Africa, Verwoerd's father received an assignment in Bulawayo, Zimbabwe, where the family lived for five years. Young Verwoerd performed well academically there and in Brandfort, Free State, South Africa, his next home. Developing a strongly anti-British political orientation in Zimbabwe, he immersed himself in Afrikaner life in Brandfort. Verwoerd completed secondary school in 1918 and proceeded to the University of Stellenbosch.

At Stellenbosch, Verwoerd was elected chair of the Students' Representative Council in 1923. He majored in sociology, psychology, and logic. After receiving his B.A., he was appointed to a position in the Psychology Department, completing his master's in 1923 and his doctorate in 1924. In 1925 Verwoerd traveled to Germany for study at Leipzig, Hamburg, and Berlin. In 1927 he and his wife, Betsie Verwoerd, returned to Stellenbosch, where he assumed a position as professor of applied sociology. Becoming chair of the Department of Sociology and Social Work in 1933 at Stellenbosch, he began to work with social welfare organizations and undertook a committee assignment on housing and unemployment focusing on the plight of poor Afrikaner whites.

Verwoerd joined the Purified Nationalist Party in 1935 as Afrikaners were attempting to unite politically and also became a member of the nativist Broederbond. He left academia to establish the Nationalist paper *Die Transvaler* in 1937. The major objective of *Die Transvaler* was to lure Afrikaners away from the British-oriented United Party and foster the idea of a Christian-National republic. During World War II, *Die Transvaler* adopted a pro-German stance and was opposed to South African involvement with the Allies. That stance became more explicitly

anti-Semitic when Nationalists sought to limit Jewish immigration, deny Jewish citizens party membership, and discourage support for their businesses.

Despite the party's national victory in parliament, Verwoerd lost his local election by a narrow margin in 1948. However, the new prime minister, Daniel F. Malan, appointed him to the senate, and in 1950 Verwoerd became minister of native affairs. In this role, which he described to his wife as the "Great Induna," or great chief, Verwoerd reviewed and restructured the entire ministry, considered the most important in the South African cabinet, and formulated a body of apartheid legislation. On the death of J. G. Strijdom, Malan's successor, Verwoerd became prime minister in 1958.

After organizing a successful whites-only referendum to create a South African republic, Verwoerd attended the Commonwealth Prime Ministers' Conference in London in 1961. There he explored the possibility of South Africa remaining a member of the British Commonwealth. Although rebuffed by the British, Canadians, and Afro-Asian bloc because of apartheid, the prime minister received a hero's welcome when he returned to South Africa in early 1961. He had hoped for commonwealth approval of South Africa's apartheid policy given the pro-British sentiment of English-speakers in the white electorate. Afrikaner Nationalists applauded South Africa's removal from the commonwealth.

Verwoerd was assassinated on 6 September 1966, before a parliamentary session in the presence of about four hundred people. The assassin, Demetrio Tsafendas, was later tried and incarcerated in mental institutions until his death in 1999. Officially classified white, he had been born in Mozambique to a Greek father and a Coloured mother. In a 2001 book Henk van Woerden argued convincingly that the assassination was politically motivated.

madams. Black domestic workers neglected their own families to be at the beck and call of the white madams and often lived in servants' quarters near the madams' houses. This enabled the madam to engage in leisure activities or to pursue employment to enhance her family's income. Cock illuminates gradations of female exploitation in the South African context in focusing on the relationship between maid and madam.

Increasing Black Nationalism

In 1952 the African National Congress, whose membership was estimated at 100,000, organized a campaign of defiance to protest racially discriminatory laws, burning passes and defying regulations concerning segregated facilities. Eighty-five hundred people were arrested during the four-month campaign, which resulted in a treason trial and the eventual acquittal of the accused. In 1955 the African National Congress and similar political organizations met and drafted the Freedom Charter, which embraced the tenets of a nonracial,

democratic society in which major capitalist enterprises would be nationalized.

Ideological differences within the ANC resulted in Robert Sobukwe breaking away to form the Pan-Africanist Congress (PAC) in 1959. In 1960 the PAC organized a campaign to protest pass laws and low wages. At Sharpeville, near Johannesburg, in March 1960, police opened fire on a crowd of demonstrators, killing 69 and injuring some 180. The government declared a state of emergency and arrested 1,600 people. The massacre precipitated international condemnation of the South African government, diminished investor confidence, and threw the economy into recession.

After Sharpeville, the ANC and PAC were banned, initiating underground political activity. Nelson Mandela, who had already been imprisoned on other charges, and his compatriots, taken into custody at a farm in the Johannesburg suburb of Rivonia, site of the ANC's underground headquarters, were

HELEN GAVRONSKY

Helen Gavronsky was born to Lithuanian Jewish immigrant parents near Johannesburg in 1917. She married Moses Suzman in 1937 and had two daughters. Later she returned to the University of the Witwatersrand to complete her B.A. Then she was hired as a lecturer in economic history. The United Party invited her to run for a seat in Houghton, a northern suburb of Johannesburg, in 1952. With the support of her husband, she successfully ran for the seat, which required her absence from her family while residing in Cape Town half a year. In parliament Suzman was a proponent of racial equality, South Africa's return to the commonwealth, rule of law, and the administration of justice. During her tenure in parliament she visited prisons, townships, and "resettlement areas" in the rural homelands. She was in parliament when Hendrik Verwoerd was assassinated and visited Nelson Mandela on Robben Island and in Pollsmoor Prison.

Often at odds with the United Party over apartheid legislation, she formed the Progressive Party in 1959 and became its sole representative. After fourteen years, six colleagues joined her in 1974. Although it was unpopular to participate in an increasingly oppressive apartheid parliament, Suzman was a vigorous advocate of racial equality. Despite their admiration, many black South Africans were critical of her antisansctions stance in the 1980s.

Suzman received many international honors, including honorary degrees from Oxford, Cambridge, and Harvard; the United Nations Human Rights Award (1978) and Medallion of Heroism (1980); and the Liberal International Prize for Freedom (2002). Suzman left parliament in 1989 but continued her activities in the Helen Suzman Foundation, which is devoted to liberal causes.

charged with sabotage and conspiracy to overthrow the government. In 1964 all but one of the codefendants were sentenced to life imprisonment. The Rivonia trial signaled the cessation of black nationalist resistance in South Africa. Many members of banned organizations sought refuge in other countries. Neighboring colonies provided South Africa a protective buffer against guerrilla insurgency, investor confidence was restored, and the country embarked on a period of economic prosperity. Meanwhile, after an all-white referendum, South Africa was declared a republic outside the commonwealth in 1961.

Dismantling of Apartheid

The outbreak of the Soweto riots in 1976 marked the denouement in the South African struggle. Students in the Johannesburg township rioted when the government made Afrikaans the language of school instruction in science subjects. Combating police bullets with sticks and stones, hundreds of students were killed. Others fled the country. The ANC set up recruitment stations in Mozambique from which refugees were transferred for military training. Coloured students in Cape Town intensified their activism. Unrest continued around the country and lasted well into 1977, having a deleterious effect on the economy. Refugees, both male and female, began to infiltrate the country to conduct acts of sabotage.

South Africa's protective buffers began to erode in 1975 with the independence of Angola and Mozambique, followed by that of Zimbabwe in 1980, allowing for increasing guerrilla infiltration into the country. After the Muldergate information

scandal, P. W. Botha, minister of defense, became prime minister in 1978. Muldergate was an information scandal in which substantial sums of money allocated to buy international media support for apartheid was funneled to the *Citizen*, a pro-government newspaper in Johannesburg (Saunders, p. 116). The disclosure and attempted cover-up precipitated dissension within the ranks of the National Party. Botha's total strategy combined militarism and reform.

Recognizing the potential for a racial bloodbath, the Nationalists sought a "consociational democracy" in which no racial group would dominate. In an effort to bring legitimate leaders to the negotiating table, a campaign began to free the long-imprisoned ANC leader Nelson Mandela in the early 1980s. The president (formerly prime minister) proposed a tricameral parliament with chambers for Asians, Coloureds, and whites. The exclusion of those classified African led to the formation of the United Democratic Front to coordinate activism within the country.

In the mid-1980s major Western powers initiated economic sanctions against apartheid South Africa. Governmental negotiations began in 1990, when Mandela was released from prison. The ANC and other liberation organizations were "unbanned," or legitimized. An interim constitution was written, and elections were held in 1994. The ANC was victorious nationally.

Conclusion

When South Africa celebrated its first decade of postapartheid government, it had rejoined the commonwealth and a number

of international bodies. The ANC was returned to power for a third term in April 2004 with 70 percent of the vote. Some progress had been made toward racial equality despite inequities in the distribution of wealth. However, South Africa continued to grapple with the legacy of apartheid—high unemployment, low literacy rates, inadequate housing, the HIV/AIDS pandemic, and the dynamics of globalization. In the early twenty-first century the unemployment rate was estimated at 38 to 40 percent. According to the South African Survey 1999, one-third of South Africans needed adequate housing. The HIV rate in prenatal clinics was 22.8 percent in 1998.

South Africa is not viewed as competitive in global production due to high labor costs. A number of mining and manufacturing enterprises have established branches in other African countries. The government seeks to attract new investment and to enhance the skills of its black labor force. With regard to the Internet, in the early twenty-first century South Africa was the best-wired country in Africa.

ARCHITECTURE.

This entry includes three subentries:

Overview

Africa

Asia

OVERVIEW

Architecture is the crystallization of ideas. Architecture has been defined many ways—as shelter in the form of art, as a blossoming in stone and a flowering of geometry (Ralph Waldo Emerson), as frozen music (Johann Wolfgang von Goethe), man’s triumph over gravitation and his will to power (Friedrich Nietzsche), the will of an epoch translated into space (architect Mies van der Rohe), the magnificent play of forms in light (architect Le Corbusier), a cultural instrument (architect Louis I. Kahn), or inhabited sculpture (sculptor Constantin Brancusi). The architectural critic Ada Louise Huxtable framed a rather clinical definition, saying architecture is a “balance of structural science and aesthetic expression for the satisfaction of needs far beyond the utilitarian.” Most people in the early twenty-first century—users, that is, as opposed to designers and critics—seldom think of architecture as anything more than a mute utilitarian container. Yet architecture is a form of nonverbal communication, as was recognized by many builders in centuries past. Architecture speaks volumes about the values and priorities of the designer or architect, and of those who built it. This view of architecture has been voiced by many commentators but was expressed particularly well by the nineteenth-century critic John Ruskin, who pointed out in his preface to *St. Mark’s Rest* (1877) that nations “write their autobiographies in three manuscripts—the book of their deeds, the book of their words, and the book of their art. Not one of these books can be understood unless we read the other two; but of the three, the only quite trustworthy one is the last.”

Accounts of military exploits and written expressions of theory and practice are records of ideas often subtly worded to shade the values of a time and culture; architecture, in contrast, is fundamentally driven by the most essential economic pressures. Architecture therefore is a truly revealing cultural artifact. In contrast to all the other durable visual arts, architecture comes into being only through the coordinated efforts of client, architect, builder, and scores of workers, and therefore—since it requires such a formidable financial investment—caprice and personal whimsy are normally restricted, replaced by the pressures of what is truly important in the culture of client, architect, and builder. Architecture is a “bottom line” art form. Moreover, who people are and what they do is influenced, if not determined, by the architecture around them. As Winston Churchill suggested in speaking to Parliament in 1944, “we shape our buildings, and afterwards our buildings shape us.”

Early Humans in Europe

Buildings or shelters were being constructed by early human ancestors as early as 400,000 to 300,000 years ago, judging from the traces found at a site called Terra Amata, near Nice, France. The remains of the oldest human dwellings found so far do not suggest anything other than protection from the elements, but that must have changed with the rise of thinking in terms of symbols and metaphors between 50,000 and 30,000 years ago among Neanderthal people in Europe and certainly their Cro-Magnon *homo sapiens* successors. How symbolic thinking may have found expression in shelters so far has been impossible to determine, for all that survives from the infancy of modern humans are nonorganic materials; whatever else they may have built of timbers and hides, or carved in wood, long ago disappeared. The tantalizing evidence that does endure is found in the skilled paintings of animals and cryptic symbols created deep in the caves of Spain and France, in Australia, and at other locations.

Also suggesting a complex system of spiritual belief is the evidence of careful and thoughtful burial given some Neanderthal individuals, which became more customary for the Cro-Magnon. Reverence and respect for the remains of the dead as departed members of the human community seems to have developed about 250,000 years ago, along with ideas concerning some persistence of life after death, or at least the notion that the remains of dead parents, elders, and children merited care and reverence. Megalithic stone burial chambers were built in France and Ireland as early as 6,700 years ago (4700 B.C.E.). Cut into the limestone hill of Hal Saflieni, Malta, is a tomb called the “hypogeum,” carved perhaps 5,500 years ago (3500 B.C.E.). Because it was excavated long ago, much of its chronological evidence was destroyed, but another semisubterranean burial site on the Maltese island of Gozo, called the Brochtorff Circle, was excavated in the 1990s and more accurately dated as having been built roughly 6,000 years ago.

Built evidence suggests that around 5,500 years ago the notion of time as a continual cycle of recurring celestial events was well developed in northern Europe, as the technically sophisticated construction of such sites as the Newgrange tomb in the Boyne Valley of Ireland (constructed 5,200 years ago) and the first phases of construction at Stonehenge in the plain of Salisbury, Wiltshire, England (started about 4,950 years ago) demonstrate. The enormous well-known megalithic stones at Stonehenge were put in place much later, between 4,000 and 3,500 years ago. These sites were carefully constructed to mark critical points in the cycle of the year, such as the day of the winter solstice sunrise and the summer solstice sunrise and sunset.

Antiquity: Egypt, Greece, Rome

Egypt. In ancient Egypt, Greece, and Rome architecture reflected the worldviews and underlying concepts of each society itself. The culture of ancient Egypt was rooted in chronometric concepts—the cycle of the year, the notion of time extending endlessly from the past toward an unfathomable future, the human spirit continuing in existence into this future. As Herodotus (c. 484–c. 420 B.C.E.) observed in his *Histories*,

Aerial view of Stonehenge, Wiltshire, England. Some early constructions, such as that of Stonehenge, which was constructed in three phases between 2950–1500 B.C.E., were dedicated to marking time and the cycle of seasons throughout the year. © JASON HAWKES/CORBIS

Egypt is the gift of the Nile, a long linear oasis extending from the south to the north, where the river expands into its delta and empties into the Mediterranean. Across this south-north line lies the east-west path of the sun. These two orthogonal lines and the cycles of what define them—the daily passage of the sun and the yearly rising flood and lowering of the river—also define the human life cycles of ancient Egypt. Geometry and symmetry were fundamental to this life, both in remeasuring the fields after inundation and in laying out the ancient temples, the houses of the gods where endless ceremonies were carried out during the course of the year. The linear, rigorously ordered grid of the temple layout exemplified the idea of *ma'at*, a concept that combines the ideas of truth, justice, order, stability, security, harmony—the total of the right order of things that was established by the gods at the creation of the world.

For artisans, scribes, officials, and others who served the bureaucracies, life could be very pleasant in the valley of the

Nile, at least during the politically settled periods that lasted hundreds of years. So the ancient Egyptians came to think that following death, an individual's soul passed into an afterlife where—properly provided for with a preserved physical body and stores of food and drink, and assisted by statue-substitute servants—life could be enjoyed forever. It was for this reason that so much of the Egyptians' creative effort and energies went into the building of their temples, tombs, and (for the Pharaoh god-kings) the pyramids that were their ascent stairs to join the gods. Their focus was on the life to come.

Greece. The Greeks, for whom daily life was a much more arduous and risky affair, focused not on an unverifiable spiritual life after death but on achieving knowable excellence of human achievement in this world. Their term for this was *aretē*, that quality of excellence that comes from studied refinement, skill, and testing, demonstrated by achievement through valor in war or athletic competition or contest, *agōn*. Excellence could be

Columns at the Hypostyle Hall of The Temple of Amon, Al Karnak, Egypt. Constructed c. 1315–1235 B.C.E. Ancient Egyptian society gradually came to ascribe special significance to the afterlife, and thus much care and detail was given to the design of temples and tombs. © ROYALTY-FREE/CORBIS

represented in poetry, music, and athletic skill—all of which were the subject of contests—as well as in sculpture and architecture. Through such contests individuals learned their abilities and limitations, what the priests of Apollo meant when they said “know thyself.” In all things the ancient Greeks sought *logos*, a concept that encompasses reason, logic, generating idea, conception, a natural order that existed in the world, the opposite of *chaos*. The Greeks strove to realize this ideal of balance and symmetry (from *symmetria*, meaning “of like measure”). Heraclitus (c. 540–c. 480 B.C.E.) described this concept of symmetry, saying “measure and logos are firm in a changing world,” and describing how cold is balanced by hot, day by night, health by disease. The risk was that such mental constructs might venture into the realm of mystic speculation, as was somewhat the case with Pythagoras of Samos (c. 580–c. 500 B.C.E.), who asserted that the universe was governed by a symmetry of numbers, demonstrated by the harmonic sounds created by vibrating strings of proportional lengths. Out of this theorizing, however, came such highly useful mathematical demonstrations as the Pythagorean theory describing how the areas of the squares drawn on the two sides of a right triangle are together equal to the area of the larger square drawn on the side of the connecting side, or hypotenuse.

This perfection of mathematical proportions and excellence in construction was embodied in the Greek temples, buildings erected in durable permanent materials such as marble, with

blocks having sides ground to perfect planes that fitted together so tightly that a knife blade could not be inserted between them. In particular, the temple dedicated to Athena Parthenos (the Parthenon), built atop the Athenian acropolis in 447–438 B.C.E., in addition to having this precision of assembly, also incorporated in its design numerous interrelated proportional systems governing such dimensions as the ratio of building length to width to height, and the thickness and spacing of the outer ring of marble columns, among many other dimensions and relationships. Moreover, it incorporated a subtle inward slant to the columns, especially a diagonal inward slant to the corner columns, as well as optical corrections, such as the upward swelling curvature of the base repeated in the upward curve of all the parallel horizontal lines of the building. These nearly imperceptible optical corrections make the building appear to be straighter and lighter, more perfect, than is physically the case. What the eye actually sees, then, and what the mind expects to see, are not in exact agreement. The result is that the building constantly shimmers and shifts in the viewer’s perception between these two subtly conflicting mental activities, giving it a visual stimulation that has excited comment since the time of its construction.

Rome. Greek architecture is not particularly concerned with the enclosure of interior public spaces. Most activities in the Greek city-state polis took place in outdoor spaces such as the agora (marketplace) or the open precincts around temples. The Romans, however, developed numerous kinds of public buildings to house groups of people—law courts (basilicas), markets, and baths, among others—as cities across their empire grew in size and density of population. To certain abstract constructs of Greek culture and learning, the Romans added a practical mind-set that enabled them to solve technical problems such as supplying water to their cities and carrying away waste products. They adopted arch and vault construction for a wide variety of buildings. To this they added the use of readily available volcanically modified materials to make a form of natural concrete. Using this concrete enabled Romans to vault spans of unprecedented size in their public buildings.

All these social programs and architectural developments come together in the Roman public baths, versions of which were built in cities the length and breadth of the empire, including Bath, in England, and Paris among countless other settlements. Aqueducts, carried aloft on stacked arches, brought water into the baths, where it was heated and distributed to the various bathing areas, with cold, tepid, and warm pools. In the warm bath areas the rooms themselves were heated by means of hollow passages under the floor and running up through the walls, acting as so many chimney flues for fires kept burning in side furnaces. In the early 2000s the great public baths of the city of Rome stand, mostly in fragmented unroofed portions, as testaments to the engineering skill of the Romans, but a better sense of the majesty of these vast spaces can still be glimpsed in the church of Santa Maria degli Angeli, originally the baths built by the emperor Diocletian in 298–306 C.E., but sufficiently intact to be converted into a huge church with monastery by Michelangelo in the mid-sixteenth century.

Romans, for the most part, were concerned with the here and now. During the republican period Romans embraced the

The Parthenon (Temple of Athena Parthenos), Athens, Greece. The focus of ancient Greek architecture was symmetry and harmonious proportions. The design of the Parthenon, which was constructed 447–438 B.C.E., displays the precision and exacting detail to construction common to the period. © HECTOR WILLIAMS

quality of *gravitas*, a sense of the importance of matters at hand, combined with ingrained discipline, patriotic responsibility, and seriousness of purpose, austerity, conservatism, and a deep respect for tradition. A good Roman citizen upheld a rigid morality, served the state, maintained unimpeachable honor, and strove for a physical and spiritual asceticism—all qualities discernable in the first Roman emperor, Augustus (r. 27 B.C.E.–14 C.E.) himself. It is all too easy to think of Romans comporting themselves as commonly depicted in novels and films, devoted to depravity and sensual excess, but this was more the case during the later empire. The goal of many earnest Romans in the first centuries after Augustus was to reestablish the moral standards of the republican past. In many ways, the best representative of the Roman personal values of probity and self-discipline can be found in the emperor Marcus Aurelius (r. 161–180), trained in the tradition of the Greek Stoics. His *Meditations*, intended for his personal reflection—with their repeated admonitions to uphold personal honor because of its basic practicality—are a tribute to the persistence of republican virtues.

Middle Ages

Even around 175 C.E., as Marcus Aurelius was writing his *Meditations*, Christianity was spreading across the empire. Of the various cults and religions that vied for converts during the early years of what has come to be called the common era,

Christianity was the most persuasive for several reasons. Unlike the impersonal state religion of Rome, with its removed and depersonalized rituals to placate Jupiter and the deified emperors, Christianity offered direct communication with a personalized deity, embodied in the crucified Christ. The present world, with all of its shortcomings and disappointments, was seen as only the preparation ground for a subsequent eternal life. The classical focus on the practicalities of the here and now faded in importance. In the West, the old Roman Empire was transformed, through invasion after invasion from the north and east, as well as through the rise of Christianity, whose strong vertical bureaucratic structure took on much of the character of the fading Roman government. The old position of the Roman emperor as chief priest (*pontifex maximus*) was taken over by the bishop of Rome as head of all bishops, and therefore head of the church.

Although Christianity maintained that all humans are born in original sin, and are destined to persist in this fallen state, doomed to spend eternity in Hell, doctrine held out the hope of Heaven. This consuming aspiration, directed away from the present world in favor of the next, is embodied in the abundant and mutually reinforcing vertical motifs in Gothic architecture, developed in France and other areas of Europe around 1150. Every line of the Gothic cathedral seems to point toward heaven. Moreover, the architecture is covered across its entire

Baths of Diocletian, Rome, Italy (built 298–306 B.C.E.), refurbished as the Church of Santa Maria degli Angeli (interior). In ancient Rome, the use of modified concrete led to buildings that were large and spacious, as can be seen in this church, which was converted in the mid-sixteenth century from a public bath house. © ELIO CIOL/CORBIS

surface with sculpted images drawn from Scripture and the lives of the saints. Influenced by the writings of the abbé Suger of St.-Denis, architects opened up ever larger clerestory windows in the upper ranges of the churches and cathedrals. The windows were filled with highly colorful stained glass, an allegory of divine light, with images amplifying the stories told in the stone carvings. The churches became veritable Bibles in stone and colored glass, inculcating scriptural lessons in the faithful.

The later High Gothic urban cathedrals, for the most part dedicated to the Virgin Mother—Our Lady, or Notre Dame,

in French-speaking regions—were not only ecclesiastical buildings commissioned and paid for in part by the church, but also municipal undertakings raised to celebrate the status and power of the cities. Often the naves of these cathedrals were owned by the city, while the transept and crossing area as well as the choir were church property.

Renaissance. The culture of the so-called Middle Ages in Europe, focused on the life of the church, was bolstered by Scholasticism and the infusion of Aristotelian logic through the writing of St. Thomas Aquinas (c. 1224–1274). By the

fourteenth century, with the growth of merchant cities in Italy and the development of banking, wealthy merchants began to underwrite the new scholarly study of Roman and Greek literature and history, not so much to augment religious doctrine but for its own inherent merit and political implications. In fact, in Florence, where the powerful and enormously wealthy Medici family supported scholars and artists, the qualities of humanism were seen as demonstrating how the self-governing Florentines were superior to the autocratic rulers of other Italian states. Thus was set in motion a rebirth of ancient classical learning, a Renaissance.

The challenge of the time was to link humanist study with religious doctrine, to uncover how the knowledge of the ancients paralleled and thus supported church doctrine; the means for this was a reinvigorated Neoplatonism. Just as Scripture maintained that Adam had been made in the physical image of an all-perfect god, so too did the pagan Roman architect Vitruvius (1st cent. B.C.E.) declare that within the form of the human body could be found the modules of the most perfect geometric forms, the circle and the square. His written description was beautifully depicted in the well-known drawing by Renaissance artist/architect Leonardo da Vinci, planned as

Santa Maria delle Carceri Church, Prato, Italy. Constructed 1485–1506. In Italy during the Middle Ages, most religious architecture was simple and clean in design, comprised of balanced combinations of circles and squares. © DENNIS MARSICO/CORBIS

an illustration for a new edition of Vitruvius's *Ten Books on Architecture*: a man with outstretched arms just touches the edges of a circle and square.

The circle and square became the measure of perfect architectural form as well in scores of new churches and chapels built in Italy. Of the many examples, the small church of Santa Maria delle Carceri in Prato, designed by Giuliano da Sangallo in 1485, shows this modular perfection well. Its basic plan is a square of about 38 feet, extended upward to the top of the main cornice to form a cube. Short half-square arms project on the four sides. Atop the internal cube span four semicircular arches (half the height of the cube), and these define four curved pendentives that carry the topmost dome, circular in plan and nearly a perfect hemisphere in section. Circles and squares, and their three-dimensional counterparts, define the edges and perimeters of this idealized building.

The Renaissance emphasis on the ability of the human mind to grasp the rational structure of the universe led Martin Luther (1483–1546) to analyze the New Testament in search of support of papal practices, particularly the sale of indulgences. Instead, Luther uncovered in the letters of St. Paul the assertion that salvation was God's gift through faith and repentance, not something to be parceled out by, much less purchased from, an established church and clerical hierarchy. Coupled with the desire of numerous German princes to shed the political yoke imposed by the Roman Church, Luther's church reforms led to a splintering of the church universal. Delayed in reacting to this attack, the Roman Church convened the Council of Trent (1545–1563) to draft responses to the Reformation split in the church. Whereas the Reformationists, to varying degrees, shunned the use of sensory aids in worship—and in certain

regions of Northern Europe engaged in the wholesale destruction of paintings and statuary—the Council of Trent decreed that, on the contrary, the ordinary worshiper can only grasp the mysteries of faith with difficulty and so highly evocative painted and sculpted imagery were to be emphatically employed. A superb illustration of this dictum can be found in the highly emotive and mysteriously illuminated sculpted figure of St. Theresa found at the end of the right transept arm of the church of Santa Maria della Vittoria, Rome, built by Gian Lorenzo Bernini in 1645–1652. Here in a total work of art, fusing painting, sculpture, and architectural enframement, the ecstatic divine experience of St. Theresa is shown to the common worshiper in terms of seemingly carnal ecstasy, an analogy easily understood. Architecture, merged with painting and sculpture, was to serve as an instrument of propaganda in bringing the strayed faithful back into the protective arms of Mother Church (exactly the image Bernini said he was after in the curved encircling colonnade of his new piazza in front of the huge basilica of St. Peter's in Rome).

Modern Era

The emphasis on the place of human understanding and reason, on rational analysis, initiated by the Renaissance and Reformation, reemerged in the eighteenth century.

Enlightenment. During the so-called Age of Reason, or Age of Enlightenment, scientific analysis of the structural forces at work in a building began to be modeled mathematically, and the strength of building materials such as different woods and stones were tested and recorded in statistical tables. A good example in which the Age of Faith and the Age of Reason overlap can be seen in the Church of Saint Geneviève in Paris, begun in 1755 by architect Jacques-Germain Soufflot. Returning to the perfected forms of the Renaissance, Soufflot used a plan based on a Greek cross, with four arms of equal length extending from a central rotunda capped with a dome. Heavily influenced by what he had learned on a recent trip to southern Italy to inspect and study the ruined Greek temples at Paestum, near Naples, Soufflot used rows of structural Corinthian columns inside the church, balancing the weight of the smaller domes over the arms of the building directly on these columns. Seldom in the preceding three centuries had free-standing columns been used—as in ancient Greek architecture—for true structural support. Moreover, the great central dome was supported by slender piers. Using his knowledge of the strength of materials, Soufflot made the entire building much more delicate and lighter in appearance than had been the accepted norm. When cracks began to appear in the dome piers, construction was ordered halted while Soufflot's computations were subjected to scrutiny. Overall, Soufflot's calculations were proven to be correct, although some strengthening of the building took place. The building was finished in 1790 after Soufflot's death, but such was the shift in ideology and patronage in those tumultuous years of the French Revolution that the church was desacralized and converted to become the Panthéon, a memorial to great deceased French military and literary heroes.

United States. The nascent utilitarianism incorporated into the design of the Panthéon was carried to the newly formed

Nineteenth-century drawing of the Panthéon (originally Church of Saint Geneviève), Paris, France. Constructed 1755–1790. During the Age of Enlightenment, attention began to be paid to different methods of structural support, one example being the freestanding columns Jacques-Germain Soufflot used in his design for the Panthéon. © ARCHIVO ICONOGRAFICO, S.A./CORBIS

United States of America where the demands of commerce became the driving cultural force. The greatest and most innovative achievements made by American architects were not in churches, nor even in buildings to house representative government; in these they borrowed heavily from Greek and Roman and even Renaissance models. Instead their most innovative achievements were made in the design of the freestanding single family residence (as in the work of McKim, Mead & White in their early years, and in the career of Frank Lloyd Wright) but most recognizably in soaring office skyscraper towers. The first accomplishments were made in Chicago in the 1880s and 1890s in ten- and twenty-story office towers, but the lead soon passed to New York architects, who piled floor upon floor to create spires of forty and fifty stories. In an effort to attach a measure of culture and time-honored respectability to his world headquarters, Frank W. Woolworth instructed his architect Cass Gilbert to model his new fifty-five-story office building, to be named the Woolworth Building, on northern Gothic European guild halls. Although a marvel of applied engineering—from its massive caisson foundations extending to bedrock, to its steel frame clad in terra

cotta panels, to its innovative elevator system, among scores of other technical innovations—externally the building is Gothic in style, artfully composed, like Gothic churches, with every line straining heavenward. Here, however, the aspiration is not for heaven, but for self-advertisement, aggrandizement, and profits. Woolworth called it a “Cathedral of Commerce.” The apotheosis of the American office tower was reached in the soaring 102-story Empire State Building, 1929–1931, begun just months before the onset of the Great Depression. The tallest building in the world, it was not surpassed in height for thirty years.

American office skyscrapers became ever taller by the mid-twentieth century—sixty, eighty, and finally a hundred stories. These were proud towers, often showing little real concern on the part of patrons or architects for the impact on urban scale. They became symbols of American enterprise, and were first exported by American corporations around the world, and then embraced by developing countries around the globe in the late twentieth century. Even where the concentration of activities into narrow soaring towers made no practical sense—most

notably in the twin Petronas towers designed for Kuala Lumpur, Malaysia, in 1996, by the American architect Cesar Pelli, to rise 1,476 feet or 450 meters—towers they became nonetheless, as symbols of national power and pride. Such dramatic symbols, proud, standing free in the open air, inescapable emblems of American cultural imperialism (in some viewers’ eyes), proved irresistible targets for terrorists at the dawn of the twenty-first century. Damaged in 1993 by a bomb, the twin World Trade Center towers (1,368 ft., 417 m) were brought crashing to the ground on 11 September 2001, after terrorists used commercial aircraft as flying bombs. For the terrorists, the ideas represented by the towers were too loathsome to let stand.

Postmodernism

As the twenty-first century opened, new architectural paradigms emerged. One building type that gained new cachet as the embodiment of urban identity and cultural striving was the art museum. Such commissions came to represent the pinnacle of an architect’s career, particularly after Frank Gehry made the small city of Bilbao, Spain, a cultural destination with his Guggenheim Museum on the waterfront there.

Gehry’s free-form undulating buildings are only one representation of postmodernism, a multifaceted philosophical

MBF Tower, Penang, Malaysia. Constructed 1990–1993. In designing the MBF Tower, architect Ken Yeang utilized construction methods that allowed for natural light and ventilation, a technique seen more and more frequently in the twenty-first century. PABLO ZIEGLER / EMPORIS.COM

and artistic expression derived from literary analysis. In many instances the drive of late-twentieth-century architects to break the strictures of conventional mid-twentieth-century modernism rendered their efforts both disjointed and self-absorbed. The counterpart to this kind of postmodernism is found in so-called developing countries around the globe. Since roughly 1950 there has been a growing reawakening in these areas to long-standing regional building cultures and building methods. This “critical regionalism” encourages architects to draw once again on the wisdom gained in centuries of construction in their regions, in preference to the imported European and American building forms and methods, with the accompanying reliance on high energy consumption for lighting, heating, and cooling buildings. This regionalism began with the work of Hasan Fathy in Egypt and his advocacy of adobe brick in vaulted and domed construction, a time-honored building method in that land, and one that used building materials available at minimal cost. More recently in Egypt, Saudi Arabia, numerous Middle Eastern countries, and generally in the Third World nations, there has been a return to traditional building forms (but often using twentieth-century materials) for various public buildings but especially for mosques because of their strong symbolic importance. In Sri Lanka, architect Geoffrey Bawa drew on imagery associated with traditional small-scale village meeting houses for his expansive Sri Lanka

Parliament of Sri Lanka, Kotte (near Colombo). Constructed 1980–1983. Beginning in the mid-twentieth century, some architects advocated a return to traditional designs that drew upon the resources readily available in the area. Parliament building complex; its recognizable broad overhanging eaves and open pavilion-like structures providing shade and free movement of air in this tropical country.

Around the globe, as the twenty-first century began there was rising interest in sustainable building design and construction, in using materials in ways that minimize toxic production methods, and in using natural sunlight for energy and natural air movement and water for cooling. In this way, over time, the impact of such architecture on public resources will be limited and the total social and economic cost minimized. Among many late-twentieth-century architects who drew on this design philosophy, one whose work is particularly interesting is Ken Yeang of Malaysia. His thirty-two-story MBF Tower in Penang employs the skyscraper tower form, a symbol of progressive modernity, but also uses traditional ideas such as curved external terraces and separation of elements to promote natural ventilation in place of massive cooling machinery.

These examples demonstrate that there need be no elemental conflict between the use of modern materials such as concrete, glass, steel, and aluminum in the creation of traditional forms that reflect long-established ways of living and also make accommodation to local climatic conditions.

AFRICA

Sketching a comprehensive history of African architecture remains a daunting task because of the enormous size of the continent, the thousands of distinct ethnic groups that inhabit the vast lands, the differences in climate, and the various colonial, economic, political, and religious experiences. Yet, African geography, characterized by the large size of the continent, which encompasses multiple population and cultural distributions, can provide the methodological and temporal means for studying and understanding the continent's architectural history, practices, and scholarship.

The "Triple Heritage" Architectural Concept

Looking at the floor plan of a family dwelling in Africa, one needs to ask: Who lives there? Is it a Muslim family, a Christian family, or a family that believes in ancestor worship? Is there an extended family ancestors' shrine? Is the dwelling laid out as an extended family compound or as a single-family bungalow in an exclusive wealthy section of the city? When examining the tectonics—that is, the construction methods by which the structures of the house, the styles of decorations on the façade and elevations (fronts), roof, openings, and columns, are held together in harmony—of a built object in Africa, one is bound to reflect on what the walls are made of. Are they constructed from grass, branches of trees, reeds, raffia palm fronds, timber, coral shells and sands, clay, or stones? Regarding more recently built structures, one must ask: Are the walls built with concrete materials, zinc, plywood, synthetic materials, engineered wood, or cardboard boxes? What about climatic control and protection from the elements such as the sun and rain? Is the roof of the dwelling high-pitched, low-pitched, sloping to one side, or flat? What material(s) is it made of? Slate, zinc, shingles, clay, thatch, or grass? How are cooling, heating, and humidity controlled? Furthermore, because one of the most important aspects of buildings is the elevation, and many traditional African compounds have portals, one is bound to ask questions regarding

the relationships between the portals and the elevations of the houses in the compound, such as: What styles and motifs articulate the portal's surrounding elements, and how are the doors and windows decorated? Are they painted with clay or other pigments? Do they display specific symbols that can be recognized by the members of the community? These are questions that can be addressed with a clear understanding of Africa's geography.

The distribution of climatic zones and vegetation types, along with the availability of building materials, influences the manner in which people build in different parts of the continent. While the coastal tips of northern and southern Africa are covered by Mediterranean vegetation, further inland one encounters semiarid wooded steppe lands that border the deserts—the Sahara Desert in the North, the Kalahari Desert in the South. Both regions are buffered by vast Sahel and savanna grasslands and forests that stretch to West Africa and parts of East Africa. Heading north from the West African Atlantic, mangrove forests, dense tropical rain forests, and evergreen forests gradually transition into Sahel and savanna woodlands and then into the desert proper—the Sahara.

The distribution of cultural groups and political experiences across different parts of the continent from ancient times through the present also underscores the importance of understanding the geography of the continent when studying its architectural heritage. The northern parts of the continent, comprised of the countries of Morocco, Algeria, Tunisia, Libya, and Egypt, are inhabited by populations that are predominantly Muslim, and certain cultural buildings and edifices from the past and present reflect this way of life. The Muslim population in northern Africa extends to West Africa in countries such as Mauritania, Senegal, Guinea, Mali, Burkina Faso, Niger, and Chad, although these nations contain pockets of Christian communities. Similarly, building techniques reflect these religious cultural affinities as well as responses to specific regional, vernacular, and climatic needs.

Moving eastward toward the Atlantic coast from the northwestern African coastal countries, a great change in religious affiliations and cultural identifications can be observed among citizens of the same country. For example, in Sierra Leon, Liberia, Côte d'Ivoire, Ghana, Togo, Benin, Nigeria, and Cameroon, the populations in the northern parts of these countries are predominantly Muslim, whereas the southern populations are predominantly Christian. The middle parts, often identified as middle belts, seem to have balanced numbers of Christians and Muslims. In the Central African Republic, Gabon, the Democratic Republic of Congo (formerly Zaire), and Angola, large Catholic and other Christian denominations reside side by side with large Muslim populations. With the exception of Ethiopia, a Christian country with a predominantly Coptic sect as well as a minority Muslim population, many East African countries are predominantly populated by Muslims with fairly large number of citizens affiliated with the Christian faith. The Republic of Sudan, Djibouti, Somalia, Kenya, Uganda, and Tanzania have large Muslim and minority Christian populations. As in West Africa, northern Sudan is predominantly Muslim, whereas the southern part

is principally Christian. Mozambique, Zambia, Zimbabwe, Namibia, Botswana, and the Republic of South Africa are inhabited by populations that are predominantly Christian with significant populations of Muslims. Once again, the architecture of these regions of Africa reflects the cultural and climatic variations.

It is important to emphasize that the West did not introduce Christianity to all parts of Africa. Certain North African territories and East African countries such as Ethiopia adopted the Christian faith in the middle of the fourth century C.E.—that is, about the same time that Imperial Rome adopted Christianity as its official state religion. One cannot ignore, however, the proselytization of the Christian faith to Africans by later colonizing European missionaries. Also, keeping in mind that the Islamic religion began to spread on the continent in the seventh century C.E., one is left with the inevitable question: What form(s) of cultural affiliations were on the African continent before the coming of Islam and Christianity? The answer is that there has always been indigenous African culture; in fact, one has to speak in the plural by stating that there have always been indigenous cultures that were generated and propagated by the peoples of the continent and that varied greatly from place to place. Indigenous African cultures have had the greatest impact on the continent's architecture(s).

When discussing African architectural practices, the most important thing to keep in mind about the indigenous, Western, and Islamic aspects of African cultures is that they are broad concepts that vary from place to place and region to region. Nevertheless, these concepts lay solid foundations for studying the continent's architecture across time and space in different regions of the continent. For that reason, Nnamdi Elleh, in his book *African Architecture: Evolution and Transformation* (1997), summed up the original sources of African architecture as indigenous, Western, and Islamic in what he called the "triple heritage architectural concept." The formation of this theory followed years of research exploring the works of architectural historians such as Udo Kultermann, Peter Garlake, Susan Denyer, and Susan B. Aradeon, and it took into consideration the geography, anthropology, sociology, history, and political systems of Africa, especially as reflected in the works of such scholars as Ali A. Mazrui, who first coined the phrase "triple heritage" in his book titled *The Africans: A Triple Heritage* (1986).

It is obvious that for a continent as large as Africa, such a sweeping proposition can be problematic. The triple heritage concept needs to be clarified, because when examined from cultural, functional, stylistic, and tectonic perspectives, there are gray areas in which it is difficult to separate indigenous from Western architectural motifs, or indigenous from Islamic architecture. Conversely, there are several cases in which motifs that help identify Western and Islamic architecture cannot be completely isolated from one another. Issues of regionalism and vernacular articulations that are inspired by climatic necessities and available building technologies can compound this problem. This is where history and archaeology can help sort out how these three large building cultures came together and provided the continent its architectural heritage. The aim in

Ruins of a conical stone tower of a convent in Zimbabwe. The religion of a region and other cultural variations can play an important role in African architecture, affecting such choices as elevation, construction style, building materials, and decoration or ornamentation. © CHARLES & JOSETTE LENARS/CORBIS

adopting this historical approach is not necessarily to achieve a total level of cultural separation asserting in absolute terms that this is indigenous, that is Western, and that is Islamic—as desirable as that may be; it would be hard to reach a level of absolute certainty regarding which tectonic and stylistic motifs could be identified and separated from one another in all cases. Nevertheless, understanding the mechanisms in which architectural fusion took place among the three cultures places one in a better position to determine the functions, styles, and systems of the continent's architectural practices. Hence, the next three sections provide synopses of the indigenous, Western, and Islamic aspects of the triple heritage architectural concept.

The Roots of Indigenous African Architecture

The most challenging task for scholars of African architecture is determining its historical sources. This task is compounded by the nuances of intellectual historiography that bifurcate the continent into two parts comprising an "uncivilized" black Africa occupying sub-Saharan regions and an Arab North Africa

fairly “civilized” because of its proximity to the Western civilizations of the Mediterranean region and southern Europe. Gaining currency from the middle of the eighteenth century, the early history of Africa, which was constructed primarily by European explorers, has been an obstacle to scholars who work on the architectural history of the continent because it favors the advancement of the concept of a “primitive” architecture for sub-Saharan Africa in opposition to a mature Islamic architectural civilization for northern Africa. As such, when looking at the history of sub-Saharan African architecture, early scholars of the subject ignored its historical, geographical, and regional variations. Often, the published titles on African architectural history were classified under “primitive” architecture. This method of exploring African history has a major consequence because it denies the reality that Africans also produced monumental architecture during ancient times.

The evidence from archaeological sites in different parts of the continent contradicts the notion that Africans were unable to produce monumental architecture. So far, there are only two main texts that ground traditional African architecture in antiquity and make a strong case for exploring what the archaeological evidence reveals about the continent’s architectural history: Elleh’s aforementioned *African Architecture* and Labelle Prussin’s *African Nomadic Architecture: Space, Place, and Gender* (1995). Both books strongly argue that scholars should look at the archaeological records in the Sahara, especially from the regions of Tassili and Fezzan, in order to gain insights into how different architectural elements evolved on the continent. Prussin’s contribution is particularly interesting in that it traces the origins of the tent structure and the role of women in its construction and perpetuation from prehistoric to contemporary times. Prussin’s propositions help buttress Elleh’s concept of the triple heritage when it comes to the relationships between ancient Egyptian architecture and traditional architecture in sub-Saharan Africa. In *Art History in Africa: An Introduction to Method* (1984), Jan Vansina makes the point that ancient Egyptian art and architecture cannot be fully understood without recognizing that it inherited most of its traditions from the Saharan cultures that predate it by more than three thousand years.

Usually, when people think of ancient Egyptian architecture the image that comes to mind is great pyramids and temples that were built by people whose skin color was lighter than the complexion of people who reside in sub-Saharan Africa. The implication is that, culturally speaking, these people with lighter skin color are entirely distinct from those with very dark skin, and, as such, those with very dark skin produced nothing in antiquity. On the contrary, and backed by strong archaeological evidence, Elleh argues that early Egyptian dynasties and their monumental architecture were built by ancient African kings. Thus, indigenous African architecture includes pyramids, temples, clay (adobe) structures, tent structures, huts made of grass and reeds, and a combination of multiple building materials, and the tectonics of each structure depended on its geographical location and the time in which it was conceived and produced.

For example, Elleh emphasizes that monumental architecture such as the pyramids did not just develop in ancient Egypt overnight. It evolved slowly following the desiccation of the

Sahara Desert, whereupon certain building traditions from the Sahara were transferred to the newly founded kingdom of Egypt by Menes (fl. c. 2925 B.C.E.), the pharaoh whom archeologists identify as Narmer. By the third and fourth dynasties, when Djoser’s Step Pyramid and the Great Pyramid of Khufu (Cheops) were built, the pharaohs were African kings, and their monumental productions were indigenous African productions. This proposition could be extended to the Middle Kingdom (2000–1786 B.C.E.) when most of the powerful pharaohs ruled Egypt. The evolution of ancient Egyptian dynastic architecture shows that long before the conquest of Egypt by Alexander the Great, king of Macedonia, in 332 B.C.E., the Assyrians had taken over around 670 B.C.E., followed by the Persians in 525 B.C.E. This leads one to recognize that the early structures built before the invasions were all proposed and constructed by indigenous African monarchs. J. C. Moughtin’s book *Hausa Architecture* (1985) sheds light on the relationships between certain ancient Egyptian architectural motifs and the motifs that are used by Hausa adobe builders. The relationships between Hausa building traditions and Islamic building traditions within the West African region was studied by Prussin in *Hatumere: Islamic Design in West Africa* (1986). Also important are Peter Garlake’s contributions on the architecture of Great Zimbabwe, the site of ruins within Zimbabwe dating from as early as the eleventh century C.E.

Western (European Colonial) Influences on African Architecture

It has been suggested that the relationships among the three strands of the African architectural heritage cannot be completely isolated from one another in many cases because the cultures have intermixed over time. Yet there are two clearly defined phases during which Western-inspired architectural styles were imported into Africa. The first phase began with the Roman conquest of the North African city-state of Carthage in 146 B.C.E. at the end of the Third Punic War. This conquest brought with it Roman building cultures and architectural traditions that can be found throughout most of North Africa, especially in sites such as El Djem, Tunisia, where a Roman coliseum dating to 300 C.E. can be found.

The second phase began much later, during the fifteenth century, when European explorers began to look for a sea route to the Orient. Pioneered by the Spaniards and the Portuguese, who sailed around the West African Atlantic coasts on their journey to India and the Far East, numerous trading fortresses began to dot the West African coastal landscapes as trade between Europe, Africa, and the Orient became more lucrative. These large structures also heralded the arrival of people from other European countries, such as the Belgians, Dutch, English, French, and Germans, who began to settle along the African coastal territories. Among the first and largest of the European structures was Fort Elmina, built by Diogo d’Azambuja, a Portuguese captain, in 1482, in what was then called the Gold Coast (today’s Ghana). The booming trade between Africa, Europe, and the Orient expanded to the Americas as the slave trade brought from Europe new seekers of treasures in Africa.

In 1820 about five thousand English settlers moved to the Cape in southern Africa. In 1830 France invaded and occu-

pied Algiers. In 1867 the availability of diamonds in the Griqualand West region of southern Africa was brought to the attention of the European settlers. Likewise, gold was brought to the attention of Europeans at Lydenberg, in Transvaal, in 1873. The Berlin Conference of 1884–1885 set in motion the “Scramble for Africa” in which the European powers subdivided the continent into spheres of influences. Cecil Rhodes, who would become prime minister of the Cape Colony in 1890, founded De Beers Consolidated Mines in 1888 and the British South Africa Company one year later. This synopsis of nineteenth-century colonial African history mirrors the manner in which Western architecture was spread on the continent from the turn of the nineteenth century through most of the twentieth century. Because of the manner in which the continent was settled by later European economic immigrants, it is not surprising that South Africa was the area most greatly influenced by Western architecture.

The Arrival and the Sources of Islamic Architecture in Africa

Coupled with Islamic architectural influence in Africa are the processes of Arabization in northern Africa spawned by

migrating and conquering Muslims who were spreading the faith and the new forms of political leadership that Islam inspired from the early part of the seventh century C.E. The religion founded by the prophet Muhammad (c. 570–632 C.E.) spread rapidly throughout most of the Arabian Peninsula into northern Africa. By 641 Egypt had fallen to the Muslim conquerors, and it was only a matter of time before the remaining parts of Byzantine North Africa fell. The rapid spread of Islam and its new building traditions, which incorporated traditions from Byzantine Rome, helped inspire various styles of Islamic architecture in northern Africa. The Great Mosque of Kairouan, Tunisia, started around 670 and completed in the ninth century, is one of the great mosques that set the pace for the new building traditions that emerged in northern Africa. The evidence that Islam had spread to most of West and East Africa before the tenth century is abundant, and Islamic-inspired architectural structures dating to the fourteenth century can be located in Mali, such as the Great Mosque of Djinguere Ber, and Tanzania, such as the Palace of Husuni Kubwa at Kilwa. It is important to keep in mind that the styles of Islamic architecture varied greatly between northern, western, and eastern Africa.

Conclusion

While the triple heritage concept is an important starting point for understanding African architectural history, scholars have to look beyond the traditional sources by exploring the influences of late-twentieth-century capitalism in order to understand the forces that are propelling contemporary African architectural practices. Following the independence movements of the 1960s, leaders of the newly independent African states sent many students to Europe and the Americas to study architecture. Also, a number of schools of architecture were established in Africa, and several postcolonial cities, such as Dodoma, Tanzania; Yamoussoukro, Côte d'Ivoire; and Abuja, Nigeria's new federal capital, which was designed for three million inhabitants, were built. These twentieth-century modernist projects remain to be studied and documented.

ASIA

Parallel to cultural developments in the West during the centuries around the start of the common era—and in essential isolation from the West—completely separate developments were occurring in southern and eastern Asia, shaping civilizations and cultures that continue to this day, and whose fundamental philosophical views continue with little change, despite long contact with the West.

Indian Architecture

The first of these cultures to be treated, and in some ways those that had the most important influence on other Asian cultures, were those that developed in what is now India. As early as 5,000 years ago several cities flourished along the Indus River in northeastern India, producing remarkable artwork and forms of writing still debated as to methods of decipherment. A native Dravidian religion later developed in this area, with emphasis on male and female fertility imagery. About 3,500 years ago groups of Aryan invaders moved in from the north, bringing more ascetic religious practices. These two ancient belief systems underlie Indian temple architecture to this day, combining abstract diagrammatic and symbolic plan arrangements overlaid with a profusion of luxuriant carvings portraying the numerous gods, shown in episodes from their many stories, including depictions of transcendental male and female physical union.

Around 2,600 years ago three major religions developed in India—Hinduism, Jainism, and Buddhism—each with a variant belief in the transmigration of souls, reborn in new bodily form after death. In Hinduism, with its pantheon of numerous deities largely associated with natural elements and events, the ancient emphasis on the individual and the universal, male and female, the phallic *lingam* form and the corresponding female *yoni* imagery, was strongly developed. Hinduism, with its many elaborate rituals carried out by Brahmin priests, was rejected by Jainism, and also by Buddhism, started by Siddhartha Gautama (c. 563–c. 483 B.C.E.), who, through meditation directed at release from human desire, achieved the state of “enlightened one,” or Buddha. Spread throughout India and far beyond by disciples and monks who emulated the Buddha's example, Buddhism rejected the elaborate Hindu rituals in favor of seeking release from self with the extinction of desire, leading ultimately to a state of *nirvana*.

Hindu architecture. In Hindu belief the primordial world floated in a vast ocean, with a sacred mountain at its center consisting of five or six ascending levels or terraces. From this idea developed the concept of the gods residing in the mountains or in sacred caves; this led to the creation of temples as caves carved into the solid rock of cliff sides, the carved elements of the shaped space inside recalling more ancient forms once carved in wood. A good example is the Vishnu cave-temple carved out in the sixth century at Badami in Karnataka, southern India, a hall with many square columnar piers, oriented on a north-facing axis.

Two axes typically govern Hindu temple architecture: a horizontal ground-plane axial system oriented to the cardinal directions, most often facing east; and a towering mass marking a vertical axis. This vertical mass, the *shikhara*, represents the sacred mountain, and rises in massed layers, gently rounded at the top. The enormously thick masonry walls of the base enclose a small internal chamber, the sacred cave-womb space, *garbhagriha*. Leading up to the *garbhagriha* are several chambers, aligned on the principal east-facing axis, surrounded by columnar porches, the entire complex set on a tall plinth or base, the *mandapa*. The type of the northern Indian temple is well represented by the Khandariya Mahadeva temple at Khajuraho, built about 1030 in

the Madhya Pradesh region of north central India, whose rising, slightly parabolically curved *shikhara*, in the quintessential mountain profile, is composed of bundled layers.

Buddhist architecture. Ironically, Buddhist architecture in India is comparatively rare, surviving better in examples based on Indian prototypes but built in places to which Buddhism was carried, such as Sri Lanka and Cambodia, and in wooden framed temples built in China and Japan. The building type mostly closely related to Indian sources is the *stupa*. Following the Buddha's death, his ashes were divided into ten parts, which were carried to places associated with his life and teaching. These portions of his remains were buried in mounds inspired by the small mounded village memorials or *chaityas* traditionally built over the remains of deceased leaders. The Buddhist stupa, a large domed mound covered with stone, represents the dome of heaven; it is enclosed by circular walkways for meditation, and defined by encircling stone fences punctuated by large gates in the cardinal directions representing the winds. A splendid example (remaining in India) is the Great Stupa at Sanchi in the Madhya Pradesh, begun by the Indian ruler Asoka sometime between 273 and 236 B.C.E. The broad dome, 120 feet (36.5 meters) in diameter and rising 54 feet (16.5 meters) in height, is capped with a square railing (*harmika*) and a spire-like form (*chatra*) resembling superimposed umbrellas representing the stages of enlightenment achieved by Buddha as well as symbolizing the bodhi tree under which he achieved his final enlightenment. As Buddhism spread eastward, this *chatra* form is believed to have inspired the development of the Chinese pagoda tower (the name for which derives from the Sanskrit *dagoba* for stupa).

Islamic Architecture

The religious landscape of India, and indeed large portions of southeast Asia, was dramatically changed with the spread of

Detail of the sculptured gate of the Great Stupa at Sanchi, India. Constructed sometime between 273 and 236 B.C.E., the Great Stupa is one of the few surviving examples of original Buddhist architecture. Stupas were built to commemorate the deeds of Buddha, and some are said to enshrine his mortal remains. © ARCHIVO ICONOGRAFICO, S.A./CORBIS

Islam from the west. Islamic armies of the Turks and Afghans conquered northern India in the late twelfth century, and an independent Islamic state was declared there in 1206. Mosque building now took the place of temple building, revealing a fundamental difference in the concept of the religious building. Whereas the Hindu temple was a vertical point marker in space, its interior densely enclosed, dark, mysteriously introvert, the mosque in contrast (inspired by the court of the prophet Muhammad's house in Mecca) was open to the sky, a public gathering place for prayer, extrovert. The introduction of Islam in Hindu India set up a fundamental conflict that still continues, after eight centuries, to generate intense clashes and to cause bloodshed.

By about 1500 this Islamic empire was enlarged by Babur, founder of the Mughal dynasty, to extend from Afghanistan to Bengal. By this time a distinctive north Indian Islamic culture had emerged, with Islam established as the official religion, but with later Mughal emperors such as Akbar and Shah Jahan fostering a broader cultural tolerance. Where the teaching of Islam held firm, however, was in the elimination of figural sculpture from sacred buildings (although figural painting

was practiced separately). Gardens, mirroring the Koranic descriptions of paradise, became a design specialty of the Mughals.

For many observers, the pinnacle of Mughal architecture was reached with the creation of a striking white marble tomb, the Taj Mahal, built by the bereft emperor Shah Jahan on the banks of Jumna River near Agra, Uttar Pradesh, to honor his beloved wife Mumtaz Mahal, who died in childbirth. Begun around 1631, the building itself was finished in six years, while the garden and adjoining buildings were completed in 1643. Bounded by a wall punctuated by a large entry gate on the southern edge is a broad square garden laid out in a precise grid, with channels of water on the axes (symbolic of the rivers of paradise) converging on a slightly elevated pool in the center. Lawns and planted beds fill the four quadrangles; originally intended to have different plants producing flowers continuously during the cycle of the seasons, the flower beds were framed by fruit trees. No literate Mughal entering the garden could fail to appreciate the images of paradise that informed every aspect of the design, for over the entry gate, written out in black marble inlay in a white marble band, is this passage from the Koran:

But Oh thou soul at peace,
Return thou unto thy Lord, well-pleased, and well-pleasing unto Him,
Enter thou among thy servants,
And enter thou My paradise.

At the northern edge, on a raised platform is the white domed tomb, a masterwork conceived by the Shah's architects, Ustad Ahmed Lahori and 'Ahb al-Karim Ma'mur Kahn, aided by the court calligrapher Amanat Khan. The square mass of the central building is a symbol of calm and harmony, for it is exactly as high as it is wide, and the height of the dome is exactly the same as that of the arched entry block. The white marble mass of the building is embellished everywhere with representations of the flowers of paradise, crafted of inlays of jade, lapis, amber, carnelian, jasper, amethyst, agate, heliotrope, and green beryl. In addition to the flower and geometrical ornamental inlays, black marble inlay everywhere presents passages from the Koran that relate to paradise on the Day of Judgment. In its purity of material and its balance of proportions, the Taj Mahal serves as a fitting representation of paradise.

Chinese Temples and Residences

Buddhism was introduced to China around the first century B.C.E. Buddhist temples there were built in the wood-frame tradition that had developed in China around the second millennium B.C.E. A good example, because constrained in size, is one of the oldest surviving wood buildings in China, the Nanchan Temple on Wutai Mountain in Shaanxi province, begun 782 C.E. Stupas in China were replaced by pagodas, inspired not only by the multilevel *chakra* but also drawing on the tradition of local watchtowers. The horizontal layers of the stacked parasols were modified as encircling projecting roof bands (as in the brick pagoda of the Song Yue temples at Song Mountain, Henan province, built in 523). From this evolved

the timber-framed pagoda, with superimposed broad eaves carried by the densely stacked brackets, as seen in the Fogong temple at Yingxian, Shaanxi province, built in 1056.

Before the onslaught of Western influence in the nineteenth century, China's social structure had long been shaped by two philosophical systems resulting from the writings of two sages of the fifth century B.C.E.—Laozi and Confucius (Kong fuzi). These two systems fit nicely with the Chinese concept of *yin* and *yang*, the necessary presence of basic dualities or polarities in the universe, such as male and female. The system of Laozi, called Daoism (from *Dao*, "the way"), in comparison with Confucianism, is nonrational or naturalistic, and nonauthoritarian, embracing the spontaneous variation of nature. Confucianism, in contrast, originally developed as a system to ensure logical orderly governance, was rooted in a sense of underlying order, obedience to authority, veneration of ancestors, and respect for one's elders. These two philosophical systems were brought into alignment with the religious tenets of Buddhism, which flourished in China (prior to the Communist Revolution in the mid-twentieth century).

Confucian ideas of an orderly system intended to promote and maintain social order are well illustrated by one of the oldest manuscripts to survive in China, *Kao gong ji* (The artificer's record), from the fifth century. This remarkable document is a guide for laying out cities, outlining general principles that hold true in large measure for modest residential compounds as well as for the sprawling complex of the imperial household and governmental center of Ming and Qing China—the Forbidden City, Beijing. Chinese culture is about containment—the nation is bounded by a wall (the Great Wall to keep out the barbarians); the city is bounded by a wall (indeed, the word for city and wall is the same, *cheng*); and the individual household compound is bounded by a closed wall. The *Kao gong ji* instructs that a capital city should be a square 4,000 feet to a side, oriented to the cardinal directions, with three gates to a side. The main gate should face south, and the principal street runs north-south, leading to the governmental center. Each of the cardinal axes and directions is associated with one of the five elements, with attributes and colors associated with each of the cardinal directions. East is linked with spring, wood, and the color green. South is associated with summer, fire, and red. West is associated with autumn, metal (in particular gold), and white. North is connected with winter, night, and the color black. Where the axes of the city intersect in the center, *zhong*, is the location of the ruler's residence and place of administration, associated with a vertical *axis mundi*, earth, and the royal color yellow (the central imperial palace buildings—and only these buildings—were covered with yellow glazed roof tiles). There, in a room facing southward toward a court sat the emperor, likewise facing south, at the center of all things.

Residences were walled family compounds, ruled by the male master, with lesser authority associated with his wife and several consorts. The walled house was made up of a series of inward-focused courtyards, and the "good wife" was one who never ventured outside the walls. Ideally laid out on a north-south axis, the house had a simple door opening to the street,

Entrance to Phoenix Hall, Byōdōin Temple, Honshū, Japan. Previously the site of aristocrat Fujiwara Yorimichi's country villa, Byōdōin was converted into a Buddhist monastery in the mid-eleventh century. Phoenix Hall was built at the time of this conversion and was named for its resemblance to the outstretched wings of the mythical bird. © ARCHIVO ICONOGRAFICO, S.A./CORBIS

leading to a first inner service court, lined by kitchen and service rooms to the south, with children's and guest rooms east and west. A door in the northern wall of this court led to a second inner court, lined with children's suites east and west, but on the axis on the north side of this court would be the parents' suite of rooms, often in the very center of which was a large room, the ancestral hall, with an altar on its north side for the veneration of ancestors and the gods.

In contrast to this ordered regularity and the straight axial lines of the house itself was the studied and felicitous irregularity of the adjoining garden in compounds of the more well-to-do. In a *yin* (feminine) and *yang* (male) balance, the house was seen as Confucian while the garden was Daoist. While some gardens could be large, such as the famous ones in Suzhou, even a small court could be made a symbol of nature by the adroit use of a small lagoon or pond, a few selected trees, a selected unusually irregular rock. Paths were made of curved or broken and bent lines, since inauspicious or malevolent spirits could only move along straight lines. Gardens were considered more difficult to design than houses, and they were intended to look as if they had grown entirely out of nature. Hence, the intellectual study of garden design and the making of gardens was a discipline associated with highly educated

poets, philosophers, and men who had distinguished themselves in government service.

Japanese Architecture and Gardens

Japanese architecture, like Japanese culture, is distinct and unique but at the same time incorporates elements imported from China, notably Buddhism. The native religion of Japan, Shinto, is described as a form of nature's idealization, and was largely responsible (some scholars have suggested) for Japan's being able to retain a distinct cultural identity in the face of the strong Chinese influence. The "way of the gods" (the literal meaning of *Shinto*) is based on deep respect for *kami*, an eternal superconsciousness believed to be inherent throughout nature, in ancient trees, in remarkable boulders, in streams, and other natural manifestations, provoking profound awe. Shinto as a religion is itself unique, having neither dogma, scriptures, nor form. The religious content of Shinto, reflected in a native focus on purity of form, material, and construction in objects and architecture, is thought to have been formulated during the Yayoi period (c. 300 B.C.E. to c. 300 C.E.). *Kami* is considered present also in human constructions of utmost simplicity of form and purity of construction. This is demonstrated by the ritual reconstruction, every twenty years,

of the most sacred Shinto shrines, as at the Ise Jingu precinct or shrine on the eastern coast. There, since the reign of Emperor Temmu (672–686), now some sixty times, on identical adjoining sites, the complex of buildings has been meticulously duplicated and rebuilt with new carefully prepared cypress timbers and thick perfectly trimmed thatch roofs, leaving only the most sacred central pole covered and protected on the adjoining site, awaiting the next rebuilding.

Beauty as a principle pervading all nature and, ideally human construction, reshaped Buddhist architecture, introduced from China after 552 C.E. Factions of the imperial family, early converts to Buddhism, strongly endorsed this new religion that was seemingly so contradictory to native Shinto, and supported the building of a temple and monastery complex that became the Horuji temple complex, marked by its tall five-storied pagoda. Other larger temple and monastery compounds followed elsewhere, but perhaps the perfection of Sino-Nipponese Buddhist architecture was reached in a private residential compound converted by its owner, Fujiwara Yorimichi (994–1074) into a realization of the Pure Land Buddhist Paradise as illustrated in the Taima Mandala brought from China in the late ninth century. Built in 1053 in Uji, near Kyoto, the Byodoin contains the regent's private chapel, the Amida Hall, called the Hodo (Phoenix Hall) because its plan with central tail and outstretched wings is said to resemble the phoenix, and also because of the ceramic phoenix images crowning its roof. Reflected in the waters of the lake, the outstretched wings might be seen to suggest flight. Inside sits a gilded wooden image of the Buddha, seated on an open lotus, hands serenely folded in meditation.

An exceptionally ascetic form of Buddhism—Chan (Zen) Buddhism—was introduced from China around 1200. Emphasizing pragmatism while shunning elaborate external rituals, Zen Buddhism held strong appeal for the ruling samurai warriors. Replacing perfunctory ritual with highly focused meditation and stern self-discipline, Zen Buddhism proposed a different path to enlightenment, and its reduction to pure essence is well illustrated by the austere meditative rock gardens of Zen monasteries, most notably in the rock garden at Ryoanji, built in the 1480s in Kyoto. Within this temple courtyard, five groups of judiciously placed rocks are set into a broad bed of carefully raked white pebbles, presenting an image resembling islands in a shimmering sea or mountain tops poking through layers of clouds.

A fine residential example showing the Zen Buddhist focus on essentials and on refinement of detail can be found in the Katsura Villa, built from c. 1616 to 1660 in stages by Prince Hachijo Toshihito and his son Noritada on the Katsura River southwest of Kyoto. The plain-frame construction of now-darkened unlacquered cedar, contrasted with white plastered walls and white paper screens, the studied angles of its gentle gable roofs, and its internal spaces governed in their proportions by the standardized *tatami* floor mats measuring roughly 3 by 6 feet, perfectly realize Zen ideals. But as part of the villa complex itself, the purest manifestation of Zen artlessness, painstaking attention to detail, and careful balance of differing textures in building materials and garden elements

is found in the five dispersed teahouses placed with subtle precision in the surrounding garden. With absolute simplicity of building materials and intimate human scale, the Japanese teahouse is the perfect setting for the austere, stylized, slowly choreographed quasi-religious tea ceremony in which partaking a beverage can be considered a Zen meditation.

Leland M. Roth

ARISTOTELIANISM. Aristotelianism is the tradition that stressed the theoretical “sciences” rather than the practical disciplines in Aristotle’s encyclopedia of the disciplines, and within the theoretical disciplines the systematic presentation of “true and certain” knowledge rather than the inductive search for its principles.

Greek Aristotelianism

The edition of Aristotle’s works made by Andronicus of Rhodes (fl. c. 70–c. 50 B.C.E.) established the knowledge of a comprehensive, structured body of demonstrated conclusions as Aristotle’s ideal of science. The works of Alexander of Aphrodisias (fl. c. 200), the first great commentator on Aristotle, complemented this view of the philosopher’s scientific corpus. The Neoplatonic movement attempted to harmonize the thought of Plato and Aristotle as the two great representatives of the Greek tradition. The tradition of commentary on Aristotle as an introduction to the higher wisdom of Plato was represented at Athens by two works that transformed Aristotle’s encyclopedia into an idealistic system. The *Elementatio theologica* (Rudiments of theology) and the *Elementatio physica* (Rudiments of physics)

of Proclus (410?–485) exhibit all forms of substance as deriving from a single first principle, the Platonic One.

Alexandrian exegesis of Aristotle's text, following Ammonius Hermiae, a pagan (fl. c.550), was more independent. John Philoponus, a Christian (fl. c. 529), even contested various Aristotelian notions. His introduction of the Judeo-Christian idea of creation into philosophy rendered Proclus's entire system questionable. These Alexandrian developments determined, in large measure, the approach to Aristotle's philosophy in the Byzantine world. Plato and Aristotle were regarded as representatives of "Hellenic philosophy," as part of a pagan tradition, generally opposed to "our (Christian) philosophy." The interest of Christian theologians in Aristotle was mostly limited to the parts of his logic necessary in theology, although under the dynasty of the Komnenoi (11th–12th century), Aristotle's practical philosophy enjoyed a rebirth with the commentary on the *Ethics* put together by Eustratius of Nicaea (1054–c. 1117). After the fall of Constantinople to the Crusaders in 1204, the necessity of answering the challenge of an increasingly sophisticated Latin theology led to the composition of compendia of Aristotelian doctrine, although the debate regarding Aristotelian methods of proof continued.

Arabic Aristotelianism

By the ninth century practically the entire corpus of Aristotle's works, together with those of his Greek commentators, had been made available in Islam. Aristotle's classification of the natural sciences supplied the structure for an encyclopedia in which classical authors like Hippocrates (c. 460–c. 377 B.C.E.) and Galen (129–c. 199), Euclid (fl. c. 300 B.C.E.) and Ptolemy (second century C.E.) also found a place. The understanding of science as a body of strictly demonstrated conclusions was decisive for Islamic Aristotelianism. In their commentaries on this enormous body of new doctrine, Arabic philosophers tended to comment on the logic, metaphysics, and natural philosophy as parts of a philosophical encyclopedia; few commentaries on the practical philosophy were written. Muslim thinkers opposed studies concerned with their own way of life, called the "Arabic or traditional sciences" (the Koran; traditions; kalam, or dialectical theology; and the like), to the "Greek or rational sciences," associated for the most part with Aristotle's name. Kalam's task was to supply the faithful with logical proofs for their belief, but its methods of proof forced the Aristotelian philosophers to refine their idea of scientific methodology.

In his *Catalogue of the Sciences*, the Persian philosopher, al-Farabi (c. 878–c. 950) attempted to fit the "traditional sciences of the Arabs" into the Aristotelian division of the sciences. The doctrine of God is taken up under the theoretical science of metaphysics, whereas kalam is regarded as a part of politics, with the function of defending the articles of faith. Al-Farabi demanded that the theologians provide strict demonstrations in defense of Muslim doctrine. About a century later, another Persian philosopher, the famous physician Avicenna (980–1037), undertook to reform kalam in accordance with the Aristotelian theory of demonstrative science and understood kalam not as a part of politics, but rather as metaphysics. Through the Persian theologian al-Ghazali (1058–1111),

Avicenna's conception of logical proof was influential in Muslim theology. Averroës (1126–1198), writing in Muslim Spain, also confronted the theologians with Aristotle's idea of demonstrative science, stressing the truth and certainty of Aristotle's presentation of theoretical science.

Medieval Jewish Materialism

Medieval Judaism also needed Aristotelian science and the logic that went with it. Where conflicts between philosophy and the Jewish faith appeared, some thinkers—of whom Moses Maimonides (1135–1204) was the most significant—held that philosophical speculation must proceed according to the theory of demonstrative science, without regard for theological doctrine. Only when the philosophical and theological doctrines have been clearly defined can one ask how the two realms are related. In spite of this view, an increasingly critical evaluation of Aristotle's doctrines in the light of the Jewish faith appeared in the fourteenth century.

Medieval Latin Aristotelianism

The works of Aristotle were made available in the Latin West in three clearly distinguishable stages. The first stage opened in the sixth century with Boethius's (c. 480–c. 524) translations of Aristotle's treatises on logic, along with some notions transmitted by Cicero (106–43 B.C.E.). Such works had but little effect upon the monastic life of the early Middle Ages. The second stage began in the twelfth century with the gradual translation of the entire corpus of Aristotle's works. Working in the tradition of the *concordia discordantium* (reconciliation of disagreements), Scholastic teachers made the epoch-making decision not to try to separate—as the Byzantines and Muslims before them had done—their own religious disciplines from the profane sciences inherited from the ancients. They attempted rather to situate theological teaching within the Aristotelian classification of the sciences. The masters were guided at first by Boethius and then by Euclid. In his *De hebdomadibus* (Concerning the weekly conferences), Boethius described the organization of scientific knowledge much as Aristotle had done, and early authors sought to develop a general theory of scientific method from it. Gilbert de La Porrée (1076–1154) maintained, for example, that first principles can be established for all the liberal arts and in the same way for theology itself. Nicholas of Amiens (fl. c. 1190) in his *Ars fidei catholicae* (Art of the Catholic faith) attempted to present theological doctrine in accordance with Euclid's geometrical model.

The condemnation in 1210 and 1215 of Aristotle's *libri naturales* (books of natural philosophy) at Paris was followed by an intense effort to axiomatize the quadrivial sciences. The attempt was most successful in the science of optics, a science subalternate to geometry. But the philosophers also turned their attention to Aristotle's theory of science. Robert Grosseteste (c. 1175–1253) commented on Aristotle's *Posterior Analytics*, explaining that "science" means true and certain knowledge derived by syllogistic demonstration from first principles. Accordingly, the theologians undertook to transform their discipline into an Aristotelian science. In his *Summa aurea* (Golden compendium), William of Auxerre (c. 1150–1231) proposed taking the articles of faith as the principles of theological demonstration, on the basis of which Catholic theology could be presented as a structured

body of strictly demonstrated conclusions. This lead was followed in particular by the Dominican theologians of the early part of the century.

By about 1230 the Latins had at their disposal the complete body of Aristotelian teaching together with Averroës's commentaries. The Aristotelian paradigm for science was established institutionally in the year 1255, when Aristotle's works were prescribed for the lectures in the Paris arts faculty. Working within this paradigm, the Latins made, in the course of the next two centuries, enormous progress not only in mathematics and the physical sciences, but also in the Aristotelian practical philosophy, following new translations of the *Ethics* and *Politics*. Albert the Great (c. 1200–1280) was among the first to turn his attention to the complete Aristotelian encyclopedia. His paraphrases of all of the fundamental works in Aristotle's encyclopedia prepared the way for the vast commentary literature through which the Middle Ages assimilated Aristotelian science.

The Aristotelian paradigm was also taken up by the theologians, most prominently by Thomas Aquinas (1225–1274). At this period the theologians were faced with the same problem as that which confronted the masters of arts—the systematic presentation of a body of traditional knowledge. In Thomas's view, theology should present the teaching of Scripture and the church fathers deductively, taking its departure from the indemonstrable, but to the Christian evident, articles of faith. Thomas sought to establish a concord between Aristotle's conclusions and revealed doctrine. While Christian doctrines could not be proved, their acceptance was thought to be able to be shown at least reasonable because congruent with basic philosophical conclusions that Aristotle was thought to have demonstrated.

Anomalies in this paradigm appeared even in the thirteenth century. About the year 1250, as Averroës's real position on the immortality of the human soul became known, the Latins came increasingly to distinguish between the teaching of Aristotle and that of Averroës. But in the year 1277 the bishop of Paris condemned 219 propositions—of which the majority represented Aristotelian positions—because they entailed consequences contrary to revealed doctrine. In the light of the condemnation, John Duns Scotus (1266?–1308) proposed a new conception of the theoretical sciences. His claim that the first object of the intellect is not sensible reality, but, rather, being as such, made it possible to study corporeal reality in a metaphysical way in contradistinction to the corporeal reality studied by the Aristotelian physics. The fact that many of Aristotle's doctrines were in apparent conflict with Christian teaching helped the philosophers to adjust the metaphysical assumptions that lay behind many of his positions, especially in astronomy. Aided by the Aristotelian idea that the individual sciences are autonomous in their own realm, philosophers like John Buridan (c. 1295–c. 1358) were able to develop theories in physics that were independent of Aristotle's treatment, while mathematicians like Nicole d'Oresme (c. 1325–1382) turned to areas that Aristotle had neglected.

Renaissance Aristotelianisms

During the third and final stage in the evolution of Latin Aristotelianism, the traditional conception of the Aristotelian

encyclopedia of the sciences became increasingly untenable. This period began in the year 1438 with the arrival of the Greeks at the Council of Florence. The aged philosopher George Gemistus Plethon (c. 1355–1450 or 1455) charged the Latins not only with being unacquainted with Platonic philosophy, but also with misunderstanding Aristotle's teaching. These misunderstandings arose because the Latins had been misled by Averroës to believe that the philosopher's works contained a demonstrative summary of scientific truth. Nevertheless, the Renaissance witnessed a vast increase in the literature of commentary on Aristotle's works. But at the same time Aristotelianism became but one among many philosophies, with Platonism, Stoicism, and Epicureanism also claiming attention. And the hierarchically unified worldview offered by Scholastic Aristotelianism had by the sixteenth century broken down, so that we must speak, in this period, not of one, but of several Aristotelianisms.

Catholic Aristotelianism. The encounter of the Christian Aristotelianism adumbrated by Thomas Aquinas with a secular Aristotelianism that had arisen in the Italian medical faculties resulted in the radical transformation of the Aristotelian speculative sciences in the sixteenth century. The Scholastic understanding of Aristotle's science of human nature was challenged in particular by Pietro Pomponazzi (1462–1525), who maintained that according to Aristotle the doctrine of the soul belongs to physics as a part of the doctrine dealing with *corpus animatum* (animated physical bodies). Because the soul is a material form, it is impossible to prove its immortality. The proponents of Christian Aristotelianism took up this challenge. They sought to retain Aristotle's deductive theory of science but were forced to modify radically Aristotle's ideas of the subject matter of natural philosophy. Their efforts were based on the search for metaphysical rather than physical proofs for the soul's immortality. Dominicans like Tommaso de Vio (Cajetan, 1469–1534) and Crisostomo Javelli (d. c. 1538) and Jesuits like Benito Perera (c. 1535–1610) and Francisco Suárez (1548–1617) constructed a new science of metaphysics based on the revealed idea of creation. The high point of this development was reached with the publication of Suárez's *Disputationes metaphysicae* (Metaphysical disputations) at Salamanca in 1597. Suárez retained the Aristotelian–Scholastic understanding of science and used the Scotist distinction of reality into *ens infinitum*, *ens creatum immateriale*, and *ens creatum materiale* (infinite being, immaterial created being, and material created being) to render the growing crisis of the Aristotelian physics as the science of *corpus mobile* (changeable physical bodies) irrelevant to Scholastics.

Italian secular Aristotelianism. Constrained by the immense amount of scientific material that the Renaissance had recovered, Aristotelian authors in Italy wrote increasingly during the sixteenth century about the teaching of this new body of doctrine and sought to situate Aristotle's theory of science within a broader context. Jacopo Zabarella (1533–1589), professor at Padua, was the author who brought these developments together most successfully in his tract *De methodis* (On method) of 1578. He distinguished scientific "method" from "orders" of presentation. There are two "methods" of discovery: (1) the compositive or synthetic method, which is the

demonstrative method of “science,” as Aristotle had conceived it; and (2) the resolute or analytic method belonging to the operative disciplines or “arts,” which begin with the end of an action and seek to discover the means and principles by which this end may be attained. “Orders” of presentation are simply ways of presenting the available material clearly. There are two “orders” corresponding to the two “methods” described above.

Lutheran Aristotelianism. Despite Luther’s rejection of Aristotle, the Aristotelian conception of science gained a central place in Protestant universities. Lutheran authors of the late sixteenth century tended to regard theology as a practical science and, following Zabarella, came to think that theological doctrine should be presented according to the analytic “order.” In his *Epitome theologiae* (Epitome of theology) of 1619, Georg Calixt (1586–1656) first applied Zabarella’s idea of the analytic method to theology. But the *Formula concordiae* (Formula of concord) of 1577 established a Lutheran orthodoxy, and philosophical textbooks, like the *Exercitationes metaphysicae* (1603–1604; Metaphysical exercises) of the Wittenberg professor Jacob Martini (1570–1649) and the *Metaphysica commentatio* (1605; A metaphysical commentary) of Cornelius Martini (1568–1621) of Helmstedt, turned to the metaphysics proposed by Suárez, which all those who admitted the idea of creation could accept. Their understanding of the relationship between philosophy and theology opened the way for the free development in Lutheranism of a natural theology as a theoretical science, presented in accordance with Zabarella’s synthetic order. The first independent treatise on *Theologia naturalis* (Natural theology) was published by Christoph Scheibler (1589–1653) at Giessen in 1621.

Calvinist Aristotelianism. Reformed theologians of the early seventeenth century regarded their science as essentially theoretical. In the works of authors like Bartholomew Keckermann (1571/73–1609) of Heidelberg and Danzig, Clemens Timpler (1567–1624) of Heidelberg and Steinfurt, and Johann Heinrich Alsted (1588–1638) of Herborn, the idea of a synthetic presentation of doctrine was maintained, but the encyclopedia of the disciplines was enlarged and transformed by a theory of the arts, a “technology.” Reformed theologians began to use the term “system” for ordered compilations of Christian teaching. For the Marburg professor Rudolph Goclenius (1547–1628), who used the word for the first time in his *Lexicon philosophicum* (1613; A philosophical lexicon), “ontology” has the role of assigning to each of the scientific disciplines its proper place in this new encyclopedia of the practical, productive disciplines.

Neo-Scholasticism. The last edition of the Latin text of Aristotle’s works was published by the Jesuit Silvester Maurus (1619–1687) in the year 1668. After the Thirty Years’ War, Protestant Aristotelianism generally disappeared. But Catholic Scholasticism continued to enjoy a shadowy existence in the seminaries decreed by the Council of Trent (1545–1563). A new literary form appeared, the *cursus philosophicus*, a summary of Scholastic teaching in philosophy, generally written in the form of disputations on the works of Aristotle. The purpose of the *cursus* was to provide the basic philosophical knowledge necessary for the study of Catholic theology, and it tended

increasingly to return to the teaching of one of the great thirteenth-century doctors, like Thomas Aquinas (Thomism) and Duns Scotus (Scotism).

Modern Study of Aristotle

The Neo-Scholasticism of the nineteenth century thought of Aristotle’s philosophy as a response to the Enlightenment’s rejection of a worldview in which revelation appeared necessary and its acceptance reasonable. The *cursus* found the support of the Catholic Church in Pope Leo XIII’s encyclical *Aeterni Patris* of 1879 and various pieces of legislation concerning the instruction in seminaries. The Dominican and Jesuit orders followed the doctrine of Thomas Aquinas, while the Franciscan order followed that of Duns Scotus, both emphasizing Aristotle’s metaphysics, even for cosmological and psychological questions.

The publication by the Berlin Academy of the *Aristotelis opera* between 1831 and 1870 and of the *Commentaria in Aristotelem graeca* between 1882 and 1909 has supplied the basis for the modern study of Aristotle and the Greek tradition of his philosophy. The *Aristoteles latinus*, undertaken by the Union Académique Internationale in 1939 for the edition of the medieval Latin translations, two collections of the Latin translations of the Greek commentaries, as well as a series of English translations of them, have contributed to a new understanding of Aristotelianism in the twentieth century.

ARTS.

This entry includes two subentries:

Overview

Africa

OVERVIEW

While people have always made objects that are rightly considered works of art, the *idea* of the arts is a separate category of human endeavor—distinct, that is, from other kinds of human activity such as hunting or food gathering or making in general—is a relatively modern construction.

The “Era of Art”

In the forward to his monumental study of the medieval icon, *Bild und Kult*, translated *Likeness and Presence* in the American edition, Hans Belting explains the book’s rather curious subtitle—*A History of the Image before the Era of Art*—in terms that immediately focus on the issues surrounding the idea of the visual arts, especially just what they are and how they function in culture as a whole:

Art, as it is studied by the discipline of Art History today, existed in the Middle Ages no less than it did afterwards. After the Middle Ages, however, art took on a different meaning and became acknowledged for its own sake—art as invented by a famous artist and defined by a proper theory. While the images from olden times were destroyed by iconoclasts in the Reformation period, images of a new kind began to fill the art collections which were just then being formed. The era of art, which is rooted in these events, lasts until this present day. From the very beginning, it has been characterized by a particular kind of historiography which, although called the history of art, in fact deals with the history of artists. (p. xxi)

The historiography to which Belting refers is exemplified by the work of Giorgio Vasari (1511–1574). A painter in his own right, he was by all accounts the first serious collector of drawings—he believed that they revealed the very moment of artistic inspiration. His passion for drawing also led him to found the Accademia del Disegno (Academy of Design) in Florence in 1562. He theorized that *disegno* (meaning both “drawing” and “design”) was superior to *colorito* (“painting in color”) because the former was an exercise of the intellect, while the latter appealed only to the sensual appetites. At the

Reliquary effigy of St. Foy (gold and silver over a wooden core, studded with precious stones and cameos), mostly 983–1013, with later additions. Created to contain the skull of a martyred child who was put to death for refuting pagan worship, the artistic power of the effigy lies not in its resemblance to the actual child, but in its purpose as the vessel that houses the sacred remains. © GIRAUDON / ART RESOURCE, NY

Accademia he encouraged artists to develop their talents unfettered by the constraints of tradition and convention, arguing that genius was most readily realized in invention.

All of Vasari’s preoccupations are reflected in his *Lives of the Most Eminent Painters, Sculptors, and Architects*, first published in 1550 and then greatly revised and expanded in 1568.

Vasari's book marks the historical moment when what people today so readily think of as the visual arts were transformed from objects reflecting the manual skills of the individual craftsman to reflections of the intellectual and creative powers of the artist. Before the "era of art," the image, however artistically made, served specific cultural, religious, or political functions. It was required, quite literally, to perform. As Belting puts it, "Authentic images seemed capable of action, seemed to possess *dynamis*, or supernatural power" (p. 6). They performed miracles, warded off danger, and healed the sick. If in the "era of art" images lost this power, they gained a considerable expressive dimension. They became the medium through which artists—in the era of art, they are called "artists"—express their own ideas and feelings and make manifest their own individual talent or genius.

The difference between the image before the era of art and the image after is readily apparent if we compare the reliquary effigy of St. Foy at Conques in France and Leonardo da Vinci's (1452–1519) famous *Mona Lisa*. St. Foy was a pilgrimage church built in 1050–1120 to accommodate pilgrims on their way to Santiago de Compostela, in the northwest corner of present-day Spain, a favorite pilgrimage destination because the body of the apostle St. James the Greater, which lay at rest there, had a reputation for repeated miracles. St. Foy housed the relics of St. Foy ("Saint Faith" in English), a child who was martyred when she was burned to death in 303 for refusing to worship pagan gods. Her skull was contained in this elaborate jeweled reliquary, which stood in the choir of the church where pilgrims could view it from the ambulatory that circles the space. The head of the reliquary was salvaged from a late Roman face guard and parade helmet and reused here. Many of the precious stones that decorate the reliquary were the gifts of pilgrims themselves. The saint's actual skull was housed in a recess carved into the back of the reliquary, and below it, on the back of her throne, was an engraving of the Crucifixion, indicating the connection between St. Foy's martyrdom and Christ's own.

Now, the St. Foy effigy, fashioned out of the antique Roman mask, bears no real resemblance to the saint herself. Its value resides not in any likeness, but in its contiguity with the skull housed within. It literally "touches" the physical remains of a child burned to death, at least symbolically, by the soldier whose face this mask once guarded. The Roman artifact has thus been completely transformed—from the pagan to the Christian, from male ornament symbolic of war to a female form symbolic of faith. And it symbolizes, further, the transformation that awaits the faithful, from the physical confines of the body to the spiritual realm of the soul. Pilgrims decorated the reliquary not merely in penitence for their sins but because they felt, in its presence, the need to sacrifice their material wealth in symbolic repetition of the saint's sacrifice of her person. In one of the most important first-hand accounts of the relationship between the cult statue and the pilgrims who came to venerate it, Bernard of Angers, who made three trips to Conques beginning in 1013, describes how he was at first skeptical of the reliquary's power: "I looked with a mocking smile at [his companion] Bernier, since so many people were thoughtlessly directing their prayers at an object

without language or soul, . . . and their senseless talk did not come from an enlightened mind." But he soon changed his mind:

Today I regret my foolishness toward this friend of God. . . . Her image is not an impure idol but a holy momento that invites pious devotion. . . . To be more precise, it is nothing but a casket that holds the venerable relics of the virgin. The goldsmith has given it a human form in his own way. The statue is as famous as once was the ark of the covenant but has a still more precious content in the form of the complete skull of the martyr. This is one of the finest pearls in the heavenly Jerusalem, and like no other person in our century it brings about the most astonishing miracles through its intercession with God.

It is as if, he says, "the people could read from the luster of these eyes whether their pleas had been heard" (pp. 536–537). It is the efficacy of the relics within that the people read into the statue's outward gaze.

The relationship between the image and its beholder is entirely different in Leonardo's *Mona Lisa* (1503–1506). In the first place, the image is, above all, a likeness. Vasari was the first to use the name by which the painting is now known, leading to speculation that the sitter is Lisa Gherardini, who married the Florentine merchant Francesco Bartolomeo del Giocondo in 1495, but other testimony contradicts this thesis, and her identity remains a mystery. This mystery, of course, lends the painting much of its fame, for without any relevant biographical knowledge, any clues as to what she might be thinking are pure speculation. As David Summers put it in his important contribution to global and intercultural art history, *Real Spaces* (2003), "She is the individual mask of her own inwardness, of the mind and heart suggested to us by her famous smile." Leonardo's purpose, Summers reminds us, was to make "the invisible (the movements of the soul) visible in the movements of the body," even in such a small movement as the upward turn of the sitter's lips. But Leonardo himself recognized

that artists run the risk of making images look like themselves because the same individual soul that shaped the artist's physical appearance also judges the beauty and rightness of the figures the artist makes. Leonardo recommended that artists study proportion, which will give them the means to counteract this distorting narcissistic tendency. His argument assumes coincidence between individual appearance and individual soul, outwardness and inwardness. It also suggests the difficulty of distinguishing the perception of another from oneself. (p. 331)

Thus the enduring myth that *Mona Lisa* is in fact a self-portrait, Leonardo's revelation of his "feminine side." But more important, Summers makes clear here the way in which the visual arts, in the era of art, are removed from the cultural dynamic that informs the medieval icon. Just as surely as the meaning of the reliquary statue at St. Foy resides "inside" its mask, so the meaning of the *Mona Lisa* resides beneath her

Mona Lisa (1503–1506) by Leonardo da Vinci. Oil on wood. Da Vinci's masterpiece is a study in inwardness and what exists just below the surface, and admirers have spent centuries trying to decipher the subtle clues in the subject's face for an indication of what thoughts are in her head. © THE BETTMANN ARCHIVE

superficial appearance. But her meaning is private, personal, immaterial. She is forever meditative, forever a mystery, a self-reflective soul. People visit the Louvre in the early twenty-first century, in a procession not so unlike that of the medieval pilgrims, because, in the space between image and beholder, the self-reflection that the image portrays is recreated in one's reflections upon it. As Denis Donoghue has put it, "The mysteriousness of art is in all art; . . . it suffuses the space between the image and its reference" (p. 32).

From *Ars* to *Arte* to *Beaux-Arts*

The transformation of the image from an efficacious to a reflective space is coincident with the rise of the very idea of the "arts." Before the era of art, the word *art* had much broader meaning than it does today. The Latin *ars* (and the Greek *technē*) referred to almost any branch of human endeavor—the work of the farmer, the shipwright, the military commander, the magician, the cobbler, the poet, the flute player, the vase painter, all were included in the general category of the "arts" so long as their endeavors were executed with a certain

degree of skill. In the *Ethics* (book 6), Aristotle distinguished between two spheres of action—*praxis*, doing, or moral or political conduct, and *poiesis*, making, producing, or performing. The intellectual virtue attendant to *poiesis* is *technē*—art, technique, skill, and know-how—"the trained ability of making something under the guidance of rational thought" (1140.9–10). Aristotle further distinguishes between the liberal and servile arts. The liberal arts are those that work with the intellect, including the verbal arts of grammar and rhetoric and the mathematical arts of arithmetic, geometry, astronomy, and music. The servile arts are those associated with physical labor and, generally, work for pay. Thus the work of the farmer and the cook were more or less equivalent to that of the architect, the sculptor, and the painter. As John Boardman puts it in his *Greek Art*, "Art for Art's sake" was virtually an unknown concept; there was neither a real Art Market nor Collectors; all art had a function and artists were suppliers of a commodity on a par with shoemakers" (p. 16).

Even by Vasari's time, things had hardly changed. He does not use the Italian *artista* to refer to "the artist," but rather *artifice*, "artificer." "What a happy age we live in!" he wrote, reacting to the sight of Michelangelo's Sistine Chapel frescoes. "And how fortunate are our artists [*artifice*] who have been given light and vision by Michelangelo and whose difficulties have been smoothed away by this marvelous and incomparable artist [*artifice*]." Indeed, the word *artista* was more generally used to refer to those who studied the more intellectual liberal arts, particularly rhetoricians. Furthermore, the Italian word *arte*, which in modern usage means simply "art," was in medieval times and throughout the Renaissance, the word for "guild," including, in Florence, the *Arte della Lana*, the wool guild; the *Arte di Seta*, the silk guild; and the *Arte di Calimala*, the cloth merchants' guild. Thus *art* remained simply making, skill, and know-how. The bankers had their *arte*, and so did the lawyers—perhaps because of their rhetorical skill the lawyers' was the most prestigious of all.

Not until the middle of the eighteenth century did the arts separate themselves off from other fields of endeavor into their own exclusive area of expertise. In what is one of the best surveys of the history of the *arts* as an idea, Larry Shiner points to two crucial texts—Charles Batteux's *Les beaux arts réduit à un même principe* (The fine arts reduced to a single principle), published in 1746 in France and translated into English three years later as *The Polite Arts; or, A Dissertation on Poetry, Painting, Musick, Architecture, and Eloquence*, and the 1751 edition of Denis Diderot and Jean Le Rond d'Alembert's *Encyclopédie*.

Batteux claimed there are actually three classes of arts: those that simply minister to our needs (the mechanical arts); those whose aim is pleasure (the beaux-arts par excellence); and those that combine utility and pleasure (eloquence and architecture). Batteux also used two other criteria for separating the beaux-arts from the rest: genius, which he calls "the father of the arts," because it imitates beautiful nature, and taste, which judges how well beautiful nature has been imitated. . . . The *Encyclopédie* now grouped all five fine arts (poetry, painting, sculpture, engraving, and music) under the faculty of

imagination as one of three main divisions of knowledge, splendidly isolated from all other arts, disciplines, and sciences. (pp. 83–84)

Nevertheless, as Shiner points out, Diderot's article "Art" in the *Encyclopédie* ignores the new category of "beaux-arts" altogether and concentrates exclusively on the mechanical arts, representations of which constitute almost the entirety of the *Encyclopédie's* illustrations. It would be another twenty-five years before an article on the "beaux-arts" would finally find its way into a supplement to the *Encyclopédie*. According to d'Alembert, the category of the *beaux-arts*—the term that the English world would translate first as the "polite arts" and then as the "fine arts"—consisted of any works that have pleasure for their aim and that rely on the imagination (inventive genius) as opposed to memory (history) or reason (philosophy). The cult of originality and imagination inaugurated by Vasari in his *Lives* reached its ultimate conclusion here.

The "Arts" and Other Cultures

Shiner makes a convincing case that the arts are a modern invention, "not an essence or a fate but something we have made . . . [an] invention barely two hundred years old" (p. 3). One of the first to convincingly argue the point was Paul Oskar Kristeller in his 1950 essay "The Modern System of the Arts," but Shiner's argument is distinguished by its awareness that the category of the "arts" is a markedly European construct, one that in recent years has come under increasing scrutiny as the (Western) art world has "opened" itself to works made in other cultures. In the process, the very idea of the "arts" has begun to change once again.

One of the key moments in this process happened in the summer of 1989, with the opening of an exhibition in Paris that announced itself as "the first world-wide exhibition of contemporary art." Called *Magiciens de la terre*, or *Magicians of the Earth*, the show consisted of works by one hundred artists, fifty from the traditional "centers" of Western culture (Europe and America) and fifty from the so-called Third World, from Asia, South America, Australia, Africa, and, incidentally, Native American art from North America. The show's curator, Jean-Hubert Martin, conceived of the exhibition as a way to show the real differences between and specificity of different cultures. But the exhibition raised many questions of the kind articulated by Eleanor Heartney in her extended review of the show in *Art in America*:

Can there really, one wonders, be any continuum between a Kiefer painting and a Benin ceremonial mask? How does one make judgments of "quality" about objects completely foreign to our culture and experience? Is there any "politically correct" way to present artifacts from another culture, or does the museological enterprise inevitably smack of cultural exploitation? Wary of the tendency to romanticize the lost purity of vanished worlds, the organizers have emphasized societies in transition, in many cases choosing Western and non-Western artists who represent an exchange of influences between their respective cultures. Still, one wonders if

Kwakiutl mask from British Columbia, Canada, 1887. Painted wood. The Kwakiutls, a native American tribe found along the northwest coast of Canada, utilized masks for virtually every occasion in their culture. William Rubin, director emeritus of New York's Museum of Modern Art, attempted to compare Kwakiutl art to that of Picasso to prove that abstraction is a universal concept. © BILDARCHIV PREUSSISCHER KULTURBESITZ / ART RESOURCE, NY

such exchanges are really equivalent. Is the same thing going on when an artisan from Madagascar incorporates airplanes and buses within the traditional tomb decorations of Madagascar and Mario Merz appropriates the igloo or hut form into his sculptures? (pp. 91–92)

In order to treat all the show's exhibitors on equal terms, the curators included only the names of each work's creator and its geographical origin in identifying the pieces. As a result, the average Western viewer was encouraged, as Heartley says, "to apply preexisting Western esthetic standards to objects where such standards are irrelevant" (p. 92).

Nevertheless, in its recognition of the growing impact of Western culture and modern technology on "evolving" cultures, and its refusal to romanticize the originary purity of the artifacts on display, the show marked a distinct advance over the Museum of Modern Art's 1984 exhibition *'Primitivism' in 20th-century Art: Affinity of the Tribal and Modern*. Curator William S. Rubin tried to show that abstraction was a universal language by comparing, for instance, Pablo Picasso's *Girl before a Mirror* to a Kwakiutl mask from British Columbia the likes of which Picasso had almost certainly never seen and arguing that what "led artists to be receptive to tribal art" in the twentieth century

The greatest gifts are often seen, in the course of nature, rained by celestial influences on human creatures; and sometimes, in supernatural fashion, beauty, grace, and talent are united beyond measure in one single person, in a manner that to whatever such a one turns his attention, his every action is so divine, that, surpassing all other men, it makes itself clearly known as a thing bestowed by God (as it is), and not acquired by human art. This was seen by all mankind in Leonardo da Vinci, in whom, besides a beauty of body never sufficiently extolled, there was an infinite grace in all his actions; and so great was his genius, and such its growth, that to whatever difficulties he turned his mind, he solved them with ease. . . . In learning and in the rudiments of letters he would have made great proficience, if he had not been so variable and unstable, for he set himself to learn many things, and then, after having begun them, abandoned them. Thus, in arithmetic, during the few months that he studied it, he made so much progress, that, by continually suggesting doubts and difficulties to the master who was teaching him, he would very often bewilder him. He gave some little attention to music, and quickly resolved to learn to play the lyre, as one who had by nature a spirit most lofty and full of refinement: wherefore he sang divinely to that instrument, improvising upon it. . . . He practised not one branch of art only, but all those in which drawing played a part; and having an intellect so

divine and marvellous that he was also an excellent geometrician, he not only worked in sculpture, making in his youth, in clay, some heads of women that are smiling, of which plaster casts are still taken, and likewise some heads of boys which appeared to have issued from the hand of a master; but in architecture, also, he made many drawings both of ground-plans and of other designs of buildings; and he was the first, although but a youth, who suggested the plan of reducing the river Arno to a navigable canal from Pisa to Florence. . . . And there was infused in that brain such grace from God, and a power of expression in such sublime accord with the intellect and memory that served it, and he knew so well how to express his conceptions by draughtmanship, that he vanquished with his discourse, and confuted with his reasoning, every valiant wit. . . . It is clear that Leonardo, through his comprehension of art, began many things and never finished one of them, since it seemed to him that the hand was not able to attain to the perfection of art in carrying out the things which he imagined; for the reason that he conceived in idea difficulties so subtle and so marvellous, that they could never be expressed by the hands, be they ever so excellent.

had "to do with a fundamental shift in the nature of most vanguard art from styles rooted in visual perception to others based on conception"—that is, abstraction (p. 11). The reaction to Rubin's show was dramatic—and negative. Many critics believed that Rubin unwittingly outlined the terms by which so-called tribal cultures had traditionally been appropriated—that is, colonized and consumed—by Western culture. Others pointed out that Rubin's so-called tribal art was not, to the cultures that produced it, art at all. In a particularly severe review in *Artforum*, Thomas McEvelley took Rubin to task for insisting that the specific function and significance of each of the objects in the show was irrelevant. "But it is also true," McEvelley points out, "that he attributes a general function to all the objects together, namely, the esthetic function, the function of giving esthetic satisfaction. In other words, the function of Modernist works is tacitly but constantly attributed to the primitive works. . . . Religious objects . . . are misleadingly presented as art objects" (pp. 58–59).

In other words, most of the works in this exhibition were produced before their particular cultures had entered the "era of art," and Rubin proceeded as if Western historiography determines global historiography. There was long-standing precedent for Rubin's position, one of the most notable of which was Paul Guillaume and Thomas Munro's ground-breaking *Primitive Negro Sculpture*, first published in 1926 but still current enough in 1968 to be reprinted by Hacker Art Books. As Christa Clarke has summarized the book's ground-breaking principles: "*Primitive Negro Sculpture* . . . differs from earlier publications in providing clearly developed aesthetic criteria for an evaluation of African sculpture. The text not only makes distinctions between 'art' and 'artifact,' but also specifies ideal formal properties and delineates cultural 'style regions' based on shared stylistic characteristics" (p. 41). All the illustrations in the book were from the collection of the Barnes Foundation, collected by Albert C. Barnes in order to demonstrate his own aesthetic theory,

Quetzal feather headdress of Aztec emperor Montezuma II, c. 1520. Fashioned from beads, shells, and over four hundred iridescent quetzal feathers, this elaborate headdress was presented to Holy Roman Emperor Charles V by Cortés. Quetzals were considered sacred by the Aztecs, who believed the birds represented wisdom and peace. © ERICH LESSING / ART RESOURCE, NY

which was founded on the belief in ideal form. In Clark's summary:

Great art does not imitate nature but interprets the experience of seeing nature through "plastic means"—that is, through color, line, light, and space. This exclusive focus on "plastic form" provided a critical framework that encompassed all visual material, regardless of cultural origin or subject matter. Barnes's aesthetic studies led him to consider African sculpture as the purest expression of three-dimensional form. (pp. 42–43)

Thus Guillaume and Munro, working at Barnes's behest, not only differentiate African "art"—sculptures and masks (i.e., religious objects and fetishes)—from African "artifacts"—cups, utensils, musical instruments—but they emphasize the formal qualities of the "art" in particular:

To the eye, to the hand, to both together moving over the surface, the statue is like music in its succession of repeated and contrasting sensuous forms, its continuities and subtle alterations of a theme. Or rather it is the material for music that one may compose at will,

proceeding always in a new order from line to line and mass to mass, singling out and reorganizing the elements, perceiving always some new relationship that had never presented itself before. (p. 33)

Guillaume and Munro may as well be writing about the art of Picasso or Henri Matisse (1869–1954), both of whose work, of course, Barnes admired and collected.

In fact, one of the most notable aspects of modern art historiography in the West is its refusal to see the artifacts of other cultures in terms other than the formalist aesthetic of modernism. McEvilley underscores the fact with a telling example:

In New Guinea in the '30s, Western food containers were highly prized as clothing ornaments—a Kellogg's cereal box became a hat, a tin can ornamented a belt, and so on. Passed down to us in photographs, the practice looks not only absurd but pathetic. We know that the tribal people have done something so inappropriate as to be absurd, and without even beginning to realize it. Our sense of the smallness and quirkiness of their world view encourages our sense of the larger scope and greater clarity of ours. Yet the way Westerners have related to the primitive objects that have floated through their consciousness

would look to the tribal peoples much the way their use of our food containers looks to us: they would perceive at once that we had done something childish in appropriate and ignorant, and without even realizing it. Many primitive groups, when they have used an object ritually (sometimes only once) desecralize it and discard it as garbage. We then show it in our museums. In other words: our garbage is their art, their garbage is our art. (p. 59)

In sum, the category “art” is by no means universal.

In *The Invention of Art*, Larry Shiner points out that “the Japanese language had no collective noun for ‘art’ in our sense until the nineteenth century” nor before the nineteenth century had anyone in China “grouped painting, sculpture, ceramics, and calligraphy together as objects” sharing any qualities in common (p. 15). Indeed, there is, among non-Western peoples and those cultures that exist on Western culture’s margins, a growing antipathy to the appropriation of their “crafts” into the art context. Shiner cites a statement by Michael Lacapa, an “artisan” of mixed Apache, Hopi, and Tewa heritage, that he encountered at the Museum of Indian Arts and Culture in Santa Fe in 1997:

What do we call a piece of work created by the hands of my family? In my home we call it pottery painted with designs to tell us a story. In my mother’s house, we call it a wedding basket to hold blue corn meal for the groom’s family. In my grandma’s place we call it a Kachina doll, a carved image of a life force that holds the Hopi world in place. We make pieces of life to see, touch, and feel. Shall we call it “Art?” I hope not. It may lose its soul. Its life. Its people. (p. 273)

Quite clearly, the process that would transform Lacapa’s pottery, basket, or Kachina doll is not so much their appearance in the Museum of Indian Arts and Culture (where they apparently fall on the “culture” side of things), but the fact that they were to be purchased, collected, and commodified by agencies outside the culture and “life” in which they were produced.

Homi Bhaba, one of the great students of contemporary “global” culture, has reminded us of the “artificial” consequences of Western colonization. “The great remains of the Inca or Aztec world are the debris,” he writes, “of the Culture of Discovery. Their presence in the museum should reflect the devastation that has turned them from being signs in a powerful cultural system to becoming the symbols of a destroyed culture” (p. 321). The headdress of Montezuma II (in Nahuatl, Motecuhzoma; r. 1502–1520), presented to the Habsburg emperor Charles V (r. 1519–1556) by Hernán Cortés and now in the Museum of Ethnology in Vienna, is a case in point. Consisting of 450 green tail feathers of the quetzal bird, blue feathers from the cotinga bird, beads, and gold, it is a treasure of extraordinary beauty. But the historical moment is being approached, if not already here, when such objects will be allowed to give up their status as “art,” except insofar, perhaps, the recognition that the “arts” are a historically constructed phenomenon that conveniently serves to mask social history. “It seems appropriate,” Homi Bhaba says, “[to make] present in the

display of art what is so often rendered unrepresentable or left unrepresented—violence, trauma, dispossession” (p. 321). It seems likewise appropriate to let the arts, which in the early twenty-first century have neither pleasure nor the revelation of genius as their principal aims, represent these things.

Henry M. Sayre

AFRICA

Between 1520 and 1521, the famous German painter and engraver Albrecht Dürer (1471–1528) purchased two African ivory carvings in the Netherlands. He was so impressed by their craftsmanship that he noted in his diary:

all sorts of marvelous objects for human use much more beautiful to behold than things spoken of in fairy tales.

. . . And in all the days of my life, I have seen nothing which rejoiced my heart as these things—for I saw among them wondrous artful things and I wondered over the subtle genius of these men in strange countries. (Fagg, p. 9)

The Myth of Primitivism

Although stylized carvings from the kingdoms of Sapi, Benin, and Kongo were popular in Europe in the sixteenth century, scholarly interest in African art in general did not begin until the nineteenth century, when European colonization of Africa increased the number of examples arriving in European museums. But by this time the European attitude to the arts of other cultures had changed drastically, having been influenced by ideas of Enlightenment and evolution. Both ideas placed European culture at the apex of human development, using its naturalistic representations as the benchmark for the arts of other cultures. And since most of the sculptures and masks from Africa were stylized or conceptual in form, European scholars looked down on them as “primitive” and a failed attempt to imitate nature.

Although naturalistic representation turned up as early as 1910 in Africa, such as the terra cotta and brass figures of Ife, Nigeria, they were dismissed as the works of foreigners. In fact, Leo Frobenius, the German anthropologist who first brought Ife art to world attention, attributed the portraits to the ancient Greeks, who, he speculated, might have settled among the Yoruba before the Christian era. According to him, if a full figure in the Ife style were to be found, it would almost certainly reflect a proportion similar to that of classical Greek art. Fortunately, a full figure has been found and dated to the twelfth and sixteenth centuries of the Christian era. Contrary to expectation, its proportion is completely different from that of Greek art but closer to what is found in the generality of African figure sculpture—the head being about a quarter of the whole body, notwithstanding the naturalistic treatment of body parts.

By and large the myth of primitivism is no longer taken seriously. First, its assumption that naturalism was a late stage in the progressive evolution of art from the conceptual to the lifelike has been debunked by the occurrence of naturalistic images in the prehistoric rock art of Africa, Europe, and Australia. Some of the examples from Africa were created about twenty-five thousand years ago. Second, from a close study it is now known that the disregard for naturalism in African art is deliberate, not the result of a technical deficiency. It has been influenced by different cosmologies that not only trace the origin of art to supernatural beings but also identify the human body as a piece of sculpture animated by a vital force or soul. In other words, art makes the spirit manifest in the physical world. The time-honored ritual still associated with the creation of sculptures and masks today clearly shows that art in precolonial Africa was not so much concerned with imitating reality as with evoking its essence. Thus stylization hints at the interrelatedness of the physical and metaphysical. Ironically, the same so-called primitive art of Africa contributed significantly to the birth of modern European art at the beginning of the twentieth century, inspiring prominent artists such as

André Derain, Maurice Vlaminck, and Pablo Picasso, among others, to abandon naturalism in favor of stylization and abstraction.

Functionalism, Structuralism, and “One Tribe, One Style”

The pre-nineteenth-century European distinction between “art” (the nonutilitarian) and “craft” (the utilitarian) also contributed to the prejudice against African art, given its use in ritual ceremonies. This distinction turned African sculptures and masks into ethnological specimens and a gold mine for anthropologists interested in the relationship between art and society. Some applied the functional theory developed in the 1920s by the French sociologist Émile Durkheim (1858–1917) and his followers, emphasizing the interconnection of ritual, religion, language, social practices, and symbolic expressions. Others employed the structuralist model popularized in the 1950s and 1960s by Claude Lévi-Strauss (b. 1908) to search for deeper meanings or a concealed order in symbolic or language systems. In both approaches—often combined in the same study—art was treated as part of an organic whole and as an aspect of myth, religion, or kinship system. Little attention was paid to aesthetic factors, individual creativity, and the historical factors affecting form and style (for a comprehensive review of the literature, see Gerbrands).

Between 1935 and 1946, the Museum of Modern Art in New York organized major exhibitions of African and Oceanic art to familiarize the public with their influence on European and American modernism. By the 1950s some American art historians such as Robert Goldwater (New York University) and Paul Wingert (Columbia University) had started offering courses in African art. The emergence of many newly independent African states from the 1960s onward resulted in a worldwide increase of scholarly interest in African affairs.

Most of the early surveys of African art focused on style areas, inaugurating what Sidney Kasfir (1984) calls the “one tribe, one style” conceptual model. Its underlying assumption was that the styles and iconographical elements that define the art of a given group had been fixed for centuries, untouched by outside influences. It thus encouraged the study of African art in the “ethnographic present.” A sea change occurred in the late 1960s and early 1970s with the arrival in the field of new scholars who combined art-historical and anthropological methods in a more critical way. Apart from focusing on the art of specific African cultures, they took cognizance of individual and regional variations within a major style area. In addition, they documented artistic exchanges between contiguous and distant groups due to military conquest or centuries of trade, migration, and/or social interaction.

Unlike their predecessors, who focused mainly on art objects and ignored the artists who created them, the new scholars and their students recorded names of artists, possible dates of objects, and contexts of use, among other data. Since then there has been a shift from an emphasis on the religious significance of art to its implications in the realm of politics, psychology, gender, mass communication, and performance. Such was the involvement of art in all phases of life in precolonial

Africa that scholars began to use the term *art for life's sake* to distinguish African art from the European idea of art for art's sake.

In the early twenty-first century the more rigorous approach of a new generation of scholars is shedding new light on old problems and assumptions. For example, previous scholars paid little attention to the interaction between Islam and African art or simply concluded that Islam had had a totally negative impact on African sculpture, given its injunction against image-making. Late twentieth and early twenty-first century scholarship provides evidence to the contrary. Field studies by René Bravmann (1974), Labelle Prussin, Frederick Lamp, and other scholars demonstrate that Muslims in some areas of West Africa have not totally abandoned their ancestral art and religion. By emphasizing the recreational function of African masking, they have succeeded in preserving it in an Islamic context. It is therefore not unusual (among the Baga of Guinea and the Dyula of Mali, Côte d'Ivoire, and Ghana) to see masked performers in the early twenty-first century during important Islamic holiday celebrations, such as the end of Ramadan or the birthday of Prophet Mohammed. Non-Muslims are also known to attach Islamic talismans to altar sculptures so as to make them more efficacious. Arabesque motifs also abound in masks, wood carvings, and fabrics all over Africa. Thus the idea of "tradition" in African art has been modified. Whereas it was once regarded as a strict conformity to forms handed down from the past, in the early twenty-first century the idea is understood as a process of continuity and change (for an overview of the major paradigms in the study of African art up to the 1980s, see *African Art Studies* [1987], Adams, and Ben-Amos).

Beyond Sub-Saharan African Art

Admittedly, the influence of African sculpture on modern art has virtually eliminated the evolutionist prejudice against its conceptual form. Yet it has encouraged a scholarly bias for figure sculpture and masks from West, Central, and Equatorial Africa, marginalizing the equally significant artistic expressions in other media within and outside the region. Until the turn of the twenty-first century, this bias isolated the study of sub-Saharan African art from those of northern, northeastern, and southern parts of the continent, where the decorative arts predominate.

It is gratifying to note, however, that in the early twenty-first century scholars are beginning to correct this anomaly. Surveys cover not only the entire continent (including Ancient Egypt, Nubia, and the Swahili civilizations of East Africa) but also previously neglected art forms such as body adornment, weaving, pottery, calabash decoration, leatherwork, beadwork, and architecture. Thanks to new data from archaeology, prehistoric rock art, various eyewitness accounts by Arab and European visitors to the continent between the eleventh and nineteenth centuries, and works of African origin that found their way to Europe from the fifteenth century onward, it has become possible to attempt a more comprehensive and reliable overview of the artistic developments in the continent from the earliest times to the present, though there are still gaps in knowledge.

The Paradox of Modernism

As is well known, European colonization of a good part of Africa between the late nineteenth century and the mid-1970s resulted in the imposition of European values. It also disrupted the social order, precipitating metamorphic changes. Having discredited African art as "primitive" and as "fetishes," colonial administrators introduced a new art education program, stressing naturalism and art for art's sake. At first talented Africans were encouraged to go to Europe for further training, but by the late 1930s European-type art departments had been established at Achimota College, Gold Coast (now Ghana), and Makarere College, Uganda. Others were introduced in the 1940s and 1950s in Senegal, Nigeria, Republic of Sudan, and Congo-Leopoldville (now the Democratic Republic of Congo). The paradox is that colonialism foisted European-type naturalism on Africa, touting it as "modern art" at the same time as the leading modern European artists were being inspired by African stylization. Conversely, "modernism" had different implications in Africa and Europe during the colonial period, denoting naturalism in the former and stylization/abstraction in the latter.

Dissatisfied with this paradox, some European expatriates in Africa initiated an alternative modernism—a conceptual art that would evoke the spirit of African art without necessarily imitating its forms. They established informal art workshops where individuals without previous art training could create freely, emphasizing genre and folkloric themes. These workshops include L'Academie de l'Art Populaire Congolais, Elizabethville (now Lubumbashi), Democratic Republic of Congo (founded in 1946 by Pierre Romain Desfosses); the Poto-Poto School of Art, Brazzaville, Peoples Republic of Congo (founded in 1951 by Pierre Lods); the Central African Workshop, Salisbury, Southern Rhodesia (now Zimbabwe) (founded in the late 1950s by Frank McEwen); the Lourenço Marques Workshop, Mozambique (founded in 1960 by Amancio Guedes); and the Oshogbo Workshop, Oshogbo, Nigeria (founded in 1962 by Ulli Beier). The graduates of these workshops created images ranging from the realistic and surrealist to the expressionistic and abstract. Some were very original while others were derivative, reflecting influences from European modernism, or what Marshall Mount describes as "a rather condescending Western stereotype of what African painting should be" (p. 75).

The Traditional, Neotraditional, and Authentic

As mentioned above, many Africans have not totally abandoned their cultural heritage despite conversion to Islam. This is also the case with Christianity. During the colonial period, many converts venerated their ancestors secretly. Those living in the urban areas frequently returned to their villages to participate in initiation ceremonies and annual festivals featuring masks. Thus artists trained in the traditional or the so-called classical styles continued to receive commissions, though the number of their local clients had declined considerably.

However, these artists found new clients in the international market created by the interest in African sculptures and masks as a result of their influence on modern European art. The huge demand led some artists to move from rural to urban areas,

forming cooperatives such as those of the Bamana (Bamako, Mali), Senufo (Abidjan, Côte d'Ivoire), Edo (Benin City and Lagos, Nigeria), Ibibio (Ikot Ekpene, Nigeria), Okavango (Rundu, Namibia), Wakamba (Nairobi, Kenya), and Makonde (Dar es Salaam, Tanzania). These cooperatives were still flourishing in the early twenty-first century, creating what is popularly known as “neotraditional,” “tourist,” or “souvenir” art. They specialize in copying and mass-producing the art of the ethnic groups to which they belong, in addition to occasionally replicating popular images in exhibition catalogs from other groups. Their products are sold wholesale to traders who then distribute them across Africa and overseas, making them available at hotel lobbies, supermarkets, boutiques, and duty-free shops in local and international airports. Other artists specialize in beadwork, leatherwork, jewelry, weaving, dyeing, pottery, and calabash decoration, among other arts.

This revival of interest in African art during the colonial period encouraged the Catholic Church in Nigeria to explore the possibility of adapting the art to a Christian context. So between 1947 and 1953 the church established an experimental art workshop in the Yoruba town of Oye Ekiti, Western Nigeria, where it employed the services of Yoruba artists. Two young British priests, Kevin Carroll and Sean O'Mahoney, supervised the project. They supplied the themes and encouraged the artists to render biblical characters in the Yoruba style, though without the rituals that sometimes preceded or accompanied the production of images destined for local shrines. The workshop produced madonnas, crucifixes, nativity sets, altarpieces, baptismal fonts, carved doors, and other works with Christian motifs. The finished objects replaced imported artworks in Catholic churches within and outside Oye Ekiti. The reception of the images, however, varied; it was positive in some areas but so negative in others that they had to be removed because they reminded some Yoruba Catholics of the “pagan” shrines of their ancestors (Carroll; Picton, 2002, pp. 100–101).

Thus a distinction is now made between “traditional” and “neotraditional” African art. The former refers to a work in the so-called classical style originally created for and actually used in private rituals or public ceremonies by the same society to which the artist belongs. The “neotraditional,” on the other hand, refers to a similar work created outside its time-honored context for the tourist/souvenir market or to function as “art for art's sake.” And because most Western scholars and curators regard the used image as “authentic” and the unused as “fake,” the carving cooperatives in the urban and rural areas have devised various ways of artificially aging replicas to enable them to make the grade. In fact, such is the demand in the early 2000s for “old” or “authentic” art that a well-executed contemporary work may be passed over in favor of a damaged mediocre piece if the latter appears to be much older.

Sidney Kasfir (1992) has criticized this Western “antiquarianist mind-set” because it tends to ignore formal quality, an important yardstick for judging a work of art. According to Christopher Steiner, because “authenticity” is defined by Western patrons, those who sell both ancient and recent African art “are not only moving a set of objects through the world economic system, they are also exchanging information—mediating,

modifying, and commenting on a broad spectrum of cultural knowledge” (Steiner, p. 2).

Pan-Africanism, Negritude, Decolonization, and the Search for a New Identity

It is easy to understand why art historians ignored modern and contemporary African art for a long time. First, they were preoccupied with the so-called classical African art, which had influenced the birth of modern European art. Second, some of them assumed that the belief system that inspired the best of African creativity was on the wane due to the negative impact of colonialism, Western education, industrialization, urbanization, and mass conversion to Islam and Christianity. That African creativity has not only recovered from the ordeals of colonialism but has in fact been rejuvenated is apparent in the early-twenty-first-century rise in the number of mainstream museums and galleries collecting contemporary African art as well as in the spate of publications on it.

Although it is customary to trace the beginnings of this recovery to the period after World War II when the products of the colonial art schools used their art to critique the colonialism as part of local agitation for political independence, the roots lie much deeper in the Pan-African movement of the nineteenth century. Spearheaded by George Padmore (1902–1959) and Henry Sylvester Williams (1869–1911) of Trinidad, Edward Wilmot Blyden (1832–1912) of the Danish West Indies, and W. E. B. DuBois (1868–1963) of the United States, among others, the movement organized a number of international conferences of black leaders from Africa and the Americas between the early 1900s and the 1940s. There were two principal objectives. The first was to inspire all blacks within and outside Africa to be proud of their color, history, and cultural heritage; and the second, to unite all blacks in their struggle against racial discrimination and toward the decolonization of Africa.

These conferences—along with Marcus Garvey's (1887–1940) ideology of “Africa for Africans,” which promoted a millennial vision of decolonized Africa as a future superpower—generated many debates and publications on different aspects of black history and culture as well as the political, economic, and creative potentials of blacks. In the United States, the quest for a distinct black identity in the arts gave birth to the Harlem Renaissance of the 1920s and 1930s during which African-American artists, writers, musicians, dancers, and intellectuals experimented with their African heritage. In France, Pan-Africanism, along with the Harlem Renaissance, inspired the Negritude movement in the 1930s among a group of African and Caribbean students.

Apart from celebrating the richness of their African past in their works, the Negritude writers and poets also questioned the “civilizing mission” of Europe in Africa, in view of the impact of African art on European modernism. Besides, they claimed that black people all over the world share certain cultural and emotional characteristics that constitute the essence of blackness and called on artists to capture this essence in their creations. The journal *Presence Africaine* was founded in Paris in 1947 to serve as an organ for disseminating the Negritude manifesto to the black world.

In short, these black-consciousness movements culminated in the political agitation that spread across Africa after World War II, motivating artists to explore the potentials of their African heritage and synthesize them with Western elements. The situation varied from one country to another, however, depending on the degree of the artistic commitment of the political leadership. For example, when Ghana gained political independence from Britain in 1957, Kwame Nkrumah (1909–1972), an active member of the Pan-African movement, became its first prime minister and, later, president. He urged contemporary Ghanaian artists to research into their ancestral legacy and to cultivate an “African personality” in their works. To this end, he made funds available for public art projects.

Léopold Sédar Senghor (1906–2001), one of the founders of negritude along with Aimé Césaire of Martinique and Léon Damas of Guyana, became the first Senegalese president when Senegal became independent from France in 1960. During his twenty years in office, he promoted negritude as a national artistic philosophy, becoming the patron of the “École de Dakar,” a group of artists manifesting this philosophy in their works. Having been influenced by negritude while studying in Europe, the Nigerian artist Ben Enwonwu (1921–1994) returned home to become his country’s flag bearer in the search for a national identity in the visual arts, especially after Nigeria gained independence from Britain in 1960. As the special art adviser to the government, he received a lot of commissions to decorate public buildings.

However, the most significant attempt to decolonize the visual arts in the country was initiated by the Zaria Art Society formed in 1958 by a group of students at the Nigerian College of Arts, Science and Technology in Zaria, whose art department was dominated by expatriate art teachers. To counter the naturalism being forced upon them by their teachers, these students (now known as the “Zaria Rebels”) organized private sessions to formulate strategies for evolving a Nigerian identity in their works. Space limitations will not allow a survey of artistic developments in all African countries. Suffice it to say that political independence inspired a cultural and artistic reawakening throughout sub-Saharan Africa. It led to a drastic review of the colonial art education program. New art schools, museums, and national galleries have since been created to promote an African consciousness in the arts, although not everybody agrees with the premise of Negritude that all black people share a common emotional characteristic.

There were similar post-emancipation reactions in northern and northeastern Africa (Mauritania, Morocco, Algeria, Tunisia, Libya and Egypt, and the Republic of Sudan) where there are large Arab populations, although Egypt and Libya attained political independence before World War II. The academic realism introduced to these countries during the colonial period has been modified. In the early twenty-first century, their contemporary artists experiment with different materials, forms, and ideas, seeking inspiration from diverse sources ranging from Islamic calligraphy and crafts to Pan-Africanism and different Euro-American styles. In Egypt some artists also draw on ancient Egyptian and Coptic sources in an attempt to relate the past to the present.

While Ethiopia has been exposed to Orthodox Christianity since the fourth century, it was never colonized except for a brief period of Italian occupation between 1936 and 1941. For a long time, the Ethiopian Church was the chief patron of the arts, commissioning metal crosses, illuminated manuscripts, paintings, and murals. Most of the artists were priests trained to work in the Coptic-Byzantine or modified Italian Renaissance style. But in the early nineteenth century, the nobility and members of the royal family started commissioning secular paintings from freelance artists. Modernization commenced in the 1920s with the introduction of European-type art education. Some Ethiopians later studied in Europe, returning in the 1930s to popularize new forms and styles. A school of fine arts was created in 1958; initially the school encouraged students to focus on Ethiopian history, culture, and political aspiration, but by the start of the twenty-first century the school’s program stressed experimentation and individual creativity.

South Africa became a Dutch colony in the seventeenth century. The British took it over in the nineteenth century, granting it political independence under white minority rule in 1910. The notorious apartheid system that disenfranchised the black majority was introduced in 1948. Until recently, most of the well-equipped and state-sponsored art institutions were reserved for whites. Blacks had to be content with informal art workshops or craft centers run by churches and philanthropists. Black art focused mainly on black suffering under the oppressive apartheid regime between 1948 and 1994. Much of white South African art, in contrast, reflected the prevailing trends in Europe. However, by the 1980s some concerned white artists, no longer willing to be silent while the rest of the world condemned apartheid, had started using their art overtly or covertly to critique it. Since the end of the apartheid system in 1994, contemporary South African art has been charting a new course, reflecting on the past and projecting the collective aspirations of a new nation now ruled by a black majority.

The Postcolonial, Postmodern, and Transnational

In the early twenty-first century contemporary African art is no longer confined to the works of black artists; it now includes those produced by artists of European, Arab, and Asian descent. That it has come of age is evident in the creative ways it often combines ancient African elements with new and frequently Western materials, forms, and techniques to reflect the peculiarity of the continent’s history and the complexity of its encounters with other cultures. No wonder that contemporary African artists have been receiving more invitations to participate in international exhibitions and biennials. Africa itself has become the site of major expositions such as the Cairo International Biennial in Egypt, first held in 1984; the Dakar Biennial (Dak’Art) in Senegal, first held in 1992; and the Johannesburg Biennale, South Africa, first held in 1995.

The strong visibility of contemporary African art on the world stage was reflected in the inclusion for the first time in a 1996 major textbook on world art (Stokstad) the works of two contemporary African artists, Magdalene Odundo of Kenya and Ouattara of Côte d’Ivoire. In 1998 curator Okwui Enwezor of Nigeria, the founder of *Nka: Journal of Contemporary African Art*, was appointed the artistic director of

Documenta 11 in Kassel, Germany—the first time an African would be trusted with such a major responsibility. A year later, the Egyptian artist Ghada Amer won the UNESCO Prize at the Forty-Eighth Venice Biennial in Italy. As Barbara Pollack aptly observes in the April 2001 issue of *Art News*: “While the political upheavals in . . . [African] . . . countries serve as a backdrop to their work, many of these artists struggle to make individual statements that transcend politics and nationality. By so doing, they are transforming our very definition of African art” (p. 124).

As the postcolonial period in Africa coincided with the post-modernist deconstruction of the Eurocentric hegemony in the visual arts, the question has been raised as to whether the two phenomena are related. They are, insofar as the multiculturalism promoted by the postmodern movement has opened new doors for contemporary African art, enabling it show the world that the creativity formerly associated with its past has been rejuvenated. Yet, and as Kwame Anthony Appiah points out, much of the so-called postcolonial African art is not as independent as implied in the rhetoric of decolonization. For despite an increase in local patronage, contemporary African art still depends largely on the European-American market, which in turn exerts a considerable influence on its materials, techniques, form, and content as well as on what is produced and where it is exhibited overseas. In other words, elements of the colonial—now neo-colonial—still lurk in the postcolonial like an old masquerade in a new costume. No wonder some critics see a kind of “neo-primitivism” in the emphasis on self-taught art in major exhibitions such as “Magiciens de la Terre,” organized in 1989 by the Centre Pompidou in Paris, and “Africa Explores,” organized in 1991 by the Center for African Art and the New Museum of Contemporary Art in New York (Oguibe and Enwezor, p. 9; Picton, 1999, pp. 120–125; Hassan, 1999, pp. 218–219).

Lastly, it is significant to note that many African artists have been living permanently abroad since the middle of the twentieth century, if not earlier. Many have become naturalized English, French, Belgian, or American citizens, yet they retained strong ties with Africa. This has produced a “double consciousness” that often resonates in their work, transcending racial, geographical, and national boundaries while at the same time identifying the black self in a largely Caucasian ambience—a new home away from home in the global village that the world has become.

ASCETICISM.

This entry includes two subentries:

Hindu and Buddhist Asceticism
Western Asceticism

HINDU AND BUDDHIST ASCETICISM

The English term *asceticism* derives from the Greek *askesis*, originally meaning “to train” or “to exercise,” specifically in the sense of the training and self-denial that an athlete undergoes to attain physical skill and mastery over the body. The Stoics adapted the word to refer to the moral discipline of the sage who learns, through self-mastery, how to act freely—how to choose or refuse a desired object or an act of physical pleasure at will and how to control the emotions with reason. Plato and the neo-Platonic philosophers also used the term in the sense of the denial of “lower” sensual desires in order to cultivate “higher” spiritual traits.

The word was then passed on from the Greeks to early Christians in this sense of self-control over physical and psychological desires in favor of spiritual ideals or goals. Asceticism has come to function cross-culturally to refer to a whole host of activities in the religions of the world. Most religions have at least some practices that can be deemed ascetic: fasting, celibacy, seclusion, voluntary infliction of pain, bodily mutilation, temperance or complete abstinence from intoxicants, renunciation of worldly goods and possessions, and, in some cases, religious suicide. Asceticism can also include the cultivation of moral qualities requiring self-restraint and discipline, such as patience and forbearance. One sometimes reads of an “inner asceticism,” which involves various practices where one learns to be “in the world, but not of it.”

Ascetic practices are engaged in for a variety of ends. Many traditions encourage or demand asceticism at periodic or designated times of the religious calendar, usually for purification or preparation for a significant ritual event. Fasting and celibacy are particularly common practices used to this end. Most rites of passage or life-cycle rites also require some form of self-denial and self-discipline on the part of the person undergoing the ritual. Ascetic practices as forms of penance are also very frequently prescribed for expiation of sin or impurity. In some cases, ascetic practices are employed as a sort of sacrifice to the deity or powers one is trying to influence to obtain fulfillment of a request, while in other instances asceticism is seen as meritorious in general, leading to or ensuring a good result in this world or the next.

Many religions have within them an elite group of specialists, renunciators or monastics, who maintain an ascetic lifestyle more or less continuously. These “permanent” ascetics may be marked by their special appearance (distinctive clothes or robes, or no clothes at all; long, uncut hair or heads completely shorn of hair; the possession of certain characteristic implements or items, such as a begging bowl or staff; or in some extreme cases, signs in the form of physical mutilation, such as castration). They may be associated with particular locales (monasteries or other isolated and secluded areas, such as forests, deserts, jungles, or caves; or a mandate to wander homeless) to further indicate that they have separated themselves from ordinary society. Ascetic techniques in many traditions are said to bring magical or supernatural powers.

While asceticism is a feature of virtually every religion, it plays an especially prominent role in the three principal Indian religions: Hinduism, Buddhism, and Jainism. All three of these traditions originated at more or less the same time and out of the same religious and philosophical milieu. In the middle centuries of the first millennium B.C.E., many individuals and groups known collectively as “wanderers” (*śramanas*) arose in India to oppose certain features of the older Vedic religion and to advocate new ideas, methods, and goals. Most wanderer groups—especially those responsible for the formation of the new religions of Hinduism, Buddhism, and Jainism—shared the belief that this world has suffering and potentially endless rebirth. This negative evaluation of the world came to be called *samsara*. All three religions also posited the new religious goal of an escape or release from this cycle, variously called *moksha* (“liberation”), *nirvana* (“extinguishing” of suffering and rebirth), or *kevala* (“isolation” or “perfection”).

Samsara is believed to be perpetuated by desire, *karma*, and worldly life in general. The quest for liberation from *samsara* thus entailed asceticism and renunciation, and such practices became central to all three of these Indian religions. Meditation techniques, yoga, austerities of various sorts all were developed to further the end of disengaging from the world of sensual desires, and this in turn led to the final goal of release.

Asceticism in Hinduism

Asceticism in the form of yoga and meditation possibly goes back to the earliest period of Indian history. Seals depicting a figure sitting in what looks like a yogic pose have been found at sites

of the Indus Valley Civilization dating to the second millennium B.C.E. In the texts of the early Vedas (c. 1500–c. 1000 B.C.E.), ascetic practices appear in a variety of contexts. References are made to long-haired silent sages (*munis*), clad in soiled yellow garments or naked, who are depicted as having supernatural powers, acquired perhaps as a result of their ascetic practices. The early texts also tell of the shadowy wandering ascetics (*vratyas*), who seem to have also practiced physical austerities.

The Vedas in some places say that the deities gained their status, or even created the entire universe, through the power of their inner, ascetic heat (*tapas*), acquired through the rigorous practice of physical and spiritual self-discipline and mortification of the body. The term *tapas* derives from a Sanskrit root meaning to heat up or burn, and refers to any one of a variety of ascetic methods for achieving religious power. In the Rig Veda, Indra is said to have achieved his divine place through the practice of asceticism and the generation of this powerful “heat,” while elsewhere in that ancient work are encountered cosmogonic hymns that attribute the origins of the universe to the Primal One who creates by “heating up ascetic heat.” The metaphysical qualities of both truth and order are said to have derived from ascetic heat, and the ancient Indian seers (*rishis*) also were supposed to have achieved their powers through ascetic heat.

This notion of ascetic heat as a creative, or even coercive, religious force was to persist in Indian religious thinking through subsequent centuries to the present. One may gain ascetic heat through a variety of ascetic techniques, including fasting, chastity, and various yogic techniques such as breath control (*pranayama*), and through it the adept can procure tremendous supernatural powers and even the status of a god. In the Upanishads, epics, and other Sanskrit texts one often learns of various ascetics who force their way into heaven and become gods through the power of their ascetic heat. Deities such as Shiva were especially associated with this power of ascetic heat, derived from proficiency in yoga, meditation, and extreme austerities.

Various classes of ascetics (*tapasvins*, “specialists in the practice of *tapas*”) eventually arose in Hindu India and are sometimes enumerated. They are mainly differentiated by the form of austerities they engage in. Some ascetics, for example, stay totally stationary for years at a time or remain standing or in water for weeks on end. Some ascetics subsist solely on fruits, wild plants, and roots, or they live only on grain left in the fields. Among the most famous are ascetics who practice the “five fires” ritual (building four fires around themselves, with the sun as the fifth) and “spike-lying” ascetics who sleep on beds of nails.

A second strand of asceticism within the Hindu tradition might better be termed “renunciation.” Such renunciation can be either *tyaga* (relinquishing a desire for actions to produce effects) or *sannyasa* (abandoning family, social, economic life, and the ritual activity associated with the householder’s way of life), in order to pursue single-mindedly the ultimate goals of religion. World renouncers seem to have been a feature of Indian religious life since very early times. Already mentioned above are the silent sages and wandering ascetics discussed in the Vedas. Later texts depict a wide variety of renouncers, hermits, and ascetic “orders” living in the jungles and forests.

Among such ascetics were those who, with or without their wives, live on wild fruits and plants and maintain a ritual sacrificial fire; those who are “god-possessed” but perform the Vedic rituals; those with matted hair who wear bark clothing; those who sleep on the ground, eat only what drops from trees and plants, and regulate their meals according to the waxing and waning of the moon; those who wander from one monastery to another, eating only eight mouthfuls of food per day; those who remain naked, live under trees or in graveyards, and remain indifferent to what they eat or receive from others; renouncers who wear red and beg only at the homes of high-caste Brahmins; and radical ascetics who do not remain more than a day in any one place and live on cow urine and feces.

Renunciation (and the values and practices associated with it, especially nonviolence [*ahimsa*], vegetarianism, lack of possessions, and begging for a living) came to play an enormously influential role in Hinduism from the time of the Upanishads onwards. Not only were there dedicated ascetics and renunciates who committed their lives to this kind of religious practice; even those who chose to remain householders were influenced by renunciatory values. From a very early date, then, Hinduism was shaped by asceticism and renunciation.

Yet the Hindu tradition also had dissenting voices. The religion was somewhat divided about the value and necessity of asceticism and the renunciatory lifestyle. Some ancient texts condemn renunciation in general. (In the Hindu epic *Mahabharata*, one of the heroes of the epic goes so far as to say that renunciation is only for those who have failed in worldly affairs.) More often, texts condemn renunciation by householders—those with families to support and occupations to fulfill.

Indeed, Hindu texts written in the wake of the wanderer movement often extolled the householder’s life of marriage, reproducing, and raising children. In the *Dharma Sutras* the householder stage is sometimes said to be the only legitimate or best stage of life—better even than the stage of pursuing the ultimate religious goal of final liberation from rebirth. Those in all other stages of life (the student, forest dweller, and world renouncer) depend on the householder, in part because it is the householder who feeds or donates to them when they beg from him:

A householder alone offers sacrifices. A householder afflicts himself with austerities. Of the four stages of life, therefore, the householder is the best. As all rivers and rivulets ultimately end up in the ocean, so people of all stages of life ultimately end up with the householder. As all creatures depend on their mothers for their survival, so all mendicants depend on householders for their survival. (*Vasishtha Dharma Sutra*, 10.14–16, quoted in Olivelle, p. 93)

As another text puts it, when “carried out with zeal,” the householder stage of life procures both happiness in this life and heaven in the next:

Just as all living creatures depend on air in order to live, so do members of the other stages of life subsist by depending on householders. Since people in the other

three stages of life are supported every day by the knowledge and food of the householder, therefore the householder stage of life is the best. It must be carried out with zeal by the man who wants to win an incorruptible heaven [after death] and endless happiness here on earth. (*Manu*, 3.77–79)

Nevertheless, one also finds ascetic and renunciatory values—especially nonviolence (*ahimsa*), but also nonpossession and ascetic heat—included in ethical lists that seem generally applicable to all, no matter what stage of life they are in. Indeed, even the householder's life came to include certain kinds of austerities, especially as a way of penance and cleansing one's conscience: "If his mind-and-heart is heavy because of some act that he has committed, he should generate the inner heat [*tapas*] [prescribed] for it until he is satisfied. . . . Those who have committed major crimes and all the rest who have done what should not be done are freed from that guilt by well-generated inner heat" (*Manu*, 11.234, 240).

From an early age in the history of Hinduism there was also a recognition that one could live two basic kinds of religious lives within the boundaries of the religion: a life of engagement and a life of disengagement. Both were usually regarded as legitimate (although some texts do weight one or the other more heavily), and both were accorded Vedic authority and pedigree. Both were also generally regarded as efficacious—according to the following text, engagement leading to a state of equality with the gods, and disengagement to a transcendent condition beyond the world of *samsara*:

There are two kinds of Vedic activity: the one that brings about engagement [in worldly action] and the rise of happiness, and the one that brings about disengagement [from worldly action] and the supreme good. The activity of engagement is said to be driven by desire in this world and the world beyond; but the activity of disengagement is said to be free of desire and motivated by knowledge. The man who is thoroughly dedicated to the activity of engagement becomes equal to the gods; but the man who is dedicated to disengagement passes beyond the five elements. (*Manu*, 12.88–90)

Reconciling these two apparently different modes of religious life was not always easy, however. On the face of it, the life of engagement and the life of disengagement appear to be incompatible—the one involved in the world of activity and *karma*, and the other attempting to renounce such activity and free oneself of *karma*.

One of the principal methods for synthesizing the two was the system of the four stages of life (*ashramas*)—perpetual student, householder, forest dweller, and world renouncer—developed especially in the *Dharma Sutras*. In some texts the four states of life seem to have been regarded as four different types of life that a student could pursue after study with a teacher. In other cases, however, the early authorities insisted that there is only one legitimate stage of life, that of the householder. Finally, however, the tradition settled into conceptualizing the system of

stages of life as progressive and more or less incumbent upon all upper-caste Hindus. This framework of stages of life could then be used to affirm life in the world (by emphasizing that all must pass through the householder stage of life before renunciation) while still incorporating the values and practices of asceticism into the ideal life of the Hindu practitioner. Three of the four classical stages of life emphasized ascetic practices, as will be seen, while the system also validated, and indeed insisted upon, the legitimacy of and need for the nonrenunciatory householder stage.

In the ideal structure laid out in Hindu texts, the first stage of life is that of a student. A young boy is given over to a teacher (*guru*), whom he lives with and serves for many years while studying the sacred Vedas under the teacher's guidance. The lifestyle assigned to this stage of life is one of austerity, asceticism, and discipline. Not only should the student remain chaste for the duration of this period; he should also observe a variety of other restraints and avoidances:

The chaste student of the Veda who lives with his guru should obey these restraints, completely restraining the cluster of his sensory powers to increase his own inner heat. . . . He should avoid honey, meat perfume, garlands, spices, women, anything that has gone sour, and violence to creatures that have the breath of life; anointing [his body with oil], putting make-up on his eyes, wearing shoes, and carrying an umbrella; desire, anger, and greed; dancing, singing, and playing musical instruments; gambling, group arguments, gossip, telling lies, looking at women or touching them, and striking another person. He should always sleep alone and never shed his semen, for by shedding his semen out of lust he breaks his vow. (*Manu*, 2.175–80)

Another text gives a slightly different list of observances, vows, and practices, but similarly emphasizes the importance of an austere life dedicated to self-restraint, the cultivation of virtue, and obedience to the teacher:

Now the rules for the studentship. He shall obey his teacher, except when ordered to commit crimes which cause loss of caste. He shall do what is serviceable to his teacher, he shall not contradict him. He shall always occupy a couch or seat lower than that of his teacher. He shall not eat food offered at a sacrifice to the gods or the ancestors, nor pungent condiments, salt, honey, or meat. He shall not sleep in the daytime. He shall not use perfumes. He shall preserve chastity. He shall not embellish himself by using ointments and the like. He shall not wash his body with hot water for pleasure. But, if it is soiled by unclean things, he shall clean it with earth or water, in a place where he is not seen by a guru. Let him not sport in the water whilst bathing; let him swim motionless like a stick. . . . Let him not look at dancing. Let him not go to assemblies for gambling, etc., nor to crowds assembled at festivals. Let him not be addicted to gossiping. Let him be discreet. Let him not do anything for his own pleasure in places which his teacher frequents. Let him talk with women so much only as his purpose

requires. Let him be forgiving. Let him restrain his organs from seeking illicit objects. Let him be untired in fulfilling his duties; modest; possessed of self-command; energetic; free from anger; and free from envy. (*Apastamba Dharma Sutra*, quoted in Embree, pp. 84–86)

Also among the duties laid out for those in the student stage of life is begging for a living—more precisely, begging and then turning over the proceeds to the teacher. Begging, for the religious student and other renunciates who legitimately live by such means, was said to be like fasting:

He should fetch a pot of water, flowers, cow dung, clay, and sacrificial grass, as much as are needed, and go begging every day. A chaste student of the Veda, purified, should beg every day from the houses of people who do not fail to perform Vedic sacrifices and who are approved of for carrying out their own innate activities. He should not beg from his guru's family nor from the relatives of his mother or father, but if he cannot get to the houses of others he should avoid each of these more than the one that precedes it. And if there are none of the people mentioned above, he should beg from the whole village, purified and restrained in his speech, but he should avoid those who have been indicted. . . . When he is under the vow [of a chaste student] he should make his living by begging, nor should he eat the food of just one person; when begging is the livelihood of a person under a vow it is traditionally regarded as equal to fasting. (*Manu*, 2.182–85, 188)

When the student reaches marriageable age, he should take a wife and start a family, eschewing, by and large, renunciatory and ascetic practices in favor of the pursuit of private gain (*artha*)—understood as material prosperity, self-interest, political advantage, and in general getting ahead in the world. Hinduism thus recognizes making a good living (in an acceptable occupation) and taking care of one's family as important and indeed religiously enjoined goals of life. Private gain is listed as one of the three “ends of life” in Hindu texts, the other two being the pursuit of religious duty (*dharma*) and the pursuit of pleasure (*kama*). And while following the dictates of religious duty is obviously of great importance for one's spiritual well-being and can involve certain ascetic practices, especially for purification and penance, the pursuit of pleasure and creature comforts is to be fully embraced in the householder stage of life. In some texts, private gain is in fact the most important of these ends of life: “Of the three ends of human life, material gain is truly the most important. . . . For the realization of religious duty and pleasure depend on material gain” (*Artha Sastra*, 1.7).

But, according to the scheme of the ideal stages of life, when the householder has completed this stage of life (upon the birth of grandchildren), he should begin to withdraw from the world and once more cultivate a more ascetic lifestyle. After finishing the life of a student and after marrying and raising a family as a householder, a man may enter the third stage of life, that of the forest dweller. This stage of life, like that of the student, is characterized by ascetic practices and detachment from the

world, including the renunciation of cultivated food (in favor of wild food that grows in the jungle) and of all possessions:

After he has lived in the householder's stage of life in accordance with the rules in this way, a twice-born Vedic graduate should live in the forest, properly restrained and with his sensory powers conquered. But when a householder sees that he is wrinkled and gray, and [when he sees] the children of his children, then he should take himself to the wilderness. Renouncing all food cultivated in the village and all possessions, he should hand his wife over to his sons and go to the forest—or take her along. . . . He should eat vegetables that grow on land or in water, flowers, roots, and fruits, the products of pure trees, and the oils from fruits. . . . He should not eat anything grown from land tilled with a plough, even if someone has thrown it out, nor roots and fruits grown in a village, even if he is in distress [from hunger]. (*Manu*, 6.1–3, 13, 16)

Subsistence on gathered food that grows naturally and spontaneously in the wild can be supplemented with food obtained by begging. The begged food, however, should be only enough for “bare subsistence” and should be obtained from the right donors:

He should get food for bare subsistence by begging from priests who are ascetics themselves, from householders, and from other twice-born forest-dwellers. Or a man who lives in the forest may get [food] from a village, receiving it in the hollow of a leaf or in his hand or in a broken clay dish, and eat [only] eight mouthfuls of it. To perfect himself, a priest who lives in the forest must follow these and other preparations for consecration, as well as the various revealed canonical texts of the Upanishads, and those that sages and priestly householders have followed, to increase learning and inner heat and to clean the body. (*Manu*, 6.27–30)

The final stage of life is that of the world renouncer, who continues and furthers the ascetic practices of the forest dweller: “And when he has spent the third part of his lifespan in the forests in this way, he may abandon all attachments and wander as an ascetic for the fourth part of his lifespan” (*Manu*, 6.33). In this stage, the renouncer sends his wife away to live with his sons and performs a ceremony equivalent to his own funeral, stating that from this time on “no one belongs to me, and I belong to no one.” Dying to his social persona, the wandering hermit from this time forth may no longer return to his previous home and should live entirely detached from the things of this world, owning nothing, alone and without companions, perfectly content and indifferent. He should beg but once a day, and he should not be “addicted to food” or hope for lots of alms or be disappointed should he receive nothing.

He should always go all alone, with no companion, to achieve success; realizing that success is for the man who is alone, he neither deserts nor is deserted. The hermit should have no fire and no home, but should go to a

village to get food, silent, indifferent, unwavering and deep in concentration. A skull-bowl, the roots of trees, poor clothing, no companionship, and equanimity to everything—this is the distinguishing mark of one who is Freed. He should not welcome dying, nor should he welcome living, but wait for the right time as a servant waits for orders. . . . He should live here on earth seated in ecstatic contemplation of the soul, indifferent, without any carnal desires, with the soul as his only companion and happiness as his goal. . . . He should go begging once a day and not be eager to get a great quantity, for an ascetic who is addicted to food becomes attached to sensory objects, too. . . . He should not be sad when he does not get anything nor delighted when he gets something, but take only what will daily sustain his vital breath, transcending any attachment to material things. (*Manu*, 6.42–45, 49, 55, 57)

The system of stages of life was the principal way in which Hinduism reconciled the apparently contradictory pulls of its life-affirming and world-renouncing strains. But there was also another way of reconciling the householder and renunciatory ways of life in the classical texts of Hinduism. This is the yoga of action (*karma yoga*) in the *Bhagavad Gita*. As opposed to the renunciation of action characteristic of ascetics and world renouncers, the *Bhagavad Gita* advocates a renunciation in action: one performs one's duties in society but dedicates the fruits of all action to God.

Asceticism in Buddhism

According to Buddhist texts, Siddhartha Gautama (c. 563–c. 483 B.C.E.), the founder of Buddhism, was born into a royal family and raised in the lap of luxury. Upon learning of the true nature of the world outside his insulated life—a world full of suffering, sickness, old age, and death—Gautama immediately renounced his privileged life, left his family, and joined a group of ascetics in the jungle.

The time of the Buddha seems to have been one in which many different renunciatory groups in the uninhabited regions of north India experimented with various techniques—ascetic, yogic, philosophical, and meditational—to attain release from suffering and rebirth. Early Buddhist texts are replete with references to ascetics of various types. One such text depicts the typical ascetic (*tapasvin*) of the time as one who

goes naked, is of certain loose habits, licks his hands, respects no approach nor stop; accepts nothing expressly brought, nor expressly prepared, nor any invitations. . . . He takes food once a day, or once every two days, or once every seven days. . . . He feeds on herbs, or on the powder of rice husks, on rice-scum, on flour of oil seeds, on grasses, on cowdung, or on fruits and roots from the woods. . . . He wears coarse hempen cloths, discarded corpse cloths, discarded rags, or antelope hide, or bark garments. (*Digha Nikaya*, quoted in Bhagat, p. 151)

According to hagiographies of the life of the Buddha, Gautama hooked up with such a group and practiced and

mastered the radical ascetic regimen they advocated, to such an extent that he ate virtually nothing and shriveled to nothing more than skin and bones. Finding that he had not achieved his goal through such austerities, Gautama rejected the ascetic path and pursued what he called the “middle way” between the poles of sensuality and asceticism: “There are two extremes, O monks, which he who has given up the world ought to avoid. What are these two extremes? A life given to pleasure, devoted to pleasures and lust; this is degrading, sensual, vulgar, ignoble and profitless. And a life given to mortifications; this is painful, ignoble and profitless” (*Mahavagga*, quoted in Bhagat, p. 161).

Buddhism in its origins is thus somewhat ambivalent about the usefulness of asceticism. On the one hand, it rejects the extreme forms of physical abnegation and self-torture that appear in the other Indian religions it grew up with. Buddhism denies that such physical asceticism alone can procure for the practitioner the highest spiritual goals. On the other hand, however, there can be no question that Buddhism requires its more serious practitioners not only to renounce worldly life but also to train diligently in self-discipline and self-control through the “eightfold path” (right views, intention, speech, action, livelihood, effort, mindfulness, and concentration). Attaining the permanent peace and happiness known as *nirvana* also requires the elimination of desire and aversion through ascetic self-discipline and abnegation. If one can eliminate desire, selfishness, and egotism by more moderate means, the more radical physical austerities are unnecessary: “All mortification is vain so long as selfishness leads to lust after pleasures in this world or in another world. But he in whom egotism has become extinct is free from lust; he will desire neither worldly nor heavenly pleasures, and the satisfaction of his natural wants will not defile him. He may eat and drink to satisfy the needs of life” (*Mahavagga*, quoted in Bhagat, p. 162).

While the Buddha rejected the extreme forms of physical asceticism recommended by others, he did allow for a number of ascetic practices called the *dhutangas*. These practices are said not to be the path itself but only preparatory for the path; they help the seeker eliminate all forms of attachment. The *dhutangas* include wearing only monastic robes made from discarded fabric, living only on alms begged for indiscriminately, eating only once a day, living in the forest or at the foot of a tree or in a cemetery, and sleeping only while sitting upright (and never while lying down).

The main form that asceticism took in Buddhism was monastic renunciation of the world. In stark contrast to the Hindu system of the four stages of life, in which renunciation was relegated to the end of life after the householder stage, Buddhists insisted that as soon as one recognized that this world is like a “house on fire,” one should give up the worldly life and join the monastery. There, in the company of other monks or nuns, one could pursue a regulated life of study, meditation, and self-discipline similar to the monastic lifestyle pursued in other religious traditions.

Asceticism in Jainism

The founder of the religion of Jainism was, like the Buddha, a world renouncer. Unlike the Buddha, however, Mahavira (599–527 B.C.E.) embraced a program of extreme austerities

to reach his religious goal. Having left the social world, Mahavira adopted the life of a naked wandering mendicant and for twelve years practiced the most severe of physical austerities until he reached perfection.

The life of Mahavira set the tone for the development of the Jain tradition. Jainism is perhaps the most ascetically oriented of all the world's religions. Most Jains are and have always been householders, but even householders are urged to live lives of self-restraint and especially nonviolence. Jain monks pursue lives of even greater austerities, following the five "great vows" (no killing living beings, truthfulness, no stealing, chastity, and renunciation of possessions) and, in some sects, not wearing any clothing. Jains seek ascetic heat in both its "external" and "internal" forms—the former entailing fasting, begging, and mortification of the body; the latter requiring penance, modesty, service to others, study, meditation, and nonattachment to the body. The epitome of asceticism is found in the Jain tradition of religious suicide by starvation.

Conclusion

While renunciation of the world and asceticism have had a huge influence on Indian religions, it must be remembered that the more extreme practices have always been limited to the very few, the religious virtuosi. Also, these world-denying and self-abnegating practices have always coexisted with equally or more powerful strains in these traditions valorizing a worldly life and, to some extent, material goals. The ascetic quality of Indian religions has often been exaggerated, even caricatured, at the expense of a more realistic portrait—one that admits the impact of asceticism on these traditions while contextualizing such practices and values within what have always been complex and varied religious traditions.

WESTERN ASCETICISM

Asceticism, defined for our purposes within the context of the premodern tradition, refers to specific passive and active practices that are engaged in out of ideological motives: on the one hand, abstinence from nourishment, sleep, sexuality, social communication, and social ties—thus from natural human expression—and from other components of civilization, such as bodily cleanliness; on the other hand, the active cultivation of physical revulsion, whether through intentional exhaustion or bloody self-mutilation. As long as the passive practice is performed in a balanced manner, it may bring positive physical and spiritual results. More common, however, are examples wherein this sort of practice leads to abiding physical and spiritual damage; with the active sort this is generally the case. While technically similar, certain therapeutic practices, engaged in for medical reasons, are not to be considered asceticism in this context. Asceticism, although grounded in metaphysical motivations, is decidedly a concept concerned with practical realization; thus the following will discuss both theory and practice.

The Ancients

The ancient Greek word *askesis* referred at first to the physical practices of soldiers and athletes, and only later to intellectual exercises such as philosophizing, training of the will, or morality. Religious asceticism only played a role with small groups (cultish chastity of the priestesses of the Roman goddess Vesta, castration of the priests of the Egyptian god Attis), or during specific times (yearly abstinence for several days in honor of Ceres) or activities (especially magic).

The main arguments for asceticism lay, on the one hand, in the realm of a cult's purity codes and, on the other, in the philosopher's requirement for ethical strengthening of will and nonattachment: marriage and children would only disrupt the thinker's conduct of life. Thus retreat from the world was recommended by philosophers such as Plato, and many wise men, like Apollonius of Tyana in the first century C.E., took vows of chastity. Related is the philosophical ideal of imperviousness to all earthly circumstances (apathy, ataraxy). Within Orphicism, Pythagoreanism, Stoicism, and Cynicism there were strains that viewed the physical as far inferior to the spiritual. The essential ancient conception (the *soma sema* doctrine, for example, in Plato's *Gorgias*) was that the soul, caught in the "grave" of the body, should be liberated through a weakening of precisely this body. Examples of this idea occurred in the Eleusian fasts, in Neoplatonism, and—most clearly delineated—in Manichaeism. Passive asceticism was considered the best means to attain this liberation. Ascetic tendencies supported, furthermore, a strand of ancient medicine that energetically recommended abstinence from sexuality, as the discharge of semen was thought to weaken the body and soul of both men and women.

In Old Testament Judaism, asceticism only appeared in the form of cultish abstention, or fasting, as practiced by the Nazareans or John the Baptist, or more strictly in sects such as the Therapeutae. The Celts utilized fasting as a coercive method for deciding disputes: they fasted at their enemy's door, thereby compelling him to fast as well, on pain of loss of honor.

Early Christianity

The most important early Christian ascetic forms were fasting and sexual abstinence. The former, as habitual practice, cannot be traced back to Jesus—his disciples did not even fast on the Sabbath. He said of himself, “The son of man came eating and drinking,” wherefore he was criticized as a “glutton and drunkard” (Matt. 11:19). His apparently exceptional forty-day fast in the desert (like Moses and Elias) became, nevertheless, the paradigm whereby this practice later became part of the permanent *imitatio Christi*. The basis for the ideal of chastity was in Jesus’s saying “And there are eunuchs who have made themselves eunuchs for the kingdom of heaven’s sake” (Matt. 19:12). Yet this was practiced very rarely (according to the most important theologian of the third century, Origen of Alexandria), in order to avoid comparison with the priests of Attis. Paul was more influential, teaching, in the face of the imminent coming of the end of the world, that he who has a wife shall behave as if he has none (1 Cor. 7:29). He only allowed for physical love reluctantly, as a concession; it was far preferable that all believers would be as chaste as he. For how else could one concentrate oneself entirely upon Christ? The doctors of the church built upon these elements enthusiastically and combined them with misogynist components of the Judaic creation doctrine and ancient philosophy. St. Jerome (c. 347–419 or 420), who devalued marriage in favor of chastity, and St. Augustine (354–430), who argued that original sin is reenacted through the sex act, laid the foundations of the Christian sexual ethic that are still with us today. Doubts about the eschatological salvation of married people (as in the ascetic sect of the Encratites) were, however, consistently refuted as heresies.

Christian asceticism, as a movement that truly shaped the conduct of life, found its most emphatic expression in the monastic fathers in the deserts of Egypt and Syria, who were also paradigms for the ideal of *contemptus mundi* and self-mortification. The spread of asceticism throughout the Western world paralleled that of monasticism, which based itself consistently upon vows of chastity, poverty, and obedience. The following aspects contributed to its ideological background:

1. The wish to imitate the religious founder (*imitatio Christi*), a consequence of a (hardly authentic) saying of Jesus, “And anyone who does not take up his cross and follow me is unworthy of me” (Matt. 10:38).
2. The reception of the pagan *soma sema* doctrine: spiritualized, this led to the commandment, in harmony with a dualistic belief system, to “leave” all pleasurable earthly things in order not to sully oneself with material goods (*contemptus mundi*).
3. The monastic ideal of the *angelikos bios*, the angelic life, which implied wakefulness, fasting, and sexual abstinence, since angels neither sleep, nor eat, nor love.
4. Self-punishment during earthly existence in order to avoid the incomparably more horrific divine revenge in the beyond; also, taking on penance

for another’s sins (with the same intention) as atonement toward the Godhead.

5. Presentation of an immaterial oblation.
6. Weakening of the body with the aim of rendering it less susceptible to sinful practices.

The Middle Ages

The high and late Middle Ages were the epochs of the widest proliferation of ascetic ideals in European history. Up to the turn of the first century, self-mortification was almost exclusively the duty of the “virtuosos” of this religion, the monks; it was only after the church reform of the high Middle Ages that an outbreak of lay piety initiated this ideal for every truly engaged Christian in the world. A maxim of St. Bartholomew of Farne (d. 1193) can be taken as paradigmatic of the wide proliferation of the *soma sema* doctrine: “We must inflict our body with all kinds of adversity if we want to deliver it to perfect purity of soul!” The mendicant orders, founded in the thirteenth century, were especially important for the spread of ascetic ideals among the laity. Their basic tenets, grounded in asceticism, were traditional: contempt of the world as well as weakening and chastisement of the body as an instrument of sin. In addition to these goals of self-salvation, and in contrast to older monasticism, the goal of brotherly love fostered the attempt to atone for the sins of other believers, both living and deceased. The founders of the Minorites and the preaching orders created a precedent as well. St. Francis of Assisi (1181 or 1182–1226) taught, “I have no greater enemy than my body,” arguing that “We should feel hatred towards our body for its vices and sinning!” For St. Francis this attitude entailed fasting and self-flagellation for the disciplining of the body, which he called “brother donkey.” This metaphor, beloved by the ascetics, expresses the idea of the body as a beast of burden that, according to *Legenda maior*, the life of St. Francis by St. Bonaventure (c. 1217–1274), “should be weighed down by hard work, often scourged with the whip, and nourished with poor fodder.” As for St. Dominic (c. 1170–1221), aside from the usual waking and fasting, three times every night he would “whip himself with an iron chain: once for himself, once for the sinners in the world, and one for the sinners who are suffering in purgatory.”

The most common ascetic practices of the Middle Ages and the early modern period were poverty, self-flagellation, fasting, waking, hunger, and other works of penitence.

Self-flagellation (*disciplina*), previously rare, spread first with the teachings of the doctor of the church Pier Damiani (1007–1072): he recommended that one flagellate oneself for the duration of forty psalms daily, on high holy days one-half more again. His treatise *De laude flagellorum* (In praise of flagellation) established this idea: participation in the sufferings of Christ promises a part in his glory (self-punishment and reward). Many saints of the late Middle Ages individually practiced similar self-punishments; as a collective practice, self-flagellation was institutionalized in convents such as those of the Dominicans in southern Germany. This ascetic act was practiced collectively by the laity as well, at least since the advent of

the many flagellant movements from 1260 to 1348, which were reactions against plague and apocalyptic fears; there sprang up, in Italy above all, numerous penitential brotherhoods (*penitenti*) with the popular name Battuti. A practice initially developed as a reaction against a particularly terrifying crisis situation became thereby an abiding institution that existed into modern times. Self-flagellation was, as a rule, practiced along with meditations on the Passion, with the aim of imitating Christ's sufferings. Ludolf of Saxony (c. 1295–1377), for example, demanded in his widely read *Vita Christi* that the reader should whip himself, at least in his imagination, to perfect the scourging, and should stretch his arms out in the form of a cross, to imitate the Crucifixion.

Genuflection (*veniae*) was one of the most common methods of prayer, practiced already in ancient times. The prayer position became, in the ancient church, a penitential practice and, at least from the high Middle Ages on, an ascetic achievement: St. Maria of Oignies (c. 1177–1213), for example, managed up to six hundred genuflections without interruption.

Wakefulness (*vigiliae*) found its theological justification in Luke 6:12, when Jesus kept a vigil before calling the twelve apostles. Here too the monks of the Middle Ages attempted to outdo their religious leader: some, for example, such as the beatified Benevenuta of Bojanis, bathed their eyes in vinegar. Sleep deprivation was a given in any case, since sleep was constantly interrupted by the cloister's prayer rhythm; it was further assured by hard beds.

Penitential robes (*cilicium*) and girdles (*cingulum, catena*) were often worn by those living in the world, even under everyday clothing. The beatified father confessor Wilbirg of St. Florian (c. 1230–1289), who chastised himself with an iron girdle that inflamed the skin egregiously, outlined their typical rationale: "In this way I have afflicted my flesh hardily and through this affliction have I won a reward which is not small."

Fasting (*ieiunum*) was not only prescribed during certain times in the church year (Holy Week) but was, beyond this, the most frequently practiced ascetic achievement. The two female doctors of the church, St. Catherine of Siena (1347–1380) and St. Teresa of Avila (1515–1582), followed this practice: in order to force themselves to regurgitate, they inserted, amid great pain, plant stems or branches down their throats to their stomachs. Catherine called this act "retribution" and introduced it with the words "And now we will deliver retribution to this most wretched sinner!" In 1380 she died of thirst, following an ascetic trial. According to themselves and the reports of their contemporaries, many late medieval ascetics took their holy anorexia to the point that they were able to live entirely without nourishment: these included Benevenuta of Bojanis, Elsbeth Achlerin, St. Lidwina of Schiedam, and the Swiss national saint, Nicholas of Flüe.

Total chastity (*castimonia*), in accordance with the above-mentioned ideal of Paul and the church fathers, was a matter of course for all who took their priestly role or monasticism seriously. It is not surprising that numerous visions by celibate men and women have come down to us that openly or subliminally incorporate sexuality, be it in the form of sadistic

punishment fantasies in purgatory or hell or as the mystical love union of bride and Christ. As many married lay people began, following the eleventh- and twelfth-century church reforms, to strive for monastic ideals, the problem of accommodating asceticism and the *debitum maritum* came sharply to the fore. Some couples, like the count and countess St. Eleazar and St. Delphina of Sabran (fourteenth century), carried on a chaste marriage. Women with less pious husbands, like St. Dorothy of Montau (1347–1394) or St. Francesca of Rome (1384–1440), made every sexual coupling into a torture through self-mutilation.

Ascetic practices of this kind were not generally intended to be private matters; they were supposed to be public, as part of a contemporary worldview that saw the ascetic's suffering body as a sign written for God—a visible demonstration of election and an exhortation to imitation. The contemporary paintings and sculptures of, for example, St. Bernardino of Siena, John of Capistrano, and Nicholas of Flüe, document this clearly.

Asceticism gained, from the high Middle Ages on, a further function that had not previously been present—the mystical inducement of trancelike or ecstatic states. In this function—which fully parallels the preparation for the soul's journey of shamanism, excepting that Christianity does not employ drugs—asceticism was practiced by almost all experiential mystics from the late Middle Ages to the present, although it evoked criticism from some theoretical mystics, such as Meister Eckehart (c. 1260–?1327).

Extreme ascetic trials were often demanded as tests of obedience or as punishments by father confessors or cloister leaders; the disciplining of the individual therefore served the interests of the churchly authority's exercise of power. The internalization of asceticism as an ideal could also, seen from a sociological perspective, subconsciously serve this same goal.

Western Christianity did not consist only of Catholics, of course, but included, with increasing frequency toward the turn of the first millennium, alternative sects as well. Heresies, developed as a result of intensive theological and philosophical reflection, such as Amalric of Bena's doctrines in the late twelfth and early thirteenth centuries, but also, in time, Protestantism, show a particular tendency toward asceticism. Sects that leaned toward libertine ideas, however, such as the Adamites, the Free Spirit Brotherhood, and the Luciferians, were naturally opposed to asceticism. Asceticism, however, took on an enormous significance in the dualistic heresy of the Manichaean tradition. According to its teachings, the material world was evil, especially anything that was related to sexuality and its accompanying animal satisfactions. The "light soul" needed to be freed from the prison of "dark materiality." Thus the Cathars (Albigensians) fasted three days in every week and an additional forty days every year. Marriage was forbidden. An extreme form of nutritional deprivation, the *endura*, was practiced as well, whereby terribly ill sect members would fast themselves to death; sick babies would be deprived of their milk, a practice that was called "preparing a good end." The intensification of Catholic asceticism since the twelfth century was, to a large extent, a reaction to these practices, an attempt, in other words, to outdo these heretical dualists.

The Early Modern Period

In Catholic lands the medieval ascetic forms were continued in principle, especially in the Latin countries, aided by the development of a thorough theoretical collection of texts on asceticism and mysticism systematizing the abovementioned theological foundations. St. Veronica Giuliani (1660–1727), who, among other things, used her tongue to lick half of her cloister clean of dust and spiders, may be taken as a practical example; the most widespread theoretical example of a *direttio ascetica* (ascetic instruction) was the *Direttorio ascetico* by the Jesuit Giovanni Scaramelli (1687–1752).

Sects like the Jansenists had strands who practiced extreme forms of asceticism: in Paris, after 1730, there appeared the female Convulsionists, who swallowed burning coals or pebbles, suffered under the body weight of other members, and voluntarily underwent crucifixion for hours at a time. This was a mass movement that spread through the energy of group dynamics and evolved during communal religious services.

Twiggy modeling a dress, 1968. By the mid-twentieth century, asceticism had been diluted to a concept practiced primarily by those seeking to attain personal satisfaction in sports, political or financial gain, or, as in the case of a fashion model, a desirable physical appearance. © BETTMANN/CORBIS

The Protestant reformers, more emphatically even than the humanists, rejected the asceticism that had previously been quite well known because they counted it as an act of “good works” and a mark of monasticism. With the exception of Methodists and Anglicans, Protestant piety recognized retreat from the world but no active asceticism. Max Weber and Ernst Troeltsch have seen this attitude as a strict work ethic and a denial of the earned pleasures of an upwardly mobile life of production and consumption; in other words, Calvinism is an “internal asceticism,” or a secularized equivalent of monastic asceticism (implying, naturally, a considerable expansion of the term’s meaning). To the Enlightenment philosophers, asceticism was no longer comprehensible and became merely a cause to mock Catholicism.

Modernity

Since the Enlightenment, even the Catholic Church has come, more and more, to reject the above-described ascetic forms—at a distance from an approximately eighteen-hundred-year tradition—as aberrations and “exaggerations.” In the early twenty-first century, Catholic theologians of this denomination define asceticism as balanced, consisting of harmless penances like moderation in alcohol and nicotine intake or separation from the entertainment industry, as components of a lifetime of striving for perfection. In twenty-first-century monastic life, ascetic achievements are limited to a daily practice regulated by prayer times and reduced to a mild fast before the holy days. Often asceticism is just a synonym for morality—practices that manifest a striving toward God (avoidance of sin, practice of the virtues, or concentration on God). Even Pope Pius XII’s teaching that a Christian should wish to seek physical pain in order to take part in the sufferings of Christ, should reject sensual satisfaction and debase his flesh, has not altered the general watering down of the ascetic ideal. That ideal has more in common now with the (Protestant) philosophy of the eighteenth and nineteenth centuries, which reached back to the original meaning of the word: Immanuel Kant saw in asceticism a cheerful fulfillment of duty, Friedrich Nietzsche an exercise of the will. In the modern age, asceticism, thus secularized, is practiced for purely personal purposes: in sports (painful training and sexual abstinence in order to attain ultimate achievement), for the realization of aesthetic norms (fasting to attain an ideal figure, sometimes to the extent of a striving for gauntness), or for the attainment of social and lucrative ends. In 2004, for example, the English television station Channel 4 aired a reality show in which the contestants competed to see who could go without sleep the longest—a week of sleep deprivation brought the winner 140,000 euros.

Another ascetic form, grounded in subjective ethics—not religious as a rule—is fasting for the implementation of an ideological stance (as in ancient Ireland). In modern times it has become a common method (hunger strike) to appeal through the media for the sympathy of the public.

Conclusion

As a widespread phenomenon, asceticism was historically significant only within the religious realm. Self-discipline and self-infliction of pain, as voluntary practices of piety, primarily

functioned as part of a predetermined contract with the Godhead in the sense of a religious *do ut* (principle of reciprocity) that anticipated a reward in this and the other world. Asceticism was therefore always commonly seen as a means to an end, although it may have been, for those with corresponding psychosomatic dispositions, a goal in itself. Remarkably, no other religion besides Christianity so positively values suffering and pain. This value begins with voluntary participation in the Passion of the religious leader, attains a decided accent with Paul, the martyrs, and monasticism, and reaches its high point in the era between the thirteenth and the eighteenth centuries. And Christianity alone uses, as its most important symbol, a physical body that has been pierced with nails to an instrument of torture and left there to die. In the third chapter of her major work, *Il dialogo*, Catherine of Siena emphasizes the foundations of Catholic asceticism: “For God, who is infinite, wants infinite love—and infinite suffering.”

With the advent of Protestantism and, above all, through the Catholic Church’s own reception of the Enlightenment, such roads to the heavenly realm became obsolete. Behind this change was also a fundamental transformation of the historical perspective on the body, which manifested itself in law with the elimination of torture and capital punishment. From a social psychology perspective, asceticism is defined as an elite organization of conduct of life that critically rejects the general cultural values of the “masses”; psychologically, asceticism is seen as a socially accepted and rewarded overcompensation for guilt feelings, as in masochism and the death instinct. In the Western world of the early twenty-first century, traditional Christian asceticism, with very few exceptions, no longer exists; asceticism only exists in purely personal, secularized, analogous forms, which inspire more criticism than admiration.

ASIAN-AMERICAN IDEAS (CULTURAL MIGRATION).

Asian migration to the United States is a trans-Pacific flow of people, social networks, and cultural values. Asian immigrants arrived in America with their own lifestyles, labor and vocational skills, business expertise and capital, family rituals and traditions, religious and philosophical beliefs. As Asians have adapted to American society, some of their home cultures have remained, others have disappeared, and still others have changed. Migration is often a process of negotiation over cultures during which Asian immigrants and their descendants construct new identities, community structure, and cultural sensibilities. Race and ethnicity play important roles in such processes. The formation of Asian-American culture is not a simple blending of Western and Asian cultures. (This entry will not cover immigrants from South Asia.)

The Migration of Values: Religion and Education

Asian experience in America illustrates how cultural values are transplanted, transformed, and developed. In Asia, Confucianism, Buddhism, and Daoism play important roles in people’s spiritual life. Confucianism is a philosophical doctrine that guides Asians in human relationships, such as the relationship between the rulers and the ruled or between parents and children. Although Buddhism is a religion, Buddhist teaching is more psychological than theological. When monks pray for deceased family members at a funeral, they help people relieve pain. Daoism advises people to live a simple life and to pursue tranquility and harmony with nature. Those belief systems accompanied Asian immigrants to America. The respect for elders and filial piety advocated by Confucianism have influenced family relationships in both early and contemporary Chinese-American families. Family and district associations of early Chinese communities made sure that a joss house for ancestry worship was available for immigrants and sometimes built temples for prayers. Hsi Lai Temple, completed in 1988 in Hacienda Heights, Los Angeles County, is the largest Buddhist temple in North America. A high percentage of early Japanese immigrants were Buddhists as well, since the Jodo Shinshu (True Pure Land) branches of Amida Buddhism were prevalent in the southwestern part of Japan where immigrants came from. Once rooted in American society, Asian cultural institutions have adapted themselves to local settings. In the early twentieth century, Japanese Buddhist priests often prayed in both Japanese and English, referred to their temples as “churches,” installed pews in the temples, and even used hymnals in prayer activities.

Influenced by Confucianism in China, education is the most important social mobility path in Asia. Asian immigrants

have brought their belief in the value of education to the United States. Children are expected to compete vigorously at school and earn good grades, and parents often feel obliged to see children through college. Ethnic-language schools have existed in Asian communities since the nineteenth century. Asian children often go to ethnic-language school after attending regular American public schools, though many of them dislike the arrangement. However, language class is only part of the curriculum, as ethnic-language schools often provide Asian cultural classes as well as classes supplementary to public school education. Ethnic-language schools in the early Japanese community offered English-language classes to assist the second generation to do well at American public schools. Contemporary Chinese-language schools often provide SAT or other college entrance preparation classes. Education is an important agenda in the Asian-American family. The value of education has been transmitted to the second generation as Asian parents send their children to attend ethnic-language schools.

Media and Festivals

Other cultural components of Asian-American communities include ethnic-language newspapers, journals, and Web sites, as well as radio and TV stations. Ethnic mass media are instrumental in allowing immigrants to receive news about both America and their home country and to obtain information on job and business opportunities. It also gives them a sense of community. Ethnic festival celebrations are the most visible community events to provide Asian-Americans with a collective cultural identity. Nisei Week in Los Angeles is the largest ethnic festival for Japanese-Americans. Created in the 1930s, the Nisei Week festival aimed to rejuvenate Little Tokyo's economy and reach out to mainstream American society. More importantly, the *issei* (immigrant) generation was concerned about rapid assimilation of the *nisei* (second) generation and wanted to use this occasion to promote ethnic pride among the American-born Japanese. *Nisei* were often advised that buying in Little Tokyo demonstrated their loyalty to Japanese culture. During Nisei Week, stores were colorfully decorated, fashion and talent shows were performed, and a grand parade was organized. The Nisei Week queen often rode together with local government officials in the parade. Under the festival atmosphere, however, lay conflicts between generations, racial tensions, and the struggle of Asian small-business owners.

Lunar New Year is the most important festival for Chinese-Americans. In China, it is essentially a family celebration. Family members clean the house, pay off debts, cook a rich family dinner, give red envelopes containing money to children, and use firecrackers to scare away evil spirits. In America, however, it becomes a public event. Chinese community organizations sponsor the Lunar New Year banquet, organize a dragon or lion dance parade, and decorate the community with red lanterns and bright banners. Before the Chinese Exclusion Acts were repealed in 1943, many Chinese immigrants were separated from their wives and children in China. Clan association banquets replaced the family feast in order to give the single males a sense of family life. Merchants allowed their employees a couple of days off from work to express ethnic solidarity. The Lunar New Year festival was also an occasion to reach

out to mainstream America. While most stores were closed in China during the holidays, decorated Chinatown welcomed visitors as merchants commercialized it to attract tourists. Modeled after the Rose Bowl Parade on New Year's Day in Los Angeles, the Golden Dragon Parade tradition originated in the San Francisco Chinese community in the 1950s. Local celebrities, government officials, famous Chinese professionals and artists, and Miss Chinatown U.S.A. all rode on the floats during the parade. As the Chinese take this occasion to show their ethnic pride, the Lunar New Year gains new meanings in America.

Influences on Mainstream Society

Asian-American culture has influenced American society at large. Grocery chains such as 99 Ranch Market attract both Asian and non-Asian clients. Many Americans consult acupuncture specialists or feng shui masters. Asian food is probably the most visible transplanted culture in America. Wherever they went, immigrants brought their cookery with them. A business directory in 1856 listed five restaurants and thirty-eight grocery stores among eighty-eight Chinese businesses in San Francisco. Obviously Chinese immigrants cooked their own meals and visited Chinese restaurants during their leisure time. However, as racial discrimination gradually forced the Chinese out of other occupations and channeled them into menial service jobs such as the restaurant or laundry business, many Chinese picked up cooking skills and worked as professional cooks. With numerous Chinese restaurants and laundry shops in metropolitan areas during the exclusion years, cooking and laundry became an ethnic label for Chinese-Americans. To adapt Chinese cuisine to American society, Chinese immigrants created "sweet and sour pork" or "chop suey" as "authentic" Chinese dishes in America and invented the "fortune cookie" as an additional incentive to American customers. Restaurants in China had no such thing as a "fortune cookie." Original "chop suey" consisted of intestines and giblets, as ordinary Chinese did not want to waste any part of butchered livestock. Hundreds of "chop suey houses" appeared in New York, Boston, Washington, Philadelphia, and Chicago in the 1900s after Li Hongzhang, a senior Chinese official, visited the United States in 1896. Chinese restaurant operators capitalized on the visit and marketed "chop suey" as Li's favorite dish. Being an authentic Chinese food in America, chop suey is defined in Webster's dictionary as "a dish prepared chiefly from bean sprouts, bamboo shoots, water chestnuts, onions, mushrooms, and meat or fish and served with rice and soy sauce." While the Chinese restaurant has become popular in America society, cooking is a false trademark of Chinese ethnicity.

Herbal medicine, on the other hand, is a true ethnic skill of the Chinese. Like Chinese restaurants, herbal stores began to appear as soon as the Chinese arrived in America. With the growth of Chinese immigrants, more and more herbal doctors arrived to serve the needs of the community. Soon the herbalists began to serve non-Chinese patients as well. By the 1930s, many Chinese herbal doctors had more Caucasian patients than Chinese. Unlike Chinese cuisine, herbal medicine could not change its ingredients, flavor, or dispensation to suit the taste of mainstream Americans. As a transplanted culture, it

had to remain distinctively Chinese for its effectiveness. Herbal medicinal formulations were made from hundreds of indigenous herbs gathered in the mountains and valleys of China. The supply of medicine relied on the constant importation of herbs from China. In their efforts to bypass unfair restrictions and cross ethnic boundaries to serve a larger community, Chinese herbalists developed and expanded an ethnic career and business in a Western society where most of their patients were not familiar with Chinese culture and where the medical profession was becoming increasingly standardized and regulated. Acceptance of and respect for Chinese herbal medicine demonstrate how mainstream American patients adapted themselves to an Asian medical therapy. The history of Chinese herbal medicine is a case of reverse assimilation and an expression of ethnic resilience in cultural migration.

ASSIMILATION. In 1964 Milton M. Gordon (b. 1918) produced a groundbreaking book called *Assimilation in American Life*. He informed readers that three different theories of assimilation existed in the United States: “Anglo-Conformity,” the “Melting Pot,” and “Cultural Pluralism.” Gordon acknowledged, though, that Anglo-Conformity was “the most prevalent ideology of assimilation in America throughout the nation’s history” (p. 89). The other two theories, proposed by members of minority groups who wanted to “fit in” but who were unwilling to accept the cultural demands of the dominant society, suggested that all people who came to the United States ultimately mixed together and formed a “new American,” or

that individuals could “assimilate” while maintaining aspects of their own culture. History has shown, however, as Gordon himself noted, that to be accepted by others as an American, one had to conform totally to the values of Anglos in the United States. (“Anglo” values are sometimes referred to as WASP—white, Anglo-Saxon, Protestant—characteristics.)

Colonial Period

No one questions, of course, that the United States, and the British colonies before the formation of the American government, almost always welcomed European Caucasians as future citizens. In the colonial era there was an incessant call for additional laborers. And although much of the need was filled by black Africans, white people had no desire to intermingle with them socially or on an equal basis. Since the way to assimilate in American society requires marriage with a member of the dominant culture, and adoption of the folkways and mores of that culture, any non-Caucasian could not be considered. Nonwhites could not become white, and prejudice prevented most white people from marrying people of any other skin color.

Starting in colonial America, however, the standards for assimilation included adoption of the religion and language of the community. Most of the Pilgrims, Puritans, and others who traveled to the southern part of what is now the United States were Protestants. Catholics were feared because they were viewed as subject to the “tyrannical dictates” of the pope in Rome. The epithet “Jews, Turks, and Infidels” assumed inferiority, non-Protestant faiths, and lack of the attitudes and characteristics required of all Americans.

These views did not prevent Catholics and Jews from coming to the colonies, but these groups were rarely accepted as equals by members of the dominant culture. It is true, also, that some Protestant denominations, such as Quakers and Huguenots (French Protestants), were also looked down upon. Once they changed their denominations, however, they had the option of blending with members of the dominant culture. Some accepted the colonial demand for assimilation into a more mainstream Protestant denomination. This choice, however, was usually made by their children or grandchildren. Moreover, other European immigrants could either conform to American values or choose to remain with people of similar backgrounds. The latter was not acceptable to the colonists; it concerned members of the dominant culture. Benjamin Franklin (1706–1790) warned fellow Pennsylvanians in the eighteenth century about the Germans in their midst:

Why should the *Palentine Boors* be suffered to swarm into our Settlements, and by herding together, establish their Language and Manners, to the Exclusion of ours? Why should *Pennsylvania*, founded by the *English*, become a Colony of *Aliens*, who will shortly be so numerous as to Germanize us instead of our Anglyfying them? (Dinnerstein et al., 1999, p. 7)

Franklin’s thoughts reflect not only the values of people of his own time but also those of Americans throughout the centuries. As a result of their anxiety about maintaining the

dominant culture, colonists feared new immigrants who might undermine it with their own preferences. Often individuals, some of whom had been here perhaps for less than one generation, expressed the most hostile feelings about the new immigrants. Subsequent generations in the United States also frowned on newcomers with different backgrounds. Only foreign-born Protestants who spoke English were easily accepted without criticism by Americans.

From the colonial era stereotypical impressions of almost every group became part of the thought and expression of members of the Anglo-American culture. Descendants of the English regarded Germans as fat, stupid, and drunk; Jews and Quakers as clever and wealthy; Scots-Irish as violent and drunk; and French, Spaniards, and other “papists” as “hot-blooded lovers” and “slaves” of tyrannical rulers in the Catholic Church. Nineteenth- and twentieth-century immigrants like the Irish, the Poles, and the Jews were similarly branded with epithets Americans fantasized.

Responses to Crisis

Whenever a crisis occurred in American society, some ethnic group was usually targeted as the culprit. In the 1790s, at the time that the English and French were battling for control of the Atlantic Ocean, French “radicalism” supposedly undermined American society. Fears of the French led to the passage in 1798 of the Alien and Sedition Acts, which gave the president unilateral power to jail and/or force people back to where they came from if they criticized the government. During World War I, Americans denounced people of German ancestry; during World War II, the U.S. government incarcerated Japanese-Americans; and after the attack on the World Trade Center and the Pentagon, on September 11, 2001, legislation quickly passed through Congress calling for the “registration” of Muslims from several Middle Eastern and Asian nations. In each of these periods, most other Americans regarded members of these groups as threats to the security of the nation.

Throughout American history, once crises had passed, Caucasians could engage in whichever economic endeavors they chose. Members of society who had not married people of the dominant culture, however, had a more difficult time functioning in the United States. Some, who were even prohibited from having equality by state laws or customs, such as Asians and Mexican-Americans, nonetheless found their niche in a variety of endeavors. The Irish, in the nineteenth and twentieth centuries, could buy saloons, join the army, or attend law school. Civil-service positions were generally open to them as well as to others of different backgrounds who passed qualifying examinations. Through the middle of the twentieth century many political “bosses” were of Irish ancestry. Given the opportunities for independent entrepreneurs, Jews as well as Japanese rose in society. After World War II, where educational opportunity existed, everyone who partook of it fully moved up a notch or two on the socioeconomic scale.

Nonetheless, many newcomers and their children still retained traditional values and refused to marry outside of their cultures. Although almost everyone acculturated in stages, that

is, adopted the characteristics, attributes, and behavior of members of American society, it sometimes took three or four generations before they actually assimilated. For these people and their descendants, “success,” but not total acceptance, was also possible. Thus, in tracing the evolution of people in American history, one notes that while wealth or accomplishments were always signs of having succeeded in the dominant culture, such attributes were not enough to be considered “one of us.” An athlete or an entertainer might be extremely skillful, popular, and appealing in his or her field of endeavor, but still not accepted as an “equal” by members of the dominant culture. At one time a Jewish actor or an Italian baseball player might be universally applauded, but that did not make Jews or Italians part of the mainstream.

In general, Americans welcomed all Caucasian immigrants until approximately the 1920s. There were always concerns, though, that non-Protestants could not fit into American society. Thus, when the tide of European immigration turned overwhelmingly Catholic and Jewish in the late nineteenth and early twentieth centuries, Congress passed laws curbing their influx. In the 1920s new immigration legislation favored people whose compatriots had predominated in the settlement of the United States. Laws establishing quotas for different nationalities passed in 1921 and 1924, respectively. These bills set low quotas for southern and eastern Europeans but much more generous ones for the British, Germans, and Irish. In the 1930s American consular officials placed more stringent restrictions on Jewish people trying to emigrate from Germany than they did on non-Jews. Similarly, after World War II, legislation to bring in displaced persons from Europe favored non-Jews over Jews, and former fascists over Communists. Not until 1965 did Congress pass immigration legislation favoring family unification.

The opportunities for assimilation in American society have always been greater for Caucasian Protestants than for people of other backgrounds. Before World War II sociologists noted that people of different national heritages had begun marrying members of other ethnic groups who shared their religion. In the 1960s, the nation witnessed a rise in the rates of intermarriage by people of European descent who had had different religious and ethnic backgrounds. The United States Supreme Court then declared, in *Loving v. Virginia* (1967), that states could not ban interracial marriage. Immediately the prohibition of interracial marriage, which still existed in twenty-two states, mostly in the South and the West, ceased.

Since that time, Americans of all stripes have witnessed increasing numbers of marriages based on individual choices and characteristics. Demographers and statisticians, moreover, have concluded that more than 50 percent of all Americans have chosen life partners based on individual characteristics rather than religious, ethnic, or legal considerations. As one boy put it in 1993, “I’m half Italian, half Japanese, and all American.”

Class, rather than any other factor in the twenty-first century, should be examined before making assessments about intermarriage as well as ease of assimilation. In the twenty-first century, in countries such as Germany and England, both class and heritage play a more significant aspect in acceptance than

ASTROLOGY

they do in the United States. But unlike the United States, where place of birth determines citizenship, in some European countries—for example, Switzerland—one is never automatically a citizen, regardless of birthplace.

Overview
China

OVERVIEW

Astrology, the effort to relate earthly occurrences to the stars and planets, is one of the oldest known intellectual endeavors. The oldest evidence for the Western tradition of astrology comes from Mesopotamia in the late third millennium B.C.E. Mesopotamian astronomical documents correlated celestial phenomena like eclipses with public events, including political changes and natural catastrophes. The first surviving “natal” horoscope, recounting the position of the planets at an individual’s birth, is also Mesopotamian and dates from the late fifth century B.C.E. One Mesopotamian people, the Babylonians or Chaldeans, long remained famed for their astrological ability. Astrologers generally were called Chaldeans as early as the first century B.C.E. in Rome.

Greek interest in astrology began in the Hellenistic period, as Alexander the Great’s (r. 336–323) conquests exposed Greek thinkers to Mesopotamian culture. The Greeks put astronomy in a cosmological framework, emphasizing the motions of the planets rather than static correlations. Hellenistic Alexandria was a center of astrology, and the Hermetic texts that originated there incorporated astrology into their magical and religious system. The Hellenistic period also saw the first evidence

of Jews embracing astrology, a practice traditional Judaism condemned.

The Roman upper classes also initially condemned astrology, which they associated with popular divination and superstition. This position is reflected in Marcus Tullius Cicero’s (106–43 B.C.E.) *On Divination*. Following the Roman conquest of the Hellenistic east in the first century B.C.E., Roman interest in astrology increased. The earliest evidence for Roman astrologers dates from this period. The Stoic school of philosophy, popular among the Roman elite, endorsed astrology along with other forms of divination. (The Epicureans, great rivals of the Stoics, condemned it.) Astrology became particularly prominent in the Roman Empire, as Augustus Caesar (63 B.C.E.–14 C.E.) employed it in his propaganda, subsequent emperors employed court astrologers, and rebels and aspirants to the imperial throne consulted astrologers to estimate their chances for success.

The imperial period saw the first surviving Latin astrological work, the Roman poet Manlius’s Stoic-influenced *Astronomica*. Manlius had little astronomical or mathematical skill, however, and the most important astrological writer in the Roman Empire was the Greek astronomer Claudius Ptolemy (2nd century C.E.), author of the most influential ancient astrological book, *Tetrabiblos*. Ptolemy, more a codifier than an innovator in astrology, defended it as a science of the influence of the stars on the terrestrial world based on conjecture rather than certainty. The early Christians attacked astrology, associating it with determinism and Gnosticism. St. Augustine of Hippo’s (354–430) denunciation of astrology in *The City of God* was particularly influential in the Latin West. The Christian Roman Empire included astrology in its strong antdivination laws, which were however only sporadically enforced.

Medieval Astrology

During the early Middle Ages, astrology, like many ancient disciplines, languished in the Latin West less because of the church’s condemnation than because few Westerners were able to draw an astrological chart or read Greek astrological works. The most important theoreticians and practitioners in the early Middle Ages were Arabic speakers in the Islamic world. Arabs developed several astrological ideas later accepted in the West, such as the correlation of patterns in human history with the conjunctions of Jupiter and Saturn, the so-called great conjunctions. Greek and Arabic works of astrological theory were translated into Latin only in the twelfth and thirteenth centuries. Medieval intellectuals like Albertus Magnus (c. 1200–1280) and Roger Bacon (c. 1220–1292) endorsed astrology but faced the problem of reconciling astrological determinism with the Christian doctrine of free will. They claimed that the stars influenced only the body, and not the soul. St. Thomas Aquinas (c. 1224–1274) conceded that the stars influenced human passions, and that many astrological predictions were correct because most people were ruled by their passions. He claimed, however, that the wise man could resist his passions, and thus the stars could not determine his actions. The medieval emphasis on the power of the stars over the body helped astrology become closely allied with medicine. Charles V of France (r. 1364–1380), whose library contained many books

Map of Tycho Brahe's system of planetary orbits around the earth, with signs of the horoscope (1660–1661), by Andreas Cellarius. Danish astronomer Brahe, who calculated the measurements of the solar system in the sixteenth century, was one of the last major Western astronomers to practice astrology. © STAPLETON COLLECTION/CORBIS

on astrology, contributed to the foundation of a college of astrological medicine in the 1360s.

Not all late medieval intellectuals accepted the new astrology. Six propositions of Bishop Étienne Tempier's famous prohibition of 1277 condemned astrology, mostly on the grounds of its determinism. The Scholastic philosopher Nicole d'Oresme (c. 1325–1382) vigorously opposed astrology. He reiterated the Christian attack on astrological determinism and added a new argument, that the velocities of the heavenly bodies were mathematically irrational and incommensurable, and thus it was impossible to know them exactly enough for astrology to work.

Astrology in the Renaissance and Reformation

As in other ancient sciences, Renaissance humanists claimed to be recovering the true, ancient astronomy from corruption by Arab and medieval Latin writers (although Arab-derived great conjunction theory remained very popular.) Renaissance philosophers, particularly those influenced by Neoplatonism, also extended the discipline's scope. The third book of Marsilio Ficino's (1433–1499) *Three Books on Life* (1489) treated the planets as a guide to all aspects of human life. Girolamo Cardano (1501–1576), who wrote a commentary on the *Tetrabiblos*, scandalized many by drawing a natal horoscope of Jesus Christ. While Martin Luther (1483–1546) and John Calvin (1509–1564) both condemned astrology, many of their Protestant followers (including Philipp Melancthon; 1497–1560) practiced it. Protestant astrologers were particularly interested in reconciling astrology with the apocalyptic interpretation of the Bible, using the stars and great conjunctions to help predict the date of the end of the world.

Astrology was an important support for professional astronomers in the late Middle Ages and Renaissance, as many

patrons were interested in astronomical data principally for its astrological uses. The leaders of the scientific revolution differed in their opinions of astrology. The last major Western astronomers to seriously practice astrology were Tycho Brahe (1546–1601) and Johannes Kepler (1571–1630), both of whom drew horoscopes for the monarchs they served. Mechanical philosophers like Marin Mersenne (1588–1648) and the “Christian Epicurean” Pierre Gassendi (1592–1655) denied the doctrine of the influence of the stars on the Earth that astrology was based on, as it had no mechanical explanation. Although several of the founding members of the Royal Society practiced astrology, it lost its central intellectual role in the late seventeenth century. Astronomers increasingly justified their science as useful in navigation and cartography rather than astrology. Copernican astronomy did not “disprove” astrology, but the shift from an earth-centered to a sun-centered cosmos did call into question traditional geocentric astrological interpretation. Astrology also suffered from the general decline of magical thinking as Europe entered the eighteenth century. Although many ordinary people continued to believe in astrology, it was not taken seriously by most scientists and intellectuals.

CHINA

In China, coordination of human activity with the sun, moon, and stars, including the cardinal orientation of structures in the landscape, can be traced back to the Neolithic cultures of the fifth millennium B.C.E. In the words of Sima Qian (fl. 100 B.C.E.), “Ever since the people have existed, when have successive rulers not systematically followed the movements of sun, moon, stars, and asterisms?” By the early Bronze Age, around the beginning of the second millennium, attention had already begun to focus on the circumpolar region as the abode of the sky god *di*, and from this time forward the North Pole increasingly became a locus of practical and spiritual significance. The polar-equatorial emphasis of Chinese astronomy began to take shape, which meant that the ancient Chinese remained largely indifferent to heliacal phenomena and the ecliptic (the sun's apparent path through the skies). A prominent feature of this polar focus was the use of the handle of the constellation Northern Dipper (Ursa Major) as a celestial clock-hand and the identification of certain cardinal constellations with the seasons and their unique characteristics—the green dragon with spring, the red bird with summer, the white tiger with autumn, the dark turtle

with winter. As Sima Qian would later say: “The 28 lunar lodges govern the 12 provinces, and the handle of the Dipper seconds them; the origin [of these conceptions] is ancient.” Massings of the five planets, *di*'s “Minister-Regulators,” solar and lunar eclipses, and other astronomical and atmospheric phenomena were seen as portents of imminent, usually ominous events. Astronomical records are not abundant in the earliest written documents, the oracle-bone divinations of the late Shang dynasty (c. 13th to mid-11th B.C.E.); however, a theory of reciprocity prefiguring later Chinese astrological thinking is already in evidence. What transpired in the heavens could and did profoundly influence human affairs, and conversely, human behavior could and did provoke a response from the numinous realm beyond the limits of human perception. Astral divination was reactive and opportunistic and, as elsewhere, never focused on individuals beyond the royal person, but only on affairs of state such as the sacrifices to the royal ancestors, the harvest, warfare, and the like.

By the late Zhou dynasty (1046–256 B.C.E.) *tianwen*, “sky-pattern reading” or astrological prognostication, took as its frame of reference the twenty-eight lunar mansions or equatorial hour-angle segments into which the sky was by then divided. In classical “field allocation” astrology of mid to late Zhou, these twenty-eight segments of uneven angular dimensions were correlated with terrestrial domains according to different schemes. Allocated among the astral fields for purposes of prognostication were either the nine provinces into which China proper was traditionally thought to have been divided, or the twelve warring kingdoms of the late Zhou, whose successive annihilation by Qin led to the establishment of the unified empire in 221 B.C.E. The classical job description of the post of astrologer royal is found in the third century B.C.E. canonical text *The Rites of Zhou*:

[The *Bao zhang shi*] concerns himself with the stars in the heavens, keeping a record of the changes and movements of the stars and planets, sun and moon, in order to discern [corresponding] trends in the terrestrial world, with the object of distinguishing (prognosticating) good and bad fortune. He divides the territories of the nine regions of the empire in accordance with their dependence on particular celestial bodies; all the fiefs and territories are connected with distinct stars, based on which their prosperity or misfortune can be ascertained. He makes prognostications, according to the twelve years [of the Jupiter cycle], of good and evil in the terrestrial world. (trans. Needham, p. 190; modified by the author)

In this scheme, movements of the sun, moon, and planets formed the basis of prognostication, taking also into account their correlations with the five elemental phases (Mercury-Water; Venus-Metal; Mars-Fire; Jupiter-Wood; Saturn-Earth), as well as *yin* and *yang*. While sparsely documented in contemporary sources, probably as a result of the hermetic nature of the practice, evidence suggests the influence of astrological considerations was pervasive. As a common aphorism put it not long after the founding of the empire, “astute though

the Son of Heaven may be, one must still see where Mars is located.” Although Babylonian influence on Chinese astrology has occasionally been claimed, and a few suggestive parallels between specific late planetary prognostications (c. 100 B.C.E.) have been drawn, on the whole the evidence in favor is unpersuasive. Ancient Chinese cosmology and astrology are distinctive in essential respects, and any parallels are so circumstantial that it is more likely that throughout its formative period Chinese astrology developed in isolation from significant external influences. When it comes to China's immediate neighbors, the flow of ideas has been overwhelmingly outward from the center.

Early Imperial Period

In the early imperial period, Han dynasty (206 B.C.E.–220 C.E.) cosmologists amalgamated field-allocation astrology with hemerological concepts (lucky and unlucky days for various activities), yin-yang and five phases correlative cosmology, as well as the symbolic trigrams of the *Book of Changes*, to develop the systematic and highly complex method of divination embodied in the *shi* or diviner's board so representative of that period. Examples of the latter excavated from Han tombs typically consist of a round heaven plate with the Northern Dipper inscribed at the center as if seen from above, and with the twenty-eight lunar mansions, months of the year, or solar chronograms inscribed in bands around the circumference. The pivot of the heaven plate is conventionally placed in or near the handle of the Dipper in recognition of its symbolic centrality and numinous power, while the square earth plate underneath is graduated around its exposed perimeter in concentric bands showing the twenty-eight lunar mansions, the twelve earthly branches and ten heavenly stems marking the cardinal and intercardinal directions, the twenty-four seasonal nodes, and so on. Some examples substitute for the heaven plate an actual ladle fashioned from magnetic lodestone and designed to rotate within a highly polished circular enclosure representing the circumpolar region.

As originally conceived, the twenty-eight lunar mansions did not technically constitute a zodiac, since, with the exception of comets, novae, and the like, the sun, moon, and planets did not actually appear among their constituent stars: many of the latter in ancient times actually lay closer to the equator than to the ecliptic. Rather, astronomical phenomena occurring within a given astral field were connected with noteworthy events in the corresponding terrestrial region. In terms of classical resonance theory this was because the astral and terrestrial realms were continuous and composed of the same quasi-matter, quasi-*pneuma* called *qi*. Theory held that disequilibrium at any point in the system could potentially provoke imbalance throughout by a mysterious process somewhat analogous to magnetism or sympathetic resonance. In case of disruption it was essential to identify the cause and to take corrective action, based on yin-yang and five phases phenomenological correlations, to remedy the situation and restore harmony to the system. Unlike the Ptolemaic scheme, which has aptly been dubbed “astrological ethnology,” despite modifications designed to take account of historical changes in political boundaries and the relative balance of power between

the empire and its non-Chinese neighbors, from the outset field-allocation astrology was resolutely sinocentric. The non-Chinese world remained essentially unrepresented in the heavens and in astrology except as a reflex of Chinese concerns.

Though individualized horoscopic astrology did not figure in the repertoire, the increasing complexity of astrological theory in Han times was accompanied by a proliferation of prognostication methods and devotions directed toward astral deities. The ancient cult of *Tai yi*, the supreme ultimate or numinous cosmic force resident at the pole, rose to prominence even in the imperial sacrifices, being imaginatively linked in contemporary iconography with the image of the celestial thearch driving his astral carriage (Ursa Major) around the pole.

The Dipper is the Celestial Thearch *di's* carriage. It revolves about the center, visiting and regulating each of the four regions. It divides *yin* from *yang*, establishes the four seasons, equalizes the Five Elemental Phases, deploys the seasonal junctures and angular measures, and determines the various periodicities: all these are tied to the Dipper. (Sima Qian, *Shi ji*, "Treatise on the Heavenly Offices")

The protection of *Tai yi* and lesser astral spirits was invoked both in local cults led by magicians and by imperial officials, in the latter case especially before initiating major military campaigns, when

a banner decorated with images of the sun, moon, Northern Dipper, and rampant dragons was mounted on a shaft made from the wood of the thorn tree, to symbolize the Supreme Ultimate and its three stars. . . . The banner was called 'Numinous Flag.' When one prayed for military success, the Astrologer Royal would hold it aloft and point in the direction of the country to be attacked. (Sima Qian, *Shi ji*, "Basic Annals 12: The Filial and Martial Emperor")

Prognostication based on the appearance of the stars of the Dipper appeared, as well as that based on the color, brightness, movements, and so forth, of comets, "guest stars" or supernovae, eclipses, occultations of planets by the moon, and a variety of atmospheric phenomena. Ancient precedent dating from the Three Dynasties (Xia, Shang, Zhou) of the Bronze Age in the second millennium led to the establishment by Han times of certain astrological resonance periods, especially dense clusters of the five visible planets at roughly 500-year intervals, as the preeminent sign of Heaven's conferral of the "mandate" to rule on the new dynasty. Other alignments of the five planets, or simply their simultaneous appearance in the sky, were popularly held to be "beneficial for China," in an indirect allusion to the existence of a non-Chinese world. Not surprisingly, given the close theoretical link in Han imperial ideology between portents, anomalies, and the conduct of state affairs, the popularization of prognostication by omens led to a politicization of astrology, and the fabrication of all manner of portents for political ends, especially during succession

crises, reached a level unmatched in later imperial history. Because of the connection between astrological omens and state security, in time only imperial officials were allowed to make observations and study the records, and by imperial decree unauthorized dabbling in astrological matters became a capital offense.

Six Dynasties Period and After

Along with the gradual spread of Buddhism in the centuries following the collapse of the Han dynasty, efforts were made by Buddhist writers during the Three Kingdoms and Six Dynasties period (220–589 C.E.) to integrate Indian Buddhist cosmological and astrological concepts and to reconcile incommensurate numerological categories—for example, matching the Buddhist *mahābhūtas* (four elements) with the Chinese five phases. Subsequently, attempts were made to establish even more complex correspondences between Chinese and Indian astrological sets such as the twenty-eight lunar mansions with the twelve Indian zodiacal signs derived from Hellenistic astrology, the nine planets of Indian astronomy with the seven astral deities of the Northern Dipper, and so on. During the Six Dynasties era and the early Tang dynasty (618–906) in particular, China's most influential translators of Buddhist astrological works and compilers of astrological treatises were Indians such as Qutan Xida (Gautama Siddhārta, fl. 718), author of the *Kaiyuan zhanjing* (Kaiyuan reign-period treatise on astrology), the greatest compendium of ancient and medieval Chinese astrological fragments. On the whole, however, these efforts at syncretism exerted surprisingly little influence on long-established Chinese astrological theory, especially given the drastic decline of Buddhism following the Tang dynasty proscriptions in the mid-ninth century and the subsequent resurgence of Neo-Confucianism. Assimilation was also hindered by the difficulty of rendering the foreign concepts and terminology into Chinese, which was often accomplished by means of bizarre or idiosyncratic transliterations.

At the popular level Chinese astrology continued to absorb influences (Iranian, Islamic, Sogdian) via the Central Asian trade routes, and although certain Western numerological categories (such as the seven-day week) are represented in the enormously popular and widely circulated *lishu* or almanacs (documented from the ninth century), and individualized horoscopic astrology appears in later horoscopes (from the fourteenth century), Hellenistic concepts apparently had little discernible impact on the practice of astrology at the imperial court. Until modern times the most common popular forms of divination employed ancient prognostication techniques connected with lucky and unlucky denary and duodenary cyclical characters (paired to generate the sequence of sixty unique designations used to enumerate the days since at least the Shang dynasty), fate-calculation based on the eight characters *bazi* designating the exact time of birth, and so forth.

During the Song dynasty (960–1279) astrology entered a period of routinization and gradual decline, in part as a result of overexploitation by sycophants and careerists as a means of enhancing their status or prospects at court, and in part because of the resurgence of Neo-Confucianism and a return to a more anthropocentric outlook. Along with an increasing emphasis on

human affairs and moral self-cultivation, which was philosophically antithetical to superstition, the archaic belief in an interventionist Heaven that communicated by means of signs in the heavens faded into the background, and *tianwen* or “sky-pattern reading” shifted focus from the ever-precarious genre of prediction to a safer and more manageable interpretive mode. As a consequence, the objective status of natural phenomena declined, and the practice of astrology by imperial officials on the whole reverted to routine observing and recording of observations, focusing on the anomalous.

Henceforth, the interpretation of “sky-patterns” was Confucianized—one might even say domesticated—and only isolated instances of inductive generalization from observation are to be found, rather than interpretation more or less tentatively based on historical precedent. Given its subservience to the state ideology, Chinese astrology was incapable of growing into an independent body of learning or science of the heavens, but remained throughout imperial history the handmaiden of politics when not dismissed as mere superstition, which humble status is confirmed by the traditionally low rank of the post of court astrologer.

ASTRONOMY, PRE-COLUMBIAN AND LATIN AMERICAN. The sun and the moon, the planets and the stars are the same the world over. One might hypothesize, therefore, that diverse cultures of the world would think the same of them. The two American continents, having been cut

off from the Old World from the time of the Asian migration across the Bering land bridge more than ten thousand years ago up to European contact in the fifteenth century, provide an excellent laboratory to test such a hypothesis. One does find some remarkable Old–New World parallels. For example, ancient Maya divisions of the movement of the planet Venus inscribed on bark paper are practically identical to those written in cuneiform by the Babylonians. Moreover, in both of these highly urbanized cultures, planetary sightings were employed to the same end by a class of astronomer-astrologers situated very close to royalty: to cast omens.

This essay is divided into two parts. It begins by reviewing the astronomies of the so-called high cultures of the New World: the Maya, the Aztecs, and the Incas, those must often be compared with the classical world, Egypt, and the Middle East, from whom are inherited the roots of modern scientific astronomy. Then follows a brief examination of astronomical practices by less complex societies of North and South America.

“High Cultures” of the New World

Of all the Pre-Columbian civilizations none has received as much attention both by scholars and the media as the ancient Maya. The reason is very simple: at its pinnacle, between 200 and 900 C.E., the classical Maya civilization created great art, sculpture, and architecture; they devised a complex religious pantheon; and they developed syllabic writing and numerical systems on a par with the West.

Maya. Maya math was directed largely toward timekeeping (indeed the priest in charge of the calendar was—and still is—called the keeper of the day, *ah kin*). They counted their days in a base-20 system. Like the Babylonians (who used a different base) they dealt with time uniquely, by changing the scheme so as to identify the third position with 360 (18×20 rather than 20×20). Here was a way of handily reckoning the approximate length of the year. By the beginning of the Christian era they were writing inscriptions in “long count” that reckoned the number of days lapsed since the most recent cycle of creation. Maya mathematicians fixed the great event, which we would transcribe as 0.0.0.0.0 on their temporal odometer, to a date that corresponds in the Christian calendar to 12 August 3114 B.C.E. Though the reasons why they did so remain elusive, this deep-time setting of the commencement of creation is relatively common in highly stratified societies. But Maya time was enmeshed with other cycles that suggest a belief in a sensate universe, with all of its components interconnected—a universe that did not operate apart from human concern.

A shorter cycle, called the *tzol kin* (count of days), which the Maya still employ in the early 2000s, predated the long count by several centuries. Widespread throughout Mesoamerica yet unknown in the Old World, this 260-day round consisted of a series of twenty day-names preceded by numerical coefficients ranging from one to thirteen. Thirteen was the number of layers of heaven in Maya cosmology, while the bodily origin of twenty already is obvious. But other reasons may underlie the popularity of the number 260. In contemporary

Guatemala, there is evidence linking this basic time cycle to the human gestation period. This convenient round number approximates nine lunar months (265.77 days) in the same way that 360 approximates the length of the seasonal year (365.2422 days). The *tzol kin* is also a close approximation to the mean interval of appearance of Venus as evening or morning star, and it beats harmoniously in the ratio of 2:3 with the eclipse reckoning period of 173.32 days. Such approximations offer the advantage to the calendar keeper of assigning particular sets of dates in the *tzol kin* to eclipse or Venus warnings.

Astronomers, along with the mathematicians and scribes who worked with them during the Classic period (c. 200–900 C.E.), were members of a courtly class. Excavations of an eighth-century elite burial at the Maya ruins of Copán, Honduras, revealed the remains of a scribe, his paint pot and brushes still intact. These specialists were required to know with meticulous accuracy every celestial cycle that might conceivably guide human destiny. Control over these time periods by the Maya lords, their superiors, enabled them to appropriately schedule their own affairs as well as those of the state. As in China, such court professionals advised the ruler about the proper time to make decisions. When should they enter into armed conflict, set a date for a royal marriage, or an ascent to the throne? When ought they to conduct a ritual, or make an offering to pay the debt to the gods for their assistance in producing a good crop or a healthy newborn child? One can imagine royal appointees going from town to town, their codices filled with detailed planetary calculations and agricultural almanacs tucked under their arms, ready and willing to advise the local rulers on such issues. Likewise can be imagined their subordinates advising commoners in the marketplace.

Inscriptions on carved monuments (*stelae*) at the Maya ruins of Copán, Yaxchilán, Palenque, and elsewhere connect seminal events in the lives of the rulers with key sky events such as eclipses and planetary conjunctions. These suggest that the ruler may have achieved cosmic status, there being an implied descent of royalty from ancestor deities who resided in the sky. Outdoor rites held in the open spaces that front the temples served to legitimize heaven-ordained actions by the ruler. Cosmic hierophanies, the interplay of timed light and shadow to manifest the sacred, were likely staged in the architecture of Palenque and Yaxchilán. The shadow of a descending serpent on Chichén Itzá's largest pyramid is still witnessed today on the spring equinox.

There exists little evidence regarding Mesoamerican observational technology. Pictographs from Central Mexican codices depict men peering over what could be sighting devices that consist of pairs of crossed sticks. Often these characters are portrayed in the recesses of temples, which suggests that such edifices might have been preferentially aligned toward events that took place at the local horizon. A few oddly skewed misshapen structures and buildings with narrow slots or windows do seem to align astronomically. For example, the cylindrically shaped Caracol of Chichén Itzá, Yucatan, possesses built-in sighting shafts oriented to key positions of Venus, the Mayan god representing the recycling of creation.

Aztecs. At the time of European contact, the Aztecs controlled a vast empire centered on their capital of Tenochtitlan on the site of modern Mexico City. While their well-described practice of human sacrifice might tend to divert one's attention from pursuits so esoteric as astronomy, it must be remembered that the Aztecs offered the blood of their captives to the sun god Tonatiuh to keep the heavens in motion, lest eternal darkness befall them. Politically such a policy may be thought of as a mechanism of control and domination exerted by the Aztec rulers over their newly conquered tributaries all around the lake basin that surrounded their island capital. But from a religious perspective these sacrificial acts might be better regarded as mandatory rites of renewal of cyclic time in the life of the Aztec city paired with its dedication to cosmically sanctioned military conquest. The shape of Aztec time is also manifest in their documents. The Aztec historical record is rife with pictorialized events of nature, among them eclipses and smoking stars (comets and/or meteors). These books tell the reader that the sky is very much a part of civic life, for the pictures are juxtaposed alongside events of social importance, such as deaths, conquests, and accessions.

The Templo Mayor, largest of all Aztec buildings, exhibits a celestial alignment. One informant told a sixteenth-century Spanish friar that a certain festival took place at the temple when the equinox sun stood at its midpoint, but because it was a bit misaligned, Moctezuma needed to pull the temple down and straighten it. The temple's orientation is just what it would have had to be to permit the rising equinox sun to fall into the notch between the twin temples that once surmounted the flat-topped forty-meter-high pyramid. When the sun arrived there, Spanish chroniclers relate, a royal observer situated in the plaza fronting the bottom of the stairs carefully watched it. Like a town crier he would signal the time to begin the ritual of human sacrifice that attended that particular month of the year. The Aztec 52-year calendar round (the meshing of 260- and 365-day cycles) was cosmically timed as well. It began with the precise sighting of the Pleiades in the overhead position at midnight. When the time approached, one chronicler says, the priests ascended the Hill of the Star to affirm that the movements of the heavens had not ceased and that the end of the world was not imminent. Thus, one thinks of the sky as part of the background set for the effective performance of religious rites.

Inca. The Inca, whose even larger empire thrived in the Andes while the Aztecs ruled much of Mesoamerica, embedded the sky in a unique scheme that united ideas about religion, social organization, and hydrology. The *ceque* system was conceived as a giant mnemonic map built into the capital city Cuzco's natural and artificial topography. Likely used elsewhere, the system is best known from descriptions by Spanish chroniclers, who state that ceques were imaginary radial lines grouped like spokes on a wheel, dividing the city into sections much like a pie graph. The wheel's hub was the Coricancha, the navel of the world and the temple of ancestor worship.

Each of the Cuzco's forty-one *ceques* was traced by a line of *huacas*, or sacred shrines, that extended outward along irrigation canals and natural water sources across the landscape.

The Inca believed the 328 *huacas* to be openings in the mountain body of Pachamama, or Mother Earth, and there specific Xin groups left her offerings at specified times of the year. Some huacas were temples, others intricately carved rock formations, natural springs, and other landscape features. Still others were astronomical markers involved with the establishment of a calendar.

While not all investigators agree on the precise placement of astronomical *huacas*, it seems clear that they were part of a horizon-based solar calendar. In one instance, the northernmost pillar of a set of four on a hillside overlooking the capital served as a warning device. When the sun reached there the planting season in the Cuzco valley was approaching. People who cultivated crops at higher altitudes, where growth occurred at a slower pace, therefore would be allowed sufficient additional time to sow their seeds before planting commenced in lower levels of the valley. These dates were marked by the other pillars. The *ceque* system also indicated the various kin and ethnic groups that made up the population by designating certain *huacas* to their care. In this sense the order of worship of the *ceques* and their *huacas* constituted a mnemonic scheme that incorporated information, including astronomy, considered vital to the operation of the state.

Less Complex Societies

Other great indigenous cities of the Americas also used the pristine order evident in the sky to establish social order on earth. For example, the same general kind of sky symmetry found in Cuzco is apparent at Cahokia, located near where the Mississippi and Missouri Rivers join. Built one thousand years ago, Cahokia was truly a significant economic and political center of great proportions: it controlled the distribution of maize and exotic trade items over a very wide area. Though no chroniclers ever wrote about it and no indigenous writing system survives it, its axis of orientation is cardinal, and mound alignments imply that the sun was a major object of attention. Following and marking out the annual solar path along the horizon, rulers of this economic hub regulated the seasonal flow of goods and services and scheduled the holidays. Their accompanying solar rituals would take place when the local populace and the tributaries of the state turned out in the plaza in front of the great Monks Mound. The same can be said of Ohio's Hopewell, who erected large geometrical earthworks in the first millennium C.E. The axes of these structures, the interior spaces of which, like Great Britain's Stonehenge, were used as places of assembly, are aligned to the solstices and possibly to the stationary points of the moon at the horizon.

North America's Hopi of Arizona were among the many Native American skywatchers. The Hopi marked the solstices, which the elders referred to as "houses" where the sun stops in his travels along the horizon. At these places along the high mesa the priests erected small shrines. There a sun priest in charge of the calendar would deposit prayer sticks as offerings to welcome the sun and to encourage him along on his celestial journey. Some of these shrines have special openings that allow shafts of sunlight to penetrate particular directions, thus serving as another way to mark time. Sometimes the sun priest would gesture to the sun, whirling a shield on which was painted a sun

design, to imitate the sun's turning motion, hastening away any malevolent spirits who might impede the great luminary.

Though archaeoastronomers and historians of pre-Columbian astronomy suffer a lack of data relative to their Old World counterparts (the entire corpus of pre-Columbian Mesoamerican texts can easily be accommodated by a coffee table), they are offered some distinct advantages. First, some cultures survive and remain isolated enough from the domination of the West, so that authentic astronomical customs and beliefs can still be retrieved. Second, these living cultures are not so distant in time from their predecessors. Data from these cultures offer inroads into understanding the more complex systems of the past. For example, present-day Quechua-speaking people of South America still chart constellations that date all the way back to Inca times, if not earlier. They still call the Pleiades *colca*, or "storehouse," as the Inca named them; and alpha and beta Centauri, which are among the few bright stars that may figure in alignments tied to the *huacas* of Cuzco's *ceque* system, represent the "Eyes of the Llama." They are part of a parade of dark cloud animal constellations that, along with star-to-star constellations like our own, comprise the Milky Way, which is so much more prominent in the southern than in the northern hemisphere.

What once was a cosmic temple lives on in the early twenty-first century's cosmic house. The Pawnee lodge of the Midwest United States has a smoke-hole through which can be observed certain groups of stars used in storytelling. Likewise, the bell-shaped quarters of the Warao of Venezuela's Orinoco Delta consist of a zenith pole marked out with a yearly calendar calibrated by following the ascension of the solar image at noon. The difference between house and city is but one of size and social complexity. If the home incorporates a design for life and the calendar regulates activity, it is easy to understand why cities such as Cuzco and Tenochtitlan would have been imbued with similar cosmic imagery.

Whether ancient or contemporary, what is striking about pre-Columbian astronomy is that, in stark contrast with the West, all of the sky observations seem to have been acquired with either low technology or no technology. These societies used neither wheel nor gear, and few of them employed metals. Moreover, their mental devices diverge from those of Western astronomy. One hears mention neither of fractions nor of Euclidean geometry. Nor did indigenous Americans raise questions about the rotundity of the earth, or speculate on whether the Sun or any distant celestial body might lie at the center of the universe. This is because the spatial view of the universe—the concept of orbits, maps, deep space—is one of the gifts of the Greeks. Such concepts are culture-bound, and one ought not anticipate that pre-Columbian people would have entertained questions that appear to be common sense to the Westerner. This does not mean that Native Americans did not philosophize or theorize about the world around them. Their speculations were basically human centered. Theirs was not a mechanistic universe that operated as an entity apart from what is thought of as human consciousness.

In sum, studying pre-Columbian skies helps enable a realization of the uniqueness, rather than superiority, of the

Western worldview. The sky offered Native Americans a means of solving some of life's basic problems: how to regulate human activity, how to understand and worship the gods, and above all how to know what it means to be a member of society.

ATHEISM. The term *atheism* usually refers to the belief that there is no God or are no gods. This position has been called *positive atheism*, since it involves an actual belief and not just the absence of belief. In contrast, *negative atheism* involves the absence of belief in a God or gods. Atheism is typically contrasted with agnosticism, the view that one cannot know if a deity exists. Negative atheism, however, is compatible with agnosticism, for in the name of rationality one who does not know if God exists should suspend belief in God.

In Western and Near Eastern societies the term *atheism* has sometimes been used narrowly to refer to the denial of theism, in particular Judeo-Christian and Islamic theism. According to theism, God is a personal being, an all-powerful, all-knowing, and all-good creator of the universe who takes an active interest in human concerns and guides creatures by revelation. Positive atheists disbelieve that this God exists and reject concomitants including an afterlife, a cosmic destiny, the supernatural origin of the universe, an immortal soul, the revealed nature of texts such as the Bible and the Koran, and a religious foundation of morality. Negative atheists, in the narrow sense, simply do not have a belief in the theistic God and what that entails.

Theism is not a characteristic of all religions, however. For example, although the theistic tradition is found in Hinduism in the Bhagavad Gita, the earlier Upanishads teach that ultimate reality, Brahma, is an impersonal and pantheistic god. Positive atheism in its broadest sense would advocate disbelief in the pantheistic as well as the theistic aspects of Hinduism. Indeed, there are skeptical and atheistic schools of thought

within the Hindu tradition itself. Theravada Buddhism and Jainism are commonly believed to be atheistic, but this interpretation holds only for the narrow sense of disbelieving in a creator God. For although these religions reject a theistic creator God, they accept numerous lesser deities.

In the Western world, nonbelief in the existence of God is a pervasive phenomenon with a long and illustrious history. Ancient philosophers such as Lucretius were nonbelievers, and important thinkers of the Enlightenment such as the Baron d' Holbach (1723–1789) and Denis Diderot (1713–1784) were outspoken atheists. In the nineteenth century the most articulate and best-known atheists and critics of religion were Ludwig Feuerbach, Karl Marx, Arthur Schopenhauer, and Friedrich Nietzsche. Bertrand Russell, Sigmund Freud, and Jean-Paul Sartre were among the twentieth century's most influential atheists. In contemporary philosophical thought atheism has been defended by, among others, Paul Edwards, Antony Flew, Paul Kurtz, John Mackie, Michael Martin, Kai Nielsen, Michael Scriven, and J. J. C. Smart. In the United States, many contemporary atheists are also self-identified as humanists, secular humanists, or rationalists.

At the beginning of the twenty-first century atheism can be found from the Netherlands to New Zealand, from Canada to China, from Spain to South America. State atheism prevailed in the U.S.S.R. until the breakup of the Soviet Union. It was estimated in the 2002 *New York Times Almanac* that there are in the world about 222 million atheists (4 percent of the total population) and 887 million agnostics (negative atheists).

Popular misunderstandings of atheism abound. Thus, for example, it has been claimed that atheists are immoral, that morality cannot be justified without belief in God, and that life has no meaning without belief in God. There are, however, no grounds for supposing that atheists are any less moral than believers; many ethical systems have been developed that do not assume the existence of supernatural beings, and the meaning of life can be based on secular purposes such as the betterment of humankind.

Philosophically, atheism has been justified in differing ways. Negative atheists attempt to establish their position either by showing that the standard arguments for the existence of God—for instance the argument from first cause, the argument from design, the ontological argument, and the argument from religious experience—are unsound, or by demonstrating that statements about God are meaningless. Positive atheists argue in turn that the concept of God is inconsistent and that the existence of evil makes the existence of God improbable.

In particular, positive atheists have maintained that theism does not provide an adequate explanation of the existence of seemingly gratuitous evil such as the suffering of innocent children. Rejecting the standard defenses given by theists, they argue that justifications in terms of human free will leave unexplained why, for example, children suffer because of genetic diseases. Positive atheists hold that arguments that God allows much pain and suffering in order to build human character fail,

in turn, to explain why there was suffering among animals before human beings ever evolved and why human character could not be developed with less suffering than in fact there is. They argue that an explanation of evil better than the explanation that God has given us free will or the chance to develop character is that God does not exist.

Atheism has wide-ranging implications for the human condition. Among other things it entails that ethical goals must be determined by secular aims and concerns, that human beings must take charge of their own destiny, and that death is the end of human existence.

Although it is sometimes associated with materialism, communism, rationalism, existentialism, or anarchism, there is no necessary relation between atheism and any of these other positions. Some atheists, for example the objectivist writer Ayn Rand (1905–1982), have been opposed to communism, and some—for example, Bertrand Russell—have rejected materialism. Although all contemporary materialists are atheists, the ancient materialist Epicurus believed that the gods were made of atoms. And although rationalists such as René Descartes have believed in God, many contemporary atheists consider themselves rationalists. Jean-Paul Sartre was an atheist and an existentialist; Søren Kierkegaard was an existentialist who accepted God. In turn, Karl Marx was an atheist who rejected anarchism, but Leo Tolstoy was a Christian who embraced it.

In sum, atheism is a complex phenomenon with a rich history, brilliant defenders, and a wide following. It is often unjustly maligned and confused with other positions.

AUTHENTICITY, AFRICA. Ideologies of authenticity within African thought are self-affirming and counterideological positions adopted by individuals, groups, and communities of resistance who have all had their identities traumatically impacted upon or disrupted by forces of imperialism and conquest—namely slavery, colonialism, and neocolonialism. African authenticity is in this sense fundamentally an ongoing cultural, socioeconomic, and political process of self-definition. Particularly noteworthy are the theoretical and philosophical commonalities between these discourses, which enable their collective identification and characterization as movements seeking self-affirmation and self-legitimation as part of a vital project of self-rehabilitation.

The African oral tradition, a very significant part of African epistemology and knowledge production, has been vital to this project. One thinks immediately, for example, of the Jamaican-Caribbean–West Indian reggae group Culture, which, espousing the old “Back to Africa” philosophy and vision of Marcus Mosiah Garvey (1887–1940), consistently critiques and confronts “the West,” or Babylon (a historical and geographical referent for England and other imperial powers), in its music as a way of combating the dominance and hegemony of an ever-pervasive Western imperialism. The powerful and invigorating lyrics of Culture and the melodious spiritual chanting of Rastafari worldviews are deployed as a critical counterdiscursive ideology that continually reminds Africans and black people generally of the “agony and pain” of slavery, whose effects, as is constantly affirmed, are being felt even in the early twenty-first century.

Culture espouses an ideology of authenticity—nostalgically articulated around the idea of Africa as “home,” or the homeland to which all black people must return one day. With this recurrent theme, the world-famous group not only connects Caribbean cultural identity with Africa but also blames the dispersal of Africans in the diaspora on an inhumane imperialist system, the oppressive entity of Babylon, which from the days of slavery until the present has bequeathed a debilitating legacy of brutal racist exploitation on Africans and peoples of African descent. As a sign that Africa (as against the Caribbean or the New World) remains the authentic home for Black people, the members of Culture indict the slave master and sing of “travelling from home to Jamaica” (in the track “Still Rest My Heart,” of the album *Three Sides to My Story*) while yearning for liberation and affirming black humanity. African displacement and dispersal within the diaspora therefore become emblematic of a historical abnormality necessitating redress. Retribution is envisaged in the form of “fire,” which the prophetic voice of lead vocalist Joseph Hill calls upon to “burn” Babylon or the West as a means of ensuring restitution.

African authenticity would also be unimaginable without Cheik Anta Diop’s *The African Origin of Civilization*, a classic work with an interdisciplinary fusion of historical, anthropological, sociological, and linguistic material that, together with such accompanying texts as *Precolonial Black Africa* and *Civilization or Barbarism*, redefines the historical contribution of black people to world civilization by staking a claim for perceiving Ethiopia-Nubia and ancient Egypt as historical sources of present-day civilization. Diop’s comprehensive assemblage of evidence on the black race contests the epistemological dominance of Western civilization in contemporary knowledge production by contending that European civilization, which posits itself as evolutionarily and universally superior and as a global model, is derived from Greek civilization, which in turn “stole,” or borrowed, largely from black Egyptian and African civilization.

In literature, authenticity has found expression in *Muntu* and *Two Thousand Seasons*, two historical narratives by Ghanaians Joe de Graft (1924–1978), a playwright and theater practitioner, and Ayi Kwei Armah (b. 1939), a novelist and critic. Reconstructing precolonial African history, *Muntu* proposes that Africans inhabited a state of innocence devoid of

materialistic greed, exploitation, and corruption before the advent of European colonialism and the transatlantic slave trade. The nostalgic precolonial world of *Two Thousand Seasons* similarly narrativizes the vicissitudes of a pan-African community whose hospitality before the dawn of Arab and Western slavery and colonialism was encapsulated in a humane philosophy articulated simply as “the way.” The gruesome images of imperialist gluttony and excess and the portrait of the corruption of precolonial traditional institutions of governance in Africa in both works also, however, encode a rhetorical idealism that has led to accusations of racial essentialism, a critical charge indiscriminately applied to other discourses of African authenticity.

Relevant in this regard is Negritude, the literary movement of the 1930s developed by French-educated African and Caribbean students and intellectuals in France and founded upon a politics of racial solidarity among mutually oppressed African, Caribbean, and other black people in response to the alienating and suffocating ambience of French colonialism and culture. Led by poets Aimé Césaire (b. 1913) of Martinique and Léopold Sédar Senghor (1906–2001) of Senegal, Negritude harked back to an old and authentic Africa whose identity Negritudists identified with in the face of the inequalities they experienced within the failed French colonial policy of assimilation. Although the racialist discourse of Negritude was justifiable, it did not always state its case properly.

Similarly, *Toward the Decolonization of African Literature*, a work that claims to be exorcising African literature of domination by aesthetic and critical Eurocentrism, has come to be equated with a deeply conservative endeavor to retain a purist form of African identity in an impractical and regressive manner. In this polemical work of soul-searching that advocates a return to African sources within literature and cultural theory and clamors for deep immersion in African aesthetics as central to the project of reinventing an authentic African identity in the aftermath of colonialism, authors Chinweizu (b. 1943), Onwuchekwa Jemie (b. 1940), and Ihechukwu Madubuike (b. 1943) also present exoticized notions of African culture and African tradition, thereby diminishing the force of their argument. Critics have, however, never addressed the deeper question of Eurocentrism that Chinweizu and colleagues raise and have instead gleefully exploited the glaring simplification of African identity in *Toward the Decolonization*. However, the prevailing contradictions in no way invalidate the urgent need for a counterdiscursive and oppositional critique of the Western aesthetic and critical domination of African literature.

The ideological project of African authenticity is in the final event a critical counterculture that self-consciously contests all oppressive ideologies. Such a project informs *I Write What I Like*, the radical and defiant work by the famous political activist and black South African Steve Biko (1946–1977), whose resistance to the vicious and inhuman system of apartheid in South Africa led to his incarceration, brutalization, and subsequent murder. While Biko’s text has been acclaimed as the definitive work of the black consciousness movement, which he founded and led, it is also an individuated work locatable outside the strict parameters and confines of the black consciousness movement.

Biko’s quest for authentic liberation for black people was unique in contending that self-emancipation derived foremost from within a person’s psychological makeup. Biko was the first singularly and vociferously to contend that liberation from the structures and strictures of apartheid could in no proper sense be spearheaded by, for example, the white liberal establishment in South Africa. Biko therefore encouraged black South Africans as an oppressed group to adopt a strategy of liberation in which their self-worth necessitated a calculated disavowal of the patronizing contribution of members of the oppressor group.

Reactionary and reductionist attempts to deny the historical realities that works of African authenticity speak about have often engendered some willfully gross misinterpretations and simplistic trivializations of what are essentially and in reality existentially rooted quests for freedom and liberation. While African authenticity is often misconceptualized as a puritanist discourse, it is an ambivalent creative process and a miscellaneous philosophy or approach to life that inevitably closely relate to other forms of African thought and practice. Thus one might, for instance, find the concept being expressed in different kinds of material artifacts that may simultaneously be referred to as African art, African culture, and so on.

Overview

East Asia

Latin America

OVERVIEW

The term *authoritarianism* can be applied to a great variety of contexts. It can refer to authoritarian behavior, leadership styles, or personality types in families, industrial enterprises, bureaucracies, and other forms of organizations. Here, it refers to political regimes that fall under this broad label. The major characteristics of authoritarian regimes include a limited political pluralism with restrictions on the activities of interest groups and parties, a low level of social mobilization and popular political participation, a dominantly "subject" or "parochial" political culture, and usually a personalized form of leadership.

The term came into use in the nineteenth and twentieth centuries when it became necessary to distinguish hierarchically structured, traditional monarchical or more recent "bonapartist" autocratic regimes from liberal democracies, on the one hand, and all-encompassing "totalitarian" systems, on the other. Liberal democracies can be defined with regard to three major dimensions: an open and competitive political pluralism (usually in a multiparty system), a high level of political participation (as in fair and free elections, referenda, etc.), and political institutions that guarantee a certain separation of powers, the rule of law, and basic human rights (such as freedom of expression, information, organization, religion, etc.). Totalitarian systems, at the other extreme, are characterized by monistic, all-encompassing social and political organizations (such as a single party; dependent unions; organizations for women, youth, etc.), a high level of social mobilization (as in political rallies, high election turnouts), an explicit, monolithic, absolutist ideology, and a strong repressive apparatus. In fact, however, these distinctions cannot always be drawn precisely and some "gray" areas exist between these types. In common usage, all nondemocratic systems are lumped together as "dictatorships." Whereas the original use of this term in the Roman republic referred to emergency powers for a limited period, today it implies all kinds of arbitrary rule and political repression. Nevertheless, important qualitative differences can be found among such nondemocratic regimes.

Dominant Characteristics of Political Systems

Among the most important dimensions of political systems are the basis of legitimacy, the party system, the pattern of

recruitment of the executive, the actual power structure, the scope of political control, the ideological orientation of the system, and the formal vertical and horizontal separations of power. Legitimacy can be based on strong attachment to a political leader (charismatic), on elective procedures (legal-rational), or on a customary or informal acceptance (traditional) of political incumbents or a regime. Party systems are distinguished according to their degree of competitiveness, ranging from one-party states without any competitive elements, through semicompetitive single-party structures and restricted multiparty systems, to fully competitive ones. The recruitment of the executive can be achieved by inheritance, direct election by the population, a majority vote by parliament, or through forceful usurpation. The actual power structure within the executive can be strongly personalized and clientelistic or have a small collective group at its base (e.g., a military junta or a politburo of a centralized party), or it can be broadly composed to incorporate the most important plural elements of society.

The scope of control can range from limited to totalitarian. Ideological orientation is considered in relation to its respective social basis. This can consist of a "communalistic" (e.g., ethnic or religious) group, or of the lower, middle, or upper classes of society, corresponding to the political continuum of "left," "center," and "right." Finally, in a constitutional sense, the vertical separation of power can be viewed as complete, as limited but with an independent judiciary, or as nonexistent. Similarly, the horizontal separation of power can be federal or centralized. These dimensions and their discrete expressions are listed on the left-hand side in Table 1.

Specific Forms of Authoritarian Rule

Based on the characteristics outlined above, we can differentiate six forms of authoritarian rule.

Authoritarian monarchy. The most traditional political system in the world today is the authoritarian monarchy. Its basis of legitimacy is customary and is often linked to mythical assumptions regarding the foundation of the respective dynasty. Examples of this type are Ethiopia (until 1974) and Saudi Arabia. Accession to the throne is generally regulated by heredity, and there is little, if any, open political competition. Formal separation of powers is nonexistent, the power structures are personalistic and reinforced by an aristocratic upper-class ideology. In former times, most regimes of this kind were built upon feudal agrarian structures. Today they tend to have centralized and absolutist characteristics.

"Old" oligarchy. Another type of authoritarianism, which has been prevalent in Latin America, is the "old" oligarchy or, to use Howard J. Wiarda's term, the *traditional-authoritarian* regime. Such a regime receives its support from feudalistic or "neofeudalistic" rural structures and, since the late twentieth century, from segments of the urban upper classes. In the old oligarchy's extreme forms (e.g., in Nicaragua until 1979), a small number of leading families exercise almost exclusive control over political and economic life. In this system, a leader may be replaced relatively easily by another, sometimes through holding manipulated elections that do not alter the power structure.

Table 1. Dominant characteristics of political system types

Characteristics:	Types:											
	Authoritarian Monarchy	"Old" Oligarchy	"New" Oligarchy	Semicompetitive	Personalistic military	Corporatistic military	Socialistic military	Socialist	Communist	Fascist	Theocratic	Democracy
Legitimacy:												
weak or none		X	X	(X)	X	X	X	X	X			
traditional or customary	X							(X)	(X)		X	
personalistic (charismatic)				(X)			(X)	(X)	(X)	X	(X)	
elective (legal-rational)			X									X
Party System:												
no party	X	X			X	X					X	
one party without competitive elements			X				X	X	X	X		
one party with competitive elements or restricted multiparty		(X)		X		(X)		(X)				
multiparty												X
Head of Executive:												
monarch	X											
president or prime minister		X	X	X				X	X	X		X
military ruler					X	X	X					
religious leader										X		
Power Structure:												
personalistic	X	X	X	X	X		(X)		X	(X)		
collective group				(X)		X	X	X		X		
representative												X

Political leadership in these states has been connected with the traditional elements of the Catholic Church and the military. Antonio de Oliveira Salazar's (1889–1970) Portugal, and to some extent Francisco Franco's (1917–1989) Spain, also can be placed in this category. Political activities and the media are usually controlled by the regime's repressive apparatus. Other elements that constitute a separation of powers, such as an independent judiciary or a federal structure, are equally lacking.

"New" oligarchy. The "new" oligarchy receives its support from the dominant urban groups in a contemporary context. In this "hegemonic" regime, open competition for public office does not occur. Usually, there is a single-party structure, which, however, is predominantly formal and not very effective. Instead, great emphasis is placed on the bureaucracy. Public opinion and the media are controlled, while leadership is centralized and highly personalistic. In this respect, some charismatic elements of legitimacy may exist. Compliance is established either in terms of passive acceptance or by repressive measures. Both the social base and "inclusiveness" vary in ethnic and class terms. In a majority of cases, a relatively wide ethnic base is combined with more restricted class interests that

favor the prosperous groups in society. Countries such as Cameroon, Tunisia, and the Philippines (under Ferdinand Marcos; 1917–1989) are cases in point.

Semicompetitive authoritarianism. Another type can be termed "semicompetitive." In Latin America this system was also based on the traditionally dominant classes, but there is a greater balance between the rural and urban elements. This type also comes close to what Wiarda calls an "open corporatist" system. The contending elements are often institutionalized in "conservative" and "liberal" parties such as those found in nineteenth-century Chile, Colombia, or Uruguay. The "dominant one-party" system in postrevolutionary Mexico is a special case in point. Active participation remains restricted to the middle and upper segments of the population, while mass mobilization is largely prevented or restricted to more symbolic functions. In a different social context, one-party systems embodying competitive elements (e.g., that of Kenya until 1992) and states in which "regulated competition" prevails (e.g., Singapore, Lebanon until 1975) can also be subsumed under this category. Semicompetitive regimes tend to follow established constitutional rules within a presidential or

parliamentary system. Regular transfers of power occur within the set framework. They are generally less repressive than “oligarchic” systems. The media often enjoy greater freedom as well.

Socialist authoritarianism. “Socialist” regimes reveal another pattern. They are characterized by an effective single-party organization, a centralized system of government, and an ideology directed toward an egalitarian social order and a “non-capitalist” and “self-reliant” development. Freedom of expression and pluralistic forms of organization are curtailed. There is, however, a great deal of variation. One group (e.g., Tanzania and Guinea after independence) attempted to found their specific type of socialism upon their societies’ egalitarian traditions and culture. Another group (e.g., Algeria, Mozambique) advocated a Marxist-oriented “scientific” brand of socialism. In both groups, there may exist some semicompetitive elements in the intraparty and parliamentary spheres. Socialist regimes must be distinguished from their totalitarian “communist” counterparts, if only because of their generally “underdeveloped” condition and the relative lack of effective social control.

Military regimes. In addition to civilian regimes, there are systems that are controlled by “men on horseback” (Janowitz). These military rulers come to power through a coup d’état after the previous civilian institutions fail. In the absence of significant countervailing powers, the military’s monopoly over the physical means of coercion makes less efficient civilian governments an easy prey for armed groups. The social bases of these regimes are usually rather narrow. Some military rulers act as temporary caretakers and make genuine attempts to return their countries to civilian rule (as Olusegun Obasanjo in Nigeria in 1980). Others, on the contrary, seek to establish their power permanently. Three subtypes can be distinguished.

The first is personal military authoritarianism. These regimes center around a “strong man” and his most immediate following. Because there are few, if any, formalized input structures, they rely heavily on their centralized output apparatus. In many Latin American countries, this type of rule was exercised by the characteristic “caudillo” in the nineteenth century. Although the caudillo’s ascent to power was largely due to his personal qualities (i.e., his military prowess and perhaps charismatic appeal), his rule cannot be understood without reference to the established landed oligarchy. The large haciendas remained one of the stable elements in turbulent times, and caudillos often were (or became) *hacendados* as well. In cases where a caudillo managed to establish a durable regime, this was often accomplished through a system of regional and local subpatrons, the “caciques.” Since this type of rule is highly personalistic, it remained inherently unstable. Caudillos were often overthrown by successful rivals.

A second subtype is corporate military authoritarianism. In the 1960s some Latin American states, such as Brazil and Argentina, witnessed the emergence of more “modern” military regimes. In these countries, power had been assumed by the military on a corporate basis. Within the leading ranks of the armed forces, a certain institutionalized transfer of power was established. Although the political orientation of these regimes was “national” and favorable to “modernization,” they nonetheless

have left older social structures essentially intact. Formal interest groups and parties were strongly regulated, and the repressive nature of the regime was often particularly blatant.

A third subtype is that of socialist military authoritarianism, which establishes its authority on a permanent basis through the creation of a single-party system. In contrast to the other forms of military rule, these regimes have a socialist and lower-class orientation. In such cases (e.g., Gamal Abdel Nasser’s Egypt, or Peru after 1968), the power of the military was directed toward social reforms. The long-term success of such reforms depends, however, upon the government’s ability to secure participation from below. If these efforts fail, a shift to a semicompetitive type of regime (e.g., Anwar as-Sadat’s Egypt), a polyarchic system (in Peru after 1980), or a return to personalistic military rule may take place.

Outlook

After the dramatic events in Eastern Europe in 1989–1990 and their repercussions in other parts of the world, many of these authoritarian regimes disappeared. To a large extent, they were replaced by liberal democracies. Nevertheless, in some regions, most conspicuously in the Middle East, nondemocratic regimes persisted (e.g., the monarchies and sheikdoms in the Arabian peninsula, the personalistic military dictatorships in Iraq, Lybia, and Syria, or the “semicompetitive” systems in Egypt and Tunisia). In other areas, as in parts of the former Soviet Union, communist regimes were transformed into “post-totalitarian” but still harshly authoritarian and personalistic “new oligarchic” or “sultanistic” ones. In other cases, the newly established democratic forms of government remained defective with respect to important aspects such as truly “free and fair” elections, meaningful popular participation, and the guarantee of the rule of law and basic human rights. Some authors termed these regimes purely “electoral,” “illiberal,” or “delegative” democracies. In most cases, they resemble the former “semicompetitive” or even “new oligarchic” types.

Thus, at the beginning of the twenty-first century authoritarianism has been on the decline and at least the worst totalitarian forms of rule, with the possible exception of some fundamentalist “theocratic” ones, seem to be over. New variants, however, may yet occur and there remain certain authoritarian and populist dangers in some of the longer-established democracies as well.

EAST ASIA

Grand claims have been made about the superiority and inevitability of liberal democracy. Do they hold true for East Asian countries? According to typologies in political science, most East Asian countries are considered authoritarian. Japan, Philippines, Taiwan, Thailand, and South Korea are considered democracies; Indonesia is considered ambiguous while all other East Asian governments (Brunei, Cambodia, China, Laos, Malaysia, Myanmar, North Korea, Singapore, and Vietnam) are seen as authoritarian. While this way of organizing and talking about the world is dominant in political, academic, and even popular discourses, its persuasiveness is often compromised upon closer scrutiny.

First, this classification system is confusing because its analytical categories are heavily infused with normative overtones; not only do governments involve scholars in their international programs (e.g., Alliance For Progress), students of politics are also often politically invested and concerned with social change. This conflation of the scientific and the ideological has been criticized by Jeanne Kirkpatrick. She observed that regimes were not classified only by their political form (e.g., regular elections, civil and political liberties) but by their ideologies and economic organization. Totalitarian regimes were exclusively communist regimes with command economies while authoritarian regimes were typically market-driven and seen as more benign despite being equally repressive.

Second, mediating the dichotomous categories of democratic/authoritarian are various theories of democratization whose predictions about East Asian regimes are, at best, as often inaccurate as they are accurate. Democratization and its absence were explained by a variety of factors tied to modernization, such as, in order of theoretical importance, socioeconomic development (measured by the Human Development Index), the rate of pop-

Southeast Asian countries	Freedom House rating (2000)	Average annual GDP per capita (1975–2000)
Un-free countries (Rating 5.5–7)		
Myanmar	7.7	1.3%
Vietnam	7.7	4.8%
Laos	7.6	3.2%
Brunei	7.5	unavailable
Cambodia	6.6	1.9%
Partly free countries (Rating 3–5.5)		
Malaysia	5.5	4.1%
Singapore	5.5	5.2%
Indonesia	4.4	4.4%
Free countries (Rating 1–2.5)		
Philippines	2.3	0.1%
Thailand	2.3	5.5%

ulation growth, and the vigor of civil society. Conversely, it was believed that with economic and social development, or modernization, authoritarian regimes would transition to democracy. The strongest formulation of this modernization theory is perhaps Francis Fukuyama's "end of history" thesis, in which he predicted the triumph of liberal democracy over all other political forms in late capitalism through increasing institutional and ideological convergence globally.

Among East Asian countries, evidence against the thesis outweighs evidence for it. In Northeast Asia, economic development in Japan, Taiwan, and South Korea appeared to have triggered a transition to democracy while its absence in Mongolia and North Korea correctly predicts nondemocratization. With the exception of China, which remains staunchly nondemocratic despite impressive economic growth (8.1 percent average annual GDP per capita from 1975 to 2000), the thesis appears to hold true.

In Southeast Asia, there are ample instances where economic growth induces the reverse. As a region, despite the fact that Southeast Asia has a higher average income than South Asia (considered "partly free"), it is rated as the least free region in Asia by Freedom House and remains the only region in the world that has not established a regional system of human rights.

Among the five Southeast Asian countries rated as "unfree," only three support the thesis that economic stagnation inhibits democratization. In prosperous Brunei and in Vietnam (which has the second highest average annual GDP among the ten countries), there appears to be no correlation between economic development and democracy.

The most significant counterevidence to the theory comes from the "free" and "partly free" countries, with Singapore and the Philippines being especially significant counterevidence to the thesis. Singapore was able to forestall democratization despite impressive economic development (considering the devastation of the recent Asian economic crisis that significantly lowered these figures). Singapore's average annual GDP per capita from 1965 to 1990 was a stunning 6.5 percent. In the case of the Philippines, the absence of economic development did not appear to handicap political development; it is the most free despite being worst off economically.

Empirically, the reality of political regimes in East Asia offers mixed evidence to the thesis that economic growth would trigger democratization. In trying to understand why and how they are perpetuated, we obviously need more than modernization theory. Modernization theorists themselves are cognizant of the problems and have attempted to repair the theory without relinquishing the essential paradigm, its dichotomies, or categories.

Revised Modernization Theories

Concerned with the persistence of authoritarianism despite strong and sustained economic growth in East Asia, revised modernization theorists began to argue that authoritarianism was necessary for late-industrializing countries to kick-start their economies, but continue to subscribe to the transition paradigm by pointing out that after the initial phase of growth, contradictions between authoritarianism and capitalism would trigger what is seen as the natural evolution to democracy. In this sense, revised modernization theorists merely redefine authoritarianism as a necessary evil and as a steppingstone; they do not deviate significantly from the modernist view of authoritarianism as transitory and democracy as the end point.

Another revisionist group criticized the economic determinism of modernization theorists but continues to frame the question of authoritarianism within the transition paradigm. For instance, O'Donnell, Schmitter, and Whitehead turned to more voluntaristic explanations by focusing on the role of civil society in triggering a transition to democracy. Theorizing about political opposition in East Asia, Rodan criticized these approaches for romanticizing civil society as "the locus of free-minded and mutually cooperative groups and individuals beyond the state's purvey" (p. 3). Because civil societies cannot exist as alternatives to states but only in relation to them, the notion of civil society not only presupposes the state, but its autonomy crucially depends on and can only be guaranteed by the state. In East Asia, the relationship between civil society (if it exists) and the state is often one of co-option. Depending on how scholars perceive the state, studies of East Asian societies often refer to this political arrangement as paternalistic or guardian states if authority is perceived to be benevolent, or clientelist or nepotist states if authority is deemed corrupt.

A third attempt at revising modernization theory clusters around the concept of "modern authoritarianism." Within modernization theory, authoritarianism had been understood as a premodern phase, and it was believed that with modernization, societies develop into either totalitarian or democratic polities. Rejecting this typology, Linz elaborated on regimes that were authoritarian and modern and proposed a definition of authoritarianism that has become classic:

Authoritarian regimes are political systems with limited, not responsible, political pluralism; without elaborate and guiding ideology (but with distinctive mentalities); without intensive nor extensive political mobilization (except some points in their developments); and in which a leader (or occasionally a small group) exercises

power within formally ill-defined limits but actually quite predictable ones. (p. 255)

The applicability of this theory to East Asia should be obvious, even if actual empirical studies were few and far between. While much of theorization on authoritarianism focused on Spain and Latin American countries, it should be recalled that among developing countries, few regions were modernizing (and leaving feudalism behind) as quickly as East Asia.

As with other revisionist attempts, this theory continues to operate within the modernization paradigm. First, it continues to subscribe to the authoritarian-democratic dichotomy; liberal democracy remains the point of reference while authoritarianism appears to be a residual category into which all nondemocratic countries are shoved. Because authoritarianism is seen as a crisis of governance within a democracy, it continues to be seen as unstable and lacking in legitimacy.

Second, what (revised) modernization cannot afford to acknowledge (without having to undergo a paradigm shift) is that even in the most coercive of states, authoritarian governments have always attempted to justify their policies and to acquire legitimacy for their governance. Especially with the global hegemony of democratic values, authoritarian governments in East Asia are devoting more and more attention to the articulation of national ideologies and are less willing to rely on sporadic justifications or sheer coercion. From Vietnam's exhortation to citizens to become "cultural soldiers" to Indonesia's Pancasila democracy to the variants of Asian Values discourse articulated by Cambodia, China, Malaysia, Myanmar, and Singapore, the reality in East Asia challenged the "modern authoritarianism" thesis that regards authoritarianism regimes as ideologically weak, unable to secure consent, and thus illegitimate and unstable.

Legitimate(d) Authoritarianism

While (revised) modernization theorists focused on the transitory nature of authoritarianism, there were other theorists who were interested in the internal logic and staying power of authoritarianism in East Asia. Focused on the question of legitimacy, these approaches typically developed in dialogue with Max Weber's (1864–1920) theory of the three modes of legitimacy (traditional, charismatic, legal-rational). We will review Karl Wittfogel's (1896–1988) exploration of bureaucratic centralization (legal-rational legitimacy) and Lucian and Mary Pye's investigation of Asian culture (traditional legitimacy) before considering how recent theoretical developments such as hegemony theory may contribute to the further understanding of authoritarianism in East Asia.

Wittfogel's *Oriental Despotism* argues that water control and distribution (especially the management of extensive system of canals) spawned hydraulic civilizations with authoritarian centralized empires and sprawling bureaucracies both deeply hostile to change. Critiques of this thesis range from observations that irrigation is often organized locally rather than by centralized bureaucracies to highlights of counterevi-

dence from the West such as the rise and fall of ancient Greece and the chronic backwardness of eastern Europe.

Resonating with other studies of the cultural-psychological studies of authoritarianism (such as studies of fascism in Germany), the Pyes' study of cultural psychology focused on values of frugality, hard work, family values, respect for authority, and Asians' understanding of power. Critiquing the imposition of Western notions of power in understanding Asian societies, they argued that power should not be understood as "participation in the making of significant decisions" or in terms of choice but as status and, indeed, the freedom from having to decide at all. To the Pyes, this Asian sense of power generates authoritarian regimes: "When power implies the security of status, there can be no political process. Contention and strife cease" (p. 22). Insofar as power derives from morality, any challenge to the system or democratic competition is necessarily an affront to the leader and is thus responded to with a heavy hand.

This thesis has been criticized for its culturalism (using culture as an explanation rather than as something to be explained), which in this case generates the tautological thesis that "authoritarian cultures produce authoritarianism." Exactly what is Asian or Confucian culture, and is culture destiny? While the Pyes focused on hierarchical features, others rediscover alternative trajectories to argue that Asian cultures have democratic roots. For instance, William Theodore de Bary and Wei-ming Tu demonstrate the affinities between Confucianism and liberalism while Chu and Winberg Chai argue that current authoritarian regimes distort Confucian values and that if implemented correctly, Confucianism would produce democracy. Furthermore, even if there is agreement on the nature of Asia's values and historical roots, its future—what to preserve and what to change—remains something hotly debated by East Asian leaders (e.g., Singapore's Lee Kwan-Yew versus South Korea's Kim Dae-Jung).

Whatever the mode of legitimacy—legal-rational, charismatic, or traditional—contemporary theorists are increasingly acknowledging that authoritarianism can be legitimate(d) and that the distinction between democracy and authoritarianism is more blurred than modernization theories suggest. Given the problems with modernization theories, the question of why authoritarianism in East Asia is sometimes seen as legitimate by its subjects and the question of why it endures despite development need to be broached from the perspective of legitimacy rather than in terms of modernization. Because legitimacy is a subjective concept pegged to the perceptions of the ruled, the question of why authoritarian regimes (especially prosperous ones) endure is necessarily a question of ideology and research in this direction necessitates close examination of cultural and historical conditions within a regime rather than the broad socioeconomic comparisons associated with modernization theory.

One useful perspective comes from cultural studies, especially the concepts of hegemony and popular authoritarianism. Instead of the dichotomy of democratic/authoritarian, Antonio Gramsci (1891–1937) postulated the categories of consent/coercion—the latter categories do not correspond

with the former because they are not mutually exclusive. Following Weber's definition of the state as an organ with a legitimate monopoly over coercion, Gramsci distinguished between this "outer ditch" of coercion and an "inner ditch" of consensus and commonsense. To the extent that there is consensus, it becomes unnecessary to mobilize repressive state apparatuses to discipline society; political alternatives are sufficiently de-legitimized through the molding of commonsense. Since the 1990s, some applications of this theory to Asia have included John Girling's analysis of middle-class hegemony in Thailand, John Hilley's analysis of Mahathirism in Malaysia, and Soek-Fang Sim's analysis of the Asian Values project in Singapore.

The various theories outlined here can combine to offer a sophisticated understanding of authoritarianism in East Asia. Modernization theory, although flawed, offers effective descriptions of the democratization pressures confronted by rapidly developing countries. What it fails to do, and what is advantageous about localized theories, is the focus on how history, geography, culture, and ideology can come together to engender countervailing forces that stabilize the regime and arrest the drift toward democracy.

LATIN AMERICA

Traditional interpretations of authoritarianism in Latin America root this phenomenon in the style of Iberian colonization in the region. The Hispanic world, this argument alleges, was naturally more authoritarian than Anglo-Saxon cultures. Furthermore, the cultures they encountered in the New World (particularly the Aztec and Inca Empires) were themselves very hierarchical, which further facilitated authoritarian forms of governance. Subsequent interpretations have generally rejected the racist implications of these theories in favor of more sophisticated and nuanced explanations. Nevertheless, debates continued on how best to confront authoritarian tendencies.

Authoritarianism is related to, but distinct from, dictatorship and totalitarianism. Unlike totalitarianism, authoritarian regimes sometimes allow limited political pluralism (though, unlike in a democracy, that opposition is limited and often not legitimate). In addition, authoritarianism lacks a defined ideology, which characterizes totalitarian regimes. Furthermore, authoritarianism tends to rely on apathy rather than a mobilized and engaged population. George Philip notes how rising inequality under democratic government leads to disenchantment, with significant minorities preferring authoritarian over democratic leadership. Some scholars contend that democratic systems can be strengthened through a reformation of political institutions, such as political parties and electoral processes. Others maintain that prolonged socioeconomic crises are a larger threat to stability and that economic growth is necessary to prevent a lapse back into authoritarianism. These economic policies, however, often take the form of neoliberal reforms that are profoundly antidemocratic and lead back to an authoritarian style of governance.

Caudillos

During the nineteenth century, authoritarian political structures were expressed in the form of caudillo styles of leadership. A lack of a functioning democratic system that allowed for peaceful transfers of power from one civilian government to another led to a series of palace coups and military governments. Facing a power vacuum after the disappearance of patriarchal monarchies at independence, leaders sought legitimacy through charisma and appeals to tradition rather than expressing a coherent ideology. A caudillo, which broadly means a “strongman,” style of government represents the use of charisma rather than military force to keep political forces under control through promotion of allegiance to a central leader. These caudillos were not necessarily of a specific ideological orientation, could be associated with liberal or conservative politicians, and could take a military or civilian form; in addition, they might be rooted in either urban or rural populations and be oriented toward either modernizing or tradi-

tional forces. Perhaps the most common unifying thread among caudillos was their appeal to nationalism. Caudillos sometimes relied on legal means, including elections and plebiscites, to legitimate their control but once in office tolerated no dissent to their authority. Representative of this in Mexico are both Benito Juárez (r. 1861–1872) and Porfirio Díaz (r. 1877–1880; 1884–1911) who came into power claiming to support freely contested elections but then became deeply entrenched in power. Both caudillos were liberals from the poor and largely indigenous southern state of Oaxaca. They relied on this home base of support to maintain themselves in power even as their policies increasingly served elite interests. Juárez is commonly regarded as Mexico’s first “Indian” president though he implemented legislation that took land away from rural villages. Díaz ruled using the strategy of *pan o palo* (carrot or the stick) to reward lavishly his supporters and repress brutally his opponents. It took the Mexican Revolution (1910–1920) to remove Díaz from power after thirty-four years, one of the longest-running dictatorships in the history of Latin America.

One of the most noted and resilient examples of Latin American authoritarian regimes is that of General Antonio López de Santa Anna (1794–1876) during the first half century after Mexico’s independence in 1821. Santa Anna held power eleven different times with catastrophic results perhaps unequaled in Latin America’s history, including the loss of half of Mexico’s territory to the United States. Seemingly contradictory ideological principles, including adhering to federalism, centralism, liberalism, conservatism, and even monarchism, characterized his different times in office. When liberals held the upper hand, he ruled Mexico as a liberal. Later Santa Anna became a conservative and passed some of the most reactionary legislation in Mexico’s history. Historians often point to his charisma and political opportunism as explaining his success in holding onto (or, more accurately, repeatedly returning to) power. Will Fowler, however, finds such interpretations to be unsatisfactorily simplistic in explaining Santa Anna’s resilience. Rather, his success is a result of elite support, motivated by the desire to preserve hegemonic class interests. Santa Anna’s promises to deliver political stability and prevent social dissolution were more important than differences in ideology. A subsequent long tradition of casting the ruler as a villain is what has made it “difficult to understand why he was so successful” (Fowler, p. 13). Santa Anna perhaps was no worse or no more opportunistic a leader than his contemporaries, just perhaps more successful in riding out political changes. In Fowler’s assessment, his commitment to elite privilege and detachment from partisan politics ultimately made him an arbitrator of competing ideological interests. Whichever group currently held the upper hand courted his support in order to consolidate its control over the country.

Caudillos were not necessarily a negative force and have sometimes been divided into the categories of “cultured caudillos” and “barbarous caudillos” (Hamill, p. 5). Mariano Malgarejo from Bolivia is often considered to be a classic representation of the later. He abrogated land titles of Indian peasants and sold off large slices of Bolivian territory as if it were

Tanks in Santiago during the Chilean coup. In 1973 Chilean military forces overthrew the democratic government of President Salvador Allende, supplanting it with a dictatorship that widely repressed basic human rights and banned any political opposition. © HORACIO VILLALOBOS/CORBIS

his own personal property in order to generate funds to put down chronic revolts against his government. As a result, Bolivia lost to neighboring countries half of its territory as well as its outlet to the sea. Like Santa Anna, Magarejo was perhaps no worse than any other caudillo but just more active and successful at this style of government.

Corporatism

Traditional interpretations of authoritarianism argue that after independence in the early nineteenth century, the Latin American republics had difficulties in shaking their Iberian heritage. Although they drafted constitutions that borrowed heavily on liberal ideals and institutions, leaders proved ineffective at governing. As a result, many Latin American countries soon shifted to dictatorial forms of government, marked with elite rule, political instability, militarism, and authoritarianism. This led some leaders to argue that the new republics needed strong, centralized governments more than social and economic equality. Fowler points to these as common reasons throughout Latin American history for the “longevity, resilience, and endurance” of authoritarian regimes, including “the consummate political skills of the dictators, their pragmatism, flexibility and timely opportunism, their use of clientelism, patronage and cooption, their personalist politics, prestige or charisma, and effective repression.” Authoritarian leaders supplemented these characteristics with the use of military forces, a manipulation of political parties, and expression of “a certain ideological vagueness” (Fowler, p. xiii). This au-

thoritarian tradition hindered the emergence of Western-style democratic forms of government.

Corporatist theories, which gained popularity in the 1950s, emphasized this Iberian heritage of authoritarianism to explain underdevelopment in Latin America. This authoritarianism expressed itself politically through a patriarchal monarchy, economically in feudalistic landholding systems, militarily with elitist structures, and religiously with the Catholic hierarchy. During its colonization of the Americas, Iberia transferred these authoritarian institutions to the New World. Corporatist interpretations blamed a failure of democracy and economic development on the persistence of hierarchical structures in modern institutions, with power flowing vertically from the top down. Jan Knippers Black summarized corporatist theories as “blaming the Iberians” (p. 4). Critics of corporatist theories have noted that countries like Chile that were subject to authoritarian military rule toward the end of the twentieth century were on the fringes of Spanish colonization and emerged out of a long democratic tradition. Given this reality, many aspects of corporatist theories begin to break down, as do interpretations that place blame on the legacy of hereditary absolute monarchies for the persistence of strong, centralized authoritarian structures.

Bureaucratic Authoritarianism

In the second half of the twentieth century, personalist dictators such as Manuel Noriega (r. 1983–1989) in Panama gave

way to authoritarian military regimes, particularly in the South American countries of Argentina, Chile, Brazil, and Uruguay. These authoritarian regimes were unparalleled in their brutality and suppression of civil society and political movements. Fearing a rising leftist threat, both from electoral coalitions as well as armed guerrilla movements, these authoritarian regimes sought to redraw the structure of their countries along more traditional lines. Rather than relying on the personal power of an individual dictator, these regimes used military institutions to maintain control over society. The resulting bureaucratic-authoritarian regimes fundamentally restructured political and economic institutions to remake their countries along neoliberal lines that dramatically widened the gap between the rich and the poor. Critics claimed that these economic reforms were so unpopular that they could only be imposed through undemocratic means. Popular reactions to structural adjustments that sharply reduced living standards led authoritarian regimes to crack down even more viciously on their opponents.

The Argentine political scientist Guillermo O'Donnell introduced the concept of *bureaucratic authoritarianism* to describe institutional dictatorships that were not a legacy of Iberian rule but used coercion to respond to what they viewed as threats to the capitalist system. While the revolutionary left condemned these dictatorships as fascist and turned to armed struggle as a means to overthrow them, O'Donnell argued "that the appropriate way to oppose them was through an unconditional commitment to democracy" (O'Donnell, p. xiii). These regimes resulted from a failure of democracy to extend the protections of citizenship to an entire population. A notable gap between liberal principles and exclusionary economic practices led to what O'Donnell terms "low-intensity citizenship" (p. 143). Unfortunately, economic inequalities persisted and even grew as part of neoliberal policies that were retained even after O'Donnell's long-desired return to democratic governance in Latin America.

Alberto Fujimori's (r. 1990–2000) government in Peru in the 1990s provides another important variation on the authoritarian tradition in Latin America. In what came to be known as an *autogolpe* (self-coup) or "fujicoup," Fujimori launched a coup against himself in April 1992 to shut down the congress and rewrite the country's constitution. Using what George Philip calls "semi-authoritarianism," Fujimori realized some significant policy achievements, including stopping inflation and ending the bloody Shining Path guerrilla insurgency (p. 169). More significantly, his violation of Peru's constitutional order did not lead to a fall in his popularity. Rather, many people believed that the country's crisis legitimized authoritarian measures. By 2000, however, the crisis had passed, and public opinion swung away from support for his abuses of power. His fall from power was neither a triumph of democracy nor a blow against authoritarianism but a result of popular responses to a changing political situation.

In an interesting twist on condemnations of authoritarian traditions in Latin America, James F. Petras and Frank T. Fitzgerald argue that sometimes democratic governments are not authoritarian enough to defend positive social reforms. Pointing specifically to Salvador Allende's (r. 1970–1973) gov-

ernment in Chile in the early 1970s and the Sandinista government in Nicaragua in the 1980s, they note that the ruling classes do not give up their elite privileges without a struggle. This argument contrasts these failed attempts at social, economic, and political transformation to that of Cuba. If the Cuban government had not taken the drastic authoritarian measures that it did in the early 1960s, the revolution's attempts to redistribute wealth to the lower classes and extend education and health care throughout the country would have failed. Because the bourgeoisie and their international allies are not ideologically committed to democratic rule, they do not hesitate to use whatever tactics might be necessary to undermine social reforms when they are implemented through democratic means. Ironically, Petras and Fitzgerald argue, social reformers need to utilize authoritarian tactics to defend democratic processes or risk total failure.

The fall of Salvador Allende's government in Chile is the most noted example in Latin America of a fall of a democratic government to an authoritarian regime. Rooted in a long history of civilian institutions, Allende pledged to put the country on a "Chilean Road to Socialism" that would utilize existing democratic structures to redistribute wealth in an attempt to end extreme economic and social inequalities. When his reforms led to nationalization of U.S.-owned copper mines and other industries, the U.S. Central Intelligence Agency (CIA) helped engineer a bloody military coup on 11 September 1973 that overthrew his government. General Augusto Pinochet (r. 1974–1990) then implemented one of the most savage military dictatorships in the history of Latin America. A country that had one of the longest democratic traditions in Latin America now became a prime example of an authoritarian regime that suppressed the basic principles of liberal democracy, including values of individual freedom, civil liberties, social and economic equality, and free elections. At the same time, these regimes embraced *laissez-faire* economic systems that critics subsequently termed "savage capitalism." As a type of dictatorship, they outlawed political opposition and greatly restricted individual freedoms.

As relations with the Pinochet dictatorship illustrate, the U.S. government "supported authoritarian regimes that promised stability, anticommunism, and economic trade and investment opportunities." David F. Schmitz notes how this policy conflicted with a theoretical embrace of the principles of liberal democracy and human rights. U.S. officials viewed Latin Americans as racially inferior and strong authoritarian leadership as necessary to maintain order, prevent social and political chaos, and implement neoliberal policies necessary for economic modernization (Schmitz, p. 304). Rather than fostering democratic institutions, U.S. support for authoritarian regimes often led to political polarization, instability, and radical nationalist movements. Critics constantly charge that such support conflicts with U.S. interests, virtually no matter how those interests are conceptualized. "Equating dictators with freedom," Schmitz maintained, "blinded American leaders to the contradictions and failures of their policy" (p. 7). Authoritarian regimes often performed poorly in terms of economic development and, together with extensive human rights viola-

tions, lost legitimacy internally. Democracy emerged and economies grew in Latin America in spite of, rather than because of, U.S. policies.

By the end of the twentieth century, with a reemergence of democratic governments throughout Latin America, authoritarianism appeared to be safely buried in the past. Nevertheless, Leigh Payne points to the persistence of an authoritarian tradition in right-wing threats to democratic structures. These “uncivil movements” that use political violence to promote exclusionary objectives do not necessarily seek to overthrow democratic systems, but nevertheless they are able to shape the discourse and practices of democratic institutions. A search for social justice and equality all too often continues to be an elusive goal. In subtle, and sometimes not so subtle, ways, authoritarianism is still a force to be reckoned with in Latin America.

AUTHORITY. The conceptual history of *authority* reveals it to be an essentially contested concept because of the many debates about its sources, purposes, and limits, as well as its proximity to the concept of power.

Since Plato’s critique of Athenian democracy, physical force and rhetorical persuasion have been viewed as types of power but not authority. Hannah Arendt observes that “[i]f author-

ity is to be defined at all, then it must be in contradistinction to both coercion by force and persuasion through arguments” (p. 93). Indeed, it is only when authority fails that force or persuasion is used to elicit compliance. This distinction is reflected in Jean-Jacques Rousseau’s (1712–1778) discussion of what a legislator must do to form a political community guided by the general will:

Since, then, the legislator can use neither force nor argument, he must, of necessity, have recourse to authority of a different kind which can lead without violence and persuade without convincing. That is why, in all periods, the Fathers of their country have been driven to seek the intervention of Heaven, attributing to the Gods a Wisdom that was really their own. (pp. 207–208)

In this passage, religious authority is so widely accepted and unquestioned by the people that, if it is appealed to, no force or persuasion is necessary.

Rousseau’s legislator, however, might be engaging in deception by invoking religious authority as a proxy. To be authoritative, the legislator’s statement should be accepted or rejected on its merits. As Richard Friedman states, “[i]f there is no way of telling whether an utterance is authoritative, except by evaluating its contents to see whether it deserves to be accepted in its own right, then the distinction between an authoritative utterance and advice or rational persuasion will have collapsed” (p. 132). Deference toward authority may not be automatic, as those affected by it evaluate its statements to judge whether they are, in fact, authoritative.

Given this, it may be said that if power is the ability of some individual, group, or institution to control, coerce, or regulate others, authority is the recognition of the right of that individual, group, or institution to exercise power. In short, those over whom power is exercised recognize that whoever or whatever is exercising that power is doing so legitimately. There is an element of trust, faith, and recognition on the part of those following authority that the person exercising it possesses some quality (for example, wisdom, expertise, or the fact that the person was elected by the people) that ought to be deferred to. If this is the case, then authority, rather than simple power, exists and must be followed, adhered to, and, within limits, obeyed.

The Sources of Authority

One approach to authority focuses on the question of who has a right to rule, and on what this right rests. Early notions of authority based it on the right of the strongest, the many, or the wisest to make laws. For example, while Pericles (c. 495–429 B.C.E.) praises Athenian democracy as the rule of the many according to the rule of law, Plato (c. 428–348 or 347 B.C.E.) views it as an unstable form of government that rests on the opinion and force of the majority. Instead, he prefers authority be given to those who possess reason and wisdom. Also, from antiquity to the Middle Ages, authority is often related to the divine, with rulers seen as “gods” themselves or as receiving authority from a divine power. In the European Middle Ages, the notion of civil and religious authority was

clearly tied to the Catholic Church. For example, papalism asserted that the pope had final authority over both ecclesiastical and civil realms. Also, the notion of divine right monarchy, promoted by Robert Filmer (c. 1588–1653), asserted that the absolute authority of monarchs rests on Adam's patriarchal authority in the Garden of Eden.

In the latter part of the Middle Ages, the intellectual flourishing of the Renaissance led to the rediscovery of the notion of self-government in the form of republican city-states such as Florence, Italy. In turn, this influenced the emergence of the social-contract theory of John Locke (1632–1704) and Rousseau that rests legitimate government on the consent of the citizens of a political community. Locke's theory of consent and the right to revolt helped shape the Declaration of Independence and the republican character of the U.S. Constitution. However, the social-contract theory was criticized as resting on abstract notions of consent, reason, equality, and liberty. Edmund Burke (1729–1797), for instance, favored moderate reforms of existing institutions, and stressed that members of each generation must respect their entailed inheritance that obliged them to follow traditions established by previous generations. Furthermore, Joseph-Marie de Maistre (1753–1821) saw the abstract ideas that inspired the French Revolution as undermining the "throne and altar," which were the traditional authorities that held society together.

Authority and Legitimacy

Another approach to authority focuses more on the question of whether those who are ruled accept authority as legitimate regardless of its source. This approach originated with Max Weber (1864–1920), who distinguished three ideal types of authority: traditional authority that rests on history and tradition; charismatic authority that rests on the personality of the leader; and legal-rational authority that rests on impersonal rules and powers and is associated with the office rather than the personal characteristics of the office holder. If those affected think that power is exercised legitimately, then any of these three types of authority is legitimate, regardless of its moral justification.

Weber suggested that as societies modernize, authority transforms from traditional, to charismatic, to legal-rational. This implies that only one type of authority exists at a time, or that authority is a linear sequence from traditional to charismatic to legal-rational. Clearly, these three types of authority coexist. This is illustrated by distinguishing between the notions of "an authority" and "in authority." For example, the U.S. Congress possesses legal-rational authority, and representatives and senators have certain powers that derive from their office. Representatives and senators are "in authority" but are often influenced by individuals called to testify before committee hearings who, because of their charisma or expertise, are "an authority."

The Purposes of Authority

The purposes of political authority are as contested as its sources. For some, authority should promote a virtuous society. The desired virtues differ depending on whether one looks to Aristotle's (384–322 B.C.E.) discussion of the golden mean, Niccolò Machiavelli's (1469–1527) discussion of republican

virtue, religiously inspired notions of Christian or Islamic virtue, or the emphasis on character as evident in Bill Bennett's *Book of Virtues*. For some, authority should promote a just society. Similarly, the definition of justice differs depending on whether one looks to Plato's ideal republic or John Rawls's (1921–2002) view that justice is the fair distribution of resources and opportunities in a society. And for some, authority is needed to provide stability and order. Here too are found differences ranging from Thomas Hobbes's (1588–1679) emphasis on an absolutist government created by the consent of the people who simply desire protection and order, or the republican tradition that suggests that stability comes from dividing authority among different branches of government that check and balance each other.

Since authority is valued but exists in tension with other social values, there is a debate about its limits. Some, like Filmer and Jean Bodin (1530–1596), defend absolute authority in the hands of one person, and oppose the separation of its powers, on grounds that absolutism alone can provide stability and order. Others, such as Locke and James Madison (1751–1836), suggest that absolute authority in the hands of one person or group of persons inevitably leads to arbitrary and excessive power that squelches political and civil liberties. Thus, authority must be divided among separate branches that can check and balance each other, and operate within certain constitutionally prescribed limits such as the Bill of Rights. Furthermore, the authority of government can conflict with the demands of conscience or standards of justice that transcend government. Thus, civil disobedience, as Henry David Thoreau (1817–1862) suggests, can be justified on grounds that individuals should not be coerced into supporting an evil they otherwise oppose.

Several controversies continue to surround authority in the early 2000s. Issues such as identifying the origin of the social-contract tradition and delineating the limits of obedience continued to attract scholarly attention. Other debates are both scholarly and politically important. For example, the proper relationship between religious and secular authority remains controversial in the United States, France, and in some predominantly Islamic countries debating democratic reforms. There are also ongoing concerns that all types of authority are not respected or deferred to as much as in the past. Cultural conservatives in the United States especially bemoan the loss of respect for and faith in authority, and point to a culture that promotes relativism, cynicism, and irony as the culprit. Finally, the U.S. government's reaction to the terrorist attacks of September 11, 2001, the invasions of Afghanistan and Iraq, and the Patriot Act have each, in different ways, sparked controversy. For example, there continues a global discussion about the appropriate use of unilateral or multilateral military force. And, within the United States, the tension between governmental authority and civil liberties remains controversial. From these examples, one can see that the historical debates regarding the sources, purposes, and limits of authority remain important in this era.

SOME DEFINITIONS OF AUTOBIOGRAPHY

Philippe Lejeune: “A retrospective account in prose that a real person makes of his own existence stressing his individual life and especially the history of his personality” (“The Autobiographical Pact”).

Sidonie Smith and Julia Watson: “Our working definition of autobiographical or life narrative, rather than specifying its rules as a genre or form, understands it as a historically situated practice of self-representation. In such texts, narrators selectively engage their lived experience through personal storytelling” (*Reading Autobiography*).

Leigh Gilmore: “As a genre, autobiography is characterized less by a set of formal elements than by a rhetorical setting in which a person places herself or himself within testimonial contexts as seemingly diverse as the Christian confession, the scandalous memoirs of the rogue, and the coming-out story in order to achieve as proximate a relation as possible to what constitutes truth in that discourse” (*The Limits of Autobiography*).

AUTOBIOGRAPHY. Growing scholarly interest in the relationship between truth and fiction, along with popular interest in personal life-narratives and the “culture of confession,” have brought new prominence to the genre of autobiography. Indeed, according to Leigh Gilmore, the number of English-language autobiographies and memoirs roughly tripled from the 1940s to the 1990s (p. 1, n. 1), and scholarly attention to life writing has followed this trend. Paradoxically, however, as interest in autobiography has risen, debates over the nature and definition of the genre have become increasingly prevalent. Etymologically the word “autobiography” is a compound of the Greek terms *autos* (self), *bios* (life), and *graphe* (writing). At its simplest, then, autobiography can be defined as “self-life-writing.” But, as illustrated by debates over what counts as autobiography—and indeed, over what counts as “truth” in the postmodern world—the apparently simple act of writing one’s own life is much more complex than this definition suggests. In fact, autobiography is as diverse and as protean as any literary genre, and attempts to define it have always been troubled.

Scholars of autobiography have long theorized the genre not as a discrete set of characteristics but as a literary and cultural practice informed by diverse cultural, rhetorical, and institutional contexts (see especially Bruss; Butterfield; Eakin; Egan; Gilmore; Hesford; Lionnet; Smith and Watson). This way of thinking resonates with postmodern theories of language, subjectivity, identity, and power that have reshaped how we think about autobiography and other “true” stories. “Self-life-writing,” then, involves more than simply writing or reading a life story; it also requires attention to the rhetorical situation in which that story is embedded and to the cultural narratives that shape what counts as “truth” in a particular time and place.

Culture and Identity: Narrative Strategies

Contemporary philosophers and cultural critics have convincingly argued that identity and experience are themselves socially constructed, shifting according to historical and cultural ideas about personhood and everyday life. Despite this postmodern turn to thinking about how identity is made, not born, scholars of autobiography nevertheless insist on the materiality of identity in theorizing life writing, particularly the material consequences of race, ethnicity, class, gender, sexuality, and ability, and how autobiographical narratives are affected by culturally available identity categories and narratives. From Sei Shōnagon’s *The Pillow Book* (Japan, c. 1000 C.E.) to Margery Kempe’s *The Book of Margery Kempe* (England, 1436) to Benjamin Franklin’s *The Autobiography of Benjamin Franklin* (United States, 1771–1789) to Richard Rodriguez’s immigration memoir *Hunger for Memory* (United States, 1982), identity and narrative provide key frames through which autobiographers negotiate their life stories. For example, Shōnagon’s notebooks, containing observations, poems, and stories written by a tenth-century Japanese woman, differ in many ways from

AUTOBIOGRAPHY AND TRAUMA

Given the culture of confession that infuses contemporary life in the United States, it may not come as a surprise that trauma memoirs have become remarkably popular with both autobiographers and audiences alike. Trauma memoirs often narrate state-sponsored and human rights violations, such as Elie Wiesel's *Night* (1960) and Loung Ung's *First They Killed My Father: A Daughter of Cambodia Remembers* (2000), but they also often narrate acts of individual violence, such as rape, domestic violence, and incest, such as Mary Karr's *The Liar's Club* (1995) and Michael Ryan's *Secret Life* (1995). Autobiographies that attempt to narrate traumatic experiences, such as child abuse, rape, and war, are caught within a paradox: trauma is often understood to be defined by a radical unrepresentability, since it is that which shatters the self and makes language and narrative impossible. In this context, narrative, argues Arthur W. Frank in *The Wounded Storyteller: Body, Illness, and Ethics* (1995), is an ethical as well as an aesthetic imperative, testifying to the narrator's continuing presence in the world in spite of injury, illness, and even imminent death. Indeed contemporary scholars of trauma autobiographies have become increasingly interested in the process

and the politics of articulating pain and injury through life narrative. For example, Marianne Hirsch's *Family Frames: Photography, Narrative, and Postmemory* (1997), Annette Kuhn's *Family Secrets: Acts of Memory and Imagination* (1995), and Nancy Miller and Jason Tougaw's collection *Extremities: Trauma, Testimony, and Community* (2002), explore the difficulty of representing trauma. Significantly Leigh Gilmore's *The Limits of Autobiography: Trauma and Testimony* argues that trauma is a key site at which to deconstruct the generic boundaries between fiction and non-fiction, the imagined and the real. Many authors of trauma narratives, such as Mikal Gilmore, Dorothy Allison, and Jamaica Kincaid, strategically choose to turn away from the autobiographical label and instead to embrace fiction as a genre that can achieve the project of self-representation without putting the author in the position of being scrutinized and judged by readers and critics. As these theorists suggest, turning one's life into a story is laden with difficult representational and political choices concerning which stories to tell, which culturally available narratives to draw upon, and which generic categories to affix to the final product.

Franklin's archetypal autobiography, which reveals his investment in white male privilege in the early U.S. republic. Nevertheless both autobiographies show that "self-life-writing" is a process that is historically and culturally situated, and through which identity and experience are negotiated, materialized, and refashioned.

Significantly Franklin's *Autobiography* relies on a larger cultural narrative, the bildungsroman, which has widely accepted currency in the United States. The bildungsroman follows a classic narrative trajectory of conversion in which the individual hero embarks on a long journey that ends with his resolution with the larger social community—in Franklin's case, the national community as represented by Philadelphia. The bildungsroman provides narrative shape and truth-value to a wide range of mainstream and marginal autobiographies published in the United States, from Franklin's to Mary Antin's *The Promised Land* (1912), Jade Snow Wong's *Fifth Chinese Daughter* (1950), Malcolm X and Alex Haley's *The Autobiography of Malcolm X* (1965), and Rodriguez's *Hunger for Memory*. The fact that several immigrant, ethnic, and women

autobiographers have relied on the bildungsroman to give their stories a recognizable trajectory and broad cultural currency is no accident. Indeed many autobiographers have used this form deliberately and strategically in order to persuade their readers that they too deserve a place of privilege in the United States and that their achievement of the "American Dream" is a result of individual hard work and intelligence. Therefore many autobiographies that are shaped by the bildungsroman narrative downplay structural inequities such as gender, ethnicity, race, class, sexuality, and ability. Wong and Rodriguez, for example, openly dispute the assumption that gender or ethnicity has served as a barrier in their lives, even when their autobiographies clearly show otherwise. The bildungsroman, then, is a form that both enables and constrains the kinds of life stories that can be told by particular autobiographers.

Narratives of mobility and/or immobility structure a wide variety of autobiographies that bring into view questions concerning the representation of the racialized, gendered, and classed body. Unlike the heroic journey narrative of the bildungsroman, which relies on an individualized story of social

mobility, many autobiographical narratives of mobility and immobility engage questions of community, belonging, and citizenship and their relationship to how the freedoms of particular bodies are granted or restricted. For example, the slave narrative articulates the broad cultural, economic, and historical forces that compelled racialized subjects into slavery in the United States, Britain, and the British colonies. Frederick Douglass's *The Narrative of the Life of Frederick Douglass, an American Slave* (1845) gained wide influence in the United States in the nineteenth century for its indictment of white slave owners whose personal and political freedom depended upon the forced servitude of an entire class of people. Slave narratives by female slaves, such as Harriet Jacobs's *Incidents in the Life of a Slave Girl* (1861) and Mary Prince's *The History of Mary Prince, a West Indian Slave* (1831), added to this an exploration of how gender also operated to the advantage of white men in the slave economy. An examination of slave narratives, then, exposes the abstract narrative of individual social mobility in bildungsroman narratives to be a patent fiction and shows instead how race, gender, and class privilege operate to enable or constrain particular bodies and particular life narratives.

Likewise other autobiographical narratives structured by the dynamics of immobility or restricted mobility provide key insights into how society is constructed around gender, race, ethnicity, class, sexuality, and ability. For example, early American captivity narratives told the story of American Indians' supposed savagery and white women's supposed civility. For example, Mary Rowlandson's *A True History of the Captivity and Restoration of Mrs. Mary Rowlandson* (1682), perhaps the most famous of the captivity narratives, creates a solid opposition between white settlers and native "savages," arguing in the process that the settlers, not the natives, have God-given authority over the American wilderness. In contrast, prison memoirs and Japanese-American internment narratives illustrate the racial and class dynamics that constrain the movement of individuals who are deemed by the state to be a danger to the citizenry. In one of the most famous internment narratives, Jeanne Wakatsuki Houston and James D. Houston's *Farewell to Manzanar* (1973), the narrator describes the racialization process by which Japanese immigrants and citizens were reconstructed as enemies of the state solely on the basis of their ethnicity and without regard to their citizenship status or national loyalties. Similarly prison memoirs such as Alexander Berkman's *Prison Memoirs of an Anarchist* (1912) and *Against All Hope: The Prison Memoirs of Armando Valladares* (1986) expose how race and class factor into a supposedly impartial criminal justice system. As these autobiographies illustrate, mobility and immobility are intricately tied to social constructions of race, ethnicity, class, gender, and citizenship status and differ radically depending upon one's privilege or lack thereof. The choice to write an autobiography shaped by the form of the slave narrative, the captivity narrative, the prison narrative, or the internment narrative is likewise a choice with a range of political and rhetorical effects and is not simply a neutral or self-evident choice. Likewise immigration narratives provide a culturally intelligible form for many autobiographies and call attention to the ways in which "citizen," "alien," and "immigrant" are shifting and socially constructed categories. Immigration narratives some-

times draw on other culturally available narratives such as the bildungsroman, as we have seen with Jade Snow Wong and Richard Rodriguez. But other immigration autobiographies resist the individualist trajectory of the bildungsroman by explicitly challenging the terms by which the nation-state defines "citizen" and "Other." For example, in Judith Ortiz Cofer's *Silent Dancing: A Partial Remembrance of a Puerto Rican Childhood* (1990), the concept of *La Tristeza*, "the sadness that only place induces and only place cures" (p. 14), functions as a poignant way to theorize the pain of immigration and displacement. In Ernesto Galarza's *Barrio Boy: The Story of a Boy's Acculturation* (1971), the narrator constructs his life as a series of lessons in coming to gender, ethnic, and class consciousness. Self-consciously portraying his life as historically and psychologically representative of all Mexican immigrants to the United States, Galarza resists the psychological characterization of Chicanos as lacking "self-image" (p. 2) and insists that his identity, like his autobiography, is profoundly affected both by his childhood in Jalcoctán and by his participation in the U.S. Chicano labor movement of the 1960s.

The case of immigrant and ethnic autobiography brings up another issue that informs the study of self-life-writing: namely, the question of who can speak for whom. The politics of collaboration, editing, and translation inform much ethnic life writing throughout U.S. history as well as earlier and non-U.S. autobiographies such as Margery Kempe's *Book*, over which questions about the author's literacy continue to throw her status as autobiographer into doubt. In the U.S. context, a primary example of the politics of who can speak for whom is the history of nineteenth- and early-twentieth-century Native-American autobiographies, many of which were produced collaboratively between the native subject and a white ethnographer. For example, *The Life of Ma-ka-tai-me-she-kia-kiak, or Black Hawk* (1833), transcribed and edited by J. B. Patterson, and *Black Elk Speaks* (1932), transcribed and edited by John G. Neihardt, are both as-told-to autobiographies that call attention to the politics of cross-cultural representation, translation, and authorial agency. But the collaborative autobiography continues into the late twentieth century and on to the present day with classics such as *The Autobiography of Malcolm X* and the contemporary *testimonio* of Rigoberta Menchú, *I, Rigoberta Menchú: An Indian Woman in Guatemala* (1984), transcribed and edited by Elisabeth Burgos-Debray.

Menchú's *testimonio*, published and circulated in North America, calls for attention to the contemporary politics of globalization and the transnational production, circulation, and reception of life narratives in the "First World" about "Third World" subjects. But *testimonio* also differs from conventional autobiography. As Doris Sommer argues, whereas autobiography generally tells the story of an individualized "I" and its unique experiences, in *testimonio* the "I" becomes plural and stands in for a community of people who share a common identity and representative, rather than unique, experiences. In Menchú's case, this plural "I" has renewed public and scholarly interest in the question of "truth" in autobiography, as she has been accused of misrepresenting "her" experiences for aesthetic and political gain.

“Outlaw” Genres

Debates such as these over the slipperiness of autobiography as a genre have led contemporary scholars to turn to the increasingly complex production and reception of autobiographical “outlaw genres,” which call attention to how generic distinctions have always been troubled, fluid, and contestable. In “Resisting Autobiography: Out-Law Genres and Transnational Feminist Subjects” (1992), Caren Kaplan argues that hybrid autobiographical forms constitute strategic political moves for women, ethnic, and immigrant authors who do not wish to write their lives according to culturally available scripts. Moreover, Sidonie Smith and Julia Watson’s edited collection *Getting a Life: Everyday Uses of Autobiography* (1996), broadens conceptions of autobiography past purely written forms into everyday cultural practices that are in fact identity practices. These scholars point out that contemporary “autobiographical” texts call into question the generic boundaries between fiction, autobiography, biography, ethnography, myth, and performance. Authors are increasingly labeling their works “biomythography” (Audre Lorde’s *Zami: A New Spelling of My Name*, 1982), “fictional autobioethnography” (Norma Elia Cantú’s *Canícula: Snapshots of a Girlhood en la Frontera*, 1995), and other generic hybrids, and many authors are combining text with images and drawings that call attention to the visual as a self-representational practice. For example, Art Spiegelman’s two-volume *Maus: A Survivor’s Tale* (1986 and 1991) uses a comic book or “graphic novel” form in order to explore Spiegelman’s troubled relationship with his father, a survivor of Auschwitz, and his life story. Cherríe Moraga’s *Loving in the War Years: lo que nunca pasó por sus labios* (1983) and Gloria Anzaldúa’s *Borderlands/La Frontera: The New Mestiza* (1987) combine personal essays and poems with history and feminist theory in English and Spanish to create hybrid forms that are both autobiographical and academic. And Theresa Hak Kyung Cha’s multimedia *Dictee* (1982) draws on autobiography, biography, photographs, drawings, and cinema in order to explore the challenges of immigration for the Korean-American narrator and her mother.

Outlaw genres suggest that autobiography is moving from a generally textual narrative form into a range of complex oral, textual, visual, and performative cultural practices that explore the challenges of identity and self-representation in diverse ways and through diverse media. Coco Fusco and Guillermo Gómez-Peña’s autobiographical performance art is one striking example of contemporary attempts to expand self-representation beyond textual forms. In *Year of the White Bear: Two Undiscovered Amerindians Visit the West* (1992), Fusco and Gómez-Peña, dressed up as exotic tribal figures from an unnamed and “undiscovered” island, displayed themselves in a cage in London, Madrid, and New York. Counting on their audiences’ familiarity with the colonial practice of putting native peoples on display for Western audiences, Fusco and Gómez-Peña were surprised by the extent to which their performance, intended as a satire of popular nineteenth-century cultural expositions that presented cultural tribes as specimens, was taken literally and as truth by audiences. This ironic performance of racialized identity goes to the heart of questions of truth, authenticity, and audience

expectations in “nonfictional” self-representational acts. It also illustrates the continuing need for autobiography to be theorized complexly and rhetorically, especially in the contemporary global landscape in which texts cross national, cultural, and language boundaries with ever-increasing frequency.

Wendy S. Hesford

AUTONOMY. *Autonomy* was first used by the ancient Greeks to describe city-states that had the power to legislate their own laws and direct the course of their own affairs. The etymology (*auto* [self] + *nomos* [law]) suggests self-governance or the imposition of law on oneself. The original implication of autonomy was pejorative when applied to the individual. When, for example, in Sophocles’ tragedy, the chorus uses the word *autonomos* to describe the actions of Antigone, the audience is meant to understand that she has placed her own judgments above the laws of the city—a clear violation of Greek norms.

By the seventeenth or eighteenth century, however, people as well as governments came to be viewed as autonomous agents. If human reason is able to discern the difference be-

tween right and wrong, each person can formulate his or her own conception of how to live without relying on religious or secular authorities.

This idea had a decisive impact on liberal political philosophies, which claimed that each person is sovereign over himself, so that the only way governments can exercise control over their citizens is on the basis of consent, implicit or actual. In this way, authority flows not from the ruler downwards but from the citizens—conceived as free rational agents with an equal share in society—upwards. Along these lines, Jean-Jacques Rousseau (1712–1778) argues that freedom for the individual consists in obedience to self-imposed law, and the sovereignty of the state derives from laws that the people, as expressed in the general will, impose on themselves.

It is generally agreed that the classic formulation of the doctrine of autonomy occurs in Immanuel Kant (1724–1804). While God or a national leader can command certain actions and threaten punishment if we do not obey, each person is responsible for the actions he performs. In fact, Kant took this idea to its logical conclusion: every moral agent is both an end *in* itself and a being capable of legislating morality *for* itself.

Suppose God or a political leader orders us to do something. Why should we obey? No one doubts that life will be uncomfortable if we do not. But the question is not “What is it in our interest to do?” but “What are we obliged to do?” Kant’s point is that obligation must derive from within: no external source can create obligation *for* us. Rather than say, “Do this” and “Don’t do that,” a person in authority must allow us to see for ourselves what is right. Not to do so is patronizing or degrading.

Kant therefore proclaims: “The will is thus not merely subject to the law but is subject in such a way that it must be regarded also as legislating for itself and only on this account as being subject to the law, of which it can regard itself as the author” (p. 38). Once we can regard ourselves as authors, reward and punishment no longer matter. The only thing that matters is whether we are convinced our action is right.

Even for as vocal a critic of Kant as John Stuart Mill (1806–1873), autonomy plays a central role. The best way to maximize the happiness of the greatest segment of society is to restrict the authority society can exercise over the individual and grant the individual sovereignty over his thought and person. The only warrant society has for interfering with this sovereignty is if the actions of one person impinge on the rights of another. Barring that, each person has the right to pursue his own happiness in whatever way he judges best.

Finally, one can find the doctrine of autonomy in the thought of John Rawls (1921–2002), for whom a just society is one which free and equal agents would choose for themselves if they had to take a place in that society but did not know what place they would be assigned—rich or poor, gifted or challenged, religious believer or atheist. This is simply a modern way of expressing the idea of implicit consent and saying that each person has the right to formulate and pursue his or her own conception of the good life.

Common Misconceptions

It is worth noting that, for Kant, autonomy does not permit me to do as I please. If it is degrading for someone to deny me the status of a moral agent, it is equally degrading to deny someone else that status. In Kant’s view, the only law I can impose on myself in a coherent fashion is one that simultaneously upholds the dignity of others.

A second misconception concerns authorship. To say that I must *regard* myself as the author of something is not to say that I am the author in fact. Consider the Fifth Amendment to the U.S. Constitution. Although I was not present when the founders drafted it, by prohibiting torture it articulates a principle to which I am strongly committed. So I can take responsibility for it even if I had to learn about it in a civics class.

Finally, there is the question of scope. Although Kant defines autonomy as rational self-legislation, this does not mean it is based on an intelligence test. By rationality he simply means the ability to recognize that moral agents have obligations; as such, autonomy applies to all of humanity regardless of education or social standing.

Objections

Though it is often said that Kant’s conception of autonomy leads to atheism, there is no reason why this has to be so. I can obey God as long as my reason for doing so is that the commandment to obey is morally valid; what I cannot do is obey blindly. The same is true of the government. Rather than urging obedience to legitimate authority, autonomy rejects the claim that legitimacy is irrelevant to authority: “Right or wrong, it’s my country, my religion, my family, and so on.”

Another objection claims that emphasizing individual sovereignty undermines virtues like trust, friendship, and cooperation. It does—if that means it is possible, in principle, for one person to be right and the rest of society wrong. But it hardly follows that one should go through life disregarding the advice of others and avoiding intimate relationships. To say that I should take responsibility for my actions is not to say that I must become a citadel. To live up to my obligations and fulfill myself as a person, I need the help of family, friends, and a host of institutions. All autonomy demands is that these groups or institutions respect my dignity as a free and rational agent (as well as respecting the dignity of others). At bottom, what autonomy denies is any form of political, religious, or moral tyranny.

AVANT-GARDE.

This entry includes two subentries:

Overview
Militancy

OVERVIEW

Beginning in the nineteenth century, the term *avant-garde* has been applied to a wide range of social activities, from military to political to artistic. Since the early twentieth century, however, it has most commonly been used to designate those artists who, in making works of art, knowingly transgress aesthetic and social norms, seeking thus to scandalize, to disrupt established canons of taste, and to criticize the limits of society and project utopian alternatives.

In the common viewer or reader, avant-garde art often provokes indignation, uproar, outrage, puzzlement, or even violent rejection. Still, these audience responses, which have accompanied the artistic avant-garde throughout its history, do not lead back to a common set of stylistic and attitudinal traits that would allow for a clear, exhaustive conceptual analysis of avant-gardism. As an art-criticism term, *avant-garde* has been applied equally to the extremist subjectivism of the expressionists and the geometrical rationalism of Russian suprematism and constructivism; in music, to the serialism of Karlheinz Stockhausen (b. 1928) and the chance-operational compositions of John Cage (1912–1992); in literature, to the “transrational” pure-sound poetry of the Russian futurists, the densely allusive modernist epic of Ezra Pound (1885–1972), and the graphic and grammatical minimalism of concrete poets; in film, to the lush romanticism of Stan Brakhage’s (1933–2003) handmade films and to the self-reflexive, analytical bent of Malcolm Le Grice (b. 1940); in architecture, to the exuberant utopianism of El Lissitzky (1890–1941) and the icy rationality of Mies van der Rohe (1886–1969); and in performance, to the minimalist, disciplined stage images of Samuel Beckett (1906–1989) and the Dionysian spontaneity of the Living Theater. Similarly, the political affiliations of the avant-garde offer no unitary picture: ranging from the tormented anarchism of the early expressionists to the studied political indifference of Marcel Duchamp (1887–1968), from the fascist partisanship of Italian futurism to the communist and Trotskyite engagements of the surrealists, from John Cage’s playful antiauthoritarianism to the more regimented left-wing politics of many American artists of the later 1960s and the 1970s.

The term’s conceptual blurriness, however, has hardly hampered its successful career in the arts. On the contrary, its indeterminate content and constantly shifting, constantly expanding application points to essential features of “avant-garde” dynamics in the art world. Less a coherent concept than a highly effective ideological metaphor, the term and the ideas surrounding it have proven a convenient vehicle for unsettling artistic conventions and canons of value, for proliferating technical innovations from one medium to another, and for communicating new aesthetic ideas across disciplinary as well as national borders.

Avant-Garde as Ideological Metaphor

The ideological components of avant-garde as a metaphor can be grouped under three headings: political, formal, and temporal-historical. The avant-garde artist, often a self-conscious member of a sectarian group or movement, creates artworks that at once lay claim to formal innovativeness and to their effective quality as social criticism. “Avant-garde” connotes precisely this implication of social criticism in acts of formal innovation and the artist’s corollary struggle to find new artistic expressions—new figures and forms—to probe imaginatively beyond the strictures of a given social order. But this conflation of form and political meaning carries only two dimensions of avant-garde as metaphor. A further, temporal dimension gives that ideology its peculiar depth. “Avant-garde” also suggests an historical measure that lies in the future, a goal toward which artists are leading, while others merely follow. Through its artistic practice and products, the avant-garde adumbrates this end toward which the whole of a society is—or at least *should be*—heading. Where the avant-garde was, it is implied, there the social mainstream must inevitably find itself.

At first glance, the ideology is patently absurd. How could an abstract painting, a dadaist collage, an aleatory musical composition, or a film composed of mere patches of light and color be an anticipation of a new social norm, when it cannot even appeal to the present taste or understanding of a majority of citizens? At this point, however, the political and formal dimensions of the metaphor come to the ideological rescue of the avant-garde artist, by investing this estrangement of the artist from the audience with a paradoxical surplus value. The interpretative gap between the artist and his or her audience is taken by the artist (or by his or her critical champions) to represent the difference between the transfigured future, which the artist anticipates figurally, and the unredeemed present, which the audience literally embodies and from which the artist must break free. The audience’s lack of understanding with respect to the avant-garde work thus in no way discredits or devalues the work in the artist’s eyes. On the contrary, from the perspective of the avant-garde, this incomprehension indicates that the artist has authentically broken with the present and now stands in secret league with the future. The audience must be directed, perhaps even forced to catch up over time, to that which the artist has already discovered freely, through acts of artistic intuition and creation. But of course by that time the artist will have already moved on to new terrain, in perpetual revolt even against those utopian orders that presently can hardly be imagined.

Theories and Historiographies of the Avant-Garde

Theories and historiographies of the avant-garde have tended to emphasize one of the three dimensions of this basic ideological metaphor—political, formal, and temporal-historical—while downplaying or even excluding the others.

Examples of important formally-based theories and histories include the work of the art critic Clement Greenberg, who conceived of avant-gardism as the intensified focus of artworks on the essential properties of their media and attacked prominent avant-garde multimedial experimentation (such as minimalist sculpture) as leading to a bad theatricality akin to kitsch; Umberto Eco, who in his study *The Open Work* discussed the avant-garde's construction of works that require participatory completion by performers and audience; Julia Kristeva, who in *Revolution in Poetic Language*, sought to show how avant-garde poets such as Rimbaud and Mallarmé disrupted the grammatical means by which language functions as a vehicle of normal communication and ideology; and Marjorie Perloff, who traced out in a series of books the landmarks of a "poetics of indeterminacy," a futurist legacy, and a Wittgensteinian poetics.

Theorists of particular importance for the illumination of the political dimension of the avant-garde include Peter Bürger, whose *Theory of the Avant-Garde* focuses on the institutional status of art as autonomous from social life and the avant-garde's attempt to break down that autonomy and return art to its effective place in society; the urban historian Manfredo Tafuri, who considers the unanticipated role that avant-garde radicalism played in subordinating modern architecture and urbanism to big business, socialist planning, or the capitalist state; Fredric Jameson, who views the avant-garde as an intense site in which the contradictions of late capitalism were given aesthetic and experiential form; and the poststructuralist philosophers Jean-François Lyotard and Gilles Deleuze, who interpret avant-garde art as postconceptual models of embodied thinking in which mind, body, and technology merge in novel, free ways.

Theories focused on the temporal and historiographic dimension of the avant-garde are rarer than the other two, more dominant orientations, but these include the writings of the Frankfurt school philosopher Theodor Adorno, especially in his studies of modern music; the poet Octavio Paz's Harvard lectures, *Children of the Mire: Modern Poetry from Romanticism to the Avant-Garde*; Peter Osborne's *The Politics of Time: Modernity and Avant-Garde*; and Fredric Jameson's *A Singular Modernity*.

In the early years of the twenty-first century, however, a theory that accounts holistically for the interactions of all three dimensions of the avant-garde's basic metaphor—its constitutive identification of the formal with the political and the temporal-historical—had yet to appear.

MILITANCY

Gustave Courbet (1819–1877) was the first artist to assume the mantle of the avant-garde, savoring its military associations from within his outpost in the Pavillon du Réalisme he had constructed to exhibit his paintings that had been rejected by the official salon of the 1855 World's Fair. While the largest of these works—*Studio of the Painter: A Real Allegory* (1855)—could be thought to constitute a manifesto of Courbet's beliefs, he issued a written manifesto as well, in which he stated his determination to be "nothing but a painter."

Courbet's rejection from officialdom was institutionalized in 1863 by the Salon des Refusés, which France had been forced to set up next to the recognized salon in the Palais des Beaux-Arts. It was to this salon of the refused artists that Édouard Manet (1832–1883) was consigned, showing his *Déjeuner sur l'herbe* and *Olympia* to the shrieks of laughter of the scandalized visitors. Indeed, it was Manet's own determination to be "nothing but a painter" that incensed his viewers,

Dancers perform *The Rite of Spring*, English National Ballet, 2003. At the ballet's premiere in Paris in 1913, Igor Stravinsky's dissonant composition and the distinctly unusual choreography sparked outrage in the audience, which raised such an uproar that the dancers were unable to hear the music. © ROBBIE JACK/CORBIS

since his maintenance of the painterly qualities of his works led him to suppress the half-tones of representational shading and to flaunt wide expanses of percussive white paint in the eyes of his audience. "Nothing but a painter" was soon endowed with the epithet "*l'art pour l'art*" or art for art's sake, another mantle willingly assumed by the growing numbers of the self-professed avant-garde.

It is the position of Peter Bürger, whose *Theory of the Avant-Garde* (1984) remains the best treatment of this subject, that the withdrawal of the artist into the sanctuary of art for art's sake was the necessary condition for the formation of what he terms the "historical avant-garde," or the first wave of intensely militant activity that characterized the movements of futurism, cubism, dada, and surrealism during the opening decades of the twentieth century. Because their militancy was aimed at breaking down the barriers separating art from the life around it, it was necessary, Bürger maintains, that these barriers really existed. By incorporating the columns they cut from their daily newspapers into works now called *collage* (or gluing), the cubists transgressed the sanctity of the special province of the work of art. This same principle of transgression was practiced by the dada *photomonteurs*, such as John Heartfield and Hannah Hoch, who extended the collage technique to include photographic reproductions from

illustrated magazines in order to wage political battle against the mounting powers of fascism.

Another obvious example of this avant-garde indifference to the separation of art and life is the readymade, introduced by Marcel Duchamp (1887–1963) in the form of the urinal he entered into the New York Salon des Independents in 1917. For Bürger, these transgressive modes of operation constituted specific paradigms of avant-garde attack against the boundaries of *l'art pour l'art*. Further, he argued, after the historic avant-garde had come to an end during World War II, the postwar avant-garde had no ground on which to maneuver except that of repeating the already-explored paradigms of the earlier avant-garde: the readymade, the photo-montage, the monochrome painting, the assemblage. Bürger's designation for this state of affairs and the artists consigned to it is "neo-avant-garde," which would include the photo-montage canvases of Robert Rauschenberg (b. 1925), the readymades of Andy Warhol (1928–1987), the monochromes of Lucio Fontana (1899–1968), and so forth.

The cries of rage that greeted Manet's *Olympia* soon became the hallmark of the avant-garde as each new transgression elicited its own storm of protest, such as the audience that stormed out of the theater during Igor Stravinsky's (1882–1971) *Rite of*

Spring or the thunder of catcalls hurled at *Parade*, scored by Erik Satie (1866–1925) for typewriters and other machines.

The philosopher Stanley Cavell posits that these expressions of anger, triggered by the fear of being hoodwinked by a fraudulent work, are what characterizes modernism itself, such that “the dangers of fraudulence, and of trust, are essential to the experience of art” (pp. 188–189). In relation to the avant-garde, he writes, “What looks like ‘breaking with tradition,’ in the successions of art is not really that; or is that only after the fact, looking historically or critically; or is that only as a result not as a motive: the unheard of appearance of the modern in art is an effort not to break, but to keep faith with tradition. It is perhaps fully true of Pop Art that its motive is to break with the tradition of painting and sculpture; and the result is not that the tradition is broken, but that these works are irrelevant to that tradition, i.e., they are not paintings, whatever their pleasures” (pp. 206–207).

The scholar and critic Leo Steinberg has also emphasized this problem of fraudulence dogging the most important works of modernism and striking not just the outsider or layperson, but the inner circle of artists as well. In “Contemporary Art and the Plight of Its Public,” he reports Henri Matisse’s anger at Pablo Picasso’s *Les Femmes d’Alger* (1907), which he called “Picasso’s hoax,” and Georges Braque’s refusal of the picture with: “It is as though we were supposed to exchange our usual diet for one of tow and paraffin.”

Two important essays by the critic Clement Greenberg analyze the relation between the avant-garde and modernism: “Avant-Garde and Kitsch” (1939) and “Modernist Painting” (1960). As Greenberg defines it, in the 1939 essay, “Kitsch is a product of the industrial revolution which urbanized the masses of Western Europe and America and established what is called universal literacy” (1986, p. 11). He gives as its examples: “popular, commercial art and literature with their chromeotypes, magazine covers, illustrations, ads, slick and pulp fiction, comics, Tin Pan Alley music tap dancing, Hollywood movies, etc., etc.” (p. 11). If, as he puts it, “Kitsch is vicarious experience and faked sensations” (p. 12), there were artists who felt the need to resist this fraudulence. These, to which are given the name “avant-garde,” “sought to maintain the high level of [their] art by both narrowing it and raising it to the expectation of an absolute in which all relationships would be either resolved or beside the point. ‘Art for art’s sake’ and ‘pure poetry’ appear, and subject matter or content becomes something to be avoided like a plague” (p. 8). In order to pursue this “purity” the avant-garde artist detaches himself from bourgeois society to which he is nonetheless attached, as Greenberg puts it, “by an umbilical cord of gold.”

“Modernist Painting,” assuming the existence of the avant-garde, gives an account of how the “narrowing and raising” of a given art began historically, and what its new logic consists of. Defining modernism as an Enlightenment phenomenon, Greenberg locates its onset with Kant who “used logic to establish the limits of logic” (1993, p. 85). What then follows is that “the essence of Modernism lies . . . in the use of characteristic methods of a discipline to criticize the discipline itself, not in order to subvert it but in order to entrench it more firmly

in its area of competence” (p. 85). What each art sought, Greenberg argued, was to exhibit “not only that which was unique and irreducible in art in general, but also that which was unique and irreducible in each particular art” (p. 86). What follows from this is that “the enterprise of self-criticism in the arts become one of self-definition with a vengeance” (p. 86).

For painting itself, self-criticism produced as defining features: the flat surface, the shape of the support, and the properties of the pigment, all of which needed, under Modernism, to be acknowledged openly. “Manet’s,” Greenberg explains, “became the first Modernist pictures by virtue of the frankness with which they declared the flat surfaces on which they were painted” (1993, p. 86).

Greenberg’s avant-garde continues through the twentieth century, picking up ever-new strength and certainty. For him, Bürger’s “neo-avant-garde” could only be a version of Kitsch, the triumph of not-art in place of the real thing.

AZTLÁN. As a region in mythical geography, Aztlán (the land of the [white] herons) has a long history. According to the Náhuatl myth, the Aztecs (whose name is derived from Aztlán) were the last remaining tribe of seven, and they were advised by their god Huitzilopochtli to leave Aztlán in search of the promised land, which they would know by an eagle sitting on a cactus, devouring a serpent. They found it, and there they built Tenochtitlan, now Mexico City. Later the Aztecs remembered the region of their origin as an earthly paradise. Wanting to know more about it, Moctezuma Ilhuicamina (r. 1440–1469) sent his priests in search of Aztlán. They found it and gave the ruler a hyperbolic description of the place, as told by Diego Durán (1537–1588) in his *Historia de las Indias de Nueva-España y Islas de Tierra Firme*, a work finished in 1581 and translated into English in 1964 as *The Aztecs*. Although other early historians mention Aztlán, Durán presents the most elaborated description of the utopian nature of the city.

With few exceptions, the topic of mythical Aztlán was forgotten until the 1960s, when the rebirth of the myth flourished in Chicano thought. The cultural nationalists—one of the most important branches of the Chicano movement—appropriated the term *Aztlán* to establish the indigenous nature of their culture, a characteristic central to their philosophy. The appropriation of the myth took place during the “Crusade for Justice Youth Conference,” held in Denver in March 1969. It was there that for the first time the myth of Aztlán was mentioned in a Chicano document, “El Plan Espiritual de Aztlán.”

“El Plan,” which owes its creation to the poet Alurista, became the cultural nationalists’ manifesto. First, it establishes the unique nature of Chicano culture, since La Raza (the Bronze race) has an Aztec origin. The Spanish word *raza* means “the people,” and *raza de bronce* means “the brown people,” who claim to be descendants of the Aztecs. Second, it identifies Aztlán as the Mexican territory ceded to the United States in 1848—that is, present-day California, Arizona, New Mexico, and parts of Colorado. Third, following one of the basic ideas of the Mexican Revolution, it recognizes that the land belongs to those who work it. And fourth, it identifies the Chicano nation with Aztlán.

Aztlán became the symbol most used by Chicanos and Chicanas—activists as well as authors—writing about the history, the culture, or the destiny of their people. In April 1969 a group of concerned activists met in Santa Barbara and drafted *El Plan de Santa Barbara: A Chicano Plan for Higher Education*. Recommendation number nine deals with students’ organizations: “The various students groups, MAYA, MASC, UMAS, adopt a united name as symbol and promise; such as CAUSA (Chicano Alliance for United Student Action) or MECHA (Movimiento Estudiantil Chicano de Azatlán)” (p. 22). The name MECHA was adopted and is much in the news, as during the 2003 elections for governor of California one of the candidates, Cruz Bustamante, was attacked for having belonged to MECHA during his student days.

During the spring of 1970 the first number of the journal *Aztlán* (still in existence) was published, and in it the plan was reproduced in both English and Spanish. The prologue consists of a piece by the Chicano poet Alurista (b. 1947), “Poem in Lieu of Preface,” in which he unites the mythical Aztec past with the present. From that year on books based on the concept of Aztlán multiplied. The myth of Aztlán was popular not only among academics, but also among the common people. According to Michael Pina:

A cultural renaissance inspired by the powerful ideological thrust of cultural nationalism swept through the barrios of the Southwest. . . . Chicanos turned to pre-Hispanic myths and symbols. . . . The most outstanding example of this practice is illustrated by the vital role that the Aztec myth of Aztlán played in the development of Chicano nationalism. (Anaya and Lomelí, p. 40)

Artists and dramatists also took up the concept. In 1971 Luis Valdez (b. 1940), who had helped César Chávez organize

the farm workers, published his collection *Actos* (one-act plays). In the preliminary piece, “Notes on Chicano Theater,” Valdez states, “The concept for a national theatre for La Raza is intimately related to our evolving nationalism in Aztlán” (p. 3).

The myth has been utilized with advantage for political purposes. The novels of Miguel Méndez (b. 1930) and Rudolfo Anaya (b. 1937) are examples representative of two aspects of cultural nationalism based on the concept of Aztlán. In *Peregrinos de Aztlán* (1974) Méndez depicts the plight of the Yaqui Indians of the border in their peregrination back to Aztlán. The narrator, the old Yaqui Loreto Maldonado, tormented by the memories of his fallen and abused people, wants to take them back to Aztlán, the lost paradise.

Anaya’s *Heart of Aztlán* (1976) is also a novel about the search for Aztlán. Clemente Chávez, a man of some years, goes to the mountains, guided by the blind minstrel Crispín, on a truly imaginary pilgrimage: “They walked to the land where the sun rises, and . . . they found new signs, and the signs pointed them back to the center, back to Aztlán” (Anaya, pp. 129–130). For Anaya, Aztlán is not a political concept but a personal one. Clemente finds Aztlán in his own heart. “Time stood still, and in that enduring moment he felt the rhythm of the heart of Aztlán beat to the measure of his own heart. . . . A joyful power coursed from the dark womb-heart of the earth into his soul and he cried out I AM AZTLAN!” (Anaya, p. 131). This spiritual interpretation of Aztlán has been criticized by writers who believe that Chicano literature should be social, that literature of this type “didn’t contribute to that movement, or to bettering the life of the people in any way” (Johnson and Apodaca, p. 424).

For Clemente the search for Aztlán has ended. In a similar way it has also ended for the followers of cultural nationalism, as the movement—like the social movements of other ethnic groups—came to an end in the early 1980s. Even Alurista, the creator of the nationalist concept of Aztlán, in an interview with Wolfgang Binder agreed about the danger of idealizing the Aztecs and their myths. “Yes, without question, and I see it now” he said in 1981. “At the moment we are talking of a period during which the call of arms was the cry for self determination. So it was very important to be proud of everything we had been” (p. 4). In the early 2000s younger Chicanos and Chicanas considered the idealization of Aztec mythology as belonging to a romantic period in the history of their culture. While the symbolism of Aztlán still resonated in the literature, art, and political legacies that it helped inspire, few idealized that aspect of their historical past.

B

BARBARISM AND CIVILIZATION. Barbarism and civilization are salt and pepper concepts that are inextricably interlinked. In the Western world, “barbarism” is derived from the classical Greek word *barbaros* (barbarian) that referred originally to foreigners who did not speak Greek. In the modern world, barbarism carries a negative connotation of unrefined and savage. “Civilization” is derived from the Latin word *civis* (citizen) that referred originally to those living in a Roman city. In the modern world, civilization carries a positive connotation of education and sophistication.

Although “barbarians” and “barbarism” come from the ancient world, “civilization” does not. Fernand Braudel maintains that “civilization” first appeared in 1732 in regard to French jurisprudence that “denoted an act of justice or a judgment which turned a criminal trial into civil proceedings” (p. 3). In 1752 the statesman Anne Robert Jacques Turgot used “civilization” to describe a process of being civilized. “Civilization” stood firmly against its opposite of “barbarism.” By 1772 “civilization” and its mate “culture” replaced “civility” in England and fostered *Zivilization* (civilization) alongside the older *Bildung* (culture) in Germany (see Braudel, p. 4).

Friedrich Engels: Barbarism and Civilization

Against this backdrop, the dual concepts of barbarism and civilization emerged in the works of Friedrich Engels (1820–1895), who was influenced by Lewis H. Morgan’s (1818–1881) pathbreaking study *Ancient Society* (1878). Engels writes: “Barbarism—the period during which man learns to breed domestic animals and to practice agriculture, and acquires methods of increasing the supply of natural products by human activity. Civilization—the period in which man learns a more advanced application of work to the products of nature, the period of industry and of art” (1972, p. 93). Homeric Greeks, native Italian tribes, Germanic tribes of Caesar’s time, and the Vikings represent the upper stages of barbarism. Citing descriptions in Homer’s *Iliad*, Engels continues: “Fully developed iron tools, the bellows, the hand mill, the potter’s wheel, the making of oil and wine, metal work . . . the wagon and the war chariot, shipbuilding with beams and planks, the beginnings of architecture as art, walled cities with towers and battlements, the Homeric epic and a complete mythology—these are the chief legacy brought by the Greeks from barbarism into civilization” (p. 92).

It is evident that modern Western ideas of barbarism and civilization have a hierarchy built in. On the one hand, barbarians are seen as belligerent precursors of civilization. On the other hand, civilization is considered a culturally advanced

stage of human development. Many of these ideas begin in ancient Greece.

Herodotus and the Barbarians

The Greek historian Herodotus (c. 484–420 B.C.E.) divides the world into those who speak Greek and those who do not. Barbarians are the latter. Herodotus writes: “But the Greek stock, since ever it was, has always used the Greek language, in my judgment. But though it was weak when it split off from the Pelasgians [originary Greek tribes], it has grown from something small to be a multitude of peoples by the accretion chiefly of the Pelasgians but of many other barbarian peoples as well” (p. 57). Herodotus further punctuates the Greek language: “But before that, it seems to me, the Pelasgian people, so long as it spoke a language other than Greek, never grew great anywhere” (p. 57). The Greeks saw the barbarians as fascinating enemies whose “natural status” was that of the slave (see Harrison, p. 3). Herodotus scrutinizes two “barbarian” cultures on the opposite ends of the spectrum: the Egyptians and the Scythians. In Egypt, the sky rarely rains while the river always rises when others fall; in Scythia, the sky rains in summer but not in winter while the river never changes; in Egypt, the Nile unites the land while in Scythia, the Danube divides the land into many districts; in Egypt there is one king while in Scythia there are many; in Egypt, they believe themselves to be the oldest of peoples while the Scythians believe themselves to be the youngest; in Egypt, culture is marked by strict religious rituals that rarely change while the Scythian culture illustrates constant change and varying rituals (see Herodotus, pp. 138–290, cf. Redfield, pp. 35–37). As Herodotus claims, the Egyptians know many things while the Scythians know one great thing, “how no invader who comes against them can ever escape and how none can catch them if they do not wish to be caught. For this people has no cities or settled forts; they carry their houses with them and shoot with bows from horseback; they live off herds of cattle, not from tillage, and their dwellings are on their wagons” (p. 298). At the time of Alexander the Great (356–323 B.C.E.), the Persians were the main barbarian adversaries. Fighting his way through Asia, he arrived at Maracanda (Samarkand, Uzbekistan) in Sogdiana, the first meeting point of Eastern and Western civilizations (see Arrian, pp. 351–537). Although Alexander occupied the fortified citadel, he was unable to secure it because of counterattacks by Scythian coalitions. A major city on the Silk Road, Samarkand was the site for Chinese paper mills established in the early eighth century (see Gernet, p. 288) and the center of a Turkic-Mongol empire under Tamerlane in the fourteenth century (see Nicolle). Tamerlane’s grandson, Ulugh-Beg (1394–1449), was an astronomer who built

Attila Burning Townships during the Invasion of Italy, woodcut, c. 19th century. Embodying the barbarian threat to Western civilization, Attila the Hun (406?–453) conquered much of Central Europe. Although tribes such as the Huns were all overthrown by stronger forces of civilization, they represented what Arnold J. Toynbee termed a barbarian “heroic age.” © BETTMANN/CORBIS

an observatory at Samarkand and was the first since Ptolemy to compile a star chart.

Toynbee’s Rhythm of History

Paying close attention to the ancient Greeks and Romans, Arnold Toynbee did not subscribe to a linear, hierarchical view of civilization. Even Karl Marx and Friedrich Engels’s dialectical approach to history resulted in successive stages of development toward a desired end (see Marx and Engels, pp. 23–40). Although Toynbee’s own vision of human history was nostalgic for the lost past and pessimistic for the future, his comparative theory of civilizations (East and West) was linked to an acute understanding of Greek philosophy and an essentialist view of Chinese philosophy. Toynbee concentrates on the idea of a “rhythm” of history. On the one hand, Empedocles’ ancient Greek philosophy sees the universe caught in the ebb and flow of a rhythmic alternation of the “integrating force” of love and the “disintegrating force” of hate, a unity arising from plurality and a plurality arising from unity (see Toynbee, 1935, pp. 200–201). On the other hand, Chinese philosophy sees the universe caught in the ebb and flow of a rhythmic alternation of the “shadow” force of yin and the “sunshine” force of yang: “Each in turn comes into

the ascendant at the other’s expense; yet even at the high tide of its expansion it never quite submerges the other, so that, when its tide ebbs, as it always does after reaching high-water mark, there is still a nucleus of the other element left free to expand, as its perpetual rival and partner contracts” (p. 202). Toynbee’s assessment of the growth and breakdown of civilizations is a yin-yang beating out of “the song of creation” through challenge and response, withdrawal and return, and rout and rally (Toynbee, 1939, p. 324).

Through this rhythm of history, tensions between state and church are disrupted by an interregnum of barbarians that Toynbee calls collectively the *Völkerwanderung* (the wandering peoples). In the Western world, this refers to Germanic and Slavic tribes from the north on the borders of the Greco-Roman civilization as well as Sarmatians and Huns from the Steppes of Eastern Europe. Although they were all overthrown by stronger forces of civilization, these wandering tribes represent a barbarian “heroic age” (Toynbee, 1939). The Vandals and Ostrogoths were destroyed by Roman counteroffensives, while Visigoths succumbed to both Frankish and Arabian assaults. In the long run, Toynbee felt the barbarians had little impact on Western civilization because the church was more powerful in regard to cultural and philosophical transmissions (see 1935, pp. 58–63, cf. Bury, pp. 177–230).

Toynbee could not apply his yin-yang theory of history in any great detail to China itself. In *Reconsiderations*, he laments the lack of a classical Chinese upbringing: “I should, of course, have taken Chinese, not Hellenic, history as my model, and I should have seen Chinese history as a series of successive realizations of the ideal of a universal state, punctuated by intermediate lapses into disunion and disorder . . . the Yin-Yang rhythm would be cyclical without having any regular periodicity” (1960, p. 188).

China’s Yin-Yang Polarities

A closer look at China validates Toynbee’s suspicions. China had ancient words for both “civilization” and “barbarism” that are still in use today. *Wenming* refers literally to a bright and clear culture that possesses writing, art, and literature. In China’s classical world, the most used term for barbarian was *hu* (beard), which gave rise to expressions such as *huche* (talk nonsense) (see Wilkinson, p. 724). The Chinese word for barbarian combined both the Roman idea of *barbarus* (“the bearded one”) and the Greek idea of *barbar* (“talk nonsense”). The Han dynasty expression *yiyi gong yi* (“use barbarians to attack barbarians”) (see Wilkinson, p. 723) is reminiscent of Julius Caesar’s deployment of subdued Germanic and Gallic cavalry at Alesia against Vercingetorix’s Gallic horsemen (see Caesar, pp. 186, 218, 221).

Although the Greeks, Romans, and Japanese share a centralized view of their own respective civilizations, it is only the Chinese who name theirs as such. In the Wei and Jin periods (220–420 C.E.), Zhongguo (Middle Kingdom) and Huaxia (Cathay) were syncopated into Zhonghua (Central Cultural Florescence) (see Smith, p. 3), making civilization both a geographic and cultural entity for all under heaven. Even today, the term for “middle kingdom” is retained in the name of the People’s

Republic of China (*Zhonghua renmin gongheguo*). As Richard Smith, a renowned historian of China, maintains: “Barbarian conquest affirmed and reinforced this Sinocentric world view rather than shattering it” (p. 3). Like Toynbee, Smith sees every aspect of Chinese civilization, including barbarian intrusion, as following the polarities of yin and yang. He writes: “Yin and yang were, then (1) cosmic forces that produced and animated all natural phenomena; (2) terms used to identify recurrent, cyclical patterns of rise and decline, waxing and waning; (3) comparative categories, describing dualistic relationships that were inherently unequal but almost invariably complementary” (p. 4). Hence, yin and yang are mutually conditioning linked opposites that are co-constitutive of Chinese cosmology. When Smith writes that “the boundaries of China waxed and waned in response to periodic bursts of either Chinese expansion or ‘barbarian’ invasion” (p. 11), he echoes Toynbee’s universal rhythm for civilizations as “the perpetual alternation of a Yin state of quiescence with a Yang burst of activity” (1960, p. 188).

Mongols and Manchu Emperors

Non-Han peoples as “outsiders” were “dynamically and inextricably intertwined” with Chinese civilization (Smith, p. 11). Confucians felt that barbarians could adopt Chinese culture and become Chinese (see Ebrey, p. 179). Therefore, the history of China is the history of barbarian withdrawal and return. The pressure of the Ruzhen (Jurchen descendants of the Xiongnu) invasion in the Jin dynasty and the Mongol attacks of the thirteenth century forced the southern courts to establish strict civil service examinations. As the Mongols Genghis Khan (c. 1162–1227) and his grandson Kublai Khan (r. 1260–1294) adapted to Chinese culture, Confucian-style civil service examinations were reestablished. In 1313 the commentaries of the neo-Confucian Zhu Xi were included in these examinations, where they lasted until 1904 (see Smith, p. 37). The overthrow of the Mongols by Chinese patriots in the Ming dynasty saw the reinstatement of a Qin-Han structure of civil, military, and despotic reign. In turn, the Ming were ousted by the Manchu (Tungusic descendants of the Ruzhen), who marked the beginning of the Qing dynasty. The Manchu were organized under banners or civil-military units distinguished by colored flags. Before 1644, their administrative units for conscription and taxation recruited Chinese and Mongols. By 1648, the “multi-ethnic army” of bannermen included less than 16 percent Manchu (see Naquin and Rawski, pp. 4–5). Like the Mongols, the Manchu adopted Chinese culture, allowing for a renaissance of ancient philosophy and literature (see Goulding). While the first emperor of China burned most of the books in the known world, the Manchu established the largest known library that included literature and philosophy of China’s classical age (see Smith, p. 3; cf. Wilkinson, pp. 273–277, 485). Although censorship saw the destruction of many Ming books, the Complete Library of the Four Treasuries (1772–1782) resulted in seven sets of thirty-six thousand volumes (see Naquin and Rawski, p. 66). Whereas the Western world annihilated barbarians in a quest for civilization, the Eastern world accommodated them as co-constitutive elements of its yin-yang cosmology.

BEAUTY AND UGLINESS. Beauty is a vital and central element of human experience. It is associated with pleasure, which influences personal choices and cultural developments. Poets praise it, artists strive to capture it in their works, moralists warn against its deceiving influence, scientists seek to uncover its secrets, and philosophers reflect on its illusive nature. Expressions of the vitality of beauty in its role in everyday life are found in any culture. The attraction of beauty, the desire to be beautiful and obtain beautiful objects, is universal, although the manifestations of this desire vary across cultures and ages. Classical Western philosophy has regarded beauty as one of the three fundamental concepts of human understanding: truth (and falsehood), good (and evil), beauty (and ugliness). However, in the seventeenth century beauty was considered a marginal concept, while in the twentieth century it came to be regarded as dispensable altogether.

Beauty is typically related to the visual field, but is not limited to it. The Hebrew Bible attributes beauty mainly to human appearance and natural scenery, but also to the voice (Ezekiel, 33:32), to wisdom (Ezekiel, 28:7), and to God (Psalms, 50:2). The ancient Greeks ascribed beauty to things that are morally good, appropriate, and pleasing, be they natural objects or artifacts, tangible and concrete or abstract, personal deeds, or social institutions. In China beauty refers to wealth, longevity, talent, good reputation, and behavior. There appears to be a cross-cultural agreement that beauty is relevant to all aspects of life, but the nature of the concept and its actual applications are a matter of constant dispute. The variety of tastes and their suppleness, the difficulties in justifying judgments of beauty (and in determining their common ground) indicate that the idea of beauty is far more complicated than the way it appears in everyday experience.

Theories of beauty typically focus on two aspects: defining beauty, and determining its function and significance.

Definitions of Beauty

In the *Greater Hippias*, Plato (c. 428–348 or 347 B.C.E.) ascribes to Socrates the viewpoint that knowledge of beauty is a prerequisite for actual applications: one cannot properly distinguish between beautiful and ugly objects without knowing what beauty is. On the other hand, in the *Symposium*, Plato has Diotima argue that knowledge of beauty begins with direct experience of particular cases and knowledge of the abstract form of beauty is the highest and final stage, distilled from everyday experience.

Direct experience, Socrates claims, is unreliable. It reveals a complex of contradicting qualities that cohabit in the same object: any beautiful object is at the same time not beautiful when compared with a higher beauty. Appearance can be misleading. A person may appear beautiful when wearing suitable clothes, although he is not truly beautiful. Socrates in fact dismisses all expressions of physical beauty as untrustworthy. The ultimate beauty that contains no contradicting elements is beyond earthly experience. Plato portrays such absolute beauty in the *Phaedo*, where Socrates sees its heavenly form. Socrates rejects further the idea that beauty is that which functions properly: an object may function well, but if its purpose is evil,

the object is not beautiful. He also disagrees that beauty should be defined as a cause of delight. The good, Socrates argues, also causes delight, and the two should be kept distinct.

Socrates concludes in the *Greater Hippias* that beauty is difficult to define. Voltaire (1694–1778) goes further to argue that beauty, due to its relativist nature, is not just difficult but impossible to define. In his *Philosophical Dictionary* (1764) Voltaire writes that the toad sees beauty in large round eyes and a flat snout, and the devil sees beauty in a pair of horns and four claws. Epicharmus (c. 530–c. 440 B.C.E.), the comic dramatist, similarly remarks that a dog considers a dog the most beautiful creature, and equally an ox prefers an ox, a donkey a donkey, and a pig a pig. Realizing that beauty has no common core, Voltaire believes that one had better save oneself the trouble of attempting to study its nature.

Neither the difficulties presented by Socrates nor Voltaire's reservations have discouraged philosophers, artists, critics, and scientists from reflecting upon the nature of beauty throughout the centuries. Attempts to define beauty can be divided into two main groups: theories that regard beauty as a form of order and theories that regard beauty as a kind of pleasure. Theories of beauty may be divided further according to the logical status assigned to beauty: objective, subjective, relative, and relational. The objective approach asserts that beauty inheres in the object, and that judgments of beauty have objective validity. The subjective approach maintains that beauty is not a quality of the object but rather a creation of the mind. Relativism tends to associate beauty with cultural values, and the relational approach regards beauty as a product of both the object and the contemplative mind.

Beauty as a form of order. The Pythagoreans believed that beauty is a manifestation of harmonious, mathematical relations such as the golden section. In this proportion a straight line, c , is divided by two unequal parts, a and b , in such a way that the ratio of the smaller, a , to the greater part, b , is the same as that of the greater part, b , to the whole, c . Ugliness is the expression of disorder and a lack of rational proportions. Beauty was thus considered an objective expression of cosmic truth. The ancient Egyptians were probably the first to use the golden section in the design of the Pyramids, but it was Pythagoras of Samos (c. 580–c. 500 B.C.E.) who first presented its mathematical formulation.

Many have followed the Pythagorean notion of order. Plato writes that proportions constitute beauty (*Philebus*). Aristotle (384–322 B.C.E.) associates beauty with order and size in *Poetics*, and with symmetry and definiteness in *Metaphysics*. St. Augustine of Hippo (354–430) holds that beauty is based on numbers (*De libero arbitrio*). St. Thomas Aquinas (c. 1224–1274) mentions proportion and harmony among the three requirements of beauty (*Summa theologica*). Gottfried Wilhelm von Leibniz (1646–1716) describes beauty as an obscure, sensual perception of mathematical configurations (*Principles of Nature and Grace Based on Reason*, 1714), and the painter William Hogarth (1697–1764) formulates principles of beauty applicable to art (*The Analysis of Beauty*, 1753). Many other authors expressed similar views.

Plotinus (205–270) is an exception. In *Enneades* (I, 6) he rejects the idea that beauty consists of order and proportion. His main points are: (1) Proportions, order, symmetry, and harmony apply to compound objects, while beauty is also found in simple elements like sunlight or gold. (2) The parts of a beautiful object must be beautiful, too, because beauty cannot consist of ugly elements. However, the parts themselves are simple and cannot convey order. (3) A beautiful face may look ugly when it expresses anger or wickedness, yet its proportions are the same. (4) Physical beauty is a reflection of the divine beauty, which unifies the formless multiplicity of matter. Thus, unity, not complexity, is essential to beauty.

Notwithstanding Plotinus's criticism, the Pythagorean notion of beauty became influential in Western philosophy for two principal reasons: The association of beauty with order was appealing to the rational mind, and experience suggests that the parts of a beautiful object are well situated, complement each other, and create a unified whole. This understanding generated the notion of unity in variety: Beauty resides in complexity that is unified by order. Accepting the fact that order is the key concept for understanding beauty, the question arises whether there are unifying laws of beauty that apply to all cases of beautiful objects, in the same way that the laws of nature apply to all physical phenomena.

Alexander Baumgarten (1714–1762) believed that the laws of beauty, like the laws of nature, could be uncovered by systematic, empirical investigations. He called for the establishment of a new science, which he named *aesthetics*. This science was intended to investigate direct perception in which particular representations are combined into a whole. Baumgarten was not influential among philosophers, but psychologists and mathematicians from the nineteenth century onward pursued his vision, seeking to translate the traditional formula—unity in variety—into measurable variables. In the field of psychology, the investigation of beauty is associated mainly with Gestalt theory and experimental aesthetics. Ernst H. Weber (1795–1878) and Gustav T. Fechner (1801–1887) investigated sensual perceptions and the relation between the intensity of the stimulus and the responsive sensation it causes. Fechner founded experimental aesthetics and made it a branch of psychology. Max Wertheimer (1880–1943), Wolfgang Köhler (1887–1967), and Kurt Koffka (1886–1941) defined the principles of the “good gestalt” (*Prägnanz*) and examined its application in various fields. A good gestalt expresses order, regularity, simplicity, stability, and continuity. According to Hans J. Eysenck (1916–1997), the fundamental law of aesthetics derives from the law of the good gestalt while, conversely, the law of aesthetics determines the properties of the good gestalt (1942).

In the mathematical realm we find George D. Birkhoff (1884–1944), who analyzed polygons and vases in order to formulate a concept of beauty. Birkhoff's conclusion is that the pleasure derived from any work of art or object of beauty depends on two variables: order (O), which expresses the unity of the object, and complexity (C), or the diversity exhibited by the object. The resulting measure of the aesthetic pleasure (M) derived from an object is then expressed mathematically:

Statue head of Queen Nefertiti, Egypt, 14th century B.C.E. Beauty has long been considered by many to play a prominent role in sexual selection among both animals and humans. Noted feminist Camille Paglia believes this theory can be traced back as far as ancient Egypt. © CORBIS-BETTMANN

$M = O/C$ —that is, aesthetic pleasure is equal to the ratio of order to complexity (*Aesthetic Measure*, 1933).

From a different perspective, information theory inspired the idea that beauty is a measurable informative value. This theory offers a mathematical apparatus that describes, analyzes, and measures the transmission of information in communication systems. A clear message—namely, a highly ordered message—is a message of low informative value, high redundancy, and high predictability. Since the elements of a beautiful object are obviously neither redundant nor predictable, beauty in this context is regarded not as a form of high order, but rather as a happy medium, a balance between high order and disorder. Sir Fran-

cis Galton (1822–1911) demonstrates this idea of averages by superimposing photographs of convicted murderers and distilling a single photograph out of the many images. According to the viewers who examined the photos, this composite photograph was the best-looking face of all the original ones. Galton concluded that the average (composite) face is free from the irregularities that variously blemish each of the individual faces (1878).

Daniel E. Berlyne (1924–1976), one of the leading figures of experimental aesthetics in the twentieth century, sets the idea of happy medium in a psychological perspective. He describes the pleasure derived from beauty and good art as a reduction of arousal. The complexity of the object generates arousal in tension, and subsequently, when the unified whole is perceived, tension is reduced. According to Berlyne, experiments tend to confirm that some intermediate degree of complexity produces the most pleasing effect and that extremes of simplicity or complexity are distasteful (*Conflict, Arousal, and Curiosity*, 1960).

Monroe C. Beardsley (1915–1985), one of the most influential aestheticians of the last century, criticizes attempts to render beauty or good art in terms of a happy medium or an

average. He maintains that the identification of complexity with disorder fails to explain the fact that complexity is a relevant ground for praise, and that the degree of informative value is not high enough to establish the aesthetic worth of an object. Beardsley agrees that beauty is a form of order, but argues that the beauty formula inspired by information theory leads to absurdities. Aesthetic order, according to Beardsley, escapes mechanical patterns and is marked by freedom, diversity, and uniqueness (1968). Abraham Moles (1920–1992) similarly acknowledges the limitations of information theory. He distinguishes between semantic information and aesthetic information. Semantic information has a universal logic and can be expressed in different languages. Aesthetic information cannot be translated into any other language or system of logic; it refers to particular objects apprehended by particular spectators (1966).

The notion of organic form or an organic whole suggests that beauty expresses a nonmechanical order consisting of inner forces or structures. In an organic form the whole precedes the differentiation of the parts, and the various parts are interdependent. Plato is the first to offer a formulation of art as an organic form (*Phaedrus*) in relation to literary works of art. Samuel T. Coleridge (1772–1834) turns to organic form in his

defense of Shakespeare's works against the claim that they are formless. He emphasizes the harmony required in such works, not only between parts but also between matter and form. George E. Moore (1873–1958) adds that the value of an organic whole is different from the sum of its parts (*Principia Ethica*, 1903). Harold Osborne (1905–1987) defines aesthetic order in terms of an organic whole that cannot be reduced to its parts and is, therefore, directly apprehended as a whole. Beauty is an emergent property of a whole that reflects upon the parts, although each of the parts on its own is aesthetically neutral (1982). Heinrich Wölfflin (1864–1945), an influential art historian, describes good art as an organism in which nothing could be changed or moved from its place, but in which all must be as it is (*Principles of Art History*, 1915). Ruth Lorand, however, argues that the concept of an organic whole ignores, in most of its variants, the quantitative aspect of beauty. Some objects are more beautiful than others, and absolute beauty of the kind described by Wölfflin and others is hardly ever found. Aesthetic order, according to Lorand, is quantitative, highly informative, unpredictable, and, paradoxically, an order without laws (2000).

Beauty as a kind of pleasure. The immediate connection between beauty and feeling, and the difficulties inherent in defining beauty as a quality of the object, have given rise to the idea that beauty is not a quality of the object, but rather an emotion evoked by the object. St. Augustine asks whether an object is beautiful because it pleases or pleases because it is beautiful, and answers that the object pleases because it is beautiful. That is, beauty is the cause of pleasure and not identical with it (*De vera religione*). By contrast, Thomas Aquinas does not separate beauty from pleasure; he calls that beautiful whose apprehension pleases us. The definition of beauty as an expression of emotion usually renders judgments of beauty individual and subjective. René Descartes (1596–1650) regards beauty as totally subjective and dependent on individual conditions (letter to Marin Mersenne, 1630). Baruch Spinoza (1632–1677) dismisses beauty as mere sensual content. He mocks those who believe that beauty is objective, and that God, too, finds delight in beautiful things. (*Ethics*, I, appendix, 1667).

Empiricists of the eighteenth century, however, regarded this subjective aspect of beauty as an informative indication of human nature. Taste, the capacity for appreciating beauty, became a key concept. Francis Hutcheson (1694–1746) defines beauty as a source of pleasure that indicates not only qualities found in the object, but also the character of the spectator's sense of beauty (*Inquiry into the Original of Our Ideas of Beauty and Virtue*, 1725). Joseph Addison (1672–1719) writes that perhaps there is no real beauty, only certain modifications of matter that the mind pronounces beautiful (*The Spectator*, 1712). In his *Essays on the Intellectual Powers of Man* (1785), Thomas Reid (1710–1796) describes beauty as an occult quality: we know how it affects our senses, but not what it is in itself. According to Edmund Burke (1729–1797), beauty is the quality that causes love or passion and is not an objective quality like proportion (*A Philosophical Enquiry into the Origin of Our Ideas on the Sublime and Beautiful*, 1757). Archibald

Alison (1757–1839) goes further, arguing that it is impossible to imagine an object of taste that is not an object of emotion (*Essays on the Nature and Principles of Taste*, 1790).

David Hume (1711–1776) writes in the same spirit that Euclid did not mention the beauty of the circle in any of the relevant propositions because beauty belongs to the sentiment of the spectator and is not a quality of the circle (*Enquiry Concerning the Principles of Morals*, 1751). He defines beauty as an expression of a subjective order that reflects our nature, customs, or capricious inclinations (*A Treatise of Human Nature*, 1739). In his influential essay *Of the Standard of Taste* (1757), Hume observes that different spectators equally praising the beauty of the same object does not necessarily indicate that they refer to the same features, or that they find delight for the same reasons.

Immanuel Kant (1724–1804), regarded as the most influential figure in modern philosophy, sought to bridge the gap between rationalism and empiricism. His account of beauty in *Critique of Judgment* (1790) is the first systematic analysis of the aesthetic phenomenon in modern philosophy. Kant rejects Baumgarten's vision of aesthetics as a science and holds that genuine judgments of beauty do not convey knowledge; they are individual judgments that cannot be generalized. Like Burke, he distinguishes between the beautiful and the sublime: Beauty

Illustration from *Beauty and the Beast* (1874) by Walter Crane. Freud believed that humans found beauty in that which inspired sexual feelings. Darwin concurred with this theory, claiming that beauty played a role in the courting habits of many diverse cultures. © HISTORICAL PICTURE ARCHIVE/CORBIS

pleases through the free play of imagination and understanding and sustains the mind in restful contemplation. The sublime presents a disharmony between sensual capacities and reason. Thus, the feeling of the sublime carries with it a mental agitation: it is a pleasure compounded with displeasure. Kant defines beauty in terms of a peculiar kind of pleasure that consists in paradoxical features. He formulates four elements of the pleasure evoked by beauty: (1) Unlike the pleasures of the good and the pleasant, the pleasure of the beautiful is devoid of all interest. It is a disinterested pleasure. (2) Unlike other pleasures, the pleasure of the beautiful is not based on concepts. It is a non-conceptual pleasure. (3) The pleasure of the beautiful is a form of purposiveness without the presentation of a purpose. That is, the beautiful object demonstrates an inner order that is not subordinated to any external purpose. (4) The pleasure of the beautiful raises expectations for universal agreement. It is cognized as the object of a necessary liking. The necessity of universal assent that we associate with judgment of taste is a subjective necessity that we present as objective by presupposing a common sense. Kant, therefore, defines beauty as subjective-objective.

Many authors after Kant, however, preferred to deny the objective aspect of beauty and defined it as essentially subjective. Edgar Allan Poe (1809–1849) writes in *The Philosophy of Composition* (1846) that when men speak of beauty, they do not mean a quality but an affect—an intense and pure elevation of the soul. George Santayana (1863–1952) follows Hume by stating that beauty is not a property of an object. It is an emotion, a pleasure that is erroneously regarded as a quality of the object, such as color, proportion, or size. In this view, beauty is a value that reflects the beholder's position, and therefore is

entirely subjective. The tendency to relate beauty to objects and expect other people to experience the same beauty is, according to Santayana, a strange psychological phenomenon that calls for psychological investigation (*The Sense of Beauty*, 1896).

However, not all of those who explain beauty in terms of pleasure consider it subjective. Clarence I. Lewis (1883–1964), for instance, regards all evaluations, including aesthetic evaluation, as forms of empirical knowledge. In *An Analysis of Knowledge and Valuation* (1946), he states that all forms of empirical knowledge are relational—that is, they depend equally on both the qualities of the object in question and the contribution of the contemplating mind. Viewing beauty as a relational quality bypasses the subjective-objective conflict and draws similarities between perception of beauty and relational perception of other qualities. Samuel Alexander (1859–1938) maintains that beauty is a kind of illusion that depends on the viewer's perspective. The perceived beauty is a result of a mutual contribution of the genuine qualities of the object as well as the mind that apprehends it (*Space, Time and Deity*, 1920).

John Locke (1632–1704) differentiates between objective and relational qualities. The former are primary qualities independent of the spectator's apprehension; the latter are secondary and tertiary qualities that reflect sensual perceptions and emotional reactions (*An Essay Concerning Human Understanding*, 1690). Following this understanding, David W. Prall (1886–1940) maintains that beauty is constituted in pleasurable apprehension and is therefore a tertiary quality that reflects the spectator's reaction to the object's qualities (*Aesthetic Judgment*, 1929). Beauty, as a tertiary quality, is most sensitive to individual differences

among spectators. Individuality is also central in Mary Mothersill's definition of beauty. According to Mothersill, an object is beautiful if it causes pleasure by virtue of its aesthetic properties. Aesthetic properties are the properties that define the individuality of the object and distinguish it from others. The measure of beauty, so Mothersill holds, demands a reliable affect theory, since the measure of beauty is in fact the measure of the emotion it causes (1983).

Opposites of beauty. Examining the opposites of beauty illuminates the nature of beauty from a different angle. Although ugliness seems to be the immediate opposite of beauty, the complexity and peculiarity of the concept generates more than one opposite, each contrasting beauty in a different way.

The ugly. George E. Moore defines beauty in terms of the good—that of which the admiring contemplation is good in itself—and, accordingly, ugliness in terms of evil—that of which the admiring contemplation is evil in itself (1903). Understanding beauty in terms of order renders ugliness as a form of disorder. Rudolf Arnheim defines it as a struggle of conflicting, uncoordinated orders (1966). Conflicts express trends and values and therefore ugliness, like beauty, is a matter of cultural conceptions. For example, in the 1939 film *Gone with the Wind*, hair dyed shocking red is associated with prostitution and is thus considered ugly; it created a conflict with the prevailing standards of decency. Contemporary Western notions of decency are different; as a result, the sight of colored hair is no longer shocking or perceived as irregular, as it used to be.

The boring. Boredom indicates a failure to maintain a sufficient degree of novelty or a failure to deal with materials that interest the observer. This may partly explain the phenomenon of fashion: an oft-repeated style gradually loses its charm and fails to evoke the pleasure it generated before. When set in opposition to beauty, boredom indicates that beauty is stimulating as long as it maintains some degree of novelty.

The insignificant. An insignificant object, even if well-crafted, may be cute, pretty, lovely, or decorative, but not startlingly beautiful. The boring is not equivalent to the insignificant. We may be bored by something we hold significant and be attracted by trivial, insignificant objects.

The meaningless. A meaningless object is neither beautiful nor ugly. A meaningless object cannot be beautiful, since one cannot grasp any integration of its parts or be moved by it. A person who is unable to recognize the category within which the particular object falls (and is unable to make sense of it) is unable to appreciate its beauty.

Kitsch. Kitsch consists of beautiful elements, but it is not beautiful in a strict sense. Thomas Kulka holds that a prerequisite of kitsch is that it should employ familiar and well-tested elements that evoke positive responses (1988). Kitsch uses images—such as a bouquet of red roses or a red-roofed hut on the edge of a breathtaking lake—that appeal to many in order to manipulate sentiments and desires for commercial or political purposes. Kitsch is not a failure to create good art; it is, rather, a form of deception that requires “know-how.” Seeing kitsch in opposition to beauty suggests that the genuine experience

Portrait of a Young Man (1487) by Sandro Botticelli. Tempera on panel. Theories about the relationship between art and beauty have varied throughout time. Plato saw art as a deception that was a separate concept from beauty, while many contemporary philosophers considered art itself to be beautiful. © NATIONAL GALLERY COLLECTION. of beauty is sincere, and that it is not constituted by well-tested effective formulae.

The Function of Beauty

According to Kant, beauty has no function beyond the pleasure it generates. As much as this view influenced philosophical discourse, it did not satisfy natural scientists and social and cultural researchers.

Beauty and sexual selection. Charles Darwin (1809–1882) sought to answer the question: how has natural beauty been acquired and what is its purpose? He rejects the idea that beauty in nature is a merely arbitrary outcome of physical forces. Darwin believed that the beautiful colors and diversified patterns we see in butterflies, moths, fish, birds, and other creatures must be beneficial in some way. In *The Descent of Man and Selection in Relation to Sex* (1871), he presents the theory that beauty is a result of accumulative sexual selection. Studying mating rituals among various species, Darwin concludes that the animals' splendid decorations, their pomp and display, could not be inconsequential, and that it is impossible to doubt that the female admires the beauty of her male

partner. This contrasts with the traditional view expressed by Burke (1767) that beauty is feminine, while the sublime is masculine.

Kant states that only humans are capable of appreciating beauty. Darwin insists that the origin of the ability to notice beauty (and appreciate it as such) is the same for animals and humans. Yet he agrees that humans' perception of beauty is far more complex than that of animals and involves cultural values and traditions. He examined courting customs in different cultures and confirmed that beauty plays an equally central role in choosing mates, in spite of cultural differences.

Sigmund Freud (1856–1939) concurs with Darwin as to the origin and role of beauty in human life. In *Civilization and Its Discontents* (1930), Freud asserts that there is no doubt that beauty originates in sexual feelings, and that all forms of pleasure are related to sexual love. According to Darwin and Freud, the function of beauty is universal, but the variety of its manifestations coheres with cultural relativism. Tattoos serve as a beautifying means in one culture and are condemned in another. The Makalalo women used to pierce their upper lips and place a ring in it. Piercing, until recently regarded as esoteric in Western culture, is now commonplace in Western society. Facial hair (beard or mustache) is thought to enhance masculine beauty in Western culture. While the American Indians considered facial hair vulgar, they appreciated long hair for men. However, the passion for beauty and the readiness to suffer to achieve it are similar in all cultures.

Naomi Wolf, an active feminist, denies that this is true. She rejects the idea that beauty answers genuine, universal needs. Beauty, according to Wolf, is a myth created during the industrial revolution and used ever since by men to manipulate women for their own interest. Beauty, she holds, is not universal and is not a function of evolution. The readiness of women to suffer in order to achieve the false ideal of beauty indicates the dominance of men and confirms male manipulation. Thus, according to Wolf, the female suffering for beauty is not a genuine product of evolutionary forces (1991). Camille Paglia criticizes this kind of feminist approach for concentrating on images of beauty of the last century and for failing to encompass a broad historical view. Paglia places the origin of beauty in ancient Egypt (1991).

In contrast to Wolf's position, Nancy Etkoff argues that beauty is a powerful and genuine element in everyday life. She agrees with Darwin that beauty influences sexual choice, but she goes on to argue that it influences all aspects of life from early childhood on. Beauty is not the result of political or economical manipulation, but rather the other way around: due to its strong impact, beauty is used as a means of achieving political and economic ends. Beauty, according to Etkoff, is not a product of a certain period in history; its origin, rather, lies in human nature itself (1999).

Beauty and art. Art was traditionally considered a source of beauty; some even argued that natural beauty is subordinated to artistic beauty. Plato, however, separated art and beauty into two independent concepts: real beauty reflects truth, while art is a deceiving imitation of nature. Aristotle, by

contrast, held that good art is beautiful and that, therefore, the two are inseparable: a good work of art is a beautiful work. The Aristotelian aesthetic tradition prevailed for centuries, but it was the eighteenth century that gave rise to the idea that creating beauty is the essential purpose of art.

Kant holds that good art is beautiful, although it differs significantly from natural beauty: a good work of art is a beautiful representation. A representation can be beautiful even if its subject matter is not beautiful. Georg Wilhelm Friedrich Hegel (1770–1831) argues that beauty is the essential feature of art, and natural beauty is a reflection of artistic beauty (*Aesthetics*, 1835). In this view, beauty reflects intentional creation, not incidental results of blind, natural forces. The poet Friedrich von Schiller (1759–1805) associates art with freedom and beauty: we arrive at freedom through artistic beauty, since it is a product of intentional, free choice (*Letters on the Aesthetic Education of Man*, 1795). The comparison between artistic and natural beauty led Oscar Wilde (1854–1900) to the observation that life and nature imitate art far more than art imitates life or nature. Art is the creation of beauty; life and nature constitute its raw materials (*The Decay of Lying*, 1894). Benedetto Croce (1866–1952) similarly states that the sense of natural beauty is a derivative of artistic beauty. Beauty of nature cannot be explained unless one regards it as the work of a divine creator. Beauty, according to Croce, is a synonym of intuition and expression, and these refer to the artistic form. The content of the work is beautiful only when wrought into form.

Robin G. Collingwood (1889–1943) defines art as an attempt to achieve beauty (*Outlines of a Philosophy of Art*, 1925). However, his viewpoint did not gain influence in the twentieth century. The prevailing analytical trend preferred, it would seem, clear-cut, definable notions and has not been conducive to the study of the paradoxical nature of beauty, its ambiguous logical status, and the endless disputes over matters of taste. Thus, beauty has been dismissed as a vague and insignificant concept and considered irrelevant to art. Ludwig Wittgenstein (1889–1951) remarks in this analytical vein that beauty is an odd word that is hardly ever used (*Lectures and Conversations on Aesthetics*, 1938). John A. Passmore states that there is something suspicious about the notion of beauty, and that artists seem to get along quite well without it. He associates beauty with kitsch and bourgeois art (1954).

The association of beauty with superficiality and tranquil bourgeois life stood in contrast to the revolutionary spirit of modern art and the general atmosphere between the two world wars and after. Detaching beauty from art became common practice. According to Curt J. Ducasse (1881–1969), there is no essential connection between art and beauty. Art is an attempt to express feelings, and artists may intend to create or express ugliness in their work (*The Philosophy of Art*, 1966). Nelson Goodman (1906–1998) argued that many of the best paintings are, in the most obvious sense, ugly. Beauty, according to Goodman, is a vague and deceptive concept, while art is a kind of language that has no essential bond with beauty (*Languages of Art*, 1968). The influential and much-discussed institutional definition of art presented by George Dickie (1974) similarly bypasses the notion of beauty.

Mary Mothersill strongly criticizes the wide neglect of beauty and its detachment from art. She argues that the idea of beauty is indispensable and taken for granted in art criticism, because although critics do not explicitly refer to beauty, the idea is implicit in their criticism (1984). Mothersill's analysis of beauty reflects a change in approach. By the turn of the century we witness the growth of a renewed interest in various aspects of beauty. Wilfried Van Damme examines the anthropological perspective of beauty (1996). Eddy M. Zemach defends the objectivity of aesthetic properties and their empirical testability (1997). James Kirwan studies the history of the concept in order to illuminate the experience of beauty (1999). Peg Zeglin Brand examines the role and significance of beauty in social life and in relation to gender (2000). Lorand offers a theory of aesthetic order that revives the connection between beauty and art (2000), and Nick Zangwill rethinks the metaphysics of beauty (2001). These and other contemporary studies confirm that beauty is central to human experience in spite of its neglect in the discourse of the last century. The genuine vitality of beauty is bound to intrigue the reflective mind and inspire further investigations of its nature.

BEHAVIORISM. Behaviorism is a theoretical approach in psychology that emphasizes the study of behavior—that is, the outwardly observable reactions to a stimulus of an organism, whether animal or human—rather than the content of the mind or the physiological correlates of behavior. Largely centered in the United States, behaviorism had an early stage (1910–1930) that was dominated by the work of the comparative psychologist John B. Watson, and a later stage, neo-behaviorism (1930–1955), defined by the psychologists Edward C. Tolman, Clark Hull, and B. F. Skinner.

Behaviorism has its roots in the work of Ivan Pavlov (1849–1936), a Russian physiologist who studied medicine in St. Petersburg and physiology at the University of Breslau in Germany. Pavlov designed a series of experiments to understand learning, a psychological process, in terms of the physiological process of conditioning, or training, reflex responses. His experimental animal of choice was the dog, though he expected that his results could apply to humans as well. Dogs normally display a salivation reflex at the sight of food. Pavlov's experiment involved ringing a bell at the same moment that the dog was presented with food. After presenting both stimuli in this joint manner, Pavlov simply rang the bell without also presenting the food—and found that the dog salivated. The normal reflex had been conditioned to appear in response to an unconventional stimulus. An organism's innate responses could thus be trained by this conditioning method to be elicited by a range of stimuli that did not normally produce them, and Pavlov used the method to examine the ways in which responses could be excited and inhibited. The method of conditioning reflexes could, according to Pavlov, replace a mentalistic language about what animals see or hear or feel with a physicalistic, materialist language about responses to stimuli. The conditioning method focused on outward, objective observation of animal behavior, rather than on guessing about the content of an animal's mind. In Pavlov's interpretation, seemingly purposeful behavior on the part of the animal could be reduced to the training of reflexes, or the formation and breaking of habits. Such a view bears a strong similarity to that of the behaviorists who followed, but in an important respect Pavlov differed from them. He never abandoned the idea that he was basically a physiologist and that there could be no science of psychology independent of physiology. Pavlov intended that the acts comprising an animal's behavior should eventually be explained in terms of the workings of its brain. He had no patience with the American behaviorists' belief that behavior formed its own autonomous branch of scientific study.

Pavlov, whose views formed the foundation of Behaviorism, believed that learning consisted of a series of conditioned responses. His experimental animal of choice was the dog, though he expected that his results could apply to humans as well. © BETTMANN/CORBIS

Behaviorism (1910–1930)

Pavlov's experiments in classical conditioning were familiar to Western psychologists from 1906 on and formed the heart of the behaviorist method. In 1913 John B. Watson (1878–1958) systematically and provocatively set out the principles of behaviorism in a manifesto entitled "Psychology As the Behaviorist Views It." Watson was a comparative psychologist interested in making psychology a real science by defining it as the study of outwardly observable behavior, rather than of thought, imagery, consciousness, or mind. In doing so he intended to break psychology's ties with philosophy. As a comparative psychologist with interests also in developmental psychology—the study of how the mind develops in childhood, as well as over the course of evolution—Watson knew that the conventional psychological method of introspection was inapplicable to the subjects of his science. Children and animals could not be asked to introspect, to divulge the contents of their minds, and guessing at what they were thinking Watson judged to be unscientific. Focusing instead on behavior rather than on consciousness was therefore the only way to proceed. Watson also had a practical motivation for his behaviorism—he wanted to make it the science of how people act.

Watson was born in Greenville, South Carolina. He attended college at Furman University and graduate school in the department of philosophy at the University of Chicago, where he was trained in comparative psychology by the neurologist Henry Herbert Donaldson and the psychologist James Rowland Angell. Watson was interested in the work of Jacques

Loeb (1859–1924), a German-trained materialist physiologist at Chicago who studied tropisms, or movements in plants and animals, that he interpreted in solely physico-chemical terms. Donaldson and Angell, however, dissuaded Watson from working with the radical Loeb, and Watson instead wrote his dissertation on the correlation between brain growth and learning ability in rats.

In 1908 Watson became professor of psychology at the Johns Hopkins University, but as a comparative psychologist felt marginalized in the department. In his 1913 manifesto he devised a way to bring comparative psychology to center stage. A truly scientific psychology, he wrote, would abandon talk of mental states or conscious content of minds and instead focus on prediction and control of behavior. By focusing on objectively observable behavior, by getting away from mind, consciousness, and introspection and examining physical variables instead, psychology would become a legitimate science. Like Pavlov, Watson believed in observing and training physical responses to stimuli, making no reference to mind, and thereby treating animal and human behavior on the same level. In his 1919 book, *Psychology From the Standpoint of a Behaviorist*, Watson rejected the concept of mind completely, interpreting even imagery, thought, and language all in terms of behavior accessible to an objective observer.

At Johns Hopkins, Watson was associated with the psychiatrist Adolf Meyer, the head of the Phipps Clinic, where Watson applied behaviorist conditioning methods to children. In a famous series of experiments conducted with his gradu-

ate assistant Rosalie Rayner, Watson trained a child by the name of Little Albert (aged 9–13 months) to fear a rat, a response the child then produced in reaction to the sight of any furry creature. Watson's evident success in training even such a deep-seated reaction as fear led him to believe that all of a person's behavior could be altered, any habit could be formed or broken, by the engineering of stimuli—that is, by the control of the person's immediate environment. In his 1924 book *Behaviorism* Watson expressed this environmentalist view in its most extreme terms. But by then Watson had been forced to resign his position at Hopkins because of his involvement in an extramarital love affair with Rayner. He and Rayner moved to New York City, where Watson joined the John Walter Thompson advertising agency, and where both Watson and Rayner became popular authorities on child-rearing according to behaviorist principles. Their *Psychological Care of Infant and Child* appeared in 1928.

Watson was not the only psychologist during the 1910s to advocate behaviorism. At Columbia University Teachers College, Edward L. Thorndike (1874–1949), experimenting with cats learning their way around puzzle-boxes, similarly argued that the study of objectively observable changes in behavior, and their correlation with changes in stimuli, formed the heart of a legitimately scientific psychology. Thorndike formulated the law of effect, which held that pleasure or reward will reinforce a certain behavior, while pain will extinguish it: thus the animal's experience has important consequences for its behavior.

Neobehaviorism (1930–1955)

The second phase of behaviorism, neobehaviorism, was associated with Edward C. Tolman (1886–1959), Clark Hull (1884–1952), and B. F. Skinner (1904–1990). Like Thorndike, Watson, and Pavlov, the neobehaviorists believed that the study of learning and a focus on rigorously objective observational methods were the keys to a scientific psychology. Unlike their predecessors, however, the neobehaviorists were more self-consciously trying to formalize the laws of behavior. They were also influenced by the Vienna Circle of logical positivists, a group of philosophers led by Rudolph Carnap (1891–1970), Otto Neurath (1882–1945), and Herbert Feigl (1902–1988), who argued that meaningful statements about the world had to be cast as statements about physical observations. Anything else was metaphysics or nonsense, not science, and had to be rejected. Knowledge, according to the logical positivists, had to be built on an observational base, and could be verified to the extent that it was in keeping with observation.

A professor of psychology at the University of California at Berkeley, Tolman focused his experimental work largely on white rats learning their way through mazes. He differed from his behaviorist predecessors by taking a more holistic approach to behavior than they had. Rather than talking in terms of atomistic, isolated stimuli and responses, Tolman emphasized their integration with the environment by referring to them as “stimulating agencies” and “behavior acts.” In his 1932 *Purposeful Behavior in Animals and Men*, Tolman argued that purpose and cognition were essential to behavior and should be

Yvonne Skinner and daughter with experimental psychologist B. F. Skinner's invention, the “baby box,” 1945. The “baby box” was a glassed-in playpen in which temperature and humidity were automatically controlled. Skinner's youngest daughter spent her infancy in one. Controversial and misunderstood by the general public, the box was intended by Skinner to serve in the same capacity as a crib, but with an enhanced environment to keep a child safe and healthy. © BETTMANN/CORBIS

interpreted not as mentalistic entities but as outwardly observable features of behavior describable in objective language. He also defined the notion of the intervening variable, a link between stimulus and response that helps to determine behavior. As many as ten intervening variables could exist between a stimulating agency and a rat's decision to move in a certain direction at a choice-point in a maze.

Of the three neobehaviorists, Hull was the most ambitious about constructing a formal theory of behavior. He believed he had found the fundamental law of learning or habit-formation—the law of stimulus generalization—and that this law not only underlay all behavior in animals and humans, but was a principle basic enough to unify all the social sciences. According to the law, a response could be called forth by an unconventional stimulus as long as that stimulus was associated, either temporally or in character, with the stimulus that usually called forth the response. As long as the unconventional stimulus was similar enough to the usual one, it could elicit the response. Pavlov had noted this effect when his dogs salivated at the ringing of a bell. Hull further theorized that learning was continuous—that is, when an animal was trained to respond to a particular positive stimulus (or avoid a negative stimulus), all aspects of that stimulus impinging on the animal's sensorium were gradually associated with that response. Thus the animal learns in an incremental way, not in an all-or-nothing burst, and thus engineering the appearance of stimuli could precisely control the animal's ability to form habits. These laws of behavior explained how all learning took place without resorting to immaterial notions like soul or free will. Hull, who had originally intended to become an engineer, even designed a variety of machines that worked on the principles of conditioning reflexes, in order to demonstrate

that learning was a wholly mechanistic process. He expressed his laws of behavior in mathematical terms, filling his 1943 *Principles of Behavior: An Introduction to Behavior Theory* with complex equations.

The rigor for which Hull strove in his science was evident both in his exclusion of any nonmaterial entity and in his formulation of laws. It was also evident in the hypothetico-deductive method by which he believed psychologists must work. Here Hull's inspiration was the certainty of scientific knowledge achieved by the natural philosopher Isaac Newton (1642–1727). In Hull's method, the theorist began with the observation of a certain behavior, derived axioms from that observation, deduced consequences from the axioms, tested the consequences through experiment, and then refined the axioms, ultimately establishing the laws of behavior on a firm observational and experimental footing. In 1929 Hull moved from his teaching position at the University of Wisconsin at Madison to a prestigious post at the Rockefeller Foundation–funded Institute of Human Relations at Yale, where he remained until his death in 1952. Hull's laws of behavior and his rigorous scientific method became central to the Institute's mission to unify the social sciences. Hull's theory of behavior integrated psychology, psychiatry, sociology, and anthropology by describing learning as the forging of connections between stimulus and response, and then envisioning this mechanism as the mediator of all social and cultural activity. The build-up and breakdown of habit was thus interpreted as the key to all behavior. Hull and his work formed the focal points of the Institute of Human Relations, which lasted only as long as Hull lived and was dissolved after his death. His approach was, however, continued by his friend and supporter Kenneth Spence (1907–1967), a psychologist at the University of Iowa.

The Harvard psychologist B. F. Skinner, the third of the important neobehaviorists, rejected Hull's attempts at formal theory building and returned to the Watsonian project of founding a science entirely on the observation of behavior. Skinner devised an experimental set-up, the so-called Skinner box, in which a pigeon or a rat would be rewarded for accomplishing an act, such as raising its head above a certain line, or pressing a lever, by the release of food pellets. In his 1938 *Behavior of Organisms*, Skinner explained that a movement rewarded in this way was reinforced—that is, made more likely to occur—while one that was punished was stamped out. A behavior that was followed by the repetition of that behavior—a movement selected and maintained by its positive consequences—Skinner called the operant. His approach therefore was referred to as operant conditioning. Both animals and people behave the way they do because of the positive consequences produced by past behavior. For Skinner, all learning was a matter of such reinforcement, and his method consisted of recording sequences of movements that revealed the patterns by which behavior was reinforced. He avoided talking about habit formation, and even about stimuli, restricting his science to the observation of these movement patterns.

In his 1953 *Science and Human Behavior*, Skinner explained the principles that underlay his psychology. First, he argued that his science was entirely based in observation, and that theories

and hypotheses played a limited role in it: his approach was radically inductivist and empiricist. Second, since psychology was supposed to be restricted to the level of behavioral observation, it had no need of being reduced to or explained in terms of physiology. Physiology was not more fundamental than psychology—it was either unobservable, hence unscientific, or part of behavior itself. Third, for Skinner, mental processes or states were to be interpreted as behavior—memory, knowledge, imagery, and other such mentalistic entities he dismissed as metaphors or fictions. Past consequences of behavior, not mental states, motivated future action. Skinner's 1957 *Verbal Behavior* was his attempt to deal with thought and language in terms of reinforced movements. Finally, Skinner believed that biological adaptation was the ultimate criterion for the persistence of a behavior: if an action aided survival, it persisted.

Skinner argued that behavior could be shaped, or controlled, by controlling the rewards or reinforcements meted out in response to them—that is, by controlling the environment. In the mid 1950s and 1960s, some penal and psychiatric institutions adopted this method of behavior modification to shape the behavior of their inmates. In his 1948 book *Walden Two*, Skinner had prepared the ground for such application of his science by imagining a utopian community led according to behaviorist principles. In his 1971 *Beyond Freedom and Dignity*, Skinner argued that such ethical principles as free will and individual responsibility are simply illusions, and what will make us truly free is the realization that behavior is instead controlled by the past and by the environment.

Neobehaviorism came in for strong criticism in the late 1950s and 1960s. Philosophers of science questioned the claim that any science could be theory-neutral and based solely in observation; observations were themselves seen to be theory-laden. Psychologists questioned the idea that learning was a singular entity that could form the basis for all of psychology. In particular, cognitive psychology, drawing on insights from computer science, redefined mental processes such as problem solving, learning, and memory in terms of information processing, a development that gave a new autonomy and a new respectability to the study of internal mental states. Influenced by this cognitivist turn, the psycholinguist Noam Chomsky (b. 1928) published a scathing review of Skinner's *Verbal Behavior*, arguing that language had to be understood in terms of universal and innate mental structures, not as behavior shaped by the environment. Behaviorism is currently regarded by psychologists as one approach among many; both cognitivism and neuroscience are arguably as influential in understanding mind and behavior.

BILINGUALISM AND MULTILINGUALISM. A bilingual individual, generally, is someone who speaks two languages. An ideal or balanced bilingual speaks each language as proficiently as an educated native speaker. This is often referred to as an ideal type since few people are regarded as being able to reach this standard. Otherwise, a bilingual may be anywhere on a continuum of skills.

Literacy abilities may be an additional dimension to bilingualism, but they are often referred to separately as *biliteracy*, leaving *bilingualism* to carry the weight of oral language abilities. Bilingualism is a specific case of multilingualism, which has no ceiling on the number of languages a speaker may dominate. The timing and sequence in which one learns each of the languages has led to other distinctions between kinds of multilingualism. Much of the linguistics literature, for example, identifies native language or mother tongue as a first language, ignoring the possibility or diminishing the value of having more than one native language or mother tongue. Such a person is often referred to as a simultaneous bilingual, while someone who acquires the second language after the first one is often referred to as a sequential bilingual ("early" if between early childhood and puberty, and "late" if after puberty). The context of

language acquisition leads naturally to distinguishing between "informal" bilinguals, who acquire their languages outside of formal settings like schools, imitating the natural processes of acquiring the mother tongue, and "formal" bilinguals, who generally learn the language in schools or similar settings.

When these terms apply to groups, one speaks of bilingual or multilingual communities or nations. The aggregate enumeration of the speakers in these groups (also referred to as language diversity or demography) will often profile the number of monolingual and bilingual speakers of each language. For example, there may be a multilingual community in which speakers are monolingual in each of three languages. This would be rare, and the language groups would probably be isolated from each other. More often than not, a multilingual community or nation has multilingual individuals. If the situation involves social or political power, then a language group may be referred to as a language minority (minority-language) group or a language majority (majority-language) group, reflecting the power relationship to other groups in the society or political unit.

Language Diversity

The linguistic diversity of the world has depended on the world population and the number of languages in the world. The world population grew from about 300 million at the time of Christ to an estimated 1 billion in 1804, 2 billion in 1927, and 6 billion at the end of 1999, and is projected to reach 10 billion around 2183. In 1950 there were only four countries with a national population greater than 100 million persons. In 2003 the number of such countries had grown to eleven. The United Nations projects that in 2050 such countries will number eighteen. India, China, and the United States were the top three countries at each of these points in time.

The twentieth century was the highest growth period in the history of humanity, almost quadrupling the world population. The highest rate of growth occurred between 1965 and 1970 (2 percent per annum), and the largest annual increases in population occurred in the late 1980s, with 86 million people added to the world population annually.

One should keep in mind as well that the distribution of the population and its languages around the world is uneven, have changed over time, and are expected to continue such changes, at least into the near future. In 1750, for example, 64 percent of the estimated world population was located in Asia, while 21 percent was in Europe, 13 percent in Africa, and 2 percent in the Americas. By 1950, Asia had lost almost 10 percentage points and Africa about 4 percent; Europe remained steady at 22 percent, but the Americas grew to 14 percent of the total equally between the northern and southern countries. The United Nations Population Division projects that in 2150, Europe and North America will shrink in percentage from 22 percent to 7 percent and from 7 percent to 4 percent, respectively; Asia will remain steady at 60 percent, but Africa will more than double its proportion from 9 percent to 24 percent, and Latin America will increase slightly its portion of the world population from 7 percent to 9 percent. These changing distributions of the human population across

Spanish	Spain	43	322–358
Bengali	Bangladesh	9	207
Arabic			207
Portuguese	Portugal	33	176
Russian	Russia	30	167
Japanese	Japan	26	125
German	Germany	40	100

SOURCE: Data from McGeveran, pp. 626–627

the world have had and will continue to have an impact on the numbers of speakers of specific languages in those regions, and urbanism and migrations will increase the probability of language contact between speakers of different languages. By the middle of the twentieth century, more than half of the world’s population was considered urban. By the end of the twentieth century, about 4 percent of the world’s population did not live in their country of birth.

The world’s language diversity is only now being better understood and described. The sources of estimating the number of languages in the world vary in the quality of their data and methods, not the least of which is their varying definitions of language. Some authors estimate that somewhere between 30,000 and 500,000 languages have been created and died in the course of human history, indicating that languages usually have a short life span as well as a very high death rate. Only a few (such as Basque, Egyptian, Chinese, Greek, Hebrew, Latin, Persian, Sanskrit, and Tamil) have lasted more than two thousand years.

One of the more widely cited and consistent sources on the number of languages and speakers of those languages estimates that there were approximately 6,800 oral languages in the world at the beginning of the twenty-first century. Some experts argue that the inclusion of manually signed languages would increase the estimate to 12,000 human languages. Chinese Mandarin, English, Hindi, Spanish, and Arabic have been identified as the languages with the greatest number of native speakers in the world in 2000 (see Table 1).

More often than not, the enumeration of speakers through government or organizational surveys only takes into account a single language per person, despite the normative multilingualism around the world. This current multilingualism has been promoted by the greater language contact of the twentieth century, in part the legacy of colonialism and the postcolonial practice of establishing new nation-states with populations that belonged to different ethno-language communities.

In many areas of the imperial colonial language (such as English, French, Spanish, Dutch) was spread as a second or

replacement language among the colonized population, albeit with a wide range in the language proficiencies of these speakers. In some instances, the number of native speakers of these colonial languages is greater outside the metropole of the colonizing nation, and even the second-language speakers of these colonial languages may be larger than the native speakers of the same language. In 1999, for example, English was estimated to have 341 million native speakers around the world and 508 million second-language speakers; Spanish was estimated to have 358 million native speakers globally and 417 million second-language speakers.

In 2000, the enumerated languages were unevenly divided across the world in the various continents. Africa had 30 percent of the oral languages but 13 percent of the world’s population; Asia had about 33 percent of the world’s languages and 61 percent of the world’s population. The Pacific Oceanic area had about 19 percent of the languages, the Americas 15 percent, and Europe had approximately 3 percent of the oral languages and about 12 percent of the world’s population. The two most linguistically diverse countries, Papua New Guinea and Indonesia, together had more than 22 percent (1,500) of the world’s oral languages, most of which are not spoken in any other country. An overwhelming 83 to 84 percent of the world’s languages are spoken in only one country.

The range in the numbers of speakers of a particular language is large, from several hundred to hundreds of millions. The median number of speakers of a language was probably around 5,000 to 6,000 at the turn of the twenty-first century. More than 95 percent of the world’s spoken languages have fewer than 1 million native users, while some 5,000 (83 percent) spoken languages have fewer than 100,000 speakers, and more than 3,000 spoken languages have fewer than 10,000 users. About 1,500 spoken languages and most of the sign languages have fewer than 1,000 users. In 1999, some 500 languages had fewer than 100 speakers.

Ranka Bjeljac-Babic proposed that no language could survive unless 100,000 people speak it, and so estimated that at the beginning of the twenty-first century, ten languages were dying each year. Michael Krause projected that 50 to 90 percent of the spoken languages would disappear during the twenty-first century. From one perspective these languages will “wither” by a “voluntary” failure to transmit the language from one generation to another. From another perspective, many of these languages are threatened and “murdered” by repressive nation-state policies and language majoritarian practices, not unlike what has been seen in the past. European colonial conquests, for example, eliminated at least 15 percent of all languages spoken at the outset of the colonial period. According to Bjeljac-Babic, “Over the last 300 years, Europe has lost a dozen [languages], and Australia has only 20 left of the 250 spoken at the outset of the colonial period. According to I, about 540 (three-quarters of the total) have died out since Portuguese colonization began in 1530” (p. 18).

These “heritage” languages will be replaced by another language, adding to the numbers of native speakers of that second language, which may be a regional language or a language

of wider communication (an international or world language). If size is a significant factor in the robustness and continuity of a language, then the growth of some of the medium-sized languages with the addition of persons who otherwise would have spoken their heritage language might retard their demise.

It is more difficult to estimate the number of new languages created during any particular period, either from the “splitting” of a natural language into mutually not understandable varieties, the transformation of pidgins (reduced-language contact speech) into elaborated creoles by the acquisition of native speakers who complexify it for all required purposes, or the revival of “dead” languages, such as Hebrew’s revival by the new state of Israel, which developed its vocabulary to reflect a modern and more complete range of functions.

Language Diversity in Civil Society

The core sense of “civil” society is generally understood as the societal interaction, organization, and activity that takes place outside of government or the state. From this standpoint, the role of language diversity in civil society has varied across time and settings. Factors such as whether a group of people or a society is primarily rural or urban, sedentary or migratory, will often influence language diversity and individual bilingualism. The social and political relations between groups often determine how it is perceived, treated, or utilized within the society as a resource, problem, or even as a part of the civil and human rights of individuals or groups.

For example, Sue Wright describes the elite in Europe for much of the Middle Ages and the Renaissance as “multicultural and multilingual” because of their need to interact and collaborate with each other despite the different native languages in the region. Acquiring other languages was seen as an expected and normal activity for these mobile elites. Most of the population, however, were sedentary farmers, serfs, or peasants, living in small, monolingual villages and having no contact with or need to learn other languages. They spoke a variety of one of the language “continua” of Romance, Germanic, Celtic, Slavic, or Baltic. The dominant Christian Church operated across kingdoms and “nations” with a common language of wider communication—Latin. In general, villagers attempted to accommodate “others” who did not speak the village language, who were often travelers or soldiers, but otherwise people understood each other from one village to the next, even if their vernaculars were slightly different.

According to Eduardo Ruiz Vietez, three activities caused changes in this situation: the consolidation of national kingdoms, the reformation of the church, and the development of the printing press. The consolidation of kingdoms into more fixed territories meant that the royals governed a multilingual population at the same time that the vernacular language of the capital was promoted as a standard. The first grammar of such a vernacular was presented to the king and queen of Castille, Spain, in 1492, as an instrument of nation building along with the sword and the Bible. The Reformation promoted the translation of the Bible into vernacular languages, establishing a need for literacy and standardization of the text in various lan-

guages. Wright describes the emerging relationship between language and the printing press: “Printers adopted standardized languages with enthusiasm. Print capitalism profited from the standardisation of national languages, because the process delivered bigger markets than the splintered linguistic landscape of the dialect continua” (p. 2).

By the eighteenth and nineteenth centuries in Europe, *nation* was understood in civic terms and in ethnic or cultural terms. Within the civic, fixed territorial states, nation-building pressure was placed on disparate groups. Within the ethnic states, the boundaries were fixed around the single group, with other ethnolinguistic groups often pushed out. Single-language standardization and its association with the state developed a single concept of the nation as a single, unified cultural body, even while in reality, many of these nations contained regional, historically rooted, language minorities (such as the Catalans or Basques), and even migratory or nomadic language groups (such as the Romani) that continue into the early twenty-first century.

For another pattern of language diversity and civil society, one can turn to the Mexican Aztec Empire during the fifteenth century. In the fourteenth and fifteenth centuries, the Aztec Empire was organized into a tributary system, where the Nahuatl language was used in the metropole and throughout the empire. In the subjugated areas of the empire, bilingual administrators, such as “tax” collectors and local governors, were the brokers in local towns and villages and would mediate the tributes and administrative interactions with the central government. Beyond these interactions, the need for Nahuatl was minimal among the local populations, who continued to use their local languages. The language of the empire was highly valued and its value provided an incentive for individual bilingualism among the population, although individual bilingualism was not widespread.

The situation changed after contact with the Spanish and, later, other Europeans. With the imposition of the Spanish colonial structures, Spanish became the “instrument” of empire building, not just nation building. It became the prestige language and was imposed through the process of evangelization and conversion. The libraries of the Aztec Empire were

Table 2. Countries by number of languages, 2000

Country	Languages	Population (2003)
Papua New Guinea	850	5,500,000
Indonesia	670	220,500,000
Nigeria	410	133,900,000
India	380	1,068,600,000
Cameroon	270	15,700,000
Australia	250	19,900,000
Mexico	240	104,900,000
Zaire (Democratic Republic of the Congo)	210	56,600,000
Brazil	210	176,500,000
Philippines	172	81,600,000

burned and destroyed by the Spanish. Religious leaders, colonial administrators, and indigenous elites, who learned each other's languages, became bilingual and brokered the creation of revised local histories and knowledge. Over time, Spanish was promoted as a single substitute for the indigenous languages, increasing its number of speakers, even while many indigenous languages survive into the early twenty-first century.

In these and other ways, communication in language-diverse settings has been promoted through bilingual brokers. Travelers, soldiers, missionaries, and immigrants often learned new languages to facilitate these communications. Certainly in language contact situations individual bilinguals in the various languages played key roles in the civic interactions between peoples. If the language situation was more complex, involving three languages, a pidgin as "common" language often arose to broker communication between groups.

In the twentieth century, the development of popular schooling in multilingual situations often was organized with bilingual or multilingual instruction. Early primary grades were often taught in the native language of the community, with the regional and/or the national languages added as the student matured. The integration of countries into regional economic, political, and civil societies, such as the European Union, has put social pressures on groups to maintain their national languages at the same time they are to learn other regional languages and some languages for wider communication, such as English. This results in the promotion of at least a trilingualism among the population.

The transnational movement of people (as immigrants, refugees, and international workers) has also created the need for learning the host country's language(s), and for addressing the language needs of their children in schools. When there are substantial numbers of speakers of these (immigrant) languages concentrated in one place over a sufficient time to establish local organizations and institutions, such as local ethnic economy or independent community mother-tongue schools, then there are other local accommodations that often follow, with and without the support of the host society and the dominant language majority.

Government Policies to Accommodate Language Diversity

Official statements or policies about language can be made by governments at any level. These official statements about language may also be made at an institutional level, such as a church, labor union, or school. In general, the statements are about the *status* of a language, designating it as an official or national language; its form or structure (*corpus*), elaborating the language lexicon, or morphology; or its *functions* or use (including domains of use), as in the media of instruction in schools.

Government or official positions regarding language policies may be designed to *promote* a language through its recognition, use, or resource allocation; to *tolerate* the language, by not making any policies with regard to it; to *restrict* it, by conditioning societal benefits, rights, or services on knowledge of

the language; or to *repress* it (sometimes referred to as *linguicide*), by actively prohibiting its use and its transmission from one generation to another. Very often these approaches or designs are influenced by whether the language is seen as a resource (promoting foreign-language learning, for example), a problem, or a right (human or civil). Language policies of promotion and repression may be justified in several ways, sometimes ideologically similar, such as by national unification. Their means, however, are drastically different. These approaches to language policies may favor single or multiple languages. India, for example, has two official languages—Hindi and English—and more than fifteen national languages, reflecting the status of other languages within the component states of the nation.

The juridical concept of human rights has developed over the last hundred-plus years. Language has often been considered an important aspect of these rights. Two international standards are developing: the right to be free from discrimination based on language, and the right to access (acquire and use) one's mother tongue and the languages of the community and state if they are different. In some countries these rights are tied to "individual" freedoms of expression and speech (as in some Western countries); in other countries, they are seen as part of the right to cultural integrity and identity (some socialist countries, for example, recognize clearly identified national minorities as nations with inherent rights and protections).

Evaluation of Language Policies

The success of language policies and planning by governments is not uniform across time and place. Neither is success measured in the same ways. Any such evaluation of language policies would need to take into account the goal, its justification, and the means to achieve it.

L. F. Bosnahan reviewed four cases of language imposition, of which three were successful in seeding and developing the imposed common language of empire—Latin during the Roman Empire, Greek during the Greek Empire, Arabic during the rise of Islam, and Turkish during the Ottoman Empire. The first three cases were successful in having the imposed language become the exclusive or principal speech of the population, replacing the preexisting vernaculars. Bosnahan cites four features he believes made this success possible, if not determinative, where all four cases shared the first two features and were differentiated by the third and fourth: (1) each language was imposed by military authority, resulting in a political unity that increased commercial, political, economic, and/or cultural contact among different sections of the united area; (2) once imposed, it was maintained for at least several centuries by similar authority, allowing the adoption and then transmission of the language across several generations and the spread across the population; (3) the area of language imposition was already multilingual, making the imposed language one for wider communication; and (4) knowledge of the imposed language conferred material advantages and benefits widely recognized among the population, including employment, citizenship and its attendant rights and privileges, acquisition or grants of land, and trade opportunities. Bosnahan identifies another characteristic to which he does not attribute

a share of the language imposition but which seems, nonetheless, important: a group that acquires the imposed language more quickly or readily than the rest of the subjugated population becomes an elite or intelligentsia that functions in the first stages of the military invasion and pacification as the interpreters and minor officials of the new authority, and subsequently as the medium through which the new language is transmitted to the subjugated general population.

One can look to other goals or situations, such as group co-existence, democratic pluralism, national integration, or the amelioration of group conflict. Each might require a different type and method of assessment. Some of these might be guided by principles of language diversity that have been borne out by research: (1) language conflict is usually related to other conflicts; (2) individual bilingualism in language contact situations is generally a normal result; (3) language conflict most often arises when one group attempts to impose its language on another; and (4) no two languages will be used by the same group of speakers for all of the same functions at the same time.

Whether there are 6,800 languages in the world, or 3,000, or less than 1,000, globalization is making the globe an ever smaller village. Communication will continue to be humanity's most important task. Addressing language diversity by encouraging individual multilingualism seems to be a continuing, viable strategy for success.

BIODIVERSITY. See **Ecology; Evolution; Nature; Wildlife.**

BIOETHICS. Bioethics as a field is relatively new, emerging only in the late 1960s, though many of the questions it addresses are as old as medicine itself. When Hippocrates wrote his now famous dictum *Primum non nocere* (First, do no harm), he was grappling with one of the core issues still facing human medicine, namely, the role and duty of the physician. With the advent of late-twentieth-century science, an academic field emerged to reflect not only on the important and age-old issues raised by the practice of medicine, but also on the ethical problems generated by rapid progress in technology and science. Forty years after the emergence of this field, bioethics now reflects the profound changes in medicine and the life sciences.

Nature and Scope of Bioethics

Against the backdrop of advances in the life sciences, the field of bioethics has a threefold mission: (1) to raise important questions about the general practice of medicine and the institutions of health care in the United States and other economically advanced nations, (2) to wrestle with the novel bioethical dilemmas constantly being generated by new biomedical technologies, and (3) to challenge the presumptions of international and population-based efforts in public health and the delivery of health care in economically underdeveloped parts of the globe. While attention to the ethical dilemmas accompanying the appearance of new technologies such as stem cell research or nanotechnology can command much

of the popular attention devoted to the field, the other missions are of equal importance.

At the core of bioethics are questions about medical professionalism, such as: What are the obligations of physicians to their patients? and What are the virtues of the “good doctor”? Bioethics explores critical issues in clinical and research medicine, including truth telling, informed consent, confidentiality, end-of-life care, conflict of interest, nonabandonment, euthanasia, substituted judgment, rationing of and access to health care, and the withdrawal and withholding of care. Only minimally affected by advances in technology and science, these core bioethical concerns remain the so-called bread-and-butter issues of the field.

The second mission of bioethics is to enable ethical reflection to keep pace with scientific and medical breakthroughs. With each new technology or medical breakthrough, the public finds itself in uncharted ethical terrain it does not know how to navigate. In the twenty-first century—what is very likely to be the “century of biology”—there will be a constant stream of moral quandaries as scientific reach exceeds ethical grasp. As a response to these monumental strides in science and technology, the scope of bioethics has expanded to include the ethical questions raised by the Human Genome Project, stem cell research, artificial reproductive technologies, the genetic engineering of plants and animals, the synthesis of new life-forms, the possibility of successful reproductive cloning, preimplantation genetic diagnosis, nanotechnology, and xenotransplantation—to name only some of the key advances.

Bioethics has also begun to engage with the challenges posed by delivering care in underdeveloped nations. Whose moral standards should govern the conduct of research to find therapies or preventive vaccines useful against malaria, HIV, or Ebola—local standards or Western principles? And to what extent is manipulation or even coercion justified in pursuing such goals as the reduction of risks to health care in children or the advancement of national security? This population-based focus raises new sorts of ethical challenges both for health care providers who seek to improve overall health indicators in populations and for researchers who are trying to conduct research against fatal diseases that are at epidemic levels in some parts of the world.

As no realm of academic or public life remains untouched by pressing bioethical issues, the field of bioethics has broadened to include representation from scholars in disciplines as diverse as philosophy, religion, medicine, law, social science, public policy, disability studies, nursing, and literature.

History of Bioethics

Bioethics as a distinct field of academic study has existed only since the early 1960s, and its history can be traced back to a cluster of scientific and cultural developments in the United States during that decade. The catalysts for the creation of this interdisciplinary field were the extraordinary advances in American medicine during this period coupled simultaneously with radical cultural changes. Organ transplantation, kidney dialysis, respirators, and intensive care units (ICUs) made pos-

sible a level of medical care never before attainable, but these breakthroughs also raised daunting ethical dilemmas the public had never previously been forced to face, such as when to initiate admission to an ICU or when treatments such as dialysis could be withdrawn. The advent of the contraceptive pill and safe techniques for performing abortions added to the ethical quandaries of the “new medicine.” At the same time, cultural changes placed a new emphasis on individual autonomy and rights, setting the stage for greater public involvement and control over medical care and treatment. Public debates about abortion, contraceptive freedom, and patient rights were gaining momentum. In response, academics began to write about these thorny issues, and scholars were beginning to view these “applied ethics” questions as the purview of philosophy and theology. “Bioethics”—or, at the time, “medical ethics”—had become a legitimate area of scholarly attention.

In its early years, the study of bioethical questions was undertaken by a handful of scholars whose academic home was traditional university departments of religion or philosophy. These scholars wrote about the problems generated by the new medicine and technologies of the time, but they were not part of a discourse community that could be called an academic field or subject area. Individual scholars, working in isolation, began to legitimize bioethical issues as questions deserving rigorous academic study. But bioethics solidified itself as a field only when it became housed in institutions dedicated to the study of these questions. Academic bioethics was born with the creation of the first “Bioethics center.”

Ironically, academic bioethics came into existence through the creation of an institution that was not part of the traditional academy. The first institution devoted to the study of bioethical questions was a freestanding bioethics center, purposely removed from the academy with its rigid demarcations of academic study. The institution was the Hastings Center, originally called The Institute of Society, Ethics and the Life Sciences, which opened its doors in September 1970. Its founder, Daniel Callahan, along with the psychiatrist Willard Gaylin, M.D., created the center to be an interdisciplinary institute solely dedicated to the serious study of bioethical questions. Callahan, a recently graduated Ph.D. in philosophy, had been one of the isolated scholars working on an issue in applied ethics, and he had found himself mired in complex questions that took him far afield from the traditional boundaries of philosophy. His topic, abortion, required engagement with the disciplines of law, medicine, and social science, which he felt himself unprepared to navigate. With academic departments functioning as islands within a university, it seemed that truly interdisciplinary work was impossible. The Hastings Center was founded to create an intellectual space for the study of these important questions from multiple perspectives and academic areas.

The second institution that helped solidify the field of bioethics was the Kennedy Institute of Ethics, which opened at Georgetown University in 1971. The founders had similar goals to those of Hastings, though they placed their center inside the traditional academy. While housed outside of any particular academic departments, the Kennedy Institute came to look more like a traditional department, offering degree pro-

grams and establishing faculty appointments along a university model.

From these modest beginnings, the field of bioethics exploded, with dozens of universities following suit, creating institutions whose sole function was the study of bioethical issues. Its growth was fueled by the appearance both of new technologies such as the artificial heart and in vitro fertilization and new challenges such as HIV. Bioethics was now permanently on the academic map and central to public discourse.

Institutions of Bioethics

Since the early 1970s, as bioethics has gained legitimacy, there has been an increasing trend of bioethics centers becoming academic departments. Originally modeled on the structure of an independent “think tank,” the bioethics centers of the early twenty-first century are often housed within either a medical school or school of arts and sciences, indistinguishable in structure from any other departments in those schools. The professionalization of bioethics has taken it from the academic margins to the center, and with this development has come all of the trappings of traditional academics, such as tenure, degree programs, professional conferences, and academic journals.

Beginning in the 1980s, medical schools began housing bioethics institutes either as departments of medical ethics or departments of medical humanities. Located within an undergraduate medical school, the duties of these departments include the ethics education of the M.D. students. Whereas the original bioethics centers had as their primary focus the production of scholarly research, departments of bioethics have pedagogical obligations and are viewed as institutions designed to serve the narrower educational mission of the school. Bioethics institutions that are instead housed within a school of arts and sciences have the same type of pedagogical obligations, though perhaps serving a different student population, namely, university undergraduates or graduate students. Departments of bioethics, depending on their configuration, offer traditional undergraduate or graduate courses, undergraduate majors or concentrations, graduate degrees (usually master's degrees), undergraduate medical school ethics training, and/or residency ethics training. By the early twenty-first century, there were more than sixty master of bioethics programs in the United States, attracting a diverse student population including recent undergraduates; students pursuing joint J.D., M.D., and Ph.D. degrees; and midcareer professionals from the fields of law, medicine, and public policy whose work requires specialty training in the field of bioethics.

Another result of the professionalization of bioethics was the pressure to publish in traditional scholarly venues, such as academic journals. But the formation of a new academic field of study necessitated the creation of academic journals in which to publish these novel scholarly works. Journals emerged that were designed solely for works in the field of bioethics, including the *Hastings Center Report*, the *Kennedy Institute of Ethics Journal*, the *American Journal of Bioethics*, and *Bioethics*. But the mainstreaming of bioethics into the academy also opened up space within traditional medical and scientific jour-

nals for scholarly works in bioethics. Research in bioethics is now routinely published in the likes of the *Journal of the American Medical Association*, the *New England Journal of Medicine*, *Science*, and *Nature*.

Perhaps the institution most effectively used within the field of bioethics is the Internet. All major bioethics institutes, centers, and departments (and some journals) have elaborate Web sites, not only offering information about the specific institution, faculty, and degree programs, but also undertaking an educational mission to raise the level of public debate about current bioethical issues. These Web sites offer substantive information for individuals seeking to become better informed about these issues. One of the most developed Web sites is the companion site to the *American Journal of Bioethics* (www.bioethics.net). This Web site not only offers actual scholarly works in the field but also includes a high school bioethics project, job placement information, a “Bioethics for Beginners” section, and a collection of bioethics news stories from the popular press, updated daily, with direct links to the original news articles.

The Methods of Bioethics

The founders of the field of bioethics and its first leaders were largely theologians or philosophers. Reflecting the scholarly conventions of their home disciplines, the first works in bioethics centered on a normative analysis of bioethical issues, arguing for or against the moral permissibility of a particular technology, practice, or policy. Starting in the 1970s, these philosophers and theologians were joined by physicians and lawyers, who too made normative claims about bioethical problems. But by the mid-1990s, bioethics was attracting populations of scholars who had not previously been well represented in the field, namely, social scientists and empirically trained clinicians, both physicians and nurses. With the entry of these new groups of scholars, the “methods” of bioethics began to shift, mirroring the methodologies of the new disciplines becoming central to the field. With this change, bioethics included not only normative analysis but also the empirical study of bioethical questions, what Arthur Caplan has called “empiricized bioethics.”

Empiricized bioethics takes one of two forms: either it seeks to collect empirical data needed to shed light on a bioethical problem, or it attempts to stand outside the discipline in order to study the field itself. Projects taking the first form use either qualitative or quantitative social science methodology to collect data needed to make persuasive bioethical arguments. These empirical studies might explore, for example, patient comprehension of medical information, patient and family experience with medical care, the ability of children or incompetent adults to give consent for research participation, or the frequency with which practitioners face particular ethical dilemmas.

Projects taking the second form explore the way in which the field of bioethics is evolving, the influence it has had on policy formation, the methods and strategies it employs, the field's understanding of itself, and its place in public life and contemporary academia. One very prominent contemporary

method employing this strategy is narrative bioethics, or what might be called “deconstructionist bioethics.” Using the insights of literary criticism, these bioethicists examine the discourse of the field to reveal its biases, conventions, and assumptions, making the field more self-reflective about its motives and goals. Along the same line, the field has seen the development of feminist bioethics and disability bioethics, both of which focus on issues of inclusion and exclusion, voice, and their confluence on particular substantive issues. Altogether, the empirical methods of bioethics have been so well received in the field that by the early twenty-first century, all bioethics centers and departments had representation from the social sciences or clinical medicine, and in many cases the empiricists constituted the majority of center or department membership.

One final methodology that has had a significant presence in medical humanities departments is literary analysis, in which literary texts are used as a vehicle for the ethics education of clinicians in training. These medical humanists use first-person illness narratives or first-person testimonies from clinicians, as well as important works in fiction, to teach health care professionals about the ethical issues involved in being both patient and practitioner.

Current Issues in the Field: Bioethics in the Early Twenty-First Century

The bioethical issues being addressed by the field are too numerous to count, but the flavor of bioethics in the early twenty-first century can be conveyed by an exploration of the bioethical implications of genetic research, health care access reform, and stem cell research, arguably the most pressing issue in the field to date.

Advances in the science of genetics, including the Human Genome Project and the ability to find genetic markers for particular diseases, have raised difficult ethical dilemmas. Two of the most pressing issues are preimplantation genetic diagnosis and the genetic testing of adults. With the technology to identify inherited diseases in the early embryo comes questions about which embryos ought to be implanted, which diseases constitute a legitimate moral reason to discard an embryo or become the criterion for embryo selection, which traits ought parents be allowed to select or test for, and who ought to have access to this technology and on what grounds. For example, while there might be widespread support for testing embryos that might carry the trait for Tay-Sachs disease or cystic fibrosis, there are troubling questions about selecting embryos on the basis of sex, nonlethal trisomes (such as Down’s syndrome), or aesthetic or character traits that technology may someday be able to screen for. In adult medicine, genetic tests already exist to detect mutations leading to some forms of inherited breast cancer and to Huntington’s disease. Here, questions arise about privacy of health care information, psychological impact, stigmatization, lack of informed consent, health insurance access, and familial disclosure. With the advent of commercial genetic testing centers, patients will soon have easy access to genetic tests independent of the practice of clinical medicine, without the benefit of genetic counseling services, professional psychological support, or adequate, and possibly accurate, clinical information.

The Internet, for example, will likely bring universal access to any genetic test as it becomes available.

Emerging Issues for the Future

As the twenty-first century unfolds, new and expanding areas of research will require increasing attention to their related ethical aspects.

Neuroethics. Knowledge about the human brain holds much promise and offers much needed hope to those who suffer from disorders of the brain and mind. The relative accessibility of the brain through biochemical, electrical, and magnetic stimulation, as well as surgery, makes neurological interventions tempting as knowledge of brain structure, wiring, and chemistry grows. Nevertheless, there has been little systematic analysis of the ethical implications of the revolution in the brain sciences. This revolution raises numerous ethical questions and issues:

- The “essence” of personhood and identity
- The relation between physiological structures and higher functioning (“mind” or “self”)
- The ways in which abnormalities in the brain might account for atypical or antisocial human behavior
- The acceptability of using pharmaceuticals, implants, or other interventions to enhance innate traits such as memory, attention span, or musical ability
- The legitimacy of intervening to alter aspects of personality, mood, or emotion; to assess the effectiveness of treatments or incarceration in modifying criminal behavior; or to detect predispositions to both desirable and undesirable behavior in persons who cannot themselves consent

New knowledge of the brain will soon have an enormous impact on the legal and penal systems. How to integrate knowledge of the brain into the practice of forensics, the prosecution of persons accused of crime, and the screening of those seeking parole are all issues likely to become pressing in the not-too-distant future. Equally controversial will be the use of new knowledge about the brain in the detection and prevention of the onset of undesirable behavior in adolescents and children and in trying to improve or enhance their capabilities and skills.

Eugenics. While there has been much attention in bioethics to the mapping of the human genome and to the nuclear transfer techniques used to clone Dolly the sheep and other animals, the most provocative genetics-related issue facing society during the first half of the twenty-first century is likely to be to what extent ought humans design their children. Rudimentary steps toward making eugenics a reality are all around us.

The finalization of a crude map of the human genome and other animal and plant genomes means that medicine will soon have at its disposal a huge amount of information about the contribution genetics makes to a wide variety of traits, behav-

iors, and phenotypic properties. In addition primitive efforts to introduce genes into the cells of the human body through gene therapy will be refined to the point at which genetic surgeons should be able to introduce targeted genes with specific functions into both somatic cells (cells in a person's body) and germ-line cells such as the stem cells in the testicles that create sperm in a man's body. And the ability to analyze the genetic makeup of sperm, eggs, and embryos has already led to some infertility clinics offering genetic testing for diseases as a part of their standard care for their clients. This means that parents of tomorrow, both infertile and fertile, will increasingly look to medicine to diagnose potential problems and risks before babies and children are created. The issue will not be whether humans should design their children but to what extent and with what if any limits on how far one may go to improve, enhance, and optimize them.

When should a person die? Another fascinating emerging ethical issue is whether humanity should seek to control the time of death. It is one thing to agree that individuals who are dying have the right to withdraw or not initiate medical treatments. It is quite a different matter to say that someone who is not terminally ill but is suffering from a terribly disabling chronic condition, a severely diminished quality of life, or the prospect of decades of life in a state of dementia or extreme frailty should have the right to medical or technological assistance in dying as is already the case in the Netherlands, the state of Oregon, and Colombia. The focus of these debates, however, has been almost exclusively the terminally ill. As the population of the world ages over the course of the twenty-first century, more and more persons may begin to ask or demand the right to control the timing of their death, whether they are deemed terminally ill or not.

BIOGRAPHY. One of the oldest genres of literature, biography is a written account of a person's life. It is also known as "life writing," a broader term that encompasses autobiogra-

phy and other narrative forms such as letters, memoirs, journals, and diaries. The term *biography* derives from the Greek *bios* (life) and *graphein* (to write). Latin and Greek terms for biography were used in antiquity. Before the adoption of the word *biography* into English in the seventeenth century, common terms for biography were *life* and the Latin *biographia*.

Many of the earliest "histories" were biographical accounts of the lives of important historical figures. Biography often has been associated with the field of history (and at times has been considered a branch of it), but distinctions between them were drawn beginning in ancient times. Whereas the writers of histories always have purported to present the truth accurately, biographers more obviously have praised their subjects or have presented them as exemplars for moral or didactic (educational) purposes.

Although formal definitions of biography vary, biographical literature includes such forms as character sketches, single biography, serial biography, literary biography, ethical (or didactic) biography, critical biography, and hagiography (sacred biography). In addition, biography shares many features with other literary genres, including travel writing and epistolary literature (that is, literature based on letters), and certain novelistic forms, such as the biographical novel and the bildungsroman that follows the development of a young character. The mixture of fiction with fact in biography means that it has much in common with imaginative literature. For example, the emergence of the novel as a genre paralleled developments in biography. Many early novels adopted a biographical form. In contemporary literature, a novelized biography may be nearly indistinguishable from a biographical novel.

Some commentators have indicated that biography, as an independent form, has been predominantly a product of Western civilization. In particular, they have pointed to the comparatively greater focus on the individual personality in Western biographical literature. If one follows a narrowly construed definition of biography, and adopts Western forms as standards, then this conclusion may seem plausible. Yet while the development of biography in the West has followed a unique trajectory, the production of biographical literature (and likely the biographical impulse witnessed in oral cultures) appears to be universal. Nevertheless, some differences between Western and non-Western traditions must be considered. In China, for example, biographical literature has been largely contained within a historiographic tradition and has been primarily related to the literature of the art of government. In India, biographical writings (such as fragments regarding the Buddha) have been contained within a larger body of spiritual literature.

Just as it is difficult to find an unbiased historical narrative (and many histories have been written for political purposes), biography long has been written for political, moral, or didactic purposes. The origins of biography in epideictic rhetoric (panegyric, or elaborate praise) means that biographers (whether of kings or revolutionaries) have been more interested in praising their subjects' actions or characters than in presenting historically accurate accounts. For this reason, the genre has lent itself to politicized narratives (including political histories or political romances) and narratives that define personal

identity. Although biography traditionally has centered on rulers, philosophers, or literati, modern biographers have taken a wide variety of persons for their subjects, including women and individuals from underrepresented or persecuted groups.

Ancient Biography

Biographies have evolved from short narratives that commemorate the deeds of illustrious figures to more complex forms that present the life of an individual in considerable detail. The earliest biographical records include the hieroglyphic inscriptions on Egyptian monuments (c. 1300 B.C.E.) and cuneiform inscriptions found in Assyria (c. 720 B.C.E.) and Persia (c. 520 B.C.E.). These quasi-biographical works commemorated the deeds of kings. Similarly, the oldest biographical writings in England were runic inscriptions that related the lives of heroes. Apart from Western quasi-biographical works, the earliest biographies appeared in the second century B.C.E. in China. The *Shih-chih* (Historical records) by Sima Qian (formerly transliterated as Ssu-ma Ch'ien, c. 145–c. 85 B.C.E.) included short character sketches, anecdotes, and dialogue between archetypal subjects. The historian Ban Gu (formerly transliterated as Pan Ku, 31–92 C.E.) continued this tradition in the *Han shu* (History of the former Han dynasty).

While biographical literature existed in the West as early as the fifth century B.C.E., a more defined notion of biography did not appear there until the Hellenistic age. Ion of Chios (c. 490–c. 421 B.C.E.) wrote quasi-biographical character sketches of eminent figures such as Pericles and Sophocles. Xenophon (c. 431–c. 352 B.C.E.) wrote a life of Cyrus (c. 365 B.C.E.) that praised the king. He also commemorated Socrates in the *Memorabilia*. Other quasi-biographical works include Plato's dialogues on Socrates, the *Apology* and the *Phaedo*.

Among the earliest surviving biographies are those contained in *De viris illustribus* (On illustrious men), by Cornelius Nepos (c. 100–c. 25 B.C.E.). This work became a model for subsequent serial biography, a form that consisted of the collected lives of one or more categories of illustrious persons. Plutarch (c. 46–after 119 C.E.) is perhaps the most famous ancient biographer. His *Parallel Lives* comprised forty-six biographies assembled in pairs. This work was an early example of a collection of single, autonomous lives. Plutarch showed a greater interest in revealing a subject's moral character than in documenting historical details, a feature that is typical of panegyric literature. He also praised his subjects in many anecdotes and digressions.

Other early biographers included Cornelius Tacitus (c. 56–c. 120 C.E.) and Suetonius (c. 69–after 122 C.E.). Suetonius presented the life of Julius Caesar and the lives of the first eleven emperors in his *De vita Caesarum* (c. 110 C.E.; English trans. *The Twelve Caesars*, 2003). Following Plutarch, he emphasized the personal lives of the emperors rather than historical details in his collection of single lives. Suetonius also wrote *De viris illustribus* (c. 106–113; On illustrious men), a series of biographies of illustrious figures (philosophers, orators, and literati) that became a model for serial biography.

Diogenes Laertius (3rd century B.C.E.) wrote the *Lives of Eminent Philosophers*, a series of biographies of Greek philosophers.

This work is the most complete surviving example of the ancient genre of philosophers' lives (the revival of which in the fifteenth century had a major impact on early modern biography). Diogenes notably indicates in his accounts that the actions and behaviors of the philosophers serve to exemplify their teachings. Although he focused on the private lives of his subjects, he also was known for his meticulous documentation of sources. His serial *Lives* were instructive to later biographers because he arranged them by the relations of masters to disciples and by individuals' contributions in their fields. St. Jerome (c. 347–419 or 420) wrote the exemplary serial biography in late antiquity. His *De viris illustribus* (c. 392; English trans. *On Illustrious Men*, 1999) was an elaboration on Suetonius's notes on the lives of the philosophers. It was widely imitated for three centuries and revived as a model in the twelfth century. He also incorporated elements of classical biography in his lives of saints, which greatly influenced medieval biographers.

Medieval and Renaissance Biography

The works of Plutarch, Suetonius, and St. Jerome remained models for biographers in the medieval and Renaissance periods. The characteristic biographical form of the medieval period was the life of the saint (the sacred life or hagiography). Although many collections of saints' lives or acts (martyrologies) were compiled, there was often little differentiation between the characteristics of individual saints. While medieval hagiographers heavily drew on classic biographies, they focused on praising the spiritual virtues of their subjects and offered evidence for their canonization. Hagiography consequently developed unique conventions, such as the preservation of miracles and the martyrdom of saints. Exemplary lives of this period include Adamnan's *Life of St. Columba* (c. 690), Bede's *Life of St. Cuthbert* (c. 731), Eadmer's *Life of St. Anselm* (c. 1124), and Jean de Joinville's *History of St. Louis* (c. 1309). Other important biographical works include the *Lives of the Fathers* and the *History of the Franks* by Gregory of Tours (538–594), Bede's *Ecclesiastical History of the English People* (c. 731), and later Einhard's *Life of Charlemagne* (c. 829–836; based on Suetonius's *The Twelve Caesars*).

Humanist biographers in the Renaissance were influenced by classical lives and the lives of saints. Petrarch's incomplete *De viris illustribus* (begun c. 1337; On illustrious men) is in the tradition of single biographies of eminent ancient figures (following Suetonius and Plutarch). Giovanni Boccaccio's *Trattatello in laude di Dante* (1354–1355; English trans. *Life of Dante*, 1990) exemplifies the revival of the single life of a subject presented as an ideal. Influenced by Petrarch, Boccaccio assembled two collections of single lives concerning illustrious ancient figures, *De casibus virorum illustrium* (1355–1374; On the fall of illustrious men) and *De claris mulieribus* (1360–1374; On famous women), the first collection of women's lives. Partly in response to Boccaccio's *De claris mulieribus*, Christine de Pisan (1364–c. 1430) wrote her vernacular *Le livre de la cité des dames* (1405; English trans. *The Book of the City of Ladies*, 1998), often considered the first work of feminist literature. Notably, the earliest modern English autobiography is *The Book of Margery Kempe* (c. 1432–1436), by Margery Kempe (c. 1373–c. 1440), a work that largely follows the conventions of medieval sacred biography.

Renaissance biographers borrowed extensively from the works of Diogenes Laertius and St. Jerome, especially in developing new serial lives assembled according to notions of cultural progress. In *De origine civitatis Florentiae et de eiusdem famosis civibus* (c. 1381–1382; On the origins of the Florentine state and her most famous citizens), Filippo Villani presented short sketches of a wide variety of Florentine citizens, including poets, musicians, and painters. Later, Giorgio Vasari wrote his *Lives of the Painters, Sculptors, and Architects* (1550, rev. ed. 1568), following progressive developments in art through a series of biographies that culminated in Michelangelo. In England, William Roper (1496–1578) wrote the *Life of Sir Thomas More* and George Cavendish (1500–1561?) wrote the *Life of Cardinal Wolsey*. Other biographical writings were the *Lives of Famous Ladies* and the *Lives of Famous Men* by Pierre de Bourdeille, seigneur de Brantôme (c. 1540–1614) and Macarius's *Stepennaya Kniga* (1563; Book of degrees) in Russia.

The Seventeenth and Eighteenth Centuries

The English term *biography* was first used by John Dryden in 1683. The seventeenth century and the early eighteenth century witnessed expanded production of many types of life writing, including diaries, letters, and memoirs. Biographies by women appeared in this period, such as *Memoirs of the Life of Colonel Hutchinson* by Lucy Hutchinson (1620–after 1675) and *The Life of William Cavendish* (1667) by Margaret Cavendish (1623–1673). Some important biographical works were the five lives of eminent figures by Izaak Walton (1593–1683), the *Lives of Eminent Men* by John Aubrey (1626–1697), the diary of Samuel Pepys (1633–1703), and Roger North's *Lives of the Norths* (1742–1744). The most influential English biography was James Boswell's *Life of Samuel Johnson* (1791). Boswell adopted the methods of earlier biographers, but artfully combined letters, personal documents, conversation, anecdotes, and his own observations to present a vivid portrait of Johnson. His in-depth treatment had a major impact on biography throughout the world.

The Nineteenth and Twentieth Centuries

Early-nineteenth-century biography was influenced by Boswell's *Life of Samuel Johnson* as well as by the writers within the Romantic movement. The primary biographical form in this period was the Victorian “life and letters” (or “life and times”). It was characterized by relatively great length, sobriety, and concern with social propriety. Some biographies of this period were Thomas Moore's *Life of Sheridan* (1825) and his *Letters and Journals of Lord Byron* (1830), John Lockhart's *Life of Sir Walter Scott* (1837–1838), Elizabeth Gaskell's *Life of Charlotte Brontë* (1857), G. O. Trevelyan's *Life and Letters of Lord Macaulay* (1876), and David Mason's *Life of John Milton: Narrated in Connection with the Political, Ecclesiastical, and Literary History of His Time* (7 vols., London, 1859–1894). Popular literary genres of the later nineteenth and early twentieth centuries that were influenced by biography included the realistic novel and the historical novel.

Biography in the twentieth century reflected the rise of modernism in the arts. There was a reaction against the Vic-

torian style of biography that resulted in shorter, less studious lives. Works of modernist biography include Lytton Strachey's *Eminent Victorians* (1918) and *Queen Victoria* (1921) and the numerous lives by André Maurois (1885–1967). Changes in style also were reflected in biographers' adoption of a scientific outlook. The influence of psychology (especially Freudian and Jungian) eventually led to the development of psychobiography. Experimental forms and methods were explored in works as diverse as Virginia Woolf's mock biography *Orlando* (1928), Lord David Cecil's two-volume work on Lord Melbourne (1939 and 1954), and A. J. A. Symon's *The Quest for Corvo* (1934). Postmodern forms of life writing emerged after World War II. Although more represented in autobiography than biography, postmodern lives have been characterized by further experimentation and the broad use of nontraditional methods. Postmodern biography in many ways reacts against modernist biography but is also an extension of it. It contains elements that are antiheroic, antihistorical, and absurd, or that consciously undermine conventional forms.

There were other major developments in the late twentieth century. One was the widespread appearance of biographies by and about women, and in particular, the establishment of feminist life writing as a literary form. Feminist biography had appeared in the fifteenth century, and feminists' writings had flourished at times, especially in the late eighteenth century (for example, Mary Wollstonecraft's *A Vindication of the Rights of Woman*, 1792). The late twentieth century, however, saw the rise of feminism as a major cultural movement and a rapid increase in feminist life writings. Late-twentieth-century feminist biographies were numerous and included several lives of Woolf. Feminist biographers have drawn inspiration from the works of earlier feminists, including the writings of Charlotte Perkins Gilman (1860–1935) and Woolf's essays *A Room of One's Own* (1929) and *Three Guineas* (1938). In addition to the establishment of feminist biography and the increase in biographies written by women (with women as subjects), lesbian and gay biography also became independent forms in the late twentieth century (such as Elizabeth Mavor's *The Ladies of Llangollen*, 1971).

The late twentieth century witnessed the emergence of traditionally underrepresented groups in biography, both as subjects and as biographers. In the United States, for example, subjects were increasingly African-American, Asian-American, Hispanic, and Native American (or were members of other underrepresented or immigrant groups). Some of these biographies built on earlier traditions (for example, African-American lives range from pre-Civil War slave narratives to Alex Haley's *Roots*, 1976). Biographers working in various postcolonial literatures also produced many lives of subjects from underrepresented groups.

Another major development has been the globalization of biography. As biographical forms have become diffused around the world, they have encompassed subjects from cultures in Africa, the Americas, East and Southeast Asia, Australia, the Middle East, the Indian subcontinent, and other regions. It is notable that while biographical forms have spread worldwide, biographers have continued to draw on forms established in earlier times

(both oral and written). In the early twenty-first century, as a result of these trends, biography is an increasingly global art, evidenced by the diversity in its subjects and forms.

BIOLOGY. *Biology* comes from the Greek word for life, *bios*, and the Greek word for thought or reasoning, *logos*. It denotes the science that studies life, the properties and processes that sustain life, the evolutionary history of life, and particular living organisms. It is a science of enormous diversity, breadth, and heterogeneity unified only by the conceptual framework provided by the theory of evolution. Indeed, as famously noted in 1973 by the Russian evolutionary geneticist Theodosius

Dobzhansky (1900–1975), “Nothing in biology makes sense except in the light of evolution”—a quote now replicated in so many university-level textbooks that it is almost a dictum in modern biology.

One reason for the diversity of biology comes from the staggering diversity of organisms that can be considered living. These range from viruses, bacteria, and fungi to plants and animals, including humans. Another reason is that life can be studied on various levels in a hierarchy that ranges from the organic-macromolecular level to genes, cells, tissues, organs, and entire organisms. Furthermore, organisms interact in, and can be organized into, families, communities, societies, species, populations, biomes or biota, and perhaps even the global systems (as in the controversial Gaia hypothesis, which postulates that the earth itself is a living organism). To a large extent, biological subdisciplines are organized around each of these levels of activity or organization. Thus, for example, cellular biology, or cytology (coming from the Greek word *cyto* for cell), deals specifically with the study of cells, while ecology (coming from the Greek word *oikos* for habitat) deals with interactions between populations, species, communities, and biomes and the processes that sustain them. Since biology deals immediately with living organisms and processes, it has a large applied component. It touches on medical and health-related areas, pharmacy, agriculture, forestry, and biological oceanography. In contemporary society, the promises and problems associated with applications of biology are staggering. They range from stem-cell research, the development and use of genetically modified organisms, and the use of biological tools as identity markers (as in DNA “fingerprinting”) to the possibility of designer babies and human cloning. Whereas the physical sciences and their applications dominated science for much of the history of science, the biological sciences now dominate both popular and scientific discussions, especially after the discovery of the structure of DNA in 1953. Viewing the revolution precipitated by the applications of biology to society at the closing of the twentieth century, many commentators anticipate that the new century will be the century of biology.

The Origins of Biology

Though biology is generally regarded as a modern science with late origins in the early to mid-nineteenth century, it drew on varied traditions, practices, and areas of inquiry beginning in antiquity. Traditional histories of biology generally target two areas that merged into modern biological science: medicine and natural history. The tradition of medicine dates back to the work of ancient Greek medical practitioners such as Hippocrates of Kos (b. 460 B.C.E.) and to figures such as Galen of Pergamum (c. 130–c. 200), who contributed much to early understanding of anatomy and physiology. The tradition of natural history dates back to the work of Aristotle (384–322 B.C.E.). Especially important are his *History of Animals* and other works where he showed naturalist leanings. Also important is the work of Aristotle's student Theophrastus (d. 287 B.C.E.), who contributed to an understanding of plants. Aristotle and Theophrastus contributed not only to zoology and botany, respectively, but also to comparative biology, ecology, and especially taxonomy (the science of classification).

Both natural history and medicine flourished in the middle ages, though work in these areas often proceeded independently. Medicine was especially well studied by Islamic scholars working in the Galenic and Aristotelian traditions, while natural history drew heavily on Aristotelian philosophy, especially in upholding a fixed hierarchy of life. The Roman naturalist Caius Plinius Secundus (23–79), known as Pliny, also had a major influence on natural history during the middle ages, notably through his compendium *Natural History* (later shown to be rife with errors of fact). Without doubt the most outstanding contributor to natural history in the middle ages is Albertus Magnus (1206–1280), recognized for his superb botanical studies and for his work in physiology and zoology. A lesser known figure is Holy Roman Emperor Frederick II (1194–1250), whose treatise *The Art of Falconry* is one of the first serious accounts of ornithology.

Though animals traditionally drew the attention of many naturalists, the study of zoology remained underdeveloped during the middle ages, relying heavily on illustrated books of animals modeled on medieval bestiaries. Botany, on the other hand, flourished in the Renaissance and early modern period. The study of plants was important in medicine, as well as natural history (and in fact constituted one of the few early points of common focus in the two areas), because plants were regarded as *materia medica*, substances with noted medicinal properties. These medicinal properties drew medical attention to plants. Hence it became standard practice to plant gardens next to primary centers of medical instruction, and professors of medicine were very often experts in *materia medica* and served as garden curators. Indeed, noted taxonomists of the early modern period—individuals such as Andrea Cesalpino (1519–1603) and Carl Linnaeus (1707–1778), both of whom are considered fathers of modern botany for their work in reforming taxonomy—were simultaneously physicians and botanists. An exception was John Ray (1627–1705), an English taxonomist who also worked with animals.

Also leading to the growing interest in and need for taxonomy and to an unprecedented development of natural history were the voyages of exploration associated with the establishment of colonies from the late fifteenth century. Largely to meet the demand to classify the collections made by explorers and travelers in order to exploit these natural commodities, gardens and museums of natural history were created in European centers associated with colonial conquests, especially Madrid, Paris, and London. A new period of scientific exploration dawned with the first voyage of Captain James Cook, whose expeditions included not only astronomers and artists but also botanists, such as Joseph Banks (1743–1820). On returning to London, Banks was instrumental in helping to found the Royal Institution of Great Britain, as well as in continuing to expand Kew Garden and the Royal Society. He also encouraged these institutions to serve the interests of both natural history and the expanding British Empire in the late eighteenth and early nineteenth centuries.

While botany and medicine were closely linked, anatomy and physiology followed other trajectories. After Galen, the next major figure in the history of anatomy is Andreas Vesalius

(1514–1564) of Belgium. Unlike many anatomists (such as Galen, who relied on dissections of animals such as pigs and Barbary apes), Vesalius drew his knowledge of the human body from detailed dissections on human cadavers. He was unusual for his time in believing that the authority of nature should supercede the authority of ancient texts. His seven-volume atlas of human anatomy, *De Humani Corporis Fabrica* (On the fabric of the human body), covered skeletal and muscular anatomy as well as the major organ systems of the body. Skillfully illustrated by some of the leading Renaissance artists, the atlas was considered a work of art as well as of anatomical science. Although Vesalius challenged many of tenets held by Galen and his numerous commentators, he nonetheless retained some erroneous conventions present in Galen's anatomy, such as the existence of pores in the septum of the heart and "horned" appendages in the uterus (present in the pig uterus but not in the human uterus). Vesalius's work was shortly followed by the work of anatomical specialists such as Bartolomeo Eustachio (1510–1574) and Gabriele Falloppio (1523–1562). Eustachio specialized in the anatomy of the ear, and Falloppio specialized in the female reproductive tract.

Developments in anatomy that turned interest to the parts and organs of the body were accompanied by questions dealing with organ function. In the sixteenth century, physiology, the science that deals specifically with the functioning of living bodies, began to flourish. The major animal physiologist of this period was William Harvey (1578–1657). Harvey performed numerous dissections and vivisections on a range of animals to determine that blood circulates through the body and is not manufactured *de novo*, as Galenic tradition had dictated. Harvey's influence was felt not only in medicine, but also in comparative physiology and comparative biology, since he performed his experiments on diverse animal systems. His experiments and major treatise, *An Anatomical Disputation concerning the Movement of the Heart and Blood in Living Creatures* (1628), are considered one of the first demonstrations of the method of hypothesis testing and experimentation. While Harvey frequently drew analogies between the pumping action of the heart and mechanical pumps, he resisted the idea that the body entirely obeyed mechanistic principles. Unlike his contemporary René Descartes (1596–1650), who held mechanistic theories of the functioning of animal bodies, Harvey maintained that some kind of nonmechanistic special forces, later called "vitalistic," were responsible for the life processes of animate matter.

The mechanical philosophy—the belief that the universe and its constituent parts obeyed mechanical principles that could be understood and determined through reasoned observation and the new scientific method—thus made its way into the history of biology. This engendered a lively discussion between mechanism and vitalism, between the idea that life obeyed mechanistic principles and the idea that life depended on nonmechanistic "vital" principles or somehow acquired "emergent properties." The debate cycled on and off for much of the subsequent history of biology, up to the middle decades of the twentieth century.

During the Renaissance, the mechanical philosophy did gain some proponents in anatomy and physiology, the most no-

table figure being Giovanni Borelli (1608–1679), who sought to understand muscle action in animal bodies in terms of levers and pulleys. Some early embryologists, as followers of Descartes, espoused the belief that development too followed mechanistic principles. In what came to be known as preformation theory or “emboitement,” the seeds of mature but miniaturized mature adult forms or *homunculi* were thought to be embedded entirely intact in mature organisms (as though they were encased in a box within a box, hence the name “emboitement”). Prominent advocates of this view included Marcello Malpighi (1628–1694) and Jan Swammerdam (1637–1680). This stood in contrast to the idea of “epigenesis,” the belief dating back to Aristotle and his commentators that development began from initially undifferentiated material (usually the ovum) and then followed an epigenetically determined path of development after fertilization. One of the more prominent proponents of this theory was Pierre Louis Maupertuis (1698–1759), who argued that preformationist theories could not explain why offspring bore characteristics of both parents.

In the seventeenth and eighteenth centuries, theories of embryology and development were superimposed with theories of sexual reproduction, along with a number of theories on the origins of life, most of which upheld the idea of spontaneous generation. During this period debates raged over spontaneous generation, the idea that life was spontaneously created out of inanimate matter. The popular belief that living organisms propagated from mud in streams, dirt and detritus, or environments such as rotting meat was supported by a number of scholars from antiquity on. William Harvey’s research into reproduction, published in 1651 as *Exercitationes de Generatione Animalium* (Essays on the generation of animals), began to cast doubt on spontaneous generation. Harvey believed that all life reproduced sexually, a view he pithily stated with his famous dictum *Ex ovo omnia* (“Everything comes from the egg”). In 1668 the Italian physician Francesco Redi (1626–1697) performed a famous experiment that further detracted from the theory of spontaneous generation. By carefully covering rotting meat so that it was not accessible to flies, he showed that maggots did not spontaneously emerge. The idea that sexual reproduction characterized much of life was further reinforced when Nehemiah Grew (1641–1711) demonstrated sexuality in plants in 1682. Later, in 1768, the Italian physiologist Lazzaro Spallanzani (1729–1799) offered additional evidence disproving spontaneous generation, and in 1779 he gave an account of the sexual function of ovum and sperm. Despite this accumulating experimental evidence against spontaneous generation, new developments continued to fuel belief in spontaneous generation. In 1740, for example, Charles Bonnet (1720–1793) discovered parthenogenesis (“virgin birth”—an asexual form of reproduction) in aphids, and in 1748 John Turberville Needham (1731–1781) offered evidence of what he thought were spontaneously generated microbes in a sealed flask of broth (this was later challenged by Pierre-Louis Moreau de Maupertuis [1698–1759]). Finally, the discovery of microbial life supported the idea that living organisms spontaneously emerged from natural environments such as pond water. The seventeenth and eighteenth centuries thus witnessed a number of debates that were only resolved

much later in the late nineteenth century when distinctions were made between the very different processes associated with reproduction, the origins of life, and embryological or developmental unfolding. Belief in spontaneous generation was finally put to rest in 1860 by the celebrated “swan-necked flask” experiments of Louis Pasteur (1822–1895).

Other notable developments in the origins of biology came as the result of new instruments and technologies, the most important of which was the microscope. Developed independently by Robert Hooke (1635–1703) in England and Antony Van Leeuwenhoek (1632–1723) in the Netherlands, the microscope revealed a previously unseen and entirely unimagined universe of life. Robert Hooke first observed repeating units he described as “cells” in his *Micrographia* (1665), while Leeuwenhoek observed varied motile organisms he described as “animalcules.” While the microscope opened up cytological and microbiological explorations, it also shattered Aristotle’s notion that life is organized along a *scala naturae* (ladder of nature), since new and minute animal forms were not easily located on the ladder of creation. It also fueled the belief in spontaneous generation. Pioneering the use of the microscope and its application to anatomy, Marcello Malpighi (1628–1694), Italian professor of medicine and personal physician to Pope Innocent XII, drawing on the previous work of Andrea Cesalpino and William Harvey, studied the circulatory and respiratory systems of a range of animals (especially insects). He was one of the first to study major organ groups such as the brain, lungs, and kidneys in diverse organisms.

Modern Biology

Though there is some disagreement among historians of biology about the precise origins, the transition to modern biology appears to have occurred from the late eighteenth century to the early nineteenth century. A confluence of developments brought about this transition. In France naturalists reformed taxonomy and began to recognize the extinction of life forms. This progress resulted from the work of natural historians such as the Comte de Buffon (1707–1788), Georges Cuvier (1769–1832), Étienne Geoffroy de Saint Hilaire (1772–1844), and Jean-Baptiste de Lamarck (1744–1829) at institutions such as the Jardin du Roi. New sciences emerged, including comparative anatomy and paleontology, areas in which Cuvier is still recognized as the founding father. French anatomists such as Xavier Bichat (1771–1802) and physiologists such as François Magendie (1783–1855), by experimenting on animal systems (sometimes to questionable excess in the case of Magendie), refined and enhanced understanding of fundamental physiological processes, and thereby revolutionized physiological understanding of life. In Germany the insights of natural philosophers such as Johann Wolfgang von Goethe (1749–1832) and Lorenz Oken (1779–1851) began to generate a serious interest in a unified science of life.

All of this activity was echoed by a number of early references to biology in a number of obscure German contexts beginning in the late eighteenth century. Traditional histories generally pinpoint the first general use of the term *biology* at 1800 in the medical treatise *Prapädeutik zum Studium der gesammten Heilkunst* (Propaedeutic to the study of general medicine) by Karl Friedrich Burdach (1776–1847), who used

it mostly for the study of human morphology, physiology, and psychology. It appeared again in 1802 in the work of the German naturalist Gottfried Treviranus (1776–1837) and in the work of Jean-Baptiste de Lamarck, the French botanist and early proponent of transmutationism. Although the word gained some currency by the 1820s, especially in the English language, it was largely through the efforts of August Comte (1798–1857), the French social philosopher, that the term gained its most widespread currency. For Comte, biology, one of the “higher sciences” in his philosophy of positivism, was the discipline of knowledge that organized the study of life and sought the principles of life.

Especially critical to the development of modern biology was the period between 1828, when Friedrich Wöhler (1800–1882) artificially synthesized the organic compound urea in the laboratory (fueling the debate between mechanism and vitalism), and 1866, the year Gregor Mendel (1822–1884) published his theory of heredity. During this time the conceptual foundations of the new science were laid, and many of the defining criteria of nearly all the major subdisciplines of biology were established.

The first areas for which groundwork was laid were cytology (now part of the more general discipline of cell biology) and histology (the study of tissues). Advances in optics in the 1830s by workers such as Giovanni Battista Amici (1784–1863) significantly enhanced the resolving power of the microscope and diminished or entirely eliminated such disruptive phenomena as chromatic aberration. Techniques for selectively dyeing and staining cellular components and enhancements in sectioning that led to thinner and thinner sections further enabled researchers to see more clearly increasingly finer structures. As a result of improvements in microscope technology, a series of plant and animal observations from 1833 led to recognition of a number of cellular structures, beginning with the nucleus, first observed in orchid cells by the English microscopist Robert Brown (1773–1858). Observations on the cells of plants and animals culminated in the establishment of the cell theory in the late 1830s, the recognition that cells were the basic unit of organization in all living tissues. The establishment of the cell theory resulted from observational work by the botanist Matthias Schleiden (1804–1881) and by the animal physiologist Theodor Schwann (1810–1882). Rudolf Virchow (1821–1902) extended this theory in 1840 to include the observation that all cells come from cells, and in 1858, in his *Cellular Pathology*, he provided new foundations for understanding disease in terms of cellular disruption. The germ theory of disease, a theory that Louis Pasteur proposed in the 1860s as a result of his work in microscopy, suggested that microorganisms were the causes of infectious diseases. Advances in microscopy in the nineteenth century thus laid the foundations not only of cytology and histology but also of the new science of microbiology (the study of microbial life), which continued to explore smaller and smaller life forms well into the twentieth century.

Yet another area that drew heavily on microscopy was knowledge of heredity (later designated as the science of genetics), especially in the late nineteenth century after structures such as chromosomes were first observed and cellular reproduction

was understood in terms of meiosis and mitosis. The chromosome theory of heredity, first proposed by Walter Sutton (1877–1916) and Theodor Boveri (1862–1915), largely integrated knowledge of the fine structure and behavior of chromosomes with Mendelian genetics to suggest that chromosomes were the material carriers of heredity. This theory was not articulated until early in the twentieth century, between 1902 and 1903. This development occurred so late because Gregor Mendel’s experimental insights into the process of heredity, which had been published in 1866, was not appreciated until its rediscovery in 1900. The modern science of heredity, which William Bateson (1861–1926) designated as genetics, began in the early years of the twentieth century, with initial inquiry determining the extent to which Mendelian principles operated in the natural world. The second area of interest sprung from the pioneering research of the American geneticist Thomas Hunt Morgan (1866–1945) and his laboratory on Mendelian genetics in the fruit fly, *Drosophila melanogaster*. Beginning roughly in the 1910s and peaking in the 1930s, this classic school of genetics worked on the transmission of a number of characteristics by studying mutant forms of *Drosophila*.

Microscopic techniques also played an active role in other important areas of nineteenth-century biology, areas such as embryology, and brought into relief the interplay between heredity, development, cytology, and evolution. By the late nineteenth century, persistent questions of biological development were being tackled with techniques and insights gleaned from cytology and cellular physiology, leading to a renewal of the debate between mechanism and vitalism. Just when figures such as August Weismann (1834–1914) had articulated mechanistic theories linking heredity with development and evolution, leading to movements such as developmental mechanics, individuals such as Hans Driesch (1867–1961) challenged strict mechanism in biology by experimentally demonstrating that almost any part of the cellular constituents of embryonic tissues had the potential to develop into mature forms. Driesch’s experimental efforts were rivaled by those of Wilhelm Roux (1850–1924), the leading advocate of developmental mechanics.

The middle decades of the nineteenth century also witnessed improvements in animal physiology, especially through the efforts of the German school associated with Johannes Müller (1801–1858) and later through the pioneering efforts of Hermann von Helmholtz (1821–1894). Increasingly, work in physiology, especially that of Helmholtz, drew heavily on the physical sciences. This research further supported the view that life obeys mechanistic principles and is reducible to such sciences as chemistry and physics. Proponents of this view increasingly dominated physiology, an arch example being Jacques Loeb (1859–1924), the German-American biologist most associated with mechanistic and reductionistic approaches to biology. His essays in *The Mechanistic Conception of Life* (1912) summarized this point of view.

Unquestionably, a major development in the critical early period of modern biology was the articulation and acceptance of evolution as based largely on the mechanistic process of natural selection. Drawing on a number of transmutation theories

PROPERTIES OF LIVING ORGANISMS

- A capacity for evolution
- A capacity for self-replication
- A capacity for growth and differentiation via a genetic program
- A capacity for self-regulation, to keep the complex system in a steady state (homeostasis, feedback)
- A capacity (through perception and sense organs) for response to stimuli from the environment
- A capacity for change at the level of phenotype and of genotype

SOURCE: Ernst Mayr, *This is Biology: The Science of the Living World* (1997).

(especially those of Buffon, Lamarck, and Robert Chambers [1802–1871]), Charles Darwin (1809–1882) and Alfred Russel Wallace (1823–1913) independently formulated similar theories of species change through the mechanism of natural selection, jointly publishing their insights in a paper read to the Linnaean Society in 1858. Darwin articulated his theory more fully in his celebrated work *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life* (1859). Though the mechanism of evolutionary change continued to resist full understanding by scientists, the fact that life on earth had had an evolutionary history became widely accepted by the late nineteenth century. Because the mechanism remained uncertain, evolutionary theory remained controversial in the closing decades of the nineteenth century. Suggested alternative mechanisms included neo-Lamarckism, directed evolution, aristogenesis, and mutation theory—an entirely new theoretical formulation that drew on the new experimental science of genetics. The turn of the twentieth century is frequently known as the “eclipse of Darwin,” not so much because he fell into disfavor, but because alternatives to his theory of natural selection were being favored instead.

Between 1930 and 1950 scientists became certain about the mechanism of natural selection by integrating insights into heredity from Mendelian genetics with insights from traditional natural-history-oriented areas such as systematics, botany, and paleontology to formulate what has been called the “synthetic theory of evolution.” At this time evolutionary biology was organized as a discipline, in order to study the process of evolution from a range of perspectives. This “evolutionary synthesis”—an integration of Darwinian selection theory with the newer Mendelian genetics—is generally recognized as a major event in the history of twentieth-century biology. With the establishment of the synthetic theory of evolution, scientists began to feel that a mature, unified, modern science of biology had emerged. Theodosius Dobzhansky, whose own work in evolutionary genetics served as catalyst for this syn-

thesis, has maintained that evolution went a long way toward unifying biology.

Much of the work of twentieth-century biologists served to integrate biology. In addition, new technologies (such as the first electron microscopes in the 1930s), as well as developments and refinements in existing technologies, led to a staggering range of new discoveries in the twentieth century. In 1895 the Dutch biologist Martinus Beijerinck (1851–1931) designated what is known now as viruses—tiny living aggregations of protein and nucleic acid—as “filterable agents” because they passed through fine filters that could contain bacteria. It was known that these filterable agents could induce disease, but their structure was unknown until 1935, when W. M. Stanley (1904–1981) first crystallized the tobacco mosaic virus. This opened up further inquiry into viruses as disease-causing agents, into proteins and nucleic acids as the sole components of this very simple form of life, and into biochemical techniques instrumental for carrying out this research. By the late 1930s molecular biology and biochemistry were gaining traction. The reductionistic, mechanistic approaches of these sciences further pushed biological thinking about life in those directions. There was acute interest in the molecular structure of important proteins such as insulin, whose structure was determined in 1955 by Frederick Sanger (b. 1918), and in the role played by proteins and nucleic acids in reproduction and genetics.

In 1953 vitalistic approaches and philosophies received two body blows. First, the discovery of the structure of DNA (deoxyribonucleic acid), by Rosalind Franklin (1920–1958), Maurice Wilkins (b. 1916), James D. Watson (b. 1928), and Francis Crick (1916–2004) made the mechanism of the replication of genetic material understandable at the macromolecular level and moved genetics in the direction of molecular genetics. More than any discovery in recent biology, the discovery of the structure of DNA brought forth a revolution in biology, not just because of the theoretical knowledge gleaned, but also because of the potential applications of this knowledge.

EARLY DEFINITIONS OF BIOLOGY

From Lamarck, 1802: Biology: this is one of the three divisions of terrestrial physics; it includes all which pertains to living bodies and particularly to their organization, their developmental processes, the structural complexity resulting from prolonged action of vital movements, the tendency to create special organs and to isolate them by focusing activity in a center, and so on.

From Treviranus, 1802: The objects of our research will be the different forms and phenomena of life, the conditions and laws under which they occur and the causes whereby they are brought into being. The science which concerns itself with these objects we shall designate Biology or the Science of Life.

SOURCE: As translated by William Coleman in *Biology in the Nineteenth Century: Problems of Form, Function, and Transformation* (1971), p. 2.

The second body blow to vitalism was delivered in the same year by news of the celebrated experiment simulating the origins of life under early conditions on earth by Stanley Miller (b. 1930) and Harold C. Urey (1893–1981) at the University of Chicago. Miller and Urey enclosed the constituents of the early atmosphere of earth (methane, ammonia, and hydrogen gas) in a glass vessel and applied a high-energy electrical discharge to it, “sparkling” it to simulate lightning. A container of boiling water constantly supplied water vapor and heat. The cooling and condensing water vapor simulated rain. After letting the apparatus run for a number of hours and eventually weeks, Miller and Urey collected a brown-red pasty substance and chemically analyzed it to reveal a number of amino acids, the building blocks of proteins, and other macromolecules usually associated only with living organisms. The Miller-Urey experiment thus provided evidence that the basic building blocks for life could be generated by the kinds of conditions present in the early atmosphere of the earth. Subsequent experiments simulating conditions on other planets supported the view that life may also have originated in space, on other planets, or wherever similar conditions are found. For this area of study integrating research on the origins of life on earth with research on the existence and specific character of life on other planets, the molecular geneticist Joshua Lederberg (b. 1925) coined the term “exobiology,” the biology of organisms outside earth. Its sibling science is esobiology, or earth-based biology.

After World War II, biology boomed, and with it emerged new societies and institutions to organize the growing science. In 1947 the first umbrella organization for the biological sciences, the American Institute of Biological Sciences, was created in the United States. Other institutions, such as the National Science Foundation in the United States, established large divisions (and budgets) to fund research in the biological sciences. Both trends helped shape the direction and character of subsequent biological research. As with many other sciences in the

postwar period, the dominant site of activity in the biological sciences had shifted from its older European centers in Germany, France, and England to the United States. At the height of the Cold War, the Soviet launch of the Sputnik satellite drove a panicked U.S. government to offer even stronger support of scientific research. The biological sciences, too, benefited from this turn of events and received generous funding for research and biological instruction. Textbooks such as the popular Biological Sciences Curriculum Study drew on a virtual industry of biologists and educators to produce a series of widely read and influential textbooks for American high school students. Research in the United States continued at specialized research centers such as that at Cold Spring Harbor (in 2004 a center for molecular biology) and more traditional research settings including public and private universities, land-grant colleges, hospitals and medical centers, museums and gardens. In university education, biology as a subject area is considered so vital that it has become a requirement for general education programs. It is rapidly becoming one of the most popular majors for university students not just in the United States but worldwide.

Despite arguments for the unity of the increasingly diverse biological sciences, controversies and debates erupt between biologists about fundamental concepts in the biological sciences. Differences are especially pronounced between more reductionistic, physicalist, laboratory-driven, and experimental sciences such as molecular biology and biochemistry and more integrative, field-oriented, observational, and historical sciences such as evolutionary biology and ecology. In the mid-1960s, university biology departments became divided over differences in conceptual foundations, goals, methodology, philosophy, and scientific style. As a result, at locations such as Harvard University, departments of biology formally divided into departments of molecular biology and organismic biology, an area defined as an integrative approach to the biological sciences that includes a strong historical and ecological component. Roughly at this time ecology—a science of enormous

heterogeneity drawing on a range of approaches, practices, and methodologies and rooted in questions pertaining to adaptive responses to varying environments—became integrated with evolutionary approaches and instituted in departments of ecology and evolution. Often located within ecology and evolution departments are systematics and biodiversity studies, a newer area concerned with biodiversity, including classification and conservation.

In 1961 the evolutionary biologist, historian, and philosopher Ernst Mayr, reflecting on some of these growing differences between biologists, provocatively suggested that biology in fact comprises two sciences. The first is a biology based on proximate causes that answers questions of function (molecular biology, biochemistry, and physiology). The second is a biology based on ultimate causes that seeks historical explanation (evolutionary biology, systematics, and the larger discipline of organismic biology). While the biology of proximate causes is reductionistic and physicalist, the biology of ultimate causes is historical and is characterized by emergent properties. Much of Mayr's reflections on the structure of the biological sciences has formed the backbone of the history and philosophy of biology and has made its way into some textbooks in the biological sciences. While vitalism is no longer tenable in biology, there is considerable support for the belief that complex properties emerge from simpler strata in biology and for the idea that such emergent properties are useful in explaining life.

BLACK ATLANTIC. In writing *The Black Atlantic: Modernity and Double Consciousness* (1993), Paul Gilroy sought to devise a theoretical approach to understanding race that encompassed three crucial elements. First, the idea of race as fluid and ever-changing, rather than static; second, the idea of race as a transnational and intercultural, rather than strictly national, phenomenon; third, the focus on analyzing resistance to racism as a phenomenon that emerged transnationally and diasporically.

Gilroy seeks to provide a theoretical rendering of race that bridges the hemispheres. To this end he takes the Atlantic as his preferred unit of analysis and uses it to ground his transnational perspective on race. In Gilroy's analysis the black Atlantic represents the history of the movements of people of African descent from Africa to Europe, the Caribbean, and the Americas and provides a lens through which to view the ways that ideas about nationality and identity were formed. Thus, in *Black Atlantic* the focus is on intercontinental trade and travel as well as on processes of conversion and conquest and the resultant forms of creolization and hybridization that occur.

The author maps the Atlantic Ocean as a way to catalogue a whole series of transoceanic transactions and exchanges in the past and in the present and in so doing seeks to move beyond racially essentialist ways of thinking which posit an unvarying, pure, and singular black (or African) culture. In positing the syncretic and hybrid nature of black culture and the deep connections between the formation of modernity and the formation of black culture, Gilroy points to the fact that modernity is itself a profoundly hybrid phenomenon.

The idea of movement is central to Gilroy's argument. Hence, the image of a ship forms a central metaphor in the text. Gilroy describes ships as micropolitical and microsocial systems that focus one's attention on the circulation of ideas as well as identifying them as cultural and political artifacts. Slave ships are particularly central to Gilroy's argument as he posits slavery as a pivotal moment for the emergence of modernity, modern ideas of race, and the *Black Atlantic* as, in his words, "a counterculture of modernity." By a counterculture of modernity, Gilroy refers to the varied ways in which people of African descent responded to and resisted the fact that, in the modern West, racial terror and reason were so deeply connected. It was this yoking together of racism and modernity that led people of African descent across the globe to search for ways to construct oppositional identities, particularly through music, which Gilroy identifies as being the preeminent nontextual form through which African people not only confronted racially repressive social systems but also retained a sense of cultural integrity and forged common cultural memories.

Intellectual Antecedents

Gilroy was not the first scholar to stress the importance of understanding race as a phenomenon that both emerged and was resisted transnationally. Scholars like W. E. B. Du Bois, Eric Williams, and C. L. R. James and Frantz Fanon examined the ways in which slavery and racism were pivotal to the formation of Western modernity. These scholars focused not only on the economic importance of Atlantic slavery to the formation of the West but also on the ways in which blackness was absolutely necessary for the construction of whiteness as an identity. Du Bois and James were also concerned to document the myriad ways in which the black diaspora communities, in their attempts to construct artistic and aesthetic responses to racism, played a critical part in developing the cultural institutions of the West.

Scholars connected with the negritude movement echoed their efforts, focusing on the unique cultural contributions that they attributed to the so-called African personality. Leroi Jones (Amiri Baraka) likewise pioneered the study of the music of the African diaspora, documenting the various ways in which it allowed for the articulation of a complex, albeit nontextual, response to racism. Scholars like Stuart Hall, who brought the insights of Du Bois and Williams to bear on British cultural studies, further developed these ideas. Hall was particularly instrumental in developing an approach to the study of race and culture which sought to understand race as an ideological system which should be analyzed in its political, social, and economic dimensions and black culture as simultaneously heterogeneous and connected.

Intellectual Impact

The concept of the *Black Atlantic* has been enormously influential. Gilroy's focus on the heterogeneous nature of black expressive culture has significantly broadened the field of cultural studies, forcing it beyond its parochial concern with either the cultures of working class Anglo-Saxons or European high culture. The manner in which Gilroy places slavery at the center of Western modernity, racializing and thus fundamentally transforming Georg Wilhelm Friedrich Hegel's rendering of the master-slave dialectic has, likewise, been enormously influential in the field of philosophy.

Gilroy's particular focus on the revolutionary struggles of African-descended peoples has also been enormously influential in the field of labor history, broadening it to examine the histories of the struggles of those other than white European or American working people. His focus on music as a modality through which cultural memories are retained and passed on (in form if not in content) has also been influential in the field of history, opening up new possibilities for uncovering the histories of cultures that place a higher priority on oral, rather than written, forms of communication.

The ideas that underlie the notion of the *Black Atlantic* have also been enormously important in the emerging field of transnational cultural studies. Scholars like Arjun Appadurai, George Lipsitz, and Donna Haraway have furthered Gilroy's emphasis on the intersections between local and global cultural dynamics, examining the global circulation of ideologies, people, technology, capital, and culture. Gilroy's work also played an important role in the emergence of postcolonial studies, much of which took a transnational analysis of the idea of race as its central theoretical concern. Thus, the influence of Gilroy can be seen in the work of scholars like Anne McClintock, David Theo Goldberg, Jean and John Comaroff, Catherine Hall, and Anne Laura Stoler, whose work examines the intertwined histories of colony and metropole and the ways in which ideas about gender, race, and class emerged both transnationally and dialectically. Gilroy has also provided an important challenge to dominant ways of thinking within the field of African-American studies. His critique of essentialist thinking about race has proved to be particularly challenging to devotees of Afrocentrism.

Critiques

Although widely applauded for his intellectual innovations, Gilroy is not without his critics. Some African-Americanists have accused Gilroy of failing to understand the complexities of the African-American experience and, thus, of having underplayed the unique and enduring historical connections between Africans and African-Americans in his effort to highlight flows, indeterminacy, and contingency. The work of feminist scholars has also highlighted the androcentric nature of Gilroy's inquiry; men exemplify the Atlantic experience. Yet, the work of scholars like Vron Ware and Catherine Hall indicates that the women within the abolitionist movement, such as Ida B. Wells Barnett and Charlotte Grimké, were equally important exemplars of precisely those processes of exchange that Gilroy highlights in his text. Gilroy talks about the abolitionist movement as an example of the counterculture of

modernity as well as a transnational movement organized around race struggle. Although Gilroy provides many insightful observations about how gender was implicated in the production of both blackness and modernity, these insights are not central to his thesis and oftentimes remain unexplored. Robert Reid-Pharr notes, for example, that Gilroy fails to examine the ways in which thinkers like W. E. B. Du Bois, Martin Delaney, and Frederick Douglass conflated the regeneration of the black nation with the regeneration of the patriarchal black family.

Yet another criticism of Gilroy's work has been that the concept of the *Black Atlantic* is too narrowly focused on the experiences of blacks as minorities in the United States and Great Britain. Thus, the *Black Atlantic* proceeds from the assumption that diasporic black communities are necessarily minority communities. This assumption does not, however, hold true for people in the Caribbean. Furthermore, as Nadi Edwards points out, the ways in which Gilroy makes Afrocentric nationalism (which he opposes) the polar opposite of cultural syncretism (which he celebrates) ignores cultural developments such as negritude, which, although essentialist, also celebrated syncretism and hybridity.

Other scholars have pointed out that a narrow focus on the traffic that occurred across the Atlantic Ocean makes it impossible to understand the totality of the black experience. Françoise Vergès has pointed out that the islands of the Indian Ocean also offer important insights for understanding intercontinental trade and migration, as well as for understanding processes of conquest, conversion, and creolization. The Indian Ocean, like the Atlantic, offers a space for exploring various types of seaborne transactions and exchanges and opens up a space for thinking about the ways in which Africa interfaced not only with the Americas and Europe but also with India and South and East Asia. It also provides an opening for exploring how Africa interacted not only with the Christian, but also with the Islamic, world.

BLACK CONSCIOUSNESS. Black consciousness is the name of a black nationalist political movement originating in South Africa during the 1960s and 1970s. It proclaimed the necessity of black South Africans to rely on themselves for liberation and to claim South Africa as an African nation. Black consciousness drew on a tradition of black nationalist thought in South Africa associated with Africanist political movements and emerged during a time when the older antiapartheid movements, especially the African National Congress and Pan-African Congress, had been driven deep underground by state repression. It also drew on the rhetoric and ideology of black power and black theology coming out of the United States in the 1960s.

Stephen Biko (1946–1977), a former medical student, served as its most important leader and philosophical guide. The movement emphasized black self-reliance in the struggle against the racist apartheid system in South Africa. Many of the participants in the Soweto uprisings of 1976 espoused support for black consciousness. The suppression of that movement and especially Biko's death while in police custody in 1977 weakened the organizational base of the movement. Many of its supporters went into exile, where they mostly joined the larger African National Congress (ANC), the biggest of the movements fighting for majority rule in South Africa. Those that remained in South Africa became active in civic organizations that made up the United Democratic Front during the 1970s and 1980s. Biko himself became an international icon in the struggle against apartheid, and was celebrated in popular music, a best-selling book, and a motion picture. While the movement left little long-term institutional impact, its message of black empowerment helped mobilize the younger generation in the struggle. Its popularity forced the ANC to adopt a more populist approach to the struggle and helped create the basis for the mobilization of the 1980s, which succeeded in forcing the Apartheid regime to free ANC leader Nelson Mandela (b. 1918) and negotiate a relatively peaceful transfer of power. Likewise, the term *black consciousness* entered the lexicon of Pan-African political discourse.

Black consciousness developed out of a long tradition of racial nationalism in South Africa. Liberation movements in South Africa operated within a tension between a liberal and multiracial or nonracial view of the struggle against white domination and a more "Africanist" conception of the struggle. The former emphasized solidarity among all the peoples of South Africa, including progressive whites as well as Asians and "coloreds." The oldest and largest liberation movement, the African National Congress, generally espoused this philosophy even as it became more radically socialist in its politics after World War II. Nonracialism was enshrined in the Freedom Charter of 1955

(along with socialism), giving the movement its alternate name of Charterist. Africanist critiques emerged by the 1920s. They argued that South Africa was an African nation occupied by colonial settlers who had no inherent right to be there. Activists such as Anton Lembede (1914–1947), founder of the Congress Youth League (CYL), often called on the communal traditions of African societies as well as external advocates of black autonomy such as Marcus Garvey (1887–1940) and Booker T. Washington (1856–1915), as their inspirations. The Congress Youth League movement of the ANC in the 1940s brought together young activists who promoted a more Africanist view of the struggle, often pitted against an older ANC leadership that sought allies among liberal whites in South Africa and socialist governments abroad. The CYL movement eventually led to a split in the ANC. One faction, led by Robert Sobukwe, broke off and formed the Pan-African Congress. The rest, led by Nelson Mandela, Walter Sisulu, and Oliver Tambo, gradually took control of the ANC and pushed it to more active resistance in the face of the tightening of Apartheid. They, however, converted to (or remained loyal to) the general Charterist position on nonracialism. The smaller Pan-African Congress (PAC) during the 1950s tried to press for even more direct mobilization against apartheid. The massacre of at least sixty unarmed PAC protesters in 1960 at Sharpeville resulted in the suppression of both the ANC and PAC in South Africa, imprisoning or driving into exile most of the leaders and activists of those organizations.

The early 1960s saw a period of relative quiet in black activism in South Africa. Biko and other black students developed the concept of black consciousness in the later 1960s on the segregated university of campuses of South Africa. By the mid-1960s, the National Union of South African Students (NUSAS) was one of the few national institutions still integrated and engaged in activism for change. However, NUSAS's leaders came primarily from the English-speaking white universities of South Africa and followed a liberal, moderate anti-apartheid program. Black students, including students from Indian and coloured campuses, felt the organization was becoming less concerned with political change and more with narrow university issues. In 1967, at a meeting of NUSAS at Rhodes University in Grahamstown, the university administration required the students to use segregated facilities. In response, black students led by Biko, Barney Pityana, and Harry Nengwekulu helped found the all-black South African Students' Organisation (SASO). Biko emerged as the leading spokesman of the group. He was a medical student at the University of Natal Medical School, Black Section.

After 1969, the black consciousness movement called for blacks to liberate themselves psychologically first. It claimed many black people had internalized ideas of inferiority and dependency from the racism of apartheid. Once black people had come to believe that they had the right and power to stand up for themselves, they would then be able to take power in their own hands. One of the principle targets of the movement was the perceived dependence of blacks on white liberals to speak for them. Biko stated, "Merely by describing yourself as black, you have started on a road towards emancipation, you have

committed yourself to fight against all forces that seek to use your blackness as a stamp that marks you out as a subservient being." Biko argued that only blacks (and he included the non-African peoples of color in South Africa in this definition) were truly oppressed in South Africa and that white liberals generally sought to play the role of gatekeepers toward blacks. The movement drew to some extent on the ideas of "Africanist" critics of the nonracialism of the ANC such as Sobukwe of the PAC as well as the ideas of black power and the black theology movement in the United States. Like the PAC, the black consciousness movement also criticized the close alignment of the ANC with the South African Communist Party and the Soviet bloc.

After 1969, the black consciousness movement began to gain at least nominal adherents throughout the black population of South Africa. Black consciousness adherents created a number of organizations dedicated to political mobilization and community service. They operated in an environment where the South African government kept a close watch on black organizations and had to be careful about both their words and their actions lest they call down the repressive state apparatus on themselves. In addition to SASO, the Black People's Convention, founded in 1972, created an alliance of over seventy organizations dedicated to black consciousness, including new, often unrecognized, labor unions and the South African Student Movement that included secondary school students. Biko became the head of the organization, and the South African government promptly "banned" him, a sentence that restricted him to his hometown of King William's Town in what is now the Eastern Cape Province and severely limited his ability to remain in contact with other members and organizations in the movement. The University of Natal also expelled him from medical school.

The resonance of black consciousness's call for pride and self-reliance helped create the conditions that led to a wave of anti-apartheid unrest by 1976, despite the absence from the active political stage of leaders like Biko. A wave of strikes by black workers swept through the country in 1975 and 1976, and they were often led by "unofficial" unions affiliated with the black consciousness movement. In 1976, the government announced that henceforth it would require the teaching of Afrikaans, the Dutch-based language of white Afrikaners, instead of English in many black schools. Many blacks saw this as an effort to keep them isolated. Students in the township (a suburb designated for blacks only) of Soweto outside Johannesburg began a boycott of classes. Confrontations with the police led to a broader mobilization in favor of school and work stay-aways. Between 16 June and October of 1976, violence spread to townships in many parts of South Africa. Even though the government dropped its requirements on the use of Afrikaans, the movement took on the air of a general uprising. By the end of 1976, the South African government reported over 500 people had died in the violence, a figure many think is much too low to be accurate. Regarded as the guiding light of the uprising, although due to the banning order not particularly involved in its planning, Biko himself was arrested four times during this period, the final time in August

1977. Then, he was beaten repeatedly, suffered head injuries, taken in the back of a Land Rover to Pretoria, and died on 11 September 1977. The government denied responsibility for his death. Only with the work of the postapartheid Truth and Reconciliation Commission in South Africa almost twenty years later was formal responsibility for Biko's death laid at the feet of the police.

Black consciousness organizations and supporters came under extreme pressure after the 1976 uprisings. Many went to prison; many others went into exile. In both places, they began to drift into ANC-led circles. The ANC, for its part, adopted a more populist attitude toward mobilization. In South Africa, organizations affiliated with the black consciousness movement provided the basis for community organizations that continued the struggle against apartheid. Tensions remained between the ANC's commitment to the Freedom Charter, which called for a socialist and nonracial future for South Africa and these organizations and adherents. Some supporters of black consciousness created the Azanian People's Organization (AZAPO), which claims to be the main heir to the black consciousness movement. This movement in the 1980s and political party in the 1990s remained small.

Black consciousness represented a South African response to the conditions of 1960s apartheid. Its leaders drew on a range of ideas from abroad and from the past to shape their version of racial nationalism. Yet the influences of black power and black theology in the United States, the African nationalist movements that brought independence to much of the rest of Africa, revolutionary theorists such as Frantz Fanon (1925–1961) and Amílcar Cabral (1924–1973) merely contributed a language to what was an indigenous development. In its successful mobilization of mass protest, it forced the more widely recognized liberation movements to adopt a more populist and less rigidly ideological approach to the struggle. Likewise, its success at grassroots organizing, which again mirrored the efforts of some black power organizations in the United States, helped change the political landscape of South Africa. The main legacy of the movement remains its mobilization, especially of young people, in the 1970s as a prelude to the struggles of the 1980s that led to the end of apartheid. Nelson Mandela said at the twentieth anniversary of Biko's death, "The driving thrust of black consciousness was to forge pride and unity amongst all the oppressed, to foil the strategy of divide-and-rule, to engender pride amongst the mass of our people and confidence in their ability to throw off their oppression."

BLACK ORIENTALISM. *See Orientalism: African and Black Orientalism.*

BODY, THE. What is "the body"? If the question seems ridiculous to you, you are undoubtedly not alone. At any given time, in any given culture, most people have an intuitive, if not always easy to articulate, notion of what the body is, and probably regard that notion as shared by all human beings. The fact is, however, that human cultures have not only done an amazing variety of things to human bodies, but have imagined and experienced the nature, limits, and capacities of the human body—and its relation to the self—in extremely diverse ways.

For example, most people living in the early-twenty-first century West believe the body to be a border between the self and the external world, and one that houses only one individual self. Those whose experience departs from this are treated as suffering from a personality disorder. Many non-Western cultures, in contrast, do not regard the skin as an impermeable border between the individual and the natural world, and believe that the physical body may host multiple selves. Another example is the relationship of mind and body. Many cultural systems—Zen Buddhism is one—do not mark a radical distinction between mind and body. In contrast, mind/body dualism has been so thoroughly integrated into the fabric of Western culture that some may have difficulty imagining an experience of the self that does not partake of it.

From the significance of body parts to contemporary theory of the body, different conceptions abound. Neither "race," nor gender, nor sexuality is a universally uniform category. Different cultures imagine different organs as the center of bodily functioning, and privilege different senses; among the Suya of Brazil, for example, hearing is equated with understanding, as seeing is for Europeans and North Americans. And while contemporary biologists attempt to map a basic genetic blueprint, poststructuralists argue that the very notion of a biological body is a human invention.

From a philosophical and anthropological perspective—and to establish limits to an exceedingly broad topic—this ar-

ticle focuses on the intellectual, cultural, and political developments that various disciplines have regarded as landmarks in the history of the idea of the body.

A Brief Tour of Western Dualism from Plato to Plastic Surgery

Despite its familiarity, the notion that human minds or souls are fundamentally different from human bodies is a cultural construction that took many centuries to build. Arguably all human cultures, including prehistoric peoples, have had some concept of spirit residing *in* the body. But this does not yet imply belief in an immaterial substance distinct *from* the body. For many cultures, spirit is simply “aliveness,” the vital principle that animates all living things, from plants to humans, and is itself conceived as a kind of material substance. In both Homer and the Hebrew Scriptures, for example, the words *spirit* and *breath* are used interchangeably.

The notion of an immaterial substance that is separable from the body emerges in historical documents first as part of ancient Egyptian and Chinese beliefs in a “dual soul,” one aspect of which is joined to the body, while the other travels, after death, to the realm of the ancestors. Greek philosophers visited Egypt and were aware of such notions; their influence is especially striking in Plato (c. 428–347 B.C.E.), who believed that the soul exists both before the birth and after the death of the body. With Plato, however, it is no longer the realm of the ancestors in which the disembodied soul resides, but the world of true knowledge—the Forms. With this innovation, Plato introduces what was to become a central ingredient in later versions of dualism: the elevation of the life of the soul (or mind, or reason, depending upon the system) to the pinnacle of human achievement, with the body imagined as the enemy of its aspirations.

The body as enemy. For Plato, the body is the enemy of the soul primarily because it apprehends things through the senses—and the senses, notoriously, can lie, can deceive one into mistaking imperfect and transient versions—of love, beauty, and justice—for enduring realities. Reality, for Plato, is composed of eternal, universal Ideas that can only be seen with the mind’s eye, and so can only be known by human beings after death (or before life—Plato believed in reincarnation) when they are liberated from their bodily prison. But although Plato mistrusted the body’s perceptions, he revered the beauty of the human form and did not view the desires of the body, sexual or otherwise, as sinful. In the *Symposium* (360 B.C.E.), in fact, it is desire for another human being that first touches the philosopher with a passion for beauty, and initiates him into a quest for its timeless essence. The desires of the body, for the Greeks, are only a problem when they are permitted to overrule reason (as they were imagined, for example, to function in women). The Greek ideal was management of the desires of the body in the interests of self-mastery, not, as for Christian thought, denial of the desires of the body in the interests of purity.

Plato’s ideas about the body do not constitute a theory but must be patched together from remarks and arguments in various dialogues. For that very reason, however, they could be se-

lectively recruited—and significantly retooled—to serve later systems of Christian thought, where they have exerted a powerful historical influence. Saint Augustine (354–430) was a key architect of such ideas, which have shaped the theory and practice of many strains of Christianity, particularly Catholicism. In Augustine’s hands, Plato’s prison of the senses becomes the home of “the slimy desires of the flesh,” and the judicious management of sexual desire is replaced with the requirement to totally subdue the body’s “law of lust.” Judaic, African, Eastern, and Greek systems of thought had not viewed sexual desire as an impediment to spirituality, except with regard to an elite, ascetic caste of philosophers or priests, or when indulged in without restraint. Now what had been regarded as a natural human need became, at best, a necessary (to procreation) evil.

The body as machine. Despite their differences, the dualism of Plato and Augustine shared the ancient view of the living body—and the natural world—as permeated with spirit. René Descartes (1596–1650) was to decisively change that, in a reformulation of mind/body dualism that would herald the birth of modern science. For Descartes, the body is a mechanically functioning system with nothing conscious about it—simply the interaction of fluids, organs, and fleshly matter. Mind, in contrast, became pure consciousness—the famous “I think, therefore I am.” This was a separation far more decisive than anything imagined before, as mind and body became defined as mutually exclusive substances.

These abstract reformulations had enormous cultural consequences. For one, the human intellect became elevated to almost God-like status, as it could be imagined as capable—given the right methods of reasoning—of seeing through the illusions of the senses to the underlying reality of things. At the same time, the notion of the body as an intricate but soulless machine made radical experimentation and intervention less troubling to religious-minded scientists and doctors, and liberated human ambitions to explore, dissect, and correct the defects of nature.

In the early-twenty-first century, the body-as-machine is no longer just a guiding metaphysics or metaphor; it has become a material realization. Every day, in hospitals throughout the world, human body parts are being repaired, reconditioned, and replaced, sometimes by the organs of other humans, sometimes by machines. Normally automatic respiratory functioning, the cessation of which used to be a marker of the death of the body, now can be prolonged indefinitely by sophisticated life-support machinery. The domain of cosmetic surgery not only includes the correction of disfiguring accidents and birth defects, but prevention and repair of the physical effects of aging, the rearranging and contouring of face and body to particular beauty ideals, and even—very recently—the promotion of extreme makeovers, composed of multiple surgeries designed to produce wholly new physical selves.

Whatever one’s attitude toward such developments, what is clear is arrival of a “cyborg culture.” It is not only through the achievements of science that a cyborg culture has been established—or, as others would emphasize, the marriage of medical technology and consumer capitalism—but by virtue

of a conception of self for which the body is mere matter to be manipulated at the will of the true “I,” the “thinking thing.” Such living, historical connections between theory and practice make studying ideas about the body more than a scholarly exercise.

The Mind Embodied

From Plato to Descartes, the body has been imagined as merely attached to—and decidedly inferior to—an idealized intellectual or spiritual essence in which all hope of human accomplishment lies. In the background of this denigration of the body is the virtually obsessive need of Western philosophy and religion, until the nineteenth century, to distinguish “man” from “the animals.” Descartes is explicit: Animals have no soul, cannot think, and are mere bundles of instincts, prepackaged by God. The man/animal distinction was already there, however, in remarks strewn throughout philosophy and religion, and (with a few exceptions—for example, Thomas Hobbes and other early materialists) it gathered momentum after Descartes.

In the second half of the nineteenth century, however, the human being begins to be naturalized, imagined more as a complex animal than a potential God unfortunately trapped within a mindlessly craving material body. The foundational contribution to this transformation was Charles Darwin’s (1809–1882) theory of evolution, which demoted the human being from a fallen angel to a species that had evolved from other forms of animal life. Evolution not only placed human beings on a continuum with the “mindless” creatures from whom philosophers and theologians had struggled to distinguish them, but suggested that their vaunted, God-like intellect was merely the result of a larger brain, itself the product of environmental contingencies that had allowed certain biological features to “survive” over (that is, outproduce) others.

Not a Darwinian *per se*, Frederick Nietzsche (1844–1900) insisted forcefully on the instinctual nature of the human being, and far from regarding it as base or evil, viewed it as a force for life and an essential dimension of creativity. He mocked the notion that humans can attain disembodied existence or pure spirit, and mounted a fierce attack on those philosophers and priests who (as Nietzsche viewed it) had made life-denying, ascetic values the standard of human perfection, all the while seeking their own earthly power. For Nietzsche, such “will to power” was a positive thing, so long as it was joyously embraced in oneself and allowed to flourish in others; what he despised about the priestly caste—those “despisers of the body,” as he called them—was their professed humility and meekness, even as they dictated the terms of existence for their followers.

With this critique, Nietzsche introduced two themes concerning the body that were to become increasingly prominent in modern and postmodern thought. For many intellectuals, both before and after Nietzsche, the history of philosophy and religion has been imagined as a conversation between disembodied minds (or, more colloquially, talking heads); not only are the class, race, gender, and historical period of participants considered irrelevant to their ideas, but so are emotional attachments, self-interest, and personal history. The seeker of

Truth is supposed to be above all that. Nietzsche was the first to insist that such transcendence of embodied existence is impossible, “The eye that is turned in no particular direction,” he wrote, “is an absurdity and a nonsense. . . . There is only a perspectival seeing, only a perspectival knowing” (p. 119). Such notions have played a central role in twentieth-century critiques of Western culture mounted by feminists, deconstructionists, and Foucauldians.

The instinctual body. The second body theme Nietzsche introduced, which Sigmund Freud (1856–1939), the father of psychoanalysis, was to elaborate and systematize, is the high price human beings have paid in the process of becoming “civilized.” For Nietzsche, a decisive historical moment was the banishing of the Dionysian element—ecstatic surrender to the body, the unconscious, and the erotic—from Greek culture. Freud, unlike Nietzsche, viewed the repression of (sexual and aggressive) instinct as necessary to the preservation of human community and order. But he agreed with Nietzsche that the cost of instinctual repression in the interests of civilization was “discontent”—neurosis, depression, phobias, psychosomatic conversions, and just plain “ordinary unhappiness” (as he termed the usual condition of modern man). Much of Freud’s writing describes the developmental stages—both in the individual and in the species—that inevitably take the human being from an instinctual existence devoted to “the pleasure principle” through stages of renunciation and accommodation to the demands of reality (which Freud believed were unable to gratify all human needs, even in the most permissive society) and morality (first experienced through parental authority, later internalized as the super-ego).

Freud represents, in many ways, a synthesis of several of the trends outlined in this article so far. In the tradition of Judaic and Greek thought (and unlike Augustine), he did not regard the desires of the body as sinful. Like Darwin, he looked to nature, not God, to understand the design of the human being, and described what he believed he had found with the dedicated detachment of the Cartesian scientist. Like Plato, he believed the “higher” accomplishments of humanity—art, music, literature, philosophy—require the sublimation (or redirection) of the body, from the original aim of sexual fulfillment to the less intense gratifications of art and intellect. But like Nietzsche, he was continually drawn to the exploration of the underside of progress—the unconscious drives and desires, never fully banished from human life, and a constant reminder of the primacy of the body.

The lived body. Another philosophical spokesperson for the primacy of the body—but with a very different understanding of that primacy than Darwin, Nietzsche, or Freud—was Maurice Merleau-Ponty (1908–1961). Merleau-Ponty, in the tradition of philosophical phenomenology, did not believe the human body could be reduced to a scientific or social object of study. What such perspectives left out, he argued, was what phenomenologists call “the lived body.” From the perspective of the lived body, human beings do not *have* bodies (as they might possess hats or coats), they *are* bodies; and as bodies, are more than physically encased minds or collections of instinct. Rather, bodies are the medium of human experience,

first called into question the universality, not just of Freudian theory, but of the Western tendency to regard the body—sexuality in particular—as a source of unruly impulses that are fundamentally in tension with the need for human order.

Mead and Mauss. Margaret Mead's (1901–1978) pioneering research in Samoa and New Guinea, for example, was concerned with debunking Western ethnocentrism, including with regard to sexuality. In Samoa, Mead (1928) found that adolescence was not a period of rebellion from parents, nor was adolescent sexuality fraught with the moral constrictions of the West. By revealing the more relaxed child-rearing practices and less rigid sex roles in Samoa and New Guinea, Mead critiqued American patterns and called for their modification.

Marcel Mauss's (1872–1950) reflections on cross-cultural variations in what he called “techniques of the body” constituted another important moment in the development of anthropological thinking about the body. Mauss noted (1934) that while, universally, people successfully hold themselves upright, walk, gesture, talk, and eat, the precise renderings of these activities varies from one society to the next. Later (1938), he formulated the important distinction between the self (*moi*) and the social or culturally constructed person (*la personne*). The former refers to individuals' private, personal sense of themselves; the latter to the cross-culturally variable ways in which societies define the contours of individuals, such as expectations and rights varying by gender and life stage; the degree to which cultural members are perceived to be connected to one another and to nature; and beliefs about the human soul, its essence and location, and how it and the souls of deceased relatives influence the affairs of the living.

Personhood has been the realm of rich sociocultural research, yielding cross-cultural data with myriad implications. For example, in preindustrial societies, where perceptions of the demarcation between nature and culture, and between the living, deceased, and yet-to-be-born, are more gradual than in the postindustrial West, the proper or improper actions of humans are perceived to directly influence the well-being of entire communities (including the spirits of the dead and future generations), and nature's bounty and benevolence as well. A closer connectedness to the suprahuman world is expressed through the greater homage paid to its deceased, to widely varying burial practices centered on the corpse, and to a host of prescriptions and proscriptions concerning the bodies of the bereaved, which vary by gender and kinship status.

Biology and culture. With Mauss, Mead, Bronislaw Malinowski, Ruth Benedict, and others leading the way, anthropologists began to accumulate a storehouse of knowledge concerning the tremendous cultural variation that exists in ideas about the body and their corresponding implications for attitudes toward and practices of sexuality, reproduction, abortion, infanticide, child mortality, breast-feeding, child-raising, pawnship and slavery, and gender roles. It was from such cross-cultural knowledge that anthropology's concept of the body emerged. It is one that sees the corporeal body and its con-

through which they engage with their surroundings. Merleau-Ponty, unlike Plato or Descartes, was not concerned with some reality beyond or behind the way things appear, but with the way the world is given to embodied beings. For many twentieth-century continental philosophers, this was the definitive rejection of dualism; by doing away with “two worlds” and concentrating on the world as it appears to us, already saturated with the meaning that bodies give it, Merleau-Ponty reunited mind and body and made them natural allies in the quest for understanding.

Culturally Variable Bodies

Freud drew his conclusions about the inevitable struggle between ego and id from his own psychiatric practice, largely composed of well-to-do Victorians whose problems, arguably, were more the product of the culture they lived in than universal forms of human discontent. The point seems obvious in the early twenty-first century, after half a century of criticism of the many questionable assumptions about gender, class, and sexuality contained in classical Freudian theory. Many people associate such criticism with feminism—and indeed, feminism played a major role in placing Freudian theory in historical perspective. But it was anthropologists who

THE SOCIAL SKIN

Mary Douglas's work, as well as feminist deconstructions of the meanings contained in representations of the female body, inspired a generation of anthropologists and cultural theorists to explore the human body as a text that can be read to reveal a great deal of cultural information. This symbolic function of the body applies not only to the taboos and rituals described by Douglas, but to parts of the body, to representations of the human body—in artworks, medical texts, racial ideology, and advertisements—and to decorations and modifications of the flesh, from ornaments, hair fashion, cosmetics, masking, costuming, tattooing, piercing, and scarification, to body fattening or thinning, muscular development, and cosmetic surgery. However extreme or seemingly whimsical the practice, it always has meaning, always is shaped by the sociocultural context in and through which people act. Anthropologist Terence Turner called this dimension of the body the “social skin,” a concept that applies just as aptly to the nineteenth-century corset and twentieth-century implants as to the traditional neck rings of the Karen peoples of Burma or lip plugs of the Amazonian Kayapo.

A key difference between the body modifications of traditional societies and those of post-modern culture is that the former are dictated by group membership and are nonnegotiable by individuals. The status-significance of the size of Ethiopian lip-plates among brides-to-be is set by custom, as is who may engage in such modification. In contrast, many contemporary body modifications based on traditional practices—piercing, scarification, and tattooing—are freely adopted for their potential to express an

individual's choice of alternative values or group identifications. Other contemporary modifications—for example, exercising to change the shape or fat composition of the body, or having one's face lifted to achieve the appearance of youth—are freely engaged in and (in principle) open to members of all social groups, but reflect norms of beauty to which there is considerable pressure to conform. Those who resist or cannot afford to conform pay a stiff price, in lesser access to jobs, mates, and social power.

Whether traditional or contemporary, all body modifications carry meaning, expressing cultural ideals (and anxieties), racial biases, social status, and membership in particular groups. Those meanings may be complex—both female slenderness and male muscularity, for example, are arguably overdetermined to be attractive in the late twentieth and early twenty-first-century context for reasons having to do with anxiety over changing gender roles, the increasing association of bodily discipline with self-control and power, and the moral valuation of leanness in a “super-sized” culture of indulgence (Bordo, 1993, 1999). Bodily meanings are also unstable and highly context-dependent, raising questions about the changing politics of the body: Does hair straightening by blacks, for example, have the same significance in 2004 as it did when “natural” styles were an expression of racial pride? There is no one answer to a question such as this; different analysts will interpret such practices differently. But however controversial or layered, no bodily style can be considered to be “just fashion,” the expression of meaningless or arbitrary taste.

stituent parts, as well as its movements, gestures, needs, and desires as inextricably both physical and sociocultural. While language, social interaction, eating, drinking, and sexual activity are primary needs for which human bodies contain intrinsically biological capacities, none of these primary needs can be undertaken apart from culture. Thus the physical body is never just a biological organism. It cannot be, because human beings, as Clifford Geertz has observed, “are caught in the webs of significance that they themselves weave” (p. 5).

So, for example, while human differences in skin color, hair texture, and body size and shape have been variably selected by the pressure of different environmental conditions, there is no biological basis for the racial classifications that have been built upon those differences. Such classifications arbitrarily abstract particular phenotypical traits from a human array that is both much more varied and much more continuous than the concept of race allows. Race is not a biological “fact” but an idea—an idea around which an elaborate web of signifi-

cance, with enormous and destructive consequences for the treatment of human beings, has been woven.

The classification and regulation of sexuality and gender, too, always involve the mediation of meaning, of human ideas, in the physical or biological realm. For example, as Malinowski first showed through his groundbreaking ethnographic research among the Melanesian Trobriand Islanders, ideas about conception affect patterns of sexual control. In matrilineal societies, in which the female is believed to contribute the blood—commonly thought to be the substance that ties lineal descendants to one another—to the fetus, female sexuality is not as strictly controlled as in patrilineal societies, where descent is believed to pass through males. In patrilineal societies, female sexuality tends to be closely monitored to insure that the line remains pure of foreign male intrusion. Depending upon the multitude of ways in which patriliney is interpreted, this monitoring may range from the moral sanction that sexual intercourse be confined to marriage, to the female bodily coverings of Muslim societies, to sharply segregating the sexes, or to various forms of female circumcision that, while often performed as a rite of passage, have the effect of decreasing sexual pleasure.

Research on male same-sex intercourse also highlights how similar physical acts can have widely differing social meanings. In some Latin American cultures, males may perform same-sex acts, but according to machismo ideology, it is only if a male plays the role of the passive partner that he is considered to be a homosexual. Among the Sambia of Papua New Guinea, on the other hand, where the conception of the human body is rooted in bodily fluids, same-sex intercourse isn't even considered sexual but is a ritual of maturation. Within this system, as Gilbert Herdt's research demonstrates, adult men are believed to be created through male elders' constant insemination of boys.

The cross-cultural evidence produced by anthropologists is a powerful argument against the notion that there is a single human body whose blueprint is invariant across history and culture. Evolutionary psychologists may argue that patterns of mate selection, gender differences, and even ideals of beauty are universally inscribed in human genes, but most contemporary biological and social scientists believe that whatever the role of biology—and many consider that role significant—it never manifests itself in pure form, untouched by the guiding, shaping, and disciplining hand of culture. Even such phenotypical results of the genetic code as human height, stature, weight, as well as physiological processes such as sexual orgasm and the onset and cessation of menstruation are more responsive to the socioculturally determined physical environment than was previously thought.

Many psychologists and biologists, too, now believe that genetic determinism does not square with the facts of human physiology. The human brain is extremely large; thus if humans are to squeeze out of their mothers while it is still possible to get through, most of the neural maturation must occur after birth. In the first two years of life, the brain fixes countless synapses it didn't have at birth, while weeding out many

others. Which connections are reinforced and which atrophy is the result of the infant's (unavoidably cultural) experience, not inalterable hardwiring that maintains its timeless demands regardless of the particularities of environment and upbringing.

Politics Re-Conceives the Body

Environment and upbringing, of course, include patterns of social inequality. A new attention, not merely to the shaping and disciplining hand of culture, but to the body's role in the maintenance of (and resistance to) the inequalities of gender, race, class, and sexuality was a keynote of the political, social, and intellectual movements of the 1960s and 1970s.

Black Power, Women's Liberation, and the politics of the body. For example, Black Power, a movement that raised consciousness of racist aesthetics and ignited the "Black is Beautiful" philosophy, extended the conception of racial politics to include the body. Until the emergence of Black Power, the struggle for civil rights in the United States had focused on legal obstacles to equality. But Stokely Carmichael and others insisted that this was not sufficient, that blacks must reclaim the cultural heritage and pride that slavery had robbed from them, that they must decolonize their bodies and souls. As people became aware that racism had left its imprints on the body as well as on social institutions, that then-dominant standards of beauty—light skin, blue eyes, straight hair, narrow noses—were as much an expression of white dominance as "whites only" drinking fountains and bathrooms, allowing one's hair to go "natural" began to be seen as a political act.

Taking their cue from Black Power, early second-wave feminists (or women's liberationists, as they were then called) began to redefine the gendered body in political rather than biological terms. The 1950s had been rife with ideology about woman's nature, true femininity, and the horrible consequences of deviance from them. In the late-1960s, these notions, and their bodily accoutrements—speaking softly, moving gracefully, deodorizing, plucking, shaving, and decorating the body to appeal to men—began to be seen as training in subservience and central to the social production of gender. "In our culture," wrote Andrea Dworkin in 1974, "not one part of a woman's body is left untouched, unaltered. No feature or extremity is spared the art, or pain, of improvement." This constant requirement to modify and enhance one's body, she went on to argue, is not merely cosmetic, but disciplinary, as it prescribes "the relationship that an individual will have to her own body . . . her motility, spontaneity, posture, gait, the uses to which she can put her body." Anticipating both Foucault's description of "docile" bodies and later feminist arguments about the "performative" nature of gender, she described "the experience of being a woman" as a "construct" and a "caricature" created not by nature, but arising out of the habitual practices of femininity (pp. 113–114).

This was a pivotal moment in the history of the idea of the body, and hardly confined to Dworkin's work. Plato, Aristotle, and Hobbes had collectively created the metaphor of "the body politic," comparing the state to a human body, with different organs symbolizing different functions, forces, and so on. Authors such as Dworkin, Germaine Greer (whose

book *The Female Eunuch* [1970] was the first systematic exploration of the social construction of the female body), Anne Koedt, Shulamith Firestone, Angela Davis, Mary Daly, Barbara Omolade, and Adrienne Rich collectively inverted the metaphor, imagining the female body as itself a politically inscribed entity, its physiology and morphology shaped by histories and practices of containment and control—from foot-binding and corseting to rape and battering to compulsory heterosexuality, forced sterilization, unwanted pregnancy, and the gender-specific abuses of racism and slavery. The “politics of the body” was born.

Gender and the body: from Beauvoir to Butler. Simone de Beauvoir (1908–1986) was the first philosopher to insert gender into discussions about the body, connecting the social subordination of woman to the cultural associations and practices that tie women to the body, weighed down and imprisoned by her physiology (while men imagine they can transcend their own biology and physicality to commune with pure ideas). The association of woman with nature and body—particularly reproductive processes—became an important theme of early feminist theory throughout the disciplines. Some of the most influential contributions include Susan Griffith’s *Woman and Nature* (1978), Dorothy Dinnerstein’s *The Mermaid and the Minotaur* (1976), and anthropologist Sherry Ortner’s “Is Woman to Man as Nature Is to Culture?” (1974). Ortner argued that menstruation, pregnancy, childbirth, lactation, and breastfeeding are biological processes that everywhere in the world tie women to nature in ways that male biology and physiology do not. Hence cultures everywhere interpret women as closer to nature than men. Because people universally value culture over nature, men are thereby awarded more prestige than women.

Ultimately such notions were challenged in the 1980s and 1990s, as feminist anthropologists turned their attention to the myriad ways that women’s (and men’s) reproductive biology and physiology have been interpreted through different “webs of significance” (to use Geertz’s phrase) throughout the world. Their projects reflected an “anti-essentializing” turn in feminist thought that became a unifying project among postmodern feminist scholars throughout the disciplines, skeptical of generalizations about gender and more attuned to the variable cultural structures and assumptions through which human bodies are perceived, experienced, and socially organized.

“One is not born, but rather becomes, a woman,” wrote Simone de Beauvoir in 1952 (p. 301). In retrospect, one can see much of feminist thought since the early 1970s as an elaboration of this idea, from early-second-wave writings on the socialization of Western women—Vivian Gornick and Barbara Moran’s path-breaking *Woman in Sexist Society: Studies in Power and Powerlessness* (1971)—to feminist anthropologists’ more global perspectives on gender symbolism and sex-role organization, to bell hooks’s protests against white-biased assumptions about womanhood, to Iris Young’s studies on the phenomenology of female embodiment, to Judith Butler’s enormously influential work on the performative nature of gender.

Butler’s work was not entirely original. Both Erving Goffman and other feminists had articulated what were essen-

tially performative theories of gender—the notion that there is no stable, essential reality behind the (culturally constructed) acts that constitute gender identities. But by crystallizing, elaborately theorizing, and attaching a set of specific technical terms to ideas that had been in the air for some time, Butler seized a moment that was ripe for being marked as a new turn in feminist and postmodern theory. She also pushed anti-essentialism and social constructionism one step further than others, arguing that not just gender but biological sex has no “core” reality. For Butler, the illusion of such a core—the belief that sexual bodies have a “natural” heterosexual configuration—is itself produced by constant repetition of the bodily gestures and practices that create sexual identity. For Butler, not only are man and woman “made” by cultural discourse and practice, but so, too, is the illusion of their biological reality.

The body as symbol of society: Mary Douglas. Until the 1960s, philosophers, cultural theorists, and anthropologists had incorporated observations, perspectives on, and ideas about the body in their work. But it is only in the 1960s and 1970s that the body itself became a focus of systematic theorizing. A foundational figure in this development was Mary Douglas, who introduced the notion of the body as a system of “natural symbols” that metaphorically reproduce social categories and concerns—an “image of society” (1970, p. 98). So, for example, when societies are under external attack, the maintenance of rules governing what belongs inside and outside the body becomes especially strict. Or—a different kind of example—“a natural way of investing a social occasion with dignity is to hide organic processes” (1970, p. 12). Hence important social occasions dictate that the body be held stiffly, the limbs and hands under careful control. And in general, manners and etiquette require the conscious withholding of bodily excreta: It is impolite to spit, fart, burp, laugh out loud, or to interrupt conversation with such involuntary expulsions as sneezing, coughing, and runny noses.

Underlying the use of the body as a social metaphor, Douglas argued, is a pan-human need for order, achieved by culturally classifying and systematizing objects, including persons, events, and activities, and by instituting routines. Having established those classifications and routines, people avoid all ambiguous or anomalous objects, states, events, and activities because they interpret them as disorderly and polluting. Douglas coined the phrase, “dirt is matter out of place” to mean that “dirt is a by-product of a systematic ordering and classification of matter” (1966, p. 35). Thus what any human culture considers to be dirt is a function of that culture’s particular system and what is considered to be outside and inside its established boundaries.

The theory has broad application, not least of which is to human bodies. An excellent example is the application of her general theory of pollution to the margins of the human body. Douglas argues that everywhere, the boundaries of the body are imbued with heightened metaphorical potency—people react to them intensely; they are “loaded.” This includes hair, the bodily lining itself, the skin, as well as all the bodily orifices—the mouth, nose, tear ducts, anus, vagina, and others—and all the bodily wastes that pass through that bodily lining or boundary—such as sweat, tears, saliva, menstrual blood, and semen.

In her earlier work, Douglas concluded that all such bodily marginal phenomena are universally interpreted as defiling. Later (1970) she revised this to a more neutral position, maintaining that they contain enhanced metaphorical potential, but, depending on sociocultural context, they are either heightened to sacred valuation or else denigrated as polluting. It is this latter, more versatile position that has proved most attractive to later anthropologists. For example, feminists later pointed out that the widespread taboos segregating menstruating women may in some cultures be due to an interpretation of menstrual blood as signifying the power of fertility, rather than a polluting substance (see especially Buckley and Gottlieb).

The social management of bodies: Bourdieu and Foucault. By viewing the body as a text on which societal taboos and values are symbolically inscribed, Douglas's symbolic structuralism focuses on the reproduction of static rules rather than the production of human subjects whose bodies are experienced, trained, and regulated in very particular, practical ways. In the 1970s and 1980s, this emphasis changed, as anthropologist Pierre Bourdieu (1930–2002) and philosopher Michel Foucault (1926–1984), systematizing what in many ways was already implied in feminist body politics, shifted attention to the social “disciplining” of the body.

Bourdieu's emphasis was on what he called “practice”—the everyday habits by means of which the body is inculcated with cultural knowledge. Banally through “the seemingly most insignificant details of dress, bearing, physical and verbal manners,” culture is “made body,” as Bourdieu puts it—converted into automatic, habitual activity. As such, it is put “beyond the grasp of consciousness,” where it exercises “the hidden persuasion of an implicit pedagogy . . . through injunctions as insignificant as ‘stand up straight’” (p. 94).

Michel Foucault brought both practice and power onto center stage in contemporary theory. His work on sexuality, gender deviance, madness, and punishment historicizes the changing ways in which people are disciplined to conform to their culture, from the public torture and gallows of the middle ages, to today's largely unconscious self-monitoring and policing of one's own body. Foucault emphasizes that in the modern and post-modern world, people no longer need physical manipulation by centralized authorities in order to create socially disciplined bodies. Rather the spatial and temporal organization of institutions such as prisons, hospitals, and schools, and the practices and categories of knowledge—for example, ideas about what constitutes sickness and health—create norms (gender and sexuality among them) that work on individuals “from below”: not chiefly through coercion, but through individual self-surveillance and self-correction. Thus, as Foucault writes, “there is no need for arms, physical violence, material constraints. Just a gaze. An inspecting gaze . . . which each individual under its weight will end by interiorizing to the point where he is his own overseer” (Foucault, 1977, p. 155).

Foucault's model has been influential throughout the disciplines, inspiring many writers to perform their own genealogies of various historical discourses and practices relating to the regulation of sexuality and health. Queer theory has developed, in

large part, from his historicization and denaturalization of heterosexual norms. Feminist cultural theorists such as Sandra Bartky and Susan Bordo find Foucault's model of self-surveillance useful for the analysis of femininity, so much of which is reproduced “from below,” through self-normalization to cultural ideals of the perfect face and body. For Bordo, Foucault's notion of power was an ally, too, in the development of a model of gender that discards the notion of men as oppressors in favor of an emphasis on systems of power within which people are all enmeshed. This rejection of an oppressor/oppressed model has been salient in the emergence of third-wave feminist theory, as well as recent attention to the male body and masculine acculturation. Post-modern theorists have seized on Foucault's ideas about resistance—“where there is power, there is also resistance,” he wrote in his later work (1978, p. 95)—to support studies in the instability of culture and the role of human agency.

The Body in the Early Twenty-First Century

Bodily life in the early twenty-first century is full of contradictions. On the one hand, people appear freer than ever to become individual artisans of the physicality that they present to the world; virtually everything, from the shape of one's noses to one's sexual morphology, can be changed. On the other hand, as Western imagery and surgical technology, deployed throughout the world, makes slender, youthful beauty a global ideal, the choices seem less expressions of individuality than self-correction to standardized (and often racialized) cultural norms.

Increasingly medical technology has become an extension of human bodies, which are now subject to extensive intervention in order to repair malfunctioning organs, to prolong male sexual functioning, to facilitate conception, to determine fetal sex and to avoid genetic defects, to ensure pregnancy to term, and to determine when and how birth and death takes place. The benefits of this technology to alleviate human suffering and extend human choice seem undeniable. However the sweeping dominion of what Foucault called “biopower” has raised questions for which there are not yet clear answers, as many fundamental assumptions about the body are being physically, metaphorically, and ethically challenged.

When adults insist on gender reassignment surgery, are they realizing long-sought-for gendered identities or are they falling victim to the tyranny of genitalia as gender designation? When hearts, livers, and kidneys are implanted in needy persons from brain-dead donors, are some essences of the latter thereby perpetuated? How does such organ transfer influence Western constructions of the body as the sharply bounded sanctuary of the highly individuated self? When a child today can have five parents—genetic mother, surrogate mother, nurturing mother, genetic father and nurturing father—how is kinship relatedness constructed? When bodies can be perpetuated indefinitely on life-support machinery, where and when does life, and by extension one's body, end? The body, clearly, will always be an unfinished concept in the history of ideas.

BORDERS, BORDERLANDS, AND FRONTIERS, GLOBAL. At first glance the concept of borders, borderlands, or frontiers would seem to be straightforward. A border or boundary is a line on a map delineating a territorial boundary or the limit of a political jurisdiction. Borders are primarily, but far from exclusively, seen as properties of and under the control of states. Nevertheless, this has generally not always been the case. Even in the contemporary world where such an interpretation often does apply, the concept of borders frequently becomes much more complicated.

Complications of a Seemingly Simple Concept

The first complication is semantic. In many European languages, including British English, the term *frontier* is a synonym for border. In the Americas, and especially in the United States, *border* means boundary, between countries, between the states of the United States, or between provinces in Mexico or Canada. *Frontier*, typically but not exclusively, refers to a historical boundary between expanding European settlements and indigenous settlements. Thus in English usage in the United States, frontiers and borders are very different concepts and refer to quite distinct social markers. This usage has often been generalized to any sort of border zone or borderland between different sets of peoples coming into contact. It is frequently

extended metaphorically to refer to any boundary between known and unknown, an extension discussed further at the end of this entry.

The second complication is historical. Since the founding of the first states in human history in Mesopotamia some five thousand years ago, boundaries or borders have generally been vague, imprecise zones in which political—and to a lesser extent economic, social, and cultural—control fades away. That is, borders, boundaries, borderlands, and frontiers are zones or regions with some dimension, where there is a shift, more or less gradual, from control by one state to another or to an absence of state control. An important corollary of this complication is that the lack of precision is not necessarily a problem in semantics or conceptualization. Rather, it is often an accurate reflection of an actual fuzziness of boundary zones.

A third complication is that at different times and in different places these concepts have had different meanings, and they have been implemented in different ways. Often a word translated as *border* from one language to another had behind it a different meaning, a different concept of markers, and even different ethical and political implications of what that “border” entailed.

A fourth complication is that the meanings of these terms and how they have been implemented have changed over many millennia. Throughout these changes there have often been disconnects or divergences between their social reality and what various actors (individuals or states) thought they should be.

Finally, there is a problem of scale. Almost any border or boundary zone, when viewed from a sufficient distance, appears as a sharp line. When viewed up close, however, it becomes a zone having some width and often having blurry edges. So from a central capital, a border or frontier may seem precise. Yet from the perspectives of those living on or near the boundary or frontier, or even from the perspectives of those charged with administering or controlling it, it can be quite vague and often contentious.

Defining Borders, Borderlands, and Frontiers

In order to discuss these issues it is useful to present somewhat general definitions of these terms. The following definitions carry two caveats or cautions. First, as with any generalized concepts, they will not be precise for all uses. Second, these terms shift meaning over time and through space. Still, the following are useful for further discussion:

boundary—a demarcation indicating some division in spatial terms

border—an international boundary line; when a border is seen as a zone it is often called a borderland or the borderlands

frontier—a zone of contact with or without a specified boundary line

The term *borderlands* straddles the distinction between frontier and border and is often used as a synonym for frontier as a zone.

The contemporary concept of a border as a sharp, precise line stems from two sources. First is the Peace of Westphalia (1648), which established the modern nation-state system under which a state had full sovereign control of the lands and peoples within its borders. The second source is the development of private property as a concept, in which one individual, or state, had exclusive rights to land or territory. While in the early twenty-first century these conditions are taken as “normal” or “natural,” they are neither. Rather, the idea of a border as a precise line grew out of the needs of states to define boundaries. The idea of exclusive control of land developed from the transformation of control of land from a matter of use rights to a concept of land as an economic commodity, that is, something that can be bought and sold. In other words, these contemporary conceptualizations, which are often seen as a part of the process of modernization, were themselves socially constructed under very specific historical, political, and economic conditions.

In premodern times, that is, approximately before the sixteenth century C.E., land was most often thought of as a resource to which individuals, or more typically groups, had rights to use. In many nonstate societies, if the individual or group did not use the land—usually for a considerable time—then they lost their use rights. This is almost always distinctly different, however, from the European concept of *terra nullius*, which means “empty or unused land.” For those groups who foraged for a livelihood or who practiced shifting agriculture, “use” of land often included long fallow periods. To groups that practiced intensive agriculture—from classic civilizations to modern states—such fallow land appeared empty, hence unclaimed and available for settlement. These differences in how rights to land are conceptualized have been the source of much conflict over many millennia between agricultural states and nonstate peoples. For example, such conflicting viewpoints are at the root of the myth that the island of Manhattan was “purchased.” Dutch occupiers presumed that they were buying a commodity with exclusive rights. Indigenous peoples thought that in consideration for a gift marking friendship they were granting rights to joint use of common lands.

At least two caveats are in order in regard to such conflicts. First, nonstate peoples could and did come into conflict over use of land. Indeed, one of the major mechanisms of the spread of humans derives from such conflicts. Although they were sometimes resolved through fighting, such conflicts were more often resolved by one group moving deeper into unoccupied land, which over time led to the spread of humans over most of the earth. Second, many claims by civilizations or states that land was unused, or was *terra nullius*, were in fact veiled rationalizations for seizing land from peoples who had less complex social or political organization and who did not use the land as intensively.

From the development of the first states some five thousand years ago until the early twenty-first century, though abating somewhat since the Peace of Westphalia (1648), land could be, and often was, seized by conquest. To be ethical, such seizures often needed some sort of justification, such as a “just

war,” reparation for previous harm done, or evidence of illegitimate use by those from whom the land was seized. Obviously, such claims could, and often were, readily invented and rationalized. Still, states did develop a territorial sense and became concerned with boundaries, borders, borderlands, and frontiers. A primary concern, however, was control, mainly political and economic but sometimes also social and cultural. Even constructed barriers, such as the Great Wall of China or Hadrian’s Wall in northern Scotland that marked the edge of the Roman Empire, barriers that did constitute explicit boundaries, were primarily used to control movements of peoples and goods. They were seldom intended as absolute barriers.

Such walls and other barriers were often constructed with military and control functions in mind. They served to regulate interactions between the state or empire and the surrounding groups, whether those were other empires, states, or nonstate peoples. They were constructed to keep members within the state or empire, to keep others out, and to regulate which individuals, groups, or objects could cross the barrier as well as why, when, and under what circumstances such crossings could take place. Such barriers often marked a shift from direct control to indirect control, wherein local leaders controlled the area, but via assorted agreements with the state or empire. In essence, such barriers were not sharp or precise lines but rather the visible centerlines of zones of transition. Some people tried to avoid these controls. Such avoidance is typically defined as “criminal.” Thus borders give rise to smuggling and smugglers.

Frontier as Membrane

These sorts of considerations led the historian Richard W. Slatta to describe frontiers as membranes. This is a singularly appropriate metaphor for frontiers and to somewhat lesser extent for borders, borderlands, and boundaries. Membranes are differentially permeable with respect to what may pass through them and what is blocked. Their permeability often is different for opposite directions. That is, some goods are allowed to pass, say horses entering China from the central Asian steppes and silk leaving. Other things, such as armies, are not allowed to pass. Horses came into China but seldom left, unless mounted by soldiers seeking retribution for raids; silk left China but seldom came in. Membranes have thickness. When viewed from a distance they seem thin, almost like lines. When viewed up close they are zones through which objects, people, and ideas may pass.

Borderlands and Frontiers as Zones of Ethnic Change

Because borderlands and frontiers are zones between different human organizations, they are also zones of intense interactions of objects, peoples, and ideas. These interactions can range from very peaceful, mutually beneficial relationships to incessant warfare. Oftentimes, several types of interactions along the range from peaceful to warlike can occur simultaneously. For instance, along the northern frontier of New Spain (what is now the southwestern United States) various indigenous groups would have peaceful trading relationships with some Spanish villages while they were raiding others. This also occurred among various indigenous groups. Indeed, at

times these opposite relations were not between different indigenous groups and villages but varied from family group to family group on both sides. In short, frontiers are zones of intense interactions, often of several types at the same time. These interactions can change rapidly with local circumstances. This locally variable volatility is a special characteristic of frontiers and borderlands.

These were and are zones where different products and processes mixed and intermingled, often leading to the development of new products and processes. On frontiers one process of this sort, called ethnogenesis, is especially salient. Ethnogenesis is the formation of a new ethnic group via the amalgamation of two or more previously distinct groups.

With the interactions of different peoples, interbreeding and intermarriage were not rare, even in cases in which one or both sides tried to prevent such mixing. When the mixing became sufficiently regular and frequent, it could give rise to an entirely new group. The Métis in Canada and Genízaros in northern New Spain are examples. The Métis grew from unions between French fur traders—typically males—and indigenous women. These long-term relations were mutually beneficial. French fur traders gained access to furs collected and processed through their wives’ groups (such unions were frequently polygynous, with the trader having more than one wife, often from different groups). The indigenous groups gained access to European trade goods acquired through traders who were relatives and hence under considerable kinship obligation to trade fairly. In the early twenty-first century the Métis are still negotiating with the Canadian government for recognition as a people distinct from both indigenous or first nations and from European immigrants.

In northern New Spain there was an active trade in captives, both indigenous peoples captured by Spaniards during fighting and Spaniards captured by indigenous peoples; in both cases, the captives were typically women or children. Indigenous children raised in Spanish communities developed a separate identity that was neither fully Spanish nor fully of their natal indigenous group. If an individual Genízaro or his family rose to prominence, typically as a frontier soldier or sometimes through economic success, he or they could be assimilated into Hispanic society. When the United States annexed the region, the trade in captives rapidly ceased, and the Genízaro population gradually assimilated into either Hispanic or indigenous societies.

The anthropologist Frederick Barth describes another role for boundaries with respect to ethnic identity. Barth argues that ethnicity is not defined by its content but rather by the boundary or boundaries that separate one group from another. This seemingly counterintuitive view developed from studies showing that when individuals or families crossed ethnic boundaries (which may or may not coincide with political boundaries), they often changed identity. Such events are not all that rare in the ethnographic record. Furthermore, some individuals and families made such changes more than once in a single lifetime. Typically, such changes are associated with changes in ecological adaptation. Chinese farmers who moved onto the steppe and

became pastoralists typically joined a nomad group and took up that group's culture. If or when they moved back and again took up farming, they again became Chinese. In such cases, not only is the border or frontier a membrane, but it also is a catalyst for identity change. As noted, such ethnic boundaries seem most common where local ecology forces changes in productive strategies. Changes in climate and especially the development of new technologies allow such borders to shift over time.

Recent research by the biologist Mark Pagei and the anthropologist Ruth Mace supports Barth's interpretation. Pagei and Mace argue that boundaries help maintain a sense of group and enhance social solidarity and cooperation, but often at the cost of promoting conflict with other groups. Thus boundaries and borders play an important role in group formation, even while generating conflict between groups.

The Puzzle of Borderlands and Frontiers

These complications give rise to yet another, enduring aspect of borders, borderlands, and frontiers. On first glance they all seem the same or certainly similar. But with closer examination, each border region seems unique. This puzzling aspect of frontiers has fascinated and frustrated scholars who study frontiers comparatively. The sociologist Thomas D. Hall argues that this puzzling quality derives from the complex way in which frontiers are formed. In a nutshell, frontiers are constructed by the interaction of two or more different groups. The location, extent, duration, and changes in any specific frontier zone entail a complex mixture of factors external to the frontier zone and local factors, all mediated by the actions of the peoples who live in the frontier zone.

The broad similarity among frontiers derives from the small number of factors, in the following example numbering five, that shape most frontiers:

- the types of groups that come into interaction (three types: nonstate, tributary [or ancient] states or empires, or capitalist [or modern] states);
- the type of boundary involved (four types: local economic, political or military, long-distance economic, and cultural);
- the types of nonstate groups (three types, such as those conventionally labeled bands, tribes, or chiefdoms);
- the type of frontier (four types: buffer, barrier, internal, or external); and
- the type of ecological environment (four types: steppe, sown, hill, or valley).

These few factors, when divided into only a few basic categories, will generate 576 different types of frontiers. This immense variety—which could easily be expanded with finer categorization—explains why each specific frontier seems unique. The point of this example is *not* the specific list of factors *nor* the number of specific categories into which they are divided. Rather, it is that with only a few factors divided into a small number of categories an immense variety of frontiers or

borderlands can be described. This then “solves” the puzzle of how and why all frontiers seem similar at first glance but on closer examination seem unique. The similarity derives from the small number of factors involved; the uniqueness from the large number of ways they can be combined.

Borders, Borderlands, and Frontiers as Sites of Social Change

Because of the various complex interactions that occur along borders, in borderlands, and on frontiers, such places are very fertile areas for studying how social, political, economic, and cultural changes occur and how individuals and groups both shape and are shaped by those changes. They are zones where the local and the global interact very intensely and hence exhibit processes that are rarely, if ever, seen in more central areas. This is another reason why the study of borderlands and frontiers is often so fascinating to scholars.

Frontiers are often seen as sources of change, as in the famous frontier thesis of the American historian Frederick Jackson Turner (1861–1932): that the frontier zones of the United States shaped the country's national character. Turner has often been criticized for having the causality backwards: It was the central areas that shaped the frontier. The literature of these debates is enormous, even leading some U.S. historians to question the utility of the concept of “the frontier.” A major problem here is in the definite article: “the frontier” was in reality many, highly fluid, and changeable frontiers.

One very positive result of these debates has been the development of a growing body of writings on comparative frontiers. By comparing different frontiers, scholars have begun to uncover both common, underlying factors and their various unique constellations. Such studies have done much to further blur the distinctions between history and sociology, anthropology, and geography. A conventional, if caricatured, view of these disciplines is that history is idiographic, concerned with painting detailed pictures, whereas sociology, anthropology, and geography are nomothetic or seeking lawlike regular patterns. This conventional view is flawed in at least two ways. First, it sees the two approaches as opposites or as in conflict rather than complementary. Second, it fails to recognize that there is a vast array of possibilities of combining both types of explanations and descriptions. Studies of frontiers or borderlands, especially comparative studies, must combine both approaches in ways that often render disciplinary distinctions unrecognizable. Phrased alternatively, comparative studies of frontiers are inherently multi- and interdisciplinary. Thus the comparative study of frontiers itself forms a kind of intellectual borderland.

Borderlands and Frontiers as Metaphors

No discussion of borders, borderlands, and frontiers would be complete without some attention to the metaphorical use of these terms. Most readers of English are familiar with such phrases as “the frontiers of medicine,” “the frontiers of science,” and “space, the final frontier.” Behind these metaphors is a state-centered view of borders, borderlands, and frontiers in which such areas mark a zone of transition from well-known territory under control of the state to little-known territory not

under control of the state. This metaphor breaks down, however, if pushed too far. Spatial frontiers most often had residents on the other side who were obviously not unknown to themselves. Indeed, at first contact, from each side (and there often are or were borders or frontiers with more than two sides) the other side(s) seemed unknown and were seen as strange or mysterious by the other side(s).

The unknown quality of the “other side of the border or frontier” simultaneously generates curiosity, promise, threat, and fear. It is this combination of reactions brought on by approaching unknown and often uncontrolled territory, peoples, or ideas that is the key difference between frontiers and borderlands on the one hand and a border or boundary in the conventional sense on the other. Presumably with a conventional border, what is on the other side is known but is held separate and distinct by the border. The combination of mystery and danger accompanied by promise and curiosity seems to be at the root of the popularity of the use of frontier (and less frequently borderlands) as a metaphor. In that sense, of course, it is singularly apt for describing or labeling a transition from the known to the unknown.

Thus concepts of borders, borderlands, and frontiers seem at first glance straightforward, simple, and clear. Yet when examined more closely, they are mysterious, complex, and murky. This is why they are often regions of such fascination to scholars and thinkers in many disciplines. Also because of their transitional qualities, they are often excellent sites to study a wide variety of social, cultural, political, and economic change.

BRAIN DRAIN. See *Migration*.

BUDDHISM Buddhism, the only truly “world” religion of Asia, was founded in the fifth century B.C.E. in northwest India by a prince named Gautama, who was also called Siddhartha (“He who has reached his goal”), Shakyamuni (“Silent sage of the Shakya clan”), and eventually the Buddha, or “Enlightened One.” The religion spread throughout northern India during the next centuries, becoming a major competitor with Hinduism for popular support and royal favor. The traditions of Hinduism and Buddhism mutually influenced each other, sharing many of the same assumptions but also differentiating themselves doctrinally and, to a lesser degree, socially and ritually.

The three major forms of Buddhism—Theravada (“The Speech of the Elders”), Mahayana (“The Great Vehicle”), and Vajrayana (“The Diamond Vehicle”)—all were born in India and were given their characteristic stamp in that country. By the end of the first millennium C.E., however, Buddhism was more or less defunct in the land of its origin, in part as a result of invading Muslims who especially targeted Buddhist temples and monasteries and in part because Buddhist doctrines and deities were increasingly assimilated into Hinduism.

Long before it ceased to be a religion of India, however, Buddhism had become a pan-Asian religion. By the middle of the third century B.C.E. the great Mauryan emperor Ashoka consolidated most of the Indian subcontinent under his rule. While Ashoka may or may not have been himself a Buddhist convert, tradition gives him credit for spreading the religion not only throughout India (his “edicts” posted on pillars throughout the subcontinent are often read for their Buddhist or crypto-Buddhist messages) but also into Sri Lanka to the south, where it soon became the state religion. From there Buddhist monks brought the religion to Burma, Thailand, and other parts of Southeast Asia, where it has survived as the predominant faith of that region.

Other monks, starting from points in northern India, followed the trade routes into Central Asia and eventually into China, where Buddhism entered by the first century C.E. Although initially regarded with suspicion as a foreign and “barbarian” faith, over the course of several centuries Buddhism was gradually blended with Chinese culture until it joined Confucianism and Taoism as one of the principal religions of that region. By the middle centuries of the first millennium C.E., Buddhism had become the religion of choice of the newly reunified Chinese empire, and indigenous doctrinal and philosophical schools of Buddhism arose. By the seventh century, Buddhism had converts in China from all strata of society, from the imperial family down to the peasantry, and monasteries flourished throughout the empire. The popularity of Buddhism in China would not last, however, and by the ninth century the religion began to decline.

From China, Buddhism entered Korea by the third century C.E. Missionaries from Korea brought the religion to Japan in the sixth century, where it developed into the dominant religion of that country and exerted a huge influence on Japanese national culture. It was not until the seventh century that Buddhism came from India to remote Tibet where, after a few centuries of ups and downs, it became firmly entrenched by the eleventh century and was the state religion until the Chinese invasions in the 1950s. Tibetan Buddhism was exported to Mongolia originally as a result of the close relations between one of the ruling khans and the first Dalai Lama.

Buddhism has been known in the West since at least the time of Alexander the Great and possibly influenced some forms of Greek philosophy, the Gnostics, and early Christians. In modern times, as a result initially of immigration of Asians to Western countries in the nineteenth and twentieth centuries and increasingly because of interest among Westerners themselves, Buddhism can no longer be regarded as an exclusively Asian religion.

The Buddha and the Fundamental Doctrines of Buddhism

The historical details of the life of the Buddha, like those of the lives of many of the world’s religious founders and saints, are probably unrecoverable, buried under layers and layers of mythology and doctrinal revisionism. While there is little doubt that at the origin of Buddhism lies a strong, charismatic founder, the particular contours of the person and life of that founder can only be purely speculative. The oldest Pali and Sanskrit texts do not relay a sustained narrative about the Buddha’s life but rather give only snippets and fragmentary references that seem to emphasize his human features. This has led some to argue that Buddhism is fundamentally an “atheistic” religion, although for a variety of reasons this is a distortion of Buddhist belief. There are indications that even in his lifetime Gautama was accorded great respect and veneration and soon after his death was worshipped in the form of relics, pilgrimages to sites of significance in the Buddha’s life, and eventually in images that became the centerpieces of devotion.

The first known formal biography or hagiography of Gautama Buddha was the *Buddhacarita*, written in Sanskrit probably around the first century C.E. by Ashvaghosha. Over subsequent centuries other life stories were produced in India and Sri Lanka incorporating more and more legendary and mythical materials. The later texts in the hagiographical tradition in Buddhism increasingly stress the miraculous and supernatural elements of the founder. Indeed, in many of them Shakyamuni is portrayed as this era’s Buddha, the latest in a string of many prior Buddhas and the forerunner of a future Buddha known as Maitreya. By the time of the rise of Mahayana Buddhism in the early centuries C.E. the historical Gautama was wholly eclipsed by a complex “Buddhology” that elevates the Buddha to cosmic and, for most ordinary Buddhists, divine stature.

While there are a variety of understandings of who the Buddha was among the various adherents and sects of Buddhism, all are agreed on the basic outline of his life story. He was supposed to have lived sometime during the period from the sixth to the fourth centuries B.C.E., born into a family of the Kshatriya, or warrior-king, class in the clan called the Shakyas in northeastern India. Many accounts say his birth was attended by miracles and that he was born with signs on his body indicating a destiny either as an enlightened Buddha or as a world-conquering emperor. His parents, preferring the latter career path, kept him isolated from the outside world and educated him to be a prince. Gautama grew up under these pampered circumstances, married, and had a son he named Rahula (“Fetter”).

This sheltered life of royal luxury came to an end when the young prince was taken by his charioteer on four excursions outside the confines of the castle. On these trips he saw, for the first time, the suffering nature of a life where sickness, old age, and death are inevitable. On his last tour he also saw a mendicant who was attempting to find an alternative to such a life. These “four sights” provided the impetus for the future Buddha to immediately leave the householder way of life and go in search of the means to liberation from suffering.

The middle centuries B.C.E. in North India were a time of great religious and intellectual ferment and experimentation. Many of the religious assumptions prevailing at that time were integrated into the Buddha’s teaching and subsequent Buddhism, including the belief in karma and rebirth, the cyclical nature of time, the pervasiveness of suffering, and the positing of an alternative to suffering and rebirth.

Upon leaving his previous life as a prince, Gautama is said to have joined several of the many different groups of world renunciators living in the wilderness areas of India, including one group of radical ascetics. The future Buddha perfected the methods taught in this group, learning how to live on but a grain of rice a day, until he became skeletal and weak—but not enlightened. According to legend, Gautama abandoned the way of radical asceticism, just as he had early renounced the life of hedonistic pleasure in the castle, and soon discovered a “middle way” between these two extremes. In deep meditation under a “tree of enlightenment,” the Buddha reached

his own enlightenment and nirvana, the “extinguishing” of ignorance, suffering, and rebirth.

The first sermon or teaching of the newly enlightened Buddha was, according to the legends, given at the Deer Park in Sarnath in northeast India to members of the group of ascetics with whom Gautama had associated earlier. This first “turning of the wheel of dharma” encapsulates the fundamental tenets of all forms of Buddhism and consists of what are called the Four Noble Truths.

The first of these is the universal fact of suffering and dissatisfaction (*dukkha*). A standard formula declares that “birth is suffering, aging is suffering, sickness is suffering, death is suffering; sorrow, lamentation, pain, grief, and despair are suffering; association with what one dislikes is suffering; separation from what one likes is suffering; not getting what one wants is suffering.” Such unhappy circumstances are sometimes called “obvious suffering” and are also bound up in another central doctrine of all forms of Buddhism: the insistence that there is no “self” or “essence” to things and beings (*an-atman*). This belief directly contradicts the concept in Hinduism of an *atman*, or fundamental and underlying self (which was not conceived of, however, as the ego or temporary persona that undergoes rebirth). In the Hindu texts known as the Upanishads, realization of one’s true nature, one’s true self or *atman*, as identical to the ultimate ground of the cosmos (the Brahman), was the end of the mystical pursuit. In contrast, the positing of *an-atman* became one of the distinctive, even unique, features of the Buddhist religion. Suffering occurs in part by grasping and clinging to a self that does not, according to Buddhism, exist.

According to Buddhist doctrine, what we call the “self” is merely a composite of five “aggregates” or “heaps” (*skandhas*). These are “form” (the body in particular and physical and material form in general), feelings (pleasant, unpleasant, and neutral), discrimination (that which processes and categorizes sensory and mental information), karmic predispositions (including, among many other mental factors, will or volition), and consciousness (meaning not only mental awareness but also the “consciousnesses” associated with the five senses). The “self” is but an ever-changing conglomeration of these five aggregates—a process rather than an essential entity.

Another dimension of the first Noble Truth of universal suffering is called the “suffering of change.” Even the pleasant things and circumstances of life are not lasting, and when they are lost we suffer. Thus a second central concept of Buddhist metaphysics also tied up with the truth of suffering is that of impermanence, or *anitya*. Buddhism posits the impermanence and changing nature of all caused and compounded or composite things and beings. Suffering occurs when one mistakes impermanence for permanence and, again, becomes ignorantly attached to things and beings in the false belief that they will last.

A third dimension of suffering is sometimes identified: the “pervasive” suffering that accompanies birth in “samsara”—a word that literally means “to wander or pass through a series of states or conditions.” Samsara describes the beginningless cycle of cosmic or universal death and rebirth and the fact that phenomenal existence is transient and ever-changing. “Perva-

sive” suffering points to the recurring experience of birth, life, death, and rebirth in such a universe.

The second Noble Truth states that suffering has a cause and is not therefore eternally and hopelessly hard-wired into the nature of things. Suffering, according to Buddhism, is created by our own ignorant and habitual responses to life. The chief cause of suffering is variously identified as “thirst” (*tanha*), “craving” (*trishna*), or the “three poisons”: “desire” or “attraction” (*raga*), “aversion” or “hatred” (*pratigha*), and “ignorance” (*avidya*).

Suffering occurs because of a series of interrelated causal factors that are summarized in another important Buddhist doctrine, that of “dependent origination.” In essence this doctrine declares “that being, this comes to be; from the arising of that, this arises; that being absent, this is not; from the cessation of that, this ceases” (*Samyuttanikaya* 2.28). In its classical form, dependent origination consists of twelve conditioned and conditioning links: (1) ignorance, (2) formations (the construction of new karma), (3) consciousness, (4) mind and body, (5) the six sense fields, (6) contact of the senses with the sense fields, (7) feeling, (8) craving, (9) grasping, (10) becoming, (11) birth (i.e., rebirth), and (12) aging and death. Each link depends on the one before it. Aging and death (12) depend on birth (11), for if one were not perpetually reborn one would not repeatedly grow old and die. Birth depends on becoming (10, in the sense of the ripening of karma created in the past); becoming depends on grasping or clinging (9), which in turn depends on craving (8). Craving arises due to pleasant and unpleasant feelings (7), which depend on the contact of the senses (6) with the objects or “fields” of the senses (5), which could not exist without a mind and body (4). Mind and body depend on the consciousness of the six sense fields (3, the five senses with the mind as the sixth), which are determined by the volitional forces (2) that come into play due to ignorance (1). When ignorance ceases, karma is no longer produced, and all other links in the chain are stopped, right up through old age and death.

This brings us to the third Noble Truth, which declares that there is an alternative to suffering, the state called *nirvana*. The term literally means an “extinguishing” or “blowing out” and has sometimes been misunderstood as some kind of nihilism. Nirvana is indeed often described in negative terms: the permanent cessation or extinction of suffering and its causes (craving and the three poisons), of the false idea of and attachment to self, of mistaking the impermanent for the permanent, and of rebirth in the world of samsara. But nirvana is also depicted in positive form, as a state of absolute peace, serenity, tranquility, happiness, and bliss. One who achieves such a state is known as an arhat, or “worthy one,” and various important milestones along the way are also delineated. One who has had the experience of penetrating into the true nature of reality is called an *arya* (noble one) and a “stream-enterer,” for he or she is from that time forward moving inexorably toward nirvana. A “once-returner” has only one more lifetime before achieving the goal, and a “non-returner” will attain nirvana in this lifetime. A distinction is also sometimes made between “nirvana with remainder” (indi-

cating that the person has reached the goal but is still embodied) and “nirvana without remainder,” or “final nirvana” (*parinirvana*), which the arhat enters after the death of the body.

The fourth Noble Truth is the declaration that there is a path or method for achieving the state of nirvana. Just as suffering has its causes, so too can the end of suffering be brought about by entering and perfecting the “Eightfold Path,” which are sometimes also grouped into what are called the “Three Trainings.” The first “training” is in wisdom and covers the first two steps of the Eightfold Path: (1) right view (meaning, among other things, a proper understanding of the Four Noble Truths) and (2) right resolve (the determination to end one’s suffering). The second training is in ethics and includes (3) right speech (abstaining from lying, divisive speech, harsh speech, and idle speech), (4) right action (abstaining from killing, stealing, and sexual misconduct), and (5) right livelihood (abstaining from professions that involve harming other beings). The third training is in meditative concentration and covers (6) right effort (persistence in the training of meditation), (7) right mindfulness, and (8) right concentration. Given the crucial importance and centrality of meditation to the Buddhist path, texts go into great detail about the increasingly subtle states of mind associated with right mindfulness and right concentration.

After the first sermon at the Deer Park, the Buddha is said to have traveled and taught in India for many decades. During the Buddha’s lifetime, he also apparently inaugurated one of the central institutions of Buddhism, monasticism, the most ancient continuous institution in history. From the earliest period of Buddhism, the community, or *sangha*, consisted of laymen and laywomen on the one hand and monks and nuns on the other. But it was especially the monastics who were encompassed in the term *sangha*. The monastic rules of discipline, or *vinaya*, may go back to the Buddha himself but were in any case codified in a series of councils held after the Buddha’s passing away. Being a Buddhist traditionally means that one “takes refuge” in what are called the three jewels—the Buddha, the dharma (i.e., the teachings and the attainments those teachings lead to), and the *sangha* (sometimes meaning exclusively the monastics and sometimes meaning the whole of the Buddhist community).

The Buddha was said to have lived to the age of about eighty, at which time he “passed into his *parinirvana*.” According to the texts, relics from his body were distributed and subsequently buried at the base of distinctively Buddhist places of worship called stupas, which, together with the monasteries and pilgrimage sites, formed the spatial centers of the new religion.

Formation of Theravada Buddhism

According to legend, the first of the Buddhist councils, where monks from all over North India met to collate the Buddha’s teachings, occurred just after the Buddha’s passing away, and several more were held in the years following. In these councils, the earliest forms of the Buddhist canon were developed. Texts, originally orally recited by monks, were divided into three main divisions or “baskets” (*pitakas*): *vinaya* (rules for monas-

tics), *sutra* (discourses), and *abhidharma* (metaphysics). While different traditions have different recensions (in different languages) and even different texts in their canon, all follow this basic division of the sacred scripture into the “three baskets.”

It was in the second of these councils, held some one hundred years after the Buddha’s *parinirvana*, that sectarian differences led to a division between a group of monks called the “Elders” (Sthaviras) and a breakaway set of groups known collectively as the “Great Assemblists” (Mahasanghikas). While the exact reason for the schism is not known with certainty, it seems as though the Mahasanghikas were the more liberal of the two groups while the Sthaviras were the more conservative, preserving what they regarded as the original purity of the Buddha’s teachings. Other schisms and divisions into schools and subschools also occurred, but the Sthaviravadins survived as the “Theravadins” (the Pali name for “teachings of the elders”) in South India, especially Sri Lanka, and from there into Southeast Asia.

Prior to the eleventh century, Theravada was but one of the several forms of Buddhism practiced in Sri Lanka. While it, like all other forms of Buddhism, represents itself as “pure” and “original,” it is in fact a syncretistic blend of a variety of elements and practices. Various reforms sponsored by royal patrons have attempted to recover the “original purity” of Theravada, and among the monastics movements of conservative “forest monks” have at various times insisted on going back to the meditative base of the tradition. As the form of Buddhism that came to predominate in Sri Lanka and Southeast Asia, Theravada is sometimes also called “southern” Buddhism.

Mahayana Buddhist Doctrines and Traditions

The origins of the second major division within Buddhism are shrouded in uncertainty. What was to be called Mahayana, or the “Great Vehicle,” did not originate with any one reforming individual or emerge at any specific time. It at least partially had its roots in a pan-Indian devotional movement (bhakti) that also had a dramatic impact on the Hindu traditions of India around 150 B.C.E. and in the centuries following. Mahayana is also sometimes traced back to the “Great Assemblists,” or Mahasanghikas, but it seems that for many years, even centuries, monks who eventually became Mahayana lived and studied in the same monasteries as others. Perhaps the best way to envision Mahayana Buddhism in its earliest years was as a set of new texts that introduced new doctrinal elements into Buddhism. Those who accepted the canonical legitimacy of these new texts were Mahayana.

The doctrines put forward in these new texts were not, however, represented as new. Rather, they too were supposed to originate with the Buddha; they were regarded as “turnings of the wheel of dharma” that taught the deeper meanings of the Buddha’s message for disciples who were more capable.

Chief among the distinctive teachings of Mahayana was a new conceptualization of the goal of Buddhism. In early Buddhism as well as in the subsequent Theravada tradition, the attainment of nirvana was theoretically possible for anyone. But Buddhahood itself remained the unique feature of Gautama. The Mahayana Buddhists posited enlightenment

and Buddhahood itself as the ultimate goal for all practitioners and regarded nirvana as a lower attainment for those of a “lesser vehicle” (Hinayana).

With this new idea regarding the goal of Buddhism came a radically different understanding of Buddhology. Gautama, for the Mahayana Buddhists, was but one of an innumerable set of Buddhas who populated the cosmos. Each Buddha ruled a region, or “heaven” or “pure land,” which was also populated with highly evolved spiritual beings known as Bodhisattvas. These Buddhas and Bodhisattvas were thought to be filled with compassion and with certain abilities and powers to help those who asked for it. One of the chief features of Mahayana Buddhism is its devotional quality, consisting of the worship of and prayers to these celestial Buddhas and Bodhisattvas.

Integral to the new Buddhology that distinguishes the Mahayana is the doctrine of the “three bodies” or “three forms” (*rupas*) of the Buddha. The first is the “transformation body” (*nirmana kaya*), which refers to the physical emanations the Buddha sends out to this and other worlds. The historical Buddha, Gautama, was one such emanation according to Mahayana Buddhism—a notion that also assumes that Gautama was always and already enlightened, being merely an earthly incarnation of a previously enlightened cosmic Buddha. Under this conception, Buddhas have the capability of sending out virtually infinite numbers of transformation bodies out of their compassion and urge to help all sentient beings everywhere.

Each Buddha also has what is called an “enjoyment body” (*sambhoga kaya*), a subtle body of light that appears in that Buddha’s heaven or pure land, a paradisiacal world populated with advanced practitioners and Bodhisattvas. Conditions in such a land are highly conducive for the attainment of Buddhahood; one form of Mahayana Buddhist practice is to pray and perform other devotional activities in the hopes that one or another of the Buddhas will admit the devotee into his or her pure land after death.

Finally there is what is called the “dharma body” of the Buddha, which refers to the ultimate nature of the Buddha’s mind and to reality itself in its ultimate form. The dharma body includes the omniscience or perfect realization of wisdom in a Buddha’s mind. It also includes the ultimate nature of reality itself, its “thusness” or “suchness.”

Another innovation in Mahayana Buddhism was the superseding of the Eightfold Path with a new method (leading to a newly reconceived goal). This was what became known as the “Path of the Bodhisattva.” The first step on this path was to attain what was termed *bodhicitta*, the “mind of enlightenment” or the motivating wish to attain Buddhahood out of compassion for all sentient beings. A key ingredient to *bodhicitta* and, indeed, a virtue that takes center stage in Mahayana Buddhism, is compassion (*karuna*), which, together with “loving kindness” (*maitri*) and wisdom (*prajna*), form a triad of the distinctive virtues characteristic of the Bodhisattvas (“beings of enlightenment,” the ones who have attained *bodhicitta*) and the Buddhas as conceived by Mahayana.

Out of this driving wish for enlightenment, impelled by the altruistic intention to help end the suffering of others, the Mahayana practitioner takes various vows, swearing to live a life guided by compassion, and then engages in the “six perfections,” each associated with a progressively higher stage of the Bodhisattva path. The first of these “perfections” (*paramitas*) is generosity, including the giving of material things, protection from fear, and the giving of dharma teachings themselves. In its most advanced form, the perfection of giving includes the willingness of the Bodhisattva to give up his or her own body if necessary. Also included under this perfection is giving in the form of what is known as “transfer of merit” (*pari-namana*), the perpetual turning over to the benefit of others any karmic merit done by any meritorious act.

The second perfection is ethics (*shila*) and consists largely of avoidance of the ten basic misdeeds of body, speech, and mind (killing, stealing, sexual misconduct, lying, divisive speech, harsh speech, idle speech, coveting, ill will, and wrong views). Third is the perfection of patience (*kshanti*), specifically combating anger with compassion and loving kindness. The fourth perfection is joyful effort or “vigor” (*virya*), defined as taking joy in doing meritorious and compassionate acts. Fifth comes meditative concentration (*dhyaana*) followed by the sixth perfection, wisdom (*prajna*).

The “perfection of wisdom” consists of realizing the truths of the distinctive metaphysics that also defines Mahayana Buddhism. Especially associated with the great philosopher Nagarjuna (c. 150–250 C.E.) is the important doctrine of “emptiness,” or *shunyata*. Nagarjuna argued that, as a sort of universal extension of the earlier doctrine of “no-self,” all phenomena are “empty” of inherent nature or self-existence. Persons and phenomena exist only dependently, not independently. Emptiness is thus not the ultimate ground of being but rather the insistence that there is no such ultimate, irreducible ground. Emptiness is not some thing but the absence of intrinsic existence to all things. But neither, argued Nagarjuna, does this mean that “nothing exists.” Things do exist, but only dependently. The philosophical school associated with Nagarjuna’s thought was called the “Middle Way” school (*Madhyamika*), positing neither nihilism nor eternalism but a median between the two.

Another important philosophical tenet of Mahayana Buddhism is the identity of samsara and nirvana. Liberation is not “outside” or “apart from” a world of suffering; they are not two separate realities. Both are equally “empty” of self-nature and exist, as all things, only dependently.

While other traditions and schools of Buddhism also went from India to China, Korea, and Japan, it was Mahayana Buddhism that flourished and was further developed in those regions. Mahayana is thus sometimes called “northern Buddhism” in contrast to the predominantly Theravada traditions of “southern Buddhism.”

Mahayana Buddhism in China was heavily influenced by the preexisting religious philosophies of Confucianism and Taoism and by the presuppositions of a culture already ancient, literate, and sophisticated by the time Buddhism was brought to it in the early centuries C.E. Among the difficulties Buddhism faced

in China were monasticism and celibacy, which were understood to be in opposition to the Chinese emphasis on filial piety and ancestor worship. Conversely, the Chinese readily embraced and further elaborated the Mahayana concept of all beings having a “Buddha nature,” or the potential to achieve Buddhahood and enlightenment.

By the fifth century C.E. different schools of Buddhism arose in China. Some of these were simply Chinese equivalents of Indian Buddhist schools. San-lun, or the “Three Treatises” school, was the Chinese version of Madhyamika, and Fa-hsiang, or “Characteristics of the Dharma” school, was the equivalent of the Indian philosophical tradition known as Yogacara. But also at about this time, distinctively Chinese schools of Buddhism arose that reflected indigenous cultural and religious emphases. The importance of harmony, for example, produced schools like the T’ien-t’ai (“Heavenly Terrace”; Tendai, in Japan), which placed one text (in this case the Lotus Sutra) above all others and then organized the rest of the diverse Buddhist tradition into a hierarchically ordered synthesis. The T’ien-t’ai philosophy embraced the idea that Buddha nature exists in all things and that the absolute and phenomenal world are not ultimately different. Another school that attempted to harmonize the teachings of Buddhism into a syncretistic whole was the Hua-yan (Kegon, in Japan) school, which elevated the Avatamsaka Sutra to the highest place and oriented the rest of Buddhist texts and teachings around it.

Of special importance, however, were two other schools that arose in China, spread to neighboring regions from there, and survive to the present. The first of these was the “Pure Land” school (Ch’ing-t’u), a devotional and faith-based sect centering on the figure of Amitabha Buddha. Pure Land became the most popular form of the religion in China, Korea, and Japan, especially among the laity. Pure Land promises an easy path to salvation in the guise of rebirth into the heaven or pure land of Amitabha, where one will quickly become enlightened. The principal practice of this form of Buddhism has been to call upon the grace of this Buddha through repeating a formula known as *nien-fō* (*nembutsu* in Japanese). In its more radical forms, Pure Land has insisted that one must rely totally on the “other-power” of the Buddha and not at all on one’s own efforts.

The second of the two most important schools that arose initially in China was that known as Ch’an, or Zen as it was termed in Japan. Deriving from a Sanskrit word for “meditation,” the Ch’an/Zen tradition offers a stark contrast to the devotionalism of Pure Land. Traced back to an Indian monk-missionary named Bodhidharma, whose radical and uncompromising meditational techniques become legendary, the Ch’an/Zen tradition developed a simple but disciplined and demanding set of methods for directly intuiting one’s own Buddha nature and achieving various levels of awakening (*wu*, or *satori* in Japanese). These methods included meditation, the “direct transmission” of wisdom from the mind of the enlightened teacher to that of the student, and the contemplation of riddles known as koans.

Vajrayana or “Tantric” Buddhism

The third major form of Buddhism, like that of Mahayana, was the particular Buddhist expression of a pan-Indian religious movement. Whereas Mahayana became the Buddhist form of the bhakti, or devotional movement, Vajrayana (“Diamond Vehicle”) was the Buddhist expression of what has been called Tantrism, an esoteric, sometimes antinomian, and often controversial form of religious belief and practice that became influential throughout India beginning in the middle centuries of the first millennium C.E.

Here too, as with Mahayana, this apparently new form of Buddhism is not represented as new at all. Vajrayana claims to be the secret doctrines and practices taught by the Buddha in his guise as Vajradhara (the “Holder of the diamond”) to only his most advanced disciples. It also portrays itself as the quick way to enlightenment in this very lifetime through the attainment of “accomplishments,” or powers (*siddhis*), that speed up the process. The tantric master (*mahasiddha*) appropriates to him- or herself the powers of one or another of the Buddhas, who is invoked through the practice of meditative visualizations, symbolic gestures (mudras), and the recitation of sacred words called mantras (indeed, such is the importance of the latter that sometimes this form of Buddhism is called Mantrayana or the “Vehicle of the Mantra”).

One key to this form of Buddhism is the emphasis on initiation and the important place of the tantric master, or guru. It is the teacher who is the gateway to the powers of the tantric deity or Buddha and their secret world, or mandala. The techniques and wisdom are to be scrupulously guarded from the uninitiated, and as a result the texts of Vajrayana Buddhism are often encoded in a symbolic or metaphorical language (sometimes called “twilight speech”) not easily decipherable by outsiders. Once initiated, the practitioner forms a special connection, even identity, with the tantric deity or Buddha into whose sphere one has entered. By attempting to recognize the union with that deity through meditation and, in more advanced cases, ritual and yogic practices involving a partner of the opposite sex, the practitioner tries to “short-circuit” the mind into a realization of enlightenment and the perception of all things and beings as pure.

Tantric forms of Buddhism perhaps originated among the laity but by the eighth century had been taken up by monastic scholars and brought increasingly into the mainstream of Buddhist thought and practice. By and large the great tantric practitioners who brought this form of Buddhism to Tibet had originally been trained in the monasteries. And while Vajrayana Buddhism spread also to Southeast Asia, Japan, and elsewhere, it was primarily in Tibet and Nepal where this form of Buddhism was preserved after it was extinguished in India.

Later Developments: Modern Buddhism in Asia and Buddhism in the West

Buddhism, like all other religions, has been influenced by the forces of modernity. These forces—including scientific materialism, secularism, technological advances, and the ideologies of democracy, equality, Marxism, and so on—arrived in the traditionally Buddhist Asian countries in the forms of Western

imperialism and colonialism and the Christian missionary movement that often accompanied them. In Sri Lanka, Southeast Asia, China, and Japan, the coming of Western influences disrupted the traditional structural alliances between Buddhist monastic institutions and the government. Buddhist revivals in places like Sri Lanka and Thailand resulted in what has been called a new "Protestant" form of Buddhism that emphasizes rationality and deemphasizes the split between monastics and laity. Buddhism also often became associated with cultural and emerging national pride in the battle against the colonial powers and their impact. In Japan and Korea, Buddhist influences combined with modern concepts and in some cases Christian influences to give rise to a slew of new religious movements. And in China and Tibet, where Chinese Communist regimes have not often been favorably disposed to Buddhism, the religion survives in a much-weakened condition in comparison to its earlier influence.

Buddhism in the modern West comprises two very different kinds of groups. On the one hand, it has come to North America and Europe as the religion of Asian immigrants. For these new arrivals, Buddhism provides a sense of cultural community, continuity, and tradition in new and often challenging circumstances. Often over time the Buddhism practiced in these immigrant communities increasingly takes on the shape of Christian church worship, with the introduction of scripture reading, sermons, and youth education ("Sunday school").

The other form of Buddhism in the West is made up of Western converts who are almost always attracted not to the devotional or even the communal element of Buddhist religion as much as to the philosophical and especially meditative component. For these Western lay practitioners (there are at present very few Western Buddhist monastics), the practice of Buddhism means first and foremost meditation, a dimension of the religion formerly in Asian contexts confined almost exclusively to the monastics.
